The real reason for Ghose's antipathy to my approach arises from the fact that he places enormous emphasis on the Parliamentary accountability and public-audit aspects of the public sector. He also appears to think that majority ownership is essential, if a private sector concern is to be effectively controlled. I certainly do not agree with any of these points. My study of public enterprises extending over a long period has certainly convinced me that among the major factors that have made a mockery of the public sector in India are to be counted the wrong type of public accountability, the audit system and the bureaucratic and political dominance which make professional management of these enterprises difficult. I do hold that there are elements of healthy professional management in the large industrial private sector units which can provide excellent nuclei for the future growth of the concerned industry and that, once private ownership and control are changed through conversion of the enterprises into joint sector ones, the growth of such enterprises should be supported. Majority ownership is not necessary for control, though with term-lending institution, LIC, general insurance and major banks brought into the public sector, more and more equity capital in large concerns cannot but be owned by public sector institutions. It is not, however, necessary in my view to make a fetish of majority ownership, though this will automatically come about in course of time. What is operationally of immediate importance is effective control and this is possible even with a 30 per per cent equity holding.

I agree with Ghose that the term joint sector has been much misused and that a number of units are being set up, specially under State Government auspices which fit in with the ideas put forward by J R D Tata and FICCI, and that such joint sector projects are likely to be an aid to the growth of monopoly and not an instrument for curbing private concentration of economic power. My quarrel with him arises essentially because, in addition to wrongly emphasising aspects like majority equity, accountability and public audit, he appears to misunderstand my own approach to the joint sector.

Perhaps, as I mentioned earlier, the Dutt Committee would have done well to avoid using a term which had already been used with somewhat different meaning by other authors. The main point, however, is that if certain authorities in government and the spokesmen of Big Business wanted to twist the recommendations of the Dutt Committee and use a term supported by it in a wrong manner nothing could have stopped them from doing so. This, I am afraid, is what is happening with the concept of the Joint Sector.

Ours is a magnificent Land-2

I was born unwelcome
into an overcrowded land.
But I have shared
my home with
the exiled.

I exist in a village
imprisoned by my fields.
But in quest of my spices
man discovered a globe.

I adorn my emaciation
with the tatters of penury.
But I have gifted the world
the luxury of fine muslin.

My cookfires I light
with the dung of cattle.
But I have taught man the
abstraction of algebra.

I grew up untutored,
unmusic'd and unsung.
But my syncopated sitar
has driven nations to frenzy.

I am surrounded by children
with malnourished minds.
But I have given man
***his** first philosophy.*

I craft shoes that shod
three whole continents.
But I have just begun
to stand on my own bare feet.

I am named by many names
in a babel of tongues.
But I have adopted a name
by strangers given: India

I am sad.
But I am glad.
I am.

Ours is a magnificent land. We must build a magnificent future. Think Ahead.

In Lieu of Growth

EXPENDITURE on police by the Central and state governments has risen spectacularly in recent years. The Public Accounts Committee (1973-74) estimates, in its comments on the report of the Comptroller and Auditor General for 1971-72 relating to the Ministries of Finance and Home Affairs and the Cabinet Secretariat, that the Central government's expenditure on the police increased 52 times in 24 years — from Rs 3 crores in 1950-51 to Rs 156 crores in 1974-75 (Budget estimate). This is, of course, in addition to the even larger expenditure, estimated to have been more than Rs 300 crores in 1973-74, by the state governments on police. According to the PAC, "expenditure on police organisations of different kinds has been increasing at such a rapid rate that it calls for an urgent review by an independent high-powered commission. The expenditure on police both at the Centre and in the states has reached levels where clearly they are eroding the resources available for developmental activities."

The bulk of the increase in the Centre's expenditure on the police is accounted for by the Central Reserve Police, the Border Security Force and the Central Industrial Security Force. The expenditure on the CRP increased from Rs 13.54 crores in 1968-69 to Rs 38.78 crores in 1973-74. Up to 1964-65 there were only 16 battalions of the CRP; during the period 1965-66 to 1972-73, 16 new battalions were raised and 28 battalions of the Indian Reserve Police were merged with the CRP, so that the total number of battalions now stands at 60.

The expenditure on the Border Security Force has increased from Rs 25.44 crores in 1968-69 to Rs 57.41 crores in 1974-75 (Budget estimate). Though the BSF was meant to be deployed on the Indo-Pakistan border, its use within the country has progressively increased. Thus the Home Ministry's annual report for 1973-74 mentions that the BSF was used for maintenance of "internal security" in as many as 13 states during the year besides the Union Territories of Chandigarh and Delhi. The report also discloses that, keeping in view the progressive use of the BSF for maintenance of law and order within the country, "attempts were made to broad-base the training of the BSF personnel".

The strength of the Central Industrial Security Force, formed in 1969-70, was 15,545 in 1972-73, having risen impressively from 10,220 in 1971-72. Further increases in the CISF are on the cards, as is indicated by the statement, in the Home Ministry's written reply to the PAC, that "the demand for induction of the Force from various undertakings has gone up considerably and it has not been possible for the Force to keep up with the demand. Steps are therefore being taken to increase the recruitment and to augment the training capability of the Force".

The expansion of the CRP and the BSF and the sharp rise in the expenditure on them have been justified on the ground that the state police forces are not adequate for maintaining law and order. As the Secretary to the Home Ministry told the PAC, "Not a month passes in which we do not have pressing requests from state governments on account of one trouble or the other". However, the purpose of the large police apparatus of the Centre need not always be to supplement the state police forces; the contingency of having to supplant them on occasions to bring recalcitrant state governments to heel has apparently been taken into account by the Centre in planning the size of its police forces.

The PAC report mentions some cases of the CRP being used against the wishes of the state governments concerned. The two most significant cases both occurred in 1969 and in West Bengal where at that time a united front government, dominated by the CPI(M), was in office. In one case, the West Bengal government's request for withdrawal of CRP battalions was rejected on the ground that the battalions were required to protect property belonging to the Central government at the Farraka barrage. In the other case, the Centre turned down the state government's request for withdrawal of all CRP contingents deployed in West Bengal. This time no particular justification was advanced for the refusal; the contingents stayed put in West Bengal behind the thin pretence that they were being "withdrawn from active duty". On the other hand, the Centre is only too happy to have the states rely on the CRP. Certainly, it is not too particular about recovering the cost of deploying the CRP from the state governments concerned. As a result, arrears of over Rs 31 crores have been allowed to accumulate on this account.

The sharp rise in expenditure on the police appears to have had no impact on the incidence of crime. As the PAC comments, "in spite of heavy expenditure on the police in the Centre as well as in the states, crimes abound; particularly, economic crimes of various types are very much on the increase and the performance of the police has been far from satisfactory as large number of cases of atrocities on Scheduled Castes and Scheduled Tribes continue to occur and minorities continue to have a feeling of insecurity. What is more, there is involvement of police personnel (including senior officers) in serious crimes". The Union Territory of Delhi bears out the truth of this statement. The number of cases registered virtually doubled from 17,605 in 1968 to 34,174 in 1973. The PAC points out that "in spite of the fact that the expenditure on police in Delhi has increased from Rs 5.56 crores in 1968-69 to Rs 7.82 crores in 1971-72, it has come to be known as the crime city in India". In fact the crime position in urban Delhi is far worse than what it is in Calcutta which has a much larger population. Thus in 1972 the official figure of the total number of crimes in urban Delhi was 30,054 against 9,793 in Calcutta.

The Central and state governments are, however, not satisfied with the rise in expenditure on the police. As the Joint Secretary to the Home Ministry pointed out to the PAC, "there has been a demand from the states that there are certain major aspects of police development which hitherto have been neglected in the states due to paucity of funds, and that this paucity of funds was due to the fact that this is a non-Plan subject and therefore in future at least some of the major police development items should be included in the Plan". The joint Secretary then proceeded to describe the negotiations with the Planning Commission on this vital matter : "... during the course of the last one year we have had a couple of meetings with the Planning Commission ... and at the officials' level there has been some breakthrough in this thinking and recommendations of the Officials Committee was that certain items should be included in the Plan; but the Planning Commission has yet to take a final view of that. It is not known whether the Commission has since taken "a final view", but there can be little doubt that in the long run the so-called "breakthrough in thinking" at the officials' level will be endorsed by the Commission and at least a part of the expenditure on police will come to form a part of the Plan.

This will have many advantages. For one thing, there need be no fear then of expenditure on the police eroding resources available for development, since such expenditure would form part of the development plan. For another, it will enlarge the Planning Commission's scope for playing round with variants of the Plan. Thus it could have one variant with a certain rate of growth and a certain redistribution of incomes and consumption and another variant with a much lower rate of growth and distribution of incomes and consumption becoming more unequal but with expenditure on the police three or five times that under the first variant!

World Trade

Mixed Blessings of Floating Rates

THE latest annual report of the General Agreement on Tariffs and Trade (GATT) is apparently not quiet certain whether to regard the several major changes in international trade and payments that took place in 1973 and the early part of 1974 as representing a movement toward a global trade equilibrium or away from it. An exceptionally strong, though unusually short-lived, investment and production boom, a record expansion of world trade, the demise of the fixed exchange rate system and the transition to widespread adoption of managed floating of exchange rates were momentous developments which, taken together, made the last year a major watershed in international economic relations.

World output (excluding services) rose by unprecedented 8 per cent in 1973 compared to the annual average rise of about 5.5 per cent during the preceding 12 years. The dollar value of world exports increased by 37 per cent on top of an increase of a little less than 20 per cent in 1972 and an annual average rise of 10 per cent during 1961-71. Though the devaluation of the dollar and the high rate of inflation bloated the trade figures to some extent, there was a spurt in world exports in quantity terms by about 13 per cent in 1973 as against 9 per cent in 1972.

Trade in agricultural products rose by nearly one-half in value terms, but was not very different in volume terms over 1972. Exports of minerals increased by 46 per cent in terms of value and 11 per cent in terms of volume. The highest growth in trade in volume terms was in manufacturing at 14 per cent while in value terms it was 36 per cent. It is significant that in respect of both minerals and manufactured goods, growth of exports considerably exceeded the increase in their production.

The growth in exports of the industrial countries, at 14.5 per cent in volume terms, was higher than that of their imports by 2 percentage points. Favourable terms of trade enabled the developing countries to expand their imports, even though economic aid to them declined in real terms. East European countries' imports from the industrially developed countries rose rapidly — mainly due to higher levels of commercial credit given to them. Viewed in dollar terms, the distribution of trade among the different groups of countries did not change much. The developing countries maintained their market share at 18 per cent for the third consecutive year — thanks to favourable terms of trade. The share of the East European countries declined marginally because prices in respect of intra-area trade, which accounts for 56 per cent of the total trade of these countries, rose only marginally in 1973. There was, therefore, a small increase in the share of trade of the rest of the industrial countries.

Discussing the effects of floating rates on the level of world trade, the GATT report expresses the opinion that "while it is true that the stimulus came from the world-wide boom in production, world export statistics strongly suggest that the adoption of floating rates did not impede the response of trade to this stimulus." This is significant in the context of the fears which used to be expressed in several responsible quarters that floating rates would discourage growth of world trade because of the uncertainty about the realisation of the proceeds from trade as a result of sharp fluctuations in exchange rates.

The GATT report admits, however, that "stabilising speculation" was absent or was insufficiently present. In theoretical discussions on the subject the view has often been expressed that, under a freely flexible exchange rates regime, the tendency would be towards an equilibrating exchange rates structure in view of the two-way options that would make speculation a risky proposition. But some of the bank failures or losses sustained by banks on their foreign exchange dealings suggest that at least some currency speculators have learnt to make profits at the expense of the banking community. It is also widely accepted now that foot-loose dollars and other currencies were employed sizeably in commodity speculation, boosting commodity prices substantially. The speculation in commodities was spurred by the lack of confidence in currencies whose movements were uncertain under the floating regime. The floating regime also gave a false sense of security to several countries that they need not now worry overmuch about the consequences of heating up of their economies and the resultant inflationary pressures.

Thus floating rates, which led to commodity speculation and acute overall inflationary pressures, did contribute to the impressive rise in world trade in 1973. However, now that the commodity boom is getting deflated and several governments have realised the need to check the current high levels of inflation, will floating rates still contribute to growth of world trade? It is difficult to answer this question unambiguously in the affirmative. On balance it appears that the paeans being sung about the glory of floating rates are too simple-minded. The merits of flexible exchange rates are not to be denied; but it has also to be recognised that to be effective the exchange rate tool has to be deployed intelligently together with other policy instruments like demand management through monetary and fiscal policies.

The outlook for world trade in the current year does not suggest an expansion comparable to last year's. The annual rate of growth of imports by industrial countries in volume terms was 3.5 per cent in January-June 1974 as against 16 per cent in the first half of 1973. Similarly, the rise in exports of industrial countries to the developing countries in the first half of 1974 was running at an annual rate of 10 per cent compared to 20 per cent in the first half of 1973. From the fragmentary data available, the value of exports by developing countries appears to have continued to grow rapidly in the first half of 1974. This was, however, mainly due to the increased value of crude oil exports.

The GATT report suggests that even the rates of growth of international trade recorded in the first half of 1974 are unlikely to be maintained in the second half. The lagged response of trade to deceleration of general economic activity in the first half of the year will set very narrow limits to the likely growth of trade in the second half. A slow down in the flow of exports became evident in early summer and this was presumably accompanied by an even more pronounced decline in the flow of export orders.

Developments in the first half of the year suggest opposite kinds of impact of the oil price rise on the trade balances of the oil importing countries. Despite a rise in oil payments to 8.6 billion in the first six months of 1974, as against $ 13 billion for the whole of 1973, West Germany's trade surplus actually increased. And in the case of the US, the net oil import payment of $ 8.7 billion was almost offset by a trade surplus in other products. On the other hand, most other countries showed widening trade deficits. The largest deficits were those of the UK, Japan and Italy — $ 8.4, $ 6.6 and $ 5.2 billion, respectively. Among the major industrial countries, only Japan was successful in reducing its overall trade deficit. As for the developing countries among the oil-importers, their difficulties threaten to become much worse with their commodity export booms fast evaporating.

Foodgrains and the Economy

Inexorable Downgrade

WHAT those in authority are determined to do, they will do. Even as people die in the countryside, more for lack of adequate purchasing power to buy the food at the prevailing high prices than for anything else, the Government will go ahead to jack up administered prices for foodgrains, which will then become the signal for a further spurt in market prices. In the absence of any worthwhile political resistance, class bias will ensure such a denouement. There may not be much point, therefore, in referring to the latest report of the Agricultural Prices Commission on the price policy for kharif cereals or to the estimates of cost of production of paddy contained therein.

Even so, the report is useful because it underscores the determinants of the denouement. The Commission has, once more, drawn attention to the studies currently on under the Comprehensive Scheme for the Cost of Production of Principal Crops. While the detailed surveys under the Scheme are still going on, the results of the investigations into the cost of cultivation of paddy in the two states of Andhra Pradesh and Orissa have been made available to the Commission. These results are most revealing. The estimates of *total* cost work out to only Rs 51.50 per quintal of paddy for Andhra Pradesh for 1971-72, and to Rs 44.50 per quintal of paddy for Orissa for 1972-73. These estimates are *inclusive* of the imputed value of the inputs owned by the farmer, such as the rental value of owned land and the interest on fixed capital. Therefore, to tag on a claim for separate compensation against owned land and fixed capital amounts to a demand for double-counting. Even were such double-counting to be permitted for the sake of providing additional incentives to farmers, there would still be a margin of return, as wide as Rs 30 to Rs 40 per quintal, or as much as 80 to 90 per cent of total cost, contained in the procurement price the Government has apparently decided to offer for paddy in the ensuing season. Were allowances made for the increase in costs since 1971-72 — which, according to the Commission's rather careful estimates, would not exceed 20 per cent — the rate of return would still be between 50 and 70 per cent in the two states. If the double-counting is eliminated and the rental value of owned land and interest on fixed capital are not considered as categories of cost, the balance of cost — which would however still include the imputed value of family labour — would have been Rs 31.30 per quintal in Andhra Pradesh in 1971-72 and Rs 27.60 per quintal in Orissa in 1972-73. After applying the correction factor for the rise in costs since then, the margin of return at the current level of procurement price, in the two cases cited, would be between 80 and 100 per cent. Once the estimates of costs are made available for other states, similar margins would perhaps be found to exist between the unit cost of cultivation and the level of procurement price.

Even the Agricultural Prices Commission has not suggested procurement beyond 12 to 13 per cent of the output of paddy in any year. If roughly 40 per cent of the paddy production is for disposal in the market, then, for more than a quarter of the output, the farmers would still obtain a return determined by the market prices; in terms of the estimated level of costs, the rate of profit could then turn out to be between 200 and 300 per cent. Since the disposable paddy is concentrated in the hands of surplus farmers, they would continue to enjoy this rate of return for perhaps as much as four-fifths of their output.

According to the Government and the chief ministers, profit of this order is obviously not enough incentive. In the circumstances, it is futile to try to tell the decision-makers that there is an organic inter-relationship between the different sectors of the economy. If, for some segments of economic activity, you allow a rate of return of 80 per cent and beyond, operations elsewhere cannot take place on the basis of profit-taking of only around 10 per cent. With such anomalies in the rates of return, operations in the economy would be upset all over.

The rest of the several measures the authorities are now initiating to revive the economy are, therefore, unlikely to have any marked cumulative impact. It is possible to lift the so-called fetters on the organised industrial sector, give up all priorities of planned econo-

mic development, and forget past notions about how the structure of consumption — and hence of production — could be re-ordered in favour of mass consumption, and yet fail to reintroduce the spark of growth in the economy in view of the imbalances which continue to emanate from the sector of agriculture. The anomalies in the pricing of food crops will keep de-stabilising the pricing and cultivation of cash crops, and the disturbance generated in the farm sector will distort investment and production decisions for the non-farm sectors — including industry and commerce. Beyond a point, salvage operations can be of no avail.

Indo-Nepal Relations

Playing Big Brother Again

Brahmanand Mishra writes:

THE sudden summoning of the Indian ambassador, M K Rasgotra, to Delhi after the anti-Indian demonstrations in Kathmandu over Sikkim is one more sign indicating that a thorough review by India of its relations with Nepal is in the offing. Before leaving for Delhi the Indian ambassador had a meeting with King Birendra. Although official sources, both Indian and Nepalese, were tight-lipped, it is believed that their discussions were about Indo-Nepal ties with special reference to the concern Nepal has expressed over India 'associating' Sikkim. The Nepalese Foreign Minister's statement in the Rashtriya Panchayat on the subject had contained the unequivocal remark that "a small state being swallowed by a big country in the present epoch is a matter of concern to us".

Earlier, the Indian envoy had also met the Nepalese Prime Minister, Nagendra Prasad Rijal, the Foreign Minister, Gyanendra Bahadur Karki, and several senior Nepalese officials. After these talks in Nepal, Rasgotra was in a position to brief the policy-makers in South Block about the 'new mood' prevailing in Kathmandu. This mood has also brought out Nepal's dissatisfaction with the implementation and working of several joint Indo-Nepal development schemes like the Chhatra and the Western Kosi canal projects and the Surjapur hydel project.

Delhi, however, feels that further work on the various mutual benefit projects like the Gandhak, Karnali and Pancheshwar schemes may have to be reviewed if Kathmandu persists in its anti-Indian outbursts. India feels let down by Nepal after having given Rs 125 crores in aid over the past 20 years and having spent another Rs 60 crores on specific projects which exclusively benefit Nepal, besides having trained a large number of engineers, doctors and other specialists.

It seems that Delhi is also thinking of reviewing its attitude to the present government in Kathmandu. It is not merely incidental that the exiled Nepali Congress leader, B P Koirala, who has been generally ignored by the Government of India since he was released from the Sundari Jail in Kathmandu in 1968 and who has been living at Sarnath near Banares, is presently encamped in Delhi. Senior officials of the Ministry of External Affairs appear to have re-established close contact with him and the Nepali Congress.

External Postures

Patriotism and Lies

SWARAN SINGH is a worthy Foreign Minister. He never loses his head in a crisis situation, however serious. He can be depended upon not to divulge the whole truth. This unflappability applies even when hundreds of his countrymen are dying every week, if not every day, from lack of food.

No matter. He nonchalantly stated last week in Los Angeles that American press reports were gross exaggerations and not a single Indian had died of starvation. This was in keeping with other official statements, both within the country and outside, that Indians may die from malnutrition or from some other refined medical consequence of lack of calories, but Indians never die of starvation. These ploys may be useful in quietening the parliamentary opposition or in maintaining the myth that the country is 'self-reliant'; they may also be useful in preventing the pro-Moscow lobby in Delhi from crying about a sell-out to the Americans.

But if the Ministry of External Affairs and the Government of India feel that they can get foodgrains on easier terms from Washington by putting up a false front of confidence, they are living in cloud-cuckoo land. And since the Central and state governments seem to be quite unwilling to procure available foodgrains forcibly from the stocks of the big farmers and traders, the reluctance to beg for food from abroad amounts to a death sentence for thousands of persons in West Bengal, Madhya Pradesh, Orissa and very probably in several other states. But then such deaths are the price of the patriotism that throbs in the heart of every well-fed minister and official in Delhi or Calcutta or Bhopal.

Calcutta Diary

A M

FASTEN your seat belts, the following is an exercise in didacticism. This may be another week, but it would be inexcusable to walk away from the reality of it. People continue to die n the countryside; official relief operations remain perfunctory. One could certainly work up righteous indignation of the proper sort and ask questions about the government and its motives. To all appearances, cynicism of a kind has gripped the government — as if it could not care less whether people live or die. The poor and the destitute are dying peacefully, without protest; they are not embarrassing the authorities excessively; they are not creating any particularly difficult law and order situation. They are, in other words, behaving themselves. Since their deaths do not disturb the even tenor of the administration, why should one bother at all? There is, besides, such a thing as the hard facts of life. What is the point of becoming emotional? Official relief activity is circumscribed by low stocks of grains with the public agencies. The government, for the present, has to go slow with relief work.

Forget about the government. What of others? It is the landless labourers and the rest of the whole lot of the really down-and-out — in the urban and in the rural areas — who are starving and dying. Official misadventures have affected them most of all. These sections have, over the decades, constituted the core of support for the Left parties. The leadership of these parties has remained in the hands of middle class elements, but their franchise has always been derived from the poor. This is the time, one would have expected, when the Left would bestir itself — if for no other reason than at least to guard its class base.

Memories linger. Way back in 1943, when famine struck, the mainstream of the national movement was perforce in a state of stupor; at that juncture, it was the political Left that moved in to resist the rise in prices and provide succour to those who were without food. In terms of organisational strength, the Left parties were then generally weak, but the task of saving the poor from pestilence and death could not wait.

A remarkable relief operation was mounted by the Communist Party, which kept insisting on equitable distribution, around the country, of whatever food was available. The party railed against the profiteers and led a massive thrust against anti-social elements who were trying to take advantage of the abnormal conditions. The party's cadres, without bothering to wait for government initiative, fanned out into the countryside, collected grain through rummaging odd and not-so-odd sources, opened free kitchens, and served whatever meagre meals they were in a position to serve to the starving. They ran medical clinics in town and country, and looked after the dying and the diseased. There was a total dedication to the cause. Cadres and volunteers, belonging to different disciplines and professions, joined in. Ideology meshed harmoniously with ordinary altruism. Within the movement, there was a sharing of fervour, a sharing of grit. One major reason for the rapid spread of the Left movement in these parts in the period immediately following the War was this record of selfless service during the famine of 1943.

Where are the Left cadres now? Admittedly, the scale is not quite the same; even so, people are dying in their hundreds, as in 1943. The entire spectrum of the dead and dying consists of landless rural workers and those similarly placed, people whose traditional allegiance has been to the Left movement and from whom the Left parties have traditionally drawn their sustenance. The famine notwithstanding, everything seems quiet on the rural front. The Left has almost ceased to exist. That 1974 in not 1943 is a fact which could not have been emphasised in a more telling manner. Three decades ago, the Left cadres had spread across into the countryside. In 1974, they are dazed, without bearings. At least the majority of them simply do not know how to go about it. Along with others, they too receive news of starvation deaths every day; with their own eyes, they watch people die; their minds are certainly in turmoil. And yet, there is no movement worth the name in the countryside, hardly any relief operations have yet been organised by the Left. There is no sustained attempt on its part to rouse the masses against the depredations of hoarders and speculators. Consternation has entered the soul. The Left cadres do not rush to the villages; in case they do, the men of the landlords and the speculators, in collusion with the police, will — you will be told — lynch them, while the hungry masses will watch from the sidelines, and continue dying in a gentlemanly manner. The Left cadres do not have any more the capability — at least they do not think they have the capability — to stand up to the combined might of landlords, moneylenders, traders, and the police. They are obsessed by the thought of physical annihilation. Their impotence, of which one has been generally aware during the past two-and-a-half years, is suddenly revealed in the crudest light.

Talk to the leaders of the Left parties. They will wring their hands in apparent helplessness: they can try to revisit the countryside, try to send their cadres in, but such attempts, they are more than convinced, would be suicidal, their cadres would not only be not allowed to organise relief or launch agitations hoarders and speculators but the racketeers and the landlords themselves, fully backed by State power, would strike back with venom and liquidate them.

Maybe, somebody ought to tell these leaders that, by choosing not to go in now, they and their workers are in any case choosing obliteration. For, they are losing their *raison d'etre*. They will have to choose here, today; tomorrow may be too late. As the Americans say, it is to be a different ball game from now on.

There is hardly much point in whining that the ruling party is misbehaving, that it is using the apparatus of the army and the police for partisan purposes, or that there is an alliance between the government and the underworld for suppressing the forces on the Left. In a confrontation of classes, the ruling party will, of course, try all the stratagems — call them fair or do not call them fair — which serve its cause. Since society is riven by classes, concepts of fairness can never be neutral. It is equally inane to complain that some elements, hitherto belonging to the Left, are playing 'Judas'. History will not hold your hand and murmur sweet words of sympathy into your ear just because, for whatever reasons, a few people went back on their pledges. Such phenomena have to be taken in one's stride.

The Left has to set itself up in judgment — and judge itself. It has to analyse the factors underlying its present predicament, go over the ground of its past follies. Is it not a fact that egotism within its ranks has taken the form

of far-out individualism? Pride in one's weaknesses can perhaps constitute a tolerable ingredient for poetry; it is hardly the staple for down-to-earth political radicalism! There must be thousands, inside prison and outside, still sold on the Yenan model. It is perhaps necessary, brutally necessary, to tell them that their comprehension of historical analogues is worth next to nothing. There are yet others who too could be accused of having committed, in their own manner, acts of wholesale irresponsibility toward the working class. If the Left has ceased to be credible, if it finds the masses immobilised by a not-quite-definable *ennui*, is it not because, at a certain point of time in the recent past, it itself turned frivolous? Not to look beyond one's nose is frivolity, not to anticipate the moves and counter-moves of the enemy is frivolity. It is easy to shift the culpability of the present order of things to exogenous factors. That is corner-cutting. And through such device the Left will be cheating only itself.

Forget about the government, which has ceased to function — at least around these parts. But the Left will still have to reassert itself, if it wants to save the poor. As far as food is concerned, despite the deals in Washington and Moscow, the next season could be even worse. Courage begets courage. In case there is now no resistance worth the name, the profiteers might turn bolder still. Consider some of the facts, as they are, even for West Bengal.

This year, the rice crop in this state was supposed to be around 6 million tonnes, of which at least a quarter — 1.5 million — must have come to the market. The cost of cultivation per quintal could have hardly exceeded Rs 50, but the average market price has been around Rs 300 per quintal of the grain; Rs 375 crores or thereabouts of hard cash must, therefore, be the pay-off of the famine in the neighbourhood. This could be excellent wherewithal for the greedy ones to launch a bigger operation in the next season, when the crop is expected to be much less.

Forget the government; if this country's wretched ones are to be saved from liquidation, those who swear by the working class have to move in. In terms of their own logic, they have to seize the grain. Can they? Dare they? Who are they who are doing the calculus over again? Where are they?

The charge that the ruling party has devised the anti-smuggling operation as a 'diversion' from the economic crisis is so ill-defined that it is surprising that it is made in 1974. The economic crisis has assumed such dimensions that no 'diversions' are any more possible. Is it beyond the capacity of the Opposition Left to see the compulsions which push even the political friends of the smugglers to turn against them? The contradiction is deep and profound in today's situation. It opens immense possibilities for those who are genuinely concerned about the disastrous implications of a continuing *status quo*.

Of course, the speculation is now intense about the possibility of a mid-term poll. Indira Gandhi thinks rather flexibly on these matters and it is considered that she may well pitch the general elections for February 1975 — that is, a year ahead of the due date. Such a timing would naturally be based on the conclusion that the deteriorating economic situation will seriously erode Congress strength by 1975, whereas a snap election might well consolidate power for a crucial four years. The calculation is intelligent, but one shudders at the inflationary impact of such an operation!

Aware of the damage to her popularity and credibility, now sought to be proved statistically, Indira Gandhi will have a tough time proving to the electorate that the crises which have engulfed the country are not the direct result of the failures of her governance and government. True, the crises are rooted in old and erroneous decisions over which Indira Gandhi had no control, but who is to explain away the total collapse of national disciplines and the crack-up of honest, thoughtful administration so closely associated with her reign. The talk of mohallas and hamlets tells a tale of times that have never been so bad.

There is drought and famine — who knows the dividing line? — in widely scattered pockets of the country. The late rains may make a difference, but the reports are ominous. A breakdown in power generation seems to be developing despite the fatuous statements of Electricity Boards. It is here that the country's economy, industrial and agricultural, is being strangled, and by the glaring incompetence and cynical indifference of men who describe themselves as administrators and engineers. What's more, there's not a shake-up in sight.

Given this kind of economic and political focus, probably an early election will find favour with a power-obsessed Congress party which hasn't nourished hopes about a possible improvement in the plight of the people. What is delaying the announcement then? The constitution of a new Council of Ministers to refurbish the image of the Congress at the Centre? The still unresolved question about separating the state elections from the Central? Or is it the usual teetering on the edge of decisions? At least, party members have been asked to check the electoral rolls — whatever that may mean.

The next few weeks should give us a clearer view of what is in store for us. October begins with the visit of the Shah of Iran. Then, there is talk of restructuring the Council of Ministers. As soon as the new government has settled down, it will be making ready to confab with Kissinger, now known as 'The Copist' in untrammelled political circles. And in the background is President Bhutto's threat to bomb out the Baluchis unless they surrender their guns, a threat that could spark confrontations with Pakhtoonistan and Afghanistan — even India.

Yes, a perspective full of possibilities and pitfalls — but without intelligent leadership capable of reinforcing the creeping paralysis of the *statuts quo*.

CAPITAL VIEW

Possibilities and Pitfalls

Romesh Thapar

ANY day I expect Acharya Vinoba Bhave to take over the anti-smuggling campaign, call for a moral revolution among the kings of the parallel economy and an amnesty to mark this revolution. How else can we explain the quiet surrender of the men who until yesterday could buy their way through any situation. Indeed, if newspaper reports are to be believed, they are queuing up at various international airports to return home and enter jail. What is up?

Anything is possible in our 'unique' subcontinent. A theory which is being persistently peddled suggests that the close linkages of our politicians with the smugglers will compel the GOI to settle for fulsome confessions and compromises on assets. After all, the dock labourers, truck drivers, boatmen, retired customs officials, shop-keepers and petty traders, who became the masters of a vast smuggling empire, do not have the sustained ambitions of our leading financial tycoons. They can settle for very little, and retire to a life of meditation and religion. In fact, many of them appear to be so inclined already.

One hopes that the campaign will be pressed, not because smugglers are the only criminals but because it is necessary to expose the linkages between politicians, financiers and law-breakers — and so stir thinking on the political system and its future development. So much of our present trauma is rooted in the activities of this 'trimurti'.

Let us be very clear about the implications of the current campaign against what might be described as the physical front of the smuggling underworld. And let us see which political formation moves to exploit the opportunity for a structural attack on the political and administrative system. Alas, probably the Congress party, in its own blundering way ...

COMPANIES

Higher Prices to the Rescue

Hansavivek

INDIAN IRON AND STEEL COMPANY has shown improved performance during 1973-74 owing mainly to higher selling prices of iron and steel products, increase in output of captive collieries and better working of the Kulti works. Production of saleable steel was about 45 per cent of the rated capacity, but prices of steel products were increased twice: once from September 16, 1973 on all categories of steel at Rs 75 per tonne and then a month later there was a general price revision of steel materials, other than certain categories. The board of management, however, says that there have been substantial increases in costs which have offset the increase in prices to a "very great extent". A committee was set up by the government of India to recommended fair retention prices for steel materials. The committee's report has been accepted and steel plants are required to deposit with SAIL the difference between the sale price and the retention price which would be utilised only for modernisation and development of plants. IISCO has to contribute Rs 124 lakhs to the central development fund, and a sum of about Rs 57 lakhs has been paid on the basis of the provisional rate of contribution fixed by SAIL. There has been some delay in the implementation of the plant rehabilitation scheme on account of delays in procurement of steel, release of import licences and shortage of cement. The management, however, expects that most of the work under the scheme will be completed by March 1976.

During 1973-74, IISCO's production of steel ingots and saleable steel edged up from 4.31 lakh tonnes and 3.47 lakh tonnes to 4.39 lakh tonnes and 3.58 lakh tonnes, respectively, although the installed capacities were 10 lakh tonnes and 8 lakh tonnes and licensed capacities were even higher at 13 lakh tonnes and 10.48 lakh tonnes, respectively. Output of cast iron pipes looked up from 1.09 lakh tonnes to 1.23 lakh tonnes, against the installed and licensed capacities of 1.57 lakh tonnes. Production of steel castings, non-ferrous castings and other castings were 2,068 tonnes, 352 tonnes and 41,157 tonnes against 1,652 tonnes, 262 tonnes and 39,559 tonnes, respectively, produced in 1972-73. The installed capacities were substantially higher at 6,096 tonnes, 914 tonnes and 77,916 tonnes, though the licensed capacities were lower at 5,484 tonnes and 564 tonnes, respectively, in the case of the first two categories of castings and higher at 82,716 tonnes in the case of the third. Over the year, net sales increased by Rs 16.72 crores to Rs 89.98 crores and gross profit was up from a mere Rs 5 lakhs to Rs 189 lakhs, reflecting improvement in gross margins. After providing for depreciation, however, there was a fresh deficit of Rs 3.68 crores against Rs 5.76 crores in the year before. Equity dividend, skipped once again, seems far away.

No provision has been made for retirement gratuities payable at future dates, nor has the estimated liability been ascertained. One of the notes appended to the accounts says that letters to sundry debtors were issued in some cases and only in a few cases confirmations were received by the auditors and differences, where observed, were in the process of reconciliation. Another note points out that there have been cases of theft and forgery in respect of some of the company's own shares, not collected by the shareholders, which are under police investigation. The loss in this respect is, however, duly covered by insurance effected by the erstwhile secretaries, Martin Burn. Yet another note mentions that advances recoverable include over Rs 22 lakhs being carried forward from earlier years made to a senior officer of the company and kept in 'suspense' account in the absence of supporting documents. Out of this, only about a lakh of rupees have been cleared. The company has since instituted legal proceedings against the person concerned and terminated his services. The subsidiary, IISCO Stanton Pipe and Foundry, showed further improvement in its results during 1973.

JAY ENGINEERING had to contend with a six-month long strike at its Calcutta factory and also contraction of demand for sewing machines and fans. Production of sewing machines and fans was 1.34 lakhs and 6.17 lakhs against 2.50 lakhs and 8.21 lakhs produced in the previous year and installed capacities of 3.96 lakhs and 12.42 lakhs, respectively. The number of FHP motors produced was 35,976 and of pumps 3,497 against 37,416 and 7,209 produced in 1972-73 and installed capacities of 1.90 lakhs and 12,000, respectively. Output of castings for sale dropped from the previous year's 502 tonnes to 176 tonnes, while installed capacity was 3,600 tonnes. Both sales and gross profit were lower compared to those of a year ago, although margins were better. While the ratio of wages to sales was lower, that of inventories to sales was substantially higher. The board has recommended payment of only preference dividend. Equity distribution, made at 8 per cent last year, is being skipped. The economics of the sewing machines unit at Calcutta is showing some improvement, but the directors point out that severe power-cuts continue to restrict production. Credit curbs and increase in interest rates have added to costs of production.

BOMBAY SUBURBAN ELECTRIC's energy sales during 1973-74 recorded a growth of 7.03 per cent, although overall power shortage in the western region continued to depress the growth of the company's power system. New consumers connected to the mains aggregated 30,187 which, according to

R P Aiyer, chairman, necessitates large-scale investment to sustain corresponding enlargement of distribution facilities. Requisition of electric supply service from shanty colonies have added a new dimension to the problem of growth. Besides, the Metropolitan Regional Plan, broadly outlined by the authorities recently, will set the pattern of investment and growth in the greater Bombay suburban areas served by the company. Aiyer feels that even if in the immediate years ahead new industries and new housing development are to be banned, the power offtake in the area consequent upon more intensive and diverse use of electric energy is likely to maintain reasonable growth. At the moment, however, all the factors are circumscribed by the uncertainty about the company's tenure beyond May 1976, when the first option of purchase of the company's undertaking by the statutory authority would arise.

Meanwhile, the company has taken up viable and diversified activities. The contracts division now contributes its share of return on equity capital. Among the notable power plant erection jobs, being handled, are the erection of 2 x 100 MW turbo alternator sets at Badarpur thermal project near New Delhi and 4 x 75 MW sets at Ukai hydro project in South Gujarat. A contract has also been signed for the erection of 1 x 60 MW set (hydro) at Vaitarna. Yet another useful contract is the electrification of a five-star hotel in Mauritius. The trading branch of the division, dealing in a variety of electrical equipment, too offers fair prospects of adding to the company's earnings. With the time on the existing two computers being fully utilised, a third generation computer, capable of handling more diverse programmes involving a large volume of data processing, is proposed to be installed. In January last, BSE revised its rates for supply of electricity to all classes of consumers following a 25 per cent increase in the charges payable by it for bulk supply. In spite of satisfactory earnings, total equity dividend has been reduced from 13.5 per cent to 9 per cent in accordance with the government restrictions on payment of dividends. The company has issued 50,000 cumulative redeemable preference shares and 1,00,000 redeemable convertible debentures, both of Rs 100 each at par.

INTERNATIONAL TRACTOR COMPANY OF INDIA which experienced a marked erosion in margins, despite a higher turnover during the year to March 1974, owing to a sharp increase in costs is faring no better in the current year. According to the chairman, Keshub Mahindra; the company produced 3,854 tractors during 5½ months of the current year against only 2,960 during the same period last year, but lost money on each tractor produced and sold. He hopes that government will decontrol the selling prices of tractors and let the industry subject itself to self-discipline under a broad understanding.

MAHINDRA AND MAHINDRA proposes to close down its agro-aviation division and dispose of the assets thereof "in view of lack of real growth prospects in this business". The division has been in operation for the last five years and has been engaged in aerial spraying of insecticides, pesticides, etc. Its assets include three Bell 47G5 helicopters, two Piper-Pawnee fixed wing aircraft, and equipment and spare parts.

NEW DELHI

Necessary but Insufficient First Step

B M

THE decision to endorse the recommendation of the Agricultural Prices Commission against any further increase in the procurement prices of foodgrains, has not come as a total surprise. First, it has come only after a long tussle within the government. And second, it would make sense in food policy terms only if it is unequivocally followed up with certain other steps.

The controversy over prices appears to have been finally clinched by the Prime Minister. She alone could have rebuffed the powerful Chief Ministers of the surplus states and the lobby of rich farmers which had demanded an increase in the procurement price of paddy to Rs 100 per quintal. The Food and Agriculture Ministry itself had favoured a compromise of a price anywhere between Rs 80 and Rs 85. But the final decision has broadly followed the recommendations of the APC. For the first time, after many years, the stand of the APC has thus been upheld and the Union Government has withstood the pressure of those wanting a higher procurement price.

What seems to have turned the scales in favour of the stand taken by the APC is the realisation that concessional imports of foodgrains on any substantial scale would be very difficult — if not impossible. The Soviet Union did not respond to the request for another wheat loan. The US could not be depended upon to come to the rescue either: it was willing to give only a small quantity, of between one-half and one million tonnes on a concessional basis — and that too under PL-480, which the Prime Minister must have perceived as being politically unacceptable and risky and almost as bad for her popular image as the devaluation of the rupee had been before the 1967 general elections. For the first time, therefore, the need to do something about securing domestic supplies and securing them at the right prices was explicitly recognised.

What is not yet clear, however, is whether the government as a whole or even the Prime Minister herself is fully aware that the decision on paddy procurement price, if it is seriously intended, must be accompanied by other important and far-reaching measures. The question of procurement prices is, after all, closely linked with that of adequate procurement — especially on government account. It is clear enough that, in the prevailing market conditions and amidst the psychology that goes with it, the government cannot possibly procure large enough quantities of paddy at the level of prices it has chosen to fix. Elaborate calculations about the costs of production are irrelevant for this realisation. The Agricultural Prices Commission has specifically argued that, going by costs of inputs and such other factors, even the procurement price of Rs 74 per quintal is on the generous side. According to the APC, even last year's procurement price, of Rs 70 per quintal, provided more than adequate cushion for any increases in prices of inputs and costs of production. But costs of production are not the determinants of supply in an inflationary situation.

The experience of this year's rabi crop has been instructive enough: an increase of as much as 25 per cent in the procurement price of wheat has failed to attract sufficient grain into the market because traders and producers could extract much higher prices in the black market. Another lesson, which cannot possibly be ignored, is that it is simply suicidal to rely on private trade to procure foodgrains if the government is to be able to run the public distribution system. That the spokesmen of the foodgrains trade have publicly admitted that nearly three million tonnes of wheat are still lying in the hoards held by traders and the bigger producers, is commentary enough on the wheat-marketing policy which was adopted this year, after the so-called 'failure' of last year's official take-over of the wholesale trade in wheat.

The facile idea — given currency when wheat trade take-over was given up — that the public distribution network could be cut back on, since private trade was in a position to provide enough stocks in the open market, is quite untenable. Having taken the ostensibly courageous decision to resist another increase in procurement prices to placate producer and trader, the other logical steps — harsh and firm — must follow if the professed purpose of the whole exercise is to be achieved. There can be no question now of relying on normal market operations to procure paddy or rice stocks. The old system of procurement of rice, *viz*, a levy on millers and producers, will not work any more. It cannot be ignored in this context that the government has not yet endorsed the target of 5 mn tonnes of paddy and 1.5 mn tonnes of other foodgrains recommended by the APC. Instead, it has confined itself to announcing the procurement prices — although procurement of the order recommended is the least required in this season to run any kind of public distribution system worth the name.

The government is well aware that, as things are, demands on public distribution would very likely grow — at least till next year's rabi crop. Adequate procurement of kharif foodgrains is absolutely necessary to stave off disaster on the food front. The question of monopoly procurement of the entire marketable surplus of foodgrains — not only of wheat but also of paddy — has, therefore, to be faced squarely. The decision not to raise the procurement price of paddy is commendable only if these measures follow it. And yet, even now, there appears to be a great deal of fumbling within the government on this important question.

Another tussle within the government is on and it will be some time before a clear-cut decision emerges. The state governments want a free hand in managing their procurement effort. The Food and Agriculture Ministry is tending to let the state governments procure as they like. But this is likely to be a gamble which the Centre can ill afford. Tamil Nadu, for instance, has already indicated that it has nothing to spare for the Central pool. The states are also playing up the drought and the floods, to escape being saddled with the responsibility of undertaking an effective and adequate procurement drive. A survey by Central government officials has shown that the damage to kharif this year, on account of drought and floods, has been greatly exaggerated by the states. Except in Gujarat, where drought has considerably damaged the crops, the situation is not so bad. The distress on account of floods and drought is indeed acute in conditions of high prices of foodgrains but it is confined to certain pockets. Further, what has to be boldly underlined, is that this situation could have been mitigated had the public distribution system been effective. Again, the gra-

vity of the food situation must be traced to the weakening of the public distribution system, arising from the inability to feed the system from the Central stocks, and the high prices in the open market. The idea that the state governments can be relied upon to undertake an adequate procurement effort, on their own initiative and according to their own lights, is thus dubious.

Clearly, the fixing of the procurement price of Rs 74 per quintal for paddy is futile unless the Centre assumes the responsibility for procurement and goes in firmly for monopoly procurement. There is no way of knowing whether Indira Gandhi has fully grasped this implication of her decision on procurement prices, but certain official circles believe that she is beginning to move in that direction.

Here, the fact that the Prime Minister broadcast an interview on radio on the same day that the decision on procurement prices was announced, may be seen to have some significance. The Prime Minister called for a fresh procurement drive to flush out the hoarded wheat lying with the traders and the producers. She also threatened penal action against hoarders, similar to that against smugglers. The implications of her tough talk on the radio should be expected to unfold shortly. But, till then, whether the decision on procurement prices really presages a major policy shift in the management of the food economy remains a question.

MAHARASHTRA

The Money Plants

THE Maharashtra government appears to be speaking with two voices about the outlook for agricultural production in the state in 1974-75. Chief Minister V P Naik has spoken of a 15 per cent shortfall in the target of foodgrains production of 8 mn tonnes. At the same time, the government is letting it be known that, judging by the prospects of the current kharif season, the 8 mn-tonne target will be exceeded.

According to official assessments, kharif production of foodgrains may be more than 5 mn tonnes, with a bumper jowar crop in the offing. In addition, the recent rains in the state, especially in the Vidarbha region and the other rabi areas of the state, augur well for the next rabi season. If these calculations turn out to be well-founded, foodgrains production in Maharashtra in 1974-75 may, for the first time, touch 10 mn tonnes.

Why the state government, particularly Chief Minister Naik, should publicly underplay the likely output of foodgrains is obvious: For one thing, the state government wants to get the maximum allotment of foodgrains from the Centre that it can; for another, Naik and his colleagues want to ward off pressure for procuring foodgrains from the farmers.

In fact, it is known that, recently, there was a tussle within the government over the procurement target for the kharif crop. Chief Minister Naik had plumped for a figure of 600,000 tonnes whereas Y J Mohite — who recently replaced H G Vartak, a staunch supporter of the Chief Minister, as Food Minister — was in favour of a higher target of 1 mn tonnes. The compromise that has been finally reached is an interesting one and reflects the basic large-farmer bias of the state government.

On the face of it, the procurement target has been fixed at the apparently impressive level of 1.4 mn tonnes. What is more, the target is to be fulfilled through a system of compulsory levy on farmers, the quantity of levy depending on the size of holding. The catch, however, is that in addition to the procurement price, the farmers will be given further incentive in the form of supply of fertilisers and cement at controlled prices. Thus the government will supply one bag of fertiliser for two quintals or less of grain levy, and an additional bag for every additional two quintals of grain. Similarly, for three quintals of levy grain or less, the farmer will be given one bag of cement; for three to 10 quintals two bags; and for more than 10 quintals three bags.

The scheme imposes a compulsory graded levy, for the first time, also on producers of cash crops like sugarcane, cotton, bananas, grapes and oranges. Producers of these crops will be required to meet the levy either from their own production of foodgrains or through purchases in the market. They will also have the option of fulfilling the levy quota by making cash payments to the government equal to the difference between the procurement price and the prevailing market price as determined by the district authorities.

On paper, the incentive scheme will benefit large and small farmers alike. But it is the larger farmers who will be able to exploit it fully — by selling the cement, and in some cases even the fertilisers, at the market prices. With all that, the success of the levy scheme is by no means assured. Whether or not it will succeed will depend on the comparative attractiveness to the large farmers of the procurement price *plus* the margins on fertilisers and cement supplied to them as against the free market price of foodgrains.

How ineffective the ideas of the Agriculture Department on the levy system may actually be is to be judged in another context. The Maharashtra government proposes to introduce a new cropping pattern. Under the new scheme, it will encourage two crops of jowar during the rabi season in place of the rabi wheat crop. The jowar crop will be a 'ratoon' crop. It will be raised from the harvested stalks of the first rabi jowar crop. The government has stated that the amount of water required for the two jowar crops taken together will be the same as that required for the one wheat crop. While announcing the scheme for the new cropping pattern, Naik claimed that the state government had enough stocks of hybrid jowar seeds to meet the needs of the two jowar crops in the next rabi. The farmers are to be given loans for buying hybrid jowar seeds.

And here is the rub. It is common knowledge that hybrid seed manufacture in the state has become a very lucrative business for ministers, zilla parishad chairmen, and their supporters. While the state's Agriculture Department decides the agricultural production policies and programmes, the Rural Development Department, which is under the charge of the Chief Minister, controls in zilla parishads which control the implementation of the agricultural production programmes. It is thus the zilla parishads which decide the production programme of hybrid seeds over which the Agriculture Minister and his department have no control. The zilla parishad chairmen, in league with higher-level political leaders, decide the plots and acreage programme for the H-4 cotton, and hybrid jowar and bajra seeds. Allocation of large quantities of fertilisers, pesticides, irrigation water and credit is linked to the seeds production programme.

The present price of hybrid jowar seed is Rs 600 per quintal and that of hybrid bajra seed Rs 750 per quintal. The margin of profit on H-4 cotton seed ranges between Rs 60 and Rs 75 per kg. The entire production of hybrid seeds is purchased by the state government itself at these prices. For the kharif season, the target for hybrid jowar seeds is 52,000 quintals, for hybrid bajra seeds 27,500 quintals, and for H-4 cotton seeds 10,000 quintals.

How much the production of hybrid seeds is determined by considerations of political patronage is evident from the fact that 6 out of the 8 districts of the Vidarbha region of the state account for three-fourths of the production of hybrid jowar seeds in the state and for the bulk of hybrid bajra seeds. Against this, the Western Maharashtra and Marathwada regions account for the entire output of bajra and for one-half of jowar production. The production of H-4 cotton seed is shared by the influential farmers of the Vidarbha and Marathwada regions.

WEST BENGAL

1943 Being Re-enacted

HUNGER and death are stalking vast parts of West Bengal today. Even according to the Establishment newspapers and semi-official sources, about one-half of the state's population of 50 million are experiencing different degrees of starvation. Many of them are living on grass, weeds and leaves alone. The state's Relief Minister himself put the figure of the starving population at 15 million. Spokesmen of established political parties, including Ministers of the Congress, speak of starvation deaths by the hundreds. Despite the government's attempts to seal off Calcutta from the onslaught of hungry villagers, the city's pavements, parks and porticos are cluttered with destitute families who have managed to sneak through the police vigilance. The dress and deportment of these people distinguish them from normal city beggars; these people quite evidently belong to the farming or artisan communities. The majority of them, moreover, are of the landless labourer class — half-naked, skinny men and women, with naked, pot-bellied children.

Hunger, of course, is a perennial experience for most people in rural West Bengal during these months of the year. But it has not been experienced on the present scale for 31 years — not since the terrible days of the autumn of 1943. There is, however, one difference between 1943 and 1973. The looting of a food-train near Kharagpur about a fortnight ago, the steady increase in the robberies especially of godowns, and other lawless acts in the afflicted areas, all point to a somewhat different temper among at least a section of the deprived population. Not all would submit to starvation death without a desperate reflex action — however hopeless such action may be.

In the face of such colossal distress, the state government has done little besides bustle around. Apart from frequent trips to Delhi by the Chief Minister and his cabinet colleagues with a view to securing an increase in the fast dwindling Central allotments of foodgrains, all that Writer's Building has so far accomplished is a few 'gruel kitchens' in some of the worst affected areas. As against the need to extend relief to about 25 million people, the government has in any case planned to cover only 600,000. And, so far, according to official sources, it has actually covered only 100,000. One major Calcutta daily puts the figure at just 50,000, which too is suspect. For it is calculated on the basis of the expenditure incurred by the government on relief; what part of the expenditure accrues to the target population is anybody's guess.

The Statesman, Calcutta, has reported about Purulia — one of the most distressed areas in the state — that "The opening of the gruel kitchens has posed certain problems for the district administration. Official sources point out that corruption appears to have become an 'integral part' of the relief administration, whether it be gruel kitchens or test relief schemes. Misappropriation of relief money and material is now an acknowledged fact." "The delay", the report goes on to say, "in the opening of the gruel kitchens has again brought to the fore the vast communication gap that still exists between Writer's Building and the outgoing districts. No government order regarding the opening of the kitchens had reached the district administration by September 15, although the government decision to open them had been announced five days earlier. Nor did the district administration have any idea as to who would run them or how the supply of wheat would be available. As a result, one noticed the lack of a sense of urgency at a time when people were facing starvation in the countryside."

While every organised party looks towards someone else for helping out the starving in the countryside, foodgrains stocks — sufficient to feed the entire population of the state — stay hoarded in the state itself. As the political commentator of *Jugantar*, a daily newspaper belonging to the Ghosh family (which has supplied the West Bengal government with two Ministers, including the Food Minister himself) recently wrote:

> "... This year, the output of paddy-cum-rice and wheat in the state was not too small. Enough paddy-cum-rice was grown in the state to provide foodgrain at the rate of 16 oz per capita. The shortfall caused by drought, flood, etc, *is* being met from the Central pool. The Centre is providing about 1.6 million tonnes. Why, then, is there such a huge shortage of foodgrains? Procurement may not have been upto expectations. But where is the state's output of paddy and rice gone? This is a vital question. Some say, about one million tonnes of rice are still being secretly held by the hoarders and big farmers. The government has adopted a programme of dehoarding one lakh tonnes from this hoard. But is it now possible to dehoard this rice?"

One of a total production of nearly 6 million tonnes of rice and a marketable surplus of about one million tonnes, the state government had decide to procure only 500,000 tonnes. In fact, it collected a small fraction of even this: 160,000 tonnes. This was inevitable as the government was depending on the 'goodwill' of the rice-mill owners while the big farmers were depending on the government's unwillingness and incapacity to hurt them. Thus, only about 40,000 tonnes were procured from the rice mills, against a target of 360,000 tonnes. The state government has occasionally talked of using DIR, MISA, Essential Commodities Act, etc, to unearth and seize the hoarded stocks; but little of the sort has actually been done.

In the meeting of the WBPCC, held in Calcutta on September 8, the Chief Minister did indeed roundly condemn the landowning members of his own party for their failure to surrender the levied quantity; he even accused some Congressmen of conducting a campaign among rich farmers and thwarting collection of levies. But it all stopped there. Prafulla Kanti Ghosh — who succeeded Kashikanta Maitra as Food Minister after Maitra's disgrace in connection with the wheat bran scandal — is anyway away in the US for medical treatment; and the Labour Minister, Gopal Das Nag is temporarily holding the Food portfolio and he is too busy persuading the Centre and surplus states for more liberal allotments.

In some ways more undermining is the fact of the irrelevance of the unfocused politics of the state's political parties at a time like this. Factions of the ruling party and the CPI have been agitating for the

over hectares you need a central control room for keeping an eye on all processes from one place and Taylor provides the control panel instruments to watch all processes from a central control. This is the kind of help Taylor gives to all process industries like milk, sugar, paper, rubber, textiles, pharmaceuticals, cement, etc.

But what is so special about Taylor, you might ask?

Can't others do the same job? They can, but they don't have the experience and expertise that Taylor does. Taylor instruments incorporate the most sophisticated technology with continuous research to change and modify. Taylor provides customers with the most comprehensive design, installation and commissioning services. And on the national front there is Taylor's active participation in industrial progress, the generation of employment, the complete stress on indigenisation. And the pride in knowing that there will continue to be a lot of Taylor in the nation's life.

Check with Taylor.

It's fertilizer, ofcourse. And what is Taylor doing about it? Helping to process it from start to finish. Taylor process measuring and control instruments are there in fertilizer plants for such process variables as temperature, pressure, flow, liquid levels, humidity, specific gravity, force and load. And not just that. When a fertilizer complex stretches

convocation of the state Assembly; the CPI(M)-led 'nine-party front' has chalked out a programme of state-wide mass agitation from October 1 demanding adequate relief operations. None of the political parties has, however, come forward with a substantive and sharp criticism of the policies that have brought this suffering to the people, nor do they seem capable of suggesting alternative programmes for mobilising the state's material and human resources. The organisational wing and the MLAs of the ruling party, the Left parties and the rest of the opposition make demands on the state government; the state government makes demands on the Union government; and the (acting) Governor has appealed for international charity!

In West Bengal the CPI(M) and the other Left parties are by now fully aware of the political and physical hazards of moving against the highly consolidated rural rich, who are well protected by the minions of law and order and the enlisted thugs and smugglers. They, therefore, have opted for the line of least resistance. The CPI made much noise about its dehoarding campaign, but having little base in the countryside, drew a blank. Even the CPI(M) has opted simply for agitation against the only too obvious sins of the government. In the meantime, people are begging, deserting their dear and near ones, selling the honour of their womenfolk, and finally dying from starvation. In these details, 1943 is being re-enacted in 1974 — and, what is also significant, without much political difference.

NORTH

Supplies without Supply Line?

EVEN in the affluent state of Punjab, despite its surplus in foodgrains, there has been much unrest particularly among the poorer urban masses, following the runaway rise in prices and the scarcity of essential commodities. In the circumstances, schemes intended to ensure easy and regular supplies offer partial solace — at least till such time as when it becomes clear that the nub of the scarcity problem is not really at the retail end. The announcement by the Punjab Finance Minister, at a meeting of the state Labour Advisory Board held at Chandigarh on September 19, that all establishments employing 100 or more workers would be required by an ordinance to open fair-price shops on their premises for supply of essential commodities to their workers at fixed prices seems very much to be one of this kind — though Punjab may indeed claim to have taken the lead in this respect. Implementation of this attractive scheme, however, may take some more time as no groundwork has yet been done and no data required to see the scheme through have been collected.

The Labour Advisory Board meeting itself was representative enough. The INTUC, the Bharatiya Mazdoor Sangh, the Chamber of Commerce of Punjab, Haryana and Jammu and Kashmir, the ESI, and departmental officials participated in the meeting, and the Finance Minister presided over it. Everyone welcomed the government's gesture, and the employers promptly responded. They promised to provide accommodation in their factories for provision stores and to lend the services of a manager for the purpose. They offered to provide credit, so that each month's purchases by an employee could be adjusted against his monthly payments. According to one official estimate, over 50,000 workers would benefit from the proposed network of fair-price shops which would be opened in the 208 establishments which employ 100 or more workers. Of the prospective beneficiaries, workers in the engineering industries would constitute 41 per cent, in textile industries — including the hosiery workers of Ludhiana — 25 per cent, in the wood and furniture establishments 16 per cent, and in miscellaneous establishments 18 per cent.

The scheme envisages issue of new ration cards following surrender of existing ones to the Civil Supplies Department. Already, the Civil Supplies officials have made it clear, however, that they cannot promise supply of commodities which are getting scarce — such as vanaspati, kerosene, sugar and soap. If these are not available at other fair-price shops, they would also not be available to the shops opened under the scheme.

Nevertheless, the scheme does have distinct advantages. First, fair-price shops on the factory premises would be far more convenient for the usual purchases: there would not be the serpentine queues, the endless wait, and then the 'stocks exhausted' notices scribbled in chalk. Secondly, the labour leaders present would feel responsible to see that their followers are not harassed or put to avoidable hardship and that depot managers do not withhold stocks or sell them in the black. In a sense, the scheme would have better chances of success where labour is already organised. Thirdly, workers would be able to get credit for their month's requirements. A major reason for the employers' satisfaction about the scheme is the prospect that labour would be more stable and less prone to move out.

But the question that looms large over the scheme is the material — not financial — viability of it. Here, past experience offers little comfort. Last December, the Punjab government had in fact announced a scheme to supply wheat flour and pulses to people earning less than Rs 575 per month. Claimed to be the first such scheme in the country aiming to differentiate in prices in favour of the low-income groups, it was even accompanied by efforts on the part of the Punjab government to extend the coverage of the fair-price shops. The project was expected to provide relief to about 60 per cent of the urban population. But the scheme had little impact. Since the relief offered in prices was nominal, at 5 paise per kg, only those poor earners with large families and substantial monthly consumption of flour and pulses could benefit from it. The other categories of workers and consumers reacted cynically when they realised its petty benefit, and the scheme virtually fizzled out after some weeks. Hardly anyone talks about it now, though it did yield some immediate but short-lived political dividend to the state government.

About nine months ago, the Punjab State Civil Supplies Corporation was established with promise of supply of 14 essential consumer commodities at fixed prices throughout the year, with subsidies, if required, for the lower income brackets. The laudable aim was to ease the condition of the hardest-hit and help stabilise price levels. The Corporation, however, never fulfilled its aims, and it was clear that the net benefit to the average consumer hardly balanced the cost of establishing the Corporation. Many of the commodities it had promised to distribute soon became scarce — sugar, kerosene, and cement. Indeed, supplies shrank as demand came forth.

Thus, neither the dual pricing system nor the Corporation set-up proved useful in arresting the price rise. Evidently, undaunted by the experience, Chief Minister Zail Singh announced at Ludhiana on July 13 that the government was drawing up yet another scheme to supply essential goods to the people at uniform prices. The difference this time may be that the twice-bitten consumers may no longer fail to see such schemes as empty promises tossed at public meetings as political palliatives.

Buying Off the Large Farmers

Arun Chowdhury

THE Rajasthan government imposed levies on bajra and wheat in the last kharif and rabi seasons, respectively. The experience with these levies shows how rich farmers take advantage of small and medium farmers and their organisations to put pressure on the government but, having once got the government to agree to their demands, leave them high and dry.

The bajra levy had provoked a wave of protest from farmers throughout Rajasthan. Movements were launched by the CPI, CPI(M), BKD and other parties as well as by peasant organisations to resist the levy. Here we shall describe the developments in Jhunjhunu district.

Jhunjhunu is a major supplier of soldiers to the Indian army. There is hardly a household which does not have one of its sons in the army. Jhunjhunu's other claim to distinction is that a large number of India's leading capitalist families hail from this district.

Jhunjhunu lies in the Shekhawati region of Rajasthan. Jats and Rajputs dominate the area, both numerically and economically. There are no cities in the area, and even the towns are more like villages than urban centres. The only industrial town is Khetri Nagar, where there is a large copper project. Of the population of the district, 95 per cent live in villages and are engaged in agriculture.

Geographically, the district is part of the Rajasthan desert, but the soil here is fertile. About 50 per cent of the land is capable of producing at least two crops in the year, 30 per cent is slightly less fertile and only 15 per cent is non-arable, being in the stony Aravali hills and desert areas. There is a good reserve of subsoil water, but at depths of 60' to 80' generally. Thus, tubewells are the most effective means of irrigation. But as only a small part of the district has been electrified so far, rains, scarce and unreliable as they are, are the major source of water supply. Drought is frequent and as a rule only one crop is harvested in the year. Bajra is the staple crop, but where there is water and electricity, good crops of wheat, moong, onions and green vegetables are harvested.

Among the rich farmers, the Rajputs do not work on the land themselves, but give it over to share-croppers or daily wage labourers from amongst the poor peasants. On the other hand, the rich Jats are hard-working and their entire families work on the land. The Jats constitute a major portion of the middle and poor farmers as well. Wage rates for daily agricultural workers range from Rs 3 to Rs 5.

The farmers, big and small, were united in their resistance to the bajra levy. The movement was spearheaded by the poor and middle Jat peasantry. Tehsil-level demonstrations of 4,000-5,000 persons paved the way for a mass demonstration at the district headquarters in January 1974 with 25,000 farmers and students participating. The immediate result was the release, under mass pressure, of the peasant leaders arrested during the movement and at least temporary withdrawal of the levy enforcement machinery.

The farmers had organised themselves into Kisan Sangathans. Their demands covered a wide range of issues including cheaper electricity (the rates of which have gone up from 15 p per unit to 25 p per unit) and a reduction in the deposit farmers have to pay for electric connections (which has risen over four times, from Rs 300 to Rs 1,300). The electricity rates question concerns the rich peasants mainly, and is, along with adequate supply of fertilisers at the government-fixed rates, their chief demand. The poor and middle peasants are mainly affected by the lack of irrigation facilities and the high prices of essential commodities in the villages, which have neither rationing nor fair-price shops.

The movement gathered momentum very fast. Though the police were sent into the villages to force the people to part with their crop, the farmers put up determined resistance against all attempts to extract the levy. Practically every village formed a volunteer resistance force. Whenever any peasant leader or activist was arrested, the villagers were able to free him and force the police to withdraw the charges. Students of the area were also drawn into the struggle in large numbers.

The solidarity of the peasantry on the bajra levy issue baffled the authorities. They realised that mere force was not enough. Although they had to withdraw temporarily, they came back with a new manoeuvre when they announced the wheat levy on June 11, 1974.

Wheat is grown by only about 5 per cent of the farmers, whereas bajra is a staple crop in the area and is grown by all the peasants. So the wheat levy affected only a fraction of the farmers directly, and these were mostly the rich peasants having assured supplies of water, etc.

The levy price of wheat was fixed at Rs 105 per quintal and the levy was imposed first only on traders. At that time, the open market price of wheat was relatively low at Rs 125 per quintal as the crop had only just been harvested. The government ordered that no person could stock more than 25 quintals of wheat. The traders and rich peasants ignored the order and proceeded to buy up large stocks of wheat from the middle and poor peasants who, pressed by their need for cash, were forced to sell most of their crop immediately, keeping only small stocks for their own consumption.

Unable to procure the expected quantity from the levy on traders, the government extended the levy to all farmers having more than one acre of land. In Jhunjhunu the Kisan Sangathan denounced the levy as a 'kala kanoon' and organised the peasants to resist it. The government, however, came out with a new strategy. It offered concessions calculated to benefit the rich peasantry and create a split in the ranks of the farmers. Those who paid the levy were offered cement, fertilisers and other scarce commodities at concessional rates.

The rich farmers, who had built up large stocks of wheat, now closed in for the kill. They had made large profits by selling grain in the market at prices that had already risen to Rs 150 per quintal; now they were set out to secure cement, fertilisers, etc, at concessional prices by agreeing to pay up the levy. By bribing the village-level officials they were able to falsify the records and to understate both their holdings and their crops. But since they knew that the government was anxious to collect at least a part of the levy, they got the local officials to overstate the holdings and crops of the smaller farmers.

The large farmers did not dare to do this openly at first, for fear of the wrath of the poor and middle farmers. It was only when the government promised them police protection that they came out into the open and showed their hand. Despite this treachery, the Kisan Sangathans were successful in resisting the levy in about 25 per cent of the wheat areas. Volunteer squads were formed to chase off the police and resist arrest. On July 30, the government withdrew the levy, claiming that it had "successfully achieved its target" — when in fact only one-half of the quantity originally announced as the target had been procured.

The poor and middle peasants are wiser after this experience of treachery by the rich peasants. They are now reorganising the Kisan Sangathans and are continuing their struggle on their basic demands which include:

(1) control on prices of essential commodities;
(2) removal of corruption and malpractices in government bodies;
(3) radical changes in agricultural policies on issues such as electricity charges and connections and fertiliser distribution;
(4) issue of revenue records and passbooks to individual peasants indicating their actual land holdings;
(5) distribution of government land among the landless; and
(6) short- and long-term loans by land development banks and co-operative banks on easier terms.

INTERNATIONAL AFFAIRS

Last Stage of Imperialism

G P D

IN a delightful book on the myths and realities of the Kennedy era David Halberstam recounts an interesting conversation between Vice-President Lyndon Johnson and Stan Karnow of the *Saturday Evening Post*. Johnson, who was on a whirlwind tour of Asia in 1961, described Diem of South Vietnam as the "Winston Churchill of South-East Asia". Stan Karnow asked him if he really believed that about Diem. "Shit, man", Johnson answered, "he is the only boy we got out there".

This about sums up US foreign policy. It is remarkable that the world has — or, shall we say, the Americans have? — changed so very little. Whether it is Vietnam or Chile it is a question of getting the right kind of 'boys' to rule the barbarian east or south. If they cannot get there, instal them. If the wrong people get into various Presidential lodges then remove them. A clever, neat strategy indeed.

Or not so clever perhaps. But for the Western political scientists, who come out every other year with learned treatises on *coups d'etat* and the modernising role that the military plays in the third world, almost everybody else sees the American game quite clearly. The CIA, the chief agency for carrying out these grand operations, seems to have perceived the utter futility of indulging in the American political scientists' make-believe. In deference to them, it still does not talk of "subversion", for the American Academy has reserved that word for people like the Vietcong who, being outsiders, have no right to fight the local Americans and, of course, President Thieu! Anyway, the CIA has not interfered in the strictly domestic matter of the terminology of the Western political scientist. It has simply admitted that it was busy strengthening democracy in Chile, reserving the right to define 'democracy' to itself. Colby did, however, give one assurance — that he did not consider military dictatorships as particularly democratic. All that he had to submit was, presumably, that they can be more democratic than the popularly-elected government of President Allende. As long as Harvard dons agree with him how does it really matter?

The series of disclosures on the CIA's activities in Chile raises one interesting question. Why is the CIA in a confessional mood? It is rather hard to believe that Chile would be the last place where Colby or people like him would venture to make or unmake governments. A very active press and the general atmosphere following Nixon's resignation may have contributed to these confessions. The rivalries between the State Department and the CIA and, very likely, the rivalries within the State Department between the officers and total outsiders like Kissinger might also have contributed to these disclosures. There must be many in Washington who are quite jealous of Kissinger's meteoric rise in American politics.

All this, however, can be only a part of the story. The confidence and nonchalance with which everybody, including President Ford, admitted the CIA's role in Chile cannot be so easily explained away. The first thing to be recognised is the ruthless and amoral character of American foreign policy. It is just not a case of the white man's burden.

During the good old colonial period, the people from across the seas came to Asia, Africa or Latin America with avowed imperialist purpose. They were expansionists, aggressors, imperialists, and so on. All that was unmistakable. Curiously, imperialism then had one redeeming feature. It carried with it modern education, modern means of communication and, above all, a modern consciousness. Ultimately, these were the roots of its destruction. In a very peculiar way that imperialism was still not completely devoid of ideas. It surely was the last stage of capitalism in terms of its growth. But it still was not the last stage of savagery and brutality which the Americans have provided in the post-Second World War period.

In other words, the Americans now seem fairly confident that even a pretence of humanitarian or, for that matter, proselytising zeal is thoroughly unnecessary. Their foreign policy has become completely non-ideological. It is now power in its straight, savage form. No victorian imperialist could have dreamt of such an unabashed assault on the elected government of a people without, in his own way, a sincere desire to 'civilise' the people. There was, of course, much unintended hypocrisy in all that: unintended because I do not think the nineteenth century European really understood the forces which drove him to be an imperialist.

The modern American clearly sees these forces; but he bangs the table and asks: so what? Then he takes the next step; pours millions of dollars, arms if necessary, into a poor country and brings the government down. He has been doing this for donkey's years. Nearly 60 years ago, in 1916, the United States intervened in five countries of Latin America in one year — Cuba, Dominican Republic and Guatemala being some of the countries. Sounds familiar, doesn't it? History seems to have changed little since 1916! In fact, it seems to be repeating itself like a nightmare!

It is a measure of the confidence and audacity of the Americans that they can, coolly and with impunity, go on discussing in the open the various accomplishments of the CIA. And why shouldn't they? They know that, in spite of all this, the most powerful will continue to deal with them and the weak will play their game. Cynicism is the last stage of imperialism!

THE EXTERNAL FACTOR

By Courtesy of Americans

IS the American cure going to prove worse than the American malady? President Ford started out in seemingly fine fashion, oozing candour and love and forgiveness. The American people lapped it all up. Quite plainly, though, there was more to Ford's action than met the eye. Forgiveness is not always compatible with candour, and the new President's preemptive decision to pardon Richard Nixon now threatens to rekindle the embers of Watergate. President Ford, by his act of pardon, has reopened the issues.

Mute Issue

The next few months will therefore continue to be turbulent for the polity of the United States. With Nixon out of the arena, the Republican party had started to look forward to recovering its political fortunes, hoping that the results of the elections in the first week of November would not be as disastrous for it as had been predicted some months ago when Watergate passions were at their height. But Ford's extraordinary act of benediction has brought into the open the hitherto relatively mute issue of the juridical concept of equality of all citizens before the law. Partly as if to assuage such reactions President Ford has gone further to announce a procedure for the grant of Presidential pardons to the Vietnam draft-evaders who are currently living abroad. These latter are, however, hemmed in by a number of caveats and conditions, in stark contrast to the pardon of Nixon which was unconditional and straightforward. Besides, there could be other complications. For, criminals currently under sentence — or to be sentenced in future — cannot now be deterred from filing suits in their hundreds and thousands claiming the prerogative of Presidential pardon in their case too. The judiciary might not sustain their claims; it could be said that there is no inherent natural right for each and all to receive Presidential bounty. But whichever way the judicial decisions go, the American air will remain heavy with controversy.

The consequences of Gerald Ford could be severer in the arena of external relations, and this, irrespective of whether or not Henry Kissinger is retained as Secretary of State. It could be only conceivable that Ford's comparative experience and naivity are showing out. What the new President has openly stated about the role of the Central Intelligence Agency cannot be crossed out as 'non-operative'. True, all major powers indulge in espionage and cloak and dagger operations. The role of the CIA, the NKVD, or the British MI5, may from time to time be either grotesquely exaggerated or grotesquely romanticised; but, till now, at least at the formal level, curt disclaimer for all activities of espionage agencies constituted the core of government behaviour. The Bay of Pigs was never formally acknowledged by the US administration, and, earlier, even John Foster Dulles could not be made to admit his role in getting rid of the Left-leaning Abanez regime in Guatemala in 1954. Controversy has raged from time to time over the CIA's clandestine activities in different parts of the world. But the United States administration was always careful not to own up any responsibility for what the CIA's agents might have been perpetrating here, there or, everywhere: organising the murder of a South Vietnam president, planting a bomb in a Chinese embassy, toppling a supposedly pro-communist regime in Africa or the Mediterranean, fomenting tension between China and India along the borders of Tibet, planning an insurrection against President Allende's socialist regime in Chile, and so on.

Now, suddenly, the director of the CIA has admitted his Agency's direct involvement in the manoeuvres in Chile leading to the suppression of the democratically elected Left-wing Government last year, and the take-over by the army junta. He, in turn, has been justified by his President. It was given to the American President to pretend to ignore the adduced evidence, or to apologise for the excesses committed by the CIA. He has done neither. Instead, he has decided to brazen it out. The CIA's operations in Chile, he has told the world, were fully backed by the American administration, and were vetted by the so-called 'Forty Committee', presided over by the President's National Security Adviser, Henry Kissinger. While volunteering this information, the President also enunciated the breathtaking doctrine that the CIA's role is part of the legitimate exercise of the United States' right to 'destabilise' the established government in Chile, which it did not like. Since the ideology of this government did not meet the approval of Washington, the CIA felt free to move in: what it did in Chile, acording to President Ford, was consistent with historical practice of all major nations concerned with protecting their self-interest.

'Inalienable Right'

There is no need to put on blinkers. Nearly everybody knew this is how big nations conduct themselves. But, till now, they were at least somewhat shamefaced about such conduct, and did not dare proclaim their 'inalienable right' to topple — 'to destabilise' — regimes in foreign countries which refuse to toe the line of this or that bully. Now the bully has given formal notice to the rest of the world: if it does not like somebody's face, it is going to smash it into smithereens, and that to do so is its inalienable right.

After such candour, what will the poor government in New Delhi do? The Indian Prime Minister, and the President of the Indian National Congress, had taken turns to warn the nation — almost incessantly in the past two years — against the machinations of the CIA. These machinations, the American President has now notified, are legitimate and will continue; whichever government misbehaves with the United States, or gives cause of suspicion of such misbehaviour, stands the risk of being liquidated by the CIA. So, you better behave. Considering the circumstances, perhaps New Delhi is fast learning to behave. Foreign investment is being re-welcomed, illegal expansion of capacity on the part of private industrial units has been retrospectively condoned, food aid is going to be begged of the American administration, the country's ambassador in Washington is going into contortions, attempting to explain away the magnitude of India's suspicions about the role of the CIA. The Agency may thus condescend not to topple the regime here — at least not as long as the latter continues to reform itself along the right lines. At least, we now have Henry Kissinger's assurance in this regard. With so much trouble brewing all over, what more can we ask?

Foreign Trade and Centrally Planned Economies

Sumitra Chishti

Foreign Trade of Mainland China, Fen-Hwa Mah; Edinburg University Press, Edinburg, 1972; pp i-xvii +270.
How to Approach the China Market, JETRO; John Wiley, New York, 1972; pp 227.

THE study of the foreign trade systems of centrally planned economies has been a neglected area. This has resulted in gaps of information and analysis with regard to the role, character, mechanism and principles guiding the foreign trade of centrally planned economies.

The emergence in the world order of a distinctly different form of socio-economic and political system in the early part of the twentieth century was initially not treated as a normal development resulting from any historical factor. On the contrary, it was considered an aberration of the prevailing rational world economic system. The entire operation of this new-born system was considered unamenable to any systematic appreciation and hence it was thought unnecessary to study it.

Many international economic institutions which promote studies on various aspects of economic problems did not take interest in this particular field. Most of them also subscribed to the above-mentioned approach. For instance, GATT, IMF and IBRD which contributed substantially to the understanding of foreign trade, aid and balance of payments of member countries did little to throw light on the foreign trade system of centrally planned economies because they believed strongly in the effective operation of free multilateral trade of private enterprise economies.

Individual and group research in the field, barring a few exceptions, had certain handicaps. Most of the researchers had to labour to get material for proper analysis. Further, due to the prevailing atmosphere of hostility to the system, many authors from outside were not in a position to analyse the system dispassionately. Sometimes political factors dominated the authors' interpretation. On some other occasions analytical tools evolved in the context of market economies were unable to interpret the operation of foreign trade of centrally-planned economies.

Nevertheless, the Economic Commission for Europe and the Secretariat of the UN Secretary General had made some important studies as early as in the late fifties and early sixties. The most important landmark from the point of view of studies in foreign trade, however, is 1964. The UNCTAD, for the first time, enunciated a principle of trade between the countries having different socio-economic systems (Principle 6). Further, it established a committee on trade relations between countries belonging to different socio-economic and political systems.

The centrally-planned economies were partly responsible for the limited studies of their foreign trade. Suspicious of the world outside, on the basis of the experience of the Soviet Union in the early days of its new system, these countries opted to look inwards. This effort at exclusiveness was prompted by three major factors. First, the Soviet Union being a vast country having diverse resources could envisage economic development with little dependence on foreign trade and aid. Second, Marxian theory also did not provide adequate theoretical base for planning for foreign trade. In fact, there were certain reservations about the very role of foreign trade. Third, the trade embargo and discriminatory treatment adopted by the US and the West European countries did not facilitate rapid expansion of trade with these blocs and thus did not provide a basis for generating adequate faith in foreign trade in centrally planned economies.

These factors changed in due course. The factors that brought about this fundamental change are (i) the political atmosphere in the form of a polarised world constituting an inhibiting factor slowly disappeared; (ii) the extension of the centrally planned economic system to smaller countries of Eastern Europe, which depended substantially on foreign trade in the pre-Communist period, also brought in some problems; they could not obviously follow a policy of little dependence on foreign trade without restricting the process of their growth; (iii) the compulsion of the second factor enabled these countries to remove the theoretical inhibitions and they developed a theory to support their effort, thus the theory of international division of socialist labour governing the trade flows among CMEA countries was enunciated in 1965; and (iv) the higher economic development of these countries increased the need for economical utilisation of resources which was further buttressed by the need for import of technology from the west.

The barriers of other international economic institutions in examining the foreign trade of centrally planned economies also broke down. In the late sixties many of the countries belonging to the centrally-planned economic system became full fledged special members of GATT.

While the gaps in information on foreign trade of the Centrally-planned economic system of Eastern Europe, including the Soviet Union, are getting slowly filled, the study of China's foreign trade has not yet been made in detail. China was not a member of the UN. As a result, there was no significant contribution by the UN to understanding foreign trade of China. A substantial amount of literature came out regarding the economic development of China from universities and other organisations. Analysis of foreign trade was, however, sketchy. However, this gap is slowly getting filled. One now witnesses considerable interest in China's foreign trade. This can be attributed to three reasons: First, China is getting slowly recognised and it has become a member of the UN. Second, China is considered to be a market worth billions of dollars for the exports of advanced market economies including Japan. And,

DYNAMIC FACTORS IN ECONOMIC GROWTH
Sir W. Arthur Lewis Pp. 72 Cloth with jacket Rs. 18.50
Explores some crucial problems of growth from the viewpoint of the less developed countries and provides some illuminating answers.

third, there appears to be shifts in China's economic policy objectives with regard to their importance to foreign trade, aid and technology.

The study of China's foreign trade by Fen-Hwa Mah is an aggregative study. The period of study is 1950-67. According to the author, the gaps in China's foreign trade have existed primarily because much of the crucial information is either not available or difficult to get. So he aims at reconstruction of this information within the analytical framework of market economies.

Predictably, the author begins his analysis by devoting a section to trying to identify the different features that exist in the foreign trade system of China. He attempts to find the basic premise that governs China's foreign trade policy. Quoting Yeh Chi-Chang, Minister of Foreign Trade in the fifties, he concludes that in China "export is for import and import is for the country's socialist industrialisation". However, he does not provide in detail the role of China's foreign trade policy or organisation in its development. Most of the developing countries are finding it difficult to manage foreign trade, aid and import of technology consistent with their growth objectives. In fact, in many cases, they are facing deep contradictions between their preferred growth objectives and the actual results specially arising out of being an open economy. These countries have the problem of inappropriate products, investment, technology and consumption. China is also a developing country with a different socio-economic political system. It would be of great significance to analyse to what extent China is able to overcome the stranglehold of this dependence on foreign aid and trade and how she has been able to harness this to help her growth objective. Unfortunately, the author has not touched this basic aspect. Mere analysis by using the techniques applicable to market economies may not carry us forward in understanding a system such as that of China's.

The thrust of analysis is on exchange rate, terms of trade, aid and balance of payments. The chapter describing the foreign trade of China provides only a glimpse of the structure and composition of China's foreign trade. Although the study covers the period 1948-67, one does not get adequate information on the details of trade. One notes that the author is slightly more pre-occupied with examining the Sino-Soviet trade and aid relations than with a total examination of China's foreign trade. For, apart from focusing his attention on analysing the Sino-Soviet economic relations he also frequently refers to the 'lean to one side policy' for China's initial dependence on the USSR.

The focus of attention is on the analysis of terms of trade of China with the Soviet Union. The main conclusion is that China suffered a deterioration in terms of trade with the Soviet Union. She got higher prices for her exports but paid much higher prices for imports. The author, however, lists out the commodities on which such factors did not operate. As a corollary, China had favourable trade terms with the West. This is a broad and sweeping conclusion. Evidence is not sufficient to warrant this conclusion in the bald form as presented in this book.

For constructing the overall unit value indices of China's imports from and exports to the Soviet Union, the sample of commodities covers a small group. Forty-three import commodities of the sample accounted for 26.2 per cent of total value of imports from the Soviet Union and 51 export units formed 77.2 per cent of China's exports to the Soviet Union. The import sample is highly unrepresentative. Therefore, what the author calls China's differential to explain the gaps in terms of trade cannot be fully accepted.

Trade with the West during the period 1952-60 was not in fact important for China because China had to face trade embargoes in a large number of countries, including her former major trading partners, the US and Japan. In fact, during this period, as figures presented by the author himself indicate, trade with the Soviet Union and Eastern Europe took in the range of 40-70 per cent of exports and imports. It is to be pointed out that in this atmosphere of hostility China had little option to buy from the West all that she wanted. So the whole comparison is not very meaningful. Further, the worsening of terms of trade is associated with economic welfare since 1960. This is a big jump in analysis. For, the welfare concept as developed in market economies cannot be easily applied to a centrally planned economic system. This is exactly what the author has intended to do. The arguments to substantiate this relationship are extremely weak — such as decline in Sino-Soviet Trade. It is needless to say that this was the result of political differences. The Chinese economy seemed to be in difficulty during the period 1960-63. But that is no sufficient proof for the economic impact of deterioration of terms of trade.

The most useful part of the analysis is the presentation of balance of international payments of China over the period. In this section one gets a systematic presentation of total aid, components of payments to the Soviet Union as well as the West. An interesting feature of this information is how China paid its external debt through planned generation of exportable surplus. The main features of the aid agreement with the Soviet Union also throw some light. It is significant that China repaid her debts in raw materials, tea, gold and US dollars. The loans of the Soviet Union carried 1 per cent interest per annum. There was rescheduling of debt by the Soviet Union in the period 1962-65. But China paid back its debt ahead of the debt moratorium offered by the Soviet Union.

The book also throws some light on the aid to China from the West. The character of aid was that China received commercial credits (18 months in the case of grain and fertiliser imports; medium term up to five years in the case of machinery and equipment). This section also gives information on China's aid to other developing countries. It is significant that 90 per cent of the total $ 1680.1 million for the period 1954-57 went to developing communist countries.

The book published by JETRO, originally written in Japanese, does not aim at either critical or deep analysis. It is essentially a descriptive work lucidly written, whose objective is to provide information to the exporter. From the point of view of pure information, the job is well done by the writers. The various aspects that are distinct for the centrally planned economies' foreign trade system which needed explanation i e, foreign trade policy principals, organisation and instruments are well covered. The basic principles of trade of China are very carefully listed: Enforcement of planned trade, employment of a protectionist trade policy, endorsement of principles of equality and reciprocity in trade with other countries and endorsement of a policy of inseparability of politics and economics. Despite the fact that it is meant for exporters, the insight that it provides into trade policy is very clear. The discussion of the payment mechanism also has a similar advantage. It also has a more exhaustive analysis of trade by areas and composition. The formulation of import and export programmes is dealt within a diagrammatic presentation and enhances understanding of the decision-making process with regard to foreign trade in this system.

Western Academic Sophistry and the Third World

Duncan B Forrester

The charge that western students of third world development are only too often blind guides who are incapable of seeing things as they really are and whose policy recommendations frequently betray an alarming degree of ethnocentric prejudice would be a purely academic point if did they not so often allow themselves to be used consciously or unconsciously for the promotion of policies which are purely in the interests of the western world.

The contrast between the enthusiasm with which social scientists attempt to shape and influence policy in the developing countries and the lack of any basic criticism of the values underlying the western policies which the social scientists do so much to promote and service is striking. Such an orientation is unabashed sophistry. From neglect of the basic questions of value and from attempting to understand without profound sympathy and prolonged contact, there arises amazing superficiality dressed up in jargon, linked in an unholy alliance with lack of political scruple.

Only with a renewed socratic emphasis on the underlying questions of value and a new sensitivity to the political and cultural constraints and limitations on their work, together with a rediscovery of the significance of sympathy as a condition for knowledge of the other, can western social scientists really contribute to the making of a more human world.

MANY and complex difficulties stand in the way of balanced and objective understanding of societies and cultures radically alien from one's own. The fact that strenuous and persistent efforts are made to achieve such understanding suggests that factors are involved beyond the inherent fascination of what is strange and different. There is, in the first place, the urge to seek the universalisation of one's generalisations, to test in radically different contexts hypotheses about man and society developed out of observation of one particular situation. Karl Marx, for instance, devoted considerable energy to the study of India and China and to the integration of the phenomena of the "asiatic mode of production" and "asiatic despotism" into his theory; Max Weber tested the validity of his hypotheses about the relation between the Calvinist *weltanschauung* and the development of capitalism in magisterial studies of ancient Israel, China and India. This strictly academic motivation for interest in non-western societies appears to have an inherent respectability. Nonetheless, one may argue that in some cases since the hypothesis to be tested and the theories which focus one's interest are developed in the west they may not really 'fit', directing attention away from significant areas and to some extent anticipating in the questions they ask the answers they will receive. There is also the sometimes justifiable criticism that the desire for universality, the demand that every empirical study must be structured in accordance with some theory and must produce not only description but 'theoretical conclusions', can lead to a fairly systematic disregard for the particular and the idiosyncratic. These problems will recur later.

The motivation for study of the non-western world is seldom, if ever, purely academic. Peculiar constellations of historical circumstances which bring contrasting cultures and societies into immediate and inescapable contact arouse the need for knowledge of what is alien. Contact in itself challenges the reassuring stereotypes of one's own society, and of the other, and leads to the search for knowledge which will either confirm or overthrow these stereotypes. The problem here is that such demands immediately place the desire for, and acquisition of, knowledge of the alien society within a political context; knowledge becomes instrumental either to the carrying out of foreign policy, the achievement of the aims of one's own society, or to a re-evaluation of one's own context. This simple fact helps us to understand both why it is today so common in the Third World to see western social science as part and parcel of the aggressive and exploitative impact of the West, and also why what one may loosely call the 'hippie' interest in eastern culture and religion is inescapably linked to a critique of the West and often arouses a rather strange intensity of wrath within the social science establishment. Both the motivation of the search for knowledge about other societies, and the use of that knowledge, are inextricably interwoven with the self-understanding of both societies and the conduct of the relationship between them. And that remark suggests not so much an unease about the methods and results of social science, but rather the necessity for great sensitivity to the political and moral implications of the enterprise of social science. Social science does not operate in a moral and political vacuum. It is not only a distortion of reality but quite irresponsible to suggest that it does, particularly since western academic interest in the third world followed the flag and normally served the flag. This was most clearly so in the eighteenth and early nineteenth centuries when problems of administration and social control could only be dealt with in the light of real or supposed knowledge of the social and economic condition of the colonial territory and of previous answers to these problems.

Vast quantities of data were amassed in reports and blue books, translations of old law books in Indian languages, censuses, and ethnographical studies. Government needed information, and with amazing energy government servants obtained the information that was required. The investigation of Indian culture, religion, law and society was carried on by a group of able men, many of whom showed a sympathetic insight which led them to go far beyond the immediate needs of government. The extent of their intellectual achievement can hardly be overestimated, and

should certainly not be discounted because the initial stimulus was the needs of government. On some issues, for example, the debate on the medium and content of education, considerable numbers of scholarly administrators and missionaries found themselves ranged against the policy favoured by government, and on issues of social reform generally numbers of scholarly occidentals aligned themselves with Indian reformers to press policies on a reluctant government. It is on the work of these men that modern Indian studies are based.

These early students of India were notable for the fact that they stayed there for long periods of years, learnt the languages, and often identified themselves very strongly with India. They did not simply 'bag' another culture, understood from the outside, at second hand, and, therefore, superficially, in order to illustrate some grand overarching theory. Even if one can sometimes justifiably suggest that the conceptual apparatus which they brought from the west was inadequate, or led to some rather ethnocentric emphases, one has by no means denied the general soundness of the foundations which they laid for later scholars.

Formalism

As the scope of colonial government altered from concern for law and order and political and social stability (so that commerce could peacefully drain resources to the 'mother country' and government be conducted as economically as possible) to publicly avowed commitment to welfare, government-sponsored change, and ultimately to conscious preparation for independence, the focus of academic interest became strangely narrowed. The ideology of colonialism served to disguise the real effects of the western impact upon India, and while the propaganda machine emphasised disinterested concern for the good of India as the principal motive of government, most academic interest polarised around either traditional Indology (the political relevance of which as a factor in the recovery of Indian self-confidence and the growth of nationalism was not always apparent to politicians), or, at the other pole, a concentration on the so-called political education of India and the officially sponsored transfer of institutions. Formalism and concentration on legal and governmental institutions were, of course, typical of British social science at the time. In the Indian context this approach was the easiest, for the surface similarities between Indian institutions and the British ones on which they had been modelled seemed very close, and any discrepancies in the operation of the Indian institutions could be put down to the inexperience of the participants, and the problems arising from inducing very rapid institutional growth. In all essential features, the new India was expected to model itself on Europe and forget its own particularity. The anthropologists, who did concern themselves with the particular, were seen as supplementing the census style of information which was felt to be necessary intelligence for government, and recording for future historians the primitive social systems which were doomed to disappear in the process of westernisation.

The focus of most social science research in India prior to independence was determined by the needs of government and much of it implied a rationale of imperialism. Attention was directed mainly at government policies and their success or failure; seldom were questions about the ultimate justification of these policies allowed to arise, nor did social scientists often investigate areas whose vitality and interest was not under the aegis of the colonial government. The social scientist looked through the administrator's eyes and saw only what the administrator saw. Social science did certainly lead to a certain degree of socratic self-examination among educated Indians, but as far as the western world was concerned it did little beyond confirming imperialist complacency.

The American social science which burst upon the third world in the immediate post-war period had followed a rather different pattern of evolution from the British. The Americans were critical of the formalistic and legal emphases in British social science and were convinced that they had discovered an objective and universally valid way of studying society which, conducted in independence of values, was no less applicable to Madras than to Manhattan and of far broader relevance than the older and mainly British approach. The subjects to which American social scientists had devoted themselves hitherto were mainly domestic or European, and the phenomena of change had not attracted much attention. Social science had been concerned with relatively stable and homogeneous western societies, and there was commonly an implicit assumption — which later became very significant — that the values and institutions of these societies were superior, indeed models for other nations to emulate. The conflict between this bland, ethnocentric assumption and the methodological emphasis on the separation of fact and value was, oddly enough, seldom noticed.

A surprising feature of the sudden explosion of interest in the non-western world among American social scientists in the early 1050s was their belief that in studying change they were presented with a *tabula rasa* and were doing something entirely without precedent, so that they could speak, for example, of "a revolution in comparative politics" which attempted to "look beyond description to more theoretically relevant problems; look beyond the single case to the comparison of many cases; look beyond the formal institutions of government to political processes and political functions; and look beyond the countries of Western Europe to the new nations of Asia, Africa, and Latin America".[1] With more than a little naivety they believed that "until quite recently political science was practically denuded of any explicit conception of time, thereby eliminating the possibility of constructing generalisations based upon historical patterns of development".[2] The so-called "American science of politics" had become by the end of the war a very parochial and rootless thing, oblivious to the fact that change had been not only a stimulus to, but a subject for, political thought from its beginning, and that extremely sophisticated analyses of change were to be found in the tradition they despised, and unconscious too of the extent to which commitment to a value-free objectivity acted as a cover for the unexamined assertion of the values of Americanism.

With boyish enthusiasm and freshness, the political scientists launched into the study of change in the third world, rejoicing in this challenging extension to the scope of their discipline, but confident that the fundamentals of the American science of politics would be gloriously vindicated. But very soon an odd thing began to happen: some of the more sensitive among the social scientists began to realise that their studies of the third world by no means free from value assumptions, and indeed were in many cases thoroughly ethnocentric and tied to American foreign policy objectives. The moment of truth had come, when the assumptions of a tradition had been so undercut that once again men stood where Socrates and the sophists had been. The choice was still between a cover-up operation in which the cracks are plastered over and intellect subordinates itself consciously to power rather than truth, or a thoroughly socratic scrutiny of the tradition and one's methods and values, a kind of intellectual purification. Some went one way and others the other.

Harold D Lasswell, for long the high priests of American political science, quietly ditched the ideal of value-free objectivity: "I agree", he wrote, "with those who urge that models of political development should be explicitly preferential; and that the preferential model requires an ideology of progress and a commitment to wide participation in power as a long-run goal".[3] "Political development", he continued, "needs to be understood as including willingness and capability to play a responsible role in world politics".[4] What may be meant by "a responsible role in world politics" is left to the imagination! As the social scientists became increasingly subservient to American policy and involved with inducing rather than simply studying change, they were forced "to supress some of their scruples of cultural relativism" but, as Lucian Pye acutely and accurately noticed, "this has left them without strong philosophical underpinnings to support their involvement in the development problems".[5] Political science in America felt it had largely been emancipated from what Pye calls "its earlier and strongly normative tradition", and I would call the socratic approach. Its rootlessness left it scant defence against a degeneration into unabashed sophistry. Not surprisingly the problems tackled by the social scientists were often the same as the problems of the earlier colonial administrators and their value assumptions too were frequently similar. They "stressed the need for efficient government and a capacity for carrying on public services and maintaining law, order and stability as the hall-marks of political development. The stimulus for this set of writings seems primarily to have been the authors' views of the needs of US foreign policy".[6]

If the assumptions of the new sciences of development were really those of the old colonialism, the focus of research was often narrower and the contact with the situation so short as to encourage charges that superficial conclusions inevitably arose from tip-and-run research. David Wall has attacked the 'new missionaries' of devolopment with great gusto,[7] and in as far as understanding of an alien culture and society depends upon sympathetic involvement over a period of time, armed with the necessary linguistic tools and respect for the integrity of what is being studied, I would go much of the way with him. Some of us know well the frustration and anger which often follows in the wake of the visiting expert whose recommendations do not, and cannot, allow for the real constraints and possibilities of the situation because he has been incapable of relating his problem to its true context.

Manipulative Saturation

The saturation of the third world with western researchers, scholars and experts and the exploitative behaviour of some of them would be felt as no more than tolerable irritations were it not for the closeness of the link with the formulation and promotion of western foreign policy objectives which are often, not unjustifiably, considered as manipulative and aggressive. The extent of the academic involvement with western policies in the social sciences is not always realised, although there must be by now a considerable number of western scholars who have been dismayed to discover themselves while engaged in field work regarded as spies. The pity is that there are those whose contacts have been so superficial and impersonal that they have never realised the real attitudes of many of their informants towards them, and how much this conditions their results.

The American science of politics found itself in a state of crisis with the realisation that it was not, and never really had been, value-free. Value had been denigrated as arbitrary and irrational as against objective fact and empirical theory — the latter clearly distinguished from the 'normative theory' which was thought to have spoiled the usefulness of most of the tradition of political thought. Scholars were, therefore, ill-equipped for the rational discussion of questions of value, and apt to flounder. Gradually, three distinct responses became apparent. Many continue to maintain a rather naive and optimistic belief in progress which probably had its roots in Social Darwinism and was sometimes assumed to be supported by 'the facts'.[8] Everything, or at least the things that really matter, in the third world were getting better and better, and as things improved they approximated more and more to the idyllic society of the west. It is hardly surprising that such an unexamined value system appeared to an African scholar like Ali Mazrui as "ethnocentric cultural pride". Such optimism also acted as a kind of intellectual filter, so that those who looked at the non-western world through progressivist spectacles could not really see changes which ran counter to their hopes, or appreciate the inherent virtues or resources for development in other cultures than their own. Everything that happened in the 'developing countries' — civil wars, unemployment, political corruption — was seen as progressive and positive. An elaborate mirage was conjured up to maintain the illusion that all was for the best in what was becoming the best of possible worlds. When reality finally began to make some inroads, there appeared a spate of articles on 'breakdowns' or 'decay' or 'dysrhythmic processes of change'[9] which look very like attempts to salvage a theory of development which was integrally related to a simplistic and inadequate value orientation.

The second response was to accept, in Weberian style, that values could not be totally isolated from facts, and that both intellectual integrity and the closest possible approach to objectivity depended upon specifying as clearly and precisely as possible the value assumptions of the observer. Edward Shils, for example, articulated the values which had been implicit in so much work by saying that a 'modern society' is "dynamic, concerned with the people, democratic and egalitarian, scientific, economically advanced, sovereign and influential"[10] — in other words, as similar to the United States as possible. The Soviet Union, he wrote, had undergone "a deformed modernisation".[11] He argued for the general validity of these values on the grounds that they were shared by the elites of the new states. But counting influential heads, even brown, black and yellow heads rather than white ones, may do no more than demonstrate the success of cultural imperialism. Gunnar Myrdal, more sensitive than many to the value aspect of social science, starts his monumental "Asian Drama" with 120 pages on the value premises on which the study is based.[12] This surely represents a really valiant effort towards intellectual honesty and a major improvement on studies which leave their values shamefacedly latent. "Throughout the history of social studies", he writes, "the hiding of valuations has served to conceal the inquirer's

wish to avoid facing real issues... Efforts to run away from the valuations are misdirected and foredoomed to be fruitless and damaging. The valuations are with us, even when they are driven underground, and they guide our work. When kept implicit and unconscious, they allow biases to enter. The only way in which we can strive for objectivity in theoretical analysis is to lift up the valuations into the full light, make them conscious and explicit, and permit them to determine the viewpoints, the approaches and the concepts used".[13] Proceeding to specify his values he continues: "We have attempted to look at problems in the countries of South Asia as they appear from the point of view of the interests and ideals, norms and goals that are relevant and significant in these countries themselves. The interests of foreign countries are left out of consideration, so far as the value premises are concerned".[14]

But how, on Myrdal's premises, do we decide what is "relevant and significant in these countries" in any save a quite arbitrary way? That he has really hardly succeeded in escaping from ethnocentrism and the dangers of a manipulative approach which easily lends itself to use against the real interests of the countries involved is suggested by the following: "Quite apart from the Cold War and the opportunistic tendencies to bias emerging from it, we of the west are by tradition disposed to be friendly to people in distress, once we begin to take an interest in their condition. And it is our earnest hope, apart from all selfish interests, that they will succeed in their development efforts. That we wish them to develop into national communities as similar to our own as possible is a natural ethnocentric impulse that would make itself felt in the calmest world situation. Perhaps it should be stressed again that the concern of the West about the possibility of Communist expansion in underdeveloped countries is also understandable, and from the viewpoint of our own interests valid. And these interests justify using our influence to stop it. Still less can one criticise the human sympathy that characterises the Western attitude towards these countries".[15] Is a quite unjustifiable complacency about the motives and effects of the Western impact on the third world really a respectable value premise in social science? Is it not calculated to obscure the realities of the relationship between the West and the third world in a way which subtly justifies western policies? How does such a social science avoid becoming used as an ideology of oppression? And, on the academic level, are we really so incapable of carrying out any kind of socratic critique of the values of our own society that we can do no more than state them, and admit they influence our point of view and our conclusions?

Unqualified Cynicism

A third response to the problem of values is that of unqualified cynicism. This position is well represented by Samuel P Huntington, but it is one into which the naive optimist is peculiarly liable to fall whenever he loses confidence in the self-evidence and objectivity of his belief in a universal progress towards the goal of being as similar as possible to his own society. In articles in the mid-sixties Huntington launched a vigorous and well-deserved attack on the simplicities of much of the earlier writing on modernisation and development.[16] Development he saw not as a universal and irresistible process encompassing virtually everything that happened in the third world and carrying the new states relatively placidly towards the great goal of similarity to, and friendship with, the western democracies. "Almost everything", he argued, "that happens in the 'developing' countries — coups, ethnic struggles, revolutionary wars — becomes part of the process of development, however, contradictory or retrogressive it may appear on the surface". Rapid modernisation, he argued, produces not political development, but political decay. Not all changes were progressive, and development could be, and often was, reversed. A multitude of options were open for change in every situation. He therefore regarded western intervention not as simply the facilitation of a process which is proceeding anyway with apparent irresistability, but as the choice between a considerable number of viable possibilities and goals. As a consequence, he saw western policy as having a far more active role in initiating and controlling change in the 'developing countries' and in shaping the future form and orientation of these countries than did those he criticised. Having dismissed as unrealistic and oversimple the values of the progressivists and declared that the possibilities for western manipulation of third world situations are far greater and more varied than had been commonly assumed by social scientists, one expects Huntington to make explicit his own value orientation. This he did not do, although he obviously had a great liking for strong and authoritarian government and gave high priority to suggesting that US policy should support such government. Huntington is by no means alone in supporting liberalism at home and authoritarianism abroad. Even Gunnar Myrdal speaks despairingly of the polities of the countries of South Asia as "soft states",[17] and argues that "Under present South Asian conditions development cannot be achieved without much more social discipline than the prevailing interpretation of democracy in the region permits. An authoritarian regime may be better equipped to enforce social discipline, though its existence is no guarantee of this accomplishment".[18] Possibly behind such attitudes there lurks a deep frustration arising from the very real difficulty in understanding a radically different society without great patience. Strong government will 'rationalise the society, and thus make it intelligible.

Huntington's writing is dominated by a desire to make recommendations for US foreign policy, which would in itself be unexceptionable if it did not purport at the same time to be objective as a study of the third world. And, in any case, what are his value premises? Perhaps he drops a hint when he says that political modernisation involves the rationalisation of authority: "This change implies that government is the product of man not of nature or of God, and that a well-ordered society must have a determinate human source of final authority, obedience to whose positive law takes precedence over other obligations".[19] Can patriotism, devotion to the interest of one's own country, be regarded as a reputable controlling value in social science research? In situations such as that of America in the aftermath of the Second World War, where consciousness of strength easily develops into a desire to dominate and manipulate as widely as possible, the sophistic stance is to affirm that there are no restraints on power whatsoever.[20]

The new Mandarins whose involvement with American iniquities in Vietnam Chomsky castigates[21] were lacking in moral seriousness and were willing to put their skills at the disposal of power no matter how deplorable the consequences. The cult of 'objectivity' led to a total lack of scruple. The one thing lacking from much contemporary social science is not methodological

rigour but a serious, critical and realistic examination of the values undergirding and influencing the enterprise of social science, or surreptitiously supported by its results.

Three concepts compete with each other as overarching descriptions of what is happening in the third world — westernisation, modernisation and development. There is no general agreement as to the content of these terms and as a consequence, not surprisingly, conflict as to which is the most appropriate. M N Srinivas, the Indian sociologist, opts for *westernisation* as a more accurate and less value-laden term for what is actually going on.[22] The eagerness and virtual unanimity with which American scholars differ, preferring to speak of 'modernisation', makes one suspect that they are trying to conceal something — perhaps even that they are trying to sell westernisation by changing the label on the package! For Shils, "'Modern' means being western without the onus of dependence on the west".[23] Presumably he means without recognising the degree of western manipulation of the process. For the devotees of the term, *modernisation* affects every detail of the structure and life of the communities affected, and their enthusiasm for this gigantic, all encompassing process knows no bounds. A volume published in Madras under the title "*Modernisation: The Dynamics of Growth*" and consisting of talks by 25 American social scientists specially concerned with India which were broadcast by the voice of America[24] makes revealing reading, partly because the authors speak relatively plainly without smokescreens of jargon. We read here of modern attitudes such as "a disposition to accept new ideas and try new methods; a readiness to express opinions; a time sense that makes men more interested in the present and future than in the past; a better sense of punctuality; a greater concern for planning, organisation and efficiency; a tendency to see the world as calculable; a faith in science and technology; and, finally, a belief in distributive justice" (p 4). The capacity of a modern society to apply science and technology to the solution of the problems associated with urbanisation and social disorganisation is demonstrated by the fact that the US government spends $15 billion a year for research and development involving this "dimension of modernisaiton!". We read also of "modernisation of values" and of "modernisation of religion": "Religion ... can be modernised, not simply secularised, and, while it may not be the lubricant for modernisation, it need not be an obstacle either" (p 6). Modernisation, indeed, facilitates religious practice, for "really to practise your religion well, you must be a reasonably well-composed, well-contained individual ... Despite the idyllic image that many people have of the countryside, the great majority of the world's *peasants are in a state* of culture shock produced not by *modernity* but by the hard conditions of rural life. When a man goes to the city, and especially if he secures a job in industry, he comes to have much more respect and becomes much more self-controlled. This makes it more feasible for him to practise his religion" (p 165) Well ...! That last quotation comes from a talk on "The Modernisation of Man" by Alex Inkeles, Professor of Sociology at Harvard and Director of Studies on Social and Cultural Aspects of Development at Harvard's Center for International Affairs.

Difinitions of Development

'Development' is now the most popular of the three terms, and for very good reasons. Not that there is any general agreement about what development is — there are almost as many definitions as there are writers, and articles appear almost entirely devoted to collecting and comparing other people's definitions, e g, Lucian W Pye's "The Concept of Political Development"[25] where he analyses ten definitions of political development. But development does seem on the whole a preferable term to the other two in as far as it is more open to the possibility of a variety of goals, and of paths to their achievement. Even if there is sometimes a tendency towards a kind of vulgar Marxist assumption that economic growth or industrialisation is the determinative factor out of which all other good things flow there is, on the other hand, an increasing tendency to see development as concerned (in Dudley Seers' words) with "The fulfilment of human potential" which involves "much that cannot be specified in purely economic terms"[26] or as "a process of humanisation".[27]

However, theories of change in the third world are peculiarly liable to perversion of various sorts, making them much less illuminating than they ought to be and sometimes converting them into ideological covers for policies of exploitation and aggression. In the first place, there is a tendency to assume that development is simply an externally induced and externally directed process. If development as a generally desired objective demands that the ultimate say as to what happens should be in the hands of what Paulo Freire calls, not inappropriately, "director societies"[28] and if the theories of development are manufactured in these societies, it is easy to see why development theories often justify manipulation. Development theory, therefore, becomes a justification for the belief that "men can do what God cannot, namely, manipulate others for their own salvation".[29] And once an ideology of manipulation becomes acceptable the restraints tend to go by the board: all manipulation by the director society is presented as in the true interest of the manipulated — it is progressive, educative. Even torture and genocidal wars are ultimately accepted as legitimate tools of development.

Development or modernity must not be seen as a universal which comes from outside and displaces entirely what was already there. A developing country is not a *tabula rasa* to be filled in according to the whim of the development expert. It is a society and a culture with its own soil, its own riches of tradition and human resources, its own values and ability to choose its goals, its own particular capacity for change. Not without reason does an Indian economist complain that "The modernisation approach is accompanied by the implicit, or as in the case of Myrdal's recent work quite explicit, belief that the ingredients of modernisation are *all* alien to the native soils of the 'developing countries'".[30] Again and again development is seen as being quite incompatible with the maintenance of *any* elements of a particular tradition-particularities must be ironed out if the developing countries are to approach the western model: "We (*sic*) are not going to be able to modernise primarily in terms of the traditional patterns of the societies concerned" writes Marion J Levy, Jr, "or to preserve these patterns to any considerable extent".[31] What is already there is regarded almost entirely as a complex of obstacles to development.[32] Religion, for example, is seen by Myrdal as "a tremendous force for social inertia" which because it is "permeated by irrational views and illogical thinking is inimical to the spread of the modernisation ideals and to their realisation by planning for development and the effectuating of plans".[33] This rather unguarded generalisation sounds somewhat strange in the context of the com-

mon social science assumption that values too are irrational!

Myrdal detects in the jargon of development a large element of euphemism which serves to disguise what is really happening, a tendency which systematically covers the real effects of neo-colonialism, and the actuality of exploitation. Huntington, for instance, criticises others for seeing everything in the developing countries as developmental "however contradictory or retrogressive".[34] One wonders by what criterion he can speak of something as contradictory or retrogressive unless he means simply that it is regarded as so by the US government in the light of their understanding of US interests. The fact that his own writing on Vietnam contains such appalling examples of euphemistic language — "forced-draft urbanisation and modernisation" being the most glaring example — suggests that his captivity to the very euphemistic jargon that he criticised in others is such that he just cannot see what is happening or (less charitably and more probably) that he is willing to use language systematically to disguise the truth when he regards this as desirable for political reasons. But concentration on an extreme instance such as this should not lead us to forget the alarming extent to which the jargon of development can perform a huge cover-up operation, obscuring rather than illuminating the truth.

The charge that western students of development are only too often blind guides who are incapable of seeing things as they really are and whose policy recommendations frequently betray an alarming degree of ethnocentric prejudice would be a purely academic point if did they not so often allow themselves to be used consciously or unconsciously for the promotion of policies which are purely in the interests of the "director society". The contrast between the enthusiasm with which social scientists attempt to shape and influence policy in the developing countries and the lack of any basic criticism of the values underlying the western policies which the social scientists do so much to promote and service is striking. I call such an orientation unabashed sophistry. From neglect of the basic questions of value and from attempting to understand without profound sympathy and prolonged contact there arises amazing superficiality dressed up in jargon, linked in an unholy alliance with lack of political scruple. Western scholars would do well to realise how often their efforts are seen, not without reason, as academic exploitation and intellectual subversion in the third world. Only with a renewed emphasis on the underlying questions of value and a new sensitivity to the political and cultural constraints and limitations on their work, together with a rediscovery of the significance of sympathy as a condition for knowledge of the other, can social scientists really contribute to the making of a more human world.

Erosion of Incomes of Income-Tax Payers through Inflation

N J Jhaveri

This article examines the impact of inflation on the incomes of income-tax payers and discusses alternative ways of reducing the tax burden from the standpoint of their impact on revenues and on high and low-income groups among tax-payers.

THE income of an individual (or a household) represents command over goods and services. Measured in terms of the value of goods and services which can be acquired for current consumption at a given level (i e, base-year) of prices, the purchasing power at the command of an individual over a period of time will be determined by (i) the rate of growth in pre-tax income (g), (ii) the rate of change in the level of prices (p) and (iii) the income-tax liability. If the rate of increase in income and the price level is the same, there will be no impact of inflation on personal incomes — that is, the magnitude of purchasing power, represented by income, will remain unchanged.[1] With the introduction of tax liability however, even if g = p, the assumption of a constant proportion of purchasing power being maintained will not be valid — except when the tax rate is proportional.

The tax liability on personal income is determined by two variables, *viz*, the rate structure and the level of income. Since, under a progressive rate structure, the weighted average of the marginal tax rates on incremental incomes is invariably a positive *fraction* (and the value of which is increasing), the amount of disposable (or post-tax) income would also rise as income increase — though the income-tax liability in absolute terms would have gone up. Of course, the extent of rise in the disposable income will be lower than in the pre-tax income. This would happen because of (a) the shift of the taxable income to higher marginal rate brackets, and (b) the increase in the rates of tax. Assuming that there is no increase in the level of prices, the disposable money income would also furnish a measure of the increase in real income (i e, at constant prices). On the other hand, if there is a rise in the price level, the increase in disposable income in real terms would be lower than that in monetary terms.

The purpose of this article is to examine the impact of inflation on the income-tax payers as determined by these variables. It should be clear that in the case of those who do not pay income-tax, g and p are the only two variables determining the command over goods and services or the purchasing power in real terms, since income-tax liability is zero.

Measure of Inflation: Choice of Income Deflation

The first question which arises in this context is the choice of an appropriate price index as a measure of the inflation. Income-tax payers constitute a heterogeneous group marked by wide disparities in levels and sources of incomes as well as in tastes and preferences. These differences are reflected in the varied sizes and patterns of the consumption-baskets and in the saving habits (saving being viewed as representing future consumption). An important consequence of the differences in the consumption-baskets is that, in a particular base year, the monetary equivalents of given pre-tax incomes will be higher for a person the price level of whose consumption-basket has increased more. Therefore, for perfect adjustment of the factor of inflation, a separate price index would have to be worked out for each consumption-basket. While this may be an ideal solution, in practice, a common price index has to be adopted as a measure of inflation.

But this does not wholly solve the problem. There are three different price indexes available — *viz*, (i) Consumer Price Index Numbers for Industrial Workers, (ii) Consumer Price Index Numbers for Urban Non-Manual Employees, and (iii) Index Number of Wholesale Prices. Of these, the Consumer Price Index Number for Industrial Workers is ruled out because of the predominance of the non-worker class among income-tax payers. The Consumer Price Index Numbers for Non-Manual Employees is the one which can be considered. But the details of weightage assigned to different commodity-groups in this index are not known. The available information indicates that the weightage assigned to the food articles group in the Consumer Price Index is higher than that assigned to it in the Wholesale Price Index. While details of weightage are known in respect of the Wholesale Price Index, for purposes of measuring inflation, the Consumer Price Index for Non-Manual Employees is used in this article, because it is more appropriate in the context of this study. At any rate, since the price index is used here mainly to illustrate the impact of inflation on the different groups of tax-payers, the problem of choice of a price index should not unduly preoccupy us. To the extent that there is a difference in the magnitude of change reflected in the Consumer Price Index which we use here and that reflected in the other indices, there will be a difference in the measure of the inflation *but not in the direction* of its impact. The main conclusions of the study would not be affected, therefore, by the choice of the Consumer Price Index.[2]

It is quite possible that the weightage of different commodity groups in the Consumer Price Index differs from the relative share of such commodities in a particular individual's consumption expenditure. More specifically, while the relative share of food articles in the total consimption expenditure of high-income groups is likely to be lower than the weight assigned to them in the Consumer Price Index, the share of liquor and tobacco, fuel, power, light and industrial manufactures is likely to be higher in the high-income group's consumption expenditure than the weights assigned to them in the price index. Thus, while the use of the Consumer Price Index as an inflator (or a deflator) would overstate the impact of change in foodgrain prices on the tax-payers with high incomes, it is likely to understate the impact of the changes in other prices. On the whole, for the higher income groups, the impact of inflation is likely to be somewhat overstated in the present study. It would be useful to bear in mind this point in the following analysis.

The period chosen for this exercise

is the quinquennium 1969-70 to 1973-74. The magnitudes for 1968-69 are treated as equivalent to 100 (i e, the base-year). The percentage increase (over monthly average for the preceding fiscal year) in the Consumer (all commodities) Price Index during the fiscal year 1969-70 (April-March) was 3.7 per cent, 4.2 per cent during 1970-71, 3.4 per cent during 1971-72, 6.7 per cent during 1972-73, and 15.1 per cent during 1973-74.

Indexing of Income-Brackets

The increase in money incomes during 1968-69 to 1973-74 could have been at a rate, higher than, lower than, or equal to, the rate of increase in the price level. If the increase in pre-tax money incomes is of the same order as the price rise, this does not represent any increase in the purchasing power in real terms. Besides, as mentioned earlier, under a progressive rate structure, disposable money income would constitute a smaller proportion of the pre-tax income than before the price rise; there would thus be a decline in the disposable income in real terms. If the proportion of tax liability to income in 1973-74 (or the proportion of disposable income to pre-tax income) is to be the same as in 1968-69 at all levels of income at unchanged (i e, 1968-69) rates of tax, then the income-tax brackets should have been adjusted to the full extent of the price rise. The 1968-69 income-tax brackets adjusted for price rise are presented in Table 1 for selected levels of income.

It will be noticed that income-tax bracket equivalent to the 1968-69 income range of Rs 5,000-Rs 10,000 is Rs 6,900-Rs 13,700 in 1973-74; and like-wise, equivalent to the income range of Rs 1,00,000-Rs 2,00,000 in 1968-69 it is Rs 1,37,200-Rs 2,74,400.

Thus, assuming that no adjustment is made in the income-tax brackets and that the real value (in terms of current purchasing power) of a pre-tax income of Rs 25,000 in 1968-69 remains intact in 1973-74, money income would have to rise to Rs 34,300. On an income of this magnitude, tax liability at *1968-69 rates* would be Rs 8,690 — or 25.34 per cent of income — as against Rs 4,125 — or 16.50 per cent — if income had remained unchanged at Rs 25,000. If the income-tax brackets were to be adjusted for the full extent of the price rise, tax liability on an income of Rs 34,300 in 1973-74 would be Rs 5,660 or 16.50 per cent — i e, the same as in 1968-69.

Table 1: Index Linked Income-Tax Brackets — Monetary Equivalents of Selected Upper Limits, (100 Per Cent Neutralisation)

(Rupees)

1968-69	1969-70	1970-71	1971-72	1972-73	1973-74

Note: Figures are rounded off to the nearest hundred.

Table 2: Rate of Growth in Pre-Tax Incomes and Marginal Tax Rates

(Assumption : p=10 per cent)

Marginal Rate of Tax t	g=100 per cent of p	50 per cent of p	20 per cent of p
	Additions to Post-Tax Incomes g (1 —t)= (Fraction of Pre-Tax Incomes)		
10	0.0900	0.0450	0.0180
20	0.080	0.0400	0.0160
35	0.0650	0.0325	0.0130
55	0.0450	0.0225	0.0090
75	0.0250	0.0125	0.0050
80	0.0200	0.0100	0.0040
85	0.0150	0.0075	0.0030
90	0.0100	0.0050	0.0020

Neutralisation for Price Rise and Additions to Post Tax Incomes

Between 1968-69 and 1973-74, income-tax brackets have remained more or less unchanged. Therefore, if there has been an increase, as there normally would be, in an individual's income between 1968-69 and 1973-74, his tax liability would also have increased. The relationship between different rates of growth in pre-tax incomes and marginal tax rates is presented in a generalised manner in Table 2.

Thus, for instance, if the pre-tax income of Rs 10,000 was assessed in the marginal rate bracket of 55 per cent, assuming full neutralisation (g=100 per cent of p), the addition to post-tax income would be Rs 450; if neutralisation were to the extent of 20 per cent, the addition would be only Rs 180, and so on.

Looked at from another point of view, these fractions may be considered to indicate the extent to which the loss in post-tax incomes can be recouped by incrementals to incomes. For convenience of reference, we use below the term 'recoupment fractions' to describe these incrementals. The point to be noted is that the recoupment fractions have more or less the same values, both at higher levels of income (i e, higher marginal rates of tax) but with relatively higher degree of neutralisation and partial neutralisation for price rise but lower levels of income. We may now examine, using some illustrative examples, the effect of inflation and tax rate changes.

100 Per Cent Neutralisation

(A) *Impact of Inflation*:

Let it be assumed that pre-tax incomes rise to the same extent as the increase in the price level (i e, 1968-69 money incomes are assumed to remain constant in real terms). Under a progressive rate structure, increase in tax liability due to a shift in income to higher marginal rate brackets would give a measure of the impact of inflation — assuming income increases by the same percentage as the price level. For certain selected levels of incomes, Table 3 illustrates disposable incomes at current prices at 1968-69 rates and current rates (for respective years), for 1968-69, 1969-70, 1971-72, and 1973-74.

It will be observed from Table 3 that disposable money income (at current prices) is higher, in all the cases, at 1968-69 rates. At the same time, effective tax rates (tax liability as a percentage of the money income equivalent of

Table 3: Disposable Incomes (Computed on Fully Index Linked Incomes)

(Rupees)

Pre-tax Income	A. At 1968-69 Rates				B. At Current Rates (for respective years)			
	1968-69	1969-70	1971-72	1973-74	1969-70	1971-72	1973-74	
							1973-74 Rates	1974-75 Rates
10,000	9450 (5.50)	9784 (5.92)	10452 (6.67)	12580 (8.18)	9775 (6.09)	10426 (6.91)	12458 (9.07)	12562 (8.31)
25,000	20878 (16.50)	21379 (17.45)	22499 (19.36)	25810 (25.34)	21105 (18.52)	22034 (21.02)	24996 (27.12)	25632 (25.28)
50,000	32675 (34.65)	33321 (35.79)	34681 (37.96)	38999 (43.15)	33046 (36.33)	32347 (42.13)	36284 (47.11)	29021 (43.12)
100,000	48225 (51.98)	48876 (52.87)	50716 (54.60)	56581 (58.76)	48601 (53.13)	49927 (55.30)	42244 (69.21)	55953 (59.22)
200,000	71025 (64.48)	72727 (64.93)	76430 (65.80)	86795 (68.38)	72542 (65.07)	65300 (70.78)	48942 (82.16)	87509 (68.11)

Notes: 1) Disposable Income = 1968-69 income (1+p) 1, 3, 5 as the case may be
Less tax liability, where p stands for percentage increase in the price level.
2) Figures in brackets denote effective tax rates, i e, Pre-tax incomes (100 per cent neutralisation) less Tax Liability / Pre-tax Incomes

1968-69 incomes) have also increased. For instance, on a money equivalent of the 1968-69 income of Rs 10,000, the effective tax rate increases, at 1968-69 rates of tax, from 5.50 per cent in 1968-69 to 8.18 per cent in 1973-74 — or by 2.68 percentage points; on an income equivalent of Rs 50,000, from 34.65 per cent to 43.15 per cent — or by 8.50 percentage points; and on income equivalent of Rs 2,00,000 from 64.48 per cent to 68.38 per cent — i e, by 3.90 percentage points. These increases in tax liability may be attributed to inflation.

(B) *Impact of Tax Rate Changes*:

The extent of increase in effective tax rates on account of changes in rates of tax, in 1973-74, ranges from 0.83 percentage point in respect of money income equivalent of Rs 10,000 to 13.78 percentage points on an income equivalent of Rs 2,00,000. This would imply that, between 1968-69 and 1973-74, there has been a sizeable increase in marginal rates of tax applicable to high levels of personal incomes. However, with the reduction in the marginal rates of income-tax introduced with effect from the financial year 1974-75, effective tax rates at almost all the levels are only nominally different from what they would have been if the tax liability were to be computed at 1968-69 rates of income-tax.

Disposable (Post-Tax) Real Incomes

So far, the discussion has been confined to tax liability, disposable income, and effective tax rates for certain given pre-tax income levels during 1968-69. The next question is disposable incomes *at 1968-69 prices*. This has been done in Table 4, by adopting the following procedure.

Table 4: Disposable Incomes and Effective Tax Rates in Real Terms

Pre-tax Income in 1968-69	A. At 1968-69 Rates				B. At Current Rates			
	1968-69	1969-70	1971-72	1973-74	1969-70	1971-72	1973-74	
							At 1973-74 Tax Rates	At 1974-75 Tax Rates
10,000	9450 (5.50)	9435 (5.65)	9357 (6.43)	9168 (8.32)	9426 (5.74)	9334 (6.66)	9079 (9.21)	9155 (8.45)
25,000	20875 (16.50)	20616 (17.54)	20142 (19.43)	18663 (25.35)	20352 (18.59)	19726 (21.10)	18216 (27.14)	18679 (25.28)
50,000	32675 (34.65)	32132 (35.74)	31048 (37.90)	28421 (43.16)	31867 (36.27)	28959 (42.08)	26442 (47.12)	28437 (43.13)
100,000	48225 (51.98)	47132 (52.87)	45404 (54.60)	41234 (58.77)	46867 (53.13)	44697 (55 30)	30786 (69 21)	40716 (59.22)
200,000	71025 (64.48)	70732 (64.94)	68424 (65.79)	63252 (68.37)	69954 (65.02)	58460 (70.78)	35667 (82.16)	63773 (68.13)

Notes: (1) Disposable income in real terms = Disposable money income as defined in Table 2.

TABLE 5

Notes: (1) Figures in brackets represent index worked out with row 1 values equal to 100
(2) Figures in double brackets represent index computed assuming 50 per cent neutralisation of income at the level of Rs 10,000 (= 100)
(3) (a) represents computations at 1968-69 rates of taxation.
(b) do 1973-74 do
(c) do 1974-75 do

Tax liability was computed on money income equivalents of constant 1968-69 incomes (as in Table 2). Then the disposable (after-tax) income for a particular year was converted into income at 1968-69 prices, by applying the appropriate price deflator. The disposable incomes, derived in this manner, are indicated in Table 4. For instance, the money income equivalent of a pre-tax income of Rs 25,000 in 1968-69 works out to Rs 34,300 for 1973-74. Tax liability at current (i e, 1973-74) rates of taxation on such an income is Rs 9,364, leaving a post-tax income of Rs 24,996. Converted to 1968-69 prices, this amounts to Rs 18,216. In 1968-69, at 1968-69 rates of taxation, disposable income corresponding to pre-tax income of Rs 25,000 would have been Rs 20,875. Therefore — despite an increase in money income so as to fully neutralise the price rise — disposable income in real terms was lower by Rs 2,659 than in 1968-69, indicating a corresponding increase in tax liability in real terms.

Computations show that the relative position, at different levels of income, varies considerably. The impact of inflation — measured in terms of percentage increase in effective rates of tax — shows that there is a rise at 1968-69 rates of tax of 48.3 per cent (from 5.50 per cent to 8.32 per cent) at the 1968-69 income level of Rs 10,000, and of 6.0 per cent (from 64.48 per cent to 68.37 per cent) at the income level of Rs 2,00,000. Taking into account the changes in tax rates, the percentage rise in effective tax rates works out to 67.4 and 27.5, respectively, at these levels of income. This is evident also in the multiples of effective tax rates expressed in Table 5.

It will be noticed that the index of effective tax rate, (with effective tax rate at an income equivalent of Rs 10,000 in 1968-69=100) at an income equivalent of the 1968-69 income of Rs 2,00,000, declined from 1,172 in 1968-69 to 822 in 1973-74 at 1968-69 rates indicating relative regressivity of the situation; at 1973-74 tax rates the index increased to 892 indicating enhanced effective tax burden on account of tax rate changes. However, computed at 1974-75 rates, the index again fell to 810.

TABLE 6: DISPOSABLE INCOMES IN REAL TERMS (50 PER CENT NEUTRALISATION)

Pre-tax Income in 1968-69	A. At 1968-69 Rates				B. At Current Rates			
	1968-69	1969-70	1971-72	1973-74	1969-70	1971-72	1973-74	
							At 1973-74 Rates	At 1974-75 Rates
10,000	9450 (94.50)	9274 (92.74)	8910 (89.10)	7982 (79.82)	9272 (92.72)	8899 (88.99)	7953 (79.53)	7982 (79.82)
25,000	20875 (83.50)	20400 (81.60)	19310 (77.24)	17329 (69.31)	20135 (80.54)	19007 (76 00)	16648 (66.59)	17024 (68.10)
50,000	32675 (65 35)	31804 (63.61)	30135 (60.27)	25992 (51.98)	31539 (63.08)	28108 (56.22)	24228 (48.46)	26009 (52.02)
100,000	48225 (48 02)	46733 (46.73)	44189 (44.19)	37949 (37.95)	46468 (46.47)	39853 (39.85)	30380 (30.38)	37498 (37.95)
200,000	71025 (35.51)	69312 (34.65)	65953 (32.97)	57643 (28.82)	69046 (34.52)	56982 (28.41)	37964 (18.98)	57183 (28.53)

Notes: Figures in brackets represent post-tax incomes in real terms.

If the principle of progression — i e, higher the income, higher the effective rate of tax — is applied not only to levels of tax rates but also to increments then clearly the conclusion emerges that assuming constant real incomes, the increase in tax burden (as measured by percentage rise in level of effective tax rates) on account of inflation is generally inversely related to the level of income.

DISPOSABLE REAL INCOMES

Let us now examine what happens to disposable real incomes. It will be noticed from Table 5 that, in 1968-69, with disposable income at pre-tax income level of Rs 10,000=100, the index of disposable real income, corresponding to the pre-tax income level of Rs 1,00,000 and Rs 2,00,000, was 510 and 752, respectively. In 1973-74, corresponding to money income equivalents of these two levels, the values of the index are 450 and 690, at 1968-69 rates. The indices decline sharply to 339 and 393 at 1973-74 rates. The apparent contradiction, in the (regressive) movement of effective tax rates and the (progressive) movement in the disposable income relatives, is attributable to the assumption of uniform (100 per cent in this case) neutralisation for price rise. It will be seen from Table 2 that, as a result of this assumption, the value of the recoupment fraction turns out to be quite high at lower levels of marginal rates of tax. If, for instance, 50 per cent neutralisation is assumed at the low income level (Rs 10,000), and full neutralisation at the other two levels, disposable real income multiples (shown within double brackets in Table 5) in 1973-74 *are higher than the 1968-69 multiples in columns a and c.*

Before removing the assumption of full neutralisation, it may be noted that disposable income between 1968-69 and 1973-74 (converted to 1968-69 prices) declined *progressively* — both in terms of time and levels of income. As observed with disposable money incomes, the recent reduction in tax rates has brought disposable real incomes in 1973-74 near about the levels which obtained at 1968-69 rates of tax. It is interesting that, in terms of disposable incomes at 1968-69 prices, income-tax payers upto the income levels of Rs 25,000, are marginally better off as a result of a reduction in marginal tax rates whereas income-tax payers having assessable incomes of Rs 1 lakh and Rs 2 lakhs in 1968-69 benefit in terms of the increase in disposable real income in 1973-74 to the extent of approximately one-third and four-fifths, respectively.

TABLE 7: DECLINE IN EFFECTIVE TAX RATES IN 1973-74

PARTIAL NEUTRALISATION FOR PRICE RISE

So far, it has been assumed that there is full neutralisation for price rise. But money incomes need not (and more often do not) increase at the same rate as the rise in prices. Further, as between different income-groups, it is reasonable to assume a relatively higher rate of growth in respect of non-salary incomes than in salary incomes. As a major portion of salary income is assessed in the lower and middle income brackets, one must expect a relatively lower rate of growth in pre-tax incomes (i e, lower degree of neutralisation for price rise) in respect of low and middle income brackets, as compared to high income-brackets. To simplify the problem, it is assumed that there is 50 per cent neutralisation for the price rise for all the types of income groups. (That is, g=½ p.) Disposable incomes in real terms are shown in Table 6.

Where there is partial neutralisation for the price rise, disparities in the incidence of inflation are very wide. For instance, at the 1968-69 rates, disposable income in real terms on a before-tax income of Rs 10,000 (assuming 50 per cent neutralisation) declines from 94.50 per cent of the pre-tax income in 1968-69 to 79.82 per cent in 1973-74 (or by 14.18 percentage points), and on a before-tax income of Rs 25,000 from 83.50 per cent to 69.31 per cent (i e, by 14.19 percentage points). On the other hand, the decline in the disposable real income, for a before-tax income of Rs 1,00,000, is from 48.22 per cent to 37.95 per cent — i e, by 10.27 percentage points. A part of the disparity, in the decline in the real income on account of inflation, is rectified by changes in tax rates which increase the effective tax burden in real terms — generally in a progressive manner.

It was observed earlier, that increase in money incomes is likely to lag behind the price rise more in respect of lower incomes than higher incomes. To the extent this is true, it is ap-

parent from the above illustrations that the erosion in real disposable incomes is likely to be *relatively* much more in the case of lower incomes than in the case of higher incomes. Moreover, to the extent that there is 'evasion' of income, the impact of inflation — as measured by after-tax incomes at constant prices — will be all the more severe for those who disclose (or have to disclose) their true incomes — particularly so at higher levels of income.

Tax Exemption of Personal Savings

There are various deductions — such as conveyance allowance, expenditure on books (now replaced by standard deduction), long-term savings in provident fund, etc — which reduce the taxable income. In this article, we have taken into account only the tax exemption on personal savings for illustrative purposes.

Two types of savings behaviour are assumed. One: a *fixed amount* is assumed to be saved (alternative I) in the form of provident fund, insurance policies, etc; and two: the proportion of income saved in these forms is assumed to be the same as in 1968-69 (alternative II). It is also assumed that, except at the lowest level of income (as in the example of Rs 10,000), some income is received in the form of dividends, interest, etc, which is exempt (upto Rs 3,000) from taxable income; dividend/interest income is assumed to be the same as in 1968-69 in absolute terms. For the highest income level in the example (*viz*, Rs 1,00,000) the actual amounts of saving in the form of life insurance premia, provident funds (including public provident fund), unit-linked insurance plan, Cumulative-Time Deposits of 10 and 15 years, etc, and income derived from specified financial assets are likely to exceed the amounts — Rs 20,000 and Rs 3,000 respectively — assumed in the example. But since these are the ceilings which are relevant for tax rebate, the maximum amounts eligible for concessional tax treatment have been assumed in the above example. (An increase in the amount of saving would change the numbers in the above calculation without affecting the argument.)

Computations show that: (a) in spite of the concessional treatment of saving (and some liberalisation in the tax rebate provisions during the period covered) the effective tax rates in real terms are higher in 1973-74 than in 1968-69 in all the cases, and (b) the extent of reduction in effective rate varies for the different income levels. The reduction in the effective rates of tax in 1973-74, at current rates of tax and assuming that savings are allowed as deduction, are shown in Table 7; the rates of tax, when no deduction is allowed for the saving, are also shown in the Table.

It will be noticed that, except where the ceiling on deductible savings operates (the last case in the above illustration), the reduction in the effective real tax rate is higher — both in absolute terms (measured as reduction in percentage points) and in relative terms (measured in terms of percentages) — under alternative II than under alternative I. One might conclude, therefore, that the existing provision for tax rebate on saving reduces to some extent the effective tax burden; but here, again, the effect is somewhat more favourable for the relatively higher incomes as would generally happen when, under a progressive rate structure, savings are allowed as a deduction in a uniform manner at different levels of income.

Income-Tax Revenue Statistics

The growth rates in the incomes of tax-payers in the different groups are not known for 1969-70 to 1973-74. Apart from the various shortcomings of the income-tax revenue statistics, the latest available information from these statistics relates to the Assessment Year (AY) 1969-70. An examination of income tax revenue statistics for the triennium 1967-70 show erratic trends. For instance, while the rate of increase in individual incomes assessed to tax was 0.2 per cent in the AY 1967-68, it shot up to 26.9 per cent in AY 1968-69, but sharply declined to 4.8 per cent in AY 1969-70. It is significant, however, that the rate of increase in salary income has been lower than the rate of increase in income from business and professions during these years for individual assessees. Since there is known to be large-scale evasion of non-salary incomes, the rate of growth in the true incomes of non-salaried assessees is bound to be quite high. In addition, the scope for avoidance of income — through splitting (e g, through the device of the Hindu Undivided Family or HUF) and inflated 'business' expenses, etc — the extent of neutralisation available to non-salary incomes would be undoubtedly great — particularly at the higher income levels. Therefore, although it cannot be quantified, the decline in the real disposable income of the lower income groups is likely to be quite high.

Measures to Reduce Impact of Inflation

If the impact of inflation on low income groups is to be reduced through tax policy, some measures to reduce the tax burden would be required. Several alternatives are possible. One way is adjustment in the income-tax bracket to the extent of the rise in prices (i e, indexing of income-tax brackets). Such indexing, as was mentioned earlier, restores the real value of post-tax incomes to their pre-inflation levels. This might involve a substantial loss in terms of revenue, however, and would provide sizeable relief to high income groups. An alternative, which involves smaller loss in revenue and is relatively more beneficial to low-income groups, is the raising of the exemption limit. Since raising in the exemption limit reduces the tax liability by a fixed amount, the extent of reduction in tax liability measured as percentage of tax payable now (i e, under the present exemption limit) would decline with the increase in the marginal rate of tax. Moreover, the increase in the exemption limit need not be uniform. The enhanced exemption limit can be graded so that, after a particular level of income, there is no enhancement in the existing exemption limit.

Reduction in tax rates is yet another alternative. The impact of this measure on effective tax rates would depend on the extent of reduction in rates at the different levels of income. If the reduction in the marginal rates of tax is greater at the lower levels of income, there will be relatively more relief to low income groups. On the other hand, if the extent of reduction is higher in the higher marginal rate brackets — as was done with effect from the financial year 1974-75 — the extent of relief will be more for the higher income groups!

Yet another alternative is modification of the existing incentives given for savings. At present — for the purpose of tax rebate — qualifying amounts of eligible savings (or income) are allowed as *straight deduction*, and hence the amount of tax tax rebate for a given amount of income saved is higher, the higher is the income, and *vice versa*. If the amount allowed as deduction were to be fixed as a graded proportion of the qualifying amount — declining with the increase in the size of before-tax income —, then there would be an increase in the quantum of tax saving at lower levels.

FROM THE CHAIR

Nirlon Synthetic Fibres and Chemicals Limited

Registered Office :

Nirlon House, 254-B, Dr Annie Besant Road, Worli, Bombay 400 025

Speech of the Chairman, Shri S Vaidyanatha Aiyar

THE following is the Speech delivered by Shri S Vaidyanatha Aiyar, Chairman, Nirlon Synthetic Fibres and Chemicals Limited, at the Sixteenth Annual General Meeting of the Company held on September 30, 1974:

GENTLEMEN,

I have great pleasure in welcoming you all to this 16th Annual General Meeting of the Company. The Report of the Directors and the audited Statement of Accounts have been made available to you in advance, and with your permission, I propose to take them as read.

The spiral of inflation has shown its impact all over the world and our country has not been an exception. It is a dreadful reality which everybody in the country has to face. The steep upward trend of the cost of living during the past six months clearly shows the seriousness of all the measures taken for controlling the inflation. What is being felt by the individuals in the day to day life is also experienced by the Management while administering the industry. Let us hope that the Government will hit upon some more definite production oriented measures for relieving the present situation of unabated inflation.

The supply position of Caprolactum as indicated by me in the last year continued to be alarming this year also. The Caprolactum price in the World market during the year under review has increased from $ 470 per m tonne to over $ 2,200 per m tonne. During the last few months, although the price of Caprolactum has come down slightly, but due to acute shortage of availability of foreign exchange, the STC has not been in a position to import Caprolactum to the fullest requirements. Gujarat State Fertilizers Co. Ltd have started their commercial production recently. We welcome them and wish them every success in maximum operation of the Plant. We hope Caprolactum price of GSFC which is today pegged at Rs 41/- per kg will be suitably rationalised to a reasonable level.

Taking into account the foreign exchange available with the STC and the expected availability from the GSFC, it is estimated that we will still not be able to operate our Plant to the full capacity during the rest of the financial year also.

As a result of the shortage of Caprolactum, your Nylon Tyre Cord Plant had to be closed since February 1974 and could resume operation only during this month, i e, after a lapse of over six months.

The production of Nylon textile yarn declined by about 38% as compared to the production of last year. There was a decrease in the production of tyre cord by about 33% during the year under review, as compared to last year. Due to shortage of Caprolactum as envisaged, we are afraid we may not be able to maintain our production even at the level of last year, which was much below our licensed capacity.

I am happy to report to you that during the year under review we achieved the production of Polyester filament yarn to the full expanded capacity permitted by Government. During the current year, however, there has been difficulty in obtaining raw material even for Polyester yarn, and the production will be comparatively lower during the current year.

Your Company along with other Nylon Textile Yarn manufacturers have signed a fresh Agreement with the various Actual Users' Association of nylon yarn. The special feature of this Agreement is that your Company can sell 25% of the production at a somewhat better price than the balance portion, which is at an agreed price. The terms and conditions of this Agreement were well received by the Government. As a result of abnormal increase in the price of Caprolactum the price on Nylon yarn has to be stepped up in accordance with the Agreement with the consuming industry. These factors compensated the turnover which would have been substantially low otherwise, due to the stiff fall in production.

The Polycondensation plant and machinery have been installed during the current year and is likely to be commissioned shortly. As a result of this project, your Company will be manufacturing Polyester chips which hitherto had to be imported for manufacturing Polyester yarn. The main raw material, i e, DMT and Ethylene Glycol are expected to be made available indigenously, but not in adequate quantities as required by the Industry. As a result of commissioning the Plant your Company will be saving foreign exchange worth about Rs 70 lakhs per annum.

The Company's application for importing capital goods necessary for expanding the textile yarn capacity to 4,200 tonnes, is still pending decision with the Government since no policy for permitting expansion of the existing Plant has so far been decided by them.

Your Company proposes to set up a Conveyor Belting Plant and has received a Letter of Intent for manufacturing the same. The Company is taking active steps to implement the said project at the earliest.

The Company's plans for Research and Development activities were examined by the Central Government authorities and these activities have now been recognised as such by the Central Government.

Your Company continued its efforts of earning the foreign exchange by way of export. The total export made by your Company during the year under review was higher by 100% as compared to last year, even though your Company has no obligation to export. Your Company has now been recognised by Government as a Registered Export House.

The Bonus Share proposal approved by the Shareholders at the Extra Ordinary General Meeting is being pursued vigorously with the Government.

The Company's relations with the Labour continued to be cordial. Your Company's policy to finance various activities towards cultural, social and intensive medical assistance are being continued.

Before I conclude, I would like to thank my colleagues on the Board for their co-operation, and all the Officers, Staff and Workers of the Company for the hard and sincere work they have put in for the successful operation of our Plant.

With these observations, I now move that the Report of the Board of Directors and the Annual Accounts for the year 1973-74, be adopted.

Note : This does not purport to be the proceedings of the Annual General Meeting.

Ramon and Demm Limited

Speech of the Chairman, Shri H K Shah

THE following is the text of the Speech by Shri H K Shah, Chairman, Ramon and Demm Ltd, at the 10th Annual General Meeting of the Company held at the Indian Merchants Chamber Conference Hall, Bombay, on Friday, 27th September, 1974.

LADIES AND GENTLEMEN:

I have great pleasure in welcoming you to the 10th Annual General Meeting of your Company.

The 10th Annual Report and the audited Statement of Accounts for the year ended 31st March, 1974 have been with you for some time and with your permission I propose to take them as read.

Let me begin on a cheerful note. I am happy to inform you that your Company has received the sanction from the Controller of Capital Issues for the Issue of Bonus Shares in the ratio of 4 Bonus Equity Shares for every 5 Equity Shares held.

However, we are meeting at a time when India is passing through a difficult economic situation. Both external and internal factors have contributed to our sad plight. The oil crisis has pushed up the cost of transportation, fertilisers and power. The unprecedented inflation has reduced the purchasing power of the rupee from 100 paise in 1949 to 29 paise in 1974. Hence, prices of consumer and industrial goods have touched a new high. This in turn has resulted in the clamour for increased wages, resulting in further pushing up of costs of all commodities and thereby their prices. The railway strike in May 1974 and its aftermath is an example of this process of prices chasing wages and *vice versa*.

Added to this gloomy picture is the fall in agricultural production. In 1973-74 the fall was to the tune of 10 per cent. The forecast for the next year too is not a cheerful one. Side by side, industrial growth has been declining and in 1973-74 there has been practically no growth at all.

Inflation which has resulted from the rise in money supply on the one hand and shortage of production on the other, has eaten into the vitals of India's economy. Inflation is the enemy of development. Its adverse effects have spread to all sections of society. So far one cannot see any silver lining on the horizon, and it is difficult to visualise a breakthrough.

Naturally the people look to the Government to take the lead in bringing them out of this morass. Recently a few monetary measures have been taken with a view to bringing some stability in prices.

Here I may make a mention of the recent credit squeeze imposed by the Reserve Bank of India. Apparently it is aimed at reducing the money supply and thereby curbing inflation. This measure will, no doubt, reduce the money supply but at the same time it will have an adverse effect on productive activity.

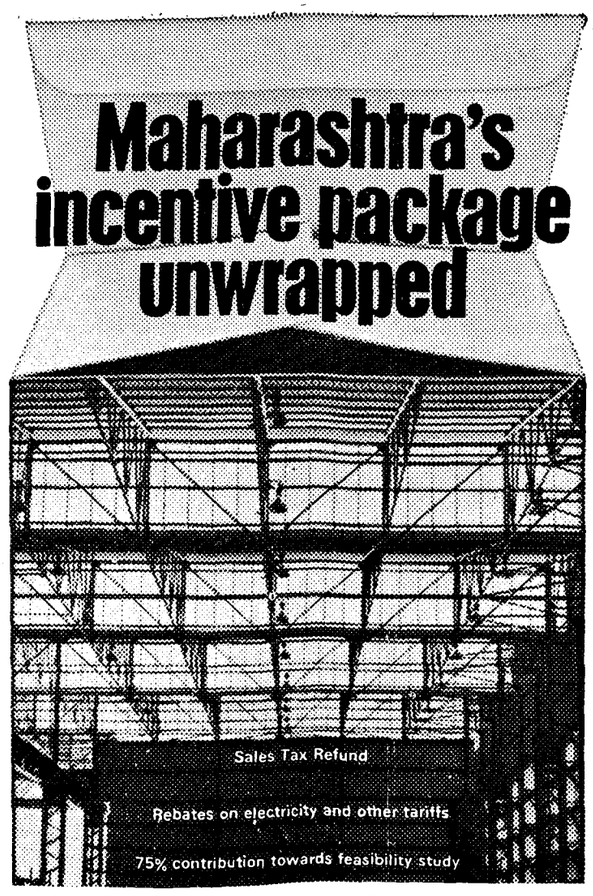
On account of the credit squeeze your Company has to face a reduction in the credit facility as well as the discounting limits with the bank. Naturally, this has affected your Company and the continuing tight money conditions have also created problems not only for your Company but also for the industry as a whole. Coupled with this, the upward trend in prices of raw materials, consumable stores and other manufacturing expenses continues. There is no indication that the trend will be reversed. The cost of financing has also gone up due to the upward revision of the basic bank rate. Incidentally, this hike in bank rate is likely to push up the cost of all materials, which in turn, would result in high prices of articles manufactured.

Shri H K Shah

The sure remedy, to my mind, for this deep-seated economic malaise is increased production — both agricultural and industrial. The steps taken or contemplated to be taken by the Government should primarily be directed to pave the way for more and more production. It should be ensured that any fiscal measure to be taken does not directly or indirectly affect productive activity in any way.

In its own modest way your Company is pursuing the policy of increased production. In 1973-74, in spite of several adverse circumstances like power cuts, shortage of raw materials, etc, the production increased from 754 tonnes to 772 tonnes. This has resulted in increased sales and the turnover was Rs 3.09 crores as compared with Rs 2.79 crores last year.

However, though the turnover has been better this year there is a marginal decline in profits. This is attributable to increased wages and increase in the cost of raw material.



This year the performance is still better. During the first five months of the current year, your Company has increased the production to Rs 1.84 crores and sales to Rs 1.88 crores. The figures for the corresponding period for the previous year were Rs 1.22 crores and Rs 90 lakhs respectively. The total sales for the current year may well amount to Rs 4.5 crores and the production rise to about 1,100 tonnes.

Your Company is vigorously pursuing the implementation of the expansion project. The Company's application for the import of machinery has been cleared by the Government of India. The Foreign Exchange for import of plant and machinery for the project will be made available to the Company as soon as the agreement between the Governments of India and West Germany over the West German Project Aid (KEW loan) is signed.

Your Company has already negotiated with the foreign suppliers for the supply of plant and machinery for the expansion project and, wherever necessary, advances towards the purchase price for the machinery have also been remitted, so as to obtain the benefit of firm prices and delivery dates. Some of the indigenous machineries have already been received and the remaining are expected to be delivered within a few months. Construction of buildings, to accommodate the additional plant and machinery for the project, has reached the final stage and is expected to be over by the end of this year.

The satisfactory results for the year have been due to the contribution made by all staff and employees as a team. To them I wish to express on behalf of my colleagues on the Board and myself our appreciation for their services and hard work during the past year.

Note : This does not purport to be a record of the proceedings of the meeting.

The Package Scheme of Graded Incentives makes all areas equally attractive.

"Grading"—an added advantage

Maharashtra's Package Scheme of Graded Incentives divides the State into 4 zones —the developed areas and the developing areas. All developing areas are graded according to existing circumstances and higher scales of benefits apply in areas which are relatively less favourably placed. For instance the Sales Tax Refund is offered for 6 years in certain areas but for 10 years in other areas.

Similar gradations apply to incentives like relief from incidence of certain rates (electricity tariff, octroi, water royalties, and non-agricultural assessment) and preferential treatment under the Government purchase programme.

And assistance—SICOM style

This scheme is implemented by SICOM —the people who work hard with expertise and guts. What's more, you can take advantage of SICOM's flexible financial assistance and plant location, project investigation and project implementation services. All given to you in SICOM style.

Avail of the Maharashtra Government's Package Scheme of Graded Incentives. Now!

In India's Life and Part of It

WHATEVER has happened to the much-publicised drive against smuggling? The arrest of the two hundred or so top operators under MISA was supposed to be immediately followed by a second round of action to smash the smugglers' organisational networks and sequester their illegal wealth. It is being guardedly admitted now that this operation has been held up, allegedly because of various legal, organisational and administrative problems. There are reports of lack of co-ordination and even co-operation among customs, enforcement and income-tax authorities. It has also been suddenly discovered that a number of top officials closely concerned with the anti-smuggling drive have chosen this particular moment to make visits abroad and that the crucial post of the Director-General of Enforcement is actually vacant. All this does not add up to a picture of earnestness on the part of the government. In fact, with the moving of K R Ganesh from Finance to Petroleum, the decks may said to have been cleared for a quiet de-escalation of the anti-smuggling operation which has yielded rich propaganda dividends for the government with hardly any bones broken.

Much has been said about the smugglers' links with politicians in power; it is also well known that the smugglers have their godfathers at all levels of the very wings of the bureaucracy which are charged with putting down their activities. These by themselves are enough reasons why no drive against smuggling will percolate below the surface. In the present instance, one may be sure that few of those now detained under MISA will be brought to trial because that would present the government with a choice between bringing forward evidence which would inevitably implicate many powerful people in the political and administrative set-up and deliberately withholding the evidence and allowing the smugglers now in detention to be acquitted by the courts. In the circumstances, MISA is convenient both to the government and the smugglers — especially since the latter's creature comforts are apparently being adequately looked after.

However, it is not only the influence that the smugglers undoubtedly enjoy among the country's top politicians and bureaucrats which gives smuggling its indestructibility and its intimate place in the country's life. It has been noted how, in recent years, gold has been displaced by a wide range of luxury consumption goods and raw materials for the manufacture of such goods as accounting for the bulk of smuggling into the country. Partly this may be attributable to the rise in the international price of gold which has made it unprofitable to smuggle it into the country. But no less an important reason is that the smugglers' clientele has changed as also the tastes of this clientele.

Not all the clients of the smugglers are black-marketeers and the like; nor is all the money spent on smuggled goods black money. A large proportion of the former are honourable men; in fact, society values their services so highly that it rewards them with very large incomes. Similarly, much of the money spent on smuggled goods — give or take some expense account fiddles — comes out of the legitimate earnings of those who are allowed these earnings both by way of recognition of the worth of their services to society and as incentives to them to perform even better. Luxury consumption is, therefore, implicit in the society's ideas of merit and of rewarding that merit. That some of the goods required to satisfy this demand for luxury consumption have to be smuggled into the country is incidental and is attributable to the country's lack of development. Consider, similarly, the uses to which the gains from smuggling are put. Like all sound, profit-making businesses, a part of the earnings are ploughed back; but much of the rest, from all accounts, goes into quite respectable, and even high priority, activities like the building of four- and five-star hotels and urban construction. The mainsprings of smuggling are, therefore, very much a part of the political and economic systems which the country has given itself.

Precisely because the drive against smuggling has almost spent itself, exaggerated claims are being advanced about the impact it has already had. The rising trend of prices, it is claimed, has been checked and some prices are in fact coming tumbling down. Against the widespread famine and starvation all over the country, this is nothing short of a cruel joke. In a few cases there may have taken place some slackening of demand and fall in prices; but this is hardly the same thing as a halting of the inflationary spiral. Taking the overall price level, it still remains true that the rise in prices so far this year has been even higher than it was over the same period last year. That apart, what are the types of commodities whose prices have

shown a tendency to ease? Some of them belong to the category of consumer durables or less essential consumption goods such as the more expensive varieties of cloth. With foodgrain prices having almost doubled in the course of a single year and the incomes of the majority of the population having remained stationary, it was inevitable that the demand for these types of goods would slacken and the rise in their prices would be checked after a point. The other type of goods the demand for which is showing signs of slackening are certain intermediate goods and capital goods which are feeling the impact of successive cuts in public sector investment. On the other hand, there are no indications at all of any easing of the prices of food articles which, after all, are what matter for most of the population. Thus in just the four-week period between August 8 and September 7, 1974, the wholesale price index for cereals rose by over 4 per cent, that for pulses by 9 per cent and that for all foodgrains by over 5 per cent. The decline in prices, of which so much is being made, is thus either of no concern to the large mass of the people or speaks of a further deepening of the economic recession.

The Famine

Productivity Norms for the Starving

A NUMBER of puritans are obsessed by the idea that fiscal outlays for augmenting the income of the rural poor must be devised so as to lead simultaneously to the creation of new capital assets. Two birds, according to this notion, must be killed with one stone: the process of adding to the earnings of the under-privileged must be accompanied by the active engagement of these people in asset-building operations. From here a kind of proselytising takes over towards different ends. The dogmatists have thus been saying that a large part of the current inflation is to be attributed to the fact that, while government funds and bank advances have been allowed to penetrate the countryside, their expenditure has not been controlled and the outlay in each case has not been accompanied by the actual creation of new productive capacity. Many among them, worried over the cost-effectiveness of fiscal outlays, are found insisting that even famine relief should have a content of development activity: do not open free kitchens, do not distribute doles, but let the poor come and work on test relief operations — such as digging a canal or building an embankment — and let them be paid strictly according to the quantum of work they put in.

Upto a point, certainly they are right. Certainly, political boondoggles and administrative corruption have siphoned off much of the funds intended for rural development. Even so, in this grim season, when landless labourers and their families are dying by the hundreds for lack of food, it is absurd to make a fetish of this argument. The application of the dogma has already led to a situation in a number of areas where those who were without food for a fortnight or more — and therefore on the verge of total collapse — have been denied succour by official agencies because they were incapable of contributing any worthwhile labour!

There are yet other inequities that are taking place. West Bengal's border with Bangladesh is being sealed with great efficiency, on the ground that destitute people are trying to cross over from the other side, where food is equally scarce. Those who want to come here in search of food belong mostly to the so-called scheduled castes. In 1971, they were the ones who, to escape the terror let loose by the Pakistani army, had dragged their bodies across the border: They had constituted more than nine-tenths of the 'refugees' in that year. As soon as the war ended, they were prodded back across the border; and the Prime Minister could announce to her electorate that the problem of refugees had been successfully tackled. They were compelled to return to East Bengal, where too they were generally unwelcome. As food falls short in Bangladesh, it is again these wretched ones who are squeezed. Foodlessness is a species of insecurity, and they try to move back to India — on account of certain assurances which (once upon a time) were given to them, or to their parents, by the leaders of the Indian National Congress. But past assurances cannot be permitted to jeopardise the living of the present leaders: the border is therefore sealed, none is to be allowed in.

In addition, within the national boundaries, railway platforms are being sealed. The poor in the countryside, who cannot get any food, suffer from the superstitious belief that once they get into a train and reach an urban centre, their chance of survival is enhanced. An "unhealthy" tendency develops, therefore, to crowd the urban pockets and to pollute the parks and the pavements there. The police and the railway authorities have been instructed therefore to pounce upon the dying who might attempt to slink into the trains. They have no business to come and disturb the well-laid plans of urban renewal.

Foreign Investment

Selective Bonanza

THE latest annual report of the International Finance Corporation (IFC) notes that though, in the year ending June 30, 1974, the international investment climate was marked by uncertainty because of floating exchange rates and the consequent volatile conditions in the foreign exchange markets, the pace of business and investment activity in both the industrial and the developing countries was strong. Preliminary data on international capital movements show that the total flow of resources to the developing countries in 1973, even excluding most of the Eurocurrency credits, was well over $ 24 billion. Of this about $ 11 billion was the form of direct foreign investment (including investments in petroleum, but excluding suppliers' credits). Direct foreign investment in spheres other than petroleum is likely to have been about $ 1.8-$ 2 billion. The partial information available suggests that the investment flows have been focused on certain countries such as Brazil, Indonesia, Korea, Malaysia, the Philippines and Tunisia. Foreign companies were also quite active in domestic investment in some of the major oil-producing countries.

Much of the foreign investment flowed into heavy industry, particularly petrochemicals, cement, iron and steel and fertilisers. The widespread shortages and soaring international prices of these intermediate goods appear to have stimulated a new investment cycle in these industries. This may also indicate that several developing countries are entering a more sophisticated and capital intensive phase of industrialisation. The heightened investment interest in the field of mineral exploration and development is another noteworthy feature. The worldwide search for secure sources of raw materials has prompted new investment in several countries including Brazil, Guatemala, Peru and the Philippines.

A number of developing countries like Indonesia and the Philippines took steps to establish facilities for local processing of raw materials in collaboration with foreign investors. Investors from some of the developed countries, particularly Japan, were eager to invest in countries like Indonesia and the Philippines to take advantage of their relatively low wages. Foreign investors also showed greater willingness to collaborate with local enterprises in the developing countries in export-oriented investments. Where the investment was primarily oriented to the domestic market, they were prepared to assume responsibility for marketing a part of the production abroad. Entrepreneurs from some of the developing countries, particularly India and Pakistan, were eager to set up joint ventures in other developing regions like Indonesia, Malaysia, East and Central Africa and the Middle East.

Many developing countries sought to increase national control over and participation in key sectors of the economy and to place greater emphasis on the local share in foreign-owned enterprises. This trend has been more evident recently in the field of development of natural resources. As in the past, there were several cases in 1973 of governments of developing countries decided to participate in or take over foreign-owned investments — but so after undertaking to pay fair compensation, so as not to impair the climate for foreign investment.

During the major part of 1973, developing country borrowers, especially those endowed with abundant natural resources, were much sought after in the Euromarkets. In all, 40 developing countries borrowed in excess of $ 9 billion equivalent in the form of publicised loans in 1973. On a gross basis, this was more than twice the 1972 level. The maturity period of the loans raised in 1973 was longer and the spread between deposit and lending rates narrower. If the unpublicised loans are also taken into account, total Euromarket borrowings by developing countries in 1973 are placed in the range of $ 11-13 billion. During the first quarter of 1974, publicised borrowings by the developing countries were still quite large at about $ 3 billion or almost around the same rate in the early part of 1973. However, the lending terms became gradually more stringent and the number of developing countries in the market declined. The liquidity squeeze was much more noticeable in the case of loans to private borrowers from the developing countries. These trends became more pronounced in the second quarter of 1974. In view of the worsened balance of payments position of a large number of developing countries, in particular on account of the rise in petroleum and food prices, their credit-worthiness in the Euromarkets has suffered.

Agricultural Finance

More and More, but to What Purpose?

THE performance of the Agricultural Refinance Corporation (ARC), whose Report for 1973-74 (July-June) has just been released, looks on the face of it commendable. The Corporation's disbursements increased by 42 per cent from Rs 65 crores in 1972-73 to Rs 92 crores. As many as 550 schemes, involving total financial assistance of Rs 251 crores and a commitment of Rs 220 crores by the ARC, were sanctioned during the year against 230 schemes with assistance of Rs 197 crores and a commitment of Rs 172 crores by the ARC in 1973. The ARC has tried to bring about some diversification — purpose-wise, agency-wise and region-wise — in its own lending operations as well as in those of the institutions eligible for refinance from it.

Minor irrigation has been the mainstay of ARC's lending operations, accounting for over 89 per cent of its total lending in 1972-73 and over 87 per cent in 1973-74. But in recent years the Corporation has increased its commitments for schemes of farm mechanisation, land development, plantations, horticulture, storage, construction of market yards, fisheries, dairy development and agricultural aviation. Aggregate financial assistance for purposes other than minor irrigation rose from Rs 65.18 crores at end-June 1969 to Rs 205.61 crores at end-June 1974.

Agency-wise, though the land development banks (LDBs) continue to be the main agency to which the ARC provides refinance, commercial banks made considerable use of ARC refinance in 1973-74. ARC's disbursements to commercial banks on this account increased from Rs 4.5 crores in 1972-73 to Rs 17.4 crores in 1973-74 or from 4.3 per cent of its total disbursements to 17.7 per cent. In sanctions, the rise was even more impressive — from Rs 25 crores for 104 schemes in 1972-73 to Rs 85 crores for 407 schemes in 1973-74.

Region-wise, the share of the Eastern region in total refinance disbursed by the ARC rose to Rs 6.48 crores in 1973-74 from Rs 1.69 crores in 1972-73. Likewise, the Central region, comprising UP and MP, also got more. However, the shortfall in ARC's disbursements in 1973-74, compared to the projection of Rs 120 crores, was due to the Eastern and North-Eastern regions and J and K and Himachal Pradesh. In the Eastern and North-Eastern regions, "where the environment for development is particularly difficult", Bihar alone shows some improvement.

The ARC's Annual Report admits that "there are no signs of a breakthrough in Jammu and Kashmir, Himachal Pradesh, Assam, Meghalaya, Manipur, Mizoram, Nagaland and Tripura, despite persistent efforts by the Corporation". However, one of the reasons advanced by the ARC for this does not bear scrutiny. ARC says: "Considerable spade-work will be needed to prepare the farmers in these areas to accept institutional finance for developmental purposes in place of subsidised but limited government funds made available so far without insistence on prior appraisal and ultimate repayment." In fact, neither "prior appraisal" nor "ultimate repayment" have been insisted upon in those parts of the country where institutional funds have been made available on the most generous scale. Discussing the large overdues in some of these states, the recent report of the Study Team on Overdues of Co-operative Credit Institutions has blamed "the absence of a favourable climate due to the attitude of the state government resulting in wilful defaults on a large scale". The encouragement of "wilful defaults on a large scale" by state governments has in no way come in the way of large disbursements by the ARC and other institutions in these regions.

Two years ago, in September 1972, the then chairman of the ARC had pointed to the rise in the overdues of primary societies from 37.7 per cent of their loans outstanding in 1969-70 to 41.1 per cent in 1970-71 and in that of Central co-operative banks from 29

per cent to 33.7 per cent. The overdues of land development banks had gone up from 13.5 per cent of loans due for repayment in 1970 to 23 per cent in 1971. The ARC's chairman had then warned that "it is not too late for remedial action to be taken so as to bring the co-operatives back onto a sound footing and enabled them to play the part expected of them in the nation's drive for increased agricultural production". However, despite this warning two years ago, the latest Annual Report of the ARC records that the overdues of LDBs "increased alarmingly from Rs 12.89 crores in 1969-70 to Rs 76.33 crores (provisional) in 1972-73; as percentage of demand, i e, the amount due for repayment, overdues rose from 21 per cent in 1969-70 to 42 per cent in 1972-73." The overdue amound is thus almost equal to the ARC's total disbursements in 1973-74. What the people of the Eastern and North-Eastern regions, where the ARC's disbursements have failed to pick up, appear to lack is the knack of securing large volumes of institutional finance and accumulating large overdues!

With overdues amounting to over 40 per cent of institutional credit due for repayment, certain important questions arise about the source of these funds and their inflationary potential. A large chunk of co-operative and commercial bank finance is, directly or indirectly, related to created money. For instance, out of Rs 309.74 crores of refinance granted by the ARC upto June 1974, Rs 163.50 crores have come from the Government of India. One-half of the latter amount has been based on funds provided by the IDA and the balance has come from the RBI or has been raised through bonds and debentures which are subscribed to by banks and other financial institutions. Similarly, the Reserve Bank pumps in large amounts of funds into the co-operative sector. The total flow of institutional funds to the farm sector — from co-operatives, commercial banks and government — for short-term and long-term purposes was about Rs 950 crores in 1969-70 and no less than Rs 1,400 crores in 1973-74. Should such funds be pumped into the system without consideration of their inflationary impact and their distribution?

The ARC, according to the draft Fifth Plan document, was expected to provide refinance facilities of about Rs 600 crores by the end of June 1979. Against this, the ARC itself has a far more ambitious programme which envisages "an aggregate disbursement of about Rs 900 crores for the five-year period" (July 1973-June 1978). However, there is no particular merit in aiming at higher disbursements without regard to the source of the funds and their distribution according to an overall plan programme and without relating the lending programmes to real inputs. The ARC's report itself illustrates this when it points out that "Dairy Schemes have ... made little progress because farmers have found it difficult to obtain quality milch cattle. The high cost of feed has made it uneconomical to maintain poultry. Fishery schemes, too, have not picked up in the absence of adequate extension work, etc."

The ARC also appears to be oblivious of the problem of distribution of the large flow of institutional finance among different groups of farmers. This question is important not only from the standpoint of equity and the distribution of the wherewithal for agricultural growth; it must now also be asked whether the flow of larger and larger amounts of institutional finance to the bigger farmers at all contributes to higher agricultural production and whether its primary contribution is not to enhance the ability of these farmers to withhold their output from the market. The one-dimensional concern only with the amounts of institutional credit has made the management of the supplies of foodgrains as well as other agricultural commodities more difficult.

Japan

Oil Dollar Haul

THE Japanese government has secured a $ 1 billion loan from Saudi Arabia. The loan is repayable after five years and carries interest at 10.5 per cent per annum.

The US has raised dollar loans from Arab oil-producing nations by selling Treasury Bills and Britain, France and Italy by issuing government guaranteed bonds. But the Japanese loan is the first negotiated on a government-to-government basis and is much larger in amount.

Negotiations were conducted with the utmost secrecy and were completed in the record time of two months. Secrecy was essential in view of the keen competition for loans from the oil-producing countries from Britain and Italy, whose balance of payments positions are critical. The need for speed arose from Japan's own deteriorating foreign exchange position. Because of the steep rise in the cost of oil imports, Japan's gold and foreign exchange reserves have dropped from $ 14.795 billion in October 1973 to $ 13.204 billion in July 1974.

For a while, Japan was able to control the situation by borrowing in the Euro-dollar market. However, following the bankruptcy of the West German bank Bankhaus Herstatt in July 1974, the Euro-dollar market tightened up, the interest rate rose to 13 per cent and Euro-dollar borrowings became difficult and costly. The Japanese Yen, which in July 1973 was holding firm at 265.70 Yen per dollar, weakened to 302.70 Yen per dollar by the end of August 1974. The seriousness of the situation can be judged from the Japanese government's readiness to pay 10.5 per cent interest on the Saudi Arabian loan. Though the 10.5 per cent may look cheap compared to the current Euro-dollar rate of 13 per cent, there are signs that international money rates will fall in the future. In that case a fixed interest rate of 10.5 per cent over five years will turn out to be expensive indeed.

The billion oil dollar loan has a deeper significance for Japan than the short-term advantage of relieving the dollar shortage in the Tokyo foreign exchange market and easing the pressure on balance of payments. It marks Japan's entry into the race for oil dollars. More important, it signifies a strengthening of Japan's hitherto tenuous relations with the Arab world. The US and European countries like Britain and France have had historical and political ties with the Arab nations. Japan's relations with the Arab nations, on the other hand, have been confined mainly to the purchase of Arab oil. This has now to change under the impact of the oil crisis and the billion dollar loan is the first major sign of change.

West Bengal

New Forms of Fiddling

A Correspondent writes:

THE economic situation in West Bengal has never been so bad. Despite the many development plans and crash programmes launched by the state government, industry and agriculture are in a shambles. Unemployment, already very high, has risen sharply, particularly among the small peasants and landless workers in the rural areas. Added to this are the floods in northern Bengal and the drought in the southern districts which have severely damaged standing crops.

Even these natural calamities cannot, however, explain the current famine in West Bengal. In 1973-74, West Bengal produced about 65 lakh tonnes of foodgrains, about 3 lakh tonnes less than in 1972-73, against a total requirement of about 85 lakh tonnes a year. With drawals from the Central pool being approximately 10.60 lakh tonnes till end-September, the net food deficit in the state was relatively small. This could not have brought on the present crisis, had the state government shown some seriousness about achieving the procurement target of 5 lakh tonnes.

Official estimates are that more than 10 lakh tonnes of grains are being hoarded, mostly by resourceful large farmers and traders. Occasional talk of busting the rings of hoarders cannot be expected to unsettle these operators. One obvious indication of the influence of this class within the state government is the failure of the Youth Congress-sponsored anti-hoarding drive to take off.

The complete inactivity of the Left political parties, particularly of the CP(M), in the face of this grave economic situation, has puzzled many. The CPI, the political ally of the ruling Congress, has conceded the failure of its recent movement to unearth hoarded grains. The CP(M) has not much more to show. In a recent statement, Promode Dasgupta, the state secretary of the CP(M), has talked of a new programme which includes mobilisation, rallies, conventions, gherao and dehoarding. The party claims to have abandoned older forms of struggle like the bandh. One ingenuous justification advanced for the CP(M)'s relative inactivity is that if it launches an all-out anti-Congress agitation when the Congress is bedevilled by faction fights, the fighting factions may be persuaded to bury the hatchet and unite in a common anti-Marxist front.

All this caution has not, however, stopped the CP(M)'s descent downhill. The Youth Congress, aided by the police, has had considerable success in dislodging the CP(M) from one trade union after another. Recent developments in an engineering factory in South Calcutta illustrate the *modus operandi* of the Youth Congress. The CP(M)-led union in this factory was first broken by strong-arm methods and workers were forced to support the newly-formed INTUC union which was then given recognition by the management as the representative body of workers. Such tactics have been repeated throughout Calcutta, Durgapur and elsewhere. In the rural areas also the CP(M) has been given a bloody nose by the Congress. But the leadership of the party remains apparently unconcerned — as the latest programme announced by the party demonstrates.

Stock Markets

No Cause for Insomnia

THE operative principle on Dalal Street is still "sell now, buy later". The volume of sale, which had never assumed severe proportions outside the speculators' ring, has declined, however. So too has the order of price fall, as was to be expected (see Table). If what in market parlance is described as 'stability at lower levels' has proved elusive, the reason is that institutions like the LIC and the UTI are no longer operating on the dictum of a past era that bull speculation is good and bear speculation bad. In other words, they do not feel compelled to 'support' the market.

The UTI is facing a resource shortage, following the outgo on account of dividend distribution for 1973-74 and the decline in investment in units. There are reports that it has entered into a swap deal in certain shares with LIC in order to bolster its cash resources. Both UTI and LIC are investing in the cali money market where their money fatches 15 per cent a year. LIC, in addition, has become a large investor in the bonds of various development agencies and municipalities.

The speculators can, therefore, no longer take it for granted that there will be a continuing supply of funds from the institutions. And that is why they are taking time to find their feet. The markets are, however, acquiring a feel of the situation. Share prices are fluctuating at lower levels, reflecting replacement buying and switches. Now that there is a restriction on bonus issues in excess of a one-for-one ratio, fresh buying in search of bonus issues will be limited.

The MISA jitters have not affected the share markets. There was a time when funds from questionable sources had poured into speculation, especially in new issues, but many burnt their fingers following strict action by the Bombay Stock Exchange authorities. More significant, from the point of view of Dalal Street, is the fact that the government is allowing price increases — to paper, cement, and commercial vehicles, to mention only a few industries. Clearly, as Dalal Street sees it, the restoration of initiative to the private sector can hardly be deferred for long. The "long run prospects are very good", to quote Birla-adviser Mandelia.

True, there is the possibility of an industrial recession. But Dalal Street does not seriously think that the problem will be any more intractable than the mild setback of 1969. Whatever be the fate of investment in the public sector, and its impact on a section of the private sector, the current shortages will continue to ensure booming revenues to the existing companies.

It is good to talk of recession, nevertheless. For one thing, pressure has to be put to secure a relaxation of credit policy and a lowering of the Bank rate. The feigned alarm over decline in prices is similarly motivated. The textile mills, for instance, have raised the bogey of a recession in textiles to beat down the grower. The cotton crop estimate for the 1974-75 season, now two months old, has been revised upwards. In sugar, too, the mills are widely advertising their fears of a drastic fall in prices at the commencement of the new season.

In fact, not many are losing sleep because of the threat of recession. If prices really come under pressure, output can always be restricted, as spinners of synthetic yarn are threatening to do. Power breakdowns, raw material shortages and transport bottlenecks provide ready-made alibis.

328 lakhs paid!

Last year, ECGC paid out Rs. 328 lakhs to settle a record 1500 claims from exporters who had insured with it. This prompt settlement of all claims has instilled a growing confidence among exporters, who now know that ECGC is there to help them out, if things should go wrong.

GREAT EASTERN SHIPPING is fast expanding its fleet. With the acquisition of two Cunard Line ships and a product carrier, the company crossed the half a million deadweight ton mark in May last. It has executed fixed-price contracts for another seven ships, — including two Swedish OBO carriers. Of the four ships under construction at Hindustan Shipyard three, together with a Scott Lithgow vessel, are expected to be delivered during 1975-76; the fourth ship from Hindustan Shipyard and two OBO carriers are expected to be delivered during 1976-77. This will complete the Rs 89-crore expansion approved by government. Meanwhile, the company has submitted the second phase, envisaging a further total investment of Rs 295 crores, which will add a further 8,63,000 DWT of capacity. The government is evidently about to relax the debt-equity ratio from 6:1 to 10:1. The borrowing limit of the board has been raised, from Rs 200 crores to Rs 400 crores. This substantial expansion is, moreover, intended to be financed largely out of foreign exchange loans, shipbuilders' credits, and rupee loans from the Shipping Development Fund Committee. The indebtedness envisaged under this plan, would necessitate the total equity — *viz*, paid-up capital plus reserves — to reach the Rs 40-crore mark. The present share capital and reserves aggregate Rs 21.40 crores.

During the year to March 1974, GES fared very well despite increase in costs. Repairs and maintenance charges for the fleet cost it Rs 1.71 crores more than in the previous year, and interest charges were about Rs 73 lakhs higher. The contraction in margins reflected the fact that there was no sale of old ships during 1973-74 — and hence no addition to the profit on account of this *non-recurring* item. During 1972-73, on the other hand, there had been a gain of Rs 1.79 crores on the sale of old ships which had inflated that year's profit. For taxation purposes, the entire profit of 1973-74 has been absorbed by the development rebate of Rs 5.06 crores accruing on the new additions to the fleet: No provision for income-tax has been made, therefore. As there is no taxable income, moreover, there will be a carry-forward of a claim for 'section 80 J relief', and so the company will in fact be carrying forward development rebate of about Rs 140 lakhs for set-off against future assessable income. The company will be able to claim for tax purposes development rebate on the four ships which are expected to be delivered upto May 31 next, and accelerated initial depreciation for the remaining ships which will be delivered thereafter.

The current year has begun very well for the company and the directors expect a still higher profit, since most of the tonnage will be employed on contract for the rest of the

year. They add, however, that the freight market may not maintain high levels next year. The company has contracted forward a very large proportion of the tonnage, and it should be better placed to weather any storm that may hit the shipping industry. The tanker fleet and the OBO carrier have been booked upto 1977, and a large part of the dry cargo is booked well into 1975. Also, the Japanese steel mills, with whom GES has a long-term relationship, have been assisting the company during the period of unforeseen difficulties following the oil crisis. The directors feel that, by the time the company's ships become free from contracts, the worst will be over. They therefore intend to undertake the large expansion programme with a 'high sense of optimism'.

INDIAN ORGANIC CHEMICALS' installed capacity of 6,100 tonnes of polyester staple fibre, based on the warranty contained in the agreement with the technical collaborators, who also supplied the process machinery and equipment, has not yet been established. Even during the second year of production, the Manali plant had problems with equipment and process. The collaborators agreed to supply some additional imported equipment free of charge to effect certain improvements in the working of the plant. An import licence was issued by government in December last, and the shipments were not completed before the end of 1973-74. Meanwhile, some improvement in the quality of the product was achieved by the company's own technical team during the latter half of last year and stocks of fibre were largely sold out, especially owing to the scarcity caused by the shortage of DMT. The company is due to allot 19,275 new equity shares of Rs 100 each fully paid up to Chemtex, for rendering of certain technical services and partly towards the supply of machinery and equipment required for the polyester fibre project as per the supplemental agreement of October 1970. These shares have not been allotted, pending settlement of contractual obligation.

Equipment and process problems apart, the polyester plant also experienced a serious shortage of DMT as supply by IPCL was curtailed. Since imports of DMT were also difficult, in the world-wide scarcity of petroleum products, the plant had to be shut down for about 17 weeks. In addition, power supply in Tamil Nadu was also restricted in the summer. Total production was thus 2,423 tonnes, against 1,124 tonnes in the previous year when the plant had operated for only part of the year. At the Khopoli unit, production of all chemicals, except plasticisers, was quite satisfactory. The company's financial results are impressive, with sharp rises in turnover and profit-margins. The ratios of both wages and inventories to sales were substantially reduced. Borrowings were also considerably lower. The company paid a 9 per cent dividend on equity, which was skipped last year. The directors would have recommended a higher payment — but for the legislation restricting dividends. The expansion of the benzyl plant, commissioned last year, is expected to be completed in the current year. The company has received an industrial licence to put up a distillery in Maharashtra, with a capacity of 80 lakh litres of alcohol.

KAYCEE INDUSTRIES is seeking to increase its licensed capacity of counters. The company's present licensed capacity is 7,600 numbers (excluding textile counters); but the installed capacity is 18,000 numbers. Actual production during 1973-74 was 11,230 numbers (including 4,042 numbers textile counters). Production of rotary switches and micro switches was 95,790 numbers and 1,15,216 numbers, respectively, against their installed capacities of 2,50,000 numbers each; and that of water meters 2,338 numbers against installed capacity of 3,600 numbers. Motor control switches have been introduced, and the range of micro switches is being expanded. The company's margins contracted last year, despite over 22 per cent rise in net sales. The ratio of inventories to sales increased considerably over the year; and the ratio of wages to sales showed a decrease. Dividend, lowered by a point to 7.5 per cent, was covered three times against two-and-a-half times previously. The Pakistan unit has been under the control and management of Pakistan Government since 1965.

SURAT ELECTRICTY is negotiating with the state government for extension of the sanction, which is at present terminable at any time upon the Gujarat Electricity Board giving one year's notice, for a further period of 10 years from 1978. Meanwhile, the company took up last year capital expenditure of Rs 43 lakhs and continued expansion of existing capacity and facilities. The existing 22 kV system at the company's 'B' receiving station is being converted to 66 kV. Civil works are in progress and the entire project, estimated to cost Rs 63 lakhs, is expected to be completed during the current year. The diesel plant has continued to supplement the supply from GEB. During 1973-74 SEC's energy sales looked up by a mere 2.19 per cent against an average growth of 10 per cent per annum achieved during the last 10 years. The decline, which was particularly steep during the second half of the year, is ascribed to frequent restrictions on power supply, the recession in the jari and diamond-cutting industries and the disturbed conditions in Surat during January and February 1974. Net sales and gross profit were also modestly better than in the last year. Although disposable profit was more than sufficient for a total distribution of 12.5 per cent on equity shares, the dividends limitation legislation has restricted the 'distributable profit' as defined in it. Hence, no additional dividend on equity shares, beyond the interim payment of 5 per cent, was recommended by the directors. R P Aiyer, chairman, points out that the legislation particularly affects the electricity supply industry adversely because the electric supply undertakings have been already functioning within the ambit of the rigorous financial control exercised by the Electricity (Supply) Act.

JAYANT VITAMINS, which came to the capital market last year with a public issue to raise part of the finance required for its project to manufacture Vitamin 'C' and other products, went into commercial production during August last. The product conforms to the standards of Indian pharmacopoeia and has been approved by all the consumers, but government is yet to fix the selling price of Vitamin 'C', which is classified as an essential bulk drug and falls within the purview of the Drugs (Price Control) Order. Meanwhile, the unabated escalation in cost of machinery, pipes, fittings, electricals, etc, has raised the project cost. It is estimated that there will be an overrun of more than Rs 60 lakhs in the total cost of the project when all sections of the plant, including hydrogen and sorbitol, are completed. This will necessitate raising additional finance by way of term loans, for which the company will soon approach the financial institutions. The central cash subsidy of Rs 15 lakhs, expected to be received shortly, because of the location of the plant in the 'backward' area of Ratlam, will also be utilised towards financing the cost of the overrun. The directors say that the company will also be entitled to a deduction equal to 20 per cent of the profits for 10 years from the start of the manufacturing operations under the Income-tax Act.

The Politics of Jogging

Romesh Thapar

QUIETLY, without fanfare, a judgment has been delivered in the Supreme Court which should help to strengthen the hands of those who are campaigning for strict curbs on the monies that a politician can spend on his or her election to a legislature or Parliament. In the unseating of Delhi Congress MP, A N Chawla, Justice Bhagwati has refocused attention, very lucidly, on some of the core problems of free and fair elections. What is lacking is the movement which could carry forward the assault on those who have corrupted the democratic process.

As always, it will be necessary to proceed beyond individual cases in order to understand how distortions will repeat themselves, unless the system of election and representation itself is brought under intelligent scrutiny: If money has falsified results, so has caste; if individualism makes for political factionalism, how are political programmes to be emphasised in a complex society? We are obviously too devoted to Anglo-Saxon practice and most uncertain about attempting innovations. Pressures will have to build to crack this, essentially imitative, mentality.

If politics is still taking a back seat, it is because we have as yet to realise how profound is the impact of this activity on the economic climate. This is unfortunate. With all the 'squeezes' that are on, the signs are that we are entering a kind of economic recession. Cars are lying by the hundreds, unsold. Cloth prices are being reduced to attract customers. If these manifestations of a recession multiply in the major areas of activity, then there will be panicky moves to revive productivity in sectors threatened with closure. And politics will continue to take a back seat.

Obviously, it is the Congress party which should take the initiative to spark off thinking on how to separate money from politics and how to deepen disciplined democratic participation at every level of national activity. The strength of feeling among the younger sections of the population is well illustrated by the support which Jayaprakash Narayan is able to muster despite a rather fuzzy programme. JP's honesty of purpose and his passion to find new answers to our problems can mobilise mass support.

The Bihar bandh, powerfully symbolic, has proved once again that the faction-ridden Congress party in the state is dangerously isolated and unable to operate. The sympathy bandhs over the rest of the country, though not on the Bihar scale, are also indicative of national anger building against lack of intelligent and honest governance. This mood is largely confined to urban India, but with famine and drought ever present one should not underestimate the spillover into the rural areas. Gujarat is a pointer.

Political leadership in India has always been at pains to prevent the build-up of national angers. Indira Gandhi is no exception. If JP is able to keep his movement under discipline even as it surfaces in other states, he will compel Delhi to talk in terms of fundamental changes in the system. This discipline will, however, become increasingly difficult as all manner of discredited politicians climb on to his band-wagon. Increasing reliance on the new leaders, being thrown up by the movement, could be the answer. But the task is formidable, for there are so many who would commend irresponsible acts in order to crush the protestors.

Meanwhile, the existing system is beginning to fester as it promotes one incompetent person after another into positions of power. The seniority principle, together with manipulative trade union activity which prevents lateral entry of fresh talents, is slowly reducing government to a business to be handled by a tiny handful of still competent persons who happen to have found their way up the ladder. But they are too few for the tasks that are demanding attraction. As with the politician so with the bureaucrat, the average and below average are striking it good holding jobs and privileges without any commitment to the nation.

All this comes into sharp focus when a visitor like the Shah of Iran descends on the scene. Considerable effort has to be expended to maintain a semblance of sophistication and efficiency. The dialogue between the two countries doesn't really make a dramatic thrust because the basic preparations are indifferent, off-the-cuff, without concretely worked-out perspectives. So poor is the understanding of the profound change possible in Indo-Iranian relations that chatter about the Shah's 'imperialist dreams' is made to sound credible.

Until the leading echelons of the Congress party at the Centre and in he states are educated about the framework within which policy is now being organised, the present confusion will continue. The tendency will be to turn to Delhi — to the most powerful in the Capital — to resolve problems and to push the ranks to some disciplined thinking. The Congress party, despite its amorphousness, was always able to show a broad programmatic framework. Now, the situation is quite different and needs urgent changing.

The shake-up in the Council of Ministers, due any day, might clarify Congress party intentions. It will have to be pretty thorough to achieve a result of this kind — although, personally, I don't think any major movement forward will take place unless there is action on restructuring the political and administrative system which keeps us marking time; jogging as it were.

Six great minds help make one great idea

Formica India's Design Panel

At Formica India we have a head for great ideas. Now 6 other great heads join with ours to bring you an imaginative range of laminate designs. Professor N.S.Bendre, Mrs.Kiran Gujral, Mr.Maqbool Hussain, Mr.Krishan Khanna, Mrs.Pilloo Pochkhanawala, Mr.Paritosh Sen. These 6 leading exponents of fine art and Formica India will now, together, ensure that every new laminate design is a distinctive design.

More Design Ideas
Formica Artwork Service for the lamination of exclusive, original designs—given by you. And a Formica Mural Service, to execute any design you like, into laminate sheets for murals.

New Concepts
This is not the first time so many new things have happened at Formica India. We have been leaders in the field of laminating technology for some time now. Leaders by providing original concepts in decor and new achievements in industry. Extending the use of laminates into newer areas has been one of our main concerns. We've explored several new possibilities. The most recent achievement has been to inter-laminate silk without damaging the texture or colour of the fabric. And we have also developed designs in many colours to beautify the traditional Gujarati "Bājot". This design is adaptable for a variety of vertical and horizontal applications.

We believe it takes a few great ideas and a lot of dedication to stay ahead. At Formica India we are fortunate enough to have both.

Formica India Limited

Calcutta Diary

A M

THE Left is mesmerised, barring those in it who have decided to build present factories with future bricks. The adherents of the Right — more precisely, those among them who are excluded from the ruling junta — cling for dear life to Jayaprakash Narayan. The power brokers, so-called, must fondly hope that the leader would come up with a few new conjuring tricks; the inchoate character of the Opposition is a great help; and it should always be possible to play upon the apprehension which exogenous elements might come to entertain about the consequences of a 'de-stabilised' India.

So, give or take a few local upheavals, the present absurdity will continue. No economic growth worth the name will take place, per capita income will dip, every now and then some people will die of starvation, the the punitive instruments wielded by the State will, however, be kept in trim. And the polity will hold together. But just about.

Even without China

There will be no dearth of ranting. On this side, Pakistan, once it is able to lick its Baluchi problem, might forge ahead economically. On the other side, foreign dispensations showered upon Bangladesh could prove adequate for that country's rapid growth even after allowing for leakage through administrative and political corruption. Sri Lanka has already a much higher standard of living than India's, the genre of the problems it faces is more tractable, and that island in the sun too may somehow be able to stay ahead of us in the matter of economic growth. Even if mention of China is taboo, other comparisons will yet be made, and discontent will continue to be widespread.

Those who are not getting the breaks, those whose consumption levels decline with every day, those whose talents are not being provided with any outlet, will increasingly begin to chafe. By and large, the chafing will be infructuous. The size of the country will guarantee that the climacteric of a local rumble is always a whimper. Some resources will always be available somewhere in the country — in Punjab or Andhra Pradesh, with the rich farmers or the richer traders. Where discontent threatens to spill over the brim of tolerance, the surplus will be pulled out from wherever it originates and used for bribing the would-be insurgents. It will not be simply a case of dangling the carrots; the disgruntled ones will be allowed a few bites as well. The ubiquitous stick will be at work too. The specific mould of politics should be a great help: Each of the parties, including the ones mouthing the most revolutonary froth, are led by middle-class specimens who are of limited stamina, impressionable, and — depending upon circumstances — even purchasable. Grand sagas of heroism are no longer a relevant category; it is the casual snippets of courage which today constitute the theme of living. Insurrectionary aspirations will, therefore, die down in no time.

No Outrage Either

There will be no growth, but there will be no uprising against the outrage either. The backward areas will remain backward and the economically weaker sections will remain weak. When things become particularly trying and measures of oppression threaten to recoil, some lollipops will be thrown to the disenchantment-mongers. But the fact that these lollipops will have to come from the resources of the surplus parts or sections will ensure that their pace of progress too is slowed down. Maintaining an efficient paraphernalia of oppression is itself enormously resource-using. What is more, once outsiders are aware that this huge mass of land and people is featured by a zero rate of growth, the gleam in their eyes will burn brighter. Steps will thus be taken to further strengthen the arrangements for defence; in any case, when things begin to go badly at home raising the spectre of outside aggression is good, solid, diversionary tactics. Squeezable resources will thus be squeezed out even more. Such being the case, those who pin their hope on the efficacy of 'unbalanced growth' of a certain kind will also be in for disappointment. A built-in depressor will set to work. The rate of economic development will remain barely ahead of the rate of population growth, and often fall short of it. Aberrations there will be. Bumber harvests will create an *ersatz* impression of relative affluence. In years of crop failure, famine will stalk the land. This apart, it will be a ding-dong existence for the nation, almost an asymptomatic existence — death will appear to be imminent, but, somehow, that critical fate will always be avoided.

Such a life is not worth living, sticklers for a zanier style may conclude. If one loses faith in the capability of the Opposition to lift the polity and the economy from this morass, what however does one do — except perhaps hope that contradictions would develop within the ruling coalition itself, thus paving the way for an explosion? Speculation is free.

May Contradictions Sharpen ...

The present arrangement between the landlords and the urban bourgeoisie could, for example, one day break down in case the difference in the rates of profit-taking starts to widen as between the two classes: If the rich farmers settle down to enjoying a clear rate of return of as much as 100 per cent and beyond, while the manufacturing capitalists cannot really make beyond 20 to 25 per cent on their capital and even so are laden with the major share of the tax burden, there could be a proliferation of envy, which could then act as a great liberating force. Or, who knows, the present organic link between the mercantile bourgeoisie and the manufacturing bourgeoisie could snap in course of time. For some more years, a leading functionary of the Indian Cotton Mills' Federation may continue to have a younger brother installed as a key decision-maker in the East India Cotton Association, and a nephew of both could be one of the principal office-bearers of the Gujarat Co-operative Cotton Growers' Society. But brothers marry and raise families; the progeny in their turn rear their own families; sooner or later, their interests may cease to converge. Or the game of handing out interminable subsidies to each and every constituent of the ruling coalition could lead to such chaos in fiscal and monetary management — and to such intense suffering for the poor — that the process of production itself may be in danger of coming to a total halt; labourers on the farms and in the factories may begin to walk out of their jobs: beyond a point, the police and the military may be unable to force them back to work, or alternatively, may be unable to perform these jobs on their own.

Even the ruling junta might be realising that it is later than they had thought a while ago. Which is why, it could be said, procurement prices for rice and paddy were not this time rais-

ed to the extent demanded by the kulaks. A fear could be developing that, operationally, the system might soon become non-feasible. But you never know. If there are enough foreign friends to bail one out, one could — and indefinitely — continue cheating destiny.

Bricks Today, Not Tomorrow

To take a hoity-toity line in relation to, for example, Jayaprakash Narayan's entrances and exits may be good, clean snobbery, but what have *they* to offer instead? Rousing a critical minimum of class consciousness among the peasantry and the working class has been the staple agenda of action for middle-class partisans of the Left. This was so circa 1947, and remains so in 1974. They have hardly made much headway in the task, largely because — one is now more or less convinced — they have been bereft of both the necessary talent and the necessary will. They now present a sorry spectacle, this great army of the unemployed, the immobilised, Left. It is immobilised because, to repeat, it decided to build present factories with future bricks; it however considered it *infra dig* to study the technology of brick-building. Peasants and workers were sought to be sustained with slogans. That did not click. At the next stage, they were sought to be dazzled by mail-order gifts. In this sphere, however, of late there is stiff competition and the Left has been easily pushed out by those who can offer more. The Left is now nearly without a profession. For sheer survival, it will have to return to hard-core brick-building. It is a chore *sans* glamour, and calls for much back-breaking labour. But what else did the Left expect? A revolution hardly ever drops like manna from heaven.

FROM OUR CORRESPONDENTS

JUTE

Untenable Asymmetry

THE chaos in economic policy-making could not have been more vividly illustrated than in the arrangements made during the past fortnight for the purchase of raw jute. Last year, there was a bumper crop. Prices had sagged in the market and primary producers had an extremely raw deal as the Jute Corporation of India failed to lift the fibre in adequate quantities. In addition, large-scale smuggling across the border from Bangladesh — it was openly alleged — had resulted in poor offtake of indigenous jute. The disappointment experienced by the growers in the last season has contributed this year to a certain shrinkage in the acreage — away from jute and to paddy — though the order of decline is difficult to gauge at this stage. Because of the vagaries of the weather, the current jute crop would in any case have been lower than that in the last season; the drop in acreage has made the crop smaller still.

This assessment of the current year's crop contributed to a stiffening of the jute prices as the jute season commenced in August. Even primary growers benefited for a number of weeks from the improvement in prices. The peak of the marketing season is yet to come. The jute growers were looking forward to a sizeable augmentation of their earnings. With foodgrain prices sky-rocketing, this rise in earnings would have barely compensated them for their increased cost of living. But suddenly all kinds of news were set afloat.

First, reports filtered in from Bombay that the Reserve Bank of India had gone back on its earlier commitment to arrange for bank advances of some Rs 40 crores to the Jute Corporation for purchase of jute fibre. The ceiling of advances was supposed to be down to Rs 20 crores, and subsequently further down to Rs 17 crores, for the entire season. Simultaneously, another news item suggested that the Ministry of Commerce had issued instructions to the Jute Commissioner asking him to ensure that individual mills did not buy more than three months' requirements of fibre. The Ministry, it was made to appear, was afflicted by a bout of instant egalitarianism: in case the big mills, who have greater financial clout, began to buy up most of the jute, the small units would find themselves preempted in the subsequent part of the season, so the Ministry's orders (it was explained) were intended to forestall such a plight overtaking the weaker mills. Another story, which began to circulate at about the same time, however, had it that the Ministry was merely following the advice of the Indian Jute Mills Association: no doubt, the Association for its own evident reasons was most anxious to cool the fibre market.

For three days the reports were not contradicted by any quarters. Purchases abruptly eased off in the centres up and down the eastern states, and there was a drop of around 20 per cent in the raw jute prices. Pressure was mounted on the government of West Bengal by peasant organisations and political parties. Following hasty exchanges between New Delhi and Calcutta, the Jute Commissioner was authorised to issue a statement denying that any formal orders had been sent to the mills asking them not to purchase the fibre beyond the three months' requirements. It was even privately pointed out that, though there was such an informal communication from the Ministry of Commerce to the Jute Commissioner, the communication was not finally transmitted to the jute mills; that, therefore, no harm was done. One reason for the official concern about the 'hotting up' of the jute market, it was hinted, was that the big mills could make this the alibi for demanding enlarged credit from the banks; and since there was no assurance of such credit being in fact used to purchase the fibre from the growers here, it might actually be diverted to corner rice stocks used to finance the smuggling of jute from across the border.

Bearish Impact on Prices

This is no straightforward situation. On the face of it, a slowdown in purchases would affect the price of raw jute and, to that extent, affect the earnings of the primary producers. But even were there no formal orders from the government, and banks were allowed to continue their advances to the mills, ostensibly to purchase of raw jute, there would still be no guarantee that such advances would be actually used for the purpose. There are ways and ways in which such advances could disappear within the labyrinth of the marketing operations. The fact remains that the rumours did have a bearish impact on jute prices. Also, on many occasions in the past, press notes issued by the Ministry of Commerce on the price policy for jute and cotton bore strong resemblances to texts of memoranda earlier submitted to the Ministry by the Indian Jute Mills Association and the Indian Cotton Mills Federation, respectively. Someone evidently did try to take the Ministry of Commerce for a ride.

Had there been greater co-ordination among the different levels of administration, and if the operations of the Jute Corporation of India were effective in reaching down to the primary producers, none of this would have mattered. For, the bank credit could have then been channelled, in near entirety, through the Corporation and its quantity liberalised. There would also have been the assurance that the credit would serve the objective of raising the income level of the poorest strata of farmers. The story of jute in this sense is no different from the story of cotton or oilseeds or foodgrains. But while in the case of cotton, oilseeds, and foodgrains, it is somehow always officially ensured that market prices do not come down, a different attitude gets reflected in government decision-making on jute.

This simply cannot be because the price of raw jute has implications for the country's foreign exchange earnings. These implications hold no less for cotton. The major difference must lie in the fact that the cultivation of jute is still, by and large, carried on by small peasants, who do not constitute a powerful enough political lobby. This is, therefore, the only commodity whose market price the authorities can permit to fall with equanimity. There is also the other fact that, while the government can easily persuade the mills not to purchase stocks beyond three months' requirements, official capability visibly caves in in the reverse situation: i e, when the mills ought to be ordered to purchase greater quantities so as to prevent a fall in the market price. Where it is a question of offering support to the weak and unorganised, the government's sense of symmetry collapses.

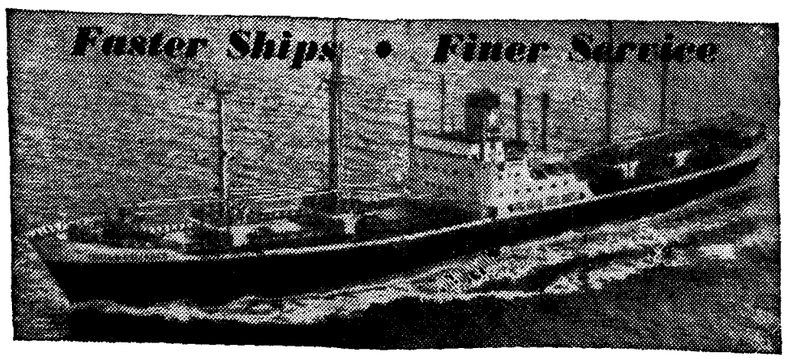
INDUSTRIAL FINANCE

In Blinkers

THE Industrial Development Bank of India (IDBI) the country's apex development financial institution, has just published its Annual Report for 1973-74, the tenth year of its operations. The Report contains a mass of data on industrial production, covering aggregate as well as group-wise trends in output, capacity utilisation, capacity-creation, and the like. What is missing, however, is a perspective of industrial development. For instance, after one has read the section titled 'Trends in Industrial Production', one is none the wiser about what has gone wrong with industrial growth in the country, what are the priorities for the industrial sector, what are the areas in which the IDBI and other term-lending institutions will encourage expansion of capacity in the coming years and other similar questions. If the IDBI had worked out its priorities clearly, it would not be doing what it is — financing every project for which assistance is sought. That is why so many breweries and luxury hotels figure among the projects financed by it. IDBI and the other term-financing institutions cannot argue that industrial priorities can be left to the licensing authorities. For one thing, many industries, including breweries hotels, do not fall within the licensing net; that apart, industrialists are able to get over the licensing hurdle in many ways. The development financing institutions cannot, therefore, take a cavalier attitude to the question of priorities. Their funds are, after all, of a created variety, depending as they do on the Reserve Bank and on the government. Therefore, just because the projects are few and there are no financial constraints on them, the financial institutions cannot afford to finance every project which comes along.

Few industrial projects can come up today in the private sector unless over 60 per cent of its cost is financed by the term-lending institutions. The data given in the IDBI's Report reveal that loans formed about 68.4 per cent of the total cost of projects, or Rs 182 crores out of Rs 266 crores. A part of the loans may be provided by sources other than the term-lending institutions, but the bulk of them come from the public financial institutions. It is time the IDBI asked itself whether this was the purpose for which the term-lending institutions were created. If, instead, these institutions widened their net and together gave not more than one-third of the project cost on average, they might help to trigger a much larger quantum of industrial investment in the country. However, we find the IDBI exulting over the fact that in the Fourth Plan assistance provided by the term-financing institutions represented 30 per cent of the estimated private sector investment in the industrial sector compared to only 19 per cent during the period of the so-called Annual Plans.

So far, 77 per cent of the assistance sanctioned by IDBI has gone to projects of Rs 5 crores and above. It may be claimed that this is because the IDBI is the apex financial institution. But this is equally true of the other all-India development financing institutions as well. As a result of such easy availability of financial assistance, with nearly two-thirds coming by way of loans from public financial institutions, the capital structure of industries has got distorted. For the same reason, the capital intensity of assisted projects has gone up and labour used per unit of net value has declined steeply — from 723 persons per Rs 1 crore in 1970 to 523 persons per Rs 1 crore in 1973.



The IDBI's narrow perspective is brought out by the fact that even when it talks of the prospects for 1974-75, it can only say that "IDBI's disbursements will show a good rise during 1974-75". But what is the rationale of this rise in disbursements — or of that which took place in 1973-74? It is well known that in 1973-74 there was a substantial fall in the volume of capital raised by companies through shares and debentures. Also, retained earnings of companies declined, possibly by 25 to 33 per cent. What, then, was the basis of the expansion in the term-lending institutions' operations?

Overall investment in the private sector is unlikely to have been much higher in 1973-74 than in the previous year. Yet the disbursements of all the term-lending institutions together increased from Rs 199 crores in 1972-73 to Rs 274 crores in 1973-74, or by 38 per cent; their sanctions likewise increased from Rs 296 crores to Rs 429 crores, or by 45 per cent. This suggests, first, that the larger industrialists have further increased their dependence on loan capital from the public financing institutions. Secondly, there is reason to believe that funds from the term-lending institutions have been substituted for bank finance for working capital purposes. There is considerable circumstantial evidence to support this view. First, almost the entire increase in assistance disbursed during 1973-74 was on account of rupee loans which rose by 52 per cent; foreign currency loans, on the other hand, declined by 8.7 per cent. If there were investment programmes being effectively implemented, commensurate with the rise in the term-financing institutions' disbursements, how could disbursement of foreign currency loans have declined despite larger commitments having been made in the

previous year? Second, the IDBI achieved its best performance in terms of sanctions and disbursements during the year under the bills rediscounting scheme. And, as its Annual Report itself says, the facilities under this scheme "were being availed of on an increasing scale by state electricity boards and state road transport corporations for purposes of expansion and modernisation". A good deal of this assistance was thus in the nature of substitution of finance from budgetary sources. In other words, the term-lending institutions appear to have become a source of finance for the private sector faced with a credit squeeze by the commercial banks and for public sector undertakings faced with a resources constraint in the Central and state budgets. Lastly, the IDBI's annual report itself admits that a part of the increase in export credit extended by the IDBI occurred because banks were in a tight position. If the term-financing institutions have provided funds to substitute for bank finance, the Reserve Bank itself could be said to be conniving with such arrangements. It agreed to lend to the IDBI, for the first time, Rs 20 crores against bills rediscounted by the IDBI.

The IDBI's Report makes much of the increase in assistance to units located in backward areas/districts on concessional terms. About 46 per cent of the total direct assistance in 1973-74 was of this type. However, considering that over two-thirds of the districts in the country have been designated as backward, this is no startling achievement. The region-wise distribution of IDBI's assistance does not bear out its claim to be concerned about the development of backward areas. In 1973-74, about 70 per cent of the assistance sanctioned in the eastern region was for projects in areas other than those specified as backward, despite the fact that almost the entire region has been designated backward. This proportion was not very different for the other regions: it was 78 per cent for the western region and 69 per cent for the northern region. Only in the southern region was the proportion 56 per cent.

Yet another disquieting aspect of the IDBI's operations is the encouragement given to so-called joint sector projects which have, it is well known, become covers for the entry of large industrial houses into non-priority areas with the the connivance of the state industrial development corporations. IDBI has increased its assistance to such joint sector projects very sharply. In 1973-74, for instance, 40 per cent and in the previous year as much as 49 per cent of its direct project assistance was for such projects. The IDBI does not seem to be having any clear policy premises in regard to the encouragement of joint sector projects. Nor does it seem to have any clear ideas about their control and management.

The Violence of Orderly Change

Anil Awachat

BABHULGAON is a small village, some six miles away from Latur town in district Osmanabad. On July 18, 1974 four men and a woman were returning to Babhulgaon from Latur, at about 10 in the night. The men were brothers and the woman, Mainabai was their sister. They were caste Hindus and belonged to a family of Shinde — Sangvikars. A little away from the village, they were allegedly attacked by a band of highwaymen, who robbed the sister of ornaments and money. The Shinde-Sangvikars managed to escape and on reaching Babhulgaon told the villagers about the incident. Some sixty men then went out looking for the highwaymen and on finding four scheduled caste Matangs there — whom they took to be the culprits — attacked them, killing Limba Rahaba and Bhiva Limba and seriously wounding Nivrutti Raghunath. The fourth Matang, Keraba Hussain, managed to run away. The bodies of Limba and Bhiva were savagely mauled.

This correspondent visited the village recently. As we neared the village, we noticed two newly constructed buildings — the school and the co-operative society's godown. A little further on were visible two clusters of huts, belonging to Mosan Jogis (a mendicant community) and Muslims. Beyond these clusters is an open yard in which stand a veterinary dispensary and a couple of offices. A number of small roads lead to different parts of the village from here. The little road on the left leads to the hundred-odd huts belonging to the Matang community, which cluster around a community 'building'. The other road across the yard leads to houses built of stone and mud; the prominent among them has a stone and mud turret with a window in it. This is the house of the Shinde-Sangvikars. The neighbouring house is also big and here the police patil lives.

We asked Nivrutti Raghunath to take us to the place where the atrocity was committed. There, on the heath, Nivrutti gave us his version of what had happened. "A Matang called Eknath died that morning. We buried him in the afternoon and then some of us started for Latur. Keraba was carrying animal bones which he had dug up — he sells animal bones to earn his living — and he had his pick-axe with him. I carried an axe with me; I was looking for wood. Bhiva is a coolie in a grocer's shop in Latur, and he wanted to borrow some money from his employer. We started back for the village at about 9 in the night. Limba suffers from nightblindness, so I was leading him by the hand. When we had come near the shrubs, we were surrounded by several persons who flashed torches in our faces. They singled out Limba and Bhiva in the attack. Keraba was trailing us. He must have taken to his heels as soon as he realised what was happening. The attackers had axes, lead balls and sticks. I heard Limba give out one agonised, heart-rending cry and then suddenly go silent. Bhiva and I were crying out for help. After some time I lost consciousness. When I came to in the morning, the Matangs from the village had gathered around us. A little later the police came. They took me to a dispensary in a truck, and there they took down a statement from me. I named eleven of the attackers in my statement."

We went to the Matangs' huts. Limba's father, Ravaba, aged 70, met us. Bhiva's mother stood near him, holding two of Bhiva's children. Bhiva had left eight children behind him. At the mention of Bhiva's name, she began to weep. Bhiva's two wives and Limba's wife were out collecting grass.

Ravaba told us that they had heard about the event in the morning, when someone came shouting about murder. They had hurried to the spot to find his son lying dead on the bed of a stream. His arms and legs were broken. Blows on the face had pushed the eyes out of their sockets. In the back, just above the waist, there was a deep wound. The clothes were drenched in blood. Limba's wives, his son, and his father had carried his body home.

Bhiva's mother had reached the spot to find her son still groaning with pain, his arms and legs crushed and his whole body covered with wounds. His dhoti had come off. She had put his head in her lap and had tried to speak to him. The constable would not allow her to give water to her dying son, though Bhiva was asking for water from time to time, because the constable said the headman (Patil) had told him not to allow anyone near the bodies. The police force came later in the morning. Earlier, Bhiva's wife had hurried on to Latur police station to inform the police and get help. The constable at the station shouted at her and pointed to Limbau Patil who had been sitting in the police station since one o'clock in the morning. When she beseeched him to bring her dying husband to Latur town so that his life might yet be saved he scolded her for interfering with their work procedure: the police, he said, could not start until all the formalities were completed. She had returned to Babhulgaon to find that her husband was already dead.

Some Matangs claimed that the trouble had started with the outcome of the grampanchayat elections; they had been threatened even before the elections, but the atmosphere had grown more tense since then. There are two factions in the village: 'Deshmukh' and 'Mule'. Most of the Shinde-Sangvikars belong to the Mule faction. Mules had controlled the grampanchayat for nearly 20 years. Recently, two Deshmukh boys had returned to the village after finishing their education in Poona. The Matangs had voted for them in the last grampanchayat elections, and they were elected. Evidently, 300 Matangs in a total of 1,500 voters had made a crucial difference to the outcome. Deshmukhs had then helped Limba to get a licence for opening a ration shop in the village. The Marathas in the village had not liked this gesture. The untouchables, who had for centuries lived under the patronage of the Marathas; now getting to be shopkeepers: There are, of course, two shops in the village — one where the high-caste Hindus live and another where the Matangs and a number of Marathas live.

Another view is that the recent attack was a revenge for some past murder. Twelve years ago a man named Kisan Burule, a Maratha, was murdered by some Matangs in the village. Village reports are that those who had wanted to get rid of Burule had employed Matangs to do the job. Matangs, forever impoverished, had undertaken the 'execution', on promise of reward of land and having their dependents looked after while they themselves were in jail. Burule was thus murdered; eight Matangs were found guilty and given life imprisonment. Some of them had recently returned to the village, to find that the promises to them had not been kept

and the families of each one of them was in ruins. Limba had been something of a leader among Matangs apart from having been elected to the grampanchayat. After the convicted Matangs had returned to the village, Limba had started to accuse the Marathas of having used and cheated the Matangs. Limba had thus made himself very unpopular with the other powerful castes.

Besides, the reports of the attack on the Shinde-Sangvikar brothers and their sister appeared less and less credible. Thus Mainabai, the sister, recalled that it was 'Nagpanchami', so her brothers had come to her husband's village to take her home with him. Because of the ST strike they managed to reach Latur only in the evening. There they had met the remaining brothers and had started for Babhulgaon on bicycles. When they were approaching the village, they were attacked by a gang of highwaymen who flashed torches in their faces and spoke Hindi. They tried to snatch the gold chain from around her neck; while her brothers struggled with them, she ran to the village and recounted the occurrence. The police patil collected some people from the village and proceeded to the place where the attack had taken place.

A Muslim girl, Mumtaz, had met Mainabai in Latur at about eight and suggested that they all go together. But her brothers had said that they were in a hurry. Mumtaz followed them a little later in other company. When they passed the spot, she claims, they heard and saw nothing. There was no crowd, there were no wounded persons. They reached the village and, a little later, heard a commotion. About fifty persons with torches, sticks, etc. were going towards the heath.

An old man living next to Shinde told us: "Mainabai did not run to the village alone; she and Hariba came together. He was gasping; and flinging his bicycle away he whispered something about highwaymen on the heath. The villagers then rushed to the spot with whatever weapons they could lay their hands on.

As Limbau Patil had figured prominently in every account, we met him. A suave man, started with a rosy account of how the village was free of strife. His version was that Nagu Shinde had awakened him at about 11.30 in the night and told him of the attack on them. He had sent for the local constable, Raghu Kalal, and some four of them had gone down the road. A crowd of about 150 had already gathered there. He had asked the constable to guard the bodies and then gone to the Latur police station, at about half past two in the morning, taking the four Shinde brothers with him. The police — a couple of constables — then started from Latur for Babhulgaon. We asked whether Bhiva was still alive when he had left for Latur in the early hours of the morning. Limbau Patil said: "I don't think so — not likely at all". We asked whether the 'highwaymen' version was a made-up story. His reply was: "I couldn't say".

Raghu Kalal, the constable, unaware of Limbau Patil's tale corroborated only part of it when we met him. He said he had gone to the heath because Patil had called for him.

"How many persons were there at the time?"
"Only the four Shinde-Sangvikars, That's all."
"No crowd?". "No."

Limbau Patil was visibly upset, but could say nothing to Kalal in our presence. Kalal continued: "Limbau Patil went to Latur leaving me with the dead and the wounded. Nivrutti and Bhiva groaned from time to time. After the panchanama, Nivrutti, who was quite conscious now, was sent to Latur".

Why did Limbau Patil say there was a crowd on the heath? Was he trying to cover up for the Shinde-Sangvikar brothers? Was he trying to make out that the mob had murdered the Matangs and that this was no premeditated attack? During the attack, as purported by the four brothers, they were unarmed. By Nivrutti's tale, the Matangs had axes. Yet the brothers were unhurt while the Matangs were dead. Police investigation and procedure also leaves much to be explained. While Nivrutti claims to have named 11 persons only the four Shinde-Sangvikars were taken into custody as against eight Matangs. Bhiva's mother's statement was not recorded. That Bhiva was alive in the morning is an inconvenient truth which must be officially hidden. We learnt that a doctor, going from Latur to Babhulgaon at about five o'clock in the morning, had seen Bhiva and said he might survive if immediately removed to Latur. The doctor did not treat Bhiva, for it was a police case. The police are obviously trying to prove that this was a case of robbery leading to murder and their efforts are therefore aimed to show that the assault by the highwaymen and the murders occurred at about the same time. The Matangs could not even secure the services of a suitable lawyer. A lawyer, who is also a Socialist party worker, refused to accept the case because it affected his position in Babhulgaon. Another lawyer demanded his fees before he would look into the case.

Meanwhile, the families of the arrested Matangs have been rendered destitute. The women were not permitted to cut grass from the fields, which are owned by the Marathas. Bhiva was a coolie in a shop owned by ex-Minister for Co-operative Department, Keshavrao Sonavane, but no help has been extended to help Bhiva's family.

We decided to meet Vilasrao and Dilip Deshmukh, to whom the Matang vote had made a lot of difference at the polls. Vilasrao Deshmukh, sarpanch, owner of about 250 to 300 acres of land, told us that though the other party had let loose a reign of terror the Matangs had voted for the Deshmukhs out of 'loyalty to the family.' Nevertheless, he said he was helpless to assist the families of the victims because of 'tension in the village'. He did not even dare attend Limba's funeral — though Limba was an elected member of the Panchayat and had supported him. His rival, Bhagwan Deshmukh, told us that Vilasrao and his family owned about 1,100 acres of land, much of which had to be surrendered under the Land Ceiling Act. The land that the family owns at present is still in excess of the ceiling. Deshmukh, therefore, would have to be in the good books of the Patil and other revenue officials of the village.

This was not the first instance either of the Matangs being attacked by the caste Hindus. We learned that the son of a Matang was beaten up by some Marathas. His father, Vithal, had gone to them and said that they should have heaten him and not the boy who could not defend himself. The Marathas promptly attacked him the following day and almost killed him. Vithal now hobbles about on crutches. A few more instances of this sort were also reported. The police Patil forms, on such occasions, the crucial link between the villagers and the police.

The worst sufferers in the struggle for power among the caste Hindus are thus the untouchables. Both factions need their support at the elections and for crime. The untouchables, also the poorest in the village, cannot refuse the local politicians, who are also the land owners and employers. I said to a Patil: "Why should the untouchables be the scapegoats in your power struggle?" He laughed and said: "These are the rules of the game. The ammies fight, kings and generals don't".

NORTH

Priority to Power, too Late

SINCE 1968-69, the people of Punjab and Haryana have become all too familiar with the consequences of a power shortage. This year, however, the shortage has been critical. The urban areas have suffered as much as the rural areas. Industry has been subjected to major cuts, of between 50 and 75 per cent. As a result, production has received a severe setback, and thousands of workers have been laid off. Because of the diesel shortage, some of the industries' own generating sets could also not work to full capacity. Agricultural operations in this region have been greatly hampered too, and had power not been diverted here from Delhi, Rajasthan, and J and K, as also from the urban centres of Punjab and Haryana, so as to keep the tubewells and pumping sets running for at least 6 to 8 hours daily, a major portion of the kharif crop would have had to be written off.

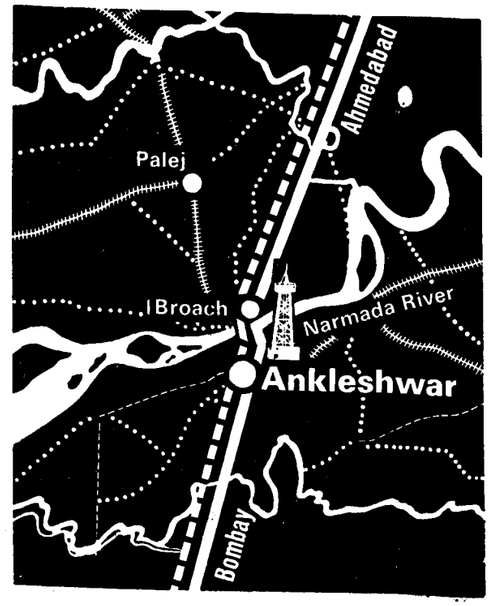
The state's revenues are bound to be depressed as a result. But it needs to be underlined that the crisis is the cumulative result of several adverse factors — not all of them natural ones. One cause of the crisis is, of course, the inadequate melting of the Himalayan snows and the failure of the monsoon, both in the hilly catchment areas of Bhakra as well as in the plains: This year, in fact, has been more dry than any other in two decades. But to these natural causes have been added unpardonable human ones: Delays in the execution of both hydel and thermal projects — with which the total power output was belatedly sought to be supplemented in order to reduce the gap in supply — have finally sealed the power situation.

The power deficit estimated for 1973-74 was 450 MW. Few had anticipated the soaring demand of both industry and agriculture. Demand has been rising at 15 per cent, annually. The planners had relied almost exclusively on the Bhakra hydel system — for upto 80 per cent of the power needs of Punjab and Haryana. Bhakra's total power potential rose by stages to 1,050 MW. Every passing year has exposed weaknesses of excessive dependence on Bhakra.

Punjab has a well-developed irrigation system, too. It has about 75 per cent of its area under irrigation, as against the all-India average of about 25 per cent. But while it would seem that this state is therefore not so dependent on the monsoon, with nearly 18 lakh acres of the 29 lakh acres of irrigated land being fed by tubewells, the reliance even for irrigation on the power supply is great. And power has been dependent on the monsoon and is getting ever more scarce.

Meanwhile, the demand for power has got a further boost as a result of the increasing connections given by the State Elecricity Board. The domestic connections have nearly doubled (from 418,660 to 799,735) between March 31, 1967 and December 31, 1973. During the same period, tubewell connections have increased by 400 per cent, from 31,876 to 122,453. But only now have realistic projections of the demand for power been attempted — the estimate being 800 MW for 1974-75 and 2,818 MW for 1983-84.

Power shortfalls will continue for a long time, because of the time-lag between projection and investment and between investment and generation. Ambitious plans have been drawn up for power generation during the Fifth Plan. The Plan's provision for power generation in Punjab is impressive enough at Rs 342 crores, for generation, distribution, rural electrification, etc. In fact, top priority is now being given to power generation. The Electricity Board's programme includes establishment of diesel sets with total installed capacity of 50.76 MW, renovation of the existing machines at Shanan Power House (at Jogindernagar, HP) after completing which the capacity would increase from 36 to 60 MW, completion of the Bhatinda thermal plant of which the first unit is being commissioned this month (capacity power production 110 MW) and the second is to be completed next year. There are long-term projects too, such as the Thein Dam for which the Punjab Government has been unsuccessfully pressing with the Centre and the Shahpur-Kandi project (installed capacity 94 MW). They are plans to exploit the hydro-electric potential of Himachal Pradesh and Jammu and Kashmir in collaboration with the governments of those states. At the same time, the Bhakra hydel system is to be backed with thermal, and if possible nuclear, power.



The tragedy of Bhakra, nevertheless, stands at the centre of the stage. This year, the inflows into the reservoir (Govind Sagar) were very poor, the water level dropping to 1,588 feet on September 30 — the lowest since the commissioning of the project. Siltation has been rapid, which has not only reduced the storage capacity and hence the generation potential of Bhakra but has also reduced its life-span by half or even more. In fact, when the Bhakra complex completed its first decade in October 1973, the reservoir was found to have already lost nearly 14 per cent of its storage capacity because of the silt. Bhakra officials do not concede this and contend that actually power generation at the Bhakra complex has been greater than the initial estimates (5,916 MU in 1973-74 against the original estimate of 4,000 MU). The Bhakra Board contends that silt-clearance operations have always been going on and that the dam's life-span is unaffected. They even claim that, at the present siltation rate, the life-span of Bhakra would be 780 years against the wide-ranging life-estimate of 550 to 730 years arrived at in the original Project Report.

In Haryana, the power position has been much worse all these years, and the state has had to depend on outside sources for its fast-growing energy needs. Haryana's per capita power consumption has risen from 57 kwh in 1967-68 to 119 kwh in 1972-73. The 100 per cent rural electrification programme which was completed in record time to attain another 'first' in the country, and the 550 per cent growth in tubewells since 1966-67, led to mounting demand as also to considerable transmission-line losses. The state's major power project is now coming up at Faridabad (62.5 MW capacity), but for very many years the state will continue to depend on Bhakra, Delhi, and Rajasthan. The minor power projects drawn up for the state will only marginally improve the situation.

Thus prospects of an early solution to the northern region's power crisis are remote. During his recent visit to the North, K C Pant, Union Minister

Oil-rich Ankleshwar town is right across the national highway, but that's not the only advantage of

Ankleshwar industrial area

What are the others?

1) 15% Central Government investment subsidy
2) 20% Central Government tax-free profits for 10 years
3) Interest free loan against sales tax
4) Soft loans
5) Easy access to industrial and social centres
6) Ready transport and communication links
7) Full infrastructural facilities
8) Prospects for chemical industries—proximity to IPCL complex

for Irrigation and Power, stated that a network of hydel and thermal power stations was being constructed, and that the power so generated would be interlinked with a common grid system to provide electricity to the northern states. While laying the foundationstone the 690 mgw hydel project at Salal, near Jammu, the Minister said the power projects "were being speeded up on a 'priority' basis. Generation of additional power will be slow in coming, however, and the rise in demand is meanwhile very high. Costs of the various projects have gone up manifold: the estimate for the Salal project itself has increased from Rs 55 crores to Rs 113 crores. The same is true of the Thein Dam, the Sutlej-Beas Link, and other such projects. The 'priority' to power, in fact, should have been accorded several years ago.

CALCUTTA

'Dramatic' Happenings

M B

"MYSTERIOUS Death of Young Man" was the caption given by *Hindustan Standard* to its staff reporter's report in its issue of July 21 on the incident of the previous afternoon at Curzon Park — so movingly written about by AM in his Calcutta Diary of September 7. According to the report, "the death of the youth remains a mystery and the police have started a thorough enquiry into the matter". The reporter added, "it is gathered quite a few extremists were in the crowd" and "the police denied that there was any lathi charge and as such the youth could not have died of lathi charge". The mystery of a young man dying while watching an open-air dramatic performance was, it appears, cleared up at the post-mortem. A rib or two was broken and the back of the skull was crushed, but what had actually killed Prabir Datta was the misbehaviour of his oesophagus which erroneously brought the food he had taken in the morning up the wrong lane to choke his windpipe. The post-mortem report should make interesting reading, indeed.

Meanwhile, the actor-director of Silhouette, the group putting up the play, and an assortment of actors and theatre workers were arrested from among the scampering crowd in the Esplanade area, even as Prabir was choking to his mysterious death. Presumably they were the "extremists" who, the *Hindustan Standard* report had "gathered", were among the crowd watching the play.

A letter addressed to the chairman of the Sangeet Natak Akademi by, among others, five Sangeet Natak Akademi award winners and one recipient of the President's Gold Medal for the best feature film, has alleged that the attack by the police on the theatre performance at Curzon Park was "a pre-planned brutal attack. And Prabir Datta, a regular spectator of their plays, was beaten to death on the spot. Plain-clothes policemen rounded up Bir Sen, the playwright-director of Silhouette, Prabir Chowdhury, their leading actor, and many others of different theatre groups". The letter added, "The West Bengal and Calcutta Police seem to consider theatre itself a non-bailable crime and they can go to the length of killing to punish the theatre." In their replies the chairman of the Sangeet Natak Akademi, K P S Menon, expressed his shock at the incident and, as quoted in *Blitz* September 7, the vice-chairman, P L Deshpande, said, "never in my life of 50 years have I heard of anything like this happening to the performing artistes in the country".

On August 3 a convention was held at the University Institute. As reported in the *Amrita Bazar Patrika* of August 4, it was convened by a group of renowned dramatists including Utpal Dutt, Ajitesh Bannerji, Badal Sarkar and Mohit Chatterjee and was presided over by Mrinal Sen. "Addressing the convention", the report goes on, "Mr Dutt alleged that the government had been desperately trying to throttle the voice of criticism. Dr Ashok Mitra called upon the people with different political views to write to counter attacks on their democratic rights. Soumitra Chatterjee, a noted film actor, suggested that a concrete programme should be taken to fight police interference in the performance of dramas and public shows."

In the resolution adopted at the convention it was stated, *inter alia*, that what had happened at Curzon Park on July 20 was not an isolated incident; it was one of many such incidents, and was part of a general onslaught on the people's democratic rights. The resolution mentioned that one of the general secretaries of the ruling party had recently said that not one of the 65,000 false cases lodged against poor peasants in the state had been withdrawn; further, a Congress MP had alleged at the Delhi session of the AICC held earlier this year that thousands of young men in West Bengal had been implicated in cases on trumped up charges.

The convention decided to stage a combined open-air performance at Curzon Park. This was done on August 24 before a large crowd. Among other items in the programme, the well known playwright Badal Sarkar produced his play 'Michhil' (Procession).

The reference in the resolution adopted at the convention to the breaking up of Silhouette's play on July 20 not being an isolated incident is not without basis. A few similar recent 'incidents' may be mentioned. At Midnapore a performance of 'Chandni Raat', a Bengali adaptation of Lady Gregory's 'Rising of the Moon', put up by Krishti Sansad, a local group, was broken up by some goons. At Uttarpara, Unit Theatre's production of a play 'Hochhe Ta Ki?' (What Is Happening?) was similarly stopped. At Harinabhi a similar fate overtook the production of a play 'Bhaja Kerasin' (Sing the Praise of Kerosene). These incidents do not appear to have been reported in the wide circulation dailies of Calcutta, which are not exactly famous for their love of Leftist politics or anti-establishment art.

However, they have reported, quite extensively in fact, the happenings around a play by Utpal Dutt. The play 'Dushwapner Nagari' (The Nightmare City) is the latest to be produced by Dutt's group, People's Little Theatre (PLT). Going by the few shows that were put up before playhouses started to back out of commitments to let PLT hire them, the play was immensely popular. Indeed, one of the theatres refused booking by the PLT on the ground that it would create traffic problems.

On August 8 *Hindustan Standard* reported, in connection with the staging of 'Dushwapner Nagari' by PLT on June 12, that "the Calcutta detective police submitted a petition before R K Sharma, Chief Metropolitan Magistrate, Calcutta, on a charge of sedition under section 124A IPC against the organisers of the drama." "It was alleged", the report added, "that the

drama depicted a plan for brutal killing of policemen and others in Calcutta, thereby suggesting in unequivocal terms that such killings in the city, attributed to Naxalites and the Communist Party of India (Marxist), were actually committed by hired goondas at the behest of capitalists and the ruling party of the government. The drama is further alleged to have indicated that the West Bengal government was being exploited by those capitalists with the connivance of the Central government."

A prayer by the petitioner for an interim injunction restraining PLT from producing the play was rejected. The Court is now going through the script of the play and hearing has been adjourned till a date in November.

The action of the police evoked a sharp reaction among artistes and intellectuals of Calcutta. A strongly-worded statement signed, among others, by Mrinal Sen, Badal Sarkar, Bijon Bhattacharjee, Shyamanand Jalan, Torun Roy, Suchitra Mitra and Samar Sen, indignantly asked: "What kind of charges are these? If the Sedition Law is used on such grounds what will remain of the already depleted freedom of the theatre? Thus to speak of hunger and price-rise is sedition in West Bengal today! To attack the criminal millionaires who are starving an entire nation is sedition! To criticise the police and the ruling party is sedition! To speak the truth has become sedition. We may not agree with everything the PLT says in its play, but we shall fight for their right to say so; or else the entire theatre movement will soon be controlled by the police."

Meanwhile, the PLT had managed to get a booking at the Star Theatre, one of the oldest playhouses in the city, for a performance of the play on August 26. A staff reporter of the *Hindustan Standard* filed the following ing report of what happened that evening:

"The staging of 'Dushwapner Nagari", a play directed by Utpal Dutt, at the Star Theatre on Monday was suspended owing to an angry five-hour demonstration by Congress workers.

"Mr Mukul Ghosh, Secretary at People's Little Theatre, the performing unit, alleged that 'a violent and abusive crowd, carrying Congress flags blocked all doors, dragged our staff out and destroyed a part of the sets'. The demonstrators were also alleged to have prevented Dutt and others from entering the theatre and beaten up artistes in the very presence of the police.

"The police, however, denied that anybody was manhandled.

"Mr Dutt said that a big crowd carrying Congress flags had gathered outside the theatre. It hurled abusive language and pushed him and an actress as they tried to go in at about 4.30 p m. All the other members of the troupe were more or less manhandled, according to him.

"The OC, Burtolla Thana, said that members of the North Calcutta Yuba Congress and the Chhatra Parishad staged a demonstration in protest against the staging of the drama which, according to them, was a 'propaganda piece of the CPI(M) and the CPI(ML)'. The demonstrators barred the entry of both artistes and the people who had come to witness the drama. The demonstration was withdrawn at about 8.30 p m. He denied the allegation that Mr Dutt and others were manhandled."

In a largely attended protest meeting held on August 30 a resolution denouncing the vandalism and declaring that "the attack on August 26 on the People's Little Theatre and its play 'Dushwapner Nagari' is a general attack on culture" was adopted. The resolution further stated that "the freedom of violence enjoyed by anti-socials in front of the police on August 26 is an attack on the entire cultural world of West Bengal" and called upon the Chief Minister of the state to punish the guilty. The resolution was signed by representatives of nearly all the important theatre and jatra groups of West Bengal as well as by others.

OVERSEAS CHINESE

Phase V in Nanyang

Pran Chopra

DURING the centuries of Imperial China, all Chinese, wherever living, were regarded as the inalienable and unviolable children of Mother China. Inalienable because not even they, let alone the countries in which they lived, were considered by China to be competent to question its jurisdiction over them; and unviolable at least during those periods when they could not be pushed around by anyone for fear of China. Especially respectful of this fear were the countries of the South Seas, or of Nanyang as Imperial China had named these waters.

Later on came a very troublesome phase II for the Nanyang Chinese, the years in which the Mother could not protect her children even in her own home against the inequities of the red-faced barbarians, much less protect her overseas family. She could do nothing when, for instance, as punishment for real or imaginary chauvinism, the Chinese in Thailand were harshly put down when at last they lifted up their heads following the defeat of Japan.

The third phase resembled a fight between divorced parents for the custody of their children. The Communists and the Kuomintang fought bitterly for the loyalty of the overseas Chinese, and even more bitterly for their money, much to the bewilderment of the children, especially the Nanyang Chinese because they were closest to the scene.

Phase IV was even worse for them. One parent, Taiwan, was losing out to the other. But the other was also disengaging from them, being too busy with other ideas and problems — such as putting its own house in order, or learning to live with the surprising power nationalism which was showing in the newly-independent Nanyang countries, or discovering friendly governments, not fraternal revolutionaries, among neighbours, or coming to terms with international realities, to which Chou En-lai was already opening the eyes of his colleagues.

Beginning with the Afro-Asian conference at Bandung, where in 1955 Chou En-lai first saw the massed power of Asia's new nationalisms, and more specifically beginning with the Dual Nationality Treaty signed the same year with Indonesia, China began to advise the overseas Chinese, especially the 15 million odd settled in the Nanyang countries, to make peace with their foster parents, the countries where they lived, and become their nationals. But this they found was easier said than done because the foster parents had their own ideas. Conditions were such that the Nanyang Chinese suffered badly in the race riots which occurred in one Southeast Asian country after another from the mid-1950s to the late 1960s. They suffered particularly badly when, because of the Cultural Revolution raging on the mainland, the Chinese overseas again began to be suspected of being chauvinists or communists or both.

During all these four phases few Nanyang Chinese had any choices. They were the passive agents, victims, beneficiaries of decisions made by China, Taiwan or their foster parents. But a new phase which has just begun, heralded by the agreement reached in June this year between Malaysia and China, gives them clear and important options.

Much more clearly than in the Dual Nationality Agreement with Indonesia, which was in any case invalidated by Indonesia in 1969, China has conceded in the agreement with Malaysia that the Chinese who have or may become citizens of Malaysia will altogether cease to be Chinese citizens, and China will have no responsibilities or rights with regard to them; others will remain Chinese citizens with the same privileges as those enjoyed by the citizens of other countries. And further it is agreed, by implication, that those who have not made the choice so far will be freely allowed to make it and, according to an interpretation mostly heard in Singapore, those who have recently made the choice will be allowed to remake it within a reasonable time.

This precedent set by Malaysia will spread. More Southeast Asian countries will recognise China, and the Chinese living in them will get the same options. And the options will be meaningful. Formerly all Chinese were treated as citizens of China whether they liked it or not. For most Nanyang Chinese this meant in the recent decades that, without the compensating advantage of the protection of China — which was too weak to protect them — they had to bear the burden of being mistrusted as foreign nationals. This will no longer be so. Those who opt for China will come under a far stronger protective umbrella than China could hold over them at any time after the glory of Imperial China had departed. Those who opt for remaining with their foster parents will no longer be mistrusted (not on this account at any rate).

An interesting and far-reaching consequence will be that, faced with a meaningful choice for the first time in their lives, all Nanyang Chinese will be sorted out between those who opt for one kind of citizenship from those who opt for the other kind. This makes the fifth phase in Nanyang qualitatively different from the preceding four, and it may gradually resolve the so-called problem of the overseas Chinese in Southeast Asia by enabling some Chinese to go back home and enabling others to stay on, but in conditions more congenial to them and more acceptable to the countries of their residence. Those who consciously adopt the Chinese nationality will obviously also acquire the right to go back, and many may exercise it if their past does not make the prospect unpleasant. But more interesting is the case of those who stay on whether as the nationals of China or as nationals of the countries of their residence.

If Chouism outlives Premier Chou En-lai, as it very well may, China's diplomatic links with the world will grow, and along with them economic links as well; the two go hand-in-hand. China will increasingly emerge on the business, commercial and financial stage of the world, and it will increasingly discover, as Russia did at a comparable stage, that dealing with governments alone is not always enough for profitable dealings with free market economies. It will also have to deal with the private entrepreneur, and it will discover that this dealing is best done through those who understand the local scene and the language of the market. And what better channel can it find for these dealings than those local Chinese who, rich in local experience, superbly versed in this language, may be willing and able to stay on while becoming nationals of China?

China will use them in much the same manner as Germany and Japan would use their nationals if they had them in these parts in similar numbers. The prospect is alluring enough to tilt the balance in favour of China for those Chinese who have yet to make their first or final choice, thus reducing the size of the overseas Chinese 'problem'.

Those who still opt for local nationalities can expect to be rewarded with the inestimable advantage of in-

creased trust. The biggest cross on their backs has been that they have been mistrusted as supporters and sympathisers of foreign inspired causes. It has soured their relations with the local populations and magnified all other barriers between the two, such as the distinctiveness of Chinese culture, the jealousy aroused by the greater prosperity achieved by the immigrant Chinese, and the resentment felt by the Chinese over the increasing restrictions to which they are subjected by local governments mistrustful of their economic power.

But the converse may turn out to be true as well, that the barriers shrink as the mistrust recedes — both because China conducts its relations with other countries more in conventional than revolutionary ways, and because the overseas Chinese opt for local nationalities at a time when the alternative of taking, or reverting to, Chinese nationality has so much to offer.

The barriers will not shrink easily, especially the economic jealousies and the frictions caused by them; if these are to go the governments and the non-Chinese peoples of Southeast Asia, as also of course the Nanyang Chinese themselves, will have to accept more sincerely than so far that on the one hand economic opportunity should be fairly shared among all and on the other hand unfair legacies of the past must be liquidated. But given normal relations between China and Southeast Asia, the chances of the disappearance of this obstinate and old problem will be better than they have been ever before.

THE FOURTH ESTATE

Air Pollution

Nireekshak

DISTORTING news and views while stopping short of outright lying is an art which All India Radio has perfected over the years. What it did with the opinions of K N Raj, the economist, was certainly not the first instance of censorship by the AIR, but it has become a subject of public controversy.

K N Raj participated in a discussion on "How to Tackle Inflation" (recorded in Trivandrum and broadcast from Delhi on June 23) on the assurance from the AIR that there would be no censorship. But when he heard the broadcast he discovered that three sentences had been deleted from what he had said. The deleted sentences were part of his answer to a question whether what he was recommending would not require "strong arm" methods against big landlords and hoarders of foodgrains. Raj replied that what was being advocated was actually not "strong arm methods" and then added that he wondered what moral basis the government had anyway for "passivity" after the "very brutal methods which it had used recently to break the railway strike". This had "demonstrated to everybody that it [the government] was not reluctant to use such [strong-arm] methods". Raj also said: "The dual standards adopted, one for the poorer classes and the other for the richer classes, showed up the class character of this government as never before."

When Raj wrote about the deletion of these sentences to the Prime Minister, she replied that though she could understand officials becoming cautious when faced with strong language, she was against "censorship, even mild forms of it". Neither politicians nor officials should shy away from criticism, she added. But I K Gujral, a Leftist of the pre-Partition vintage, has his own norms about running the AIR zamindari. In a letter to Raj he defended the deletion, asserting that the sentences concerned were a "sweeping indictment" of the government. One does not know if this was a *faux pas* on Gujral's part, resulting from a certain lack of communication between him and the Prime Minister, or whether there is some clever 'division of labour', with Gujral doing the dirty work, while the Prime Minister strikes postures of lofty liberalism for public consumption.

Gujral's AIR recently mis-used a panel discussion at the India International Centre in New Delhi to serve the government's propaganda needs. The discussion had nothing to do with the AIR. It was on "Populist Action and Public Values" and was moderated by a nominated MP. The participants were a journalist, a CPI ideologue, a teacher of German language and a Gandhian worker. The moderator abdicated his role to let the CPI ideologue launch on a tirade against Jaya Prakash Narayan and his movement in Bihar. It suited the AIR to broadcast a very cleverly edited version of the discussion, excluding viewpoints other than those of the CPI ideologue. The question to ask is: how many of the discussions at the India International Centre are covered by the radio and why was such special attention given to this particular one? Anything put out as straight AIR stuff would lack credibility with the listener, while taping a discussion in some other forum and putting out a distorted version of it would yield far greater propaganda mileage. For the same reason, the AIR gets willing journalists from New Delhi's press corps to turn out scripts to order. 'Political commentator' is the euphemism for the unemployed but highly committed journalist who has to be provided some income.

The question whether a working journalist can write for the government-controlled radio and still claim to be free is perhaps a metaphysical one. The AIR defines the limits of safe dissent and there is shrewd anticipation of what needs to be said. If there is any indiscretion the blue pencil is there.

The AIR had a big scoop on October 1 when it interviewed the Prime Minister on the current economic situation. If one remembers right, Indira Gandhi was last interviewed by the AIR in January 1966, on the day she was chosen Prime Minister. After her election, she promised the Press corps frequent meetings. She began with gusto — a press conference and a person-to-person broadcast every month. After a few encounters with the Press, she discovered she did not have much to say and the Press much to ask either. So the institution of the monthly press conference lapsed. As for the broadcasts, they became more and more impersonal because too many hands were shaping the script.

So the Prime Minister's recourse to the AIR and the interview format to air her views on smuggling, hoarding and the food crisis was puzzling. When it was suggested that a press conference would be in order, she ruled it out promptly — perhaps because that might have meant inconvenient questions on the licence scandal, the Bihar situation, etc. Then it was suggested that she should make a speech which would get the maximum coverage. She ruled that out too. An interview with the AIR was the most convenient format in the circumstances. No inconvenient questions would be asked, of course. For instance, many of her statements on the food situation would not have gone unchallenged if the interviewer had not been a government employee.

Arms Race Getting Hotter

World Armaments and Disarmament; SIPRI Year Book, 1974; Almqvist and Wiksell, Stockholm; pp 526; Sw Kr 75.

THE Stockholm International Peace Research Institute is committed to effective disarmament. The Year Books published by the Institute are a massive documentation of the arms race the world over as also a chronicle of the few weak attempts to stop it. The compilers of the Year Book under review have, as usual, done an excellent job in recording the building of arsenals, the flow of arms and the money and brain-power being devoted to developing progressively more horrific military and police weapons which can be used cheaply against unarmed civilian populations as well. New chapters have been added and the focus has been shifted to critically unstable regions like the Middle East. The facts are stunning; they need to be remembered and mulled over.

SIPRI records that world military expenditure is running at $ 207 billion a year, which is over 6 per cent of the gross national product of the world and equal to fully one-third of the combined output of the two billion people living in the world's underdeveloped regions (excluding China). Also, military R and D absorbs $ 20 billion annually and the time and energies of 400,000 scientists and engineers.

The Year Book points out that, while the military spending of the USA, USSR, UK and France has declined from 82 per cent of the world total in 1955 to 70 per cent in 1973, this does not reflect a reduction in the military capabilities of these four countries, but rather indicates the magnitude of the increase in militarisation elsewhere. The arms race has become a global phenomenon. There is growing willingness on the part of countries supplying arms to make their latest conventional weapons available for export. US supplies of F-14s to Iran and the Soviet delivery of MIG 25s to Syria are examples of this trend. In both cases, the most sophisticated aircraft have been committed to export within two years of their entering production.

Another important fact revealed by the Year Book is that US expenditure related to the continuing war in Vietnam was $ 4 billion for the fiscal year 1974 and a similar figure is projected for 1975. Although small in relation to the total military expenditure of the United States, these are still very large outlays in absolute terms; only six countries in the world have total military expenditures that exceed this figure. As SIPRI observes, the magnitude of US spending in South Vietnam reflects the scale of the fighting which continues despite the ceasefire. (The India Press has, of course, forgotten Vietnam.) A clause in the ceasefire agreement permits the replacement of major weapons and ammunition on a one-to-one basis. (Total US expenditure in Vietnam between 1965 and 1973 exceeded $ 140 billion.)

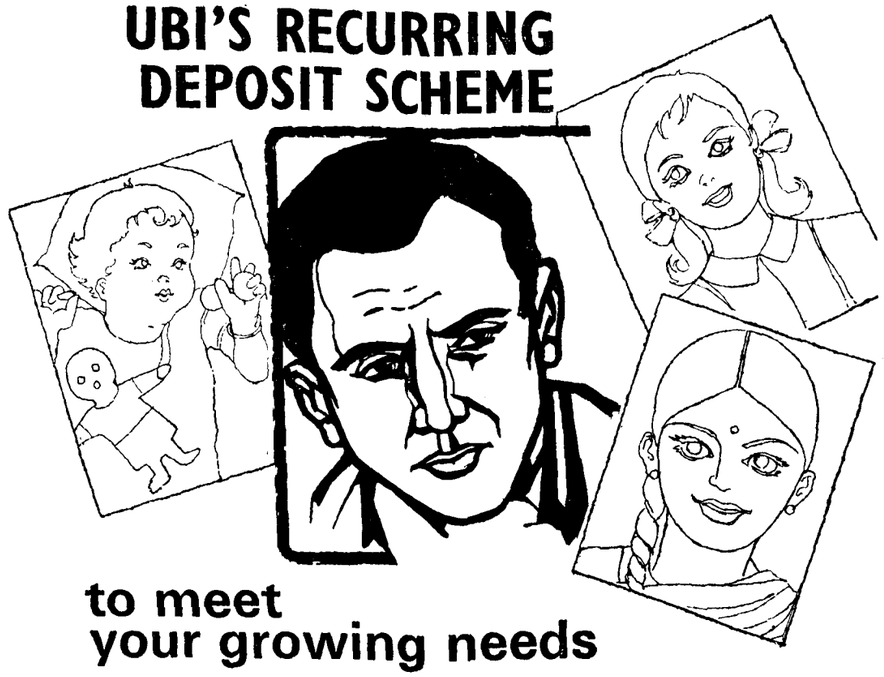
The end of direct US involvement in the war in Indochina may lead to increased proliferation of many of the new weapons is several ways. First, the decline in contracts for the supply of US forces may stimulate American manufactures to seek alternative contracts. Second, a considerable amount of surplus material and ammunitions from Indochina is being given as military assistance or sold (at one-third of cost) to 'friendly' countries. Third, the armed forces of other countries, which are not among the recipients of this bounty, are likely to seek to acquire the new technology or try to locate other sources of supply.

The end of direct involvement does not, however, mean any great decrease in covert American activity in Indochina. The military infrastructure, with its giant air force and communication centres, is retained to service the American presence in South-East Asia as well as to help intensified police activity inside South Vietnam. The USA last year pumped $ 700 million of military aid into little Cambodia, the size of Gujarat.

If the proportion of gross domestic product devoted to military purposes is used as an index, the Middle East has become the most militarised region in the world. The average annual rate of increase of military expenditure in Iran and Saudi Arabia was 23 per cent and this rate is accelerating. Whatever the state of our present relations with Iran, the Israel-Iran nexus cannot be glossed over. Arms in West Asia are apt to bring a wider war closer to our frontiers, whether we like it or not.

A special chapter in the Year Book is devoted to an analysis of the military lessons of the Middle East war. Before and during the war, a number of special orbit picture satellites were sent up by the US and the Soviet Union. The super powers thus had a grand-stand view of the performance of their weapons in combat. The SAM-6, a 6-metre weapon which downed the largest number of Israeli aircraft, was amongst the most important combat systems under observation. Losses of weapons and equipment were so heavy in the war — about one-third of aircraft and one-half of the tanks committed to battle were destroyed — that each side requested and obtained additional supplies within days of the outbreak of the fighting. This was a good example of 'instant rearmament' in the 'instant' world of the affluent! One is not inclined to agree with many of the military lessons of the Middle East war drawn by SIPRI. There are no such things as purely military lessons any more because war is no longer the army's game alone. Political, social and economic factors now dominate the play of military forces on the battlefield.

The editors have made an attempt to broaden the Year Book's canvas by including topics like submarine and anti-submarine warfare, tactical nuclear policies, etc. Here perhaps the SIPRI could include a chapter on developments in electronic warfare.



Wherever possible rough estimates and appreciations of China's and Japan's military capabilities have been included this year, as compared to the last edition of the Year Book from which China was excluded. Perhaps a more comprehensive study of China's defensive and offensive capabilities is called for in next year's edition. After all, China is the fourth super power. Its rapidly growing merchant marine and such facts as that the Chinese had the world's third largest fishing catch last year are important pointers to China's determination to be a maritime power. They are reminiscent of the manner in which, after steady and dedicated efforts in the fields of shipping, oceanography and fishing, the Soviet Union burst upon the world as a great maritime power to the surprise of many in the West.

The Year Book sadly acknowledges that while a number of inhuman weapons like high velocity bullets and

fragmentation bombs have gone up to the UN, under Red Cross sponsorship, for banning and are being discussed, no real progress has taken place towards banning of chemical or biological weapons.

The SIPRI says ruefully "no arms control treaty can completely rule out the possibility of evasion; all it can do is to minimise its probability". In a comment on the possession of nuclear weaponry, the Year Book says: "It is doubtful, at least in the long term, that nuclear weapons have had the political utility claimed for them, since their existence has indeed greatly decreased world security and, most particularly, the security of those countries actually having nuclear weapons." Regretfully, few nation states seem to agree with that assessment.

The SIPRI year book remains an indispensable reference work.

to meet
your growing needs

When do you **next** need a tidy sum?

Here's the way to save in a **planned** manner. Save every month any **fixed** amount between Rs. 5/- and Rs. 500/- according to your **capacity**. Select your **suitable** term and watch your savings grow at **compound** interest!

Not Role Conflict, but Social Conflict

Saral Sarkar

Indische Frauen zwischen Patriarchat und Chancengleichheit : Rollenkonflikte studierender und berufstatiger Frauen (Indian Women between Patriarchy and Equality of Opportunities: Role-Conflicts of Studying and Working Women) by Maria Mies: Verlag Anton Hain, 1973; pp ix + 266

A NUMBER of studies on the situation of educated and working middle-class Indian women already exist — as the impressive bibliography of the book under review shows. But Maria Mies has taken up one aspect of the situation — *viz*, the role-conflicts of such women, which arise from their having to play two or more, often conflicting roles: the roles of working women, housewife and mother.

In the first chapter, Mies describes the essential features of the brahmanical social laws relating to women, found in the 'Great Tradition' — i e, in the body of classical Sanskrit literature, consisting of the Vedas, the Upanshads, the two epics, the Puranas, and the Tantras. Mies finds this exposition necessary because the social norms — which, even today, greatly determine the lives of middle-class Indian women — are derived from norms laid down in the Great Tradition. "The older the roles are . . . the more obvious and natural the role-expectations connected with them appear to be, and the more they create the impression of universal validity" (p 19).

The first decisive change in the degrading status of women in India was brought about in the Independence movement, the effects of which Maria Mies deals with in her second chapter. This change came about in three ways: (i) legislation against social evils, (ii) encouragement of women's education, and (iii) large-scale participation of women in the Independence movement. As may be expected, while legislation, except in the instance of the practice of Sati, remained more or less on paper, education of the middle and upper classes (castes) and participation in the Independence movement proceeded rapidly, and generated tremendous enthusiasm among women.

But, Mies argues, despite the success in legislation, education and politics, emancipation of women has not taken place. For, the new ideal of Indian womanhood which was created during the Independence movement chiefly by men, partly out of political necessity, was merely a refurbished version of the same ancient patriarchal ideals of the epics.

And yet, an ever-increasing number of middle-class women are joining institutions of higher education and are working or wanting to work. Of course, lower-class women have always worked. The motivations of the better-off women in this are not only economic, but also non-economic — such as prestige, personality-building, self-realisation, real thirst for knowledge, and independence. Even so, by the very fact that these women are spending a considerable part of their day in activities away from the home, they are violating the main tenets of the ideal, underwritten by tradition and post-Independence establishment, leading them into conflict-situations.

Through several discussions and narrations of life-histories Mies has come to the conclusion that it is not enough — it is even misleading — to state that conflicts arise from incompatible role-expectations. Study of concrete conflict-situations in real life histories shows up the tremendous zeal, energy, and determination with which — and the heavy odds against which — these women are pursuing their 'immediate' goals: education and work. This appreciation is necessary to understand how Indian women react to these conflict-situations.

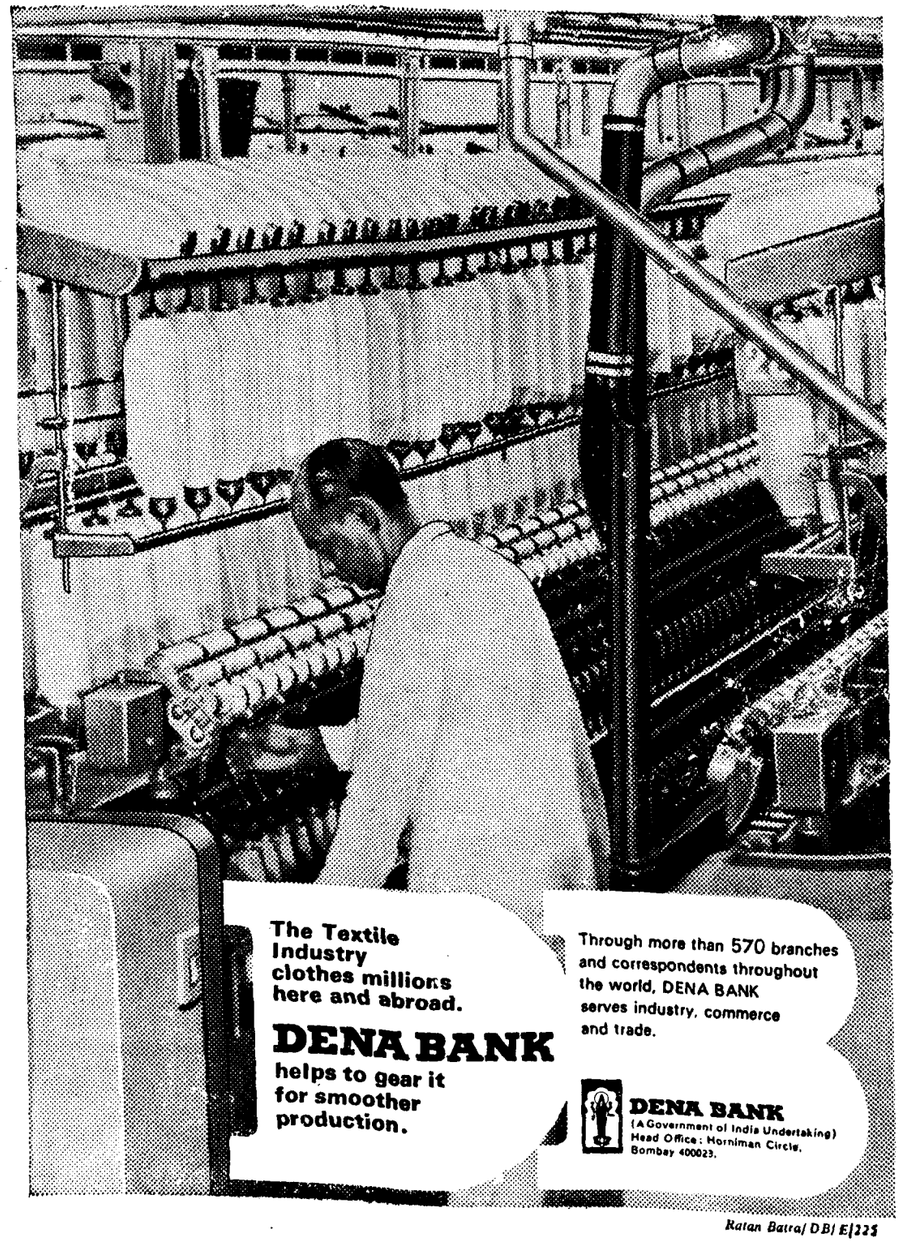
Mies mentions five different types of reaction situations of women.

(a) Those women, for whom the changed real situation has not led to any change in 'values' (or consciousness), accept without questioning the Indian ideal of womanhood and have a kind of guilty conscience because of their deviation from the norms. These — particularly married — women consider their new out-of-home roles not as a right, but as a 'privilege'. In order to overcome the guilty conscience, or to give a return for the privilege obtained, they show ritualistic over-conformity to the remaining norms, or work very hard at home to keep their husbands in good humour.

(b) Women of the upper-middle class find it easy to combine study, profession, and family, because of the presence of servants or helpful relatives. They no longer have to fulfil household duties. But they also do not attack the ideal. For them no conflict exists between the various roles of women, which they think can be easily brought into harmony with these various support structures.

(c) Some women are quite conscious of the conflict between their educational and professional aspirations and their family roles. A typical 'reaction-type' of these women is evasion of the conflict by taking up higher and higher studies and more and more courses; thus studying can become for women an 'institutionalised form of evasion'. However, for unmarried girls, this makes marriage ever more difficult. And married women generally simulate submission, playing the 'Pativrata' role, not ritualistically, but for tactical reasons.

(d) Some women openly rebel against the ideal. They are not satisfied with rhetorical talk of equality. They want to develop their own independent life and their abilities, and they want to see their aspirations fulfilled in this very life. They reject the arranged marriage system with dowry, the hierarchical relationship between man and woman, the primacy of the family-duty roles for women, and the division of labour based on difference of sex. This rebellion sometimes finds expression also in dress, hair-do, and life-style (free mixing, smoking, drinking, etc). These women openly demand a change in the role-definition of man and woman. In such rebellion, married working women have a greater choice of success because of their assured social status in addition to their economic independence (or at least dependence of the family on their income). Unmarried women, who have not yet achieved the social status, are in an insecure position; they, therefore, either compromise or risk remaining unmarried all their life.



(e) But not all who rebel in principle also rebel in action. Many show a readiness to compromise, because they do not want to break with their parents or husband for the sake of principles. Unmarried women would prefer a love marriage, but would not insist on it; a profession is of great importance to them, but they would give up the job, if the prospective husband so demands or if the family suffers from it. These women find it easier to adapt themselves to the norms.

No statistical data are available on the frequency of these various reaction-types. But one can safely assume that very few rebel. Mies, therefore, states several times throughout her book that all the progressive changes that have taken place in the real life of middle-class Indian women have failed to effect any appreciable change in their le-

vel of consciousness. But she has not anywhere attempted to answer why this change has not occurred.

The answer has to be sought, in the opinion of the reviewer, in the ideology implicit in the educational system after Independence. Mies believes that secondary and college education "is oriented towards Western models, and conveys ideas and values which are incompatible with the demands of the Indian social system: ideas of individualism, freedom and equality — e g, the right to equality of opportunity and free selection of partner, the right to free development of personality" (p 138). Here, however, Mies seems to misunderstand the proclaimed ideal to be the reality. Post-Independence education has been oriented to make women feel they are already equals of men — in this way it has actually confused them as regards the real situation. It has de-fused the need for protest against injustice and oppression from which they in fact suffer. It has opened the gates of office to women, but closed the gate of consciousness and material emancipation.

The book, which was submitted as the author's PhD thesis to the University of Cologne, is in German. A book on Indian women should find more eager readers in India than in Germany. It needs, therefore, to be translated.

Demographic Transition among Parsis: 1881-1971

I—Size of Parsi Population

Leela Visaria

The Parsis have been a remarkable exception in the general Indian demographic scene: Their fertility and mortality levels have steadily declined over the past century. In fact, their fertility is so low that despite high life expectancy, the number of Parsis has been declining for more than two decades now.

This paper examines the trend in fertility and mortality levels of Parsis. It seeks to examine the transition from high levels in fertility and mortality to low levels and the factors which have brought about this transition. The size and the sex-age composition of the Parsi population are also discussed to facilitate an understanding of their fertility and mortality levels.

The article is published in three parts. The first part discusses the size of the Parsi population and the change in the age-sex composition. The level and trends in mortality will be examined in the second part and the trends in fertility in the third.

THE Parsi population has been a remarkable exception in the general Indian demographic scene with high mortality and high fertility. Their fertility and mortality levels have steadily declined over the past century. In fact, their fertility is so low that despite a high life expectancy, the number of Parsis has been declining for more than two decades now.[1] This divergence from the general pattern found in the Indian subcontinent has drawn the attention of scholars and researchers. Besides, the continuing decline in fertility has caused grave concern both outside and within the Parsi community regarding its long-term survival. It is feared that unless special measures are taken in time to check this decline in fertility, the community might face a threat of eventual extinction.

The main objective of the present paper is to examine the trend in fertility and mortality levels of the Parsis, since the time when reasonably reliable data have become available. It seeks to examine the transition from high levels in fertility and mortality to low levels and the factors which have brought about this transition. The size and the sex-age composition of the Parsi population are also discussed to facilitate an understanding of their fertility and mortality levels.

Historical Review

Parsis, the followers of Zarathustra, who founded the religion over 2,500 years ago in Persia (Iran), fled their motherland after the Arab victory over the last ruler of the Sassanid dynasty around 640 AD and their subsequent religious persecution by the Muslims. They arrived by sea on the Western coast of the Indian subcontinent some time between 690 and 710 AD at or around Sanjan — about 100 miles North of Bombay.

Nothing is known regarding the number of people who arrived or the period over which they arrived in India. Nor is much known about the growth of the Parsi community during the subsequent several centuries. It is inferred from Kissah-i-Sanjan, a chronicle composed around 1600 AD[2] that the Parsis maintained some sort of social isolation by (a) practising endogamy and (b) not accepting any new converts to their faith. At the same time they selectively adapted themselves to the social milieu of Gujarat by accepting the language and the dress of the region. Apparently, they settled down in the area as agriculturalists and and merchants and moved South after the Muslims conquered Sanjan in 1490.

From about the seventeenth century onwards, references to the Parsis are found in the travelogues of the Portuguese, the French and the English. Parsis figured in these accounts as merchants and traders in seaports. With the rise in the political power of the European trading companies in India, the Parsis came into prominence and started migrating to the trading centres of Western India, such as Bharuch, Surat and, since the beginning of the eighteenth century, to Bombay. They served as interpreters, mediators, and trading agents and by the nineteenth century had assumed a position of leadership in economic, educational, political and social spheres.

A few estimates of the Parsi population in Bombay are available from 1780 onwards. Most of them are based on either guesswork or partial surveys and fluctuate widely from one date to another. The first somewhat detailed figures (by sex and broad age groups), were reported by the census of the island of Bombay, apparently taken on May 1, 1849 (Table 1).[3] The same figure of 114,698 as the Parsi population of "Bombay and Colaba Islands, including City of Bombay" was subsequently reported in 1857, approximately eight years later, to the House of Commons.[4] The next largest concentration of Parsis was in Surat — persons : 12,663, males: 6,285, females: 6,378, sex ratio (males per 1,000 females) 985. The population of Parsis in the Bombay Presidency as a whole was given as 132,544 (males: 69,854, females: 62,690, sex ratio: 1,114). If these figures are broadly correct, the Parsi community has never regained that size again.

The first official census of the Indian subcontinent, conducted in several provinces and states between 1867 and 1872, was neither synchronous nor quite complete. The Parsi population enumerated by the 1871 census — the year to which it is generally taken to refer — was 78,864 persons (males: 38,239, females: 36,949, sex ratio: 1,035) of whom 57.4 per cent (or

44,091) lived in the island of Bombay.[5] Since 1881, the subcontinent has had an uninterrupted series of censuses, which give the total population of the Parsis in different regions of the country. Table 2 summarises the census data on the total number of Parsis, the intercensal percentage variation and the sex ratio of the population, in the Indian subcontinent as a whole and in Bombay city.

The 1871 and subsequent census figures for the Parsis in Bombay and the Indian subcontinent suggest that the 1849 and/or 1857 figures were rather exaggerated. (If one accepts the 1849 figures, the Parsi population in Greater Bombay had decreased by 72 per cent between 1849 and 1871, a period of 22 years.) In the absence of details about the censuses conducted prior to 1872, it is difficult to identify the nature or source of errors. The classification of population according to religion could be erroneous.

During the 60 years between 1881 and 1941, there was a slow but steady increase in the Parsi population. The fluctuations in the growth rate due to famines and epidemics, that appear to be quite sharp in the data for the Indian population as a whole up to 1921, are smaller among the Parsis. One explanation for the observed steady increase in the number of Parsis seems to be its concentration in a major urban centre like Bombay with its relatively better medical facilities. More importantly, the overall prosperity of the community and its excellent organisational facilities probably mitigated the impact of various calamities on the Parsis.

The number of Parsis in India appears to have declined between 1941 and 1951, because of the exclusion of Parsis who remained in Karachi or other parts of Pakistan and Bangladesh after the Partition.[6] But even in the Indian subcontinent as a whole, the growth of the Parsi population during 1941-51 was only about 2 per cent. Apparently, much of the gain in mortality was achieved prior to 1941 and the effect of continuing decline in fertility began to affect the growth rate. Since 1951, however, the population of Parsis has been on the decline; the decrease during 1951-61 and 1961-71, has been at an average rate of 1 per cent per year. This phenomenon accounts for the growing concern both within and outside the community about its long-term survival.

TABLE 1: PARSI POPULATION OF THE ISLAND OF BOMBAY, BY SEX AND AGE: MAY 1, 1849

Age	Males	Females	Persons	Sex Ratio*
0-14	13,496 (22.1)	13,437 (25.0)	26,933 (23.5)	1004
15-49	39,192 (64.3)	32,325 (60.2)	71,517 (62.3)	1212
50-80	8,279 (13.6)	7,969 (14.8)	16,248 (14.2)	1039
All Ages	60,967 (100.0)	53,731 (100.0)	114,698 (100.0)	1135

* Males per 1000 females.

Note: Figures in parenthesis show the percentage age distribution.

RELIABILITY OF CENSUS COUNTS

A word of caution should be added before one accepts the census counts as valid. The Parsis were fairly well known in the erstwhile Bombay Presidency and Baroda state where they were concentrated. One can presume that a misclassification of the Parsis, i e, their inclusion with some other community in the category "minor religions" was not very likely in these states. However, the count of the Parsis who were located in other regions may well be less accurate. In South India, for example, the word Zoroastrian sounds very similar to "Saurashtrian"[7] and misclassification of the former seems quite likely. The census enumerators, recruited from the local population, cannot all be expected to be familiar with a small and relatively closed community. Even though the absolute level of error may be small, it can have a significant effect on the estimates of intercensal growth rates of the community. This issue is discussed further in Appendix 1 which shows the number of Parsis enumerated in different states of India during the censuses of 1951, 1961 and 1971.

The observed decline in the number of Parsis since 1951 can, therefore, partly be spurious. Further emigration of Parsis to other countries of the world has probably accelerated after 1947, which would also contribute to the decline in the number of Parsis evident in Table 2. However, reliable statistics of Parsis resident outside India and Pakistan are not available.[7] Therefore, there is no alternative but to use the information available from the censuses and other sources for the present discussion.

CONCENTRATION OF PARSIS IN BOMBAY

During most of the period between 1881 and 1971, the Parsi population in Bombay city has grown faster than in the Indian subcontinent as a whole. The proportion of Parsis living in Greater Bombay has steadily increased from 51 per cent in 1901 to 66 per cent in 1961. The decline during 1881-1901 in the number of Parsis in Bombay was probably due to some exodus from Bombay to other developing cities or to other areas of Gujarat or Bombay Presidency. However, the non-availability of birth place data for the Parsis outside Bombay precludes a verification of such a hypothesis. In any event, after 1901, the faster growth of Parsis in Bombay seems to be mainly due to a continuous trickle of migration from the hinterland to the city rather than because of any significant differences in the rate of natural increase of the Parsis in Bombay and the rest of India. The relatively rapid growth of employment opportunities in Greater Bombay, together with its attractive cosmopolitan life, would indeed have encouraged the Parsis born or brought up in neighbouring areas to migrate to Bombay.

SEX RATIO OF PARSI POPULATION

An interesting facet of the demography of a community is the relative number of men and women. This is usually measured through what is called the sex ratio or the number of males per 1,000 females.[8] Up to 1931, the Parsis shared with the rest of India an anomalous excess of males. However, the preponderance of males among the Parsis was much smaller than among other religious groups of the Indian population. Since 1951, however, the Parsis have moved from a situation of a virtual balance of the sexes — in terms of numbers — to an excess of females such as is found in most Western European or developed countries.

Up to 1951, the sex ratio of the Parsis in Bombay was higher than in

the subcontinent as a whole, most probably due to the excess of males among the migrants to the city.[9] However, compared to the total population of Greater Bombay, the excess of males among the Parsis in Bombay was very small. The high sex ratio of the total population of Bombay city (about 1,500 in 1961 and 1,400 in 1971) is due to the heavy excess of males among the migrants, many of whom tend to be rural born persons. Many of the Parsis, on the other hand, migrated to Bombay before the period covered by the decennial censuses and a majority of them have been living in Bombay for several decades now. According to the 1881 Census, for example, 70 per cent of the Parsis living in Bombay were born in the city, 22 per cent in Surat district and the rest in the other parts of the country.[10]

The special tables prepared from the 1961 and the 1971 censuses of Greater Bombay indicate the proportion of locally-born Parsis to be not very different from that observed in 1881, eight to nine decades earlier. According to these data, 72 and 75 per cent of the Parsis enumerated in Bombay in 1961 and 1971, respectively, were born in the district.[11] However, the excess of males among the migrants, noted nearly a century earlier, has disappeared. According to the 1971 Census, while the sex ratio of Parsis born in Greater Bombay was 1,010, it was 946 for those born elsewhere indicating that there was an excess of females among the migrants.[12] This phenomenon has contributed to the equalisation of the sex ratio of Parsis in Greater Bombay. On the whole, the small excess of males, reported by the earlier censuses, has disappeared and a slight reverse tendency is evident in recent decades, partly because, as shown later, the

TABLE 2: SALIENT STATISTICS ON THE NUMBER, THE DECENNIAL PERCENTAGE CHANGE AND THE SEX RATIO OF THE PARSIS IN THE INDIAN SUBCONTINENT AND IN GREATER BOMBAY, 1881-1971

	Parsis in the Indian Subcontinent			Parsis in Greater Bombay			
Year	Total Population	Decennial Change (Percentage)	Sex Ratio	Total Population	Decennial Change (Percentage)	Sex Ratio	Bombay Parsis as Per Cent of Total
1881	85,078	—	1,040	48,597	—	1,088	57.1
1891	89,490	5.19	1,035	48,307	—0.60	1,088	54.0
1901	93,617	4.61	1,043	47,741	—1.17	1,104	51.0
1911	99,412	6.19	1,039	52,435	9.83	1,105	52.7
1921	101,075	1.67	1,055	54,679	4.28	1,148	54.1
1931	108,988	7.83	1,062	61,580	12.62	1,118	56.5
1941	114,890	5.42	1,028	63,757	3.54	1,039	55.5
1951*	117,147 (111,791)	1.96	1,009 (1,009)	68,660	7.69	1,035	58.6 (61.4)
1961*	106,184 (100,772)	—9.36 (—9.86)	966 (963)	70,065	2.05	967	66.0 (69.5)
1971†	91,266	—9.43	964	64,667	—7.71	954	70.9

* The figures for 1951 and 1961 in parentheses refer to the Republic of India alone.

† The 1971 figures pertain to the Republic of India only. Tables relating to the religious composition of the population enumerated in the 1972 census of Pakistan and the 1974 Census of Bangladesh are not yet available.

Notes: (1) The figures for the Indian subcontinent exclude the Parsis in Burma and Aden. The number of Parsis in these two areas up to 1931 was as follows. The number after 1931 is not known.

	Burma			Aden		
Year	Persons	Males	Females	Persons	Males	Females
1881	83	56	27	236	164	72
1891	96	82	14	318	234	84
1901	245	160	85	328	254	74
1911	300	195	105	384	268	116
1921	380	229	151	323	237	86
1931	419	258	161	345	248	97

(2) The figure for Parsis in Bombay in 1881 pertains to only the city or island of Bombay. The 1891 figure for the same area showed a decline of 2.34 per cent (1,139 persons). The coverage of the 1891 figure in the Table above is outlined in Note 3.

(3) Our figures for Greater Bombay for 1891-1911 pertain to Parsis in Bombay Municipal area and the (then) towns of Kurla, Bandra, Mahim and Santa Cruz in Thana District. These figures differ from those given in the 1961 census publication on Parsis of Greater Bombay because the latter apparently include the Parsis located in the other towns of Thana district (except Bhiwandi and Bassein).

(4) Figures for Bombay during 1921-41 include Parsis resident in Bombay Suburban District, which was created before the 1921 census out of Thana District and which was merged with Bombay in 1950—prior to the 1951 Census. The increase in the number of Parsis in Bombay city plus four towns of Kurla, Bandra, Mahim and Santa Cruz during 1911-21 was 3.00 per cent.
The number of Parsis in the Bombay Suburban District was as follows:

Year	Persons	Males	Females
1921	2,445	1,246	1,199
1931	3,815	1,920	1,895
1941	3,944	1,884	2,060

Parsi females survive to a higher age than men.

Age Structure

Up to 1931, the censuses of the Indian subcontinent had tabulated and published data on the age composition of the population of major religious groups. Even though Parsis formed a numerically small group, separate age data for them are available from 1881 to 1931. In 1941, due to war time stringency of funds, the age data for a minority group such as the Parsis, were not tabulated separately. The 1951 and 1961 censuses of India have not included religion as a variable for any tabulations of demographic or economic data. However, the special tables compiled from the 1961 Census of Greater Bombay include the age, sex and marital status distribution of the Parsis. They were followed by a special survey of the Parsi community.[13] Similar census data for the Parsis become available from the 1971 Census in Greater Bombay on the basis of a 20 per cent sample through the co-operation of the Office of the Registrar General, India and the Director of Maharashtra Census.[14] These data seem to be adequately representative of the Parsis in the country as a whole, because nearly 70 per cent of the Parsis in India have been resident in Greater Bombay during the last two decades.

Appendix II shows the age distribution of the Parsis reported by successive censuses during 1881-1971. It is evident that the proportion of the young in ages 0-14 has declined by nearly 43 per cent during the fifty-year period from 1881 to 1931; and according to the data for Greater Bombay, by a further 38 per cent over the forty years between 1931 and 1971 (from 26 to 16 per cent).[15] As a logical converse, the proportion of persons in ages above 60 gradually but steadily increased from only 5 per cent in 1881 to 8 per cent in 1931. Since 1931, however, the proportion of aged has increased dramatically to more than 20 per cent in Bombay in 1971 (an increase of 150 per cent in forty years). Such a high proportion of the aged creates the problem of heavy dependency burden on those in the productive age group.[16] Besides, it apparently contributes also to the postponement of marriage and accentuates the decline in fertility.

Factors Underlying Declining Proportion of the Young and Rising Proportion of the Elderly

If one assumes that international migration had only an insignificant influence on the Parsi population of the Indian subcontinent, the age structure would largely be determined by the recent fertility history of the community. The influence of changing mortality on the age structure is generally small, since persons at all ages tend to share, more or less, the increased chances of survival. Therefore, the proportionate age distribution is not affected significantly by the decline in mortality. Of course, the reduction in death rates tends to make the population somewhat younger because the improvment in environmental sanitation and health services helps to control epidemic diseases which afflict the young to a larger extent than the old. On the other hand, a continuing decline in fertility over two or three generations leads to a smaller proportion of children because the number of children born tends to be smaller than that of the current generation of parents, who in turn are fewer than *their* parents. The changing age structure of the Parsi population, and particularly the declining proportion of the young aged 0-14, observed for nearly 100 years, reflects declining fertility.

Appendix I

This appendix seeks to provide a broad view of the number of Parsis enumerated in 1951, 1961 and 1971 censuses in different states of India. It is evident from Appendix Table 1 that except in Gujarat and Maharashtra, where most of the Parsis are concentrated, there has been a rather rapid decrease in the number of Parsis. However, the number of Parsis in Kerala and West Bengal appears to have fluctuated over the last two decades. It is not possible to judge whether these fluctuations are genuine or result from some misclassification. It may be useful to verify the number of Parsis in these states by collecting information through the help of the local leaders of the Parsi community residing in these states. It is also not possible to know whether the drastic reduction in the number of Parsis in the two successive decades in the southern states of Andhra Pradesh, Karnataka and Tamil Nadu, as well as in Madhya Pradesh and Uttar Pradesh is genuine or whether the problem is one of definition or identification of Parsis. In states such as Orissa and Punjab, where the number of Parsis has been very small, erratic fluctuations can well be expected.

Notes

1 Emigration of some Parsis to countries like Canada, UK and USA might be causing some decline in the population. However, the non-availability of data on the subject precludes an assessment of the contribution of emigration to the decline of Parsi population.

2 This chronicle was composed in Persian by Mobed Behman Kaikobad Sanjana, a Parsi priest from Navsari (about 140 miles North of Bombay) on the basis of what he heard from a 'Dastur' (High Priest). For an account of the exodus of Parsis to India see: Sohrab K H Katrak, "Who Are the Parsees?", Karachi: Pakistan Herald Press, 1965. 5 Census of the Bombay Presidency, 1872, General Report and Tables of the Population, Houses, etc. Enumerated in the Bombay Presidency on the 21st February 1872, Part II, Bombay: Government Central Press, 1875.

6 Almost all the Parsis living in what became Pakistan after 1947, were resident in Karachi. The numbers of Parsis in Karachi in 1941 was 3,721. The number enumerated in Sind was 3,838. The 1951 and 1961 censuses of Pakistan enumerated 5,356 and 5,412 Parsis, respectively. The proportion living in Karachi in 1951 was 94 per cent and 87 per cent in 1961. Census of Pakistan, 1951, Vol 1, Pakistan, Report and Tables, and Population Census of Pakistan 1961, Census, Bulletin No 2, Sex, Urban-Rural Religion, Non-Pakistanis.

7 "Saurashtrian" is a language spoken by a group living mostly in Madurai district of Tamil Nadu. It has been reported in the Censuses of India. Saurashtrian is believed to be a mixture of Gujarati as spoken in Saurashtra in Gujarat state and Tamil as spoken in Madurai district. Apparently, a few centuries ago, some people who migrated from Saurashtra region and settled down in this southern district, developed their own dialect, which has come to be known as Saurashtrian.

7A According to one estimate, the total number of Parsis in the world around 1951 was 140,000 (112,000 in India, 18,000 in Iran, 6,000 in Pakistan and 4,000 in the rest of the world — mostly in the UK, USA, and Canada). *Source*: Sohrab K H Katrak, "Who Are The Parsis", *op cit*, p 252.

8 In the Indian censuses, the sex ratio is measured in terms of the number of females per 1,000 males which is a continuation of the British practice. The present paper defines the term 'sex-ratio' as is done in most other countries of the world.

9 For 1881 the sex ratio of the population by migration status was available from the census and indicated that the sex ratio of the Parsis born in Bombay was 1026; whereas among those born elsewhere it was 1248. See: Imperial Census of (India) 1881, "Operations and Results in the Presidency of Bombay Including Sind", by J A Baines, Vol 1, Text, Bombay: Government Central Press, 1882, p 76.

10 Same source as in footnote 9.

11 The corresponding proportion for the total population of Greater Bombay in 1961 was 36 per cent. The 1971 Census data on place of birth are not yet available.

12 Sex-selective emigration and/or the greater longevity of Parsi females could be contributory factors.

13 In order to understand the causes for the decline in the absolute population during 1951-61, a sample survey of the Parsis of Greater Bombay was undertaken by the Census Office of Maharashtra state at the request of the Parsi Panchayat. The main objective of the survey was to ascertain the "reasons for the increasing proportions of 'Never Married' persons among the Parsis and for the low fertility of Parsi women."

The sample, consisting of about 20 per cent of the Parsi households in Greater Bombay, was drawn on the basis of the 1961 census household schedules. The census schedules did not bear the identification of the religion of the household heads; therefore, judgment, based on the names of members, was sometimes necessary to compile the sampling frame. The Parsi names are quite distinct, so that this procedure is unlikely to have introduced any significant bias. A non-response rate of about 19 per cent is more disturbing, but perhaps could not be avoided due to a lapse of nearly 15-18 months between the census and the survey. In all, the sample consisted of 9,215 persons, about 18 per cent of the total Parsi population in Bombay. For unknown reasons, the 1962 survey is referred to as the 1961 survey in the relevant census report.

The special tables and some results of the survey have been published in: Census of India, 1961, Vol X, Maharashtra, Part X (10), Parsis of Greater Bombay, Bombay: The Maharashtra Census Office, 1971.

14 The cards relating to Parsis were obtained by sorting approximately 1.2 million cards for Greater Bom-

* The 1931 census age distribution was smoothed, to remove the heaps at ages ending with 5s and 0s at the initial stage of tabulation itself, by grouping the single year age data into alternate three and seven year age groups beginning with age 4. Thus, the years 4, 5 and 6 formed the first three-year age group, followed by 7-13—a seven-year age group. From such grouping, the conventional five-year age distribution was obtained by a process of combining the halves of two adjacent age groups. This type of smoothing procedure introduces non-comparability in studying time-trend, because the age distributions in earlier censuses were not smoothed. So the 1931 age data were first desmoothed to obtain the ternary and septenary age groups. The conventional five-year age distribution is then obtained by using the single year age distribution of 10 per cent sample population of India available from the 1951 census. The assumption is that the errors in the 1931 age distribution were similar to those in the 1951 distribution.

Census of India, 1961, Volume X, *Maharashtra*, Part X (1-D), *Parsis of Greater Bombay*, Bombay: The Maharashtra Census Office, 1971.
Data compiled from the 20 per cent urban sample of Greater Bombay for 1971 census.

bay on religion column where a special code was provided for Parsis (these cards pertained to the 20 per cent sample of Greater Bombay Population of about 6 million). The number of cards obtained (12,740) formed 19.7 per cent of the total number of Parsis in Greater Bombay. The sex-ratio of the sample population, however, was 994 as against 954 for the entire Parsi population in Greater Bombay. It thus appears that males are somewhat over represented in our sample compared to their proportion in the total population.

15 The proportionate age distribution of the Parsis in the country as a whole and of those living in Greater Bombay was very similar at each census. This further supports the applicability of the estimates based on Bombay data for all India.

16 The elderly members of the community would need financial as well as psychological security. In India, the State does not provide social security in the form of old-age pension and, therefore, the younger members of the family have to support the aged. If and when they are unable to or unwilling to shoulder this responsibility, the Parsi Panchayat has stepped in to relieve or prevent the likely distress. While one admires the generosity and foresight of the leaders of the Parsi community, who have made possible the organisation of community assistance, the rising proportion of the aged and their prolonged survival inevitably create difficulty in providing assistance that would match the strong inflationary pressures in the economy during the past three decades.

Conversion of Coal into Oil and Chemicals

A Technology for Self-Reliant Growth

S N Ghosh

Coal is our most important mineral resource, but we have neglected its use both for energy and as feedstock for chemicals.

India's objectives in coal utilisation should be to produce:

(i) smokeless coke, coal gas, etc, through low-temperature carbonisation plants;

(ii) liquid fuels/chemicals by hydrogenating the coal tar residues of the low-temperature carbonisation plants;

(iii) liquid fuels (diesel, kerosene, petrol) and gases from coal; and

(iv) clean 'power gas' for both higher power generating efficiencies and preservation of a clean biosphere.

I

OUR energy planning and the entire trend of our development has ignored the basic principle that the country's natural resource endowment has to form the basis of development. We have set up industry after industry, oriented them to the 'sophisticated' technologies of the West, forgetting that these technologies were tailored to the resource availabilities for the West. Even now, the need for basic resource development has not found its due recognition.

Both for energy as well as feedstock for chemicals, this neglect of basic resource development its reflected in our neglect of coal prospecting, coal development and coal utilisation.[1] Coal is our most important mineral resource. Its primacy as a mineral resource is established even on the world scale. Long after oil's exhaustion, coal will continue to provide the world with energy and chemical building blocks. This fact should set the long-term perspective. Newer inventions and breakthroughs in technology will also lead to newer methods of coal utilisation.

India's coal reserves, though large, are small compared with those of the USSR, the US, and China. Between them these three countries account for some 88 per cent of world reserves. The UK, West Germany, Australia, India, Canada, South Africa, and Poland, together account for only 8 per cent. This further underlines the need to observe scientific methods of mining and to ensure the most beneficent use of each category of coal.

The basic difference between coal and petroleum is that the latter has a high hydrogen content. Petroleum fuels contain as much as 10 to 12 per cent hydrogen, the rest being carbon — and some sulphur whose percentage varies from a fraction of 1 per cent to 4 per cent. Coal, on the other hand, contains about 4-5 per cent hydrogen and 70-90 per cent carbon: the rest is oxygen, with minor quantities of nitrogen and sulphur. However, coal is contaminated with a fairly high percentage of mineral (matter), termed 'ash'. If the ash is separated, oxygen removed, and hydrogen added in suitable proportions, coal can be transformed into oil. The German chemist, Bergius, attempted conversion of coal into oil by a process of chemical reaction involving the addition of hydrogen under high pressure in the presence of a catalyst.

II

Three Stages of Technological Development

Bergius patented the hydrogenation of coal and other *solid* carbonaceous material of vegetable origin using hydrogen under pressure and at temperatures between 300 and 500°C. Although products obtained from hydrogenation by the original Bergius process were of poor quality, and were high in oxygen, nitrogen, and sulphur compound, and consisted chiefly of the less volatile, high-molecular-weight hydrocarbons, the process was improved subsequently. I G Farbenindustrie succeeded in the twenties in finding catalysts that increased the velocity of coal hydrogenation reactions, thereby reducing the problem of polymerisation, within the reaction chamber, of the primary products resulting from thermal dissociation of coal. Metallurgical research, too, succeeded in developing alloy steel resistant to hydrogen embrittlement. (Embrittlement of the metal here is due to the destructive action of high-pressure hydrogen at elevated atmosphere.) But the engineering tasks involved in the pumping of coal-oil paste and discharge of the heavy oil

AIR TRAVELLERS URGED TO GET HEADS OUT OF CLOUDS

GENEVA—Travellers to the Alps should keep their eye on the ground and the water to avoid missing some treats, according to the appropriate air carrier*.

Examples cited are river cruises on Rhine, Rhone, or Danube; health resorts and beauty farms; luxury bus tours between Madrid and Budapest; schools and courses; two-day "Alpine Hideaway" arrangements at country inns, very pleasant yet inexpensive; and so on.

(See the "Alpine Highlife" kit mentioned elsewhere in this issue.)

Energy Surplus: Alpine Cures Suggested

ST. MORITZ—The energy shortage has probably been less noticeable in the Alps, with their ample water power, than in some other parts of Europe.

More pressing is the question of surplus energy stored up by holiday-making visitors.

A colour brochure issued by an airline* as part of a kit of 12 called "Alpine Highlife" suggests various remedies: sports facilities in Switzerland and Austria.

The first outlet for energy is available at more than 300 "Vita Parcours" jogging circuits all over Switzerland, incorporating obstacles, parallel bars, swings, weights, etc. The brochure remarks dryly, "The Vita Parcours are a service to public health and *free of charge—therefore never crowded.*" (Italics ours.)

Energy from the Alps. Livigno (Grisons)

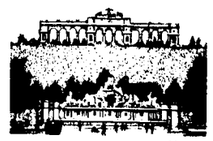
Guided hiking, mountaineering, and rock-climbing are next on the list. Seven-day excursions will delight the enthusiasts. For these, advance booking is advised.

In search of level rather than uphill movement, the energetic traveller may hire a bicycle at the airport, or the Swiss Federal Railways will have a "vélo" waiting for him at a specified station, to be dropped off at any other Swiss station afterward.

There are bicycle routes through many scenic (and comparatively level) parts of the country.

Golf and riding are other readily available energy-users.

Canoeing, sailing, and gliding allow Nature to reinforce the muscles.



Swissair or your IATA travel agent will gladly put you in touch with the right people.

STOP! LOOK! PROCEED!

To Rush or Not to Rush

Athens

Vienna

THAT, INDEED, is the question for the Zurich-bound traveller. The celebrated Bard of Avon may well have made a soliloquy on the issue, were he around today and flying Swissair.

He surely would have pondered at some length whether or not to stop off at Athens or Vienna on the way to Switzerland from Bombay, and with good cause.

A sojourn in either city is devoutly to be wished, by those who have the time. The airline of the Alps touches Athens every Tuesday and Saturday, and Vienna on Fridays. There are numerous pleasures to be enjoyed in both these amazing cities, for as long as one likes.

When alas, the inevitable moment of departure can no longer be postponed, there are daily Swissair flights ready at hand to take off for Switzerland, or wherever.

Useless Information about the Alps

THE TWO SWISS half-cantons of Appenzell Ausser-Rhoden and Appenzell Inner-Rhoden are completely surrounded by the Canton of St. Gall. A piece of Germany is enclosed by Schaffhausen Canton and the Rhine; a piece of Schaffhausen by Zurich and Germany; two pieces of Canton Solothurn by Berne, France, and Basle.

Campione is an Italian village surrounded by the Canton of Ticino (the name, appropriately, means either Champion or Sample of Italy). It lives handsomely off its gambling casino (not allowed in Switzerland).

Conversely Chiasso, the southernmost town in Switzerland, is only 56 km from Milan, and thus the favoured recourse of Italian companies to get their foreign letters off whenever the Post Office is on strike.

CHUR (Grisons)—The Canton of Grisons long held out against all motor traffic. One compromise was to allow automobiles, but only if drawn by horses. Final capitulation did not come until 1927 (the year Henry Ford produced his fifteen-millionth automobile and introduced the Model A; Lindbergh flew the Atlantic in 33½ hours).

* SWISSAIR

Bombay 29 35 35

Bangalore 5 48 62

slurry containing the coal ash, unreacted coal and catalyst particles were indeed very difficult.

In India, where most coals contain 25-35 per cent 'ash', the Bergius process would have resulted in an even greater problem of avoiding polymerisation (within the reaction chamber) of the products of thermal dissociation of coal. The problem of discharge of the heavy-oil slurry containing coal ash, unreacted coal, etc, would also be greater.

The next stage was hydrogenation of tar. Tar being a semi-liquid, its hydrogenation was a less cumbersome engineering task than was the hydrogenation of coal. The German company BASF (in the I G Farben group) developed this process. In this process, no solid material, other than a very small amount of catalyst powder, needed to be either introduced or removed from the high-pressure vessels. In other respects, however, the hydrogenation of tar presented the same problems as the hydrogenation of coal.

The problems of hydrogenation of solid coaly matter became avoidable in the twenties when a newer technique developed. This was to pass steam over red hot coke, produce carbon monoxide and hydrogen, and then cause a reaction of these two gases in the presence of a catalyst.[2] Developed by two German scientists, Franz Fischer and Hans Tropsch, this reaction is also known as indirect hydrogenation of coal. This is a versatile technique and a wide range of hydrocarbon fuels and chemicals including high-value organic acids and oxygenated compounds (alcohols) can be obtained in this process by adjusting the reaction conditions — by changing the catalysts, the temperature, and the pressure. During the Second World War, the Germans produced automotive fuels and chemicals by this route. They also produced butter from the fatty acids yielded by waxes obtained through this Fischer-Tropsch synthesis.[3] The Sasol plant in South Africa is based on this very reaction technique. This plant is producing petroleum products and a large variety of chemical products numbering about 80.

From hydrogenation of solid coal to hydrogenation of semi-liquid tar, and therefrom to hydrogenation of carbon monoxide obtained from coal, forms a series of developments which, from the twenties to the forties marked oil-deficient Germany's brilliant advance in substituting natural crude.

These are milestones which give hope to oil-poor countries; for coal is more evenly distributed over the world than is oil. Even when oil sources are depleted, the liquid fuels and chemical building blocks can still be obtained from coal.

III

India's Objectives for Coal Utilisation

It is true that India is not alone in neglecting its prime fossil fuel-cum-source of (chemical) feedstock, namely coal. Lawrence Lessing writting in *Fortune* (November 1973) bemoans that in the USA, "no other great national resource has been so neglected as coal". "Although the US was blessed with those bountiful reserves, American ingenuity has been confined to inventing more efficient ways to mine them, a field in which the US still leads. The few developments that threw light on coal's potentially higher uses all came from Europe . . .".

The USA's relative neglect was possibly explainable, for it had vast resources of the more convenient oil and natural gas and has vast tar-sand and oil-shale resources. But neglect of coal in our situation was criminal. What is even more unfortunate is that the same blind imitation of the affluent countries' sophistication which had led to our present impasse, is still very much with us. It is likely to take us in some wrong directions again.

In the USA, the new stress on coal-based development is pursuing three main objectives. Since natural gas came to occupy a large part of the American ciitzen's way of life, the USA has to try to produce a gas of high heat value to supplement the natural gas flows through their existing pipelines and distribution networks. Their second objective is to replace much of the natural gas, fuel oil, and raw coal now burnt in electric power plants with a cheap clean "power gas", which in spite of its lower rating of BTUs, would be capable of generating higher efficiencies in steam-cum-gas turbine system.[4] The USA's third objective is to produce a range of synthetic oil products.

In India, we do not have a network for distribution of town gas. So the question of a fresh scheme for producing town gas ought not to arise here. Our urban elite should be satisfied with smokeless domestic coke; and all our efforts should be directed to producing and supplying this coke. The consumption of LPG and kerosene as cooking fuel should be restrained. LPG is valuable as a feedstock for chemicals. Hence we cannot afford the "sophistication" of burning Indane, Burshane, Esso-gas, Cal-gas, etc. A number of low-temperature-carbonisation plants for production of smokeless domestic coke should, therefore, be given high priority.

Schemes for production of methane-rich gas for domestic use are not necessary in India. For there is no sense in incurring large capital costs on building gas distribution networks; and secondly because our coal resources need to be conserved. The account given in the opening section of this article would show that India's coal reserves are not really large in comparison with those in the USA, USSR or China. The problem of fuel for our villages has to be solved through replanting religiously the quick-growing trees which are suitable as firewood. Their list has been prepared by the National Commission of Agriculture. But this requires organisational effort at the grass-root level.

The difference between the US situation and the Indian one needs to be underlined because there are many in our country who gloss over the distinction between coal gasification for producing methane and coal gasification for producing a mixture of carbon monoxide and hydrogen. We do not need the former but we urgently require the latter. The former is the product of complete gasification of coal with oxygen under pressure: the latter is the product of partial oxidation of coal.[5] The two technologies are different.

India's objective of coal utilisation should be to produce:

(i) smokeless coke, coal gas, etc, through low-temperature carbonisation plants;
(ii) liquid fuels/chemicals, by hydrogenating the coal-tar residues of the LTC plants;
(iii) liquid fuels (diesel, kerosene, petrol) and the gases from coal;
(iv) clean "power gas" (for industrial use) for both higher power generating efficiencies and preservation of a clean biosphere.

To repeat, the USA's third and second objectives are our objectives, too. But we have no reason to subscribe to its first objective.

IV

Advantages of Fischer-Tropsch Reaction

In India, an attempt was made in the immediate post-Independence period to convert coal into oil and chemicals. In May 1948, the Government of India invited the Koppers (Pittsburg)

to "cover a project study of various schemes" for producing synthetic oil from Indian coals. In October 1948, the company submitted a preliminary report giving preliminary data on the technical and economic feasibility of installing synthetic liquid fuel plants in India. It included the study of six processes, chosen on the basis of possible adaptability to Indian conditions. Five out of the six processes examined were of the Fischer-Tropsch type "each employing a different method of making synthesis gas, which is an intermediate product from which synthetic fuel is made. As primary raw material for the synthesis gas, one process uses coke; a second, coke oven gas; and the three others, coal". In addition to the various processes of Fischer-Tropsch reaction described above, the report included a discussion on producing liquid fuel by the hydrogenation of tar obtained from low-temperature carbonisation of Indian coal.

The final report of 1949, which followed conferences in New Delhi regarding India's requirements, recommended a complex, combining LTC, Tar Hydrogenation and Fischer-Tropsch synthesis. It recorded that, the tar obtained from the LTC (low-temperature carbonisation) plants (Lurgi process) he hydrogenated to aviation petrol, and that the char obtained from the LTC be used as a raw material for synthesis gas, for production of petrol, diesel oil, fuel oil.

Undoubtedly, the reason for studying as many as five variants of the Fischer-Tropsch reaction technique, out of a total of six processes examined, was the great advantage of Fischer-Tropsch reaction. As explained earlier, this reaction does not seek to hydrogenate the solid coal or the semi-liquid tar. It seeks to burn coal in the presence of only a limited quantity of oxygen for the twin purpose of:

(i) obtaining carbon monoxide, hydrogen (the impurities apart);
(ii) increasing the quantum of hydrogen in the carbon monoxide-hydrogen mixture.

Then, after purging the impurities (by scrubbing with methanol), it gets the pure gases of hydrogen and carbon monoxide to react under a certain temperature and pressure in the presence of a catalyst. This hydrogenation of carbon monoxide gas is much easier than the hydrogenation of either coal or coal tar.

Since hydrogen and carbon monoxide gases are basic to any fuels or chemicals, this reaction can be made to yield any fuel or chemical by suitably adjusting the carbon monoxide-hydrogen ratio, the catalysts, temperature and pressure.[6] Fischer-Tropsch reaction is thus the most responsive to the changing demand patterns. Since purification is built into this synthesis process, its products are the cleanest (non-polluting) possible. Its operation presents less formidable engineering problems than are presented by the direct hydrogenation of the solid coal or the semi-liquid tar. Moreover, it can take any kind of coal, particularly if the powdered coal gasification process is adopted. Naturally, the Fischer-Tropsch plant is expensive.

But there is no basis for comparison of costs with the plants for direct hydrogenation. For, the commercial process of direct hydrogenation of solid coal is yet to be established; and, there is just not enough coal-tar to be hydrogenated.

In spite of the high cost of the Fischer-Tropsch plant, it is commercial, even from the private industry's criterion of 'profitability'. From the standpoint of national economics, its score is even higher. For national economics takes into consideration the benefits of import substitution, jobs to people, opening up of new fabrication facilities, etc.

V

Tar Hydrogenation No Substitute for Fischer-Tropsch

Since there are many in our country who, even now, talk glibly about examining the economics of Fischer-Tropsch plant *versus* those of tar hydrogenation plant, it is necessary to reiterate that it is wrong to contrapose the two. Both are musts. It is necessary to build coal-tar hydrogenation plants for the economic utilisation of the LTC residues. It would be wasteful not to hydrogenate the tar. But one must know the limitations of tar hydrogenation. Tar is not, and will not be, plentiful. Hence tar hydrogenation cannot be a substitute for Fischer-Tropsch synthesis.

Fischer-Tropsch opens the door to producing as much liquid fuel as we may need. It is subject only to our capacity to produce the required quantities of coal. In order to start the base for a new technology, if for nothing else, we must have experienced in operating at least a one-million-tonne plant, based on Fischer-Tropsch technique. Our purpose is not just to produce one million tonnes of liquid fuels but to scale up/multiply the plant as soon as we have mastered the technology.

To put tar hydrogenation on the same footing as Fischer-Tropsch is to commit a serious error. The progression of the two techniques indicate that there has been a great difference in their appeal, which could not have been without reasons.

The "Chemistry of Coal Utilisation" edited by H H Lowry (sponsored by the National Research Council Committee of the US), stated in its 1945 edition that the hydrogenation of *low-temperature* tar had "been studied" in Great Britain, Germany and Russia. Referring to Britain, it mentioned only one experimental plant "with a capacity of 1 to 2 tons (200 to 400 gallons) per day", erected and operated at the British Fuel Research Station in Greenwich.

Even in Germany, which under Hitler adopted a policy of 'forced engineering' to achieve self-sufficiency in synthetic fuels, the coal hydrogenation plants "temporarily processed also low-temperature coal-tar" (Lurgi report to Government of India). This shows that coal-tar hydrogenation, although less cumbersome than coal hydrogenation, had no great appeal.

In contrast, the Fischer-Tropsch plants spread rapidly in many countries of the world, following the work of these originators in the twenties and early thirties. In 1932, Fischer and his co-workers considered their process sufficiently well developed on a laboratory scale to merit pilot-plant experimentation. And in 1933, the Ruhrchemie AG undertook the construction of a plant of 1,000 tons/year capacity.

At the end of 1936, five plants, aggregating a capacity of 145,000 tons of primary oils per annum, were either completed or under construction. During 1937 and 1938, the capacity of these plants was increased to 300,000 tons; and towards the end of 1938, additional plants were under construction to yield an annual total of 525,000 metric tons. In 1939, Germany was reported to have been producing at the rate of 500,000 tons per year of gasoline, diesel oil, and paraffins by Fischer-Tropsch process (see Appendix).

The appeal of the Fischer-Tropsch technique was not limited to Germany in the pre-War period. Japan had two plants with a total output of 150,000 tons. Besides, three others of a capacity of 50,000 were under construction. France had a plant of 20,000 tons/year capacity.

The Fischer-Tropsch plants would have continued to spread, if the cost of natural crude had not become cheaper in the post-World War period following a large number of oil discoveries and/

or if the US occupation authorities, in order to subserve the interest of the oil companies, had not dismantled the Fischer-Tropsch synthesis plants in the occupied countries.

The reasons for the remarkable spread of the Fischer-Tropsch plant, within about seven years of its origin, was explained by H H Storch in terms of its flexibility in the uptake of raw materials and variability of output patterns. "The Fischer-Tropsch process is a remarkable one because of its great flexibility, both as regards raw materials and products obtainable. A variety of types of coke and coal may be used as raw materials for synthesis gas production, and the proportion of gasoline and other products may be varied considerably."

Besides the advantages enumerated above, Fischer-Tropsch has another factor in its favour. Coal tar involves operation at a high pressure of about 200/300 atmospheres. Naturally, hydrogen, too, has to be compressed to the same 200/300 atmospheres. If any inert compound is associated with hydrogen, the compression cost would be excessive. On the other hand, Fischer-Tropsch can operate at a lower pressure, at about 1-30 atmospheres. Even if any inert compound is associated with hydrogen, the compression cost in this process would be far lower.

Incidentally, some people have a notion that hydrogenation of tar would permit greater scope to our indigenous fabrication facilities than the Fischer-Tropsch reaction. Since neither is dispensable, this kind of comparison is meaningless. But if any comparison is to be made, greater advantage will be found to lie on the other side. Since tar-hydrogenation is a high-pressure operation, we would have to import high-pressure tar compressor, hydrogen compressor, high-pressure reactor, high-pressure valves, tubes, etc. Besides, tar being a corrosive material, the use of ordinary carbon steel will not be possible: stainless steel will have to be used right from the pipes and valves to the instruments and control systems.

Fischer-Tropsch reaction will, on the other hand, permit the maximum indigenous equipment. Even the synthesis reactor could be built in the country right now, if the process licensor agreed to give the drawings. Fischer-Tropsch, moreover, does not consume much power or steam.

To repeat, tar hydrogenation is no alternative to Fischer-Tropsch. We must hydrogenate all the tar that is available. And we must have Fischer-Tropsch. Our policy-makers have to be alert against two possible sources of confusion. The international oil interests find a threat from Fischer-Tropsch: They would therefore work overtime to build up inhibitions against the process. At the same time, International design and engineering firms, which have lagged behind in developing processes for utmost production of synthesis gas (hydrogen and carbon monoxide), will also like us to wait until they have developed *their own* 'advanced' processes in this field.

VI

Tar Hydrogenation and Fischer-Tropsch Not Necessarily Parts of One Complex

There is yet another school which does not pose tar hydrogenation as an alternative to Fischer-Tropsch but wants to lump the latter with the former, whenever any proposal for synthetic oil comes up. Possibly, this school is guided by the Lurgi report of October 1955. The report pointed to the demarcation line. It stated repeatedly that low-temperature carbonisation and coal-tar hydrogenation form one group and that Fischer-Tropsch synthesis forms another group. Therefore, to insist that Fischer-Tropsch must be considered together with coal-tar hydrogenation would not be correct.

In the interest of clarity it needs, however, to be pointed out that Lurgi — even after pointing out the broad divisions — had tried to link these together by a process of its own. It stated that, if its own gasification process is adopted in the Fischer-Tropsch section, then that gasifier too would yield tar; also that this tar (from the gasifier) could be sent back to the plant whose main job was to hydrogenate the tar from the low-temperature carbonisation unit.

There was, therefore, a case for clubbing both tar hydrogenation and Fischer-Tropsch synthesis, if we expected the Lurgi gasification process to be adopted in the Fischer-Tropsch plant. But that question has already been disposed of by a Committee of Experts, which had been set up to find out the most suitable coal-gasification process for synthesis gas.

The gases required for Fischer-Tropsch synthesis are the same as those required for ammonia synthesis. Up to the gasification and gas purification point, the processes for coal-based fertiliser production and synthetic oil production are the same. Hence the opinion of the Committee of Experts — which examined in detail the merits and demerits of the various gasification processes for the coal-based fertiliser plants at Talcher and Ramagundam and Korba — is relevant.

It stated that the pulverised coal gasification process of Koppers is much more suitable than the Lurgi process. Since the primary aim of the Lurgi process is to produce the methane-rich town gas/industrial fuel gas, it is not desirable for synthesis gas production.[7] Further, the Lurgi process does not permit a wide choice of suitable coals and it cannot take coal with low ash-fusion temperature. The Committee therefore said that the Koppers process — in spite of its higher consumption of oxygen and higher reaction temperature, held a much greater advantage.

These fundamental considerations about the basic raw materials and product yields enjoin us to adopt the Koppers gasification process. Since this process does not produce any tar in the gasifier, the last faint justification for considering tar hydrogenation and Fischer-Tropsch as inseparable and interdependant parts of a single complex disappears.

Disapproval of Lurgi's gasifier does not mean underrating Lurgi's potential for contributing to the solution of India's energy/feedstock problems. In both low-temperature carbonisation and tar hydrogenation, Lurgi has a claim in the world. Even in developing the fixed-bed reactor for producing the heavier petroleum products *from* synthesis gas, Lurgi was Ruhrchemie's partner. At Sasol, it did the process design for the Arge Reactor. (Detail design for both was, however, done by Kellogg in co-operation with Uhde of Germany; and the erection was done by Kellogg alone.) In our all-out drive for energy sufficiency, we may take process licence from Koppers, Lurgi, Kellogg, Uhde in their respective spheres of strength — without tying ourselves to any particular company.

VII

Fischer-Tropsch Synthesis Plant Meets Test of Commercial Viability

Since Hitler's Germany produced synthetic crude from coal for strategic reasons, an idea has gained ground that conversion of coal into oil and chemicals can at best be a strategic project and that it cannot be economical. A standing refutation of this idea is

the handsome profit being reaped, year after year, by the Sasol plant in South Africa, currently the world's only operating plants[8] (see Appendix).

It needs however, to be noted that these figures can give only a rough idea, for no other country would possibly build identical plants and operate in identical conditions. The gasifiers at Sasol produce a large percentage of methane gas for use as fuel gas by the industries in the neighbourhood at the cost of liquid fuels and chemical feedstocks. As against this, all our products will be liquid fuels/chemicals fetching high revenues. The second difference is that the Sasol profit figures include the income from an ethylene plant, a styrene plant, and a butadiene plant which are not based on coal. Thirdly, these figures include the loss on account of Sasol's venture into oil exploration.

Sasol's balance sheet for the year ending June 26, 1971 showed its assets valued at Rand 111.9 million.[9] Its share capital (fully paid) was R 109.75 million; capital reserve R 0.9 million and revenue reserve R 9.5 million. As against this, its long-term laibilities stood at R 46.6 million.

Significantly, Sasol's turnover during 1971 stood at R 81.5 million (as against R 72.2 million in 1970 and R 45 million in 1967). According to Sasol's Chairman (*vide* his statement in the annual general meeting on November 11, 1971), "although it is difficult to calculate the relative contributions of the Sasol and Natref plants (the latter based on petroleum) because of the continuous interchange of blending components, it is safe to say that, after discounting the price increases, the contribution by the Sasol plant to the turnover amounted to not less than R 76 million during the year".

The overall profit in 1971 was R 7.9 million (equivalent to about Rs 9 crores in Indian currency) despite some loss on oil exploration.

It is true that most of the equipment of the Sasol plant was installed many years ago and that the historical cost of the plant can hardly be used for working out the economics of a plant to be set up now. But it is also true that the earlier benefits, too, have become historical. A Fischer-Tropsch plant's contribution, in terms of the value of import substitution as also profit-earning, has multiplied after the series of crude price increases in recent years.

In a paper presented at a Seminar in Rumania in 1971, J H Gevaars and C W Schutte (both from Sasol, the former a senior Process Engineer and the latter a Techno-economist) worked out the plant costs, production costs and income if Sasol were now to build up a new plant of 2.5 million tonnes capacity, using its existing technology (i e, gasification which produces a large quantity of methane, which is not desirable for F-T synthesis but is useful as fuel gas to the neighbouring industries). The authors say that the total plant cost would be $ 503 million and the yearly operating cost $ 63.5 million. As against this, the annual income for products would, on 1970 prices, be about $ 141.8 million. Allowing for interest, tax and depreciation, it would yield 15.5 per cent return on investment. If the OPEC decision for increase in crude price had been taken prior to the preparation of this paper, the authors would have certainly shown a brighter prospect for profits.

VIII

Exaggerating Cost Estimates and Underrating Yield Values

In spite of the bright economic prospect of Fischer-Tropsch synthesis, there are many in our country who harp on the high investment costs of the F-T synthesis plants. We submit, the investment costs on a F-T plant (including its gasification, gas purification, synthesis reactor and condensation equipment) is much lower than is generally imagined. This author had the benefit of a look into the preliminary cost-calculation, made jointly by the specialists in the design and costing of coal-dust gasification and gas purification plants and the specialists having the longest association with F-T synthesis. This emboldens him to say that the cost of an F-T plant producing one million tonnes of oil products (from coal) will be about Rs 300 crores, if energetic steps are taken right now.

If we take into account the substitution of imports worth about Rs 90 crores per year, which is the landed cost of one million tonnes of crude, there can be no doubt that this project ought to be very high on our priority list.

The value of yields from a Fischer-Tropsch plant will be far more than Rs 90 crores, for an F-T plant goes beyond producing synthetic crude. It distills the crude into fuel and chemical products, too. In this respect it covers a large part of the job of a petrochemical refinery, i e, a refinery which extends beyond producing fuel products to the making of chemicals (see Appendix).

A Fischer-Tropsch plant of the above capacity, if based on powdered coal gasification process, will also yield tail gas, which after reformation, can be synthesised into about 500 tons of ammonia per day. Undoubtedly, this is the production of a large ammonia plant. The country would not have to spend anything extra for either gasification or purification of the gas for ammonia synthesis.

If one has to hear the plea of 'lack of funds' for such a versatile project — a project that (i) produces crude oil out of coal; (ii) does most of the processing of this crude into products which are cleaner[10] than the refinery products; (iii) yields the basic chemicals which would otherwise have to come from the naphtha route; (iv) covers most of the way to ammonia synthesis; and (v) is flexible enough to switch over to any product-mix in response to changing demand patterns, then one cannot help feeling that there is something basically wrong with our order of priorities.

The particular confusion over the subject is amazing. There are some who argue that our resources permit a 'coal gasification plant' but not an F-T plant. In other words, we have money for producing methane, but not for producing synthesis gas and converting it into liquid fuels. We have noted earlier that coal gasification for producing pipeline gas (methane) is not essential in our context[11] and that even our elite should be content with smokeless coke. If we seek to produce methane from coal, instead of synthesis gas for liquid fuels, we are turning our priorities upside down.

One would like to ask: What is the difference in cost between a methane production plant and a Fischer-Tropsch plant of equivalent capacity? Here is the evidence of Jan C Hoogendoorn, Manager, Process Division of Sasol:

> "Finally some words on the economics of the Fischer-Tropsch operation. The total cost will . . . be heavily influenced by the presence or absence of infrastructure, start-up costs, etc. Some idea of the investment can, however, be obtained from the cost figures given to the FPC[12] for SNG[13] plants in New Mexico. A Fischer-Tropsch synthesis plant would be very similar to such an SNG plant up to the point where pure synthesis gas is produced. The methanation section would be replaced by the Fischer-Tropsch synthesis and the product recovery must be added. As a rough indication we can indicate that we estimate the cost of the synthesis units proper with the primary product recovery section to be more or less equal to the estimated cost of the gasification plus raw gas purification unit . . .".

In other words, we have to subtract from the overall SNG plant the cost of the methanation section and then add the cost of the synthesis reactor or reactors along with the product recovery section. At Sasol, there are two synthesis reactors. India may not need more than one. This being so, the cost of an F-T plant would not be very much higher than that of an SNG plant of equivalent capacity.

If still, there is a tendency in some quarters to avoid F-T plants, it can be explained only in terms of the effect of decades-old propaganda by oil interests against Fischer-Tropsch synthesis.

Yet another source of confusion is the uncritical acceptance of the input-output ratios given by foreign sources. We are told five to six tonnes of coal will be needed to produce one ton of oil. Some people think that the ratio would be 7:1. Both of these are wrong. At Sasol, if five (or even six) tonnes of coal have been yielding one tonne of oil, it is because a large quantity of pipeline gas (methane) is being produced out of the coal input. If the pilot plant in Princeton based on COFD process of FM Corporation produces only a barrel or two per tonne of coal, it is because this process seeks to produce (i) char to fire utility boilers, (ii) medium-Btu gas for subsequent upgradation to pipeline gas, and (iii) synthetic crude oil. But in India, the entire coal input of an F-T plant will be devoted to producing liquid fuels and chemicals.

Indian specialists in synthesis gas production have calculated that 2.8 million tons of Raniganj coal will yield one million tonnes of oil. But one million tonnes of coal will be needed additionally to provide the drives. This means, a total input of 3.8 million tonnes of coal would be necessary to produce one million tonnes of oil. This tallies with the estimate given in a recent article in the *Petroleum Economist*. It says "the production of one ton of oil from 3.5 tons of coal has plainly become a more attractive proposition since the rise in world oil prices".

IX

Burden of Wrong Perspective

It will be strange, indeed, if the country spends money on creating new refining capacities based on imported crude but pleads lack of funds to convert its own coal into oil and chemicals. Through the Oil Industry Development Bill, the Government has sought to convey that it will have surplus money after spending on oil exploration and that it would like to invest this in the expansion of refining, fertiliser and petrochemical capacities. On the contrary, we should spend the accruals from the new cess on only two types of efforts — *viz*, exploration for natural crude oil; and production of synthetic oil from coal.

In the fifties, government policy was on the right track in launching an oil exploration with indigenous efforts. But, in its zeal for exploration of natural crude, the need to produce synthetic oil was lost sight of. When the crude price was cheap, the burden of this mistake could somehow be borne. It cannot be borne now, when the price of imported crude has trebled in just one year. (The present price is seven or eight times the lowest actual selling price in the sixties.)

There is no doubt that this country will find considerable quantities of oil and gas, both onland and offshore. But that is no research why we should ignore the principle of walking on two legs. Production from the new fields should first go to substitute our existing oil imports. It should replace the imports of the Haldia, Visakhapatnam, Cochin and Trombay refineries. If the new discoveries are so large as to permit a yearly production rate which is in excess of our total substitution requirements, then alone should we set up new crude processing facilities.

It is quite wrong to create crude-processing capacities of petroleum-product-based fertiliser or chemical plants ahead of oil discoveries. For, this will only generate in-built compulsions for higher imports. Matching the time-scale, between the discovery of more crude and the installation of new refining capacity, is possible; and none need worry on that score. For, there is a time-lag of a few years between the discovery of reserves and the commencement of crude production; the lead-time for a refinery, too, is nearly the same.[14] If we can develop speed in the former, there is no reason why we cannot reduce the time-lag in the latter.

Considerations of national economic security and political independence demand that until such time as a comfortable oil situation arises, the country must bend its efforts to produce more hydro-electricity and more coal (and thermal power) to meet its additional energy requirements without incurring additional liabilities for the oil industry. The country will have to meet its essential oil needs from synthetic crude, and its fertiliser and chemical base-stocks from coal. Luckily, *almost* the entire range of chemicals which we now get from oil can be obtained from coal. It involves a different route, and so it requires a different integration of production processes at source. Fischer-Tropsch reaction again holds the key position in this alternative system of fuels and chemicals planning.

If we do not follow this perspective we might find ourselves in an even more desperate situation in the future. After spending a total of Rs 700 crores on the 6-million tonne Mathura refinery and the pipeline for the crude to feed it, we might not be able to find the additional Rs 500 crores annually to finance crude imports. (A new 6-million ton refinery will add this liability to the country's annual oil import bill. The refinery and the pipeline may, in that case, have to remain idle.[15] Besides, we would have missed the opportunities for developing alternative energy resources with the same capital. The burden would be more unbearable, since we would have to continually pay interest to foreign countries which loaned us the capital.

If the country could incur the capital cost of the Mathura Refinery-cum-pipeline (Rs 700 crores) and the cost of four years' import of crude on (Rs 2,000 crores) F-T plants, it could build facilities within the country for producing an assured amount of 6 million tonnes of oil — and chemicals — annually. This would also include the costs of mine development. If we take into account the cost of port development facilities, tanker facilities, etc, which would have to be provided for importing foreign crude, we would realise that the potential of developing indigenous resources would have been even greater if we had re-oriented our policy.

It will be argued that "the creation of new refining capacity is being financed largely by the equipment supplier countries and the oil exporting countries. We do not have the money. So we do not have the option". To this, there is only one answer. If our credit-donor countries orient us to build newer and newer refining capacities, shutting out our proven-resource-based projects, then we are heading towards calamity.

Closing all our options, except oil exploration, will put us increasingly in the hands of the foreign oil companies. In a climate of pervasive proneness for soft options, few will perhaps care to remember that even if large reserves of natural crude are found, these are not to be consumed ravenously. Oil needs to be conserved. Even the Shah of

Iran realises that oil is too precious to be burnt as fuel and that its greater value is as a source of building blocks for chemicals.

X

False Cost-Benefit Analysis

A true cost-benefit analysis has to take into account not merely the money cost of and the financial returns on a project; it also has to take into account the material difference that a project could make to the society's life — i e, the overall cost to the society which its commissioning will entail, and the chain of social benefits and/or evils which will likely flow from it. The social cost of *forgoing* the project must also become part of such an analysis. But in the hands of exotic economists and perspective-starved technicians, the tool of cost-benefit analysis is often misused. In our country, in fact, decisive importance is often attached to the capital cost of a project; the recurring cost, which is of great moment, is often neglected.

H N Sethna, Chairman, Atomic Energy Commission, points to an even greater deficiency of the current methods of cost-benefit analysis: "Questions like *who* pays and *who* benefits are not satisfactorily answered by these methods". K R Chakravorty, pioneer of catalyst development in India, pointed to the same lacuna when he pricked the bubble of the followers of the current methodology in cost-benefit analysis: "They forget that most of the costs in coal-based plants are *assets* to the nation, while most of the costs for the plants based on imported crude are *liabilities* to the country." Chakravorty's warnings against the danger of licensing fertiliser plants based on naphtha have proved prophetic.

Even from among coal-based projects, a choice will have to be made. Every coal-based project cannot claim the same priority. As noted earlier, methane producing coal-gas plant cannot enjoy the same priority as the low-temperature carbonisation plants, producing smokeless coke and gas for chemicals. Questions such as which class of people pay for which class of people's benefit and whether we should continue to orient our developmental programmes to elite comfort are very relevant in determining this national priority.

By all national and social, strategic, economic and even environmental considerations, Fischer-Tropsch Synthesis plant scores over every other coal-based project. The question 'how much import can one F-T plant substitute?' is irrelevant.[16] What is relevant is that it opens up a new panorama of possibilities — a whole line of development which starts from an indigenous resource and proceeds all along the road of self-reliance. Also, as important is the opportunity it opens up for scaling-up of capacity. Once we have mastered the technology, we might replace all the crude oil imports, if only we can produce additional coal in the proportion indicated earlier.[17]

In 1948, the Koppers Report has estimated the cost of a whole complex — consisting of the LTC plant, Tar Hydrogenation Plant, Fischer-Tropsch Synthesis — at $ 72 million. The objective at that time was limited, *viz*, to produce 0.15 million tonnes of petroleum products (aviation gasoline, motor spirit, diesel oil, and fuel oil). The technology of those times required 17 lakh tonnes of coal per year for this production.

In 1955, the Lurgi Report recommended a whole complex of LTC, Tar Hydrogenation and Fischer-Tropsch Synthesis plant, which it called the Combined Plant. It also separated the cost of LTC and Tar Hydrogenation in one group, and the cost of gasification and Fischer-Tropsch synthesis in another. This was to leave a clear choice to the government. It could exercise its option either for the combined plant or for one of the two groups.

Of Fischer-Tropsch synthesis, together with the gasification, Koppers estimated that for a production of 0.175 million tonnes of motor spirit and 75,000 tonnes of aviation gasoline, the investment cost would be Rs 36.6 crores. Of course, out of this, Rs 32.4 crores worth of equipment was to be imported from Germany at that time.

We, in India, did not start the project at that time on account of its 'high cost'. As a result, the investment cost is so much more today. (It could have been still higher if advances in knowhow and equipment fabrication had not exercised a cushioning influence.) If we do not learn the lesson even now, we would have to face the problem later, when the odds will be still heavier. A much heavier cost in future must be reckoned in the price of opportunities being missed now.

XI

Loopholes in Plea for Waiting on Grounds of Fluidity of Technology

Even among those who accept, that conversion of coal into oil and chemicals deserves a high priority, there is a tendency to argue that "the conversion technology is likely to undergo some change; therefore, why take up the construction of a plant now?". This, again, is evasion. There will always be prospects for newer advances. To hold back a proven knowhow from commercial use, on the plea that laboratory researches elsewhere indicate chances of a more advanced technique emerging at a future date, is to put a stop to all present action.

It is known that experiments in laboratories have to be followed up with pilot plant tests before adopting the process for commercial use. Unless one loses all sense of urgency, one cannot possibly plead for waiting in the face of a national emergency. This waiting will mean postponement by at least 10 years.

The alternative process, for conversion of coal into oil, relates to direct hydrogenation of coal. In the US, researches are in progress for partial hydrogenation and solvent extraction, so that ash is separated from coal and the de-ashed coal goes into solution. The idea is to hydrogenate the ashless coal in the second stage. Both these steps require operation at high temperatures. High-temperature operation makes it difficult to maintain the liquid state of the product: the liquids tend to gasify. To prevent gasification, the operation has to be under high pressure. There are three major engineering hurdles which have to be crossed before this scheme of direct hydrogenation of coal becomes a commercial reality. The coal-oil slurry, which is a highly viscous solid-liquid slurry, has to be pumped under high pressure. The reactor of a large volume has to be operated under exceedingly high pressure. And the ash has to be filtered from a highly viscous liquid. Each of these constitutes a difficult operation.

There is no doubt that human ingenuity will some day find the solution to these problems and make direct hydrogenation a commercially viable process. But, to date, there is not even one pilot plant anywhere based on direct hydrogenation of coal to suggest its *commercial* application in the near future. There is no experience of any type to presage greater convenience and reliability than in the old, tried-out, Fischer-Tropsch.

Whatever the outcome of the researches for direct hydrogenation of coal, it is going to be an exceedingly high-pressure operation.[18] In the US, they are now saying that it might be possible to operate 200 m³ reactors at 700 atmospheres for this purpose. Even

if it becomes possible for the US to develop these high-pressure processes, it will be foolish to transplant these to our conditions where the level of metallurgy and the infrastructure in general are very different.

Moreover, reducing the ash content of US coal from 8 per cent to 3 per cent or even zero per cent, is not proof enough that it will be possible to reduce Indian coal's 30 per cent ash content to 3 per cent, without further research effort in our own country. It is also acknowledged that barring the Assam coals and the Neyvelli lignite, there is no coal in India which is easily amenable to direct hydrogenation — and in both these places, there are disputes over the quantum of reserves.

In these circumstances, the only sane policy would be to proceed on the basis of the standardised technique of F-T and to keep the windows on the world open for fresh developments. That Fischer-Tropsch Synthesis is a low-pressure operation and would not require import of equipment, except marginally, are further points in its favour.

Those who say that the Fischer-Tropsch Synthesis process at Sasol is not an up-to-date reaction technique ought to know that no improved version has been working anywhere, even on a pilot-plant scale. Those who want to copy the West's sophistication of SNG (methane) production have, of course, a different — and irrelevant — concept of up-to-dateness.

Again, there are those who say that the F-T synthesis process for liquid fuels would have been uneconomical if Sasol had not combined the manufacture of chemicals with the production of liquid fuels. We submit that the proponents of this line are the prisoners of their old habits of reasoning — which held good when natural crude was cheap. Oil has now changed *irrevocably* into a highly expensive commodity. And we, too, have a compulsion to produce chemicals from coal to replace the manufacture of chemicals from petroleum derivatives.

Waiting for somebody else to evolve a new process, is an outlook which is the antithesis of industrial culture. This 'file culture has impeded our progress. Our first idea, of starting a synthetic oil project, did not come very much behind South Africa in time. In 1943, South Africa acquired the rights to the American variation of the Fischer-Tropsch process, and in 1947 it passed a liquid fuel and oil law. The Government of India invited Koppers in 1948; again,, it appointed Lurgis in 1955 to make recommendations on synthetic oil. However, while South Africa commissioned the oil-from-coal plant in 1955, India's 'file culture' did not allow any progress to be made in this direction.

We must also realise that when we come to have an operating industry, there will be scope for a better system of feedback for R and D. The Fischer-Tropsch synthesis plant of South Africa enables that country not only to continue research to improve the existing process and products but also to carry on researches on the direct hydrogenation of coal to liquid fuels. Also, finally, if a cheaper, direct, hydrogenation of coal comes to be evolved, the Fischer-Tropsch synthesis plant can still be used for alcohol synthesis. The Fischer-Tropsch reactor is a catalytic packed-bed reactor operable between 1 and 30 atmospheres, around 300°C. It is very similar to the methanol reactor or the Oxo-synthesis (alcohol synthesis) reactor. Hence there is no possibility of loss of investment on any account.

XII

Arguments from the Opposite Pole

Resistance to anything good or pioneering comes in many forms. Where powerful oil lobbies and other interests make a common cause in opposing a measure, the resulting confusion produces arguments from opposite poles. Thus, we have at one pole the argument for waiting for the most modern technology to emerge. On the other hand, we hear arguments that there are problems in going in for a Fischer-Tropsch synthesis plant because "none other than Sasol has the knowhow to produce the distillates in which we are interested[19] and we have no diplomatic relations with South Africa". It is suggested that if there had been any operating plant in any other country producing the product-mix we require, we could possibly adopt it. This is an argument not merely for a tried technique but also for a tried reaction condition.

There is only one answer to this argument: where there is a political will, there is a way. If we are earnest about it, the problem of data for reaction conditions (carbon monoxide-hydrogen ratio, catalyst, pressure, temperature variation, etc) for different products can be resolved. What is needed is initiative.

XIII

The Hallmark of Entrepreneurial Initiative

Here we can take a leaf out of South Africa's book, even though that country pursues an apartheid policy which we detest. When South Africa took up the construction of a coal-to-oil plant, there was no full-size plant for purification of raw gas. Lurgi and Linde, both of Germany, had just developed a process jointly. Sasol thought the pilot plant data convincing enough and adopted the process.

During operation, it found that the Lurgi gasification process was producing a side-stream of gas liquor in which components such as ammonia and phenols remained dissolved. Again, it chose another "first", the Phenosolvan process in which phenols are extracted from the water with a solvent such as butyl acetate. (The ammonia was then recovered by stripping with steam and converting into, for instance, ammonium sulphate.)

In the synthesis process itself, it faced a very difficult choice. On the one hand, there was the Ruhrchemie-Lurgi process (fixed-bed reactor system) which till then worked only on some small demonstration reactors but was unlikely to create any scale-up problems. On the other hand, there was the Kellogg reactor (moving-bed type with a fluidised catalyst) on which only pilot plant data were available but which offered the opportunity of building reactor units with a much higher capacity straightaway. Though the basic chemistry for both reactor types is the same, the fixed-bed reactor produced in general straight-chain hydrocarbons with a high molecular weight, and *most* of its production was in the range of diesel oil and paraffinic waxes. As against this, the fluid-bed process of Kellogg produced the branched olefins of a low average molecular weight and the production was mainly in the range of LPG and gasoline. In view of the uncertainties and difficulty of choice, Sasol decided to build two synthesis plants in parallel using both systems. In retrospect, the decision was wise.

(Kellogg has done the process design as well as the detailed design of its own reactor. Moreover, it did the detailed design of the Ruhrchemie-Lurgi reactor, in collaboration with Uhde of Germany.)

India, in fact, is now in a far better position. It can benefit from Sasol's

long operating experience and the many experiments in design modification and variation in reaction conditions. Where the calibre of internal technical advice and scrutiny is as high as in India of today, there is no reason to shrink from a project which will be the second of its kind in the world, if our reference is limited to the post-Second World War period. Of course, if South Africa meanwhile takes up the construction of the second and the third oil-from-coal plants, or if by co-operation of German and US expertise the job of building a plant 20 times the size of the existing Sasolburg unit is taken up — as the *Petroleum Economist* reports — India's project will be the fourth or the fifth in chronological order by the time it gets the final clearance. As Jan C Hoogendoorn, Manager, Process Division of Sasol said: "The design information for a Fischer-Tropsch plant is completely available and plants can be built without any technological risk."

XIV

Concluding Remarks

Whether the international oil interests like it or not, conversion of coal into oil and chemicals has to spread in the near future. In the US, the Fischer-Tropsch process or its variant is likely to emerge soon, even though its greater attention will be to SNG production. It can not afford to wait for direct hydrogenation of coal.

Our forecast is based on the following considerations:

(i) For normal economic and political reasons, the US cannot continue for long its heavy dependence on outside supplies of natural crude.

(ii) There is a great pro-Jewish influence in American public life. The US can get out of this dilemma only by resorting to synthetic crude production on a large scale.

(iii) "Up to now, coal-to-oil conversion has been simmering only fitfully on the oil industry's back burners."[20] Natural crude having been the oil industry's main profit interest, synthetic crude received much less attention. Although "most of the major oils acquired large coal-mine holdings and reserves as prudent insurance against some future needs", the oil industry's "only visible effort in coal conversion did not begin until 1971". That situation can no longer continue. The state will have to intervene as it did in the field of atomic energy.

(iv) Environmental considerations are going to be increasingly important. A conversion like F-T, which removes sulphur at source — that is, at the raw gas stage — will be welcome to the people.

Thus the earlier we start the process of conversion of coal into liquid fuels and chemicals, the better for us and the world. It will, moreover, give us one major benefit immediately. It will to some extent free us also of dependence on oil supplying countries and their pressure for increasing further the price of natural crude oil.

APPENDIX

I How Fischer-Tropsch Technique Operates

The Fischer-Tropsch process is essentially a method for converting a carbon monoxide-hydrogen mixture into hydrocarbons containing 1 to 50 or more carbon atoms with varying degrees of saturation. Various catalysts can be used, such as iron, nickel, cobalt and some copper catalysts that are usually promoted with metallic oxides of the alkali metals. Reaction temperatures range from 400°F to 600°F and the pressures from 1 to 30 atmospheres, depending on the catalyst used. The predominating products formed vary as a function of the ratio of hydrogen to carbon monoxide in the synthesis gas, the type of catalyst used, and the operating conditions.

For instance, increasing the relative amount of carbon monoxide to hydrogen results in the production of more carbon dioxide and olefinic compounds. Similarly, increasing the relative amount of hydrogen to carbon monoxide results in higher methane formation, water, and saturated products. In general, a ratio of two volumes of hydrogen to one volume of carbon monoxide is optimum for obtaining the maximum yields of petrol and fuel oils.

Promoted cobalt catalysts were used in German installations but in the United States iron catalysts were investigated because of their higher yield of more desirable products and lower costs.

(Koppers Report Submitted to Government of India, page 76.)

In Fischer-Tropsch reaction, the different reaction conditions, pressure, temperature, feed gas composition cause not only a difference in product selectivity, but also a difference in the properties of hydrocarbon products within the same boiling range.

(From "The Sasol Story" by Hoogendoorn, Manager, Process Division, Sasol.)

The F-T Synthesis does not require a given ratio of carbon monoxide and hydrogen in the gas but may be widely adapted to high-carbon monoxide, low-carbon monoxide gases.

II Fischer-Tropsch Plant that Operated before and during the War

According to the Lurgi Report, the following are the plants which were erected for Fischer-Tropsch Synthesis just "in course of a few years", after the first industrial plant started operating in 1936:

	(Tonnes/Year)
Germany:	
Ruhrchemie Aktiengesellschaft	72,000
Gewerkchaft Victor, Rauxel	40,000
Steinkohlenbergwerk Rheinpreussen	70,000
Braunkohle-Benzin AG, Ruhland	170,000
Krupp Treibstoffwerk GmbH	60,000
Chemische Werke Essener Steinkohle	80,000
Hoesch Benzin GmbH	47,000
Wintershall AG, Werk Lutzkendorf	82,000
Schaffgotsch Benzin GmbH	40,000
France:	
Harnes (Kublmann)	30,000
Japan:	
Mike	40,000
Takikawa	100,000
Rumoi	50,000
Amagasaki	70,000
Manchuria:	
Fushin	50,000
Total	1,001,000

(*Source*: Lurgi Report)

III Profits of Sasol over the Years

	Profits (In Rand)	Sales Turnover (In Rand)
1960	1,355,000	16,400,000
1961	2,595,000	17,917,000
1962	3,611,000	21,000,000
1963	4,122,000	24,500,000
1964	4,255,000	23,250,000
1965	4,184,000	25,300,000
1966	3,977,000	33,000,000
1967	5,734,000	45,000,000
1968	5,968,000	51,500,000
1969	7,220,000	58,900,000
1970	7,640,000	72,200,000

IV Fischer-Tropsch Goes beyond Producing Crude

"The Fischer-Tropsch process does not produce a synthetic crude, but a semi-refined mixture of hydrocarbons of a relatively simple structure and completely free of sulphur and nitrogen compounds."

(Hoogendoorn in the "Sasol Story")

"... the primary products for the Fischer-Tropsch Synthesis furnish promising raw materials for further chemical treatment, because of the fact that they are entirely sulphur-free and of purely aliphatic structure."

(Lurgi Report to Government of India.)

V Production of Raw Materials for Chemical Industries and for Manufacturing Consumers' Goods

(*Source*: Lurgi Report)

In the United States more than 50 per cent of all organic chemicals, fibrous materials, plastics, etc, are produced nowadays from crude oil or its derivatives. An oil-from-coal plant will provide even a much more favourable basis for such production.

The Fischer-Tropsch products are entirely sulphur-free and their chemical structure is more clear as compared with mineral oil products. They are therefore predestined for any kind of chemical treatment.

Because of their aromatic structure the products derived from hydrogenation of low temperature tar as well as the phenols are well suitable as raw material for many chemical products.

An oil-from-coal plant including tar hydrogenation and Fischer-Tropsch Synthesis thus combines the possibilities of both petro-chemistry and coal chemistry.

This may be illustrated by the following examples:

(a) *Phenols*: Phenols are recovered as by-products from gasification, low temperature carbonisation and hydrogenation. By suitably operating the hydrogenation plant, the quantities of phenols derived from this process may even be increased considerably. The phenols are the basic material for the production of bakelite from which a variety of articles for daily use may be manufactured. The fabrication of pressed plates for use in the building industry and the manufacture of furniture might become of particular importance for India, since this would permit the utilisation of waste-timber.

(b) *Aromates*: During the second half of the last century, the aromatic hydrocarbons, *viz*, benzene, toluene, xylene, solvent naphtha, etc, have been the basis for the development of the organic chemical industry. The highly aromatic low temperature tar and hydrogenation products furnish the basic material for the production of numerous chemical products.

(c) *Solvent for the Lacquer and Plastics Industry*: The Fischer-Tropsch synthesis furnishes, in a controllable range, oxygen-rich by-products such as alcohols, ethers, esters and ketones which may be used as component for motor fuels and as a solvent or basic material for the manufacture of plasticisers for plastics.

(d) *Polyethylene*: Larger quantities of ethylene are recovered as by-product from both, the Fischer-Tropsch synthesis and the upgrading of the products to aviation gasoline, which may be worked up into polyethylene being one of the preferred plastics for the manufacture of semi-finished and finished articles. Because of its flexibility, resistance to corrosion, resistance to heat and electrical insulating properties the polyethylene has a wide range of applications.

(e) *Processing of Wax*: The Fischer-Tropsch plant affords the recovery of hard wax which is gaining an increasing importance in the packaging field. In addition to that, hard wax has a wide field of applications. It may furthermore be worked up into slab wax for the manufacture of candles, as and when required.

(f) *Processing of Olefines from the Fischer-Tropsch Plant*: The olefines may be converted into alcohols, ketones, etc. It would also be possible to produce, by way of the Oxo-synthesis, fatty alcohols which could be worked up into modern washing agents, detergents, etc, by means of sulfonation.

(g) *Production of Lubricants*: Both, the olefines from the Fischer-Tropsch synthesis and the production from hydrogenation are suitable for the manufacture of high-grade lubricating oils including aircraft motor oils.

(h) *Nitrogen Fertilisers*: The waste gases from both, the Fischer-Tropsch synthesis and hydrogenation, furnish an excellent raw material for the ammonia synthesis and the subsequent production of nitrogen fertilisers. This utilisation of the waste gases permits the production of fertilisers on a particularly economical basis.

Furthermore, urea may be produced from the ammonia and the waste carbon dioxide which are recoverable as by-products. Urea is gaining an increasing importance as fertiliser and cattle feed extender. Besides, it is more and more used for the manufacture of plastics and glue.

(i) *Insecticides and Herbicides*: Benzene, chlorine and alcohols may be used for the production of important insecticides, such as hexachlorocyclohexane and DDT. The aforegoing products are merely a few examples of the possible fields of application. All these working up methods require naturally the installation of additional plant equipment involving more or less high capital investments.

Notes

1 Oil exploration, it is also true, was not placed on scientific footing or given due importance.

2 Since these gases were obtained by passing steam which is vapour-phase water, the mixture of carbon monoxide and hydrogen were called the water-gas. Since this hydrogenated carbon monoxide is the basic requirement for synthesis into ammonia, methanol, etc, this is also often called synthesis gas.

3 It is being increasingly felt that the solution to the problem of tallow for the soaps lies in the Fishcher-Tropsch route of obtaining fatty acids from coal.

4 The means of producing this clean "power gas" and attaining higher efficiencies of power generating were discussed in the Oil Commentary of May 15, 1974.

5 It is reported that the Ministry of Mines and Metals has taken a decision to set up a plant for coal gasification. If it is for producing methane, it is a step in the wrong direction. If it is for producing carbon monoxide and hydrogen, which are essential for the production of both fertilisers and liquid fuels, it is an eminently desirable project. (Refer also footnote no 11 in this article.)

6 For details, see point I in the Appendix.

7 The chapter "Indirect Hydrogenation of Coal" by H H Storch in the book "Chemistry of Coal Utilisation" edited by H H Lowry, said the following about the Lurgi gasification process. "The high operating pressure of the Lurgi generator favours the production of methane and carbon *dioxide*. For Fischer-Tropsch Synthesis gas, neither is desirable."

8 The reasons why there could not be many more plants are discussed in Section V.

9 1 Rand is higher in value than a US dollar. Rand 0.672=1 US dollar. One Rand is equivalent to a little more than Rs 11.

10 These products are completely sulphur-free and nitrogen-free due to scrubbing of the raw gas with methanol.

11 Of course, if we have a pre-existing gas pipeline which is heavily underutilised, to that extent there is a case for producing methane. There may also be a case for supplying industrial fuel gas in certain cases. But if the methane production is sought to be taken to such a point that it produces a plea later for investment for stepping up pipeline capacity and distribution network to serve the domestic consumer, it would clearly be upsetting the priorities.

12 Federal Power Commission.

13 SNG is substitute natural gas. This is the name given to methane produced from coal or fuel.

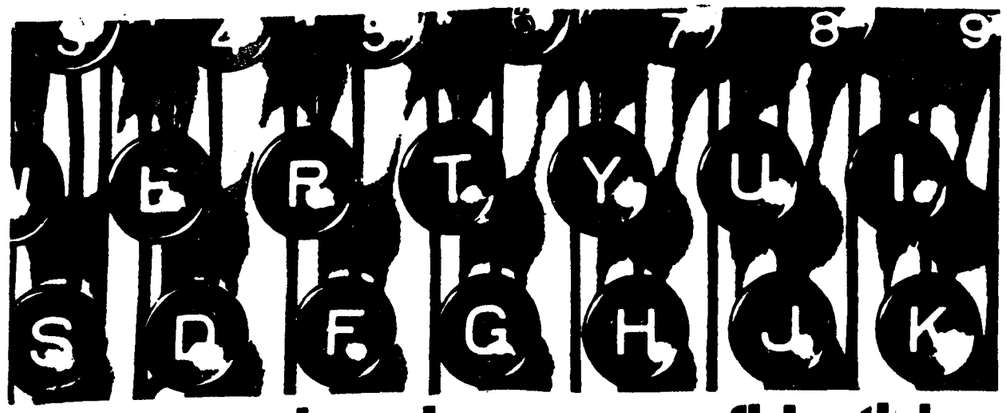
14 The only proviso is that the contemplation has to be well advanced and the design and engineering organisation for construction of refineries has to be efficient and self-reliant. This is a requirement of planning which, in order to meet the turns of situation, has to keep its alternatives ready.

15 The case for Mathura Refinery rests only on one plea that there is no sign that coal production and coal transportation can reach the desired levels within the next five years. Thus it poses a question which has two aspects. One is the aspect of increasing the efficiency of coal production mechanism. The other is of mobilising the people to defeat the vested interests that have seized the mining areas and are impeding production. The plea that this country would not be able to tackle these problems and that the refinery has therefore to be built even at the risk of increasing the dependence on foreign sources is a counsel of despair. In any case the issue should be made clear to the Council of Ministers and the ball thrown in this Council's court for a decision.

Those who believe that Mathura Refinery should be constructed now and that the programmes for refining expansion should stop thereafter, forget that Parkinson's law operates even in the field of refinery population. If we are not capable of a determined lead for a change-over to indigenous resource-based planning now, we would have to plead five years hence for yet another programme.

16 There are some who argue that production of one million tonnes of synthetic oil is fleabite when the need is for 37 million tonnes by 1979. Thus they try to belittle its importance. This is a hortsighted, foolish argument, without an understanding of its potential.

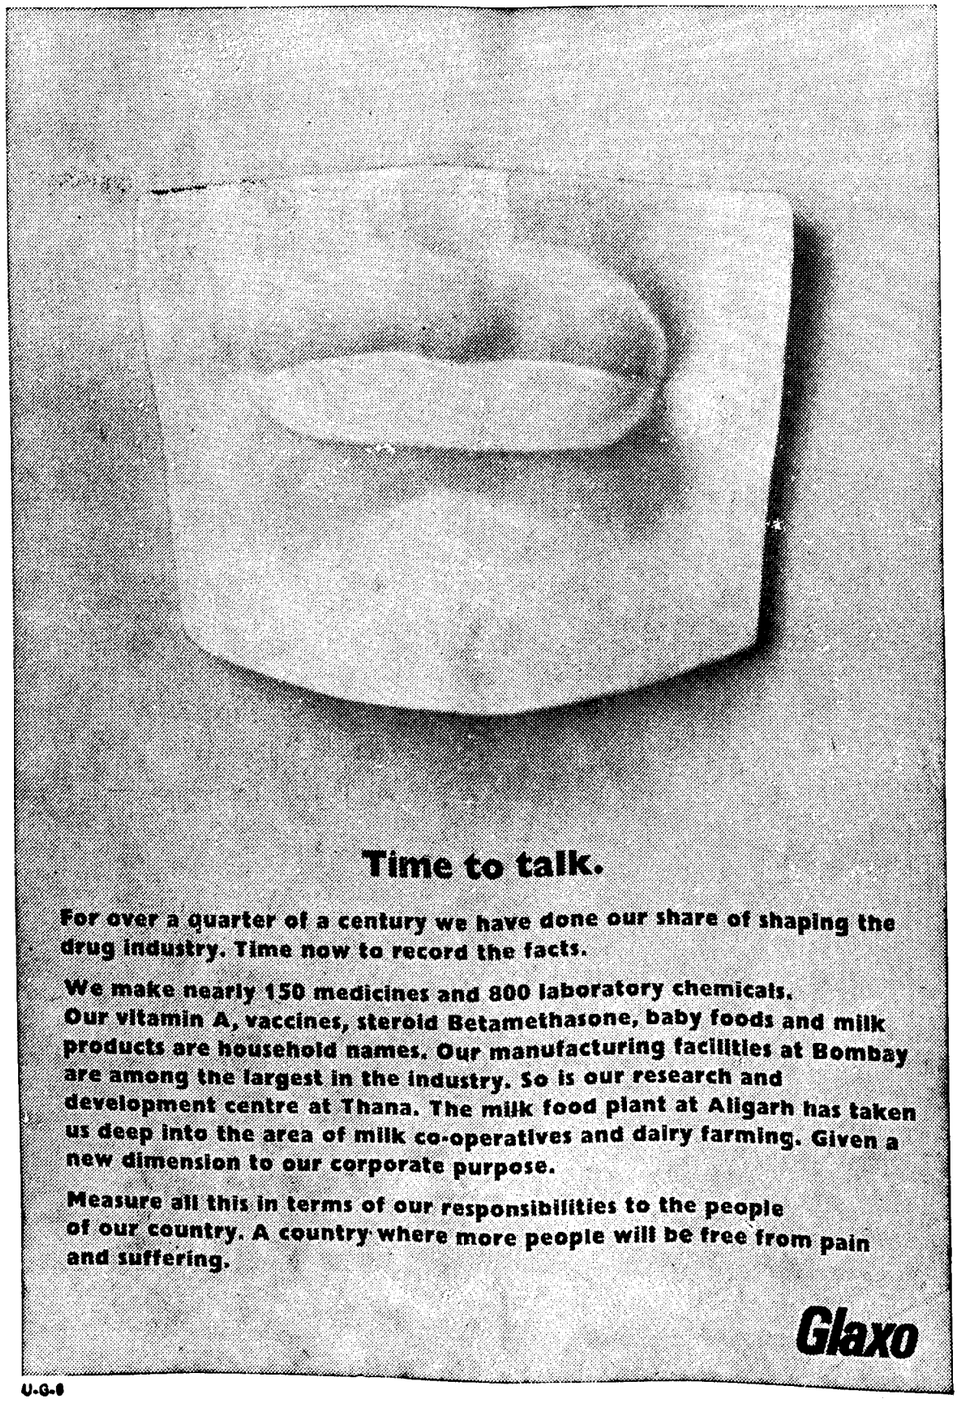
17 The proportion has been indicated in section VIII, last para.



18 So far as this author is aware, there is only one scientist *in our own country* who hypothesises that the coal can be directly hydrogenated even in a low-pressure operation, with the help of an *active* hydrogen, i e, before hydrogen becomes H_2. All support should be given to such research projects.

19 This is because Sasol alone has the knowhow for the series of modifications it carried out in the Arge reactor, originally based on Lurgi design. This is the reactor that operates for a maximum of *heavy* hydrocarbons which we need. In this operation, *relatively* little gasoline is produced. It produces an excellent diesel. Besides, its straight-chain hydrocarbons are feedstocks for the production of chemicals. The other reactor, based on Kellogg process, produces mainly hydrocarbons in the gasoline range.

20 'Capturing Clean Gas and Oil from Coal', by Lawrence Lessing in *Fortune*, November 1973.



Nirlon Synthetic Fibres

NIRLON Synthetic Fibres and Chemicals' nylon tyre cord plant resumed production only last month, after being shut down for over six months due to caprolactum shortage, During the year to March 1974, production of nylon textile yarn was about 38 per cent lower than in the previous year and production of tyre cord was about 33 per cent lower. The management feels that production this year may not even match that in the previous year again because of the anticipated shortage of caprolactum. Considering the foreign exchange available with STC and the availability caprolactum from GSFC — which has started production recently — the chairman, S Vaidyanatha Aiyar, thinks the company will not be able to operate its plant to the full capacity. Last year, production of polyester filament yarn was to the full expanded capacity, but this year's production is expected to be lower as the raw material even for polyester yarn has become difficult to obtain. The polycondensation plant and machinery have been installed, and are likely to be commissioned shortly. But for this, too, the main raw materials, DMT and ethylene glycol, are unlikely to be available in adequate quantities. Nirlon's application for import of capital goods, needed in the expansion of textile yarn capacity to 4,200 tonnes, is still pending with government. The company proposes to set up a conveyor belting plant, and has been issued a 'letter of intent' for this.

False Alarms

IT was barely three months ago, towards the end of July, that the Reserve Bank was finally persuaded to introduce changes in its credit policy which could be expected to have some impact on the inflation. The monetary authority's action had come a good year-and-a-half too late, but pressures are already being mounted to force a liberalisation of credit policy. If the Reserve Bank succumbs to these pressures, it would have abdicated its responsibility to use the credit policy instrument for rational management of the economy rather than to suit the requirements of sectional interests. There have been no developments in the price, money supply or overall economic situation to warrant any liberalisation of policy with regard to either the availability of credit or its cost.

The current scare-mongering by spokesmen of private industry and trade is entirely without any basis and is nothing more or less than blackmail to bring about an even more favourable turn in the government's economic policies. This is best brought out by the plaintive noises being made by cotton textile industry. It is well known that the textile mills have seldom had it so good as in the last two years or so. Prices of upper medium, fine and superfine varieties of cloth have risen by between 75 and 150 per cent during this period and the better-equipped, modernised mills have shifted their production patterns in favour of these varieties in disregard of exports as well as their obligations under the government's controlled cloth scheme. It is these same mills which are now crying disaster. Allegedly they find themselves in such straitened circumstances financially that they are unable to pay bonus to their workers in one lump sum and might even be forced to work one shift less — which is to hold out the threat of throwing many thousands of workers out of employment. The Indian Cotton Mills Federation has submitted a memorandum to the Finance Minister asking for a liberalisation of credit to its member-mills. Even without waiting for the Finance Ministry to act, various powerful personages have already rushed to the rescue of the textile industry. The Governor of Gujarat, for instance, is reported to have intervened with banks to secure larger credit for the Ahmedabad textile mills.

This supposedly desperate situation has arisen, if the textile industry is to be believed, because the trade — which, incidentally, is controlled by none other than the kith and kin of those who control the textile mills — is refusing to lift stocks. Also, it is alleged, cloth prices have "tumbled". What is curious is that there is little evidence of this so far in the retail prices of cloth; in any case, even the decline in prices which the industry claims has taken place is a fleabite compared to the rise which had preceded it.

In essence, the textile industry's manoeuvre is a relatively simple one. This is the beginning of the cotton marketing season and the mills want bank credit to finance cornering of cotton by themselves and by their allies in the trade. The relatively low prices at which the mills acquire their supplies of cotton now will, one may be sure, have no bearing on the prices of cloth, now or later. Cotton prices will, as usual, zoom later in the season and these prices will be used to justify hefty increases in cloth prices, irrespective of the fact that the more powerful mills would have acquired much of their supplies of cotton at substantially lower prices at the beginning of the season. The case of the textile industry can be generalised, with minor variations.

The actual trends in credit expansion in the last five months since the end of the busy season do not suggest an unbearable credit squeeze by the commercial banks. Between the end of April and October 11, bank credit for purposes other than food procurement expanded by Rs 200 crores. Though this may be lower than the credit expansion of Rs 294 crores in the corresponding period of the last slack season, in the light of the phenomenal credit expansion in the busy season it does not speak of any undue credit stringency. Further, account has to be taken of the substantial return flow of credit which should have taken place from some of the seasonal borrowers. For instance, the sugar industry's stocks are currently about one-third of their level in March; this industry alone should, therefore, have returned around Rs 100 crores to the banking system during this period.

The continued high level of bank credit should also be judged against the trends in industrial output and investment. Industrial output remained stagnant in 1973-74. In fact, the CSO's general index of industrial production has remained virtually static since the first quarter of 1972 when it was at 201.4. In the first quarter of 1974 the index was 204.1. Even there-

after many of the major industries have reported declines in output. For instance, finished steel production declined by about 6 per cent in the first half of 1974; production of cement has fallen by over 7 per cent in the first eight months of 1974; in cotton textiles, output of both cloth and cotton yarn has declined by 1 to 2 per cent; vanaspati production has declined by 6 per cent. In coal, the growth of output has been lower at about 2 per cent in the first half of the year against a rise of 6.7 per cent in the corresponding period of the previous year. It is very unlikely that the overall level of investment in 1974-75 would be higher than that in 1973-74. Since in 1973-74 also there had been no rise, the level of investment will thus have been stagnant for the second successive year.

Neither does the monetary and price situation warrant a higher level of credit. The official index number of wholesale prices (base 1961-62 = 100) is, at 329.5 in the week ended September 21, 31.5 per cent higher than a year ago, as against a rise of 20 per cent during the previous one-year period. Compared to the position a year ago, the price situation has definitely deteriorated. In the current financial year upto September 21, the general index had risen by 16.1 per cent as against a rise of 14.6 per cent in the corresponding period of 1973-74. Every major commodity group and sub-group, except industrial raw materials, as well as a number of major commodities have shown higher increases during the current fiscal year. Food articles have risen by 20.4 per cent as against 18.6 per cent last year. Among food articles, foodgrain prices have risen by 30 per cent as against 10 per cent in the previous year. In machinery and transport equipment, the price rise so far this year works out at as much as 21.4 per cent against 4.5 per cent last year. The rise in prices of manufactures was 11.9 per cent against 9.5 per cent. Among manufactures, prices of cotton manufactures have gone up by 15.1 per cent against 5.7 per cent last year. The same has been the trend in all other groups, except 'industrial raw materials'. But then the prices of industrial raw materials had risen phenomenally by 37.6 per cent in 1973-74 over and above a rise of 31.3 per cent in 1972-73. Therefore, the rate of increase this year had to be more moderate, if only because of market resistance. On the whole, there are no signs of any improvement in the price situation.

On the monetary front, it may seem that the growth in money supply during the first half of the current fiscal year has been lower than in the previous year. Money supply had expanded by about Rs 148 crores upto October 4 against an expansion of Rs 417 crores during the corresponding period of 1973-74. However, this is not the whole story. The smaller increase in money supply is largely the result of a decline in the foreign exchange assets of the banking sector to the extent of Rs 146 crores compared to an increase of Rs 51 crores in these assets in the corresponding period of 1973-74. The expansion in bank credit to the commercial sector has been more or less of the same order as in the previous year, Rs 324 crores against Rs 347 crores last year. Net bank credit to the government sector, however, has risen by Rs 614 crores against Rs 923 crores in the comparable period last year. Within this the decline has been substantial in Reserve Bank credit to government, Rs 300 crores this year compared to Rs 747 crores. Here lies the rub. On the basis of the treasury bills issued and changes in the government's balances with the Reserve Bank, the Central government's deficit as on October 4 stood at the whopping figure of Rs 825 crores. Thus, though the Reserve Bank's holdings of treasury bills are relatively low at present, the large volume of these bills which are now held by others would get rediscounted with the Reserve Bank in the coming months. The small rise in Reserve Bank credit to the government, which is responsible for the lower rise compared to last year in net bank credit to the government as well as in overall money supply, is thus likely to be a passing phenomenon. Considering the demands being made on the Centre by the state governments for drought relief, etc, and the likely deficit in the Railway budget, it is entirely unlikely that the state of the Centre's finances will show any startling improvement in the rest of the year. Therefore, there can be little hope of restraining the Central government's budgetary deficit even at a level of, say, Rs 500 crores, let alone the Budget's figure of Rs 126 crores. The fiscal situation is certainly not such as to encourage any relaxation of monetary policy.

A liberalisation of credit policy, it is being argued, is called for to tackle the recession. But the recession is not a phenomenon which has suddenly descended upon the economy with the arresting of the rising trend in the prices of a handful of items; it has been with us for a long time and is to be traced not to any changes that have occurred with regard to the cost and availability of commercial bank credit, but to the low levels of investment, particularly public sector investment, which have now persisted, with minor variations, for almost a decade. In the circumstances, the pumping in of short-term capital in the form of commercial bank credit will be of no avail. The objective of raising the cost of bank credit and restricting its availability was, quite simply, to discourage withholding of supplies from the market. It would be an act of irresponsibility if this objective is now abandoned in the face of pressures from private industry and trade.

West Europe

Inert Politics

BUKHARIN had once talked of an idealised short-term 'equilibrium' among the various classes and groups in the Soviet Union in the post-revolution period. A similar kind of equilibrium, it seems, is descending upon the various countries of Western Europe. Various forms of parliamentary democracies continue to be the exclusive pattern for Western Europe; Greece too now has reverted to conformism, with Spain the sole, uncertain holder-out. But an *ennui* is very much in evidence. The electorate in each and every country, on this side of the ideological divide, finds it hard to choose between the various parties clamouring for attention — as if it did not really matter whom it chose. So much so the choice is about evenly divided in election after election.

Thus, in France, the candidate of the Right is barely able to outpace the candidate of the Left in the Presidential election; in West Germany, the uneasy coalition of the Social Democrats and the Free Democrats still manages to stay in power, but the supposedly Right-wing opposition continues to breathe down its neck, and the opinion polls indicate that a fresh election would indeed end in a dead heat. In the United Kingdom, Harold Wilson's polyglot Labour Party, riven by internal dissension on the issue of the relationship with the EEC, has finally managed to win an absolute parliamentary majority; but the majority is paper thin, and the country would continue to be mostly ungovernable. In Italy, national sentiment appears to be about evenly divided between loyalty to the traditional Right and support for the communist-socialist combine currently surging forward. The referendum on the issue of the retention or the confirmation of the Divorce Act has made it clear that Italian conservatism is no longer the monolith it once was: there would not have been stronger evidence of the converging equilibrium of emotions than the fact that, for the first time since the end of World War II, there is a strong group of opinion within the ruling Christian Democratic party for the induction of the Communist party into government. Up north, in the Scandinavian lands, an identical trend is at work: the long, unilateral dominance of socialist groups and parties has come to an end, and the parliaments in these countries have begun to bear witness to the phenomenon of near-matching of numerical strength as between groups which were hitherto considered to be ideologically wide apart.

Once a certain standard of living has been assured for the general mass of the electorate, and full employment is either already accomplished or is round the corner, political warfare tends to enter the zone of apathy. Little local problems continue to exercise the contending parties; here and there problems of inequality and retarded development evoke controversy and emotions; issues of inflation, productivity and wage adjustments remain to cloud the economic horizon; there is often the feeling of excruciating claustrophobia following from the incapability to assert a distinctive West European ethos in response to the moves and counter-moves of the two major superpowers.

But none of these has the inner strength to generate an urge for qualitative overhaul of the structure of politics. Suddenly, all ideologies seem to have forfeited their relevance and zest in the European context. There could be no greater irony, since everyone of the imposing ideologies which, at one time or another in the past three centuries captured the imagination of political activists, has had its origin in the West European soil.

Agriculture

Carrot for Rich Farmers, Stick for Farm Workers

OVER 900 casual labourers working on the farms of the Mahatma Phule Agricultural University in Rahuri, in Ahmednagar district of Maharashtra, have been on strike since October 7. Their demands are that they be made permanent employees and given work throughout the year instead of for 4 to 6 months in a year as at present. They are also asking for wages equal to those of the University's Class IV employees. The farm workers have been organised by the Lal Nishan Party, which is leading the strike. The University authorities have refused to talk with leaders of the Lal Nishan Party. Instead, they have been trying to break the strike with the help of the students and a section of the employees. The striking workers forcibly prevented the agricultural operations from being carried out by the other employees. The University authorities responded to this by calling in the police and 16 workers, including women, were injured by tear-gas shells and in lathi charges by the police. The police also arrested 93 striking workers, 52 of them women. The University is now heavily guarded by the police and the authorities are carrying out the farming operations with the help of students and other staff members under police protection.

In their efforts to break the strike of the agricultural workers, the authorities of the Mahatma Phule Agricultural University have the full support of the state government. This is because if the workers' demands are conceded at this University, casual agricultural workers in the other three agricultural universities in the state at Akola, Parbhani and Dapoli will make similar demands. The extra expenditure as a result of granting the casual workers' demands will call for larger grants to these Universities which the state government is not prepared to make. The government is, however, pretending that it has nothing to do with the developments at the Rahuri Agricultural University which, it is pointed out, is an autonomous body.

When it comes to agricultural workers, the Maharashtra government counts its pennies. But the same government is generous with its subsidies and hand-outs to the large farmers. It is well known that it winks at, and even encourages, large overdues of irrigation charges and loans taken from co-operative credit institutions. Or take the press release issued by the government on October 16 which says, *inter alia*, "Sanction is accorded to the payment of subsidy of Rs 23,50,000 to the State Electricity Board towards reduction in tariff minimum for supply of power for agricultural pumps. The amount represents the 5th monthly instalment of the 10 instalments commencing from May 1974 in which the estimated annual subsidy of Rs 2.35 crores is proposed to be released to the Electricity Board." The same press note, incidentally, adds: "Another sanction is accorded to the payment of a subsidy of Rs 5.50 lakhs to the Electricity Board on account of supply of power to Khandelwal Ferro Alloys Limited and Universal Ferro and Allied Chemicals Limited at concessional rates."

The state government has recently announced that in addition to granting liberal taccavi loans, farmers using CHS-1 hybrid jowar seed will be entitled to free medical treatment of the crop grown out of this variety of seed. Irrigation water from government canals is to be supplied free for the 'ratoon' jowar crop in the current rabi season. And farmers who carry out bunding of water by earthern dams will get a subsidy of Rs 50 per hectare. The state government will also grant a subsidy of Rs 50 per hectare to paddy farmers who use lift irrigation water for summer paddy.

Thus, in the name of raising agricultural output, the state government every year distributes crores of rupees as largesse to the rich farmers. Against this, if the four agricultural universities in the state were to concede the demands of the casual labourers for security of service and marginal increases in wages, the cost to the universities or to the state government will not exceed a few lakhs of rupees a year. Yet one may be sure that even if the demand of the casual labourers of the Mahatma Phule Agricultural University comes before the state cabinet, which is unlikely, it will be promptly turned down on the ground of lack of resources. The University authorities may be told by the government that they will be free to concede the demand of the labourers provided the additional expenditure is met out of the University's own resources. But this will be as good as rejecting the demand.

Cabinet Reshuffle

Assurance to Smugglers

THE alarums and excursions are over for the present, and the seventh cabinet reshuffle since the 1971 Lok Sabha election is now an accomplished chore. The inner compulsions of the ruling party have played a dominant role in the reshuffle; the Prime Minister's personal proclivities have come in only at the margin — as, for example, in the award of the Ministry of Finance to C Subramaniam rather than to T A Pai. There is, however, the rather curious case of K R Ganesh which deserves some comment.

Ganesh, who had in recent weeks shot into prominence because of his demonstrated initiative in moving against the smugglers, has been moved out of Finance and made Minister of State in the Ministry of Petroleum and Chemicals. The shift, official sources have taken pains to inform the nation, has been made at Ganesh's own request and on grounds of ensuring 'ideological

affinity' between the various ministers presiding over a particular ministry. The implication obviously is that Ganesh, with his known Leftist leanings, would have found it difficult to establish a working rapport with C Subramaniam.

The government's laboured explanation is, however, unlikely to be taken at face value. Most people will be inclined to link the transfer of the minister, who had spearheaded the drive against the smugglers, as an overt rebuke administered by the Prime Minister for having pre-empted official decision-making. Rumours have been that the government's hands were forced on the issue by Ganesh's surprise announcement in Parliament of the names of a number of allegedly top smugglers. Once these names were mentioned, perforce the government machinery had to move in. To erase the impression of a reluctant Prime Minister being dragged into the arena, it was even given out that the anti-smuggling operations were being carried out under her direct supervision. The point was emphasised even by a special broadcast arranged for her on the All India Radio as the operations moved into gear.

Since this much is public knowledge, the general public will reach their own conclusions over *l'affaire* Ganesh. In the present mood of cynicism — a mood which has solid objective basis, given the government's past performance —, the shifting of Ganesh from Finance will be taken to indicate high-level opprobrium of the anti-smuggling initiatives displayed by him. It could also be considered as a warning to others who, carried away by their ideological, or even more severely personal, enthusiasm, would like to indulge in populist bravado.

At the other end, smugglers and profiteers will consider Ganesh's seeming demotion and disgrace as an assurance that the present government will not outstrip the limits of 'reasonableness' — one or two seasonal bouts of heroics are going to be there, but by and large it will allow the hucksters the privilege of live and let live. The behaviour of the commodity market in Bombay immediately following the cabinet reshuffle could be taken as at least a partial indicator that the bulls too are believers in the present system.

Kerala

Kuttanad Project Hits the Shoals

A Correspondent writes :

KUTTANAD in Alleppey district is one of the major rice producing areas of Kerala. The region suffers from the serious disability of being low-lying. The bed level of the fields is between 0.6 metres and 2.1 metres below mean sea level, which means that monsoonal floods are frequent, occurring once every few years. The loss of paddy due to floods has been estimated at 35,000 tonnes in 1961-62, 40,000 tonnes in 1966-67 and 35,000 tonnes in 1968-69. This year again there has been substantial crop loss due to floods. In addition, there is the problem of intrusion of salt water into the irrigation canals as a consequence of tidal action. This creates salinity in the irrigation water and damages standing crops. For these reasons, over most of Kuttanad only only one crop can be harvested.

The Kuttanad Development Project was conceived of as a solution to these problems. It envisaged the creation of 1,966 kilometres of permanent submersible bunds to protect the standing crop from being washed away by floods. In addition, as a separate project, a salt water barrier was planned at Thannermukkom to prevent intrusion of salt water. When the bunding was completed, the additional yield of paddy per year from the 1.24 lakh acres of land covered by the bunds was estimated at 1.5 lakh tonnes. In addition, it was planned to plant some 3.15 lakh coconut trees along the bunds, which would yield about 13 million nuts per year.

The bunding was expected to be completed within six years of commencement of the project, i e, by 1978-79. The cost of the bunds was put at Rs 19.96 crores. Altogether, the project was expected to cost Rs 26.75 crores.

According to the Scheme, as soon as the bunds were completed in an area, a second rice crop was to be grown there. As a result, it was expected that there would be an increase in output of over 8,000 tonnes in the very first year of the project; by the sixth year the additional production was expected to reach 1.49 lakh tonnes.

The execution of the Scheme was entrusted to a newly-floated agency called the Kerala Land Development Corporation (KLDC). The Agricultural Refinance Corporation was to make funds available to the KLDC for the actual bunding, while the Corporation's establishment expenses were to be met by the state government from its budget.

The KLDC was launched with much trumpeting two years ago. And, naturally, it expanded rapidly with the proliferation of departments such as engineering and agriculture. Naturally also, talent being very scarce in this country, and most of it being concentrated within the precincts of the secretariat, most of the senior staff were deputationists, who drew a special 20 per cent deputation allowance while on duty at the KLDC. This allowance alone came to about Rs 2 lakhs per year. In all, the establishment expenses of the KLDC soon rose to over Rs 24 lakhs per year.

If the KLDC had worked according to the schedule set for the project, it would have constructed over 300 kilometres of bunds by now. Instead, it has constructed barely one kilometre — in two years of operation! The KLDC's original schedule was to spend Rs 80 lakhs on bunding by March 1974. Later a *post facto* evaluation led to the target being scaled down to Rs 40 lakhs, which money was withdrawn from the ARC into the credit of the KLDC. Of this, however, barely Rs 2 lakhs has been spent so far. As for the Rs 375 lakhs worth of bunding worth that the KLDC was to implement before June 1975, the latest estimate is that at best Rs 50 lakhs worth will be completed.

The KLDC thus has the unique record of having spent nearly half-a-crore of rupees from the state government's impoverished exchequer to execute Rs 2 lakhs worth of works! Even the state PWD — not particularly renowned for its standards — can boast of a better record. As a consequence of the dismal performance, the KLDC is in danger of having the ARC refuse to sanction the Rs 16 crores that it had promised for the second phase of the project.

An artistic finish has been added to this squalid performance in the shape of a report by a special officer deputed by the Kerala government to oversee the implementation of the scheme. This worthy, a retired accountant, has pinpointed what in his opinion was the reason for the KLDC's poor performance — the fact that the engineering wing is headed by a person who is "not very senior in service". Thus, what is called for is to replace him "with a person who is either of the Chief Engineer's rank or who is next in the line of promotion as Chief Engineer". Presumably a retired Chief Engineer would be even better.

In the meantime, Kerala continues to have a 50 per cent cereal deficit.

Making the Most of It All

Hansavivek

GARWARE NYLONS is diversifying its activities. It is already setting up a project for manufacture of polyester filament yarn with a capacity of 360 tonnes per annum, which is expected to go on stream during the second quarter of 1975. Steps have been taken also to instal a depolymerisation plant for recovery of caprolactum from polymer waste. This plant is expected to be commissioned by about the same time as the first plant. The company proposes to participate in a joint venture to be established in Malaysia for production of man-made fibres. Terms and conditions of the proposal are being negotiated with the State Development Corporation of Negri Sembilan, Malaysia. The company has negotiated, along with other companies in the Garware group, for acquisition of 49,500 equity shares of Rs 10 each in Blundell Eomite Paints from Blundell Permoglaze Holdings of the UK at Rs 20 per share. The paint company has to reduce its foreign shareholding to be eligible for further expansion of business.

During 1973-74, GNs production increased considerably though supply of its main raw material, caprolactum, was scarce owing to shortage in the international market. Nylon yarn production rose from 1,390 tonnes to 1,609 tonnes, against the installed capacity of 2,394 tonnes. During trial runs, production of polyester filament yarn increased from 23 tonnes to 137 tonnes, and that of nylon chips from nil to 40 tonnes. While sales were 76 per cent up at Rs 8.56 crores, gross profit more than doubled to Rs 3.10 crores. Both inventories and wages in relation to sales were markedly lower compared to in the previous year. Dividend is maintained at 12 per cent.

The company has been advised that it is entitled to a higher rate of development rebate applicable to industries engaged in the manufacture of articles specified in Schedule V to the Income-Tax Act. The Act, however, requires that development rebate reserve, of at least 75 per cent of the development rebate to be actually allowed, will be made by debit to the profit and loss account of the relevant previous year. In order to avail of this benefit, accounts for the three years ended March 1973 have been amended. The net effect is that general reserve, which stood at Rs 52.75 lakhs, Rs 80.40 lakhs, and Rs 83.80 lakhs, as at the end of 1970-71, 1971-72, and 1972-73, respectively, has been revised to Rs 51.40 lakhs, Rs 78.37 lakhs, and Rs 29.61 lakhs, respectively. Correspondingly, the amount standing to the credit of development rebate reserve has also been amended to read as Rs 31.75 lakhs, Rs 33.34 lakhs and Rs 160.23 lakhs as on March 31, 1971, 1972, and 1973,

5 reasons why you should invest in West Bengal

1 Outright grant of 15% of the fixed capital investment under the Central Subsidy Scheme—if you're setting up industrial units in Purulia, Nadia and Midnapore districts.

2 75% subsidy on the cost of feasibility report; refund of Sales Tax as interest free, long term loan; relief from Octroi; 30% subsidy on electricity consumption.

3 Assistance in getting term-loans from financial institutions.

4 Participation and underwriting of share capital by WBIDC.

5 Assistance from the West Bengal State Electricity Board who would meet the power supply cost involved in drawing high voltage lines to the industrial premises. The WBSEB also allow easy terms of payment for high voltage industrial consumers.

Plus, the ready availability of highly skilled labour at a relatively cheaper rate; 2 big ports serving a vast hinterland, broad-gauge railway network spanning all the districts, easy availability of water and cheaper power.

Make your move now. And grow industriously— in West Bengal.

WBIDC-1 B

for Rs 30.41 lakhs, Rs 31.31 lakhs and Rs 106 lakhs, respectively. Furthermore, out of abundant caution, the company has provided Rs 140 lakhs towards development rebate reserve during 1973-74. This has resulted in excess provision of development rebate reserve of Rs 103.20 lakhs, which is proposed to be adjusted in subsequent years.

Commenting on the scarce and irregular supply of caprolactum, the chairman B D Garware stresses the need to generate enough capacity for its manufacture, either by permitting new units in the public, private, or joint sector, and also by encouraging the existing unit of Gujarat State Fertilisers to expand to the possible extent. He emphasises that the indigenous product should be reasonably priced while measuring up to the expected quality and required standards.

J K SYNTHETICS intends to further expand and diversify its activities and has amended the objects clause of its memorandum of association to include manufacture of fertiliser, raw materials for synthetic fibres, industrial gases, caprolactum and methanol. Meanwhile, it is seeking a further increase in the capacity of synthetic staple fibre plant to 2,650 tonnes per annum, based on export obligation. Its application for expansion of the production capacity of the nylon tyre cord plant, to 1,600 tonnes per annum, has been already approved by government. The machinery manufacturing project was formally inaugurated in November last. A contract has been secured along with Karl Fischer West Berlin, with whom JKS has already entered into a collaboration agreement for manufacture of machinery for production of synthetic fibres, for supply of plant and machinery and technical knowhow to Indian Petrochemical Corporation for its polyester yarn project. The cement project was delayed owing to the non-fulfilment of delivery commitments by the suppliers of plant and machinery on account of power crisis. Meanwhile, the company has obtained a 'letter of intent' to expand capacity by 4,20,000 tonnes to 6,72,000 tonnes per annum. While steps are being taken to implement the acrylic fibre project, an application has been made for extension in the validity of the industrial licence. The technical collaboration agreement with an Italian firm has been approved by government. JKS has received approval from the governments of Kenya and India for setting up a synthetic yarn plant in Kenya with a capacity of about 5.3 tonnes per day. Steps are under way to implement the project. The company's research centre has completed a process of differential dyeable nylon yarn known as 'Nova-colour Nylons', for which a patent has been applied for. Also, a process has been perfected to recover DMT from polyester waste. During 1973, the company had to contend with shortages of raw materials and power. The overall performance, however, has been satisfactory, with higher sales and profits.

FIBREGLASS PILKINGTON has erected direct melt 'E' glass tank and has initiated trial production. This facility is expected to be fully established this year. Efficiencies on 'E' glass have been low so far because of the need, due to scarcity, to use marbles from several sources. A major requirement for sucessful operation in this field is very precise and consistent glass compositions. The company is looking for improvements when its own indigenously manufactured 'E' glass is available to it. The company's insulation division has been doing well — particularly because of the uninterrupted working, as improvements in technical operation enabled the company to avoid the need of a furnace rebuild. Sharp increase in prices and short supplies of some competing materials, which are oil derivatives, offered additional opportunities. Continuous filament sales, however, were adversely affected by the sharp rise in prices of petrochemicals that quadrupled prices of resin, which comprises some two-thirds by weight of fibreglass reinforced plastic products. Even so, the company has produced good results for the year to March last, with sales up by 67 per cent and gross profit higher by 78 per cent compared to the previous year. The board recommended a dividend of 12 per cent but had to reduce it to 9 per cent on account of the dividend restrictions imposed by government. Exports, which were barely Rs 3 lakhs last year, are to be stepped up significantly this year, but the directors point out that this is possible only if costs can be contained and the company's assets put to optimum use.

KHATAU MAKANJI SPINNING AND WEAVING has recently completed its 100 years of existence. Originally established with 25,000 spindles and 230 looms, the mill today has a licensed capacity of 1,31,080 spindles and 1,494 looms. The company produced excellent results last year, with gross profit increasing nearly threefold at Rs 247 lakhs, the highest in its career, following only 29 per cent rise in sales. Dividend, maintained at 10 per cent, was covered over three times times against less than 50 per cent last year. Both the ratios of wages and inventories to sales were considerably lower, compared to the previous year. These results have been obtained despite all-round rise in costs. The directors comment that, in view of the doubling of the obligation for production of controlled cloth, increase in cost of fuel, stores, power, water, and higher interest charges, the rate of profitability cannot be maintained in the future. The company continues to pursue the modernisation programme by replacing the old machinery.

RAMON AND DEMM, which increased production from 754 tonnes to 772 tonnes during the year ended March last, expects to achieve this year an output of about 1,100 tonnes. This should increase the turnover to around Rs 4.50 crores, against Rs 3.09 crores in 1973-74 and Rs 279 crores in 1972-73. According to the chairman, H K Shah, sales in the first five months of the current year more than doubled, at Rs 188 lakhs, compared to Rs 90 lakhs in the same period last year. The company is going ahead with its expansion programme. The application for the import of machinery has been cleared by Government. Additional buildings are to be completed by the end of this year. Meanwhile, the Controller of Capital Issues has accorded consent to the issue of bonus shares on a four-for-five basis.

UNIVERSAL STEEL AND ALLOYS has installed a second arc furnace with an annual capacity of 18,000 tonnes and expects to commission it shortly after adequate power has become available. The company has also taken up manufacture of special and alloy steels, for which there is a growing demand. Meanwhile, in the first year of production, it produced 7,798 tonnes of steel ingots against the installed capacity of 10,800 tonnes—owing to the erratic power supply and the drastic power-cuts in Haryana. The company made a gross-profit of Rs 9 lakhs on sales of Rs 121 lakhs. After depreciation, the profit was less than Rs 2 lakhs.

SHRIRAM FIBRES reports sharp rise in the capital cost of its nylon tyre cord project from the original estimate of Rs 800 lakhs to Rs 1,220 lakhs, on ac-

count of 'tremendous increases' in prices of all items. The company intends to meet a part of the escalated cost by issue of rights shares of Rs 93 lakhs, and the balance by borrowings from financial institutions and banks. The directors say that escalation of the project cost is not likely to affect adversely the profitability. The plant is expected to go into production shortly.

THE FOURTH ESTATE

The Price of Dissent

Nireekshak

THE confrontation between the editor of *Hindustan Times*, B G Verghese, and the owners of the paper, the Birlas, was not altogether unexpected (see 'Fourth Estate', September 28). What was unexpected, and is perhaps unprecedented, is the near-unanimous support which the editorial staff of the paper has extended to Verghese. The staff has formed a committee to resist his removal.

The chairman of the board of directors of the paper, K K Birla, has denied that the management's action was prompted by pressure from the government. The government has matched this with its own denial of any hand in the affairs of the paper and in the termination of the editor's services. However, the committee of the staff of the paper feels that the timing of the management's decision and the circumstances in which it was taken as well as the efforts of the management to block the publication of its correspondence with Verghese constitute a double threat to the freedom of the Press and the independence of the editor — "first, the interference of the proprietors in the editor's exercise of professional obligations and, secondly, governmental pressure on the proprietors".

The management of *Hindustan Times* served six months' notice on Verghese on September 1. This was just two days after the publication of the editorial "Kanchengunga, Here We Come" which had severely criticised the proposal to give Sikkim representation in the Indian parliament and to make it an 'associate state'. According to the notice served on him, Verghese was expected to give up the editorship at the end of February next year. But the issue seems to have hotted up with Verghese insisting that he should be communicated the grounds for his removal and asserting his right to publish the correspondence between him and the management. The management has been consulting lawyers about getting an injunction against the release of the letters on the ground that all except one were clearly marked 'private and confidential'.

Ironically, B G Verghese was the first Press Adviser to a Prime Minister in this country. Nehru never felt the need for such an adviser. Shastri did not have one, though news management began to be pronounced during his 18-month tenure. Asoka Mehta is credited with the idea of a Press Adviser for Indira Gandhi, ostensibly to create a new rapport between her and the Press. The induction of Verghese into the position irked the career information officers of the Central Information Service and there was a great deal of sniping at him at the time.

Verghese returned to journalism as editor of *Hindustan Times*. After what appeared to be an erratic start, the new-look *Hindustan Times* began to make its presence felt on small issues first and larger issues later, until it acquired the character of a dissenting paper, of course within the parameters set by the Establishment. At any rate, it ceased to be a conformist paper.

It was no secret that leaders of the Congress and the government were displeased with the paper's editorial policy and approach to news. There was much gnashing of teeth, for instance, when the paper gave the Prime Minister's last new year's-eve press conference, a hardy annual, single column treatment, which is all that it merited in terms of news. Other papers had gone to town over the press conference — presumably because, to them, the very fact of the Prime Minister speaking is big news. *Hindustan Times*' investigative reports on corruption in government could not have been received with joy in the Prime Minister's camp. Neither could the story of the large number of foundations stones of projects which the Prime Minister had laid on the eve of the UP elections, preempting both the Planning Commission and the Plan, have been too well received. The paper followed up the progress of these projects in the post-election period and found that they had not moved an inch beyond the foundation stone stage.

There were reports at the beginning of 1974 that Verghese would be quitting soon. His relationship with the management was known to have been tenuous for quite some time because those in power had made known to the proprietors their displeasure over the paper's policies. After all, those who talk the year round about delinking newspaper ownership from big business have to look to the Press barons when an editor proves to be inconvenient. Similarly, editorial chairs are filled only after the nominee has been cleared by those who matter in the government. Unfriendly editors are made to fall in line through friendly advice dispensed to the proprietors by 'well-wishers' in the government. Can friendly advice and warning be construed as interference in the functioning of a fress Press?

The least the management of *Hindustan Times* could have done to establish its *bona fides* was to have communicated to Verghese the grounds on which he was being removed and to have left the rest to law. Its failure to do so and its reported threat of legal action if Verghese published the correspondence suggests there is more to the situation than meets the eye.

The government and the ruling party are certainly not above putting pressure on newspapers whose policies they do not like. And there have been cases where such pressure has extended to securing the removal of recalcitrant editors. It is now public knowledge that the editor of *Janashakti*, the Gujarati daily of the *Free Press* group, was eased out during the Congress split under pressure from the ruling party. The editor made this fact public in his farewell editorial. He disclosed that a certain Central Minister had tried to put pressure on him to get him to change his editorial line. It was after these efforts had failed that he was removed.

The National Union of Journalists was quick to support the editorial staff of *Hindustan Times*, while the Indian Federation of Working Journalists was busy with its conference in Poona, listening to pontifications by khadi-clad VIPs to whom it looks for patronage. Much as it would like to be seen fighting the Birlas, the IFWJ might have to content itself with formal pronouncements of shock and anger because Verghese is not a 'committed' editor in the sense in which the .. IFWJ leadership understands that expression.

A New Delhi Diary

A M

AMORAL city, city which is a compendium of bargaining counters, a stockyard of all-too-transparent motives and manoeuvres. V K Krishna Menon had long become an unperson here; he ceased to embody power as many as a neat dozen years ago. His death, therefore, receives only a fleeting mention in the capital's newspapers. Priorities must be set right: the state of Bakhia's health hogs more space; and, have you heard, so-and-so had dinner with the Prime Minister last Saturday, something sensational must be about to break. Neo-colonialism, though, remains neo-colonialism: the British and American papers really go to town and write long editorial pieces on Krishna Menon's life and political contributions; consternation in the capital; hasty amends have to be made; the newspapers, after an interval of a full forty-eight hours, take editorial cognisance of Menon the departed. But where is the scope for astonishment, this cultural pattern is well-established: after all, New Delhi talks of a wage-price policy only when an Edward Heath or a Harold Wilson has already expiated on it.

Unreal city. Amoral city. In his last few years, Krishna Menon had nothing to offer anybody, so pass him up. The memory of the halcyon fifties is not for this city. Talk to the Africans or the Latin Americans. For several years, for them India was the crusade against imperialism and colonialism. India was Krishna Menon; the crusade against imperialism and colonialism was Krishna Menon. Krishna Menon, the dark, tall, gaunt, sickly individual, who instilled the fear of God into the North Americans and Europeans. Thanks to him, those who were continuously at the receiving end of taunts and derogatory treatment from the colonials, got back their pride.

Their day would be made as soon as Krishna Menon would begin to lash out at the ragamuffins who were scheming and conspiring against the world's poor and underprivileged. The State Department and the American Congress hated him; the hatred was well earned. If it were at all possible, the Republican party would have impeached him — the ogre with the walking stick, who subsisted by drinking gallons of that sinister potion, otherwise known as tea, and on little else. That Mephistopheles from out east, get him if you can.

New Delhi is in a jam. NATO foreign ministers used to shiver in their shoes the moment Menon walked into the United Nations General Assembly. The London *Economist*, moved by impotent rage, used to write spiteful pieces about him. Come to think of it, these constituted a unique tribute to India's role in international affairs during that phase. Inverted colonialism should have operated in full swing. Who did or said what in response to Krishna Menon's this or that act of mischief-making could now have been recollected in zestful detail; snobbery of a grotesque sort could have broken free. The occasion of the cantankerous fellow's death could have been turned into a gala carnival of nostalgia. That is not possible. For an altogether simpliciste reason. Menon's name has got associated with the memory of the drubbing received from China in 1962. An unfortunate denouement, it being a matter of joint supply, to remember all those wondrous exploits of Krishna Menon will also mean once more making a person of an unperson. Trust that man to put the elite of this capital city in such a predicament. Such a great pity that Menon's death cannot be celebrated with proper eclat; the liability for this minor tragedy has to belong to the man himself. Therefore, condemn the fellow even though he is dead. No pleasure can be extracted from the phenomenon of his death. This, to say the least, is atrocious. The city is fuming.

Excellent News Sense

Unreal city, city without co-ordinates. The city's newspapers print full-blown pictures of a group of jawans in Bihar, all smiles, dragging the carcass of their quarry along the ground; it is a street scene from Patna; in Bihar, the jawans were out a-hunting and the particular game shot happened to be a young boy of thirteen or fourteen. You examine the picture, your day is made, such excellent news sense displayed by the photographer; what a gay, happy lot the jawans are! Unreal city, amoral city. Those laying down its ethics will short-change their own mother if that would help the flow of some extra gravy toward their direction. Decoy city, now recovering from the trauma of the visit of the Iranian emperor and his consort. City without scruples, the Shah is no longer to be referred to as just 'Shah', he has become Shahenshah. Bow before him, lick his boots, he can dispense bounty, ingratiate yourself to him, garnish your lingo with the right subservience, he has largesse to bestow upon you and me. This particular tyrant may preside over one of the most oppressive regimes anywhere any time, he may shoot two to three thousand peasants on a regular basis every year; thousands of students may at present be locked away in prison by him and subjected to unspeakable torture. But these are now unfacts, to be ruled out of order; for the tyrant is lush with money. Precious doles are a-coming, so how does it matter whether the dole-dispenser has students for breakfast and impoverished peasants for dinner? One of the city's newspapers has congratulated the authorities, and by association itself too: the official bandobast during the Shah's visit was foolproof, there was not a squeak of a protest demonstration. Even so, nothing is perfect in this world, the newspaper has gone on to lament: a group of Iranian students somehow managed to put up a few anti-Shah posters at the entrance of one of the capital's universities. How this scandalous accident could occur must provide the staple of thought for any number of committees and enquiry bodies to be set up now.

Amoral city, city without scruples, where the gentry receive near-basmati rice at maybe Rupees 1.50 per kilo from the ration shops, while in the rest of the country you can offer to pay four times as much for the coarsest of rice and not obtain any. Amoral city, its roads get wider and sleeker, the construction boom perhaps pre-empts as much as 15 per cent of the total steel and cement the nation can spare for building activity. Unreal city, the admiral's or maybe the field marshal's, daughter comes to college to take a course in diplomacy or what-have-you, has a sudden crush for the dishevelled youth who talks of the necessity of revolution, and instantly begins to consider herself a Naxalite. Unreal city, it is a passing phase, she will get over it. Unreal city, the posh new architecture could be on the outskirts of Rome or Milan, Nice or Marseilles; but the *jhuggis* next to the elegant structures are as filthy and desolate as those in darkest Calcutta; every few weeks, at dead of night or in the early hours of the morning, the police will mount well organised surprise swoops; the *jhuggis*, which were put up without authorisation by the wretched tramps, will be demolished; and the land will be restored to the Development Authority which will see to it that more of posh constructions come up uninterrupted. Unreal city, the hike in the petrol price

evokes an appropriately sympathetic response from the authorities; more buses are overnight put on the road, at strategic points with increased frequencies and at subsidised rates; the transport problems of senior civil servants and their families must be duly taken care of — the Guardians are there to protect the Auxiliaries. Absurd city, where the runway at the airport is three times as long as would be needed by the biggest of the jumbo jets, so much so that, of all places in the country, it takes the longest here to disembark following the landing of the plane. Unreal city, the affluent housewives too are as unreal as anywhere; they indolently read about starvation deaths elsewhere in the countryside, overcome by boredom they throw the morning's paper on the floor, get up, manoeuvre the car out of the garage for their stability round of golf. Unreal city, city given to centripetal gossip, gossip about who arrives and who departs, who was not dropped for what reason in the cabinet reshuffle, who is to be dropped in the next one, who is to be included or elevated, who is getting which slot where. Vulgar issues, but given the garb of life-and-death problems. Unreal city, glorious lights, dazzling boulevards, but a dead city, where the phenomenon of famine and deaths are a trite matter. Those who die are on the other side of the bridge, the are expendable; and, besides, don't you know, King Kissinger is coming.

Unreal city, whore city, city with a total capital stock of amorality which benumbs you. Whore city; at about this time, last year, it welcomed General Secretary Comrade Brezhnev with a million hugs and kisses. This is *caravanserai*: in the present season, it is Secretary of State Kissinger who is coming, and all the flags are out, all the ersatz emotions are on display, for, once more, there is the scent of money. Unreal city, where Jawaharlal Nehru once preached mail-order socialism, where the Bhupesh Guptas parodying themselves perform in the manner of drugged circus animals. Unreal city, crooked to the core, while Krishna Menon would stalk the stage, solo, and the vocabulary of anti-imperialism and Afro-Asian solidarity rolled off the corner of his contorted mouth others would work extra time to sell ideology down the drain.

An age of romanticism is to be followed, so it is alleged, by one of pragmatism. But New Delhi is for ever. Duck takes to water, New Delhi takes to bigamy. The cultural norm must be taken with dead seriousness: fend for yourself, cut corners, betray your friends, prevaricate, be a careerist, there is no greater call than the religion of survival, unreal city teaches you how to survive and expand. Your hypocrisies are not merely for ceremonial occasions, they finally define you. Meanwhile, deceive and survive. Those who fail to learn the art of survival become unpersons; their *jhuggis* are raided by the police at midnight, they are ejected into the wilderness of the ridge. Unreal city, here only the fittest survive. The fittest are those who can sharpen cards. Whore city, she will give her body to you provided you carry ready cash, and in plenty. The Shahenshah has departed, Henry Kissinger is arriving, the flags are out. The trumpets sound.

CAPITAL VIEW

Playing Ministerial Chairs

Romesh Thapar

ONE cannot but wonder at the psychological state of Cabinet Ministers shunted and shifted from pillar to post, for no apparent reason, and compelled to smile their way through the debris of one shake-up after another. The same faces reappear in the pictures. They are differently positioned, unsure of seniorities and with a few more creases in their very creased faces. So it has been in the latest operation, the seventh in three years. The eighth, a part of the unfinished seventh, is promised within a week.

What is the worth of another "analysis" of this meaningless game of ministerial chairs. Let me confine myself to capturing something of the informed reaction in the Capital. Here goes ...

Bandwagoners, partial and full-blooded, see the operation as a move towards rationalising portfolios, putting the right minister on the right job. You'd think that this simple principle had always been observed, but then that would be naive. Cabinet-making, the selection of a Council of Ministers for a subcontinent, is a complex business of balancing castes, regions and ideologies. As for capacity, skills, experience, that is a marginal consideration.

The over-suspicious, who don't trust the lady at 1 Safdarjang Road, see the game differently. A leftist "coup", they say — and even if the D P Dhars, the Raj Bahadurs, the Nurul Hasans and Raghunath Reddys disappear in the second instalment which is promised. Well, it is difficult to decipher the Left and Right, but if P N Haskar arrives in the Planning Commission, there will be a lot of such talk. He was and is considered a symbol by 'lefty' friends and admirers who are eager to re-focus the spotlights on themselves.

The cynics, and their number increases with each day, point to the way in which the exercise was conducted. An essentially party matter was entrusted to bureaucrats. Carefully arranged leaks in the Press were designed to pre-test public reaction. Everyone was made to understand that the Prime Minister's senior-most colleagues would have to forget their "preferences", would have to learn to be disciplined followers. The message certainly went home, but does India get a more efficient, more credible government?

Hard-headed observers note the humbling of Jagjivan Ram — and all the talk of auspicious rain falling around the swearing in time cannot hide this fact. Swaran Singh must be sore about his inexplicable removal from External Affairs unless Defence is now seen as a core portfolio. Dixit's banishment, for that is what it is, should hurt him deeply. Chavan should be speculating on who will make the pace at the Foreign Office. Could he not have gone back to Home where Brahmananda Reddy will now rule. Subramaniam and Pai — and, of course, money-gatherer Barua — must be happy. In a way, K D Malaviya too. The rest is marginal, and so many are still wondering whether they will come under "transfer" like D P Dhar.

Poor thing! What can she do? The party is a dump of second-raters and third-raters. Where is the talent? She has to make do with what is available. And there are the usual considerations of caste and region and ideology. A lot of poppycock. Excuses. Excuses. Excuses. The Congress party has a younger leadership. It has to be reorganised. It is not servile. It watches the elders make a merry mess, is unable to act, as yet. Indira Gandhi is no longer a leader of the young.

Peripheral comments are interesting. Not a bania or Guju (Gujarati!) in sight, and they are the ones who know the tortuous world of money. The strangest yardsticks are obviously used to decide who qualifies for the Cabinet — certainly not performance potential. The young activists who have won their spurs in various ministries keep watching for an opening to real power. Inexplicably, a Chattopadhyaya makes it. Not a Pant, a Gujral, or a Mirdha. An explanation? There is none.

We are now saddled with a government that is going to be with us until the general elections — or at least so it seems. The elections, according to the present speculation, may be next year or the year after. This means that the burden of men like L N Mishra will be carried by the party, unless the plan is to shed them in mini operations, quietly, as some crisis or the other obliges. What's the matter with a continuous or running shuffle of the Council of Ministers until a working credibility is established? A possibility when key decisions in all portfolios are now taken in the Prime Minister's secretariat.

At this point, the soft, sad voice of a still committed man is yet to be heard. When will we hear of a minister refusing to be aimlessly shuffled? When will these heirs of Gandhi and Nehru develop the stomach to resign? When will we be able to point to men of character and substance in our political life? When? There are no answers, only an embarrassed silence. And, then, humorous asides about a puppet show.

So much for informed reaction to the game of ministerial chairs. There may be excitement in the rural areas about what goes on, but certainly not in the towns. That's probably a reflection of where political interest survives. Yes, it is serious, this gap in political reaction, between town and village. And on the top of it, in Bihar, comes Jayaprakash Narayan's call to establish a parallel government.

The rain had better keep falling. It is on time, according to the Hindu calendar. We may still pull through. That is, if the farmers have followed their traditional calculations and not been confused by the usual weather forecasting of the Government of India ...

October 14

FROM OUR CORRESPONDENTS

BALANCE OF PAYMENTS

Living on Borrowed Money

IN a period of less than six months, India has borrowed thrice from the IMF — first under the compensatory financing facility, later under the gold tranche and finally under the first credit tranche. These borrowings total about Rs 370 crores. And before the current calendar year is out we will have borrowed once more from the IMF, under the Fund's new 'oil facility'. The government has announced that it will soon avail of this facility and that details in this regard are being worked out. The details that are being worked out, it is evident, relate not to our requirements of foreign exchange to be met by borrowing but to the maximum amount that we can borrow under this arrangement. The government's appetite for borrowing abroad is apparently insatiable.

The IMF's oil facility is meant to assist member countries to meet the impact of the increases in the prices of petroleum and petroleum products on their balances of payments. The resources made available under this facility will be in addition to any assistance that members may obtain under the IMF's normal facilities. The "maximum amount" that can be borrowed under the oil facility has been fixed at the extent of the increase in the cost of the member's net imports of petroleum and petroleum products over 1972 or 75 per cent of the member's quota, whichever is lower. However, since the resources at the disposal of the IMF for lending under this facility are limited, the amount that a country can actually borrow has been set for the present at 35 per cent of the "maximum amount" as defined above. The increase in the cost of a country's net imports of petroleum and petroleum products is to be calculated by multiplying the volume of its net imports in barrels by $ 5.50.

It is possible to work out roughly what India can borrow under the oil facility according to this formula. Our imports of petroleum goods were about 116 million barrels in 1972. The increase in the import cost would thus be around $ 638 million (116 million x $ 5.50). India's quota in the IMF is SDR 940 million or around $ 1,120 million. Since 75 per cent of India's quota will work out to much higher than the increase in the import cost of petroleum goods, the "maximum amount" in our case is given by the latter which is $ 638 million. Since we can borrow only 35 per cent of this "maximum amount", we can raise around $ 223 million under the oil facility from the IMF before the end of 1974. The figure of $ 200 million indicated by the government is, therefore, a slight underestimate and in all probability our actual borrowings are likely to be nearer the figure indicated above.

Press reports indicate that the funds available for the oil facility in 1975 are likely to be much larger. The total amount at the disposal of the IMF under the oil facility for 1974 is around $ 3.2 billion, all of which has come from the oil exporting countries. As the current year passes these countries will have accumulated further huge surplus balances which they will find increasingly difficult to employ gainfully. The estimated increases in the disposable balances of oil exporting countries, after meeting their import requirements, are estimated to be around $ 60-65 billion in 1974 and nearly $ 70 billion in 1975. Given the fact that investment opportunities in their own countries are limited, these countries are expected to contribute more liberally to the IMF's oil facility in 1975. The oil facility in 1975 is placed at around $ 6 billion as against $ 3.2 billion in 1974. On this basis it appears that India might be able to borrow about $ 400 million under the oil facility in 1975.

Apart from the oil facility, India can also consider borrowing under the newly-devised extended fund facility of the IMF. As under the oil facility, repayments under this arrangement start 3-4 years after the disbursement of the loan. Under the extended fund facility India can borrow as much as $ 1,000-1,200 million if it can convince the IMF that funds of this order are required for financing its balance of payment deficit. This should not be difficult at all. And in addition to what we can borrow from the IMF, some of the oil exporting countries like Iran and Iraq are also willing to lend us money against export of specific commodities in repayment of the loans.

All in all, it thus appears that if the government is so inclined, it can borrow very large sums of money abroad. What these large loans will be used for is, of course, a different matter. The Fifth Plan is as good as not there. The loans that are being raised abroad will mostly be used to finance imports of consumer goods like foodgrains or so-called 'maintenance imports' which also go to meet

the consumption requirements of the economy. Imports, financed by reckless borrowing abroad, are thus to be used to avoid the hard decisions required, for instance, to force producers and traders to disgorge hoarded stocks or to keep conspicuous consumption under check.

That this is a very short-term approach hardly needs to be pointed out. It may be possible, given the availability of willing lenders, to finance imports to sustain consumption in the economy with borrowings abroad this year and the next and the year after. But how much longer? Sooner rather than later, the problem of servicing the debt that is being merrily accumulated will have to be faced. But perhaps in the government's view that is a matter for a future set of politicians to worry about.

Internal Assessment System

Report on a Seminar on Examination Reform

A R Momin

THE system of examination is the most obnoxious anachronism in our educational set-up. It is refreshing to note that a new awareness with regard to the inadequacy of the examination system is dawning on our social scientists and educational planners. The publication of a pamphlet on examination reforms by the University Grants Commission is indicative of this awareness. It is in this context that the Seminar on Examination Reforms sponsored by the University of Bombay on August 24 deserves the attention of academics, educational planners and the interested public.

The focus of the Seminar was on the internal assessment system introduced by the University of Bombay from the year 1973. The participants in the Seminar represented the various Departments from the arts and science faculties of the University of Bombay, some local colleges and students. A major highlight of the Seminar was the presence of Edwin Harper, Director of the Educational Research Bureau, Allahabad, a distinguished educational psychologist who has done extensive researches relating to examination reforms. The Seminar began with the customary introductory and welcome speeches and an inaugural address by the Vice-Chancellor, T K Tope. After the Vice-Chancellor's speech, Edwin Harper gave his keynote address on examination reforms. Harper began by underscoring the point that there is no single formula of examination reforms which would be applicable to all educational institutions with equal validity and effectiveness. The question of examination reforms, he stressed, should be viewed in the context of the academic and socio-cultural setting of a university. The thrust of Harper's critique of our examination system was directed at the external method of assessment and evaluation. He referred to a number of empirical studies relating to the question of the reliability and authenticity of the external assessment system and said that all such studies point to a uniform conclusion: that the exernal system of examination and assessment is largely unreliable and inadequate so far as an objective evaluation of the students' performance is concerned.

Harper offered a massive critique of the external system. In the first place, the external mode of examination is chiefly a test of the student's physical stamina: the pattern of questions and the expectation of answers is such that over 90 per cent of the student's time is devoted to writing and only 10 per cent to thinking. Moreover, the external system is undemocratic in spirit because of its over-emphasis on verbal expression as a criterion to judge the student's ability. But linguistic ability, he pointed out, is closely associated with socio-economic status. The economically better placed people send their wards to public schools which provide better opportunities for the development of verbal expressiveness. Students who come from the rural areas and those who are educated in municipal schools may be lagging behind in verbal proficiency and so it is undemocratic to assess their educational ability and achievement in terms of a set linguistic category.

Harper made a forceful and convincing plea for the adoption of the internal assessment system as an ideal method of assessment and evaluation and commended the lead given in this direction by the University of Bombay. He also offered a number of suggestions with regard to obtaining reliability of results and objectivity of assessment. He suggested the introduction of a relative grading system as recommended by the Education Commission and the UGC. In this system, a grade (unlike a 'mark') has the same meaning in all subjects.

Harper's talk was followed by presentation of papers and notes on the working of the internal assessment system. While everyone welcomed the introduction of the internal system, a few pleaded for a switch over to a complete internal system, in place of the existing compromise formula of 60 per cent internal and 40 per cent external. Others felt that in a period of transition like this it is advisable to have a combination of both. The papers highlighted the difficulties faced by the various Departments in implementing the new scheme and offered suggestions to eliminate certain inconsistencies and limitations of the new system, in the light of the needs and requirements of each Department. The problems of the employed students who constitute the bulk of postgraduate students were also pinpointed.

The business session of the Seminar focused on Harper's ideas on examination reforms. Most participants shared Harper's critique of the external assessment system which he held to be responsible for academic impoverishment among Indian students. Most participants also agreed that Departments should have autonomy and flexibility in evolving their own methods of teaching and assessment in keeping with their needs and requirements. Most speakers were of the view that the syllabus should not be laid down in a rigid fashion by the University, but rather be left with each Department, preferably with the teachers concerned.

There was a general agreement about the desirability of having an examination panel for the reassessment of the student's assignment. Most speakers were also of the view that the student should be given a chance to improve his grades. Most participants felt that trust in the teacher's integrity was a basic condition for the effective working of the internal assessment scheme.

A Seminar need not necessarily end up with definitive conclusions and decisions. The fact that it facilitates a meaningful communication and exchange of ideas and experiences on relevant issues and problems is itself a token of its success. Judging by this criterion, the Seminar served a useful purpose by bringing into light certain major issues relating to examination reform which is becoming a significant point of debate and discussion in centres of higher learning in our country.

MAHARASHTRA

The Programme that Crashed

IN August 1972, anticipating a possible decline of 15 mn tonnes in the kharif crop following widespread failure of rains, the Central government launched the Emergency Agricultural Production Programme (EAPP), popularly known as the rabi crash programme. Under this programme, the Maharashtra government submitted to the Centre 13 schemes involving a total expenditure of Rs 50.66 crores. The Centre sanctioned 10 of these schemes together with a medium-term loan of Rs 24.96 crores for them. In addition, Maharashtra was sanctioned a short-term loan of Rs 16 crores for seeds and fertilisers. Thus the state was sanctioned Rs 40.96 crores by the Centre under the crash programme. In his budget speech on February 19, 1973, Maharashtra's Minister of Finance claimed with pride that "the state government was quick to take advantage of [the crash] programme and secured the lion's share of it".

Under the crash programme — decided upon in consultation with the Centre — the Maharashtra government planned to bring substantial additional area under wheat, gram, jowar and summer paddy (Table 1) with corresponding expectations about increases in output (Table 2). The state government actually spent Rs 27.52 crores on the ten schemes, for which the Centre had sanctioned Rs 24.96 crores.

Special Report

In a special report, the Comptroller and Auditor General of India has reviewed the implementation and achievements of the crash rabi programme in Maharashtra (together with the crash scheme for rural employment in the state during 1971-72 and 1972-73). The report brings out that the implementation of the crash programme was tardy, that the physical achievements fell far short of the targets and that a large part of the expenditure on the programme went to benefit rich farmers, contractors, suppliers of equipment and materials, etc. Table 1 shows that, despite the crash programme, the area under the various crops in the 1972 rabi season was lower than in a normal year instead of being higher. Table 2 shows the shortfalls in output compared not only to the targets but even to the output in a normal year.

That the results of the crash rabi programme should have been so dismal is not surprising in the light of the actual implementation of the various schemes taken up under the programme, as brought out in the CAG's report. These schemes were (i) lift irrigation in the state sector, (ii) minor irrigation in the state sector, (iii) extension and improvement of existing irrigation systems, (iv) construction of field channels in the command areas of irrigation projects, (v) energisation of tubewells, (vi) cooperative lift irrigation schemes, (vii) energisation of wells, (viii) percolation tanks, (ix) speedy completion of minor irrigation works, and (x) energisation of wells with pumps. The CAG's report points out that there was a saving of Rs 23.88 lakhs on schemes number (ii), (iv), (v) and (vi) as the expenditure incurred was less by that amount than the funds received from the Central government for these schemes. "The unspent balance was neither refunded to Government of India nor was permission of the Government of India taken for reappropriation of the savings to the schemes on which expenditure had exceeded the allotment."

In all 415 lift irrigation schemes involving an expenditure of Rs 13.26 crores, with an irrigation potential of 88,000 hectares, were proposed under the crash programme. However, only 366 works estimated to cost Rs 13.35 crores, with an irrigation potential of 78,178 hectares, were actually taken up for execution. Out of these 366 works, the CAG's report points out, only 15 had been completed by March 1973 and 70 more were completed by May 1973. The state government told the CAG that, out of the 281 works still incomplete at the end of May 1973, 134 would be completed by December 1973 and 32 more by June 1974. Since only 15 of the 366 schemes had been completed by March 1973, the lift irrigation part of the crash programme had virtually no impact on the availability of irrigation during the 1972 rabi reason. The CAG's report brings out a number of cases of delays and financial irregularities in the implementation of lift irrigation schemes. For instance, it discloses that in Chanda, Poona and Sangli districts advance payments of Rs 12.27 lakhs made to various firms remained unadjusted till November 1973; of this amount, advance payment of Rs 9.77 lakhs was made to a firm for supply of RCC pipes in Sangli district which had stopped manufacture of the pipes.

Not Foodgrains but Sugarcane

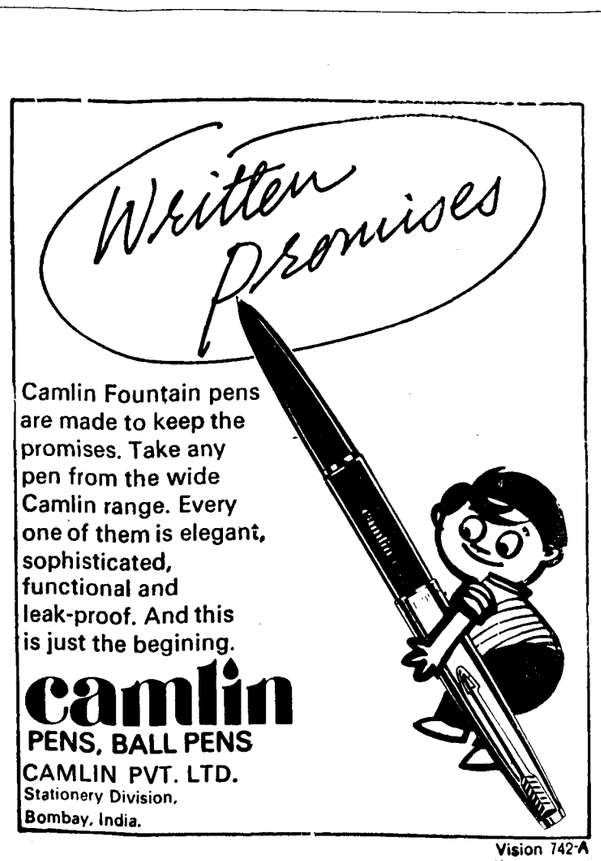
As many as 25 lift irrigation schemes costing Rs 4.27 crores, out of the proposed total expenditure of Rs 13.35 crores for the whole of the state, were taken up in just Sangli district. What is even more curious is that the esti-

Table 1: Area under Different Crops — Targets and Achievements

Crop	Targets			Achievements		
	Normal	Additional	Total	Normal	Additional	Total
Wheat	8.80	4.75	13.55	3.88	3.53	7.41
Gram	3.50	2.23	5.73	1.36	3.56	1.92
Rabi jowar	33.50	2.00	35.50	18.59	7.31	25.90
Sunflower	0.06	0.40	0.46	0.001	0.001	0.01
Safflower	3.36	0.25	3.61	1.77	1.04	2.81

Table 2: Production of Different Crops — Targets and Achievements

(lakh tonnes)



Crop	Target			Actual Production (including that under the Crash Programme)	Rabi Production		
	Normal	Additional	Total		1969-70	1970-71	1971-72
Wheat	4.33	6.60	10.93	2.48	3.90	4.51	5.02
Gram	2.63	0.33	2.99	0.40	1.01	0.99	1.33
Rabi jowar	13.97	No Target	13.97	3.80	12.98	6.94	8.34

mates for these works were prepared by a co-operative sugar factory in the district and the works were designed to provide irrigation to the lands of the members of the factory for growing not foodgrains but sugarcane, even though sugarcane was not covered under the crash programme. After this it is perhaps superfluous to add that Vasantrao Dada Patil, Minister for Irrigation and Power, hails from Sangli district and controls a large sugar co-operative there.

The CAG's report brings to light many cases of irregularities and delays, and consequent loss to the government, in the purchase and use of steel plates, machinery, etc. Supposedly to enable quick purchase of materials and equipment for the crash programme, the state government in September 1972 relaxed the normal procedures and appointed a high-powered committee to centrally arrange purchases by inviting 'limited' quotations. Orders of the value of over Rs 4.5 crores were placed in this manner. However, despite the centralised arrangements for purchase, the CAG's report points out, the state government did not have the figures of actual expenditure on such purchases. In 51 out of the 84 divisions entrusted with the implementation of the works, pumps, pipes, chain-pulley blocks, girders, etc, valued at Rs 1.52 crores out of total purchases of Rs 1.94 crores had not been used or installed till May 1973. Further, out of the total quantity of 5,173 tonnes of steel (plates, rods, girders, etc) purchased, 996 tonnes were purchased in the open market at rates higher than JPC prices on grounds of urgency, involving an extra payment of Rs 15.98 lakhs. And yet as much as 2,949 tonnes of steel valued at Rs 44.15 lakhs remained unutilised till November 1973. On the other hand, in Chanda, Nanded and Poona districts, trenches were dug to lay pipes for lift irrigation works. But the trenches got silted because of non-receipt of the pipes and rainfall in the intervening period. Out of 93 tanks (7 irrigation and 86 percolation) taken up in ten districts, only two percolation tanks had been completed by March 1974. The report is full of such examples of uncompleted and abandoned road works, after expenditures of lakhs of rupees had been incurred.

The state government received a short-term loan of Rs 16 crores from the Centre for the supply of inputs like seeds and fertilisers to farmers. The CAG's scathing remarks on the mal-distribution of high-cost seeds brings out how a part of this large sum of money was used to line the pockets of the rich seed-growers. Against the total requirement of 4.85 lakh quintals of seeds (3.67 lakh quintals wheat and the rest other crops) for the 1972 rabi season, the state government procured 3.13 lakh quintals (2.9 lakh quintals wheat) and distributed 2.9 lakh quintals (2.7 lakh quintals wheat). Thus procurement of seeds fell short of estimated requirements by 1.72 lakh quintals and even out of what was procured seeds worth Rs 20.93 lakhs remained unutilised. The state government ordered that the undistributed balance of wheat seeds (19,000 quintals, valued at Rs 18.53 lakhs) be disposed as grain through fair-price shops! Despite the shortfall at the state level, in Aurangabad and Bhandara districts seeds were distributed in excess of requirements. In Aurangabad as against the estimated requirement of 19,107 quintals, 33,464 quintals were distributed.

The state government assessed the requirement of fertilisers at 54,469 tonnes of N, 35,840 tonnes of P and 27,500 tonnes of K. But the state received 61,835 tonnes of N, 14,707 tonnes of P, and 25,027 tonnes of K. This left fertilisers worth Rs 4.01 crores unutilised. This, together with the similar experience with regard to the irrigation schemes and the supply of seeds, shows that the so-called crash rabi programme was launched without any pre-planning by the state government whose objective appears to have been to secure as large a chunk of Central funds as possible. Having secured these funds, their dispensation followed the dictates of political patronage rather than the requirements of increased foodgrains production.

THE FAMINE

A Report from Dhubri

M S Prabhakar

THIS is an account of a brief trip to Dhubri in the latter part of September. Newspapers in Gauhati had proclaimed in banner headlines a disastrous situation in Dhubri in early August, but after a couple of days' scare, the panic evident in the early reports had given place to routine reporting. But even though there were no more headlines in the newspapers, one heard of accounts of large masses of people roaming the streets of Dhubri and other small towns; of corpses in the streets, on railway platforms; of rotting cadavers providing a feast to dogs and vultures; of distress sales of lands and goods at throw-away prices; of abandoned children; of women forced to sell themselves for a few paise; of shrewd political operators making small fortunes by doing the good work of refugee rehabilitation; of rackets aplenty.

Stench of Corpses

I saw all these, and much more, during my trip. Of the damage caused by the floods, routinely described as 'uprecedented', there was evidence enough even when one was on one's way to Dhubri; long stretches of NH 31, 'a life-line passing through the heart of the North Bank', were little more than runnels and rutted potholes; for many days, the road between Gauripur and Dhubri had been under water and one made the last stretch of the journey by boat.

The smell of dead bodies hits the traveller as soon as he gets off the bus at the Dhubri Bus Stand. Let not the enthusiastic reporter dash off a report about corpses in the streets of Dhubri. The smell that welcomes him is undoubtedly of a human corpse, and it could even be the dead body of a victim of the famine. But the corpse is not lying in the street; the stench is emanating from the town hospital mortuary which is right across the street from the Bus Stand. But no matter; before one stops one's nose and forces down the upsurging bile, the cavalcade of destitutes is there for all to see; squatting, lying, sleeping on the roads; waiting patiently for the dole served by the Marwari relief society; listlessly wandering in search of food; occasionally dropping dead, or less dramatically, lying down to die.

Is it flood, or famine? Clearly, there is evidence enough of the flood for anyone to see; but the magnitude of the disaster that has struck the Dhubri sub-division can only be interpreted as a famine. It is not as though the area in question had not experienced floods and erosion in the past years, each year's disaster being dutifully chronicled by the newspapers as 'unprecedented'. But the influx of thousands of destitutes into the towns has been a special feature of this year, and this certainly has been unprecedented. The universal opinion is that while the current miseries have undoubtedly been greatly aggravated by the floods and erosion, the basic causes for these miseries have to be sought elsewhere; to wit, in the gradual spreading of famine conditions in the Dhubri sub-division (especially), and other parts of Goalpara and Kamrup districts. The steep fall in jute prices during the past two years (after a period of artificial boosting which induced many peasants to sow jute in place of paddy) is only one of the many causes that have led to widespread famine.

Updated Mortality Lists

Deaths? How many people have died of starvation in the past few weeks? According to Jehirul Islam, Chief Executive Councillor of the Dhubri Mahkuma Parishad, at least 2,000 people have died since the middle of July; about 200 people are dying every day. Mortality lists are there aplenty, and every gaon panchayat is ready to show the carefully maintained lists, constantly updated, to any inquiring visitor. Destitution? Out of a total population of a little over 850,000, more than 50 per cent have been affected by the floods and erosion — famine has hit everyone — and the number of total destitutes is more than 20,000 heads of families. The term implies exactly what it says: the head of the family has either had his whole land and homestead washed off, or has been forced to sell his land and goods in order to sustain himself and his family for a few more days before final pauperhood and hunger has driven him to the town in search of food. How does one arrive at these estimates? Evidently, the local authorities have their agencies which give more or less reliable information. But one does not need to rely on figures, official or non-official; the sights and sounds and smells of Dhubri, Gauripur, Golokgunj, Panbari, Patamari, Fakirganj ... these are witnesses enough of the miseries of a very large number of people. I visited only a few of the affected places, always returning to Dhubri to sup on the horrors of the day; but even I, on a most conservative estimate, saw over 10,000 people reduced to utter destitution, many of whom were obviously waiting to die.

*

Satsiakhamar (pop 675) is a village in Gauripur Dhap Gaon Panchayat, under Lakhimpur Thana of Goalpara sub-division. Abdul Gafoor is a resident of the village; his wife is Zubeda Begum. They had two sons and two daughters. On September 13, 1974, he throttled his wife and on the next day (Saturday), he threw his family from a raft into the river Jinjiram. Reason: inability to feed them. He now wanders about in what is left of the village, like a demented man. The police were not over-anxious to register a case, but efforts are being made to have a case registered, so that the horrors that led to the deaths might be publicly known through the trial. Abdul Gafoor's is not the only case of its kind; one was to listen to other similar, even more gruesome episodes in the days to come.

*

Golokgunj : People started streaming into the little town — little more than a village, in fact — from August 3. The influx was mainly from the Gaon Panchayats of Lakhmimari, Bisandai and Hashdohah, all affected by severe erosion. For all the thousands of people, the safest place was the railway embankment; most of these who managed to trek to Golokgunj made it to the railway station and squatted there; many died there. I myself saw a person die on the morning of September 21, one of the few people that had somehow managed to stay on on the platform, after most of the squatters had been evicted following action on the part of the GRP and the Golokgunj railway station staff; it was waterhoses. Over 2,000 people in the confines of a small railway platform, staying for over a month, had undoubtedly created 'problems' for the railway staff and the passengers, and a couple of days before our visit there, the railway staff had gone on 'sick

leave', in protest against the contamination of the platform by persons who were held to be no better than vermin. But the people of Golokgunj too had passed through a lot; for nearly three weeks, the destitutes that thronged the streets of Golokgunj had been fed almost entirely by voluntary labour and contributions. Deaths? From August 3 to September 21, 16 persons had died in Golokgunj station, and nine bodies had been picked up in the Bazar area; the assessment of Sheikh Jahan, Executive Councillor of the Mahkuma Parishad, was that about 100 persons had died in Golokgunj area.

We meet some officials later in the afternoon, and do a bit of cross-checking. They not merely confirm all that we have heard from the 'unofficial' sources; they paint an even more horrible picture of things. More than 90 per cent of the population has been hit by the famine conditions; distress sales of land are going on merrily. But we say that we heard something about a circular prohibiting distress sales of land, prohibiting registration of sales deeds. Hardly the case, we are assured. Unlike on normal occasions when I buy land from you for, say, Rs 5,000 and show its value as Rs 1,000 in the registration papers (and so, save on the registration fees), now, land worth Rs 5,000 is being bought for Rs 1,000 or less, but the deed of registration shows the correct value of the land. We are welcome to go to the sub-registrar's office and see for ourselves. Officials and 'non-officials' are all agreed that the present disastrous conditions are not due to floods or erosion alone, but are due to the accumulated effects of the policy followed all these years which have resulted in the present famine. Land pauperisation, poor production, short-sighted inducements to the peasant to grow more jute, steep fall in jute prices and the consequent inability of the peasant to purchase foodgrains, and, on the top of it, flood and erosion; lace the whole thing with a system of land relations still largely feudalistic in character with most of the land vested in absentee landlords, the majority of the peasants being landless agricultural labourers, and you have a readymade recipe for large-scale famine.

*

Panbari: Panbari is on NH 31, about five miles from Gauripur. It is the only organised refugee camp under the aegis of the government, in the whole Dhubri sub-division, indeed in the whole district. Just across the road from the Panbari camp, literally a stone's throw away, is the spic and span headquarters of the 82nd Batallion of the Border Security Force; the plush interiors of the Officers' Mess are plainly visible from the road, and the contrast between it and the squalor and confusion of the refugee camp is plain. One can be quite assured that at least in the Panbari camp, there will never be any trouble. The inmates are anyway too exhausted to pick up stones.

Commendable Fortitude

It almost looks as if Panbari had come about in a day. When we visited the place, the camp had been in existence a bare week, and everybody, the officials in charge most of all, seemed terribly harried. It was partly public pressure that had forced the government to open the camp; the people of Dhubri had had a really tough time between the end of July and the middle of August, when thousands of destitutes roamed the streets, slept and died there, and generally made things intolerable. One should add that the people of Dhubri braved the unexpected large influx into the town with commendable fortitude, and even arranged voluntary relief of sorts, before the Administration stepped in; by the middle of August, things had eased a bit for the citizens of Dhubri, and by mid-September, the official camp at Panbari had started functioning, ready to show its paces to the VIPs who had started visiting the place. When we visited the place, it was still settling down; nobody seemed to know the exact number of inmates; people were still being collected from different places — school dormitories and railway platforms and embankments — and brought in. Everyday brought its quota of fresh inmates. But though nobody knew how many were there — a rough estimate was around 4,000 — there was certainly a well-ordered list of the dead. Each day had its toll of the dead, mostly infants. One barely saw any hope of survival of all those babies; the less-than-one-year-olds hardly had any chance; one had never before seen infants barely a week old, but showing only ribs. Old men and women blindly holding on to the belief that anyone in trousers has to be somebody from the government, feebly thrusting bits of paper under your nose, wanting to explain things or have things explained to them; brisk, bustling volunteers of the Youth Congress, and members of the Educated Unemployed Young Entrepreneurs' Associations, having a glorious time in the midst of all the terrible misery. How much does it cost to build a 20' x 20' bamboo hut, with the corrugated iron sheet roofing supplied free by the government? The Young Educated Unemployed Entrepreneurs were charging a cool Rs 400 for each hutment (@ Re 1.00 per sq ft), and since ten of these hutments formed a row, the eight middle ones sharing two of their 'walls' with the neighbours, one didn't even have to have a full 400 sq ft of bamboo in each 'unit'. Much of the bamboo work was done by the inmates of the camp itself, and the able-bodied among them who were fortunate enough to catch the eye or earn the favour of the Youth Congress Volunteers, were officially entitled to a daily wage of Rs 3.50; but the 'officials' could not really tell us if the money did indeed reach the wretched person who was entitled to it. In the midst of all the confusion and pandemonium and the wailing babies and human misery, some, at least, were having a whale of a time. Whenever disaster strikes, there always seems to be little fortunes waiting to be made.

*

Fakirgunj: Fakirgunj is not so much the name of a village as the name of an area. You cross the river, and on the South Bank of Dhubri, a good 2½ hours away by country boat — the morning ferry was not running — you reach Fakirgunj, from where you take a bus to go to South Salamara, Phulbari, Sukh Char, Mankachar and other places. Now, the road upto Phulbari is more or less under water, and one has to go all the way there by boat, and take a bus from there to go to places further south. The magnitude of the disaster that has struck the interior areas is evident even in Fakirgunj area. The settlement itself is under water, and all the residents have taken shelter in makeshift tents and shacks erected on the narrow bund that is yet holding; the metalled original road is barely visible beneath the temporary constructions. But the fortitude of the people is something that makes a city man feel rather ashamed. Sheikh Nasimuddin (age around 50 years) came from Pabna, about 30 years ago. He had about 20 bighas of land, all in the Sukh Char area which has now been washed away. The erosion took place gradually, and for the past five years, he has been landless. He now makes a living by weaving on a loom hired by him; he can become an owner of a loom by investing about Rs 350, but he does not have the money. What is remarkable about his fortitude is that he continues to work in a makeshift dungeon on the side of the bund, barely inches above water, in heat and damp; for his actual home, as well as that of the owner of the loom, is now under water. But meanwhile, one has got to work (at Rs 5 per day) and he goes on working as he talks to us.

*

Chotokalia Part II: A large village (pop 2,118), now almost completely under water. Madrassa, High School, ME School, Mosque, etc. The school chowkidar takes us to the house of the Assistant Headmaster, whose house seems to be far away from the bund, surrounded on all sides by water. Some bamboos are strung together and slung across the sheet of water and we totter along it. Same story; same misery. Everyone lives on GR. Pauperisation on the South Bank is near-total. The immigrant peasant is not the type to lightly dispose of his land. He clings to it almost to his death. After all, everyone knows that the most frequent cause of murderous assault among the immigrant peasantry is a dispute over land. And if *he* is now dispossessed, either due to nature, or due to the sharpness of the local rich peasant, one can take it that he is truly and utterly dispossessed; he will never be able to be a landholder once again. A most conservative estimate of such dispossessed from the South Bank alone would be about 20,000 heads of family. They have to be settled, elsewhere.

The question is, where? Returning to Dhubri, one gets all the 'political' lowdown. The whole thing is a conspiracy on the part of some ambitious Muslim leaders. There has been erosion, but not to such an extent as has been made out. Now 'these people' have been induced to abandon their homes and flock to the cities and pressurise the government to settle them elsewhere, in some reserve land. But mark my words, wherever 'these people' are now settled, within two years, there will be a communal riot. No, that is all wrong; here is an interpretation that is not so bigotedly communal. 'These people' that are being taken to Panbari camp, do you think there is no meaning behind it? The government had propsed to establish a huge goat farm and pig farm in that area, and now some interested parties want to take these elsewhere — Cabbar — and so they will pressurise the government to settle 'these people' in the Panbari Reserve Forest area, and where will the goat farm and the pig farm be situated? More political wisdom; more prophesies of doom and disaster.

Scandals enough to satiate even the most news-hungry; of fortunes made in the refugee racket. A local Congress leader supplying 'dumasia' paddy seeds to the government at the rate of Rs 250 per quintal, while the actual market price is much lower; poor hungry women ready to sell themselves for a rupee or less, and of people willing to negotiate the contract.

Silghagiri Part I (pop 1,970): A village about six miles from Dhubri, part of Patamari GP. In this village, the underlying tensions between the immigrant destitutes and the indigenous destitutes — both Muslims — became apparent. The difference between the two was that the one was hungry in the open, or in makeshift tents pitched on the road; the other was hungry in his own house. In this village, or rather, on the road at the south of the village, had gathered destitutes from Khuda Char, Aminerchar, Char Bhagduhar, Jangila, Barbila, Kaim Bhasani — all nearby villages now under water. They are all part of Patamari GP whose total population of approximately 20,000 are all under GR. It was quite a job to make the people understand that nothing would suit the government better than to have hungry people quarrel among themselves. Once again, the narratives about the hungry and the dead; inspection of mortality lists and ration cards; and the visible evidence of fresh burial mounds, enclosed by bamboo fencing.

*

Muslims: Main Victims

It was in many ways a most harrowing week; but one modifies one's outraged sensibilities by remembering the remarkable endurance and will of the destitutes. It cannot be yet said that they have lost the will to live. If the government can provide even the most minimal kind of assistance, the majority of them can re-establish themselves, and in the years to come, can make positive contributions to the economy of the state. Everyone acknowledges that 'these people' have totally transformed the agricultural scene in those parts of Upper Assam where they have settled. But is the government desirous of making the minimum efforts necessary to provide this assistance? The least the government can do is to declare that the sub-division, along with the Lakhimpur Thana area of Goalpara sub-division and parts of North Kamrup, is hit by famine. The 'administrative' excuses of inability put forward by the Chief Minister can easily be overcome by the issuing of an ordinance. And it is the urgent task of all to mobilise public opinion to force the government to officially declare the prevalence of famine, something which anyway is raging full swing at present. The coming months will only intensify the misery, and not all the Test Relief measures contemplated for the cold season can touch even the fringe of the problem.

A most important feature of the present distress in Dhubri sub-division has been that the majority of the victims, especially in the South Bank, have been Muslims. In the Golokgunj area, the disaster has struck more or less impartially; but in the South, the victims are overwhelmingly Muslim. Though they might have all dutifully declared themselves as Assamese in the Census declarations, and though they have all, all the time, most faithfully followed the advice of their religious leaders and have solidly voted Congress, they are now left high and dry — a mere metaphor, for they are very much in deep waters — by their secular representatives and religious leaders. In the course of my wanderings, I did not come across a single instance of any Muslim organisation doing any relief work; and the people have not seen the faces of their MLAs and MP. But whether the callousness of the Congress government — a government which they have repeatedly been responsible in returning to power, for without the 'safe' blocks of immigrant Muslim votes, the Congress would have long lost parliamentary power in Assam — will ever cause them to reconsider their 'natural' political alliance with the Congress, it is too early to speculate. Here anyway is field enough for urgent politicalisation of large masses of peasantry.

Apollo Tubes

APOLLO Tubes, which is setting up a project for manufacture of steel tubes and pipes with annual installed capacity of 25,000 tonnes in Tamil Nadu, expects to commission its plant by the end of this year. The civil construction work of the factory is nearing completion and a major portion of the equipment has arrived at the site and is being installed. Technical knowhow for the project is being provided by Bharat Steel Tubes.

SOUTH

Emerging Rift in Kerala CPI(M)

Mohit Sen

THE entire politbureau of the CPI(M) has descended on Kerala. In a sense there is no reason to wonder at this since Kerala is, after all, the second mass base of that party. And that mass base has not been behaving as the party has wanted it to. The mass base itself remains large and for voting purposes it is formidable. Why, then, has it remained more than a trifle deaf to the repeated calls for action issued to it by the CPI(M) leadership of the state?

Nor is this the only question that arises. Why is it that the CPI(M)'s chief theoretician, E M S Namboodiripad who in his theoretical articles harps on the need to project a Left and democratic alternative to the Congress in practice attempts to overthrow the Achuta Menon ministry in alliance with the Kerala Congress? How does the Kerala Congress fit into his scheme of the unity of Left and democratic forces?

Further, what is to happen once the much-desired consummation comes about and the Achuta Menon Ministry is dislodged? What is to take its place? President's Rule of Indira Gandhi? Fresh elections under the auspices of the same set-up which did so much rigging in West Bengal? Is not the posing of the alternative of elections elections itself likely to breed the very constitutional illusions which Namboodiripad in his theoretical writings so ardently wants the masses to eschew?

In August the CPI(M) leadership in Kerala proclaimed that a new and final "liberation struggle" was to be launched which would rid Kerala of its present Ministry. What happened to it? Evidently it never got started. The few who participated in it are reported to have complained about the atrocious behaviour of the Kerala police who arrested them only late in the afternoon, compelling them to stand or sit for hours together in the sun! Then the public was informed that such a massive outpouring of mass discontent would take place on the day the Assembly was to meet for its autumn session that dissolution would be inevitable. But a downpour settled all that and the demonstrators scarcely mounted a threat even to the normal maintenance of law and order. When the masses refused to oblige the tantrums began in the Assembly. The Assembly was to be wrecked from within when the masses refused to oblige without!

What is even more significant is the report submitted by E Balanandan, member of the Central Committee of the CPI(M) and secretary of the Kerala unit of the CITU, to the state conference of the CITU. A good part of the report is along the traditional lines, but what was startling was the praise showered on the Achuta Menon ministry. Permanent rights to tenants; ten cents of land to homestead dwellers; job security in the developing public sector in the cashew industry; the revival of the beedi industry in the Cannanore area, etc — are all mentioned as achievements of the Ministry worthy of support. The report also contains an analysis of the withdrawal of the railway strike, of the failure of the CITU call for an indefinite strike of central government employees and of the attitudes of the Soviet Union and China to grave international issues, which to say the least are at significant variance with the line advanced by the CPI(M). It is scarcely surprising that this report has not been given any publicity in the press belonging to the CPI(M). That very fact has, of course, given it wide publicity and speculation. It is difficult to be precise about the motivations of this report which obviously does not reflect the personal views of the secretary. And, in any event, the secretary himself belongs to the top policy-making body of the CPI(M) not only in the state but throughout India. It may well be that one of the reasons for the politbureau of the CPI(M) deciding on a visit to the state at this juncture is the emerging rift at a high level in its state unit.

How is it that while ministries of a single party with vast majorities are toppling in one state after the other, the Kerala ministry has entered on its fifth year though it is a coalition of six parties and has a relatively narrow majority? Surely, one of the most important causes of this phenomenon is the record of this Ministry. It has not only done more than any other in the field of democratic reforms but it has displayed an altogether unusual determination to implement the mandate with which it went to the polls. It is this that has given it credibility.

Not that the Ministry has no blemishes nor that it has won over the entire people. Far from it. And this is far from the view of the leaders of the coalition. On the occasion of the Ministry's entry into the fifth year, the Chief Minister not only put forward the many tasks that remained to be done but highlighted the key weakness of the functioning of the coalition. The key weakness was the failure of the coalition parties, both singly and together, to mobilise the masses on a sufficient scale. In particular this failure was to be noted among the working class. This by no means meant that Achuta Menon was advocating that the working people and their organisations should not take up the innumerable problems that beset them. They should and, if anything, with increased vigour. But their role *vis-a-vis* the government should be one of still more active identification and collaboration. It was wrong on their part to leave the implementation of the policies and measures of this government exclusively to the official machinery. They should take a hand in their popularisation and enforcement. What, in essence, the Chief Minister was calling for was the move towards a type of dual power — not in confrontation but in a dialectically united relationship. This, indeed, should be seen as the key task of the ruling coalition in the last year of it's constitutional term.

Exit Menon, Enter Kissinger

G P Deshpande

WITH Menon's death the last link with our anti-imperialist past has snapped. Menon had ceased to be a significant force in Indian politics for over a decade now. The world had not significantly changed; but the Indian perception of the world had. It must have been a constant source of surprise and agony to Krishna Menon that the Indian leadership had come to take such a fond view of America and Imperialism. The process in a way had begun during Nehru's lifetime itself. It was, however, still within limits then. During the decade since Nehru's death the talk of contradiction between resurgent Asian nationalism and Western, especially American, imperialism had increasingly become an irritating nuisance for the Indian leadership. A new group of policy-planners, bright and up-to-date on the cliches, had since emerged which had no use for this 'idealistic' contradiction. They were out to build pragmatic practical approaches to international politics. They had no use for Menon.

Menon's anti-imperialism was the product of the Indian revolution. One does not know how the contemporary Indian elite has so successfully delinked our national movement from anti-imperialism. For whatever it was worth there was an anti-imperialist mass movement in this country. Nehru and Menon were products of that revolution. It was the tide of that mass movement which made Nehru the dominant political leader of this country. It was the interest of this mass movement which Menon represented and fought for abroad.

There was indeed very little in common between Gandhi, the supreme leader of this movement, and Nehru and Menon. Yet these people were together; they suffered together. The only link between them was that of anti-imperialism; or, shall we say in Menon's own words, opposition to "imperialism in all its manifestations"?

In the post-War world it was easy for Menon to see that the leading imperialist power was, in fact, the US. But it would be wrong to equate this 'anti-imperialism' with anti-Americanism. Like a good bourgeois nationalist, Menon understood power and understood it rather well. His anti-imperialism again was typically Indo-centric. He was anti-imperialist like everyone of his generation because the Western powers tried persistently to deny India its rightful place in the world community. Nehru and Menon were internationalists in the sense that they supported and championed the nationalist aspirations of all Asian, African and Latin American peoples. Menon spoke for them in the United Nations. He demonstrated that one could stand up to 'them', put one's foot down and get one's legitimate grievances heard. Decolonisation has been with us for much too long to enable us to see the impact which Menon and his India had made then. We were a force in international politics then, not because we were powerful, but rather because we were on the side of the weak against the bullies of International Politics.

The Nehru-Menon concept of non-alignment thus became a force because it was a strategy of the weak to defy the world distribution of power. The weak do not have to be mute. As long as they are not deaf to the legitimate demands of resurgent nationalisms the world over, the powers that be cannot silence them. Alignment was undesirable because it confirmed and perpetuated your weakness. Non-alignment, in other words, challenged the existing world distribution of power and rejected 'dependence upon a camp' as a viable foreign policy strategy. The roots of this thinking lay in 'nationalism'. For Nehru and Menon, products of anti-imperialist national revolution as they were, nationalism was a sacrosanct value and, logically, it led them to perceive national resurgence and the existing world distribution of power in a firm, contradictory relationship. Nehru and Menon, more than anybody else in Asia, rejected the two-camp doctrine. The Chinese have done the same, of course in a very different sense, nearly 20 years after Nehru and Menon. Teng Hsiao-ping tells us today that there is no socialist camp. Nehru had rejected that notion way back in 1962 when some people saw a concerted socialist camp move in our conflict with the Chinese.

'Camps', 'blocs' and 'alignments' were some of the terms which the Nehru-Menon foreign policy abhorred. The reason for this, again, is that, contrary to popular myths, these two statesmen were no dreaming utopians. They were hard-headed realists as much as our bright 'policy scientists' of the South Block claim to be. 'Camps' and 'blocs' for Menon were not a reality but rather clever 'abstractions of reality' manufactured by the powers that be. If these abstractions (even as their limited relevance to international politics is demonstrated everyday, there are still some incorrigibles who cling to these notions!) were not against the interests of weaker states like India, Menon and Nehru would not have been so strongly against them. 'Non-alignment' rejected all blocs, camps and alignments for the simple reason that a resurgent nationalism in Nehru's and Menon's view could not afford to lean on any side. It had to stand firm on its own feet. There was no other way.

Menon had very strong views on India's relationship with Pakistan. In much the same way as Nehru, he never understood the phenomenon of Pakistan. It was clearly an extension of the Congress-League feud on the international plane, made possible by imperialism again. It was a travesty of the concept of nationalism and nationalities to argue that the Muslims of India constituted a nation. If some of them said so it could not have been without British encouragement. It is for the historians of our nationalist movement to argue if this view of the Pakistan movement was right. What is relevant is to see the Menon-Nehru antipathy to Pakistan as essentially a function of their anti-imperialism. Therefore, they were uncompromising in their belief that Pakistan was a direct consequence of British Imperialism and as such constituted the number one threat to Indian security. Pakistan's alignment with the United States in 1954 further confirmed and consolidated Menon's conviction.

It is important to see the anti-Pakistan stance of Nehru and Menon clearly. Had it not been for Menon's and Nehru's anti-imperialism, it could have very well vitiated their perspective in domestic affairs. Being secular and pursuing a hard line towards Pakistan was not contradictory primarily because anti-imperialism had so informed Menon's outlook on international affairs. Partitions do not occur; they are caused and caused by imperialism.

Menon in so many ways was a living symbol of anti-imperialist nationalism. He was not anti-American. He was just impatient with American arrogance. To be sure, Menon must have been surprised by American behaviour during the Truman-Dulles years. It is doubtful if his view of imperialism was Leninist (more probably, it was not) and as such he might have expected a different behaviour from the Americans

in the post-colonial world. He was first impatient and later irritated with the themes in the American expositions of the world situation. He was at times angry. His wit and sarcasm were well known. He more or less reserved them for the US and its foreign policy. It was a nationalist's impatience and anger at the rather vulgar show of power that Americans were out to make. That the Americans did not understand communism was understandable. But that they did not understand nationalism was nothing short of a crime. Menon could never forgive them for it.

With Menon's death a principal spokesman of Asian nationalism is gone. His death is a sad reminder of how far we have moved from the original goals of India's foreign policy. In those days realism meant pursuing national goals relentlessly against the onslaught of imperialism. Now the new term 'pragmatism' means compromising national goals to please the superpowers. Non-alignment today means bi-alignment. The world has not changed. We have. Menon was a misfit in the present-day politics of our country. It is indeed ironical that Menon should have died right when we are getting ready to receive Kissinger and to tell him (as though he does not know) that we have no quarrels with the United States. Exit Menon, enter Kissinger. Nothing could have ushered us better into the world of, to use Indira Gandhi's words, extinct volcanoes.

BANGKOK

Old Forces in New Garb

Harish Chandola

THIS month Thai students will mark the first anniversary of their protest demonstrations which toppled the military regime in their country. Within this year changes of immense significance have occurred in Thailand.

It is now generally realised by all in this country that it will no longer be possible to re-establish absolute military dictatorship of the kind that was overthrown last year. This realisation has come because of the chain of struggles that took place during the year, and which are in fact still going on, following the successful protest movement of students. These struggles have created new pressure groups which no new Thai government can ignore. Any future Thai government will have to make compromises with these new pressure groups in order to stay in power.

In the past year various sections of the Thai population began organising themselves. During the year, for instance, workers became more organised and fought a number of struggles: textile workers went on strike for better wages, women workers in garment factories struck work for better working conditions and now workers in some large hotels in Bangkok are on strike.

Farmers fought a big struggle at the end of August and beginning of September. Seven thousand farmers demonstrated in various cities, 4,000 of them in Bangkok itself, against the low price they were paid for their rice and the high prices they were charged for their necessities. They threatened to burn their identity cards, which are documents of their citizenship, during the demonstrations. Fishermen too had staged strikes and protest rallies several times in the year over their low earnings and difficult working and living conditions.

A wave of political consciousness swept over the country resulting in people organising themselves to demand their rights. These demands, and the struggles initiated to achieve them, alarmed the landlords, factory-owners, bankers, hotel proprietors, etc, and they too are either reactivating their organisations or forming new ones and closing their ranks to resist the struggles of the farmers, workers, fishermen, etc, to protect their profits and interests. During the hotel strike, hotel-owners came together to oppose demands of the workers and resist government efforts to intervene in the strike to end it on terms seemingly favourable to workers.

In the past year a sharp division has appeared within the Thai society, with the Thai people now divided into organisations of employees and employers, landlords and peasants, moneylenders and debtors, factory-owners and workers, and so on and the struggle between these opposing forces is taking a serious form. The student movement is no longer the simple protest movement it was last year. It is now imbued with social and political ideas, which have transformed the movement into one of a different quality. It does not only want to protest against what is undesirable in the country, it seeks to change the social order.

At the side entrance to Thammasat University there are several stalls selling newspapers and magazines. As I went past, I saw some of them selling the "Communist Manifesto" and "Lenin and Revolution". One never saw such publications being sold openly in the past. A number of books and pamphlets are now being translated into Thai and are becoming available to the people. The chairman (head) of a department at the university told me that every day when he enters the campus he first of all goes from one stall to another to see if any new books or pamphlets have come out. New publications come out so frequently and get sold out so quickly that, he said, if he does not look for them daily he might miss quite a few of them.

Some days ago I attended a seminar in Bangkok on the writings of Chit Phoumisak, a social thinker who has in very simple words analysed the working of Thai society and written about its various aspects. He had been arrested for his writings by the former Thai government, had escaped, joined the guerillas and was shot dead by the Thai forces in the jungles of north-east Thailand some years ago. At the seminar there were not only university students but also students from various high schools in their school uniforms. Chit Phoumisak's writings are becoming available now and by the demand for them these days one can judge how popular they have become.

Throughout the year the student movement was greatly criticised by the Thai press, which in the past was an ally of the military regime and which is still controlled by vested interests. The government-owned radio too ran down the student movement. After the change of government, following student demonstrations, the students were told to go back to their educational institutions and study, because a new government had already taken office. The students were told by the Thai press that their duty was to attend classes and study and not to bother about what the new government did. To run the country was the government's job and not that of the students.

But since the new government had come into being entirely because of the students' struggle, the students wanted to know if it acted in a manner which would lead to establishment of democracy and social justice in the country. When the students kept on examining

the actions of the government and sometimes disagreeing with them because they served the interests of the ruling class in the country, the Thai press began calling the students "troublemakers" and even "communists".

The old leadership of the National Students' Centre of Thailand (NSCT) changed because of the change in the quality of the movement. The new leadership came under heavy attack. Since the students remained in the forefront of the struggle, all kinds of rumours were spread against them by those afraid of losing their power and privileges. Just over a month ago a student leader of Ramkamheang University was murdered for political reasons by, many in Bangkok say, rightist groups. The student had belonged to Sajjatham ('satya-dharma'), a radical and, some say, leftist group in the university. The assassination was an attempt to terrorise the student movement.

New Constitution

The new forces that have tried to organise themselves on the basis of their class interests are now trying to form political parties to contest the first democratic elections in the country in the beginning of February next year. The four-year ban imposed on political parties by the earlier military government is to be revoked soon. After the adoption of the new Constitution on October 5, 1974, the Ministry of Interior will place before the National Assembly a bill to allow political parties to be formed. It will be only after that that political parties will be officially formed and registered.

Several provisions of the new Thai constitution favour the old forces and are against the interests of the new ones. For instance, though it was the students and the youth who ousted the military regime and placed the present government in power, their demand for giving voting rights to persons of 18 years of age has not been accepted. The minimum age for contesting the elections is 25 and no independent candidates will be allowed to stand for elections. To be a candidate one must belong to a registered political party.

The new Thai Parliament will have two houses, with absolutely equal powers. The upper house will be entirely nominated by the King, perhaps on the advice of the old politicians. Elections are to be held only to the lower house.

Nobody has any doubts that old politicians and persons with money and influence will be at a great advantage in the coming elections while candidates belonging to the new forces will have practically none. It is this feeling which has caused a good deal of apathy towards the elections among students, workers, peasants and fishermen. What is the point of the elections if the conservative forces which were allied with the military regime are going to have most of the advantages in them?

Let us have a look at the forces in the country which are most likely to form political parties to contest the elections. The Speaker of the present National Assembly, Kukrit Pramoj, who is very confident of becoming the next Prime Minister, has already declared his intention to form a Social Action Party. Kukrit Pramoj has made millions during the military regime. He owns one of the largest Thai language newspapers and a posh hotel in Bangkok and has interests in banking and other industries. He is, however, a clever person and wants to call his party Social Action Party because he knows that the Thai people are looking forward to social change. But in fact he is a conservative and has too much to lose should the social system in Thailand change.

Kukrit Pramoj's brother, Seni Pramoj, is reviving his old Democratic Party in order to take part in the elections. Its members and supporters are the old elite: landlords and rich politicians, particularly in the countryside north of Bangkok. They are all conservatives and are opposed to the new political forces.

Members of the earlier Parliament and former military officers who have made billions during the boom in the country as a result of the war in next-door Indochina, and who were staunch supporters of the military regime, have gathered under the name of Serirastra group to contest the elections. They have millions to spend on the coming elections and will present a formidable challenge to those opposing them.

The new elite in the country, of liberal professional people like professors, doctors, lawyers, high-ranking government officials, young aristocrats and industrialists, bankers and businessmen, almost all of them in the age group of 30 to 40, have formed the New Force Group and are working very hard to attain power in the new government in order to preserve their newly-attained status and power.

There is also an attempt to form a socialist party to contest the elections. The persons behind this attempt are some university teachers and student leaders who are trying to bring together various left groups in the country. The young radical intellectuals who had petitioned the military regime last year for return to democracy and were arrested, and for the release of whom the students had staged demonstrations leading to the collapse of the military junta, are the persons who are trying to form a socialist party and secure the support of workers, farmers, students and other underprivileged people in the elections. On their release, these intellectuals had last year formed a group called People for Democracy.

It is, however, generally accepted that both money and influence will play a great role in the February elections. Many sections of the underprivileged are, therefore, not enthusiastic about the elections and are more keen on creating greater political consciousness in the country which, rather than elections fought by parties decked in attractive names and holding out promises only to gain political power, will set into motion processes for the establishment of truly democratic institutions.

Gogte Steels

GOGTE STEELS is entering the capital market with a Rs 96.25 lakh public issue. The issue comprises 6,12,500 equity shares of Rs 10 each and 35.000 9.8 per cent redeemable cumulative preference shares of Rs 100 each. The public issue is fully underwritten.

Gogte Steels, which has been promoted by Gogte Minerals, will produce mild steel, spring steel and high and medium carbon steel billets with an estimated production of 44,000 tonnes per annum from two electric arc furnaces. Gogte Steels is a joint sector project with SICOM holding 26 per cent of the equity. The plant will be located at the MIDC Industrial Area at Tarapur in Thana district of Maharashtra.

M N Dastur are the technical consultants to the company. Almost all the major items of plant and machinery have been ordered. The first furnace is expected to go into production by the end of 1974 and the second about two months later.

The project is estimated to cost Rs 390 lakhs. This will be financed to the extent of Rs 160 lakhs through equity and preference capital and Rs 230 lakhs through term loans.

The company has secured a letter of intent for setting up a wire rod mill for making high carbon wire rods with an annual installed capacity of 40,000 tonnes. The company proposes to implement this project as a second phase to derive the advantages of an integrated steel complex.

The public issue, which is managed by the Merchant Banking Division of the State Bank, will open on October 31 and close on November 11 or earlier, but not earlier than November 4.

Scheduled Castes and Scheduled Tribes

Problems and Policies

S D Kulkarni

Report of the Commissioner for Scheduled Castes and Scheduled Tribes, 1971-72 and 1972-73; New Delhi, Government of India, 1974, pp 410.

THE Commissioner for scheduled castes and scheduled tribes is in an enviable position compared to the other, similar, office-holders — except, perhaps, the Election Commissioner and the Comptroller and Auditor-General of India. He is appointed by the President, under Article 338 of the Constitution, and his duty is "to investigate *all matters* relating to the safeguards provided for the scheduled castes and scheduled tribes under this Constitution and report to the President upon the working of those safeguards" (emphasis added). One, therefore, expects a very frank and comprehensive report from such a Commissioner. The present report appears quite disappointing in this context.

The report begins with a small quotation from a speech by Indira Gandhi (no exact source is cited), followed by the comment that "these words coming from Shrimati Indira Gandhi, our Prime Minister, give the most befitting lead to all concerned for bringing up the large number of our brethren who have been left behind in the race of progress in order to strengthen our democracy" (p 1). Those who are striving to better the lot of downtrodden scheduled castes and scheduled tribes have not, however, waited for mere words of a Prime Minister to give them the lead in their work. One could, perhaps, excuse a Class .III civil servant if he begins anything with a quotation from the Prime Minister but not the Commissioner for the Scheduled Castes and Scheduled Tribes who has been allotted an independent constitutional status.

The first chapter, titled. 'A General Review', contains a brief reference to the appalling conditions of these castes and tribes, with the laconic remark that "as far as one can see, all this is due to the vast and distressing gap that exists between what we profess and what we practise" (p 2) but without any elucidation as to who, according to the Commissioner, is to be held responsible for this state of affairs.

The chapter is followed by a summary of important recommendations and observations. This is really the most important part of the report. Some of the recommendations are worth noting. The reviewer has preferred to mention them together with matters dealt with in different chapters of the report.

Thus, Chapter 2 of the report deals with education. It is pointed out there that, according to the 1971 Census, the percentage of literacy among the Scheduled Castes and the Scheduled Tribes was 14.71 and 11.29, respectively, as compared to the general literacy rate of 29.35. It is further pointed out that there is considerable variation in the extent of literacy among the different communities of the Scheduled Castes and Scheduled Tribes themselves. However, the Commissioner has not thought it worth his while to analyse all the available census data in this respect. Yet that would have helped to identify the areas and the communities with the very low literacy rates. The Commissioner's office should either undertake such a study itself, or pursuade the Census office to do so. For, only after such a study has been carried out would it be possible to seriously undertake the Commissioner's recommendation that it is necessary to analyse the problems retarding the growth of education among different communities of the Scheduled Castes and Tribes and to chalk out time-bound programmes for accelerating the pace of education amongst them" (p 54).

There can be no two views, of course, about the Commissioner's recommendation that hostel facilities for both boys and girls need to be improved particularly for the latter and that the rates of stipend for hostellers as well as day scholars which have been fixed long ago need to be increased. One may, however, point out that only recently the Centre has revised its rates of post-matriculation scholarships to the students of the scheduled castes and tribes. It could be recommended that all the states should also follow this example.

In West Bengal, exemption from payment of tuition fees is not granted to all the scheduled caste students but only to students from 41 communities. The Commissioner has rightly recommended that "the state government should exempt students belonging to all the scheduled caste communities from the payment of tuition fees etc" (p 63). The Commission's study of the educational facilities and concessions to the scheduled castes and tribes is full of information. It is interesting to note that Mahatma Gandhi Institute of Medical Sciences at Sevagram — Gandhiji's headquarters for many years — has no reserve seats for the scheduled castes and tribes. Also, both the Central Universities, at Aligarh and at Benaras, do not follow the policy of the Central government in reserving certain number of seats for the scheduled-caste and scheduled-tribe candidates. The same is true of the Sainik Schools run by the Ministry of Defence.

Chapter 3 gives information on the representation of scheduled castes and scheduled tribes in the services. In the Commissioner's words: "while at the policy-making level there does exist, as stated above, an ardent desire and anxiety to provide persons from amongst these communities with adequate employment under the state, in as short a period as possible, the various bottlenecks created at the implementation level, do not allow the progress being achieved at the desired speed" (p 79).

The Commissioner has rightly pointed out that the provisions of Article 335 of the Constitution — that the claims of the scheduled-caste members and tribes be considered, consistently with maintaining efficiency of administration, in the making of appointments to services and posts in the Union and the state governments — are mandatory and not directory (p 83). Statistics given by the Commissioner, moreover, only prove the oft-repeated statement that the reserve vacancies are mostly filled in for Class III and Class IV posts.

In some public sector undertakings, labour unions are said to oppose the system of reservations. Evidently, caste groups tend to safeguard the interests of their caste members. As the Commissioner points out, this may — in addition to being at the cost of the weakest castes — lead to a rift in the trade unions, and encourage the scheduled caste workers to form separate unions. It is for the union leaders to avert such rifts and prepare workers

for different bases for trade union organisation.

Some states have special cells for effective implementation of all schemes, and special provisions for the scheduled castes and tribes. The Commission has urged the states without such cells to open them immediately (p 119).

A large number of universities have not reserved seats for the scheduled castes and tribes in their services. They have justified this in the name of 'high educational standards'. The Commissioner has deplored this, particularly in view of the fact that qualified scheduled caste and tribe candidates are now available. Here, again, it would have been useful if the Commissioner had given the university-wise data of posts held by scheduled castes and tribes. A number of universities and colleges follow preferential castiest policy in their recruitment. Preference is shown to members not only of a particular caste but further to members of particular sub-castes. All these institutions, however subsist on large state aid and always clamour for more. It is high time the government utilised its power to destroy these caste dominations in recruitment. The Report contains various illustrations of the harassment and ill-treatment of scheduled caste and tribe members — in respect of promotions, transfers and other related matters (pp 136-148).

A separate chapter on untouchability (chapter 4) deserves special mention. It contains a brief summary of amendments to the Untouchability (Offences) Act proposed by the Joint Committee of Parliament on the Amendment Bill. It would have been useful had the Commissioner mentioned some amendments suggested by an independent scholar.[1] The Commissioner could also have initiated studies to find out the efficacy of the anti-untouchability laws and to suggest suitable measures. The Report does contain a list of surveys and studies undertaken by the Office of the Commissioner, and gives a brief summary of these under main heads. But it does not mention whether or not the reports of these surveys and studies are published. It would have been better had the Commissioner mentioned some of the excellent studies conducted by other official and non-official bodies. Thus, for instance, Registrar General of India has published one good study of the social disabilities suffered by the scheduled castes in South India.[2] The chapter ends with the unexceptionable conclusion: "untouchability in one form or another is practised in many parts of our country. The problem continues to be acute and requires strenuous efforts on the part of the government and non-official agencies to eradicate it" (p 161)!

The Origins of the Cultural Revolution

Vol. 1: Contradictions among the People 1956-57

RODERICK MACFARQUHAR

'In the first of three books by Roderick MacFarquhar on the *Origins of the Cultural Revolution*, there is provided an expert, objective and well-written exposure of the fascinating events of 1956-57 which cradled the Cultural Revolution.' *Spectator* *£5.50*

Cultural Revolution and Industrial Organization in China

Changes in Management & the Division of Labor

CHARLES BETTELHEIM

translated by Alfred Ehrenfeld

This is a book about what the author believes to be one of the great turning points in history. It is the author's contention that the primary aim of the Great Proletarian Cultural Revolution in China was to begin the process of transforming the age-old pattern of division of labour, thus opening up a new chapter in the history of the human race.
Monthly Review Press *$6.95*

African Encyclopedia

A single-volume encyclopedia centred on subjects of African interest. These include economic development, industry, and agriculture, as well as society, religion, and mythology. Articles on the more general subjects which are necessary in a modern encyclopedia are also included — space exploration, astronomy, international organization, natural history, science and technology, and the countries of the world. *600 pages with 500 photographic illustrations & many line drawings*
Paper covers *£1.50*

Issues in Monetary Economics

Edited by H. G. JOHNSON & A. R. NOBAY

This volume contains the proceedings of a major conference organized by the Money Study Group in 1972. The papers centred on four major issues in monetary economics: money in an international economy, recent developments in monetary theory, money and economic activity, and recent developments in British monetary policy. *Paper covers* *£3.50*

Oxford University Press

Delhi Bombay Calcutta Madras

Cases of atrocities committed on the scheduled castes and tribes given in chapter 5 make painful reading. But, apparently, the Commissioner's office has taken note of only the complaints which were received by it. This is indeed a serious limitation. The Commissioner could have received complaints of only a fraction of the actual number of cases of atrocities and harassments — particularly in the case of the scheduled tribes. An analysis of the complaints received shows that "many of these atrocities were committed by the landlords, government employees including police, panchayat members, etc etc, and can be stopped if all persons realise their social obligations towards these underprivileged sections of the society. The social workers and political parties, at all levels, should launch a massive movement to rid the body politic of social inequalities" (p 162). If this objective is to be reached the Commissioner's Office should list all the cases of atrocities reported in the newspapers and should itself investigate them. It is regrettable that the Commissioner's office has not deemed this essential and so has no field organisation of its own.

The Commissioner seems to have great faith in launching prosecutions — as is seen from his observation. "The exploitation of the scheduled tribe womenfolk by outsiders who come to operate the tribal areas deserves condemnation. The state governments should launch prosecution in these cases to put a stop to this immoral practice" (p 167). The Commissioner must surely know that prosecutions can be held up for years by influential persons. The Maharashtra police have registered a case against a brother of a Minister of State in Maharashtra for harassment of scheduled caste persons in a village in Poona District; the case is mentioned in this report, however, without any comment (p 168). Does the Commissioner perhaps not know that the case is pending in the Court for more than two years?

Chapter 6 describes briefly the development programmes under the five-year plans. Nothing more than a brief description is presented, though the topic deserved detailed analysis and evaluation by the Commissioner.

The Commissioner has recommended priority to the scheduled castes and tribes in the distribution of cultivable land. Here, one notes a distressing fact about the rehabilitation of persons displaced by construction of big industrial projects. The number of the scheduled tribe families rehabilitated is considerably less than the number of families displaced by these projects. It appears that the poor people, unable to approach courts, are worst affected by our projects. A rather minor mistake in the presentation of the data needs mention to stress the carelessness of the agencies supplying such data as also the shoddiness of the Office of the Commissioner in receiving and publishing the data. The figures in respect of Thanepade project in Dhulia District are first given for the year 1971-72; the same are then repeated as for the year 1972-73 (pp 373 and 376).

Commenting on the reports of the Governors on the administration of the scheduled areas, the Commissioner observes that "the Governors' reports should not be merely formal documents. They should give information about the working of protective legislation and the progress achieved in saving them from exploitation by moneylenders" (p 203). If the Commissioner had followed his own advice, the present report would have become a really valuable document. The Commissioner should not have relied only on the formal reports submitted to him but should also have taken note of independent research work done in this field.

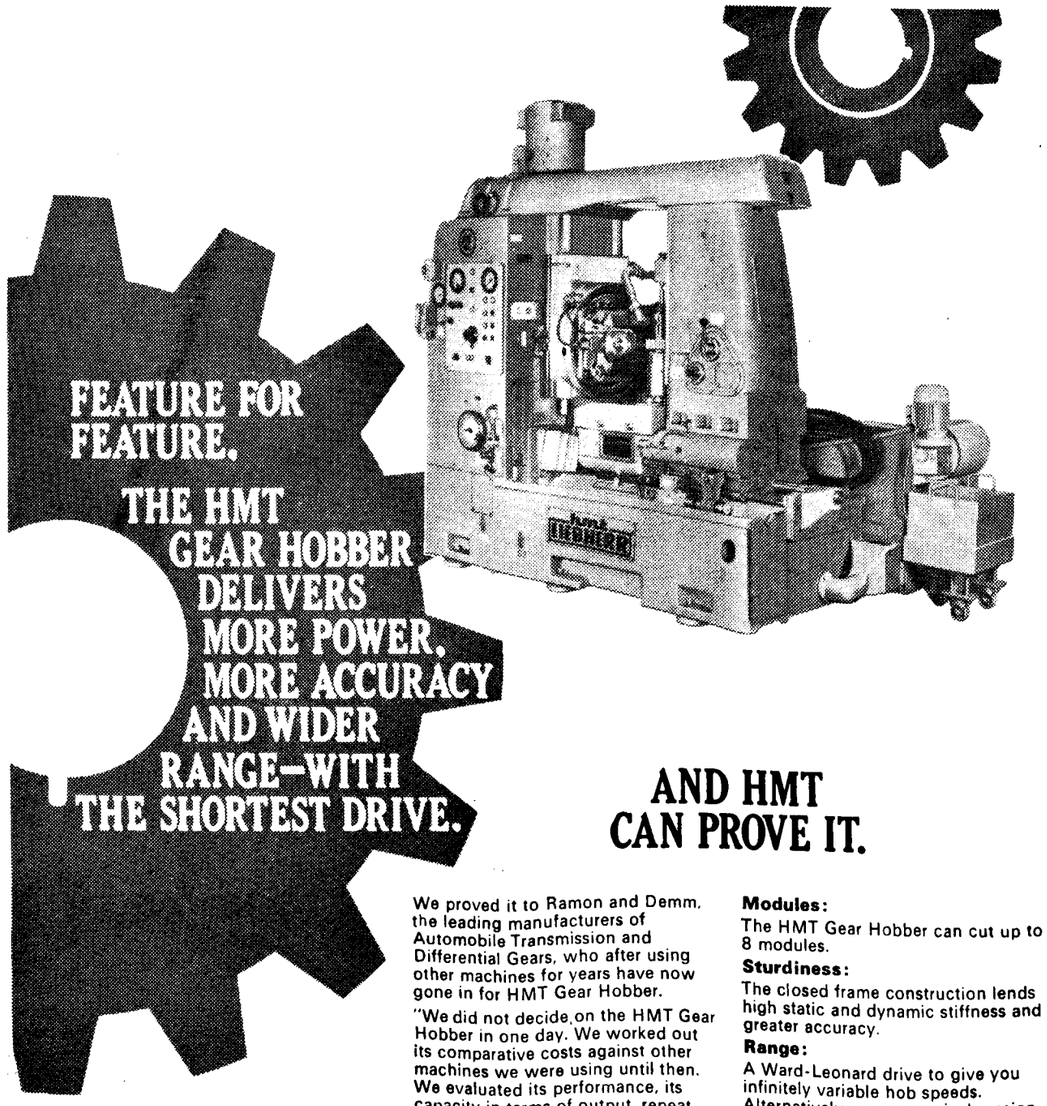
In his discussion on bonded and forced labour, the Commissioner has criticised the states and Union Territories for their reluctance to admit the existence of bonded labour in their areas. He points out these governments do not recognise bonded labour as a serious problem. He has also drawn attention of the governments to the problem of the sale of liquor from the distilleries to the tribals — which is "one of the most important single factors for the economic ruination of the tribal people" (p 221).

The discussion on co-operation among the scheduled castes and tribes is again quite factual but perfunctory. The report devotes less than four pages to the discussion on research into the problems of scheduled castes and scheduled tribes, and, as pointed out earlier, does not mention the research by independent agencies and even by the Registrar General of India. In fact, the Commissioner should have presented an exhaustive bibliography of all the relevant research in the field, instead of confining himself to government sponsored tribal research institutes.

The material on denotified and nomadic and semi-nomadic tribes is also inadequate in coverage and depth.

The report contains 66 appendices, some of which are very useful to persons interested in this problem. Of these appendices, one, 'representation of the scheduled castes and scheduled tribes in services', deserves special mention.

On the whole this is a more or less formal document, describing the general position of the scheduled castes and tribes, with an outline of government's efforts and schemes to improve it and some comments on these efforts. The comments on the lot of the scheduled tribes worth noting among these are:



> "With the enforcement of forest laws without much consideration to the human life in these forest areas; land restrictions and alienation of their lands; the indifference shown towards the human problems of the tribal communities by the planners of the industrial projects in the tribal areas; their dependence on, and exploitation by, the moneylenders, landlords and other unscrupulous elements, like liquor contractors; have greatly disturbed their way of life. No doubt, since Independence, efforts have been made to ameliorate their economic and social conditions and steps have been taken by the concerned State Governments for their development. It is, however, unfortunate that, in spite of specific safeguards provided in the Constitution for their protection and advancement, most of the tribals have not only remained neglected but an exploited lot also" (p 5).

The Commissioner should also have mentioned various movements among the tribals and the scheduled castes to improve their lot. Some voluntary agencies are doing useful constructive work among these communities and their projects should find place in a report of this nature. In spite of such major limitations, the report remains a useful source of information which is not available in one document anywhere else.

AND HMT CAN PROVE IT.

We proved it to Ramon and Demm, the leading manufacturers of Automobile Transmission and Differential Gears, who after using other machines for years have now gone in for HMT Gear Hobber.

"We did not decide on the HMT Gear Hobber in one day. We worked out its comparative costs against other machines we were using until then. We evaluated its performance, its capacity in terms of output, repeat accuracies, and other individual features. The HMT Gear Hobber gave us more advantages than we thought possible. And now we have a battery of them working in our plant and we are happy about our decision."

HMT Gear Hobber, the one machine that offers you more plus features than any other, scores on:

Horse Power:
Main motor of 6.5 kw. Because of the shortest drive, the total horse power available for cutting is more.

Modules:
The HMT Gear Hobber can cut up to 8 modules.

Sturdiness:
The closed frame construction lends high static and dynamic stiffness and greater accuracy.

Range:
A Ward-Leonard drive to give you infinitely variable hob speeds. Alternatively, an economical version with an AC drive to meet your mass production needs.

Price:
Taking its exclusive features into consideration and the competitive price, the HMT Gear Hobber is a long-run profit proposition.

The HMT Gear Hobber is manufactured in collaboration with world-renowned machine tool manufacturers — LIEBHERR of West Germany.

Please send me detailed literature, free of cost, on the HMT Gear Hobber.

Criteria of a Rational Wage Policy

A K Das Gupta

There has been a lot of debate in recent years concerning the appropriateness of the marginal productivity theory as an explanation of the wages of labour and of wage differentials. The debate has centred on the wage-profit relationship. It is now generally agreed that the theory involves circular reasoning; that the technical condition of production being what it is, one does not know what the marginal productivity of labour is unless one knows what the rate of profit is. And it is not capital alone that is involved; we have to deal with heterogeneous sorts of labour, and this makes the problem more complicated. Further, there are enterprises whose products are not saleable; in these cases, it looks as if it is more appropriate to say that marginal productivity is derived from the price of labour than that the price of labour is derived from its marginal productivity!

These logical difficulties apart, the concept of scarcity makes little sense when there is widespread unemployment of labour. In a situation like this, the concept which is relevant is just that of a minimum supply price. And so we find ourselves back to the classical world, to "cost of reproduction" and all that.

Much of what goes on in the name of scarcity in our economy is indeed the creation of social institutions. Salaries at higher levels contain elements which are a surplus and "do not enter into price". Their persistence can be explained only in terms of organised oligopolistic class interests. To invoke a theory of productivity as sanction for these high salaries is not only not warranted, it is wicked.

FOR an underdeveloped economy such as ours, which is planning for fuller employment and rapid economic development, the overriding consideration in any field of economic policy must be the creation of surplus for investment. We define investible surplus as the excess of total output over that which is necessary for the maintenance of labour engaged in production at a subsistence level. The realisation of investible surplus thus depends upon the extent to which luxury consumption is restrained. The principle of austerity must guide economic policy in the initial stages of economic development, so that resources can be released, to the maximum extent possible, towards capital goods which have a potential for the production of mass consumption goods.

Austerity is not a new concept in our country. Gandhi, it will be recalled, invoked it as a moral principle. Any luxury consumption, according to him, was an act of exploitation. I have sympathy with this view. In a country where the per capita income is well below the minimum physiological needs of a person, any luxury consumption amounts to a deprivation of some people of the bare necessities of life, and is morally open to question. In our present context, however, I would take austerity not so much as a moral principle as an economic compulsion.

The principle of austerity is often misunderstood. Extravagant consumption is often equated with economic progress and a social system which permits the existence of riches in the midst of poverty is often accepted as a necessary factor of growth. This is a misconception. Luxury consumption is the *effect* of economic progress not its *cause*, and the rich contribute to economic growth not as consumers but as savers. Economic development took place in the Western countries within the framework of the capitalist system. And if these countries received a momentum towards growth it was because capitalists saved. Capitalists exploited labour no doubt, but they did not spare themselves either. "Zero wage and zero consumption out of profits"[1] in terms of which modern economists define "maximum rate of growth" is indeed an idealisation of early phase of capitalism when, partly due to a newly acquired puritanic way of life, as some historians suggest, but largely, as one would be inclined to believe, due to the fact that articles of conspicuous consumption were yet to be discovered, capitalists who owned wealth showed greater urge towards accumulation than towards consumption. "Like bees they saved", as Keynes puts it, and their accumulation led to the creation of more wealth. If inventions initiated the process of growth, capitalists' accumulation reinforced the process. Accumulation tended to increase employment and at later stages, as labour became scarce, it tended to increase wage also. Thus whatever the distribution of *property and income* there was no conspicuous inequality in *consumption* between capitalists and labourers.

Now, it so happens that we in India missed the early phase of capitalism when luxury goods were yet to arrive in the market and when the urge for distinction spent itself largely, if not solely, in accumulation. The conditions which stimulated accumulation in the early phase of capitalism in the West do not exist now. We have tasted the forbidden fruit and have fallen from paradise. The rich man's urge for accumulation is now restrained everywhere by his love for display, and commodities making for display are multiplying.

It follows that we can no longer sustain large inequalities of income in our society if our aim is to lift it from its present state of misery and squalor. The doctrine of inequality as a growth-stimulating factor has lost much of its force, insofar as the rich now spend and do not accumulate. If historically an increasing degree of inequality has been associated with economic growth, it is because growth has taken place within a capitalist system. Capitalist entrepreneurs, being the employers of labour, succeeded in appropriating a disproportionately large share of output, leaving wages as far as possible at a depressed level. On the other hand, because entrepreneurs had large surpluses, they saved and contributed to the formation of capital. While therefore the manner in which growth took place led to an unequal distribution of income, inequality in its turn led to accumulation and to economic growth. Today the position

With Best Compliments

of

BRAKES INDIA LIMITED

Padi, Madras 50

is reversed. Large inequalities are now a source of dissipation of surpluses towards luxury consumption and are thus a drag on economic growth.[2]

These prefatory remarks are intended to show that austerity is not a primitive virtue, that the most advanced countries of the world had to practise it at some stage of their career. These countries had to go through a long period of sacrifice and hard work before they could attain their present level of living. If we want progress, we must emulate them the whole way, in spite of our late start. A wage policy which ignores this ignores the basic factor of growth and is inappropriate for an under-developed economy like ours.

The second consideration that must weigh with us in evolving a rational wage policy is the effect of wages on employment. Unemployment has been a chronic phenomenon in our country. Its scale has increased over the years until today, even according to the most moderate estimate,[3] the aggregate number of unemployed in our society exceeds the aggregate number of employed in the organised sector whose wages are supposed to be our special concern. Now, unemployment is a social menace and an economic deadweight. The voice of the unemployed goes unheard. They have no union, nor are our labour leaders interested in their welfare. They are, so to speak, on a perpetual strike forced upon them by society. Now this cannot endure long. Some day, somehow they may wake up; they have at least one weapon in their hands — the right to picket.

It is often argued that the earning of the employed are partly used to take care of the unemployed. In an economy where there is no organised social security system, the unemployed have to depend upon their relatives for maintenance if they have to survive. The argument is sometimes used in the context of the determination of minimum wages; reference is made to the responsibilities of a worker to take care not only of himself and his *bona fide* dependents but also of his unemployed relatives. This certainly is true. But it is also true that this is a wasteful method of treating unemployment. If the employed have a surplus to spare, the surplus could better be utilised for giving employment to the unemployed. It is surely more economical that the unemployed should be provided with work than that the conditions of the employed should be improved, however insistent the demands of the latter may be.

Thirdly, attention has to be paid to the relevance of wages to the choice of techniques in production. It is well known that our economy suffers from a serious imbalance in the use of technology as between agriculture and industry. The imbalance is indeed historical. While industry — large scale industry, that is — has been pursuing the modern, capital-using methods of production, agriculture still remains largely primitive. If a rational explanation of this anomaly is to be sought, one must turn to the chronic distortion in factor prices. Interest rates are low and wages are high in the industrial sector, as judged by the relative scarcities of capital and labour; and the opposite happens in agriculture. In the context of a national wage policy, one must not lose sight of the artificial stimulus that high wages provide to our industry for the use of techniques which are economically inappropriate, considering how conspicuously our economy suffers from a shortage of capital.[4]

The policy prescription which these considerations indicate should not be difficult to understand. Whether one looks at the problem from the point of view of the mobilisation of investible surplus, or from the point of view of employment creation, or again from the point of view of the choice of an appropriate technology, one is drawn to the conclusion, unpalatable as it may be, that the economy needs a policy of low wages. The organised sector in our economy maintains a level of wages which is too high, judged by the criteria that are suggested here.

The proposition, one fears, will startle many people. Is it not, they will ask, that our workers in Government undertakings are failing to secure even what, according to a tripartite agreement reached at the 15th Labour Conference, was deemed to be a "need-based minimum"? What is one to say about the railway workers' strike over the demand for a small bonus which their counterparts are already getting elsewhere? These are surely legitimate demands, judged by themselves. To say that we are a high wage economy will thus appear to many as paradoxical, if not cruel. But the paradox disappears once one reflects upon the fact that, as it stands, the minimum wage in the organised sector, low as it is by an absolute standard of comfort, is substantially higher than the average earning of the labouring population taken as a whole. The fact is that here is a country where the per capita income is well below minimum subsistence by any standard, where the bottom 30 per cent of the population is supposed to be living below what is called the "proverty-line", and where, as the Prime Minister once put it, to get secure employment is itself a privilege. The position is thus complicated; what appears to the trade unions and their supporters as a legitimate demand comes into conflict with economic viability.

II

Decisions on wage-fixation in our country have never been taken with reference to any well-defined principle. We have our Wage Boards and Pay Commissions. But they deal with specific industries. There is no doubt a certain framework within which they are supposed to operate. But the framework consists of certain concepts such as minimum wage, living wage, fair wage, etc, which are defined in the abstract, so to say, and have hardly any reference to the general conditions of the economy. Judgments concerning the concrete content of these concepts thus vary according to the interests and pressures that specific conditions surrounding the industries are supposed to provoke.

Our Government's wage policy, insofar as there is one, has been hitherto guided by considerations of industrial relations. Wage awards have followed trade union pressures coming from individual industries. No wonder, therefore, that the structure of wages in our economy has grown in a haphazard manner, introducing a competitive element in the demands of the various unions. It so happens that trade union pressures have been more successful in the private sector than elsewhere. The reason is simple. Large-scale industries in our private sector, which mainly cater to luxury consumption, are, so to say, an agglomeration of tiny islands of riches surrounded by a vast sea of poverty. They are protected from international competition by a system of import controls, while their internal market is secure, being nursed by an elite class whose earnings and propensity to consume are high enough for them to carry off whatever supply is made available in the market. A distorted production structure is matched by an equally distorted earnings structure. These industries are thus in a position to maintain a high standard of wages. If costs rise due to a rise in wages, they are covered by higher prices. Price controls are hardly any handicap. For, controlled prices themselves happen to be linked to costs; if costs are high because of a mark-up in

wages, then controlled prices are adjusted upwards.

Our Government seems to have pursued a policy of drift in this matter. Looking back, one does have a feeling that the Government's attitude to wage policy in the private sector has been allowed to be influenced by a certain ideology whose sole concern is with the wage-profit relationship. "If an industry is prosperous, labour must have a due share of the prosperity" — this conventional philosophy seems to have influenced our Government's behaviour towards private industry all these years. Now, it is a philosophy which has grown spontaneously in the process of economic and social progress in the Western countries. However attractive it may be as an ideal, the appropriateness of the philosophy for a developing economy like ours is surely open to question. Even where distributional equity is accepted as the sole criterion of policy, the institution of high wages as a damper to profits is of doubtful validity, insofar as it widens the gap between the organised sector and the rest of the economy. But where, as in our country, the overriding consideration is one of maximising investible surplus so as to carry the economy towards fuller employment, an encroachment on profits through higher wages has little to be said for it. In the context of a developing economy like ours, profits are a wholesome element. It is true that there is a danger, if profits get into private hands, that they would tend to be dissipated. The answer to such possibilities is not to cut profits down but to pool them and to plan their investment towards general economic development. If private industry is at all allowed to function, its profits must be brought under social control.

Once, however, you acquiesce in union demands in private industries, it is a question of time before workers in the public sector follow suit. This is precisely what is happening here. The history of the system of bonus is a glaring example of how reactions operate. We had to pay a large penalty only recently for the Government's earlier passivity in the matter.

All this is not to say that considerations of industrial relations are to be left aside in our choice of criteria for wage fixation. You could not do that even if you wanted to. If conditions in the developing economies of today differ from those that prevailed in the early phase of capitalism, the difference lies not merely in an extended scope for luxury consumption, it lies also in a heightened consciousness on the part of labour of its rights and privileges. If you wanted to suppress labour's aspirations anywhere today, you would do it at your peril. Passive acceptance of class domination is a thing of the past; labour today has, here as eleswhere, not only the will but also the organisation to resist injustice. Maintenance of sound industrial relations is thus an important desideratum of wage policy.

Here we face a dilemma. Unions demand higher wages, while our earlier criteria suggest lower wages. It is a genuine dilemma for the newly developing countries, particularly those like ours which have accepted democracy as their political system. I consider an answer to this dilemma to be one of the most pressing problems that face our society today.

Can we evolve a wage policy which reconciles the requirements of economic growth with conditions of industrial peace? Undoubtedly this is a difficult problem. Yet there does seem to be a way of escape. The way that suggests itself goes right deep into the *structure* of wages, as distinct from the *level* of wages.

Experience suggests that the behaviour of a group is influenced not so much by considerations of what their condition is in absolute terms as by considerations of how they stand relatively to others. This applies with special force to the economic condition of a group; workers would be content with a modest wage if they found that others were no better off. It is the relative share rather than the absolute share which is most often the bone of contention when it comes to wage claims. A rational wage policy has thus to tackle the problem of relativities in the wage structure. There are several relativities which need to be considered. There is the relativity between lower ranges and the higher ranges in any particular organisation. Secondly, there is the relativity between levels of wages in different industries, including the Government, within the organised sector. Thirdly, there is the relativity between industrial wages and agricultural wages. And finally, and no less importantly, there is also the problem of relativity at different levels between scientists and technicians on the one hand and generalists on the other.

It is clear that these relativities cannot be fully integrated into a system all at once; as they say, the egg that has been scrambled cannot be unscrambled. Yet there seems to be no doubt that it is possible to make a *move towards integration*. I take the view that labour could be persuaded to accept a period of truce provided they were assured that their present sacrifices were a part of a joint venture for the ultimate welfare of the community. This can happen, I venture to suggest, if the top salary scales are brought down to a level which is in conformity to the general conditions of the economy. Further, industrial relations are not a matter merely of wages and conditions of service. They are also a matter of the participation of labour in management. You cannot expect labour to develop the right kind of attitude to community welfare if conditions are not favourable for it to acquire a sense of belonging to the community. The problem of wage policy is in the ultimate analysis a problem in social psychology as much as it is a problem in political economy. I shall, however, leave this larger question alone and concentrate on relativities in the wage structure.

III

Let me begin with a concept which has played an important part in classical economic literature on the determination of wages — the concept of minimum subsistence. Ricardo, it will be remembered, had a notion of a "natural price of labour" which he defined as a price which is necessary for labourers "to subsist and to perpetuate their race, without either increase or diminution". The concept of minimum subsistence is central in Ricardo's theory of wages. Earlier Adam Smith had given a similar theory linking wages to the cost of maintenance of labour. Wages, according to Adam Smith, are the result of a bargain between the workers and their masters, but it is a bargain between parties which are unequal; the holding power of workers is weaker and they have the worse of the bargain. Smith argues, however, that there is a limit below which "the ordinary wages of even the lowest species of labour" cannot be reduced, and that this limit is set by the cost of maintenance of labour. "A man must always live by his work, and his wages must at least be sufficient to maintain him".[5] The basic concept of minimum subsistence figures in Smith's theory of wages too.

Now, there are two aspects in this classical account of wages which need separating out. One refers to the level to which the wages of common labour tend to conform; the other refers to the level which must be maintained in order that the labourers can bring up a family so as to be able to perpetuate their race. One is a positive theory of how wages are determined; the other is a physiological concept which can be worked out independently of what happens in the market. In classical literature one is shown to merge into the other; the minimum subsistence of labour which is considered to be a social imperative is also the level to which the actual wages of common labour has a long-run tendency to conform.

The distinction comes out more sharply in Marx's system. Marx had a notion of "value", and he had a notion of "price". The value of labour power is the value of a basket of goods which serve as the minimum subsistence of labour, and the price of labour is wages proper. The former is a definition which runs in terms of the physiological needs of labour, and the latter is an expression of the market phenomenon. Here also the price of labour is equated to the value of labour, or in other words, wages are equated to the minimum subsistence of labour. Just as in Smith and Ricardo. However, unlike in the earlier accounts, the equation is not just a long-run tendency, it is inherent in the market mechanism itself. The difference is of crucial significance.

In the account provided by Smith and Ricardo, the factor which brings wages down to the level of minimum subsistence is growth of population. In Smith's system which is characterised by division of labour and increasing returns, equilibrium is envisaged in terms of an adjustment between the rate of accumulation and the rate of population growth — a "steady state" in modern terminology. When the rate of accumulation exceeds the growth of population, wages rise beyond minimum subsistence and the population gets a stimulus to grow at a higher rate. The supply of labour increases and wages fall. The opposite happens when the rate of accumulation goes below the rate of population growth. In the steady state wages remain constant at the level of minimum subsistence. In Ricardo's system which is characterised by the operation of diminishing returns, long-run equilibrium takes place under conditions in which the rate of accumulation is zero and population is stationary. The rate of wages which keeps population in a stationary state is a rate which equals the minimum subsistence of labour.

Marx did not have any fancy for the classical doctrine of population, nor for the matter of that had he any notion of a long-run equilibrium such as Smith or Ricardo had. Yet if he believed in a subsistence theory of wages, it is because in his system unemployment figured as a chronic phenomenon. Marx explains the equation of the price of labour to the value of labour in terms of what he calls "the reserve army of labour". The existence of a pool of unemployed is what keeps wages down to the subsistence level. The capitalist can draw upon the pool whenever wages tend to rise beyond subsistence. On the other hand, it does not pay the capitalist to depress wages below subsistence; for by so doing he would depress the efficiency of labour also.[6] Labour is like an intermediate good which depreciates through use; maintaining it intact requires that wages should cover the cost of its maintenance.

IV

Now consider our economy. The classical doctrine of population does not fit. The per capita income of the people is below minimum subsistence by any standard. No less than 30 per cent of the population have a sub-standard existence. And yet the death rate in the country is on the decline. For good or for evil, this is contrary to classical expectations. We do, however, witness here a condition which was visualised by Marx. The rate of growth of population during the last twenty years or so has exceeded the rate at which employment could be created, given the manner in which the economy has been planned. Unemployment has thus grown over the years. The phenomenon has a Marxian character, and must be reckoned as a factor affecting wages. Does then Marx's subsistence theory apply here? One would certainly have a temptation to urge that it does. But one must be careful. The situation in our economy is more complicated than could be brought under the strait-jacket of Marxian theory. We have a unionised sector, as also a vast sector in which labour is not organised. And in the two sectors there are large disparities in wage rates. If Marx's rule at all applies to one, it fails in the other; there does not seem to be any inevitability about the equation between the price of labour and the value of labour. You cannot thus deduce an estimate of minimum subsistence from the supply price of labour. In the free market there is distress selling, and in the unionised market the trade unions resist a possible pressure from the unemployed. What constitutes minimum subsistence has therefore to be worked out independently, if at all it is to be used in the context of wage policy.

Once, however, the concept of minimum subsistence is divorced from market behaviour, the economist is in difficulty. His own science does not offer any guidance, and he has to turn to practitioners in other sciences. There also he faces difficulties — opinions of experts on the matter vary. The last Pay Commission was indeed hard put to it to find a solution. It gave a verdict based on an estimate of a group of experts which was way behind the estimate which is supposed to have been the basis of the tripartite agreement at the 15th Labour Conference. One may perhaps use one's hunch based on experience in comparable economies which have shown a reasonable degree of labour efficiency in the course of their economic development. Japan during the early part of the century and China of today may be cited as examples of a comparable economy where low wages have been shown to be consistent with the maintenance of labour efficiency; the calory intake of common labour in Japan during the period when it had its highest growth rate was very definitely lower than that assumed in the estimate of the last Pay Commission.

Unemployment is a crucial factor in the determination of wages. Abundance of labour keeps wages down. Yet the behaviour of labour being what it is, there is a limit below which wages cannot fall.[7] To argue, however, that the limit is set by a well-defined level of subsistence is misleading. There is indeed a snag in Marx's account of wage determination. If the unemployed are to continue to exist in society, so as to enable the capitalist to draw on them whenever there is a tendency to an excess demand, they have to be fed, even if scantily. If therefore the unemployed is the charge of the employed, the equation of wages to minimum subsistence which Marx envisages is merely formal; the effective rate turns out to be below subsistence when account is taken of the ration that the employed have to provide for the unemployed. In the classical subsistence theory this complication does not arise; there is no place for unemployment in the system. A tendency to an excess supply of labour is accompanied by starvation and death, while an excess demand is met by more births — and, of course, the unborn do not have to be maintained! However, the neatness of the classical system is secured at the expense of realism. Marx's theory is undoubtedly more realistic, but the snag is there. Marx seems to get out of the complication by restricting his theory to the industrial sector and by assuming that the unemployed reside in the agricultural sector. Land maintains surplus labour which is "set free" for the capitalist to take on for the industrial sector. Whatever nourishment is

needed to keep the unemployed alive is provided out of the proceeds of agriculture.[8]

This short excursion into history should be instructive. It should give our labour unions a perspective for an understanding of the implications of their wage claims. There is a certain *optimum relativity* between the level of wages of common labour in industry and the level of farm incomes, trespass beyond which causes trouble. If the former is so high as to overbear the price of inertia, then migration from rural areas gets a stimulus. The migrants add to the number of unemployed and under-employed in the urban area, and our social system being what it is, particularly among the lower income groups, they become "guests" of the employed. The benefit of high wages thus vanishes. A policy of high wages seemingly has an appeal, but in an economy where the per capita income is so distressingly low, it is a policy which is self-frustrating.

V

It is now possible to answer a question which has played an important part in discussions on wage policy. What are we to say about efficiency? Is not a policy of low wages inconsistent with the maintenance of the efficiency of labour? This surely is a pertinent question to ask. There does seem to exist a functional relation between wages and efficiency, at any rate within the range which is relevant to an underdeveloped country. As the level of wages is raised, there is a possibility that the worker's efficiency should increase. There is, however, an implicit link in this wage-efficiency nexus. If a higher level of wages is supposed to lead to greater efficiency, surely the presumption is that increased wages enable the worker to improve his own consumption standard. This is precisely where the paradox appears. If, as we have seen, with an increase in his income the obligations of the worker also increase, then the economy of high wages turns out to be a myth. In a society where an earning member has to look after not only his own wife and children, but also unemployed relatives, not unoften including co-villagers, an increase in wages fails to raise the consumption level of a worker if it is also accompaied by an increase in unemployment.

Further, when one is considering the problem of wage policy from the point of view of the national economy, one must not restrict one's vision to the unionised sector only; a national wage policy must bring within its purview problems of labour outside unions, too. The crux of the matter is that the average level of wages for the labour force as a whole is limited by the national output, given full capacity utilisation. Whatever one might say about the classical "wage-fund" in the context of an explanation of how wages are actually determined, it remains valid as a measure of the maximum at which the total wage bill can be sustained over a given period, consistently with a given planned rate of accumulation. Insofar as the level of wages is raised above average in one sector, it comes down below average in other sectors. Full integration of the structure of wages at a level higher than what the wage-fund permits is not a feasible proposition. You can raise the general level in money terms, but if it goes beyond the permissible limit, it can only result in inflation. If the organised sector in our economy is able today to maintain a high level of wages, it is because there is a large chunk of labour force outside it which is allowing itself to remain under-employed or wholly unemployed. Consider, for example, the rate for a daily wage-earner or the income of a small cultivator in our economy; either of these will be substantially less than the wages of ordinary, unskilled labour in the organised sector. It is remarkable that the same organisation often maintains two different rates for workers doing the same job — one for the regular employees and another for workers employed on a daily wage basis. Our Government's own rate for the latter works out to be less than half of that which it offers to the former.[9]

The concept of wage-efficiency nexus is not so simple as it is often made out to be. It is doubtful that we know precisely what level of consumption is adequate for a worker to maintain his normal efficiency. Wages in rural areas in most states or those of a worker engaged on a daily basis in urban areas are palpably low and are examples of distress selling. On the other hand, the level of wages of an unskilled worker in the organised sector, low as it is by what may be called "modern" standards, is without doubt on the high side, judged in the light of the general conditions of our economy. The differential indeed is such as to lend countenance to a presumption that efficiency of labour after all has less to do with wages than is commonly supposed. For, who will say that a small cultivator in the village whose earnings will be no more than half the earnings of an unskilled worker in the unionised sector shows less vigour in his work? The worker needs nourishment in order that he may have the *ability* to work. But this is not all; for his ability to bear fruit he has to have the *willingness* to work.

It is difficult to say in what way the worker's willingness to work is related to wages. The temper of labour unions being what it is, one suspects that there is a certain asymmetry in the relation. If the unions' demand for wages is not satisfied, then the workers will have less urge to work. But if wages are raised to meet the unions' demand, there is hardly any guarantee that the urge to work will be greater. If this is true, it is a difficult situation. And yet there is nothing in the situation to be surprised at. So long as a large differential exists, as it does in our country, between wages and top salaries,[10] it is only to be expected that the demand for higher wages on the part of labour unions will continue unabated, irrespective of the workers' contribution to production.

VI

This brings us on to the problem of fixing the maximum-minimum differential. While we argue for a policy of low wages in the bottom ranges so as to ensure that they do not get out of line with the income of the marginal farmer or of the wage rate for an agricultural labourer, we must ensure also that the salaries in the upper ranges are not out of line with the wages of common labour in the organised sector.

It is difficult to lay down a clear-cut criterion for fixing an appropriate ratio between top salaries and the minimum. In general the ratio tends to be relatively high in an under-developed country where the level of higher education in many fields is yet not commensurate with the needs of economic development and where therefore the supply of necessary expertise is disproportionately scarce. It sometimes happens in such countries that qualified personnel have to be imported from more advanced countries where the general levels of pay are high, with the result that whatever expertise is available within the country has also to be paid at rates higher than would be warranted by the paying capacity of the economy. Higher salaries in such cases are in effect fixed externally at the international level. They thus get out of line with the wages of purely indigenous labour which is in abundant supply. A kind of oligopoly is formed at the upper level which charges an extortionate price for its "scarce" services.

Conditions in India are different. An oligopoly of an upper class does exist. But it is palpably an artificial oligopoly, built into the system as a legacy of British rule. Indeed, whatever deficiencies India may have in other spheres, there is little evidence that it suffers from a shortage of trained personnel. The boot is on the other foot. If the concept of an international pay level is at all invoked here, it is not to permit import of foreign expertise, it is rather to prevent the export of our own expertise; the plea often put forward is one of "brain drain". We shall have something to say on this later. It can however be mentioned at once that while we have been experiencing undesired transfers of our own trained personnel, specially scientists and technicians, to foreign countries, we have also considerable unemployment among our university graduates, not excluding those belonging to science and technology. It so happens that since Independence the growth of universities and higher technical institutions in our country has outstripped the over-all growth of the economy.[11] Relatively to its requirements the economy seems indeed to have an excessive supply of trained personnel. In planning the ratio between minimum wages and top salaries one should therefore look for other criteria than would be suggested by international competition.[12]

There are two possible criteria which we might consider. One refers to what prevails in comparable economies. The experience of China in this regard at once comes to one's mind. From all accounts, it seems clear that bringing down the maximum-minimum differential has been an important part of wage policy in China in the post-revolution period. Whereas before 1949 the differential within an enterprise used often to be as large as 40 to 50, in recent years it has been brought down to as low a level as 5 to 7. The norm prescribed is 5, and if there are deviations here and there, they are of a small order.[13] It will be perhaps argued that the ordering of social life in China is different from what prevails in India, that the supply of community-based economic facilities are wider in China than in India and that therefore the top officer in India either in private enterprise or in the Government needs a relatively higher salary to take care of certain amenities which he has to provide for himself individually. Yet it is precisely here that our general plea for austerity comes in. If the system obtaining in our society makes for larger private expenditure, it is the system that is at fault, not our theory. An economy such as ours can ill-afford to maintain an income differential in enterprises higher than what obtains in China, nor is it necessary that it should, considering the state of supply of trained personnel relative to demand.

The other criterion which one could propose is based on what may be called the "cost of reproduction". If "cost of maintenance" of common labour is accepted as the basis of the determination of minimum wage, it is surely arguable that for the determination of higher salaries the basis should be the cost of turning out trained personnel. And this means, besides maintenance, the cost of investment in education and training. The formula which suggests itself in this regard is one which is used for computing what Keynes calls "marginal efficiency of capital". The excess earning of trained personnel over minimum wage must be enough to compensate for investments in education and training, having regard to the prospective duration of an man's active career. To be sure, this is too bare a formula and does not take account of the inducement needed for a person to undergo the necessary training or of any incentive for the expression of a person's special talent. One does feel, however, that even when adjustments are made with due regard to these considerations, the warranted span of wage-salary differential in an enterprise, net of tax, would not surely exceed what obtains in China, when account is taken of the fact that the return from investment in education does not belong wholly to the individuals concerned. Education in our country, as elsewhere, is highly subsidised, and a large part of the return belongs to the state. When the matter is viewed in this way, income taxes — deductions from gross salaries — appear as a kind of return on public investments in education and training.

The approach suggested here is in the best tradition of political economy; it is indeed an extension of the classical theory of wages to cover salaries of higher grade employees in an enterprise. If the classical economists did not follow up their theory along this line,[14] it is because their interests were confined specifically to the relation between the labouring class and the capitalist class as such. Today in our society an inordinately large element of profit and rent lies concealed within "wages" at higher levels, and there is as much conflict between incomes at different levels as the classical economists in their time saw emerging between capitalists' profits and the wages of common labour. Top salaries in enterprises in our country, net of income tax, are often 16-18 times as high as wages of unskilled workers. With perquisites added the differential would be higher still. Even in the government, where wages and salary levels are periodically scrutinised, the span of incomes (also net of tax) between the top and the bottom would work out at no less than 12-fold. If a system permitting such high differentials is still tolerated it is because the beneficiaries happen to belong to a class which, though small, is dominant in our society and has also the intellectual ingenuity to rationalise the differentials. High salaries are justified by their recipients on the ground that their contribution to production is high.

Let us examine the claim.

VII

How does it happen that a film star receives a remuneration which is so much higher than that of a garbage collector? Why does a foreman receive more than an unskilled worker, or an accountant more than a ditch-digger? These are stock questions to be found in economic textbooks.[15] The answers given are also stock answers: Anybody can do the work of a garbage collector, whereas there is perhaps only one star like Gable in the market; similarly foremen and accountants are few and ditch-diggers are many. Alfred Marshall describes the phenomenon as an "evil paradox" — dirtiness of work going with lowness of wages. Yet, while the paradox is recognised as an evil, it is accepted as a part of the market game. Wages, it is argued, are higher or lower in the market in proportion to the degree of scarcity in the supply of labour. If the remuneration which the society offers to an administrator or an engineer is high relatively to that which is offered to a garbage collector or a ditch-digger, it is because the former's supply is so much more scarce than that of the latter. From here it is just one step to what is known as the marginal productivity theory of wages — a theory which ascribes wages to the contribution of labour to production, as measured by "the difference between the total physical product which is actually secured and that which would have been secured from the same quantity of other resources if the number of labourers had been increased or diminished by one".[16] The theory assumes diminishing returns from individual factors of production, whereby it is shown that the marginal productivity of a category of labour rises or falls according as its supply is more or less scarce, the condition of demand remaining the same. Within the framework postulated, scarcity and "margi-

nal productivity" in fact come out to be convertible concepts.

Now, it is true that the neo-classical economists, to whom this marginal productivity theory is due, have by and large been careful not to attach in an explicit manner a normative significance to the theory. Yet the implication of the theory is clear: If economic equilibrium is not to be disturbed and resources are to be allocated rationally, wages must be permitted to accord with the marginal productivity of labour. The theory thus provides sanction for the pattern of wages and salaries such as has evolved in capitalist societies. The "evil paradox" is accepted as an economic compulsion, if not as a moral imperative.

There has been a lot of debate in recent years concerning the appropriateness of the marginal productivity theory as an explanation of the wages of labour. The debate has centred on the wage-profit relationship. It is now generally agreed that the theory involves circular reasoning, that the technical condition of production being what it is, one does not know what the marginal productivity of labour is unless one knows what the rate of profit is. In our present context it is not capital alone that is involved; we have to deal with heterogeneous sorts of labour, and this makes the problem more complicated. Further there are enterprises whose products are not saleable, and there is no knowing how much is lost when a unit of labour is withdrawn and how much is gained when an additional unit is employed. What, for example, are we to say about the "contribution to production" of a Secretary to the Government of India in relation to that of a typist who works with him, or of a Professor in a University in relation to the Assistant who helps him in his researches? In cases like this it looks as if it is more appropriate to say that marginal productivity is derived from the price of labour than that the price of labour is derived from its marginal productivity!

These logical difficulties apart, the concept of scarcity makes little sense when there is widespread unemployment of labour — precisely the situation which prevails in our economy. In a situation like this the concept which is relevant is just that of a minimum supply price. And so we find ourselves back to the classical world, to "cost of reproduction" and all that. Much of what goes on in the name of scarcity in our economy is indeed the creation of social institutions. Salaries at higher levels contain elements which are a surplus and "do not enter into price". Their persistence can be explained only in terms of organised oligopolistic class interests. To invoke a theory of productivity as sanction for these high salaries is not only not warranted, it is wicked.

There is one aspect of the scarcity principle which deserves special consideration. This is the concept of "transfer price". Insofar as there exist alternative opportunities open to a particular service, the degree of scarcity of its supply in one *given* line can be defined in terms of the pull that attracts it from alternative directions. The service has thus a transfer price with respect to a given line, defined by the remuneration which it could earn in the next best alternative line open to it. If an adequate supply of the service is to be retained in any one line, the price that it offers must not be less than this transfer price. This therefore is the supply price of the service, the minimum price at which it is available.

Now, in an economy where wages and salaries are not controlled with a social purpose, an inflated salary structure may obtain in one sector, being the result of special conditions surrounding it. This affects the transfer price of labour all along the line, and a tendency operates towards a general levelling up of salary scales. This is precisely what is happening in our country. For reasons which we have already stated, fancy salaries prevail in the private sector, which are completely out of tune with the general conditions of the economy, and these set a limit below which salaries in the public sector cannot be brought down. You cannot fix the pay structure of employees in the public sector in complete disregard of their transfer price. You may not know how you would define the "contribution to production" of a Secretary to the Government of India or of a Professor in a University. But you know that the former might move to a private firm in a managerial capacity, and that the latter might take to journalism.

All this is true. If indeed the pay structure in one of the more important sectors in the economy is given as a datum, then the transfer price of entrants into the other sectors is determined. And if the former maintains an inflated structure, the latter cannot ignore it while fixing their own pay structure. A certain inter-sectoral relativity in wages and salaries has to be maintained if there is to be an even distribution of manpower in the economy. This is precisely the argument which a Pay Body finds itself facing when its terms of reference are restricted to one sector or one industry alone. And this is precisely the reason why we need a national wage policy to curb excesses wherever they occur.

VIII

A part of the problem of transfer price still remains, which needs attention. Suppose we succeed in bringing down wages and salaries at all levels all along this line. This means that in regard to any occupation the domestic transfer price is brought under control. Even then there remains the problem of international transfer price of our trained personnel. Will not a general cut in salaries lead to a transfer of man-power abroad and a consequent waste of resources spent on its training? What are we to say about the so-called "brain drain"? Even as it is, our trained personnel are attracted to more advanced countries, particularly the USA, by higher emoluments obtaining there. Levelling down of salaries may, it is feared, accentuate this tendency. If only to prevent this tendency, it is urged that high salaries are to be maintained for our trained personnel whose services have an international market.

The argument is appealing. But it does not bear analytical scrutiny.

First, the highest paid categories in our society — administrators and factory managers — are the least prone to the "brain drain" effect. As it is, external demand comes by and large for the services of technologists and scientists, especially doctors. And yet even within our domestic pay system these categories are being denied their legitimate place. So long as this anomaly in internal relativity remained unresolved, this talk of "brain drain" would seem totally fatuous. Here, as elsewhere, due recognition of status within the economy would be a better method of attacking the problem than any attempt towards an adjustment of external relativity.

Secondly, — and this reinforces the above contention — in regard to those categories whose services are demanded internationally, the transfer price happens to be so high that moderate readjustments in domestic salary scales would have little effect upon the decision of would-be migrants.

Thirdly, where unemployment is pervasive, the social loss involved in the migration of trained personnel is not as great as it would appear to be; vacancies created by migrants could be filled in by candidates in the waiting list.

Finally, even assuming that a general cut in salaries would result in an accentuation of the tendency to the migration of talent, the resulting loss would surely be of a minor order when compared with the gain to society from a general levelling down of wages and salaries and the consequent saving in wage-costs and in expenditure on luxury consumption.

The so-called "brain drain" has to be accepted by an under-developed country as a fact of existence as a member of the international community, if it wishes to be one. There are however two saving factors. First, the developed countries have their own unemployment problem at different levels to take care of. There is therefore a limit to the absorptive capacity of the market for foreign expertise in these countries. Secondly, there are forces outside pecuniary interests which hold back people from foreign assignments — the will to serve one's own country. A Bhabha or a Mahalanobis could not surely be lured away from home by higher emoluments anywhere, whatever the pressure might have been. And fortunately there are still many amongst us whose sense of dedication to the country's interests is strong enough for them to resist pecuniary pressures from abroad. For the rest, one must take the consequences of an International System; one must surrender that which one cannot protect.

Yet there is one possible remedy which the international community may seriously consider. The problem essentially is one of less developed countries being given adequate compensation against the cost of education and training that it undertakes concerning persons whose services are exported. And of course it should be the obligation of the richer country which enjoys these services to pay this compensation. One possible way of attacking the problem is to have an international agreement such that a percentage of the revenue that the recipient country derives from income taxes on migrants is given over to the country from which migration takes place. It is generally agreed that international migration is assuming a perverse character. It is not unskilled labour, of which there is abundance in less developed economies, but trained personnel whose education involves costs that have freer access to the more developed countries. It is urgent that some compensatory action against losses on this account is taken under the aegis of the United Nations as part of the "trade — not aid" programme. The problem of "brain drain" indeed is one of international finance rather than one of domestic wage adjustment.

IX

Having regard to the criteria of wage policy which seem appropriate for an under-developed economy, we have argued here for a low wage policy. Our theory of wage policy has been based on the concept of a minimum that needs to be paid to different categories of labour for their respective supplies to be maintained at appropriate levels. Costs of reproduction have been shown to be the factor determining such a minimum for any particular category.

However, while accepting this austere principle of wage fixing, would we not concede that the level of wages and salaries should be permitted to rise as the economy progresses over time? Should not labour be given a share of of the increments in productivity that the economy secures as a result of additions to investment and associated improvements in technology? The answer is not unambiguous.

There is no doubt that the general consensus among labour economists, not to speak of labour leaders, would be in favour of periodical revisions in wages so as to allow labour to share a part, if not the whole, of the increments in productivity that the progress of the economy entails. This seems to be the view of the Planning Commission also. In it latest Draft Plan the Commission urges that "Increases in wages should be closely correlated with increase in productivity".[17] On the face of it the argument seems plausible. The policy to keep wages down, and thereby to keep the level of consumption down, to a minimum is a policy which involves strain on labour and ought surely to be relaxed as soon as the occasion for it is over: the fruit of economic progress must at some stage be allowed to percolate to the wage-earner if production is to be at all meaningful. However, in spite of its wide appeal and in spite of the high authority of the Planning Commission in its favour, the proposition cannot be accepted without reservation: the condition which it fits is remote, so far as the Indian economy is concerned.

Under conditions of full employment or near-full employment, it is inevitable that increased productivity per head of labour should be accompained by higher wages, and perhaps also by higher salaries. This latter depends upon whether the differentials in the base period are considered "optimum" or not, as indicated by the criteria that we choose. Full employment or near-full employment, however, is a distant hypothesis. In an economy such as ours which is afflicted with unemployment and under-employment of an enormous order at all levels, there is no case for a relaxation of our principle of austerity. In our present circumstances it would be not only immoral, but also uneconomical and hence irrational not to devote the entire surplus that accrues to the economy in the wake of progress to the absorption of the unemployed.

So far, so good. And yet our story does not end here. The organised sector, to which most of what we say on wage policy relates, forms only a tiny part of our total economy. The number employed there is less than 10 per cent of the total labour force in the economy and perhaps not more than 30 per cent of the urban labour force. A vast majority of income earners lie outside the organised sector, and it is there that the highest (as also the lowest) income group reside. How would one deal with the inordinately large incomes that are enjoyed in the unorganised sector by persons who belong to just the class from where upper salary earners in the organised sector are recruited? Are not these high incomes contrary to a rational wage system such as we are contemplating? They are, and they have to be controlled. A wage policy, however adequate it may be, would be poor comfort for the economy if it were not accompanied by a comprehensive incomes policy.

In countries where the larger part of personal incomes consists of wages, incomes policy is not often distinguished from wages policy. Indeed in some of these countries incomes policy is just a sort of euphemism for a policy for containing wage-costs as an anti-inflationary device. In our country the situation is different. If there is one thing of which one can be certain, it is that inflation in India is not "cost-induced" in the sense in which it is understood in the West — real wages in our economy have indeed lagged behind productivity. Nor do wages in the organised sector in the economy form a large element as compared to other incomes. In context of our economy, therefore, incomes policy has to be considered on its own. Clearly, this is a more complicated matter, and I would suggest, as a simplifying first step, that an endeavour should be made to bring more and more categories of income under the wage system, so that they may be directly controlled; I would not rule out nationalisation of certain professions

— such as the lawyer's or the doctor's. For the rest, we would indeed have gone a long way if only the Government's own commitments in matters like land distribution, urban property holdings, etc, were acted upon with rigour and consistency. Into these details I do not propose to enter here. For our present purpose it is enough to say that the success of a rational wage policy is contingent on an appropriate incomes policy, and that for tackling the latter the Government must not rely on fiscal policy alone but must act directly on the distribution of property. It is an odd society indeed where a man who does not work is permitted to have more than one who does work. And yet this is the kind of society which we are allowing ourselves to be in; the rentier's income is often a multiple of top salaries in our economy!

Having said all this, I shall ask one final question: What prospects are there that our policy makers will accept the arguments of this essay, that anything like a social purpose will be allowed to determine wage policy in our country? The question has two aspects. First, is the operation of the policy feasible? And second, will it be done?

Concerning feasibility, there can be no better affirmation than actual experience. Twenty years ago, when the Imperial Bank of India was nationalised, the newly constituted Board of Directors of the State Bank of India (as it was renamed) made a drastic cut in top salaries, and the Government gave its assent to it. Even the current incumbents accepted it — on just this assurance that in their case the salary adjustments would be made in instalments. If one institution, acting alone, could do this, how much less difficult should it be for the organised sector as a whole to take a concerted action along the line under the aegis of the state?

What then are we to say about the second part of our question? Here one has reasons to be sceptical. Wage policy is an aspect of social relations, and there is conflict inherent in these relations. Within the body of the employed it is a conflict between the high and the low, such as finds expression in trade union activities. Beyond it also there is a conflict which, though not articulate, is yet not less serious — the conflict between the employed and the unemployed. An understanding of perspectives, towards which the present essay purports to be a contribution, is a necessary condition for the solution of these conflicts, but not a sufficient condition. Knowledge must be aided by the policy-maker's will to use it with a social purpose. Now, this is where the system fails. Our policies are directed by a handful of men at the top, and these men are themselves involved in the conflict which they are supposed to resolve. It is a contradiction, and yet there we stand. Our small world, alas, is led less by reason than by vested interests.

Notes

[The central part of this article is based on two lectures that the author delivered at the Institute of Development Studies, University of Sussex, in the Summer of 1973.]

1 Since neither the capitalists nor the labourers can "live on air", the concept of "maximum rate of growth" apparently signifies that both live on "minimum subsistence"; a part of the income of the capitalist may indeed be considered to be of the nature of "wage".

2 See on all this my, "The Economics of Austerity" (Shastri Memorial Lecture, Banaras Hindu University, 1974).

3 See Amartya Sen, "Dimensions of Unemployment in India", Convocation Address, Indian Statistical Institute, 1973.

4 See my paper on "Differential Rates of Interest", *Economic and Political Weekly*, Vol VII, Number 27, 1972.

5 Adam Smith, "Wealth of Nations" (Everyman's edition) Vol I, p 60. Smith is aware that the worker has to maintain not only himself but also his dependents. He quotes an estimate of Cantillon saying that a common labourer must earn at least double his own maintenance, so as to be able to bring up two children, the wife's earning being supposed to be not more than sufficient to provide for herself. It is interesting to note that Cantillon's estimate, done more than two hundred years ago with reference to conditions prevailing in his own country, has a close affinity to the approach adopted by the last Pay Commission. The latter assumes, very much as Cantillon did, that the maintenance cost of two children is equal to that of one adult; but unlike Cantillon, it considers the wife to be a dependent also. A small survey that we conducted at Sewa Nagar, New Delhi, corroborates, for whatever it is worth, the Commission's assumption of the dependency ratio.

Smith himself is non-committal. Thus he says: "Thus far at least seems certain, that, in order to bring up a family, the labour of the husband and wife together must, even in the lowest species of common labour, be able to earn something more than what is precisely necessary for their own maintenance; but in what proportion, I shall not take upon me to determine." Cantillon's was a hunch on which Smith chose not to depend. Now that we have a well-developed survey system, it should be possible to find out more accurately than our ancestors could, the normal dependency ratio of an unskilled worker.

6 Some recent authors have given precision to this latter aspect by showing that there is an equilibrium in the employer's demand price for labour, which runs in terms of the functional relation between wages and efficiency. See, e g, Pradhan H Prasad, "Growth with Full Employment" (Allied Publishers, New Delhi, 1970), Chapter V.

7 "It is better to play for nothing than to work for nothing", so runs the proverb. Quoted in "Wealth of Nations", Everyman's edition, p 299.

8 Compare, e g, the following passage: "Although the number of the tillers of the soil was decreased, the land produced as much fruit as before ... When, therefore, part of the rural population was set free from the land, the means of subsistence with which they had been nourished as landworkers were likewise set free. Such means of subsistence were transformed into the material elements of variable capital". Karl Marx, "Capital" (Everyman's library) p 826.

9 *Cf*, 'A Note of Dissent' by A K Das Gupta and Niharranjan Ray, "Report of the Third Central Pay Commission", 1973, Vol IV, p 101.

10 The word "salary" is used here to mean "wages" at higher levels.

11 *Op cit*, p 110, Annexure 1.

12 *Op cit*, p 101, paragraphs 9 and 10, from where this and the previous passage have been substantially taken.

13 See Christopher Howe, "Wage Pattern and Wage Policy in Modern China, 1919-1972" (Cambridge University Press, 1973), especially Table 24.

14 Ricardo recognises that labour differs in terms of "the ingenuity, skill or time necessary for the acquirement of dexterity". But he does not go beyond stating that different qualities of labour are differently rewarded and that these rewards are adjusted in the market "with sufficient precision for all practical purposes". ("Principles", Everyman's edition), pp 11-12.

15 See, e g, Kenneth E Boulding, "Economic Analysis", 1st edition (London, 1948), Chapter 10; Paul A Samuelson, "Economics", 1st edition (New York, 1948), Chapter 5. The examples have been taken over from these authors.

16 J R Hicks, "The Theory Wages" (London, 1935), Chapter 1, p 8.

17 Draft Fifth Five-Year Plan, Part 1, p 24.

18 Let it be understood that our concern is with "real" wages. We thus assume stable money, or, alternatively, full adjustment of money wages to variations in consumers' price index.

Demographic Transition among Parsis: 1881-1971

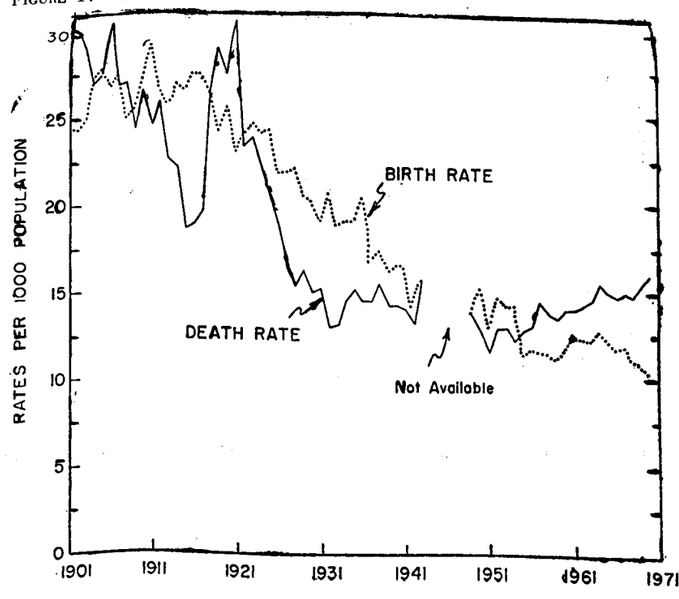
II — Level and Trends in Mortality

Leela Visaria

The Parsis have been a remarkable exception in the general Indian demographic scene. Their fertility and mortality levels have steadily declined over the past century. In fact, their fertility is so low that despite high life expectancy, the number of Parsis has been declining for more than two decades now.

This paper examines the trend in fertility and mortality levels of Parsis. It seeks to examine the transition from high levels of fertility and mortality to low levels and the factors which have brought about this transition. The size and the sex-age composition of the Parsi population are also discussed to facilitate an understanding of their fertility and mortality levels.

The article is published in three parts. The first part discussed the size of the Parsi population and the change in the age-sex composition. The level and trends in mortality are examined in the second. The third part will deal with trends in fertility.



A STUDY of the level and the trend of mortality is of special interest because it serves as an indicator of the health enjoyed by the community. Estimates of mortality are possible on the basis of more than one source and by pooling them, it is possible to build up a history of changing mortality among the Parsis for nearly a century. The vital statistics for the Parsis resident in Bombay are available from the registration records of the Municipality of Bombay.[17] The data on deaths are collected also on the basis of bodies consigned to the 'Dokhma' or the Tower of Silence.[18] Some Parsi deaths might escape recording if some bodies were not consigned to the Tower of Silence, but such cases are believed to be few. On the other hand, still-born babies as well as persons whose bodies might be brought to the Tower of Silence from outside Bombay get included in the data. The number of Parsis from outside Bombay, consigned to the Dokhma in Bombay, although non-zero, is believed to be negligible. In spite of the possibility of such errors in the registration data, they are generally quite reliable and provide us with a very valuable series of annual death rates and infant mortality rates starting with 1901. For years beginning with 1947, the figures of still-births are also available and can be excluded from deaths.

In addition, average death rates during successive decades between 1881 and 1931 have been estimated with the help of the forward survival technique from the all-India age distribution of the Parsis and the inter-censal rates of growth.[19] These estimates not only go beyond the period covered by the registration data but provide an independent consistency check on the latter.

The annual death rates (as well as birth rates) and infant mortality rates estimated from the registered data collected by the Parsi Panchayat of Bombay for the period 1901-1970 are shown in Figures 1 and 2. In Table 3 are presented the death rates and the estimates of the expectation of life at birth for males and females, derived from the All-India census age distributions of the Parsis for the period 1881-1931.[20] Table 3 also shows the estimates of vital rates for the total population of the subcontinent to provide a comparative perspective on the low levels of Parsi mortality.

It is evident from these estimates that the downward trend in mortality among the Parsis started prior to 1881. A death rate of around 30 during the late 19th century is clearly quite low in the context of the Indian subcontinent of that period. The all-India estimate of death rate at the turn of the century was around 42; nearly 40 per cent higher than that for the Parsis. During 1891-1901, when the Western region of the subcontinent experienced high mortality due to a series of famines and plague epidemics, the death rate of the Parsis remained quite low. Such ability to withstand the ill effects of

calamities reflects the relative economic prosperity of the community. However, the downward trend in mortality was apparently halted during the period and the death rate remained steady at 30. During 1901-10, the death rate declined and the expectation of life at birth increased sharply. This improvement does not seem to have been sustained during the next decade 1911-20 and the influenza epidemics of 1918-20, which severely hit western India in general, and Bombay city in particular, seem to have caused heavy mortality among the Parsis as well. This is evident in Figures 1 and 2 which show, between 1917 and 1921, an increase in the death rate and the infant mortality rate. The decade 1921-31 was relatively free from major epidemics or other calamities. The decline in mortality among the Parsis during this decade was substantial, according to the estimates based on the census data, the death rate reached a low value of 18.

Table 3 indicates a remarkable closeness between the death rates estimated from the age distribution of the Parsis in the whole of the subcontinent up to 1931 and those based on registered deaths for Greater Bombay, especially for the decades 1911-21 and 1921-31. The average death rate in Bombay during 1901-11 was about five points higher than the estimated average for Parsis in India as a whole. This is not implausible in view of the suggestive evidence in the subcontinent that prior to the Second World War, the three large cities of Madras, Bombay and Calcutta experienced substantially higher infant mortality than the respective provinces. (The average infant mortality rate during 1911-13 was nearly 400 in Bombay city and slightly less than 200 in the Bombay Province.) This pattern changed over time and by the late 1940s, the differentials between cities and rural areas had narrowed significantly.[21] The high infant mortality rates in the cities could partly reflect biases in registration; the difficulty of disposing of the dead bodies could lead to more frequent registration of births that were followed by deaths. Some of the National Sample Survey data for the early 1950s have also suggested higher infant mortality rates in urban areas than in rural. It seems likely that epidemics such as plague or cholera and other infectious diseases which were the main causes of high mortality spread rapidly in congested urban centres. Although the Parsis of Bombay had more resources to withstand the impact of epidemics or other calamities such as famines than the rest of the population of the city, they could not have altogether escaped their

FIGURE 2: INFANT MORTALITY RATE PER 1,000 LIVE BIRTHS FOR PARSIS IN BOMBAY CITY, 1901-70

effect. On the whole, the remarkable similarity between the two sets of estimates based on different sources and methods confirms the essential validity of the estimates.

The non-availability of age data between 1931 and 1961 leaves us with only the estimates based on the registration of vital events in Bombay city. According to these, the death rate fluctuated between 12 and 14 up to 1951. Since 1951, the death rate has moved slightly upward due to the changing age structure. (For 1970-71, death rate was about 16 per 1,000 population.) As will be seen below, the possibility of a further increase in the survivorship of the young, which would reduce the death rate, has been nearly exhausted. Further, the infants form a very small proportion of the total population while those aged 60 years or more form nearly one-fifth of the population. The gain in longevity at older ages occurs slowly and the elderly are naturally subject to a large number of physical ailments, many of them fatal.

Direct data on infant mortality rates are available only from 1901 onwards for Bombay from the registration statistics. According to these data, infant mortality rate was as high as 220 per 1,000 live births during 1901-11. In other words, one out of every five Parsi babies born died before completing its first year of life. However, after 1911, and particularly since 1921 infant mortality has steadily declined. During 1941-51 the infant mortality rate was only half (72) of what it was 20 years earlier (144). By the late 1960s, the infant mortality rate was as low as 25 per 1,000 live births, a level that was attained by the United States only around 1962.[22] This substantial reduction in the mortality of Parsi infants indicates the high quality of medical and health care that the community is able to provide to its members.

Mortality improvement is also evident in the estimates of life expectancy at birth (e_0^o). As noted in Table 3, e_0^o of the Parsi males around 1881-1901 was nearly 32 years — a value significantly higher than that for the Indian subcontinent as a whole. In the subsequent two decades, after a small dip during 1891-1901, the e_0^o improved for both males and females. The decennial average for 1911-21 was, however, affected by the heavy impact of influenza epidemics. During 1921-31, e_0^o reached relatively high values of 46 years for males and 50 years for females. (The corresponding estimates of e_0^o for the country as a whole were 25 and 22 years for males and females, respectively.) The estimates of e_0^o for Parsis in Greater Bombay during 1960-62, based on the registered deaths by

age, showed a longevity of 69 years for females and 66 years for males.[23] Relative to the rest of the Indian population, the Parsis indeed enjoy a substantial advantage in health and longevity. Their mortality started declining during the last decades of the 19th century and is now comparable to the developed countries of the world.

The estimates of life expectancy at birth for five decades, based on the census data for all-India for 1881-1931 and presented in Table 3, may be compared with those prepared by C Chandra Sekar for 1910-12 and 1930-32 on the basis of registered deaths of Parsis in Bombay city.[24] Chandra Sekar's estimate of life expectancy during 1901-12 (37.6 years for males and 38.4 years for females), are quite close to those based on the census age data for 1901-11 (Table 3); while his estimates for 1930-32 (52.2 and 54.2 years for males and females, respectively) appear to be relatively high compared to my estimates for the decade 1921-31. This difference is not very surprising, however, because the average estimates for the 1920s can be taken to refer to the mid-point of the decade, i e, about 1926. It is evident from the annual death rates plotted in Figure 2 that the pace of decline in mortality probably accelerated after 1920 and the average annual death rate dropped from 19.1 during the three years 1925-27 to 14.9 during 1930-32. Infant mortality dropped from about 170 to around 110, i e, by 35 per cent over the five-year period.

According to all estimates for the Parsis, the life expectancy of females has always been greater than that of males, by about three to four years. Thus, unlike the females in India, Pakistan and Sri Lanka and some small pockets of population elsewhere, where males have a better record for longevity than females,[25] Parsi women enjoy a higher average length of life than men. Evidently, Parsi females are generally treated on par with males so that their biological superiority is not thwarted by contrary socio-cultural influences.

Notes

17 Data for the period 1901-46 are available in: Sapur F Desai, "A Community at the Cross-Road", Bombay: New Book Co, 1948, p 29. Data for the subsequent period have been obtained from the records of the Parsi Panchayat.

18 The Parsis neither cremate nor bury their dead. Instead, the bodies are cast to the vultures in the 'Dokhmas' or 'Towers of Silence.' The religious belief behind this practice appears to be that all that is dead is impure, and since neither the earth, nor fire, nor water should be defiled, the dead bodies are left to vultures.

19 A detailed discussion of the forward survival method used to derive vital rates such as the death rate, expectation of life at birth, birth rate and the gross reproduction rate from the age distributions is outside the scope of the present paper. The technique of analysis and its applicability to the data is discussed at length in the author's PhD dissertation, "Religious and Regional Differences in Mortality and Fertility in the Indian Subcontinent", accepted by Princeton University, Princeton, March 1972.

20 Similar estimates have not been prepared separately for the Parsis in Bombay city because the underlying techniques of analysis are not valid for a population that is subject to migration.

21 See, Warren C Robinson, "Urban-Rural Differences in Indian Fertility", *Population Studies*, Vol XIV, No 3, March 1961, pp 218-234.

22 The infant mortality rate of the United States has been higher than that of some of the Western European countries such as Sweden, Norway, the Netherlands, Belgium, which are more or less at the same stage of overall economic development.

23 For an extended discussion of the life tables from which these estimates are derived, see: Leela Visaria, *op cit*, PhD Thesis.

24 See, C Chandra Sekar, "Some Aspects of Parsi Demography", *Human Biology*, Vol 20, No 2, May 1948.

(To be concluded)

Maize starch plays a vital role in our lives.
Maize Products discovered its versatility in India... a quarter century ago!
Leading industries now depend on us for a regular supply of starch.
Anhydrous Dextrose for life-saving intravenous injections.
Fabrilose for textiles.
Sayatex for paper.
Sayacell for dry cell batteries.
Glucose for confectionery and pharmaceuticals.
For us at Maize Products, starch still holds endless promises.
That's why our research experts are always on the job.
Constantly adding new chapters to the story of starch.

It's amazing what maize can do for you!
Ask the people at Maize Products.

Don't let power cut slash production.

The right valve gives you the power to achieve higher productivity

Increasing productivity simply means ensuring maximum efficiency while your plant works. AIL-CRANE valve is your best bet for increasing efficiency. Choose a gate, globe or check valve in carbon, alloy or stainless steel. They are all rigidly tested to efficiently control the flow of chemicals, hydrocarbons, gases, steam and oil in pipelines.

Crane Company are up against the great production hold up—downtime. They have been at it for 200 years. Developing expertise. Technical know-how.

That explains why Crane is the world's largest selling valve today. Audco India, licensees of Crane Company, guarantee you the Crane quality in valves.

Those who insist on plant efficiency anywhere in the world, insist on Crane valves. If you are equally fussy about increasing productivity, you'll naturally choose the world's largest selling valve. It's yours for the asking. Phone your nearest L&T office today. Our engineer will be at your plant site to tell you how much you stand to gain when you invest a little more in AIL-CRANE valves.

Investment, the Key

THE average index of industrial production for January-April 1974 shows a rise of 1.1 per cent over the index for January-April 1973; even over January-April 1972, the growth in the index is only 1.6 per cent.

For about a decade between 1955 and 1965, industrial output had grown at the rate of 8 to 10 per cent per annum. During this period, the increase in gross fixed assets formation among large and medium companies in the private sector averaged 9 to 10 per cent per annum and that in net assets formation around 7.5 to 8.0 per cent per annum. Employment in organised industry too had expanded by about 6 per cent annually for a decade upto 1965-66. Since then the growth rates of industrial investment, output and employment have been consistently low — lower than in the past, lower than the targets, lower than the minimum requirements of the economy, and above all, much lower than the potential.

Industrial production actually declined in 1966 and 1967. There were increases of 6.8 per cent in 1968 and 7.5 per cent in 1969, but these were not sustained in the subsequent years, except in 1972 when the growth rate was 7.1 per cent. In the other years, the growth of industrial production ranged from 5.1 per cent in 1970 to 1 per cent in 1971 and 0.7 per cent in 1973. In the Fourth Plan as a whole, as the IDBI's latest Annual Report points out, the annual compound rate of growth of industrial production was about 3.9 per cent against the Plan target of 8 to 10 per cent. The general index of industrial production (base: 1960=100), which should have reached 244-267 by 1973-44 on the basis of Fourth Plan targets, actually stood at 201. More important, the shortfall has been particularly conspicuous in basic and capital goods industries. As per the Fourth Plan targets, the index of output of basic goods should have reached 317 by 1973-74 and that of capital goods 468, whereas the actual figures were 251 and 281, respectively. Against the targeted growth rates of 9.9 per cent and 17.1 per cent, the actual growth rates were 4.9 per cent and 5.9 per cent, respectively. Even the rate of 5.9 per cent for capital goods industries is fictitious, being largely the result of price increases in 1972-73 and 1973-74, when the index of output of capital goods rose by 10.4 per cent and 11.9 per cent against 1.4 per cent in 1969-70, 6 per cent in 1970-71 and 0.4 per cent in 1971-72.

Fixed assets formation by companies in the public and private sectors also dropped markedly during this period. For the Reserve Bank's sample of government companies, the rate of gross fixed assets formation steadily declined from 11.8 per cent in 1966-67 to 6.1 per cent in 1971-72 and that of formation of net assets from 8.5 per cent to 1.7 per cent. There was some improvement in 1972-73 because of the rise in public sector investment in that year, though much of this rise was absorbed by rise in project costs. In 1973-74 public sector investment rose by about 4 per cent whereas the cost of investment rose by about 15 per cent. On the whole, the shortfall in the public sector Plan outlay in real terms in the Fourth Plan was of the order of 25 per cent; in other words, against the outlay of Rs 15,902 crores at 1968-69 prices proposed in the Plan, the actual outlay would work out to about Rs 12,000 crores over the five-year period.

Investment in the private sector followed broadly the same trend. According to the Reserve Bank's study of company finances, medium and large public limited companies in the private sector had achieved growth rates of 10.5 per cent in gross fixed asset formation at current prices and 9 per cent in net fixed assets formation in 1966-67; these rates steadily dwindled to 6.8 per cent and 2.7 per cent, respectively, in 1970-71. There has been some improvement thereafter; broadly the growth rates have been 8.5-9 per cent in gross fixed assets formation and 6 per cent in net fixed assets formation, though here again, because of the price increases, the rise in real terms has been negligible.

The same is true of employment in organised industry. During the period 1960-61 to 1965-66, the compound rate of growth of employment in the organised sector of industry was 5.9 per cent in the public sector and 6.2 per cent in the private sector giving an overall rate of increase of 6 per cent. Thereafter, the growth in employment was as low as 0.9 per cent in 1966-67 and nil in 1967-68; the subsequent increases from 1.9 per cent in 1968-69 to 4.1 per cent in 1972-73 was the result of an increase in employment in the public sector, mainly in banking, insurance, government administration, etc — that is, mainly in the non-manufacturing categories. In the first four years of the Fourth Plan (1969-70 to 1972-73) the compound growth of employment was 4.4 per cent in the public sector and 1.2 per cent in the private sector. The performance in 1973-74 was truly dismal; the rate of growth of employ-

ment in the public sector was shown to be 3.5 per cent and in private sector there was a decline of a little over 1 per cent.

The prospects for 1974-75 appear equally bleak. The official index of industrial production is not available beyond April 1974, but figures of output available for some of the major industries are plainly discouraging. Among the basic industries, finished steel output during January-August 1974 declined by 1 per cent against an increase of 3.6 per cent in the corresponding period of 1973; cement output is likely to have declined by as much as 9 per cent during January-October 1974 against a decline of 4 per cent in the corresponding 10 months of 1973; and coal output showed a lower rate of growth of 2.3 per cent during January-May 1974 against 6.5 per cent in the same months of 1973, though the improvement in output in 1973 may have been partly the result of better reporting after the nationalisation of the coal mines. Among the intermediate and consumer goods industries, output of mill-made cloth declined by 1.5 per cent and that of cotton yarn by 0.3 per cent during January-August 1974. During the same period, output of jute textiles declined by as much as 14.1 per cent against a decline of 9.6 per cent in January-August 1973. In vanaspati, the decline in output has been as much as 18 per cent, on top of a decline of 28.5 per cent in the corresponding months of 1973. Sugar output rose by only 2.7 per cent during October 1973 to July 1974 against an increase of as much as 24.5 per cent in the corresponding period of 1972-73. All of these industries together account for about 42 per cent of the total weight in the CSO's index of industrial output.

Nor does there seem to be much hope of revival in the near future. Raw material shortages have been mentioned as a serious obstacle in the way of expansion of output of agriculture-based industries. However, except for groundnut oil for vanaspati, the supply of other raw materials like raw cotton, raw jute and sugarcane has been adequate for the past one year and yet output of their manufactures has been declining, as in cotton and jute textiles, or has been growing at a reduced pace, as in sugar. The power shortage is another common alibi. However, the power situation has eased in the Eastern region and though the government has imposed restrictions on the use of power in the Western region, the restrictions on cotton mills and other manufacturing units have been the minimal. Output of raw cotton and raw jute is placed lower at about 60-62 lakh bales and 50-55 lakh bales, respectively, in the 1974-75 season against 67 lakh bales and 62 lakh bales in the 1973-74 season. However, with imports of long staple cotton of 4 lakh bales and a fairly large carryover stock of about 21 lakh bales, supply of raw cotton during the coming year should be comfortable. Likewise, unofficial sources put the raw jute stock as high as 33 lakh bales. Therefore, if the production of these agriculture-based manufactures fails to pick up, it would not be for reasons beyond the control of the manufacturers. The same is true of sugar; already the industry is estimating that output of sugar in 1974-75 will be lower than in the last season.

As for other industries, while there may be scope for raising production through organisational improvements, in the main the prospects of higher output hinge on investment, in the industries concerned themselves as well as in industries which use their output. Much the greater part of underutilisation of capacity in a number of industries can be attributed to lack of investment in modernisation or delay in replacement and renewal of equipment. For example, in steel, utilisation of capacity at Durgapur, IISCO and Rourkela can improve only after substantial investments have been made in replacement and in balancing equipment. Even in the Railways, better utilisation of available wagons requires considerable track renewal and replacement and other complementary investment. In a large number of industries like railway wagon-building, industrial machinery for such industries as paper, cement, construction and mining, machine tools, steel pipes and tubes, steel castings and forgings and light, medium and heavy structurals, capacity utilisation currently ranges between 50 per cent and 28 per cent — mainly for want of investment demand from the user-industries. In other words, unless there is a major push to investment in the economy, there can be no hope of an industrial revival. As the IDBI's Annual Report for 1973-74 rightly points out, a sustained increase in production at the rate of 9 per cent per annum would be possible only with installation of additional capacity of about 10 per cent per annum. During the Fourth Plan period, industrial capacity had grown at the rate of only 3.8 per cent per annum. The cost of machinery and transport equipment has risen by over 20 per cent. Taking the prices of other investment goods and construction materials like cement, investment costs would have risen by about 18-20 per cent. Therefore, if investment is to be stepped up by, say, 20 per cent in real terms, the increase in money terms will have to be over 40 per cent. Anything less than a 20 per cent increase in overall investment would be entirely absorbed by the increase in costs.

Available indicators of investment, however, show that even in money terms the overall level of investment in the public and private sectors in 1974-75 will not be higher than what it was in 1973-74, when it was only marginally higher than in 1972-73 at current prices and considerably lower in real terms. Among the indicators of public sector investment, gross capital formation expenditure out of the budgetary resources of the Central government increased by only 4 per cent from Rs 2,627 crores in 1972-73 to Rs 2,734 crores in 1973-74, whereas investment cost went up by about 15 per cent in 1973-74. The Central budget had proposed an increase of 13 per cent in gross capital formation expenditure in 1974-75, but due to the subsequent cuts in Plan expenditure this is unlikely to be achieved. Besides, such rise in gross capital formation expenditure as there is will be swamped by the increase in the cost of investment which will not be less than 18-20 per cent. In real terms, therefore, there will be a decline in gross capital formation expenditure of the Central government this year. Indications of this may be seen in the reported decline in the offtake of cement by the rate contract (public sector) customers in recent months.

The position with regard to private sector investment is equally bleak. Capital raised by the private corporate sector through shares and debentures was about 12 per cent lower in 1973-74 than in the previous year (Rs 132 crores). The retained earnings of the private corporate sector would also have declined by about 25 per cent in 1973-74 from Rs 177 crores in 1972-73. Against these, disbursements of the term-lending institutions were about 38 per cent higher in 1973-74 (Rs 274 crores) than in the previous year (Rs 199 crores). But a large proportion of these went to existing units as against new units. Besides, almost all the rise in disbursements was under rupee loans. These indicators taken together suggest that a significant part of the higher disbursements probably went to substitute for short-term capital from commercial banks which had become relatively scarce and more expensive. Considering all these factors, even at current prices the overall level of private sector industrial investment in 1973-74 was probably of the same order as in the previous year. For 1974-75, the available data indicate that resources at hand for investment in the private corporate sector would be somewhat higher, but the question is whether the companies would make use of them for creating fixed assets or for building up inventories and for other forms of current consumption. New capital issues by public limited companies during January-September 1974 continue to be lower by about 18 per cent at about Rs 45 crores against Rs 55 crores in the first nine months of 1973. But the retained earnings of companies would benefit to the extent of about Rs 60 crores as a result of the restrictions on dividends. The disbursements of term-lending institutions also continue to go up. IDBI's disbursements during the quarter ended September 1974 are reported to have doubled to Rs 51 crores against Rs 24 crores during the corresponding quarter of 1973.

The most disturbing aspect of the trends in industry is the stagnation in industrial employment. Applicants on the live registers of Employment Exchanges have reached the staggering figure of 83.5 lakhs, showing a rise of 280 per cent over the end-December 1968 level. The poor are thus caught between rising cost of living and growing unemployment.

Election Expenses

Entrenching Money Power

THOSE who were hoping that the Union Government's delayed flexing of muscles against the smugglers heralded a qualitative shift in the country's structure of politics have now been given short shrift. The thirteenth ordinance of the year could not have made official intentions clearer. The Supreme Court had, a few weeks earlier, unseated a Congress MP from Delhi on the ground that his personal campaign expenses, when considered together with the expenses incurred on his behalf by the party, far exceeded the limits set by the Representation of the People's Act, 1951. The ordinance renders the Court's decision null and void. Let the Court stew in its own wisdom, the government has decided that "Notwithstanding any judgment, order or decision of any court to the contrary, any expenditure incurred or authorised in connection with the election of a candidate by a political party or by any other association or body of persons or by any individual (other than the candidate or his election agent) shall not be deemed to be, and shall not even be deemed to have been expenditure in connection with the election incurred or authorised by the candidate or by his election agent".

As Parliament reassembles in November, the ordinance will be duly validated by an overwhelming majority of the MPs, most of whom would perhaps otherwise have found their tenure endangered by the implications of the Supreme Court's decision on the interpretation of Section 77(i) of the Representation of the People's Act. The entire procedure will resemble a pantomime of Richard Nixon in the act of pardoning himself.

Contrary to notions carefully propagated from time to time, the government has, it would appear, not the slightest intention of initiating any thoroughgoing electoral reform of the corrupt-to-the-core, money-based parliamentary system. The ordinance serves notice that, in the sphere of politicking, there will be merely more of the same, that the ruling party will go on using its vantage position to collect money and spend money to win the elections, and that no concept of justice or decorum will be allowed to interfere with the arrangements. The ordinance, significantly, follows reports that the government might shortly lift the ban on company donations to political parties imposed through an amendment to the Companies Act in 1969. The ostensible justification for the reversal of the ban is the demand from some quarters for it. The new president of the Congress party, known for his fund-raising prowesses, has spoken in favour of going back to the pre-1969 position where business houses and individuals could contribute to political parties by cheque. The support of a section of the Opposition seems to have been enlisted for this step in the reverse direction.

In the light of the ordinance on election expenses, it is legitimate to speculate on the residual usefulness of the judicial paraphernalia in the country, including the Supreme Court. The bench of the Court handing down the judgment which provoked the ordinance might well consider its role as altogether supernumerary. The government does not, and will not, abide its judgment. The government is not at all enamoured of the concept of a judicial system which acts as arbiter of administrative morality. Will it be too much to expect that at least some members of the judiciary will openly acknowledge this fact of their role having been totally played out, and vacate their infructuous citadels?

Managing a Contrived Recession

A Correspondent writes:

AS late as August this year, textile magnates were assuring shareholders of their respective groups of mills that sales during the current year would keep ahead of, or at the very least match, the record of 1973-74, a year of bumper profits for the cotton textile industry. Towards the end of September, the mills of the Lalbhai group in Ahmedabad closed third-shift working. Others followed suit. And now the entire textile industry has taken up the cry of recession and held out the prospect of large-scale unemployment of mill workers. Though the alleged distress in Ahmedabad has not led millowners of that city to hold out the threat of staggered bonus payment to workers before Divali, the Bombay mill industry has hinted at even that possibility.

Along with the cry of recession has been raised the cry of a credit squeeze, though, in terms of the Reserve Bank's credit policy, there has been no specific squeeze on the textile industry. Mills claim that their credit limits were frozen last year. True, but do they remain frozen? A Gujarat millowner counters this with the question: but should not credit availability be increased to match larger output at higher cost?

This is indeed a puzzle. Is there a recession or not? Stocks of cloth, much of it sold to the trade, with the cotton textile industry at the end of August stood at 1.93 lakh bales against 1.57 lakh bales in August 1973, 2.01 lakh bales in January 1974 and the monthly average of 2.26 lakh bales during the boom year 1972.

Between August and September-end something happened to agitate the mill industry. Did New Delhi sound Gujarat millowners that the ground had to be prepared for the election of the state assembly? In that event the recession cry could be viewed as a defensive action. Or was it the other way round and had the mill industry started making demands in anticipation of the elections? Thus it choked the export quota for Bengal Deshi cotton to press down cotton prices all round. By contrast, in the case of sugar, the policy has been to squeeze out an exportable surplus from the domestic market, high prices notwithstanding.

The textile industry which reaped bumper profits in 1973-74 and was saved, like other industries, from having to distribute the profits by dividend control, is now, in a situation when cotton prices have climbed down, not only chary of repaying bank credit, but is claiming additional credit. A recession would, therefore, come in handy to the industry. But how to justify it? Here is one plausible line of argument. Prices have risen by 80 per cent in about a year and this could not be sustained. Also, because of the wage and DA freeze and the sharp rise in the prices of other essential items, people have less left over to buy cloth with. Further, superfine and fine cloth prices had shot up even more than those of other cloth. This resulted in oversupply. Prices of these varieties need a correction, say the mills which have switched over to higher medium varieties in the last few months ago.

It is a demand recession then and, surely, this calls for a cut in cloth prices? The Textile Commissioner's view is that a 25 per cent cut in prices would not pinch the mills unduly. The Commerce Minister has stated that prices could be cut by 10 to 40 per cent, depending on the varieties. But the mills consider the suggested order of price reduction absurd, since allegedly it does not take into account the fact of higher cost of production. True enough, cotton prices have declined, but what about other inputs, millowners ask. True, too, dyes and chemicals are now offered on credit for upto six weeks instead of for cash, but that only shows that the recession is spreading and does not reflect the mill industry's ability to cut prices or manage with less bank credit.

So run the arguments, unconvincingly. Between the end of August and the end of September MISA was extended to economic offences like smuggling and black-marketing. The sporadic raids that came after September 17 caused a temporary panic in many markets, including the cloth market. This led to withdrawal of black money. If bank credit was insufficient for the textile industry and trade, the insufficiency was not of recent origin. In an earlier period the insufficiency was made good by black money. With the withdrawal of black money after September 17, the trade's capacity to stock for the festival season received a sharp setback. The sudden withdrawal led weaker mills to lower prices. This development came in the wake of an earlier tendency to shift from superfine and fine counts to higher medium and medium counts which is reflected in the fulfilment of controlled cloth quotas by the textile industry as a whole after a long, long time. This had led the government-run mills to somewhat reduce their prices during the past six months or so.

In sum, the reaction to MISA led the trade to expect a price decline. The trade demanded a guarantee that with every decline in prices, mills would compensate it for cloth sold to it by the mills but not disposed of by it. For this guarantee, the industry needs larger credit. Undoubtedly, many mills have obtained liberal credit, thanks to pressures from the Gujarat government and the Textile Commissioner, as is clear from the guarantees they have given to the trade.

Thus, while Ministers and officials make the appropriate noises, the mills are being allowed to manage the recession. The recession could not be severer, the mills say. Yet prices need not go down by more than 10 per cent, they add. Could the management of recession be better? No millowner today seriously believes that the 10 per cent cut, designed to afford a cushion to the trade and not a relief to the consumer, would not be made good very soon. If there is distress, government expenditure on relief will expand. The end of the fiscal year promises a surge in deficit financing. The rabi harvest prospects in many states are excellent. The anti-smuggling drive may reduce, temporarily at least, the availability of smuggled fabrics. Finally, while shifting the pattern of production in favour of higher medium and medium cloth, the mills are clamouring for a dilution in the quality of controlled cloth. In other words, many controlled varieties would be in effect decontrolled. Thus are fat unit margins to be protected.

Iranian Students

Curious Nexus

A Correspondent writes:

ON October 2, the Special Branch of the Andhra Police swooped down on two 16-year old Iranian schoolboys studying in the SSLC class in a Hyderabad school. The occasion was the Shah of Iran's visit to New Delhi and the alleged offence was the pasting of anti-Shah posters on city walls. Akbar and Syed were the names of the accused.

Later events revealed that the schoolboys had been arrested at the instance of the Iranian Consulate in Hyderabad. Does the police act at the behest of a foreign consulate? If yes, what weighty and special considerations influence such action?

The two Iranian boys were illegally detained in the police lockup for six days and beaten and assaulted. No charges were brought up nor were their friends and relatives informed. They were also not produced in a court of law.

When a lawyer engaged by the Iranian student community in the city served notice for a *habeas corpus* petition, the Special Branch volunteered some very interesting information. It was disclosed that the Iranian Consulate had spared no effort to have the students arrested so as to teach them a lesson. According to the Consulate, the students were learning communism in India. According to a police officer, however, Iranian students in Hyderabad were "well behaved and polite". The police assured the lawyer that such arrests would not be made in the future.

The direct nexus sought to be established between the Iranian diplomatic representation in this country and the police have thus come to light for the second time in the past few months. What is even more insidious is the fact that the SAVAK, the dreaded Iranian Secret Police, first established and trained by the CIA and continuing to have a close relationship with it, is now seeking collaboration with our special police agencies. The government which never tires of warning the people against the dangers posed by the CIA perhaps needs to remind itself of the close bonds between the CIA and SAVAK. The functioning of the Iranian consulates in this country, it appears, also needs to be defined more precisely.

Calcutta Diary

A M

ONCE more, one reels under the onslaught of the festive season. The season has by now been captured, almost in entirety, by the urban classes: gods and goddesses are rapidly shedding their rural roots. The poor over there do not have the wherewithal to worship divinity, and the rich do not still feel secure enough to turn the invocation of the Durga into an exercise in lavish exhibitionism. Gods and goddesses nevertheless have to survive; they have to, for the sake of the parasites who make a living out of the business of community worship, which is an urban culture. The commercialisation of the Bengali pantheon therefore proceeds apace: commercialisation and urbanisation go hand in hand.

The resulting process is akin to creating value from circulation. Put the squeeze, put the squeeze, skim the fat off the rich householder, the shady-looking businessman, the income tax-cheating professional; let the funds flow. But, at the other hand, also put the squeeze on the poor school teacher, the struggling clerk, the harassed wife of a lowly pensioner. A sub-species of Rosa Luxemburg's 'third persons' therefore appears on the scene; they will use the alibi of the season to place an imprest upon you, irrespective of your absolute or relative economic position, and thus come to funds. Do not ask them how the funds are going to be spent. Who does not know that conventional book-keeping is a hang-over from the colonial days? If you insist, an annual general meeting of the got-up *puja* committee will be convened; a report from an established firm of accountants, meticulously listing the validated heads of income and expenditure, will be made available to you; the vouchers and cash memos will all be there. These are the standard paraphernalia of the pyrotechnics of third-person existence. The tribe of parasites will continue to flourish — and reign. The world currently belongs to them.

There is a certain heartlessness in the gaiety that ensues. Canned music and ersatz glamour constitute the principal stock-in-trade of the festivities. Suddenly, the scarcity of power is no longer a relevant variable. Illuminations dazzle the eye; the drums beat, always to a crescendo; 'cultural programmes' become a compulsory appendage to the public worship of the deity; the inevitable politicians make their appearance: true to the cultural norm, they are much sought after, the new priests, they are called upon to inaugurate even the worshipping. The 'third persons' have an intensely busy time: as money jingles, they look busier, more intense, they feel more smugly self-important. This is all part of the game. There is a certain heartlessness, however, in it all. The inexorable law of survival is the inexorable law of survival. Each is for himself or herself. The 'third persons' could not care less if the hungry crowd keep pressing against the enclosures where the worship has been organised. Business is business; the business of worship could not possibly be suspended merely because a few unfortunate ones have run across some little, local difficulties, and are unable to secure the food which could ameliorate hunger. Ah, well, have you not noticed that this year, under disbursements, we have introduced an additional item: famine relief? That should take care of the problem of the destitute hungry. In the meantime, ladies and gentlemen, you will be glad to know that, in tomorrow's cultural programme, we have been able to add a further item: Shrimati Bhimpalashri Basu has kindly consented to render a number of *kathak* dances: her item will follow the recital of Tagore songs by Atanu Mookerjee.

A total dissociation from the realities of life is thus proclaimed. These realities, mind you, are not unfolding eight hundred, a thousand or fifteen hundred miles or kilometres away; these are aspects of living in the immediate neighbourhood: that woman, imploringly begging for a morsel of food, could hardly be more than one hundred metres away from the park where the community worship is taking place, the rickety children, who, empty stomach, stare vacantly at the dazzling image of the deity, are as much a part of the objective correlate as Shrimati Bhimpalashri Basu. But, there you are, commercialisation extracts its due toll, the process of civilisation is denuded of all traces of subjectivisim. Society is rendered into one vast marketplace: it is only the cry of prices which matters here, the cry of prices backed by effective demand, reserve as well as of the normal sort. The other cry, the cry of the needy, leaves no impress: money talks, the lack of money is a fatal deficiency; the consequences of this deficiency must visit those afflicted by it.

It is little use arguing in terms of the aesthetics of it either. Aesthetics has been, through the ages, always class-biased. The frolics the Romans used to indulge in did not ever attract any opprobrium from any of the contemporary critics on aesthetic grounds; it was just so much good, clean fun, exemplified by the ritual of throwing the slaves to the lions. In your weaker moments, you may feel somewhat uncomfortable with the fact that saturated talk concerning egalitarianism, socialism and frugality of living could still be combined with unbridled merriment on the part of the upper classes even as people die in the streets for the altogether mundane reason of lack of food. But this, after all, is what *laissez faire* is about; you have to take the rough with the smooth, you live and do not particularly care whether others do too. Aesthetics, unless properly seasoned and honed by pragmatism can be so much arid abstraction. Pragmatism duly takes into account the realities of class alignments in the formulation of aesthetic values.

Thus it is that hardly one politician will be around if you ever take it upon yourself to run down the institution of community worship. The slightly more sophisticated specimens amongst the politicians might even venture to educate you: the business of community worship facilitates the dispersion of surplus value, to discourage it is to condemn oneself to a bleak regime of dull work and duller profit-taking, marked by high levels of unemployment and social tension. The surplus value that circulates is not something to which one could however *per se* claim a natural right, it emerges because of the avarice of petty, scheming men, who do not mind if people go hungry, as long as they themselves can have a rollicking-ly good time. After all the sophistication is assembled, all the dissembling that is to be done is done, all the words that are to be gurgled out are gurgled out, the hungry and the starving continue to make their feeble entreaties for food, while Shrimati Bhimpalashri Basu, exhilaration in her feet and limbs, dances all night.

Or is it a new phenomenon, this slide into insensitivity? The old-fashioned virtues of simplicity, frugality and benevolence have been rendered into the oddest curiosities; they have been substituted by a genre of smart-Aleck-

ism, which believes — and with reason — that it can combine lip service to socialism with the pursuit of the goal of untrammelled private gains. Such is the legacy of the more recent years. Fixers and commission agents, 'third persons' *par excellence*, are an inevitable adjunct of the system that has come into being: fix a job, fix a speech, if the public media are under your control, you can even fix a famine. The objective correlates, as they are called, appear in an altogether different light: for you can even fix the definition of objectivity, and swiftly take care of the poet or the editor or the economist who has the foolhardiness not to go along with your definition.

Festivities and carnivals fit snugly into this arrangement. They exude and propagate the air of middle class normalcy: they, so to say, fix the environment. The festive season is on, the drums beat, the chanting of the ethereal *mantrams* enthrals you and me, the affluent flaunt their jewels and livery, Shrimati Bhimpalashri Basu's body pulsates to the rhythm of the onrushing *kathak* number, the organisers of the gala worship push their way through the crowd, they never looked brisker. The politicians feel assured, everything is under control, the famine has been fixed, the cry of the hungry is not cognisable, and has not one of the country's ministers already assured the Americans on his honour that not one person has here died on account of famine? Let the drums beat a brisker pace then, there is an eerie hint of heady excitement in that recital of the *kathak*, the season of festivities will soon be over, but, never mind, perhaps we will have other excitements forthcoming, if not exactly a pie in the sky, at least an indigenous version of the *sputnik*, and, who knows, perhaps followed by a general election?

CAPITAL VIEW

Politicians and Elections

Romesh Thapar

LIVING with intolerable delays and carefully devised bureaucratisms for the preservation of the *status quo*, one is naturally startled at the speed with which the ruling politicians issued an Ordinance to negative the Supreme Court judgment on election expenses. Of course, the Ordinance had to be issued or else a large number of the pending election appeals, including one involving the Prime Minister, would have led to unseatings. And what's an Ordinance between creatures who begin their political lives with lies — yes, quiet congressmen, loud-mouthed socialists, proletarian communists, double-talking Jan Sanghis, freedom-fighting Swatantras and what have you.

You would have thought that the politicians had spent a little of their useless time reading the details of the Supreme Court judgment. The lumping together of the party's expenses together with the expenses of the individual candidates had been carefully explained as in keeping with the highest democratic ideals. Indeed, the judgment had a rare stamp of most thoughtful probing. To negative the the judgment in the way it has been done, without proper explanation and without a promise to reform the role of money in elections, is perverse and most damaging to the whole fabric of democratic functioning.

The negation of the Supreme Court judgment in the context of the elections already held was inevitable. The practice of showing separately the expenses incurred by the party and those by the candidate had become "time-honoured" among a tribe of cynical power manipulators. But what of the future? Why is there no indication of a reform? Here is an area where the politician is full of expertise — indeed, very often it is the only area he has knowledge of.

Surely, the Congress High Command and the leaderships of the various parties of the Opposition realise the immense damage that is being done to this country by the blatant and shameless use of black money in all types of elections. All the anti-smuggling measures cannot halt smuggling if every five years the most powerful in the land go abegging for election funds. Black money will continue to function as a parallel economy so long as this prospect is present in the calculations of the traders. It is here that action is needed, and not on the imaginary significance of K R Ganesh's "influence" or "positioning" in government. Really, how puerile can we become!

Significantly, so far, there is not a worthwhile comment on the subject of politicians and elections. They will come when publicists and observers view the tangled nerves of the democratic system. All over the world, the discussion is joined on the future structures of democratic functioning — except here, of course. We love to be followers, satraps, or we just pretend not to see the writing on the wall. Will the editors of the press get off their backsides, or will they surrender following the sacking of George Verghese from *The Hindustan Times*? It will take more than editorials to inject solid sense into the democratic system we have inherited from our god-fathers across the seas.

The politicians, particularly of the ruling variety, will fight desperately to live by constitutional amendments based on the Ordinance. Battle must be joined at every level on this issue. Indeed, the first legal support should be mobilised to jam up the works in legal inanities — if that is the only recourse. We still possess the ability to boycott elections. That would expose the process very thoroughly for what it is.

At the same time, it should be possible to project the most enlightened practice of other lands in the context of Indian realities. An election fund, properly constituted or the State, for example, could take care of the essential expenditures that a party has to make. Various systems of proportional representation should be studied in order to turn the focus on programmes rather than individual ugly politicians with black money and other such aids. It can be done, whatever the reluctance of the politicians.

However, the lobbies against change are strong, including the lobby of foreign money which has a great time joining the democratic extravaganza. The argument invariably trotted out is lack of time because the decision to reform is always delayed. Well, why not postpone the next elections by a year or two by Ordinance!

The trouble with leadership today, and all over the world, is that it does not attack the structures by which systems are functioning. The fact that, today, two Indias exist where there was one in 1947, and that there will be another two Indias by the turn of the century, should put the fear of something in us. Elections are people — or have we forgotten?

October 21

Long Haul

Hansavivek

TEXTOOL has been showing steady progress since its management was taken over by the reconstituted board of directors nominated by government of Tamil Nadu on August 1, 1970. The company had then an accumulated loss in excess of Rs 200 lakhs and the position looked almost irretrievable. During the past four years, the accumulated loss has been reduced to less than a third and, with successful working for another year or so, the company can look forward to wiping out the remaining deficit. The company has outstanding orders of the value of over Rs 21 crores and it expects favourable conditions in the textile machinery market to continue for another five years, which should provide it with ample opportunity to maintain the rate of growth achieved in the past four years.

Production of textile machinery is intended to be stepped up substantially and efforts are being made to procure adequate quantities of the essential raw materials and bought-out components. New lines of manufacture such as arc furnaces, bar turning machines and fly frames have also been in good demand. Production of steel was increased last year, but it was still well below the company's full potential level owing to the power restriction, which is likely to continue. During 1973-74, Textool produced 150 spinning frames, 76 conversion sets and 96 cone winders and doubler winders against 109, 180 and 85, respectively, produced in the previous year and the installed capacities of 480 spinning frames and 96 cone winders and woubler winders. The number of diesel engines produced was increased over the year from 446 to 557 and the output of alloy steels from 443 tonnes to 596 tonnes, although installed capacities in both the cases were much larger at 2,500 diesel engines and 1,200 tonnes, respectively.

The company had to contend with power restriction for about three-fourths of the year and also considerable difficulties in obtaining textile components and raw materials and controlled commodities. In addition, credit squeeze allegedly tended to aversely affect the working results. Even so, production and sales in all lines of manufacture showed increases and the company earned the highest profit in its 28-year career. Equity dividend, however, is still not in sight, for there are, apart from the balance of past losses, arrears of cumulative preference dividends for eight years amounting to over Rs 18 lakhs.

HINDUSTAN PETROLEUM, formerly Esso Standard Refining Company of India, showed a much better performance during 1973 despite increase in operating cost from Rs 17.98 to Rs 19.68 per tonne over the year owing to general increase in price levels, higher fuel costs resulting from unprecedented crude price increases, higher crude runs, and a programmed maintenance shutdown of the refinery. Crude runs at 2.9 mn tonnes were 15 per cent higher than in 1972 and were the highest achieved since the refinery went on stream in 1954. The increase in crude run followed processing of 317,298 tonnes of crude for Indian Oil Corporation for a fee of about Rs 64 lakhs. This processing fee apart, higher neutralisation of crude price increases enabled the company to earn a net profit of Rs 37 lakhs as compared to a deficit of Rs 5 lakhs shown previously. No dividend has been recommended on equity shares. The government of India has already acquired 74 per cent of equity shareholding in the company and the remaining 26 per cent will be acquired at the end of 7 years. During this period, government has guaranteed to Esso a dividend of 15 per cent on its share of the equity. The purchase price, mutually negotiated and agreed upon, will be paid in six equal instalments.

Total crude runs during the first seven months of 1974 were 1.89 mn tonnes which included 402,000 tonnes processed on a fee basis. The crude runs for the remaining five months are expected to be 1.12 mn tonnes, thus making a total crude run of 3.01 mn tonnes for the year including processing of 422,000 tonnes on a fee basis. The product price increases granted by government so far and the operation of the crude oil price equalisation (COPE) account are expected to mitigate to a great extent the adverse impact of the unprecedented increases in crude oil prices. The COPE account does not, however, provide relief for some of the products like pitch, prices of which are not fully controlled by government. The refinery is negotiating with a customer for an increase in the price of pitch. In an effort towards further import substitution, facilities have been installed at the lube refinery unit to manufacture turbine oil base stocks, axle oils and rubber processing oils.

The company last year sold substantial quantities of chemisphere 330 to a petro-chemical unit and thus helped in saving an expensive imported product. Supplies of carbon black feed stock, developed from a refinery stream, is also a major contributor to foreign exchange savings. Sodium sulphide solution, developed by the company, has been found very useful in treatment of hair removers from animal skins. The refinery has also under development pesticide solvents, mineral jelly, battery ceiling compound and other products.

BENGAL CHEMICAL AND PHARMACEUTICAL WORKS has secured a 'letter of intent' for manufacture of 10,000 tonnes of synthetic detergent per annum. The project, estimated to cost Rs 128 lakhs, holds out promise of an annual turnover of Rs 900 lakhs. It can be implemented in two to three years' time, but it will be taken up only when the required funds are available. Meanwhile, the company is implementing the sodium dichromate project at Panihati at a cost of Rs 72 lakhs. This project too will take about two to three years to complete. The additional annual turnover expected from it is placed at Rs 130 lakhs. BCPW is also recommissioning the sulphuric acid plant at the Panihati factory, which had been shut down since 1967, at an expenditure of Rs 8 lakhs. The balancing and renovation of the tar distillation plant, also lying idle for many years, has also been taken up. The installation of a third battery of the ferro alum plant with a capacity of 30 tonnes per day and modernisation of the tar distillation unit at an estimated total expenditure of Rs 48 lakhs are being considered by the management. The company has approached Industrial Reconstruction Corporation of India for the required funds. BCPW's performance during 1973-74 was adversely affected on account of shortage of raw materials, erratic load-shedding and frequent failure and low pressure of gas supplies. Besides, recurring labour agitation held up production and despatches of finished products for several weeks at the Maniktala and Panihati factories. Despite higher sales, the company showed a fresh loss of Rs 10 lakhs, which lifted the accumulated loss to Rs 123 lakhs. Besides, arrears of preferential dividends amounted to Rs 7 lakhs.

SHREE VALLABH GLASS has started production at the straight and bent toughened glass plant set up at the Vallabh Vidyanagar factory. The unit established in the 'backward' area of Limkheda in Panchmal district of Gujarat for manufacture of superior quality raw materials required for manufacture of sheet glass has also gone into production. The company has secured a 'letter of intent' for production of special quality sheet glass near Boiser in Maharashtra. The project, estimated to cost Rs 769 lakhs, is proposed to be financed partly by borrowings from bankers and financial institutions and partly by increasing the share capital. Meanwhile, shareholders' approval is being sought to issue 24,962 equity shares of Rs 100 each at par as 'rights' on a one-for-four basis. The proceeds will be utilised to meet a portion of the expenditure incurred on modernisation of the sheet glass plant and to improve the company's debt/equity ratio. Although SVG had to experience all-round hike in costs and acute shortage of soda ash last year, its results have been a good deal better than in the previous year. While sales were a fourth higher, gross profit more than doubled. Equity dividend was raised by a point to 12 per cent, which was also payable proportionately on the 'rights' shares. The company fared well on the export front too and exported figured glass, wired glass, laminated safety glass and toughened glass to Singapore, Persian Gulf states, Indonesia, Iraq, Mauritius, Sri Lanka, etc.

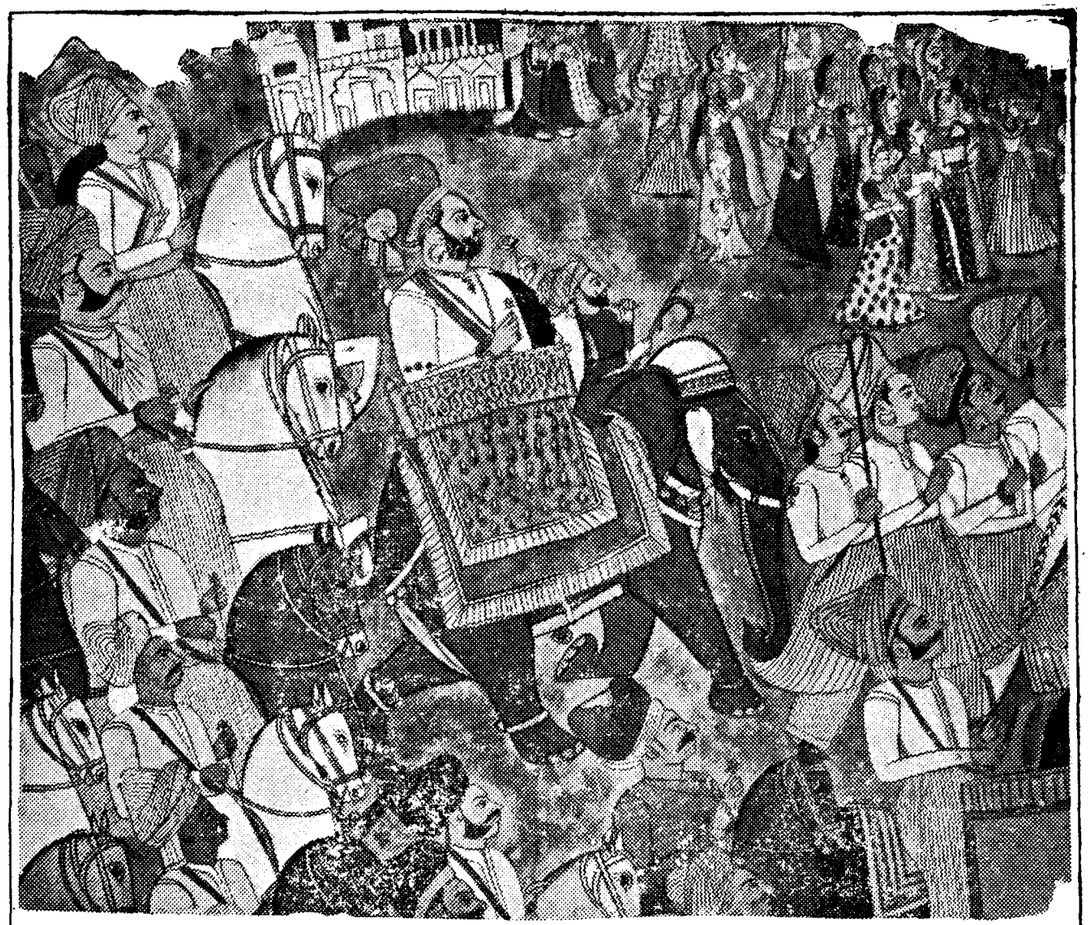
On Keeping Silent

EACH day brings news of a novel way in which our leaders have violated the law. Each day we hear of yet another norm that has been struck down. Each day brings news of a fresh scandal.

As the situation has worsened our leaders have become more audacious in violating laws, in flouting norms. Consider just a few events of the past months. Our leaders foist a fraudulent Plan on the people and then, with unabashed cynicism, bury it with hysterical shouts of world-wide inflation, of forces beyond our control. They discuss the resignation of an economist with cynical chants about how talk of realism is defeatist, of how "every dream shall become a reality and every reality a dream". They manipulate the appointment of the Chief Justice — confident that the episode will soon be forgotten. With a complete disregard for norms they pump scarce commodities into a state, sanction dubious projects for it, make reckless promises to every interest group within it (promises and outlays that ultimately leave the state bankrupt) — all to keep themselves in office. A state government manipulates restrictions on the movement of rice for a few days to enable its friends to make a killing. Another decrees a farcical ceiling on the price of wheat in Bombay and, three weeks later, lifts it — pushing jowar prices to astronomical heights and thus helping its friends, the large jowar farmers in the state. The same government abets wholesale adulteration of high quality seed. A newspaper press is burnt in one state. Instead of investigating the matter the state government heaps fresh financial difficulties on the paper. In another state another government shuts off power to a newspaper. And the Centre — instead of restraining these acts — conspires to have an editor dismissed. While all this is being done, of course, the PM assures a professor in distant Trivandrum that she is "against censorship, even in its mildest forms." Thousands upon thousands of young men and women are kept without trial in prisons while government spokesmen engage in a cynical game about "the correct number of those under detention". Corpses are found lying around in cities; horrible accounts pour in of men selling their wives and children, of mothers abandoning their children, of women collapsing within sight of ration shops and gruel kitchens. And government spokesmen play literary games — about the semantic difference between starvation ("on the one hand") and sundry maladies ("on the other"). One could go on and on.

As the situation has worsened, the perspectives of our leaders have changed in two ways. One, they no longer think of the distant future; they are just concerned about the next turn of events. Second, they think less and less about the country, about ultimate objectives, about institutions: their only thought is about staying in office. They rationalise this preoccupation with the argument that if they lose their offices, they lose all; that then they will have no way of ensuring that the country marches towards those luminous goals. Each of them — in the states even more visibly than at the Centre — is grabbing now: as if all are convinced that the game will be up soon and that, therefore, the only sensible thing to do is to grab whatever one can lay one's hands on. As our leaders are in this frame of mind, we can be certain that they will act without restraint, that cynical and authoritarian acts will soon be the order of the day.

Times of crises such as the present one impose a great reesponsibility on each of us. For the real tragedy of such times — and the real cause of the drift into an authoritarian nightmare — is not that a few leaders become rapacious, that they start breaking laws, disregarding norms or destroying institutions. Rather it is that common men remain silent, that we acquiesce.



Each of us rationalises his silence in many ways. We should bare these arguments so that they are seen to be what they are — specious alibis.

The first of these is a plea of helplessness: "what is the use of my speaking out, of my not going along; what can protest by one individual accomplish?" Each of us must realise that our leaders — whether they be in politics or administration or business — work with your hands and mine: their evil is wrought with our hands. We — as officials — collect money for them. We — as industrialists — contribute to their coffers. We — as workers — adulterate goods for our employers. We — as economists — work assiduously to make the politician's lies seem plausible. If a colleague is dismissed we — as professionals — manoeuvre to get his place.

In a very real sense, therefore, the country is not being undermined by a handful of leaders or business tycoons. The higher a person is in the hierarchy the cleaner he keeps his hands, the better sterilised his chambers. The minions — you and me — are the ones who do the dirty work. And this is precisely the reason why we are not as helpless as the first alibi would have us believe and why our protest and non-cooperation will not be inconsequential.

The second alibi is somewhat more assertive: "but how can I be sure that the things you say are true? How do I really know who is behind the ouster of that editor? Where is the *evidence*?" By a curious irony, the leaders use this alibi for not moving against their corrupt colleagues — they allege that they too lack specific evidence of wrong doing. How hollow their words sound when they plead their helplessness thus. And yet so many of us employ the same alibi to justify our silence, to go on as if nothing were happening around us. We can assess the true worth of the alibi by recalling how it was used by millions in Japan to shut their eyes to the rise of militarists in the 1920s and 1930s and in Germany to ignore the things that the Nazis were doing.

"But surely the government must have its reasons; it must know things that it cannot reveal, that you and I do not know." This too has been a highly serviceable alibi. It is one of the favourite devices of government propagandists when they are eager — as they almost always are — to snatch the benefit of doubt for themselves. A vague hint about the victim being a "foreign agent", some whispers about the conspiracies of foreign powers who do not approve of "our socialism" (our socialism? my foot — it is the laughing stock of the world), a hint or two about his "communal leanings". Yet citizens the world over have learned again and again that governments never know more than they reveal. They know much less. The Americans are the latest to have been taught this lesson again: their presidents and governments kept assuring them that there was more to the Vietnam war than they could reveal. Hardly a day passed when "national security" was not invoked as a reason for demanding the trust of the people. In retrospect we can see what a massive hoax it all

We carry our countrymen a little faster and more comfortably these days.

Respecting a rich heritage and improving upon it has always been an M & M tradition. From the versatile 'Jeep' to electronics to defence, we try to make life a little better, a trifle easier for our people. Because, for us, just to be part of the Indian mainstream of life is sufficient reason for all we do. To work together. To carry ourselves just that little further every day. So our country can stand proud among the nations of the world.

was. We can see how wrong were the people who kept quiet on the plea that "the government must know things that you and I don't". And we can now see the terrible cost of their silence.

"But, listen, why are you getting so worked up about this latest step? All this has been going on for a long while. I mean, why are you so excited about the fact that an editor has been fired? After all — let's face it — we have never really had a free press. Nothing new has happened. It is just that you are learning the facts of life for the first time." This is a much more sinister alibi — for at single moment it seems quite plausible. Each new violation builds upon others that have preceded it and thus seems to be just a minor extension of things to which all are already accustomed. Yet it is no more defensible for that reason: even as we reassure ourselves that the latest pebble rolling down the hillside does not really mark a qualitative change, that pebbles ("and much larger ones than that") have been rolling down for quite a while, suddenly one gives away and the avalanche starts, suddenly it is too late to run for cover.

To realise the full significance of an authoritarian act — one that violates norms and laws — one has to look ahead and speculate the end of the journey. In all probability the act itself involves only a handful of people and it is usually centred around a very special constellation of circumstances. The ouster of one editor, after all, involves only a few individuals. Yet its true significance transcends these individuals. In this particular instance it informs every two-penny politician in the country that he can do what he will for muzzling the press. It warns every editor that the government shall use means that are as devious as it thinks is necessary to win the forthcoming elections and, by god, if he prints anything about these he will go the way of the dismissed editor. Even more important than the inconvenience an authoritarian act causes its immediate victims and even more important than the signals it sends out to the others, each of these acts corrodes our conscience; it dulls our vigilance; it accustoms us to more tarnished norms, to lower standards. And in this way it prepares the way for the next — and more audacious — authoritarian act.

We are often lulled by the calm that follows each act. Soon the act fades in memory and in retrospect it always appears to have been inconsequential — "all that noise and fuss you made for just one editor; you see, don't you, how comfortably off he soon will be in his new job and even you must have noticed that the heavens have not fallen since he was fired". Yet the onlooker must realise that each act seems inconsequential in retrospect largely because it has since been buried amidst the clamour of even more audacious acts; that it has helped pave the way for these subsequent acts and that, therefore, in fact, it has been far from inconsequential.

"But surely you exaggerate; you are just extrapolating; how do you know things will go that far; we must retain a sense of proportion in these matters; a single step in one direction does not mean that we will persist to the end on that course." Yet we have learned again and again that once the authorities break a norm they use the new-found licence as much as they feel they need to for attaining their ends; and, as we noted earlier, as the situation worsens these ends become more and more parochial and the time-horizons become shorter and shorter. When leaders start violating norms the citizenry can be certain that such evils as are possible will indeed be foisted upon it by the leaders and that these will come to prevail in a shorter time than most reasonable men would think possible.

"But we must be patient. I agree that the act you mention is not quite in accordance with the spirit of the law. In fact, I will go along with you and say that it is unpardonable. But there is no reason to get excited about the whole thing. It is just a passing phase, I *know* them — I have known them for years. They are as dedicated to these ideals as you and I are. But after all, you will agree that they have to stay in office. If they lose the elections how will they work towards the ideals that you and I and they, ideals that all of us hold so dear? Listen, we have to be practical; we have to look the other way now and then. You just wait and see. Once they are assured a new five-year term, things will be entirely different." We should not fall for this low-means-but-high-ends deception: nor for the dedicated-but-helpless-leader bit. We do not need this bunch of ministers and "leaders" for attaining our goals, for ensuring well-being and freedom to our people. What we need for achieving these goals are the institutions, the norms and the values that the authoritarian acts of these "leaders" are destorying.

"But I am just an engineer. You are talking of things that are far wider than my job. You see, I am a specialist. I do the job I have been assigned. That's the limit of my duty. Our country isn't going to be saved by shouting about vague principles but by each one of us doing the job that has been assigned to him." The "specialist" who mouths this alibi is after the leaders' hearts: they love no one more than the quite cog. Yet it is surely obvious by now that the labours of each of us will be set to naught by the erosion of our polity. For each of us to "busy himself with the task at hand" is quite the most certain way of committing collective suicide. Thus, even as each of us does his job he must concern himself with and devote time to the larger issues — he must assess the large consequences of his acts and the larger consequences of the acts of others.

This brings us to the final alibi: "but I have to keep my job; I have a family to support". There are many responses to this. For one thing, it just does not wash for many of us: many of us who aid and abet wrongdoing are well off, we can get other jobs than the one we hold at present. For another, it is almost always possible to retain one's job and yet refuse to be an accomplice: the only cost may be a transfer or that one loses one's chance of a "promotion". Surely, in times such as these, the lures of a large city or of a larger name-plate are not worthy pursuits. How can we put them in a scale against the interests of our country, the survival of norms and institutions in our polity? But in a vital sense all these partial responses skirt the issue.

The basic point is the following one: even if the consequence of standing up today is that we may lose our jobs we should not think of this as a cost. A flood threatens us. If each of us busies himself with grabbing what he can, with gathering together and stuffing his possessions into his little sackcloth so that he may make a run for his life when the time comes; if each of us busies himself in this rather than in helping to strengthen the embankments, all of us shall surely be swept away — we, our families and all those stuffed sackcloths. We must think of our polity and of our country now. It is already very late and entities much larger than ourselves or our families are at stake. We must heed Iqbal:

Vatan ka fikr kar nadan, musibut ane wali hai, Teri barbadiyon ke mashwaren hain asmanon men.

FROM OUR CORRESPONDENTS

LABOUR

Workers' Conferences without Workers

IT is remarkable that few workers participate actively in the proceedings of or speak at the various workers' and trade union conferences organised from time to time. Thus not one industrial worker spoke from the rostrum of the Maharashtra Workers' Anti-Wage Freeze Nirdhar (Determination) Conference at Poona on October 13. Over 3,000 workers and trade unionists, half of them from Bombay, heard some 20-odd 'leaders' for five hours and voted for a state-wide token general strike and gherao of all government offices on October 30.

The conference was convened by the Maharashtra Trade Unions Joint Action Committee (composed of representatives of HMS, BMS, HMP, CITU, AITUC, Sarva Shramik Sangh and some white-collar unions). The conference was held in pursuance of the decision of the All-India Working People's Convention Against the Wage Freeze, held in New Delhi on August 28, to organise such conferences in all the major states in order to mobilise the working class against the wage freeze.

The Poona conference, however, differed from the Delhi convention in two respects. First, the AITUC which had boycotted the Delhi convention — branded by it as being "politically motivated" and specifically directed against the CPI-led Ministry in Kerala — participated in the Poona conference. Second, despite its confused and populist demands, the Poona conference did not appeal to the government to open a dialogue with the trade unions "for evolving such policies as would take the country out of the present crisis" — which had been the principal demand of the Delhi convention.

These differences are, however, formal and marginal. The AITUC's participation, for example, means very little in real terms. In Bombay and in the rest of Maharashtra it is a declining force with little support among workers — including among textile workers, at one time its strong base. The AITUC is, therefore, relatively inconsequential so far as mobilising the mass of workers for a general strike is concerned.

Similarly, despite its eschewal of an appeal to the government to open a dialogue with the trade unions, the charter of demands, the resolutions and the policy statements issued by the Poona conference are not very different in spirit from those issued by the Delhi meeting. Both concentrate on making alternative policy recommendations to the government: measures against foreign and monopoly capital, against hoarding, blackmarketing and smuggling, for a moratorium on all foreign loans, for the redistribution of land to the landless, for demonetisation of higher-denomination notes, for the implementation of tax laws, for "the abolition of corruption" (!), etc. These demands have nothing to do with a working class strategy in a period of capital crisis. Besides, they signify a complete retreat from the programme of the People's Conference organised by the Left in Maharashtra in March this year which had emphasised such demands as the distribution of 12 kilos of foodgrains per person per month at reduced prices, a minimum wage of Rs 8 per day for all workers linked to the consumer price index at 1,000, unemployment benefits, etc. In fact, even the demand for the abolition of the wage freeze, which was supposed to be the main issue before the Poona conference, was subordinated to the so-called "people's demands" mentioned above.

The demagogic oratory at Poona concentrated upon smuggling, black money and corruption. All the important Maharashtra-level leaders of the Opposition parties spoke. More (HMP-SP) made a thundering inaugural speech, Dhume (AITUC-CPI) proposed the Resolution, Kurane (CITU-CPM) supported him, Thengdi (BMS-Jan Sangh) lashed out at the Congress party, Khanolkar (HMS) defended the Resolution, Chavan (Sarva Shramik Sangh-LNP) summed up the discussion (or, more appropriately, the speeches) and made another speech against foreign capital, and so on. Not a single leader attempted to explain the wage freeze itself — why it had become necessary and possible for the government to freeze wages since August and how concretely the workers could fight the freeze. Of course, everyone declared himself against the wage freeze — notwithstanding the fact that some of them had demanded an 'incomes policy' in May — and against the 'anti-labour policy' of the government. No one, however, suggested or even hinted at a working class strategy and plan for a protracted struggle against the wage freeze, apart from the token strike on October 30.

That such sporadic actions against the government's 'anti-labour' policies tend to defuse the potential for struggle among the militant elements of the workers, that symbolic protests are no longer sufficient, that a concerted programme of education, organisation and agitation among the working class is absolutely indispensable seemed completely to escape the attention of the leaders. Their response to the workers' resistance to the plan for "another of those bandhs" and to their demand for a clear programme for the post-October 30 period was purely defensive speech-making interspersed with such meaningless phrases as "offence is our best defence", etc. They had to declare themselves in agreement with the view, prevalent among the rank-and-file militants, that all bandhs over the past year had been sterile; yet they weakly asserted that this one would be different from the rest because it was a 'strike' not a 'bandh'!

All the important leaders, speaking with fervour maintained that this would be "the last, the final struggle" and emphasised repeatedly their determination to start the struggle against the present regime and for replacing it with a "people's government", whatever that may mean. Besides the main resolution on the strike, two hurriedly drafted resolutions were passed at the conference — one somewhat irresolutely condemning the government's all-round assaults on democratic freedom and the other calling for a minimum bonus of 10 per cent for all workers.

The militants' discontent with the bankrupt programme of "struggle" under the banner of the Joint Action Committee (JAC) and their lack of faith in the leadership was expressed by the white-collar unionists, the only real workers who spoke. Some of the insurance employees' union officials criticised the JAC leaders for their 'tail-ism', their demagoguery, their bureaucratic functioning, the vacuous character of their support to the Railway strike, their lack of unity and their failure to give the working class a real proletarian programme. They demanded an assurance from the leaders that the JAC was serious about continuing the agitation against the wage freeze after October 30. They argued that such an assurance was absolutely essential because their own unions were far more democratic than the big national federations and made commitments only after a series of discussions among their rank-and-file and that their members' eagerness to participate in the JAC programmes would be conditional upon such an assurance.

The white-collar militants also exposed the "myth" that the Poona conference was "organised democratically". For this, they were fiercely attacked by such stalwarts of the trade union bureaucracy as V R Khanolkar (HMS). Otherwise an avowed anti-communist, Khanolkar mustered all his skills to defend the trade union bureaucracy of the JAC. He ridiculed the suggestion that the conference had not been organised democratically. After all, had not the workers' own chosen leaders collectively decided to hold it? Further, it was stupid to demand a plan of action after October 20; such a plan would emerge, the leaders would discuss it...

Khanolkar's speech demonstrated that, despite its internal tensions and differences, the JAC bureaucracy will always unite to crush any Left-wing criticism of its programmes, perspectives and methods. A sign that the more militant elements are beginning to see through this game was the big applause the white-collar unionists received in contrast to the hostility of the audience to Khanolkar who was heckled and hooted. The extent of democratic decision-making permitted by the trade union bureaucracy is evident from the fact that, prior to the conference, not a single major federation had discussed the programme and the draft resolution among its rank-and-file, that at the conference itself no worker was allowed to address the gathering despite repeated requests by some and that the audience did not participate proceedings.

If the Public Rally at Shaniwarwada after the Delegates' Conference on the evening of October 13 was any indication of the seriousness of the JAC about its own programme, then the JAC failed the test miserably. There had been no systematic campaign of publicity and agitation among workers in Poona; as a result, a pathetically small number of industrial workers were mobilised for the rally. The audience at the rally was largely composed of two components, roughly equal: the delegates to the conference and an inchoate petty bourgeois mass of strollers, etc, which frequents the Shaniwarwada maidan on Sunday evenings.

The Poona conference reflects the crisis of the Indian Left and the sterility of its strategy. First, incapable of building a working class cadre and of sustained political agitation among the working class, the Left has to fall back upon "the people" and "the people's demands". Secondly, having failed to organise the working class under its own banner, the Left has to rely wholly on trade unions which are given the status of political organisations and the role of the vanguard in the struggle against the present 'anti-labour' government and for the establishment of a "people's government". Finally, unable to mobilise the working class through the trade unions under its control, the Left has been forced to ally with the BMS and HMS in a vain attempt to defend its credibility among the working class.

While this is true of all the Left parties, it applies with particular emphasis to the CPI(M). The initiative for the Delhi and Poona conferences was taken mainly by the CITU and the programmes, policy statements, etc, were drawn up at its initiative. The CITU-BMS-HMP bloc essentially reflects the political alliance among the CPI(M), Jan Sangh and the SP that is being forged since before the Railway strike. The other unions in the in the JAC are vacillating allies, except the Sarva Shramik Sangh to an extent. The JAC can scarcely conceal the fragility of the underlying political alliance of such diverse elements as the CPI(M), LNP, CPI, SP, Jan Sangh and PWP.

However, despite the instability of this alliance, the likelihood of half-hearted participation by the working class and the high probability that the JAC leaders, in alliance with the police, will succeed in curbing the militancy of the working class, the October 30 strike will be of some significance. If it succeeds, it would be the first major act of resistance by workers to the wage freeze since its imposition on August 6. Till now the only protests by the working class have been either purely verbal or have taken the form of such impotent acts as refusal to accept the pay packet on pay day and collecting it the next day. Secondly, the October 30 action may be instrumental in catalysing the process of recovery of the working class from the demoralisation and passivity that it has been forced into since the defeat of the Railway strike and the imposition of the wage freeze.

Postscript (October 21): The bickering has already started. The AITUC and the CPI do not want the gherao of government offices on October 30. It is even possible that the AITUC may want to dissociate itself from the entire programme of the JAC for the 30th, though at Poona it was Dhume of the AITUC who had proposed the programme.

NEW DELHI

The Recession Scare

B M

IF the newspaper headlines are to be believed, the textile industry has agreed, under the pursuasion of the Commerce Ministry, to slash cloth prices by as much as 10 to 40 per cent. This was the pie in the sky promised by the Ministry at the end of the meeting of the Consultative Committee of MPs this week. It was a clever move. After making such a generous gesture, the industry would appear to the public as deserving of all support to get over the 'recession' that has allegedly hit it. Some of the mills also agreed to revive their third shifts which they had earlier closed down.

But what exactly does the offer of price reduction by the industry amount to? All that the industry had apparently offered to do was to sell at a discount from the mills' retail outlets. The discounts will be mainly on the superfine and higher-priced varieties. The mills' retail shops are located mainly in the large and medium urban centres and sales through these outlets cannot possibly be more than a fraction of the total sale of cloth in the country.

After the press was told that the industry had agreed to cut prices, it was also informed that a special meeting of the industry with the Reserve Bank had been arranged to make available credit to the industry at various points in order to help it out of the 'recession'. The Commerce Ministry has apparently taken it upon itself to push the industry's case for easing of the credit restraints.

But what is this so-called 'recession' that the textile industry is talking about? Even if the industry's claims about decline in cloth prices and accu-

ASHOK LEYLAND puts FUEL ECONOMY in top gear!

'Overdrive' for COMET Buses to save up to 15% diesel!

What is 'Overdrive'? It is an optional fitment in the gear train of Ashok Leyland COMET Buses.

The Benefits? At highway speeds, the 'Overdrive' can save you up to 15% in diesel consumption. Moreover, the engine wear-and-tear will be much less.

Pays for itself: In diesel savings alone, the 'Overdrive' pays for itself in about 2 months.

Already trusted: Hundreds of COMET Buses—with State Transport Undertakings and private operators—are already fitted with 'Overdrive.' Their savings are remarkable. Why not yours, too?

Specify that your new COMET Bus chassis should have an 'Overdrive' fitted. You can also get it fitted on your existing vehicle.

CONTACT YOUR NEAREST ASHOK LEYLAND DEALER!

ASHOK LEYLAND

Ashok Leyland Ltd.
Madras

FDS AL 2076A

People on the right track have a one truck mind—always Ashok Leyland

mulation of stocks of cloth are accepted, the picture that emerges is not one of recession. Cloth prices, especially prices of the better varieties, have risen very sharply in the last two years and mills have been making very high profits. All that has happened is an arresting of the rising trend of prices. Partly this may be the result of some market resistance to the continuous price increases; partly this may be due to some temporary dislocation in the cloth trade's financial arrangements as a result of the ebb and flow of black money. Yet another possibility is that the textile industry and trade may together be indulging in some scarcemongering to beat down the price of cotton at the beginning of the cotton marketing season. Whatever the explanation, it is evident that there is no case whatsoever for any relaxation of credit policy. On the contrary, the monetary authorities should so use the credit instrument as to ensure that the declining trend in cloth prices is strengthened and the price fall extended to all the varieties of cloth. Instead, what seems to be happening is that at the first faint sign of any fall in prices, the Commerce Ministry is rushing to the industry's assistance.

It is not in the case of the textile industry alone that grave anxiety is being expressed about the threat of a recession. The cry is going up everywhere that credit policy must be relaxed so that the threatened recession is averted and production maintained. The Finance Ministry, under the stewardship of C Subramaniam, seems to be most concerned about the threat. Subramaniam is showing keen interest in the credit policy for the coming busy season.

It is indeed remarkable that a slight easing of the upward trend in prices of some commodities should be considered such a grave matter, especially when arresting the inflation had been given such a high priority in the government's policies. Equally remarkable is the fact that the recession should be attributed entirely to the so-called credit squeeze which, again, till recently was regarded as the most potent weapon for managing demand and controlling the inflation. The behaviour of prices too is seen in a distorted light. It is ignored that in almost every case the consumer has still felt no relief as a result of the alleged break in the price rise and that the decline in prices has touched the retail level only in very few cases.

The fact is that the downward trend in prices of several commodities has not begun to be reflected even in the wholesale price index. In the compilation of the index, controlled prices, wherever applicable, get a heavy weightage and insofar as such articles as sugar, foodgrains, cement and steel are concerned, the authorised market prices as distinct from the actual prices that prevail are taken into account. Such fall in prices as has taken place has been in relation to the dizzy heights to which the actual market prices of these commodities had risen. The recession jitters are, therefore, largely contrived so as to extract fresh concessions from the government. Judging by the Commerce Ministry's response to the textile industry's cries of distress, the government does not appear to be at all reluctant to be pressurised in this manner.

GUJARAT

How Officials Sabotage Land Reform

THE Tenancy Act has been in force in Gujarat for the last 30-35 years and the Land Ceiling Act for nearly 15 years. In March last year the Tenancy Act was further amended with a view to (1) restoring the rights of tenants to purchase the land they were tilling which the tenants had forfeited for one reason or another; (2) preventing landlords from offering inducements to tenants to part with their lands against the law; and (3) reducing the number of absentee landlords.

Though on paper the laws appear very favourable to tenants, their enforcement depends on whether the names of the landlords and the tenants are correctly registered in the title deeds and the government records. Following widespread complaints that the village Talatis' records do not show the correct position in this regard, the Government of Gujarat had appointed a team of eight officials to go from village to village and collect data with a view to updating the records.

This team has finished its work in 12 districts. In these 12 districts it has found that there are 36,553 tenants whose names have been deleted from the records even though they are still tilling the land. Besides as many as 1,21,490 farmers had not applied for registration as tenants. Though these farmers are tilling the land, the records show the landlords as the tillers. As a result, the real tiller is forced to part with as much as half his crop or, worse still, is treated as an ordinary agricultural labourer.

The village-level officials have been assigned a crucial role in the implementation of tenancy legislation. Repeated experience has, however, shown that as a rule these functionaries openly collude with landlords to deprive the tenants of the benefits of the laws enacted for their protection. A few instances, which are typical of thousands of cases, are described below.

An Adivasi tenant of village Andhasi in Valod taluka had been tilling a plot of land measuring about 15 bighas for nearly 20 years. He gave this information to the team of officials appointed by the government to collect data on tenancy and related matters in the presence of the landlord, a Rajput. The other tenants of this landlord, fearing harassment, had decided not to appear before the team of officials. The sons of the landlord, who were present at this meeting, claimed that they and not the adivasi were the real tenants. The next day the landlord took possession of the land. The tenant filed a complaint with the Mamlatdar at Valod. The landlord in turn filed a criminal complaint with the police sub-inspector against the tenant. The police officer visited the village. In spite of the fact that the sarpanch endorsed the tenant's claim, the tenant was taken into custody, severely beaten and locked up for three days. After his release, the tenant again complained to the Mamlatdar and obtained a stay order from the Prant Adhikari. The landlord obtained a stay order against this from the Court, put pressure on the Prant Adhikari to cancel his order and took possession of the land once again. The tenant finally appealed to the Tribunal and got a fresh stay order against the landlord.

Clearly, it is impossible for most tenants to engage in such protracted litigation. In this particular case, it was possible for the adivasi tenant to do so because he was helped by a team of volunteers at their own expense. For doing so, these volunteers are being harassed by the police in all possible ways and cases of breach of peace have been filed against them. For the last three months they are being hauled up before different courts.

In another case, village Daduria, also in Valod taluka, a tenant had been tilling the land of a Desai landlord for 15 years. Fearing that he might soon lose his land to the tenant, he sold it to another Desai. Of course, he would not sell the land openly; so he made the sale secretly with the help

of the Mamlatdar by getting the name of the purchaser-landlord registered as the tenant in the government records. When the purchaser came to take possession of the land, the actual tenant, again with the help of the team of volunteers referred to above, sought the help of the Mamlatdar, but the Mamlatdar said that he could do nothing in the matter. When the sowing season came, the original tenant started sowing on one side of the field and the usurper on the other. One day there was an altercation between the two. The police have arrested the actual tenant and put him in custody, while the usurper has been left free to till the land. The team of volunteers is trying to appeal to the Prant Adhikari on behalf of the tenant; failing this, it hopes to appeal to the Tribunal.

Another case is that of a tenant in Andhasands village in Vyara taluka. Here the tenant had been tilling the land of a Parsi landlord for two generations. However, following differences with this tenant, the Parsi landlord got the name of another tenant registered in the official records with the help of the Talati, though no attempt was made to evict the actual tenant. This year, however, the tenant was informed by the Talati that he was no longer a tenant and the new tenant, whose name had been fraudulently registered in the records, was asked to take possession of the land. As a result, both the original tenant and the new tenant started to sow the land. An appeal was filed in the regular course with the Prant Adhikari who somehow got the original tenant to put his thumb impression on a declaration that he had never tilled that particular plot of land. On the strength of this declaration, he dismissed the tenant's appeal. The team of volunteers took the tenant to Ahmedabad to file an appeal with the Tribunal. Fortunately, Madhavlal Solanki, former Revenue Minister and the author of the Tenancy Act, agreed to represent him without charging any fees. He has assured the tenant that he will get him his land back. Once again, however, how many tenants, threatened with dispossession, will be fortunate to find such a powerful backer?

How corrupt officials harass poor tenants will be seen also from the following incident which occurred at Veippi. The tenant of a landlord who had settled in Africa had been tilling the land for 20 years. When he applied for possession of the land, one small plot of land, where only grass was being grown was allotted to him by the Mamlatdar who allotted the rest of the land where other crops were grown to the absentee landlord. The tenant filed an appeal. He was called several times by the appeal officer but was never allowed to present his case. Finally, without hearing him, the appeal officer passed an order that "the tenant having failed to appear, in spite of repeated summons, his appeal is dismissed". He went further and even cancelled the Mamlatdar's allotment of the grass land on the ground that the transfer of the land was illegal. He, therefore, ordered the entire land to be handed over to the landlord. The tenant has filed an appeal with the Tribunal with the help of the team of volunteers. He is, however, too poor to live in a city like Ahmedabad and there is no knowing when his appeal will come up for hearing.

There is no end to the list of similar glaring instances of injustice and oppression. The Tenancy Act, however well meant, has turned out to be costly and oppressive for the tenants and a veritable source of livelihood for lawyers. Those who try to help the tenants are involved in various police cases which go on indefinitely from one adjournment to another. In the last six months 2,000 cases involving tenants have been registered in Valod taluka alone and most of them are still lying unheard. There is a proposal to collect the details of all such cases with a view to making a direct appeal to the Governor.

MAHARASHTRA

Government's War on Adivasis

Sharad Patil

THREE-QUARTERS of the rural population of Maharashtra consists of agricultural labourers and poor peasants. There are 54.3 lakh agricultural labourers in Maharashtra, constituting 27 per cent of the population. Tribals comprise a very large proportion of agricultural labourers. The tribal population of the state is 29.54 lakhs. The tribals are not untouchables, but they are by far the most oppressed section of the population. The overwhelming majority of them are extremely backward and unorganised. The staff of the Arts and Commerce College at Sakri, in their report on "The Character, Range and Intensity of the Famine in Sakri Taluka, 1972-73", estimated the per capita average monthly expenditure of adivasis in Sakri taluka in Dhulia district to be Rs 8.50, which may be put roughly at one-fourth of the minimum required for bare subsistence.

Adivasis who fell into the clutches of sahu (non-adivasi) usurers before the enactment of the New Tenure of Land by the British at the turn of the century became agricultural labourers. Most of the rest of the adivasis became the 'asamis' of the sahu usurers — the rack-rented, debt-ridden and pauperised peasantry. Bribing the revenue bureaucracy liberally, the sahu usurers set the Act at nought and manoeuvred the alienation of the lands of adivasis on a large scale. There are 9,500 cases of alienation of lands in Dhulia district alone, out of which not less than half are those pertaining to the adivasis. The transformation of adivasis into rural proletarians through usury and then the 'primitive accumulation' through exploitation of these bound (engaged on yearly or monthly terms) and day labourers by the semi-feudal and semi-capitalist landlords and rich peasants constitutes the essence of the primary development of capitalism in the countryside.

It is largely as helpless victims that the adivasis come in contact with government schemes for development of agriculture. The various irrigation and water supply projects are a case in point. These projects being located in mountainous areas, those who are uprooted by them are inevitably the adivasis. About 10,000 families were displaced by the Ukai project alone in the talukas of Nawapur, Nandurbar, Akkalkuwa, Taloda and Shahada in Dhulia district. As the compensation given is usually in the form of cash and not alternative lands, the displaced adivasis go to swell the army of landless labourers.

Adivasi agricultural labourers and poor peasants get employment only for the duration of the agricultural season and that also on the most meagre of wages. Each year at the end of the agricultural season the bulk of the rural proletariat in Dhulia district abandons its hearth and home and migrates to Gujarat. Those who stay back survive by selling headloads of

fuel wood and grass, securing irregular employment, illicit distillation and prostitution. Even then, right up to the ripening of corn in their tiny plots of land or in the fields of the sahus, they have to live on wild roots and grain, Mahuwa flower, leaves, etc. A few years ago the Gandhi Smarak Samiti had conducted a sample survey of families belonging to the Bhil, Warli, Thakur and Tadvi tribes of Western Maharashtra. The Samiti found that during the lean months every year, more than three-quarters of these families subsisted on wild roots, while more than half were able to secure only one meal a day.

This inhuman life has taught the landless adivasis that it is only land that will make it possible for them to live like human beings. The big mass struggles for waste-land waged by the Adivasi Sewa Sangh and the Republican Party during the last two decades testify to this. But in most cases the initial impulse for the adivasis to 'encroach' on forest waste-land comes from the Forest Department, whose functionaries wish to increase their earnings. Adivasis who 'encroach' on forest waste-land are reduced to the position of virtual serfs of the Forest Department. Seizure of bullocks and agricultural implements at the time of cultivation, 'phala' (propitiation money) at sowing time, 'ira' (the 'share' of the Forest Department in the crop) at harvest time, 'pan-phul' (village-wise lump sum cash bribes), the inevitable 'panchnama', brokerage of the tout, 'chirimiri' (bribe for securing convenient date of hearing or for award of lighter sentence, etc, in cases involving real or fabricated offences) to clerks of the court, payment of fines or imprisonment every year, 'veth-bigar' (unpaid, forced labour), supply of meat and wine to the sahibs — all these are part of this serfdom.

According to the Collector of Dhulia, 'organised encroachment' has taken place on 10,000 acres of forest land in Sakri and Nawapur talukas of the district. This means that in these two talukas alone approximately 1,500 to 2,000 families of landless adivasis and non-adivasis live by cultivating forest land. For Dhulia district as a whole, a reasonable estimate would be that at least 3,500 to 4,000 landless labour families must be subsisting by cultivation of forest waste-lands. Thus the problem of forest waste-land has become a life and death issue for not less than 25,000 landless adivasis and non-adivasis in the district. If we take the districts of Dhulia, Nasik, Jalgaon and Chandrapur together, not less than 1.25 lakh landless adivasis and non-adivasis live by cultivating forest waste-lands.

Twenty per cent of the adivasis in Maharashtra live in Dhulia district. The total population of the district is 16.62 lakhs, out of which adivasis number 6.16 lakhs. It is because of this that the struggle for forest waste-land has assumed as explosive a character here as it had in Thana District.

The state government has sought to justify its organised campaign to evict adivasi and non-adivasi landless labourers from forest waste-lands on the ground that there has taken place a sharp decline in area under forests in the state. The state Minister for Forestry has contended that barely 18 per cent of the total area of the state was under forests as against the desirable minimum of 33 per cent. Government statistics, however, show that the total area under forests and land unfit for cultivation add up to 79 lakh hectares or nearly 26 per cent of the total area of the state.

More important, if the area under forests in the state has declined, the responsibility is primarily that of the state government itself. The policy of the government has been development of forests in words, but destruction of forests in deeds. The forests of the Kathi state in the Satpura ranges, now a part of Akkalkuwa taluka, ranked next only to those of the Dangs. However, forest contractor Nasarwanji Ankaleshwaria, the then District Congress President, C A Patil, now an MP, and the Forest Department combined to demolish this forest and render the Satpuras bald. The widow (then an MLA) of the Deputy Minister for Social Welfare, D N Padvi, was granted 60 acres of land carved out from standing forests. Lands belonging to Sarupsingh Mirya Naik, MLA from the Nawapur reserved constituency, and to his co-villagers hailing from Nawagaon, were submerged under the Ukai reservoir. They should have been given lands out of the vast area of Gujarat which benefited from the project. Instead, they were presented with 1,000 acres of the rich Devmogra forest after razing it clean. The Raymond Woollen Mills of Thana was similarly presented with 10,000 acres of the Laling forest land, a few miles away from Dhulia, for breeding Australian sheep. Capitalistic forest contractors, either on their own or through co-operative forest labour societies, have been hectically engaged in cutting down forests. It is due to such actions that over vast areas of supposedly forest land there have been no forests for many years before these areas are put to the plough by the landless as well as over vast tracts of so-called 'protected forests' still unscratched by the plough.

On the other hand, expansion of forests does not have to be over cultivable land. One of the richest forests in the country is that of the Dangs. It flourishes mostly on mountainous and uncultivable soil. Extensive development of forests can take place if the Maharashtra government took up afforestation of the vast denuded mountainous and uncultivable tracts of the state. Lakhs of rupees are spent every year by the Forest Department on planting forest trees, but they wither away because of lack of seriousness on the part of the government and shortage of personnel.

There is thus no basic conflict between the demand for land of the adivasi and non-adivasi landless and expansion of forests in the state. In fact, very large areas of supposedly forest land can be distributed among the landless without impairing the objective of development of forests. During his tour of Dhulia district in June this year, the state Home Minister, Sharad Pawar, admitted that 13,000 to 15,000 acres of forest land in Shahada and Taloda talukas could be distributed among the landless adivasis.

The real reason for the state government's campaign to evict the landless, mainly adivasis, from forest waste-land in Dhulia district may not thus be its concern for development of forests at all; instead it may be the Congress party's fear of losing its influence over the whole of the adivasi belt due to the rapidly increasing following of the CPI(M) and the Shramik Sanghatana. Local Congressmen had been persistently urging the Forest Minister, who is also in charge of Dhulia district, to crush the adivasi and other 'encroachers' on forest land together with their organisations. The brutality with which the operation has been carried out and the degree of force used suggest political motives on the part of the government.

The State Home Minister began a tour of the Shahada-Taloda area of Dhulia district on June 5, avowedly to establish amity between the landlords and the agricultural labourers. On that very day, 400 jawans of his Special Reserve Police struck camp at Visarwadi and proclaimed an undeclared war on the adivasi cultivators of forest waste-

lands in Nawapur taluka. A wave of terror involving indiscriminate beating of men and women, old and young, and looting spread from Nawapur to Sakri taluka.

In protest against this and against the repression unleashed by the landlords on the movement of agricultural labourers in the Shahada-Taloda area, the District Sangharsha Samiti organised a morcha of 6,000 rural and urban workers to the Collectorate on June 24. Apart from the common demands of the workers and peasants, the memorandum submitted by the Samiti to the Collector made the following demands: withdrawal of the SRP, punishment of the perpetrators of atrocities, withdrawal of politically-motivated cases, regularisation of the forest waste-lands brought under cultivation by the landless adivasis and non-adivasis and permitting them to till the lands at least for the current year.

The Collector held a press conference at Dhulia on July 1 in which he alleged that the CPI(M) had established a parallel government in Sakri and Nawapur talukas and had unleashed a reign of terror. He further declared that the government was determined to put down the encroachment on forest lands. This statement by the Collector was an attempt to cover up the atrocities committed by the SRP against the landless. It was also part of the preparation to intensify the repression. This was borne out by the pre-planned clash that was imposed upon the forest cultivators of Pankheda in Sakri taluka on July 9 by a posse of SRP and forest guards who went to Vanjankudi to uproot the Nagli seedling plots. In prearranged publicity to the incidents, it was claimed that a mob of hundreds of adivasis belonging to the CPI(M) had attacked the SRP and the forest guards and injured four SRP personnel seriously. After this barrage of propaganda, all the SRP personnel and forest guards of the area and armed constabulary from Dhulia were massed at Pimpalner, three miles from Pankheda, and waves of attacks were launched daily from July 11 onwards on the villages of Vanjarkudi, Chinchpada, Vaki, Kalikhet and Bodhra. Everybody who was caught was beaten up ruthlessly; neither women nor children nor aged were spared. Bayonets were thrust into the mouths of children crying with fright. The villagers took refuge in the forest and stayed on there in pouring rain. The villages were deserted.

It is against this background that five leaders of the Maharashtra State Sangharsh Samiti — representing the CPI(M), SP, PWP, the Red Flag Party and the CPI — toured the repression-torn areas of Dhulia from July 17 to 27. The team paid a visit to the Vanjarkudi-Chinchpada area of Pankheda on July 17 and heard the accounts of the victims of SRP atrocities. Addressing a big public meeting of forest cultivators of the taluka at Sakri on July 17, the leaders assured them of the support of the common people of the whole of Maharashtra. On July 18 a batch of 326 landless adivasis and non-adivasis, including 104 women offered satyagraha before the Sakri Tehsil office by breaking section 144. They were sentenced to 15 days' rigorous imprisonment. The leaders then proceeded to Nawapur; on the way they saw the SRP camps at Dahiwel (Sakri taluka) and Visarwadi (Nawapur taluka) and the destruction of Nagli seedling plots at Dukkarzira (Sakri taluka). Landless adivasis from all over the taluka flocked to a public meeting at Nawapur. The victims of SRP atrocities related their tales of suffering after meeting. A batch of 134 landless adivasis, including 45 women, offered satyagraha before the Nawapur tehsil office on July 19. They were sentenced to 20 days' RI. Tumultuous public meetings took place at Wadala (Shahada taluka) and in Shahada proper on July 19. Led by the Shramik Sanghatana, 1,599 men and 285 women participated in the satyagrahas in Shahada, Taloda and Nandurbar talukas on July 20 and 21. In all 2,344 landless adivasis and non-adivasis, including 434 women, took part in this civil disobedience movement. Of these, 957 satyagrahis, including 282 women, underwent sentences ranging from five days' to one month's RI.

The leaders addressed a press conference at which they issued a statement demanding (1) dismissal of the officers responsible for making the charge of parallel government; (2) immediate withdrawal of the SRP; (3) regularisation of the forest waste-lands cultivated by the landless; and (4) development of forests with the co-operation of the adivasis. At a crowded public meeting, the leaders attacked the semi-fascist repression unleashed by the government on the landless and appealed to the citizens of Dhulia to actively support the struggle of their adivasi brethren.

But instead of reconsidering its policies, the government intensified the repression. The adivasi chairman of the Sakri Taluka Panchayat Samiti, Reshma Bhoye, and other local Congressmen spearheaded a campaign to completely destroy crops raised by adivasis on forest lands. The campaign soon spread to the non-adivasi talukas of Dhulia and Nasik districts. On August 15, the 28th anniversary of Independence, the SRP beat up Raghu Daga Bhil, an adivasi forest cultivator of Morena, a village three miles away from Dhulia, so inhumanly that one of his hands was fractured. The District Sangharsha Samiti took out a morcha of the landless of Dhulia taluka and demonstrated before the Collectorate on August 21. In spite of the complaint lodged against the SRP and the assurance given by the Collector to the morcha, none of the SRP personnel recognised by Raghu Bhil in the identification parade has been arrested uptill now, while five adivasi women (one of them very old) and 20 adivasi men have been arrested in the Pankheda case and have been charged with 'assault to murder government employees', etc. Prominent workers of the CPI(M) have been deliberately implicated in the case.

It has also become clear beyond doubt that the use of SRP is not going to be restricted to suppression of the nascent movement for forest waste-land in the area, but is to be extended to suppression of the powerful movement of agricultural labourers. The Collector had stated in his press interview on July 1 that there was no problem of encroachment in the Shahada-Taloda area. The State Home Minister, Sharad Pawar, had also declared in the Legislative Assembly on August 26 that the SRP had been stationed in Shahada area for defending the adivasis against oppression by the landlords. However, on September 5, Kirsingh More, a prominent adivasi worker of the Shramik Sanghatana, was ruthlessly beaten by the SRP at Rampur, in Shahada Taluka.

Sharad Pawar had announced on the floor of the Legislative Assembly on August 2 that the government had decided to raise two new units of SRP in order to post them in the districts of Dhulia, Nasik and Jalgaon. He got a supplementary demand of Rs 7.87 lakhs passed for recruiting these units. The Minister had then boasted that his government had accepted the challenge of the CPI(M) in Dhulia district. In pursuance of this boast, the government is proceeding to transform Dhulia district into a semi-military camp.

INTERNATIONAL AFFAIRS

Peaceful Co-dominance

G P D

DETENTE is the word. It's a hot favourite of the powerful ones of the international system. In plain English, it means a series of deals that the super powers have struck with each other in recent years. In 1972, for example, the two super powers were busy either negotiating a deal or signing one every week of the year practically. Old-time notions of 'balance of power' have now been replaced by 'detente', in much the same way as 'colonialism' has been replaced by 'neo-colonialism'. The terms have changed, at times even the actors have changed, but the essence has not.

Not very long ago 'peaceful co-existence' was the term everybody was talking about. From 1957 to 1964 there was an interesting and lively polemic between the Chinese and the Soviets on the subject. It then appeared that there was a common belief shared by both Khrushchev and Mao that they were living in a world of fundamentally incompatible social systems. They had to so devise their strategies that the interests of the socialist camp were not jeopardised. The debate was bitter, noisy and even acrimonious. Curiously, it still gave an impression that it was an intra-camp debate. If the comrades appeared to be at each other's throats, it was in the pursuit of objectives which they thought they shared. The goals were clear. In many ways the peaceful co-existence doctrine was a sophisticated and improved version of the 'two-camps' doctrine. If the connection was not clearly seen, it was because Khrushchev's famous fulminations at the 1956 Congress of the CPSU had made Stalin taboo.

Stalinism Diluted

In any case, the signs of the changing Soviet strategies were already visible in the last work of Stalin on the economic problems of the USSR. Khrushchev only picked up the thread. Neither the Chinese nor the Soviets would like the Khrushchev phase in Soviet foreign policy to be described as Stalinism without Stalin. It was, of course, Stalinism diluted, made a little attractive. That difference probably had something to do with the personalities of the Georgian and the Ukranian. In retrospect, it is possible to argue that had it not been for the state of agriculture in the USSR and the Cuban episode of 1962, Khrushchev's foreign policy would have remained one of "peaceful co-existence between differing social systems". The agricultural imports played a dominant role in Khrushchev's calculations.

Opposite Conclusions

Khrushchev also believed in Soviet power. This belief is in many ways the starting point of the Sino-Soviet polemics. Back in 1958, Mao and Khrushchev drew two opposite conclusions from the power of the socialist camp. Mao seemed to believe that the socialist camp had now enough power to stand on its own and that the West wind would have to lie low before the mighty East wind. Khrushchev, on the other hand, reckoned that the power of the socialist camp was mainly defensive in character. What mattered to him most at that time was the fear that an armed confrontation between the two camps, ending in a nuclear catastrophe, would ruin the beautiful socialist world. This fear resulted in the Camp David talks between Khrushchev and Eisenhower in 1954. Even before Khrushchev knew it, the power relationship between the two camps became the power relationship between the two states. It was inevitable that the power of the socialist camp should be in reality the power of the Soviet Union. Similarly, the Gaullist challenge notwithstanding, the US had already become the dominant power of the Western camp. The Soviet-American relationship was, and still is, the central relationship of international politics of our times.

During the ten years since Khrushchev's fall, this relationship and its central, crucial role have been further consolidated. What was peaceful co-existence between different social systems has now inevitably become peaceful co-existence between the two states. It is, in fact, more than just co-existence. Peaceful co-existence has become 'peaceful co-dominance' of the world at large. The Americans call it 'detente'. The early signs of this development were visible in Khrushchev's days. But, largely, it is a contribution of Comrade Brezhnev and his colleagues in the system, President Nixon and Henry Kissinger. It is not as though the Soviets do not use the term peaceful co-existence any longer. Far from it. They cling to it tenaciously. The term has not changed; the essence has.

Kissinger is in Moscow now to assure his Soviet comrades that although, because of the dirty Democrats' conspiracy, their esteemed colleague Richard Nixon has had to quit office, they have nothing to fear from his successor in the White House. A wheat deal cancelled, he would tell them, is only a wheat deal halved. The other half might be needed by the progressive section of the national bourgeoisie in India, which, as Brezhnev would understand, is a firm ally of the Soviet Union. It does not behove a good detente statesman to pretend that one's ally is not the other's too.

Tricky Problem

Then there is the tricky problem of the weapons systems. The armies, navies and air forces of the two states should equip themselves with almost everything that technology can invent. But in so doing they should not tread on each other's toes. Kissinger has said that detente is not a final state one arrives at; it is a dynamic process. He could not have described it better. The weapons systems provide the most elaborate example of that process. It is there that both the super powers have to agree on how much they plan to expand. They have also got to agree on the areas in which either power will have a lead. The first condition of successful co-dominance is that both powers should agree that in terms of weapons systems neither will try to be heavier than the other, for in that case the delicate structure of detente would collapse. We can safely predict that for quite some time to come the thrust of Soviet-American relations will be dominated by very intricate negotiations on arms control. There is also another factor. Both powers will have to ensure that the rest of the countries continue to prefer to destroy one another with weapons which are 'obsolete' by super power standards. As long as the Arabs and the Israelis, the Indians and the Pakistanis, the Iranians and the Iraqis and so on and on, continue to take delight in killing each other with weapons which are a step or two removed from super power standards, there is not much to worry about the world.

Conflict-management is thus closely

related to weapons systems. The most important precondition for successful conflict-management is, as the last Arab-Israeli war showed, that the principal combatants should be in the main dependent upon the super powers for their supplies. American-Soviet diplomacy has to be geared to sorting out these problems. There is that tricky Cyprus problem. The Middle-East scene is also not tidied up yet. These are, however, problems which are bound to crop up from time to time. After all, detente does not mean that mutual suspicions or contradictions have withered away. Like the good power politician that he is, Kissinger knows well that they will not wither away till the state itself does. Brezhnev will probably agree with him that the possibility of that kind of catastrophe occurring is very remote indeed — the optimism of the German philosopher notwithstanding.

Decisive Superstructure

In short, if there appear to be problems and contradictions in the Soviet-American relationship it is primarily because of the enormous power of these states and the attendant complexities. The superstructure has now become decisive. It is almost threatening the base all the time. If the base of defence industries and other subsidiary industries is not to give way, the delicate power-relationship will have to be handled very carefully. Co-dominance of the world is at stake. Super powers of the world unite! You have nothing to lose but your ideological inhibitions!!

This is the message which Kissinger has probably carried to Moscow. It is very relevant right now. There are a few developments around the world which call for the attention of the super powers. Wrong people have got into the government in Portugal. The Greeks seem to have suddenly remembered that democracy was a Greek institution to begin with. The Reds seem to be rather on the offensive in places like Italy and France. Western Europe, in short, may well be in for some changes. If these developments were to take place in Latin America, American power would be enough. But when they occur in areas so close to the Soviet Union, it is only fair that the two powers should think hard and together on these matters. The European communist parties are going to meet soon. What do we the super powers make of these developments? Once the Soviet Union and the US are clear on this to the extent possible, the CPSU's delegation can go to the conference of European communist parties.

Obviously, Kissinger is not going to solve all these questions in the course of a single trip. There will have to be many more trips. But then, Kissinger has already told us that the detente is a continuous process. In short, detente is the dynamics which keeps the principle of super power management of the world static — of course, to the best of super powers' ability. Kissinger's trip to Moscow is one more dynamic step in the process.

ISRAEL

Lost Self-Confidence

Surendra Bhutani

THERE has been a sea-change in Israel since the war of October 1973. The self-confidence which was so much a hallmark of the Israeli character after the June 1967 war has been overtaken by not just doubt and self-criticism but a defeatist feeling. Israelis keep reminding themselves of the price paid by their young soldiers for not losing the 1973 war. The casualties suffered in the war were the highest in the history of Israel; it is difficult to find a street or a kibbutz which is without its war-dead.

The Israeli mood is reflected in the political changes which have taken place in the past one year. The old guard is out and new men have taken its place. The Golda-Dayan team was elbowed out when it tried to put the whole blame for the setbacks of the 1973 war on the military machine. The military generals were not given an opportunity to present their side of the case, but waves of protest movements somehow managed to bring out the truth in public. Golda Meir was replaced by a technocratic leadership under ex-general Yitzhak Rabin. Former finance minister Pinhas Sapir, the most influential man in the ruling Labour party, deliberately brought in a new face, so that once the trauma of the 1973 war has been overcome, he can stage a come-back. The powerful Defence Minister, Shimon Peres, an ex-Dayan man, is also looking for the same opportunity.

The new leadership has been unable to open any new vistas of peace. It clings to the old doctrine that peace can come only through face-to-face negotiations with the Arabs. But till then what? Reliance on American arms to fend off an attack is losing its relevance. The US-Arab rapprochement has caused great concern in Israel. After his recent visit to the United States, Premier Rabin admitted ruefully, "We don't see eye-to-eye with the US on many issues". Israeli leaders had acclaimed the partial disengagement with Egypt and Syria as a first step to peace. But they had reckoned without the Palestinians. Israeli morale slumped when commandos swooped on border settlements like Maalot and Kiryat Shimona, killing more than sixty people and inflicting fresh wounds on the already scarred Israeli psyche.

In the Doldrums

The Israeli economy too is facing serious problems. Industry, Israel's springboard for joining the affluent West, has been in the doldrums. The balance of payments gap is more than three-quarters wider than a year ago. Food prices are up 35 per cent this year. The common Israeli, particularly the Oriental Jew, has been severely affected by the inflation. Apart from the Jews from the Soviet Union, immigration is tapering off. In fact, people are leaving Israel for other countries. Recently a Belgian Roman Catholic welfare organisation said that it was looking after 600 Soviet Jews who had failed to settle down in Israel and who had been refused permission to stay in other West European countries.

However, what contributes the most to the Israeli gloom is the military outlook. If there is a new round of war, as many Israelis fear, the Arabs could field 6,000 tanks and 1,500 combat planes — which is about double their number in the 1973 war —, besides missiles aimed at Israeli cities. Israel may still have the upper hand in the next round, but the cost will be very heavy. The longer-term prospect is even more gloomy, for it is clear by now that the Zionist dream of a Jewish homeland in Palestine has come to mean a state of constant war with the country's neighbours.

Investment Behaviour of Monopoly Houses

I — Structure of Fixed Investment Decisions

Aurobindo Ghose

The phenomenal growth of monopoly houses during 1956-73 was accompanied by a progressive break-down of planning, particularly of industrial licensing as an instrument of regulation of private investment. To explain this development, it is necessary to understand the monopoly houses' behaviour with respect to fixed capital investment.

For this purpose, the investment decision itself has to be identified. The investment decision is not a simple decision. It has a structure. The identification of this structure has important implications. This paper is an attempt to understand some of these aspects.

In Section I of the paper, published this week, a detailed attempt is made to identify the structure of Indian monopoly houses' investment decisions, conceptually as well as empirically. In Section II, certain underlying attributes of the structure will be sought to be highlighted in terms of the economics of pre-emption. The concluding part will seek to derive some of the more important implications of the structure of investment decisions, particularly for understanding the time-path of the monopoly houses' fixed investment.

OF all the different forms that investment can take — fixed capital, inventory and financial securities — investment in fixed capital is by far the most significant. In quantitative terms, it has accounted for about two-thirds and more of total gross assets formation for the houses of Tata, Birla, Mafatlal and Shri Ram (see Table 1). In qualitative terms, this is a direct way of augmenting productive capacity, which is the prime purpose of investment.

To understand the monopolist's behaviour with respect to fixed capital investment, it is necessary to identify the investment decision itself. Most of the key concepts developed in this study owe their origin, in one way or the other, its writings to Michal Kalecki, particularly two of his papers: "The Determinants of Investment" and "Outline of a Theory of the Business Cycles", both included in "Selected Essays on the Dynamics of the Capitalist Economy, 1933-70", Cambridge, 1971.

Investment in fixed capital is not an indivisible, instantaneous act. It is instead a process spread over time and consists essentially of two parts: a decision-making part and a part where the decision materialise into actual investment.

The decision-making part itself is not monolithic but composite in character. The investment decision has a structure. It is not a single decision but consists of a number of component decisions, i e, intermediate decisions. The different components follow one another in a certain sequence, with appropriate time-lags. This sequence is both causal and chronological and may not be rigidly the same in all cases. Broadly speaking, the earlier decisions are those of identifying investment opportunities, choosing among them and transforming those chosen into specific investment plans. At the other end come the decisions to implement each investment plan through order of plant and machinery and start of construction. In between there is likely to exist a number of particular decisions.

It is possible to attribute a certain cost to intermediate decisions, as well as an aggregate cost to the investment decision as a whole. By cost of a decision is meant the expenditure it entails. The magnitude of such costs and the sequence in which the decisions are taken, determines the extent of reversibility of investment decisions.

By reversibility of investment decisions is meant the capability of the monopolist to postpone, modify or cancel specific intermediate decisions or even the investment decisions as a whole. Obviously, if a decision consists of several intermediate decisions, rather than of a monolithic unity, the possibility of its reversal is more. Reversibility of decisions denotes a certain flexibility to decision-making. A decision is no longer rigid and unalterable. Here it may be noted that the concept of reversibility is inclusive of and wider than the concept of revocability.

The actual extent of reversibility of intermediate investment decisions determines the correspondence or relation over time between the volumes of successive intermediate decisions. It also determines the correspondence between the volume of intermediate decisions taken at any time and the volume of investment realised subsequently.

To identify the structure of fixed investment decisions of Indian monopoly, data on various aspects of fixed capital investment of five selected industrial houses, Tata, Birla, Mafatlal, Sri Ram and Kirloskar have been examined for the period 1955-72. (For details on the nature and sources of data, see Appendix B on "Time-Phasing of Licensed Investment: Methodology and Sources of Data".) The criteria adopted for examining the different decisions relating to any investment project have been: (a) the sequence of decisions, (b) their respective costs, and (c) their respective reversibilities.

Sequence of Investment Decisions: Broadly, the sequence of decisions relating to any representative investment project are as follows:

(A) The intending investor identifies an investment opportunity, applies for an industrial licence or letter of intent, and pursues the application until it is approved.

(B) Having received the letter of intent, the investor proceeds to negotiate with foreign collaborators, foreign capital goods suppliers and public financial institutions. If the negotiations succeed, he tries to get government's approval of foreign collaboration, consent regarding capital issue and the sanction

of assistance from public financial institutions.

(C) Thereafter, he applies for licence to import capital goods, converts the letter of intent into a final industrial licence, orders for the required capital goods and arranges for the finance from the capital market and/or the financial institutions: Land having been acquired earlier, he arranges for power, water supply and labour. Contruction is taken up thereafter and machinery installed.

In this sequence, the precise position of decisions like acquisition of land and order of indigenous machinery is not fixed and unequivocal.

Although such a sequence is general, it applies in particular to the large-sized investments which only monopoly can undertake. In smaller investments, many of the above components of investment are not relevant.

Cost of Investment Decisions: The cost involved in taking different investment decisions is considered here in terms of the important stages in the investment process.

(i) Licensing: There is a cost involved in obtaining licences. This arises from the motivation and the capacity of the monopolist to corrupt the licensing system. For this purpose, he maintains an organisation to collect information vital to the timing of applications and for pursuit of licence applications till they are approved. It is not possible to quantify such costs but some evidence about their existence can be given. The ILPIC Report has observed:

> "It is well known that many of the larger industrial houses maintain liaison officers in Delhi, were licensing decisions are taken. These persons try to maintain contact at business and social levels with senior persons in Government and seek to influence the exercise of discretionary powers in their favour".[1]

Enough evidence has been given by the ILPIC Report elsewhere that such discretionary powers do actually get exercised in favour of the larger industrial houses.[2] From the viewpoint of the monopolist the costs of licensing are likely to vary as between types of licences. For special licences the cost can be particular, corresponding to the monopolistic advantages likely to accrue. For ordinary licences a standard unit cost of maintaining the public relations organisations can be assumed.

(ii) Foreign Collaboration: The relevant costs here are those of negotiations with foreign collaborators, preparation of the technical project report and of securing and expediting government approval for the collaboration. It has not been possible to give evidence of the magnitude of such costs, but they are likely to be substantial.

(iii) Capital Issue: Apart from possible costs of obtaining approval from the Controller of Capital Issues, the most tangible costs relevant here are those of underwriting, brokerage and notification through prospectus or newspaper announcement at the time of public issue.

(iv) Sanction of Assistance from Public Financial Institutions: It is possible to identify at least two kinds of costs relevant here: (a) the commitment charge of about one-half of one per cent on the sanctioned loan which needs to be paid irrespective of its ultimate utilisation and (b) the cost that can be attributed to goodwill and reliability *vis-a-vis* the public financial institutions which would be affected in case the loan agreement is not implemented.

(v) Capital Goods Imports: Costs relevant to decisions regarding capital goods imports are those of negotiations with the foreign equipment suppliers and also of goodwill lost in case of cancellation of order for import of machinery. Both these costs are likely to be considerable.

(vi) Acquisition of Land. The cost of revoking a decision to acquire land is relatively low. Land has alternative uses within an industrial house and it is also easily marketable.

(vii) Order of Indigenous Machinery: The cost of cancellation of order for

TABLE 2 : REVOCATION OF INVESTMENT PROPOSALS SUBSEQUENT TO SPECIFIC INVESTMENT DECISIONS : EVIDENCE FOR SELECTED INDUSTRIAL HOUSES

House/Enterprise	Details of Original Proposal: Date	Product	Annual Licensed Capacity	Type	Location	Year/Date of Revocation	Remarks

(5) Universal Tyres	31.8.61	Auto Tyres and Tubes		NU	Naini, UP	30.3.68	Foreign collaboration with Sanperit (Austria) approved in April-June 1963. Frequent changes in capital issue consent, regarding foreign equity participation.
(6) Electric Construction and Equipment	5.2.64	EOT Cranes	96 Nos (1,440 tonnes)	NA	Budge Budge, W Bengal	6.4.68	Foreign collaboration with KSB (Czechoslovakia) approved in April-June 1964.
(7) Indo-Newall Machine Tools	30.4.66	Grinding Machines	240 Nos	NU	Ujjain, MP	17.2.68	Foreign collaboration with Newall Machine Tools (UK) approved twice in April-June 1966 and January-March 1967. Capital issue consent underwent change regarding foreign equity participation. Capital goods import licences for UK and Czechoslovakia worth Rs 29 lakhs obtained on 16.8.66.
(III) *Revocation Subsequent to Acquisition of Land*							
Birla							
(1) Kesoram Cotton Mills	7.5.60	Steel Tubes	60,000 tons	NU	Calcutta, West Bengal	3.8.68	Provisional orders for machinery placed.
(2) New Swadeshi Mills of Ahmedabad	20.1.61	CI Spun Pipes	36,000 tons	NU	Ahmedabad, Gujarat	Not Available	Provisional orders for machinery placed. Capital goods import licence applied for but not received.
(3) Birla Cotton Mills	27.3.62	Cotton Yarns	250,000 spindles	NU	Khurja, UP	23.6.69	Provisional orders for machinery placed.
	27.8.62	Cotton Textile	500 auto-looms	SE		28.5.66	
(IV) *Revocation Subsequent to Sanction of Institutional Finance*							
Birla							
(1) CIMMCO	15.2.65	Steel Forgings	7,200 tonnes	SE Letter of Intent	Gwalior, MP	Not converted to Industral Licence	Public financial institutions sanctioned underwriting assistance worth Rs 125 lakhs in February 1966. Amount disbursed when debenture issue of 10.5.66 totally unsubscribed. Proposal not pursued any further.
(V) *Revocation Subsequent to Grant of Import Licence/Import Arrangements*							
Birla							
(1) Birla Jute	5.1.61	Fireclay Refractories	36,000 tons	NA	Satna, MP	24.11.62	Capital goods import licence for Czechoslovakia, worth Rs 1.20 crores, obtained on 15.7.61.
(2) Bharat Commerce and Industries	3.2.61	HT Insulators	1,500 tonnes	NU	Rajasthan	15.7.67	Capital goods import licence for Czechoslovakia, worth Rs 30.35 lakhs, obtained on 23.2.63.
		LT Insulators	500 tonnes				
Mafatlal							
(1) Standard Mills	7.11.62	Cotton Yarn	21,800 spindles	SE	Bombay, Maharashtra	17.7.65	State Trading Corporation of India agreed to grant £ 728,000 under package deal with Platt Bros (UK) for import of machinery.
(VI) *Revocation Subsequent to Order of Machinery*							
(1) New Swadeshi Sugar Mills	22.9.61	Industrial Alchohol	220,000 gallons per month	SE	Narkatiagani, Bihar	15.12.62	25 per cent of the machinery received by March 1962.
Sri Ram							
(1) Delhi Cloth Mills	23.4.55	Ossein	3,600 tons	NU	Najafgarh, Delhi	6.4.63	Maceration vats eady and building completed by July 1962 and 10 per cent of the machinery received.
		Gelatine	2,700 tons				
(2) Electric Industries Corporation	30.10.60	Rolled Copper Rods		NA	Calcutta, West Bengal	11.8.62	Firm order for machinery by July 1962.

Sources : See Appendix B on "Time-phasing of Licensed Investments : Methodology and Sources of Data".

indigenous machinery will not be prohibitive for an industrial house. This will be so if the machinery has been ordered from within the house, or if it has alternative uses within the house's different enterprises.

These costs affect the reversibility of intermediate decisions and also that of the investment proposal as a whole.

Reversibility of Investment Decisions: An investment decision is said to be reversible if it is alterable or revocable. An investment decision is alterable if the specifications of the investment proposal can be modified or if the envisaged timing of implementation of the proposal can be postponed. Similarly, an investment decision is revocable if the investment proposal can be foregone or cancelled.

The capability of an individual investor to reverse an investment proposal at any particular stage of decision-making would depend both on the magnitude of costs of reversal of any decision and also on the position of such decisions in the sequence of investment decision-making. Thus an investment decision like licensing in a relatively more competitive industry — where the cost of licensing can be assumed to be small — is likely to be highly reversible. The relative position in the sequence of investment decisions is also relevant, because as one proceeds towards investment implementation the costs of successive decisions keep cumulating. Thus whether an investment proposal as a whole is capable of being reversed at any one stage of decision-making is determined by the magnitude of cumulative costs at that particular stage. For example, the cumulative costs are likely to be high at the stage of order of imported machinery.

Along with the capability to reverse decisions, the desirability of reversing them has also to be examined. This desirability depends essentially on the opportunity cost of reversal. That is to say reversal of any investment proposal is not considered in isolation but in relation to other available proposals. The loss from reversal of one proposal are set against the likely gains from an alternative proposal (or set of proposals). The larger the availability of alternative investment proposals and the more varied the portfolio, the lower is likely to be the opportunity cost of reversing any particular investment proposal. Monopoly's wide command over varied economic resources and the availability to it of a large number of investment alternatives, means that its capacity to reverse investment decisions is considerable. In contrast, small

TABLE 3 : EXTENT OF LICENSED INVESTMENT PURSUED FOR FURTHER IMPLEMENTATION: INDIAN PRIVATE CORPORATE SECTOR 1956-66

Licencee Category	Value (In Rs Crores) of			Extent of Implementability of Licensed Investment	
	Proposed (Licensed) Investment on Imported Machinery	Capital Goods Import Licences		Desired	Approved

(9) Kirloskar	14	11	11	78.6	78.6

Note : Here it is assumed that the value of licensed investment on imported machinery is uniformly spread over total licensed investment.

Source : ILPIC Report, Appendices, Vol III, Appendix III-A(i) and III-A(3).

capital's capacity to reverse investment decisions voluntarily is almost absent.

The empirical nature of reversibility is now examined in relation to possibilities of postponement, modification or cancellation of investment decisions.

(i) Licensing: Postponement of investment decisions after a letter of intent/industrial licence has been obtained is indicated by evidence on (a) keeping licences completely unimplemented over long periods of time, (b) partial implementation of licences even long after the grant of the licence, and (c) delay in starting to implement a licence. Ample evidence for each of these possibilities is provided in the ILPIC Report.[3]

Modification of licences is indicated by (a) the shift in location, (b) transfer of a licence to another company within the house, and (c) by the splitting up of a large packet project licensed in the name of one house company into separate specific projects to be implemented by different companies within the house. Some examples of the first two types of modification are given in Table 2. The third type of modification is illustrated by the chemical project of Mafatlal, the initial licence for which was obtained in the name of Standard Mills, transferred to the name of NOCIL, but then revoked. Subsequently this project was implemented through four separate licences obtained by NOCIL, Polyolefins, Standard Mills and Indian Dyestuff Industries.

Revocation, cancellation or surrender of an industrial licence or the non-conversion of a letter of intent into an industrial licence are cases of cancellation of investment decisions taken at the licensing stage. Such cancellation may occur at any particular stage of the investment process, whether before or after other specific investment decisions have been taken.

A quantitative estimate of the actual extent of reversal of investment decisions subsequent to licensing has also been attempted here. It may be pointed out that this is perhaps the first attempt at such quantitative estimate. This estimate would be indicative of the degree of pre-emption of licensed investment. The estimate is based on data provided by the ILPIC Report and measures the extent of licensed investment proceeding to a subsequent stage of investment implementation, i e, applications for CG import licences. Two alternative estimates have been provided depending on alternative set of assumptions. Table 3 gives the details of the estimates as well as the methodology of estimation. The results are summarised below:

EXTENT OF NON-IMPLEMENTATION OF LICENSED INVESTMENT OF INDIAN MONOPOLY

(Percentages)

(b) *Quarterly Statistics on the Working of Capital Issues (Control) Act*, Ministry of Finance, Government of India, various numbers.

On the basis of these various estimates, it is possible to say that pre-emption of licensed investment by Indian monopoly is roughly about *double*, i e, 100 per cent more of investment is licensed than it is possible to fully implement. Since licensing is the earliest stage of the investment process and since the costs of obtaining licences are usually low, this high degree of pre-emption is understandable.

(ii) Foreign Collaboration: It is difficult to identify the reversal of specific decisions relating to foreign collaboration. An investment project accompanied by foreign collaboration may be postponed or revoked, but it is difficult to attribute such changes to the factor of collaboration itself. It is easier, however, to identify modifications in foreign collaboration proposals when the foreign equity participation is observed to change over time.

Three investment projects (from the author's case study) were found where though foreign collaboration approval was obtained within 6-9 months of grant of licence, the project was fully implemented with a total lag of 5 years or more from the date of grant of licence. On the basis of published data, it was not possible to investigate the reasons behind such postponement. Nevertheless, the point being established is that an investment project can be/or does get delayed in its implementation despite relatively quick arrangements regarding foreign collaboration. This is possible perhaps because technological progress, process-wise or product-wise, is available to the collaborant over a specified period of time.

Table 4 provides a list of cases belonging to the five selected industrial houses wherein there were one or more modifications in the absolute and/or relative foreign equity participation in the total equity of the company, e g, Sirpur Paper, Universal Tyres, Bihar Alloy Steel, Zuari Agro-Chemicals, etc. These cases have been constructed on the basis of data relating to grant of industrial licences, foreign collaboration approval and consent of capital issue. The conclusion that can be drawn is that decisions relating to foreign collaboration are very much modifiable, even after approval of the collaboration proposal by government.

As regards cancellation of investment decisions accompanied by foreign collaboration, Table 2 lists eleven specific examples of such cancellation relating to the selected houses, e g, Investment Corporation of India's boiler equipment project, DCM's superphosphate project, TELCO's auto forging project, etc.

The extent of revocation or failure of collaboration in the Indian corporate private sector is indicated by a NCAER study[4] which gives the trends in failures of collaboration proposals per Indian enterprise for the period 1960 to 1967. More than 29 per cent of the proposals were infructuous during this period, with the failure rate being concentrated in two years — 43 per cent in 1961 and 41 per cent in 1966. The assumption that can be made from this is that roughly one-fourth of all foreign collaboration approvals do not reach the stage of actual investment.

(iii) Capital Issue: Reversal of decisions relevant here can be considered in relation to consents of capital issue and to actual public issue. On the basis of data given in the "Quarterly Statistics of the Working of Capital Issues (Control) Act", it is possible to construct a time-profile of the rate of utilisation of consents issued in any particular year. By utilisation of consent is meant the amount of consent actually paid-up. The proportion of capital paid-up to the capital consented would give the rate of utilisation.

Table 5 gives the trends in utilisation of capital issue consents for the Indian corporate private sector between 1956 and 1969. For example, the utilisation of consents granted in 1956 reached 50 per cent at the end of 1957, 65 per cent at the end of 1958, but after 10 years, i e, at the end of 1965, the utilisation rate was only 75 per cent. Similarly, for consents granted in 1957, the utilisation rate was 21 per cent at the end of 1957, 42 per cent at the end of 1958, 48 per cent at the end of 1959, 63 per cent at the end of 1963, but remained stagnant at 69 per cent for the four years from 1963 to 1966.

The basic conclusions that can be drawn from Table 5 are: (a) a capital issue consent can be delayed in its utilisation, and (b) nearly 20 to 25 per cent of the total amount of consent granted at any point of time are never utilised. Like industrial licences/letters of intent and foreign collaboration approvals, decisions relating to capital issue are highly reversible.

It is also noticed that individual consents of capital issue are subject to

TABLE 5 : UTILISATION OF CAPITAL ISSUES CONSENT IN THE CORPORATE PRIVATE SECTOR (AS AT DECEMBER OF EACH YEAR)

(Percentages)

Year of Consent	Year of Utilisation													
	1956	1957	1958	1959	1960	1961	1962	1963	1964	1965	1966	1967	1968	1969 (as at 31.3.70)
1956	NA	50.6	65.4	68 3	69.0	69.8	71.1	75.1	75.1	75 1	NA	NA	NA	NA

1958			33 8	55 9	65.7	68.2	69.4	77.2	77.7	77.8	78.1	78.1	NA	NA
1959				30.0	57.4	70 6	74 4	79.6	80.5	80.6	80.6	80.6	80.6	NA
1960					23.1	49.0	56.3	65.1	77.0	77.7	77 7	77.7	77.7	77.7
1961						23.2	45.1	52.7	54.9	55.6	56.3	56.4	56.4	56.4
1962							48.9	53.9	61.5	63.7	64 3	65.1	65.6	65.6
1963								9.0	31.8	37 8	41.0	44.2	45.9	45.9
1964									13.1	29.6	43.0	45.3	45.6	45.6
1965										21.6	34.7	38.3	41.5	42.3
1966											12.6	27.1	29.2	29.8
1967												14.2	40 0	47.6
1968													33 8	53.0
1969														58.1

Note : (1) Utilisation = Capital paid-up.
(2) Utilisation is expressed in terms of per cent of value of consent paid-up.
(3) Consent for capital issue excludes bonus issue and loans from public financial institutions, but includes equity, preference shares, debentures, foreign loans and loans from non-government sources

Source : Quarterly Statistics of the Working of Capital Issues Control, Government of India, various numbers.

change in specifications, sometimes repeatedly, mainly with regard to the quantum of capital to be issued, the extent of foreign equity participation and the rate of dividend or interest at which the capital is to be issued. The possibilities of modification of decisions regarding potential capital issue, i e, with respect to consents, are hence immense.

However, as regards actual public issue, it is highly unlikely that an investment project would be modified, postponed or cancelled after the public issue. Although no evidence is being provided for this statement, this seems reasonable in view of the late stage at which public issue occurs in the sequence of investment decisions, and because of the high degree of commitment that an issue through prospectus entails to the investing public.

(iv) Capital Goods (CG) Import: It has been established earlier that nearly half of the licensed investment having import content does not reach the stage of application for CG import. This suggests that decisions relating to CG import are relatively definite as compared to decisions regarding licensing, collaboration approval or capital issue consent. Only three clear illustrations of projects which were revoked even after grant of CG licence emerge from the author's case study. These examples are presented in Table 2, i e, the Indo-Newall Machine Tools project, Birla Jute's refractories project and Bharat Commerce's insulators project.

The reversal of decisions after order of imported machinery is likely to be insignificant.

(v) Sanction of Institutional Finance: Some examples of cancellation of projects after sanction can be constructed on the basis of evidence provided at the recent hearings of the Sarkar Commission,[5] e g, High Quality Steels project and CIMMCO's steel forgings project (see Table 2 for details). This suggests that investment decisions are not entirely irreversible after this stage. But the extent of reversal is minimal, since the commitment charge on sanctioned assistance is considerable and because of the possibility of loss of goodwill. Thus an investor is likely to be cautious about obtaining sanction of institutional finance, whenever he is uncertain of implementing the investment project.

(vi) Acquisition of Land: It was suggested earlier that the decision to acquire land is likely to occur in the earlier stages of investment decision-making in the case of relatively small projects with import-content. Table 2 provides examples of three Birla projects which were revoked after acquisition of land as also provisional order of indigenous plant and machinery.

(vii) Order of Indigenous Equipment: Decisions relating to order of indigenous capital equipment are likely to be more reversible than those relating to import of machinery. To some extent this depends on greater technical flexibility of indigenous machinery in comparison with imported machinery and its relatively greater adaptability, both process-wise and product-wise. Table 2 provides details regarding three minor projects which were cancelled even after plant and machinery were partially ordered for and received, possibly from indigenous sources. One was a (Birla) industrial alcohol project, the second was a (Sri Ram) glue and gelatine project and the third was a (Sri Ram) copper rods project. Thus investment proposals are revocable even after order of machinery.

Intermediate Components of an Investment Decision: On the basis of the discussion on the sequence of decisions and their classification in terms of cost and reversibility, it is possible to identify three analytically separable parts of the structure of the Indian monopolist's investment decisions, although some amount of overlapping between the different parts is possible. These three parts correspond to the categories A, B and C of the sequence of investment decisions identified earlier. It needs to be pointed out that this structure is specific to monopoly and does not apply to small capital.

(i) *Investment Intention*: i e, the monopolist's decision to avail of existing opportunities to invest. Decisions relating to identification of an investment opportunity and application for and pursuit of a letter of intent are clearly decisions which fall in this category. Similarly, the decisions relating to application for and pursuit of an industrial licence (as distinguished from a letter of intent) prior to February 1964 also belong here. This component of the investment decision is peculiar to the Indian economy and stems from the existence and actual manner of operation of a licensing system whereby a licence is necessary in order to invest but can be held in reserve for long periods of time without imple-

mentation. These decisions, as has been shown, are highly reversible.

(ii) *Investment Undertaking*: i e, the monopolist's decision to proceed further in the investment process without full commitment to completion of the investment project. The decisions at this stage are clearly reversible, but less so than those at the stage of investment intentions. Examples of such decisions are given in category B of the sequence of investment decisions suggested earlier, e g, exploration of sources of foreign collaboration; negotiations for capital goods import and large financial assistance; and application for and pursuit of collaboration approval and capital issue consent.

(iii) *Investment Implementation*: i e, the decision to actually embark on the physical implementation of a project and complete it. Application for and obtaining of the CG import licence; finalisation of agreements relating to collaboration, machinery import and sanction of assistance from public financial institutions; conversion of a letter of intent into an industrial licence; the final order of imported and/or indigenous capital goods; and the start of construction: these are the steps which represent the decisions of investment implementation. There is a certain irrevocability about such decisions, and although some evidence has been provided to the contrary, the revocability is clearly of a low order.

This structure of investment decisions is specific to a mixed economy like India. For example, investment intention as a distinct component of the monopolist's investment decision cannot be easily identified in an US-type economy. A giant corporation which only intends to invest in fixed capital but cannot ultimately decide to, runs the risk of losing its potential market share. Practices like reservation of sources of supply of critical raw materials and technology do prevail in the USA. Nevertheless, oligopolistic competition proceeds mainly through actual additions to the individual oligopolist's stock of fixed capital, rather than through the holding of investment intentions.

Similarly, what distinguishes this structure of investment decisions is the immense possibility of reversal of investment decisions at different stages of the investment process. In an US-type economy, the rules of oligopolistic competition allow little scope for reversal of investment decisions. In India, however, the actual operation of government regulation, which facilitates preemption, is responsible for the high degree of reversal of investment decisions. In other words, the opportunity costs of reversal of investment decisions are considerably lower for Indian monopoly than it is, say, for American monopoly. This point shall be examined more closely subsequently.

Correspondence between Different Components of the Investment Process: It was suggested earlier that the actual extent of reversibility of the intermediate investment decisions determines the degree of correspondence between the different components of the investment process.

To recapitulate the broad empirical results established so far:

(i) about half the volume of licensed investment reaches the stage of applications for CG licence in any given period,

(ii) nearly one-fourth of the number of foreign collaboration approvals are failures and do not proceed further in the investment process,

(iii) nearly one-fifth to one-fourth of the value of capital issue consents is not utilised through actual public issue subsequently, and

(iv) a small, undefined, fraction of CG licences issued are not utilised, and a negligible proportion of orders for indigenous capital equipment are revoked.

On the basis of these results and the identification of the component parts of the structure of investment, it is possible to suggest the nature of relations between the different components of the investment process. Two aspects of the relations derived require to be stressed. First, the relations are indicative rather than precise. Secondly, although equality relations are used for purposes of formal argument, the relations are nevertheless in the nature of approximations.

Let I_t = volume of investment intentions at time t;

$U_t + \alpha$ = volume of investment — undertaking decisions in period $t+\alpha$ where α is the lag between I and U;

$M_{t+\alpha+\lambda}$ = volume of investment — plementation decisions in the subsequent period $t+\alpha+\lambda$, where λ is the lag between U and M; and

$F_{t+\alpha+\lambda+\gamma}$ = volume of realised investment at time $t+\alpha+\lambda+\gamma$ where γ is the lag between M and F.

Then, it follows:

Relation 1:

$$M_{t+\alpha+\lambda} = \tfrac{1}{2}.I_t$$

This relation is obtained from empirical result (i), on the assumption that licensing of investment relates to investment intention whereas applications for CG licence relate to investment implementation and also the assumption that pre-emption of licensed investment is uniform over time.

Relation 2:

$$F_{t+\alpha+\lambda+\gamma} = \tfrac{3}{4}.U_{t+\alpha}$$

This relation is obtained from empirical result (ii), on the assumption that the remaining three-fourths of the collaboration approvals fructify into actual investment. A further assumption here is that the volume of decisions regarding investment undertaking can be represented by the number of collaboration approvals; this assumption is necessitated by the absence of data on the value of proposed investment corresponding to the collaboration approvals.

Relation 3:

$$M_{t+\alpha+\lambda} = 4/5.\ U_{t+\alpha}$$

This relation is based on empirical result (iii), and on the identification of consents for capital issue as investment undertaking and actual issue of capital as investment implementation. The choice of co-efficient 4/5 rather than 3/4 will become clear soon.

Relation 4:

$$F_{t+\alpha+\lambda+\gamma} < M_{t+\alpha+\lambda}$$

This relation is based on empirical result (iv).

From Relations 2 and 3 it follows:

Relation 5:

$$F_{t+\alpha+\lambda+\gamma} = 5/4.\ \tfrac{3}{4}M_{t+\alpha+\lambda} = 15/16.\ M_{t+\alpha+\lambda}$$

Relation 5 is consistent with Relation 4. The choice of the co-efficient 4/5 in Relation 3 makes this consistency possible. Any co-efficient having a value of 3/4 or less would imply $F_{t+\alpha+\lambda+\gamma} \geqslant M_{t+\alpha+\lambda}$ which would contradict Relation 4. Substituting Relation 1 in Relation 5, it further follows:

Relation 6:

$$F_{t+\alpha+\lambda+\gamma} = 15/16.\ \tfrac{1}{2}\ I_t = 15/32.I_t$$

This relation indicates that monopoly licences more than double the volume of investment it implements in a subsequent period. This is indicative of the extent of pre-emption.

Relations 6, 2 and 5 above indicate the proportion of decisions regarding investment intention, investment undertaking and investment implementation that fructify into actual investment in subsequent periods.*

* These Relations 6, 2, and 5 can serve the function of what has been termed as "anticipatory data". On the basis of these relations and also the empirical nature of time-lags between different components of the investment process, it would be possible to *predict* the time-profile of monopoly's future investment given *current indicators* of the respective volumes of different components of monopoly's investment decisions.[6]

Having examined the structure of Indian monopoly's investment decisions in some details, the question that now arises is: what are the factors that lead to the existence and emergence of such a structure of investment decisions? This question is examined in Section II.

Appendix A

Nature of Sample of Selected Industrial Houses

This note explains the nature of the samples of the houses of Tata, Birla, Mafatlal, Sri Ram and Kirloskar, used in this study for purposes of balance sheet data.

(1) *Source*: The source of data for the five selected houses, relating to the balance sheet and profit and loss items, is the Official Directory of the Bombay Stock Exchange. This Directory collects information on those public limited companies listed in all the stock exchanges in the country. The information is culled from the respective Annual Reports of the listed companies. Except for printing errors, the Directory is authentic and an authoritative source of information. The printing errors were sought to be removed through cross-checking of different balance sheet and profit and loss items, based on the principles of accounting.

(2) *Composition of Sample*: The composition of industrial houses used in this study is in terms of the ILPIC's composition of the first-tier companies of the industrial houses, between 1956 and 1966. Since the time-series of the sample related to 1955-56 to 1969-70, some additions were made to the ILPIC composition regarding recognised house companies which were incorporated or acquired by the house after 1966 (e g, Znari Agro Chemicals for Birla and Tata — Yodogawa for Tata). From this total list of companies belonging to the selected houses, those which were listed in the Directory of the Bombay Stock Exchange were considered. Only public limited companies are listed, so privately limited companies were excluded.

(3) *Coverage of Sample*: The sample covered 92 companies in all, 22 companies for Tata, 48 companies for Birla, 9 companies for Mafatlal, 5 companies for Sri Ram and 8 companies for Kirloskar over the time-period 1955-ed in Table A.

The percentage coverage of each of the house samples in terms of the paid-up capital, total assets, sales and net profits before tax for the house as a whole in any particular year, is indicated below:

The source of data for the house totals of Tata, Birla, Mafatlal and Sri Ram is a reply to a Lok Sabha unstarred question (No 7294 which was due for answer on April 17, 1973) and for Kirloskar the source is the ILPIC Report.

(4) *List of Companies*: The list of companies included in the sample is given below:

Name of House/Enterprise

(A) TATA
(1) Andhra Valley Power
(2) Tata Hydro-Electricity
(3) Tata Power
(4) Ahmedabad Advance
(5) Central India Spinning
(6) Gokak Mills
(7) Simplex Mills
(8) Svadeshi Mills
(9) Tata Mills
(10) Scottish India Machine Tools
(11) Invest Engineering
(12) Tata Engg and Loco
(13) Tata Iron and Steel
(14) Tata Yodogawa
(15) Tata Merlin and Gerin
(16) Voltas
(17) Tata Chemicals
(18) Belpahar Refractories
(19) Indian Vegetable Products
(20) Tata Oil Mills
(21) Indian Tube
(22) National Ecko Radio

(B) BIRLA
(1) Ratnakar Shipping
(2) India Steamship
(3) Central India Coal Fields
(4) Western Bengal Coal Fields
(5) Birla Cotton Spinning and Weaving
(6) Jayshree Textiles
(7) New Swadeshi Mills of Ahmedabad
(8) Sutlej Cotton
(9) Jiyajeerao Cotton
(10) Century Spinning
(11) Kesoram Industries
(12) Soorah Jute
(13) Bally Jute
(14) Rameshwara Jute
(15) Birla Jute
(16) Indian Rayon
(17) Sirsilk
(18) Century Enka
(19) Gwalior Rayon and Silk
(20) Shree Digvijay Woollen
(21) Mysore Cement
(22) Orient Paper
(23) Sirpur Paper
(24) TEXMACO
(25) CIMMCO
(26) Electric Construction and Equipment
(27) Orient General Industries
(28) Universal Electrics
(29) Hyderabad Allwyn
(30) Hind Cycles
(31) Hindustan Motors
(32) Hindustan Aluminium
(33) Indian Tool Manufacturers
(34) National Engineering Industries
(35) Hindustan Gas and Industries
(36) Universal Cables
(37) Zenith Steel Pipes
(38) Gobind Sugar Mills
(39) New Swadeshi Sugar Mills
(40) Upper Ganges Sugar Mills
(41) Oudh Sugar Mills
(42) C and E Morton
(43) India Linoleum
(44) India Plastics
(45) Kusum Products
(46) Tungabhadra Industries
(47) Jayashree Tea and Industries
(48) Zuari Agro-Chemicals

(C) MAFATLAL
(1) Ahmedabad Jupiter
(2) New Shorrock Spinning
(3) Sassoon Spinning and Mafg
(4) Mafatlal Fine Spinning
(5) Standard Mills
(6) Indian Dyestuff Industries
(7) National Organic Chemicals
(8) Polyolefin Industries
(9) Phalton Sugar Works

(D) SRI RAM
(1) Delhi Cloth Mills
(2) Jay Engineering
(3) Bengal Potteries
(4) Sri Ram Bearings
(5) Sri Ram Refrigerations

TABLE A

(in Rs Crores)

House	Year	Paid-up Capital	Total Assets	Sales	Net Profits Before Tax
(A) TATA					
(1) House Total	1969-70	142.2	661.2	556.2	32.8
(2) Author's Sample	1969-70	116.7	543.0	514.0	32.3
(3) Coverage (per cent)		82.8	82.1	92.4	98.6
(B) BIRLA					
(1) House Total	1969-70	135.5	647.0	633.5	51.6
(2) Author's Sample	1969-70	107.2	538.9	535.1	46.6
(3) Coverage (per cent)		79.9	83.3	84.5	90.3
(C) MAFATLAL					
(1) House Total	1970-71	33.7	172.4	165.1	11.8
(2) Author's Sample	1969-70	27.6	139.0	121.8	9.5
(3) Coverage (per cent)		81.9	80.6	73.7	80.5
(D) SRI RAM					
(1) House Total	1969-70	16.5	134.7	144.8	9.5
(2) Author's Sample	1969-70	16.1	105.0	138.5	9.0
(3) Coverage (per cent)		97.5	77.9	95.6	95.2
(E) KIRLOSKAR					
(1) House Total	1966	9.7	43.0		
(2) Author's Sample	1965-66	9.2	42.7		
(3) Coverage (per cent)		94.1	99.3		

(E) KIRLOSKAR
(1) Kirloskar Cummins
(2) Kirloskar Oil Engines
(3) Kirloskar Pneumatic
(4) Bharat Forge
(5) Kirloskar Brothers
(6) Mysore Kirloskar
(7) Shivaji Works
(8) Kirloskar Electric

Appendix B

Time-Phasing of Licensed Investment: Methodology and Sources of Data

(I) METHODOLOGY

The existing material on the utilisation of licences or on time-lags in investment implementation is so aggregative, that little is known about how precisely the alternative investment intentions of an industrial house are phased out over time, or what is the nature of time-lags between different intermediate investment decisions.

With the purpose of obtaining a clearer understanding of these aspects of fixed investment behaviour, a somewhat detailed study of the time-phasing of investment licensed by the houses of Tata, Birla, Mafatlal, Sri Ram and Kirloskar, was undertaken. This study was based entirely on published material, without recourse to questionnaires of any sort.

Information on all licences/letters of intent granted to these houses between 1955 and 1972 was first sought to be collected. These licences/letters of intent were then pursued over the different stages of investment implementation, until the investment project was completed or the licence/letter of intent was revoked. The different intermediate stages of investment over which the licences were pursued, are: shift in location; transfer of ownership of the licence; government's approval of foreign collaboration proposal; grant of consent for capital issue by the Controller of Capital Issues; conversion of a letter of intent into an industrial licence; sanction and disbursal of financial assistance by the different public financial institutions; grant of capital goods import licence by the government; issue of capital to the public; acquisition of land; start of construction; and the phasing out in the actual installation of the licensed capacity.

Although an attempt was made to have a census of all licences/letters of intent granted to the selected houses, this was not possible for lack of information in certain cases. Similarly, information on the details of utilisation of the licences, especially regarding the timing of specific decisions, was not available for all the licences. Nevertheless, the coverage of the information collected in large, especially in the case of Birla and Mafatlal, accounting for more than 80 per cent of all licences/letters of intent granted to these houses during the period 1955-72.

(II) SOURCES OF DATA

The composition of the selected industrial houses is in terms of the first-tier companies of the industrial houses as identified by the ILPIC Report. The sources of data regarding the specific stages of the investment process, were as follows :

(1) *Licensing*: Information on the licence/letter of intent granted was collected from the lists of industrial licences published periodically in the *Journal of Industry and Trade* (Ministry of Industry, Government of India). The information so collected related to (i) name of the licencee; (ii) date of grant of licence/letter of intent; (iii) product and annual capacity licensed; (iv) the type of the investment (substantial expansion, new article or new undertaking); (v) the location of the project; (vi) date of transfer of a licence/letter of intent and the name of the new licencee; (vii) shift in location; (viii) date of conversion of the letter of intent into an industrial licence; (ix) date of revocation/surrender of a licence; and (x) progress report on licence implementation. Information on the value of each investment licensed was not available.

(2) *Foreign Collaboration Approval*: Information on government's approval of foreign collaboration proposal was obtained from the periodical lists of collaboration approvals published in the *Journal of Industry and Trade* and the *Indian Trade Journal*. The information related to (i) name of the Indian collaborator; (ii) name of the foreign collaborator/s; (iii) the industry of collaboration; and (iv) the date of approval.

(3) *Capital Issue Consent*: Information on the consent granted by the Controller of Capital Issues for issue of share capital, debentures and foreign loans by any enterprise, was obtained from the *Quarterly Statistics on the Working of the Capital Issues (Control) Act* (Ministry of Finance, Government of India). The information related to (i) the name of the consentee; (ii) the industry of consent; (iii) the type of consent (equity, preference shares, debentures and loans); (iv) the amount consented; (v) the non-resident participation in the issue; and (vi) subsequent changes in the consent, where relevant.

(4) *Sanction of Institutional Finance*: Information on the details of the sanction and disbursement of financial assistance given by different public financial institutions, were obtained from their Annual Reports and also from the recent public hearings of the Commission of Inquiry into Large Industrial Houses (popularly known as the Sarkar Commission).

(5) *Capital Goods Import Licence* Details of the capital goods import licences granted by the government, were obtained from the *Weekly Bulletin of Import Licences, Export Licences and Industrial Licences* (Ministry of Industry, Government of India). The information related to (i) the name of the licencee, (ii) the date of the licence; and (iii) the nature of the machinery import, in terms of its value and source of import.

(6) *Actual Investment Implementation*: Information relating to the other aspects of investment implementation such as acquisition of land, start of construction and completion of the project were obtained from the Annual Reports of the respective companies (available with the Department of Company Law), the Bombay Stock Exchange Directory's abstracts on the working of different companies and the Annual Reports of the Directorate General of Technical Development.

Notes

[The author is most grateful to S Ganguli for his guidance and also to Ashok Rudra, Prabhat Patnaik, S S Sivakumar, Jayabrata Bhattacharjee and Shoji Ito for their helpful comments and suggestions. G Doraswami provided invaluable assistance in computer programming. The author alone is, however, responsible for any errors that remain.]

1 ILPIC Report, Main Report, p 63, Section 4.54.

2 The licensing authorities' use of discretionary power in favour of the larger industrial houses has been revealed through their different practices, e g, their early intimation of impending licensing to an applicant, inadequate scrutiny and/or expeditious disposal of licence applications, "on file" decisions without going through the Licensing Committee, reversal of earlier decisions, etc. See ILPIC Report, Main Report, pp 64-74.

By-Product of a Plural Economy

A Note on the Politics of the Lost Indian in Malaysia

Jawid Laiq

In Malaysia, as in other former colonies like Sri Lanka, the pattern of physical and occupational separation between the races is a direct consequence of the plural economy and society created by colonial rule.

The effort to remove racial economic imbalances has concentrated on the uplift of the Malays. Impoverished Indians and Chinese have generally been left out of these economic development programmes. The poor Indians, in particular, have not had enough political leverage to draw the attention of the government to their economic condition.

With an Indian 'rentier' class unable to employ him and with the Chinese capitalists and the Malay ruling class unconcerned about him, the Indian labourer, politically unorganised and, therefore, powerless, is the lost man of Malaysia.

MALAYSIA's exports during the mid-1960s amounted to about 50 per cent of its gross domestic product.[1] The comparable figure for India was less than four per cent.[2] This shows the extent to which the Malaysian economy has been (and continues to be) dependent on its export sector. Rubber and tin formed around 60 per cent of Malaysia's total exports between 1957 and 1967.[3] This meant that its economy's stability was greatly dependent on the world demand for rubber and tin. During the Korean War from 1950 to 1953 the high prices offered for rubber and tin on the international market led to a 'boom' in the Malayan economy.

After the end of the Korean War, the prices of rubber — Malaysia's leading export item — continued to decline[4] till the recent upsurge which is mainly due to the oil crisis which has pushed up the price of synthetic rubber. The general decline in rubber prices affected the Indian community in particular. The Malays and the Chinese were not directly affected. The reason for this concentrated effect on Indians (80 per cent of them are Tamil-speaking) has been the compartmentalised economic structure of Malaysia which has physically separated its three major races.

Indian indentured or bonded labour was brought into Malaya by the British colonial authorities to clear the jungle and develop rubber plantations.[5] The Chinese did not come as indentured labourers but as small traders or as workers in tin mines. The Chinese traders formed their *kongsis* or commercial societies at convenient trading posts, some of which later grew into towns. Other Chinese established themselves in small communities near the mining areas. During the Japanese occupation, 1942 to 1945, a large number of Chinese in order to get away from Japanese oppression became 'squatters' on uninhabited jungle land where they cleared patches of jungle and eked out a living as subsistence farmers. These 'squatters' proved to be the main source of support and supplies for the communist guerilla movement which began in 1948. To deny the communist guerillas, the majority of whom were Chinese, any access to the Chinese squatters, a major regroupment of squatters into new villages was successfully carried out by British military force; 580,000 rural dwellers, predominantly Chinese, were resettled in 580 new villages.[6] The Malays were left largely undisturbed during the period of colonial rule to continue their paddy farming and live in their traditional villages or *kampongs*.

This short sketch illustrates the predominance of each of the three races in certain occupational groups and also in separate geographical zones. Thus, in 1957 62 per cent of the Indian population lived in rural areas. Of the rural Indian population about 50 per cent lived on rubber estates. 38 per cent of the total number of Indians lived in urban areas and worked mostly in government and municipal offices or in service industries. In 1957, 87 per cent of the Malays lived in the countryside and in concentrations of less than 5,000 people. Of the 998,000 economically active Malays 76 per cent were employed in the primary occupations of paddy farming, fishing, mining and forestry. In contrast, 53.2 per cent of the Chinese were urban dwellers and 53.3 per cent of the gainfully employed Chinese worked in the secondary and tertiary sectors of the Malayan economy. Although the proportion of Malays and Indians living in towns had increased since 1957, the overall demographic picture was much the same in 1967.[7]

In Malaysia, as in other former colonies like Sri Lanka, the pattern of physical and occupational separation between the races is a direct consequence of the plural economy and society created by colonial rule. J S Furnivall has defined a plural society as a sectionalised community which "tends to be organised for production rather than for social life; social demand is sectionalised, and within each section of the community the social demand becomes disorganised and ineffective, so that in each section the members are debarred from leading the full life of a citizen in a homogeneous community."[8] Although Furnivall's definition is based on an analysis of Dutch rule in what is now Indonesia, his definition of a plural society is also applicable to Malaysia and, to a lesser degree, to Sri Lanka.

In simpler terms, the recruitment of indentured Indian labour for Ceylon and Malaya and the encouragement of Chinese migration to Malaya was regarded by the British as the best means of exploiting and developing the natural resources of these two territories. The social consequences of the large influx of immigrants were ignored. Right up to 1942, the Malays, the Chinese and the Indians in Malaya were allowed to develop separately in their own compartment of the economy and hence of the 'community'. Very little was attempted by way of building the three disparate elements into a Malayan nation.[9] Even the educational system spread along distinct Malay, Chinese, Tamil and English channels.[10] Only in the English-medium schools did the wealthier children of the three races come together.

It was only after 1948, spurred on by the communist guerilla movement, that a belated but energetic campaign to bind the three groups together was begun.

With Independence in 1957, this 'nation-building' process was accelerated. A common language, Malay, and the removal of economic disparities between the races were the two main pillars of the process advocated by the ruling party, the tri-communal Alliance.

Through such organisations as the Rural Industrial Development Authority (RIDA) and the Majlis A'manah Ra'ayat (MARA or Council for Rural Progress) the Malaysian Government has tried to raise the Malay standard of living, which has been substantially lower than the general level of the Chinese and the Indians. It is estimated that in 1957, 23-25 per cent of the Malayan national income was earned by Malays, 60-63 per cent by Chinese and 10-11 per cent by Indians.[11] In comparison, Malays formed 49 per cent of the total population of Malaya in 1957, Chinese 37 per cent and Indians 11 per cent. The per capita income was estimated to be 359 Malayan dollars (now called ringgits) per annum for the Malays, M$ 691 for the Indians and M$ 848 for the Chinese.[12] These figures do not, of course, show the wide disparities within each race.

The effort to remove racial economic imbalances has been concentrated on the uplift of the Malays. Impoverished Indians and Chinese have generally been left out of these economic development programmes. The poorer Indians, in particular, have not had enough political leverage (being part of the 11 per cent Indian minority) to draw the attention of the government towards their own economic conditions.

The continuous fall of rubber prices after the Korean War had a direct effect on the Indian minority in Malaysia, 66 per cent of the total Indian labour force being employed on estates.[13] The fall in prices led to the fragmentation of estates, resulting in Indian and other workers losing their jobs and having to leave the estates. It was caused by the sale and subsequent sub-division into small plots of rubber estates owned by European companies.[14] These sales were facilitated by speculators who made handsome profits through the sub-division of such properties into small plots which were then re-sold to small-holders, mainly Chinese, who tend and tap the rubber trees themselves.[15]

The exodus of Indians from the estates led to the formation of the National Land Finance Co-operative Society. This Society was formed in 1960 under the initiative of V T Sambanthan, who was the President of the Malaysian Indian Congress (MIC), to "raise funds from the estate workers and to buy rubber estates to combat fragmentation and its attendant evils."[16] The Society was also formed, no doubt, with the intention of strengthening the political position of Sambanthan and the MIC.

The formation of this Society brought the Malaysian Indian Congress into conflict with the National Union of Plantation Workers (NUPW), which felt that the formation of the Land Finance Society was an unwarranted interference in a trade union sphere of interest by a political party, though it had done almost nothing to lessen the despair of the estate workers. While the leaders of the Indian-controlled union and the Malaysian Indian Congress confronted each other, the Federal and state governments maintained a detached attitude to the whole problem. At the state level, the fragmentation problem was considered to be a Federal responsibility while the Federation Government saw this as the concern of the state governments.

The political machinations in the conflict between the Malaysian Indian Congress and the National Union of Plantation Workers, and the tacit refusal of the Federal and state governments to take any firm action, must be examined in closer detail, in order to understand the political implications of what in origin was an economic issue. The MIC and the NUPW were 'concerned' about the social disruption and unemployment caused by the sub-division of estates.[17] Their concern had not, however, reached the stage of avoiding recriminations and joining together to pressurise the various state governments to enact laws which would prevent the fragmentation of estates. Instead P P Narayanan condemned the MIC leadership for "playing safe, which is not always the most progressive way for the Indians".[18] The MIC leadership was very conscious of being at the head of a small minority community which forms 11 per cent of West Malaysia's total population. The consequent lack of political leverage tends to make the MIC leadership very reticent about any move which might alienate the leaders of the United Malays National Organisation (UMNO). This extreme caution expresses itself by brushing aside issues which mainly affect the Indian labourer and are only of marginal significance to the Malays and the Chinese. The President of the MIC went to the extent of saying that Malaysian Indians "have no problems ... due to the record of fair play shown by the Malays".[19] He also condemned the NUPW's attitude as "sheer cussedness". The result of this crossfire is that no concrete demands have been put forward to remedy the fragmentation problem.

Constitutionally, changes in the National Land Code are the responsibility of the state governments,[20] but with no directives from the Federal Government and due to the indecision of the MIC, the state governments were not unduly concerned about the sub-division of estates.[21] It was also felt that there should be no legal bar to the buying and selling of land. Any such move would smack of socialism and would not be in accordance with the 'laissez-faire' economic policies of the Alliance.

Many of the Indians who lost their jobs in the estates moved to the towns. This was in keeping with a general trend in Malaysia of a marked shift in population from rural to urban areas. Between 1947 and 1957 the urban proportion of the population increased from 35.1 per cent to 50.5 per cent.[22] After 1957 also, the movement to the towns continued. Another prominent feature has been the increasing proportion of Malays who have become urban dwellers.[23] This has meant that the towns are no longer substantially Chinese in composition and are becoming more cosmopolitan. It is in the towns that the old pattern of the plural economy divided along racial lines is breaking down. Light industry is being developed on the fringes of the bigger towns, including Kuala Lumpur, Penang, Ipoh, Port Swettenham and Johore Bahru. With the different races living closer together and competing in business and employment, racial tensions can be exacerbated (as happened in 1969).

Reliance on private enterprise as the vehicle for urban industrial development puts the Federation's policy-makers in a quandary; there is no Malay middle class capable of carrying through an industrialisation programme through private enterprise. There is an Indian middle class but its forte is commerce and the civil service, and not industry.

Most of the existing indigenous private enterprise in industry is Chinese, in ownership, management and work force. A policy of industrialisation which relies on indigenous private enterprise must inevitably increase the economic power of the Chinese, either in their capacity as industrial entrepreneurs or as investing capitalists.[24] Most of the jobs created in industry will be filled by Chinese, partly because of the method of recruitment through the Chinese extended family system, and partly because Malays lack the necessary skills and training for industrial work in towns.[25]

If the migration from rural to urban areas proceeds at a faster rate than the availability of jobs in industry, the Malays, unassisted, will lose in the competition for these jobs and herein could lie the ingredients of further racial conflict. It is most unlikely that private enterprise industrialisation will much improve the economic position of the Malays, either in their capacity as industrial capitalists or workers. What is most likely is that the existing classes of Chinese industrial owners and workers will be further enlarged. The logic of unrestrained private enterprise development often "is to enrich those who already possess capital ... the sort of development that will take place will be lopsided and communal — with political consequences that could be dangerous".[26]

Due to this warped development, a part of the class structure has crystallised along ethnic lines. The government's policy-makers seem to be aware of this and part of their solution appears to be an attempt to create a Malay middle class that will eventually be able to carry through an industrialisation programme. The policy is to lay special emphasis on pioneer industries, especially foreign-owned ones, in the belief that they can be controlled more easily, induced to employ a quota of Malays, and part of their capital can be reserved for issue to Malay investors when these materialise.[27] This strategy, however, presupposes that foreign investment can be easily directed and can also be made employment-oriented.

The dilemma of a choice between a Malay dependence on Chinese free enterprise and a Malay reliance on foreign investment is being partly avoided by government investment in public enterprises which are being used as a vehicle for industrialisation. Among the established public enterprises which have developed their own industrial sectors are the Central Electricity Board, Harbour Boards and Trusts (which has created its own big industrial estates at Port Swettenham and Port Dickson) and Malayan Railways.[28]

As already stated, the FLDA and MARA have done much to bring prosperity to Malay farms and 'kampongs'. Apart from bettering the economic condition of the Malay peasant, these two public organisations are indirectly restraining the exodus to the towns.

Thus, the general economic policy followed initially under the overall stewardship of Abdul Rahman and then the closer control of Abdul Razak, has been to give the Chinese businessman and industrialist a free hand while encouraging the foreign investor and public enterprises in improving the economic lot of the Malays.[29] But a group of Young Turks in the UMNO, unofficially led by the then Federal Minister for Information and Broadcasting, Senu bin Abdul Rahman, did believe that nationalisation was the only way to improve the economic condition of the Malays.[30] This group was keen on the idea of and nationalising most forms of private enterprise in industry as well as commerce. Their main targets were the Chinese-owned concerns. This was a curiously mixed-up form of 'socialism', where the main aim was not the uplift of a down-trodden class but the improvement of an entire ethnic group, ignoring the poor among the Chinese and Indian communities. The propounders of this communal socialism, however, did not make much headway.

The Indian middle class does not have any significant role in Chinese private enterprise or in Malay public enterprise. Within the present economic structure the only roles it can adopt is that of small shopkeepers, retailers and wholesale merchants of textiles and other consumer goods, of promoters of service industries like laundering and catering. The Indian middle class is well entrenched in the service sector and there is substantial room for expansion in this corner of the Malaysian economy.

Indians with larger capital reserves have established insurance, banking and other financial companies. A large portion of the reserves of these banking and financial houses have come from Chettiars who have diversified their interests and have generally moved away from their traditional moneylending partnerships. "The Chettiars have diverted their business from moneylending to things like property-ownership, in spite of greater interest rates [in moneylending], as property values are now increasing ... The ownership of property is a safer business than moneylending although the annual returns may not be as great as in moneylending.[31] Moreover, there is an increase in the value of property every year ... These are capital gains, so in the long run property-ownership provides greater returns than moneylending."

The Chettiars in Malaysia are also known to have given large loans to Chinese businessmen which the Chinese used in establishing their own industrial firms. Why did the Chettiars themselves not invest in industry? The answer is prosaic. "Money-lending is safe while investing means risk ... the Chinese gamble while the Chettiars never gamble".[32]

With such an Indian 'rentier' class unable to employ him, with the Chinese capitalists and Malay ruling class unconcerned about him, the Indian labourer, politically unorganised and therefore powerless, is the lost man of Malaysia.

Notes

[This paper is part of a wider thesis, yet incomplete, which is a "Socio-Political Study of Indian Minorities in Malaysia, Singapore and Ceylon". The field work in these three countries was made possible by a travel grant from the University of London Central Research Committee, to whom I am most grateful.

I am also most grateful to Hugh Tinker for his guidance and to S Arasaratnam, Denis Dalton, Kernial Singh Sandhu and S R Mehrotra for their comments. For their generous hospitality and help I would like to thank R Suntharlingam, R Balakrishnan and Rama Subbiah. Demographic Transition among Parsis: 1881-1971

III—Fertility Trends

Leela Visaria

The Parsis have been a remarkable exception in the general Indian demographic scene. Their fertility and mortality levels have steadily declined over the past century. In fact, their fertility is so low that despite high life expectancy, the number of Parsis has been declining for more than two decades now.

This paper examines the trends in fertility and mortality levels of the Parsis. It examines the transition from high levels of fertility and mortality to low levels and the factors which have brought about this transition. The size and the sex-age composition of the Parsi population are also discussed to facilitate an understanding of the fertility and mortality levels.

The article is published in three parts. The first and second parts discussed the size of the Parsi population, changes in the sex-age composition and the level and trends in mortality. This, the third and concluding, part deals with trends in fertility.

IN spite of the relatively rapid decline in the mortality of the Parsis during 1901-11, 1921-31, and thereafter, their rate of growth has been quite low. During the last two decades, the growth rate has, in fact, been negative. The explanation lies in a significant reduction in the fertility level that has occurred simultaneously with the decline in mortality.

The time trend in the fertility of Parsis can be analysed for nearly a century on the basis of three alternative but complementary estimates. These estimates include: (a) inter-censal birth rates during 1881-1931, estimated by adding the inter-censal growth rate to the death rates shown in Table 3; (b) annual birth rates for Parsis in Bombay (Greater Bombay since 1951) during 1901-70, based on municipal records and believed to be reasonably complete because most Parsi births take place in hospitals;[26] and (c) data on the average parity or the average number of children ever born to Parsi women who were interviewed in Greater Bombay during 1962 under the special fertility survey. The last set of data has the advantage that it permits an examination of the trend in fertility on the basis of the experience of women in successive cohorts.

Estimates of Birth Rates

The estimates of decennial average birth rates presented in Table 4 and annual birth rates presented in Figure 1, show a rather striking and steady transition from a moderately high level of fertility to quite a low level. The birth rate estimated for the period 1881-1901 was about 34 per 1,000 population. Forty years later around 1926, it was only 25, a decline by about one-fourth.[27] (The all-India birth rate during the latter period was 48 per 1,000 population, almost the twice the rate for the Parsis.) The difference between the inter-censal birth rates estimated from the census data and the decennial averages based on the registration data for Bombay is quite small. While the estimates for 1911-21 were identical, the all-India estimates for 1901-11 and 1921-31 were slightly higher than those for Bombay.

The decline in the Parsi birth rate has continued after 1931, as is indicated by the registration data for Bombay. The average birth rate during the 1960s reached about 12 per 1,000 population. In fact, the Parsis have completed their demographic transition so effectively (!) that their birth rate has been lower than the death rate for nearly 20 years now. The rate of decline of the Parsi population has been about one per cent per year but an unquantifiable part of it may be attributable to emigration and/or possible misclassification. The decline is partly due also to the fact that the children of Parsi women married outside the community are considered non-Parsis, although this would be compensated by the inclusion of children born to Parsi males married to non-Parsi women.[27A]

Some Refined Measures of Fertility

The limitation of birth rate as an index of fertility are well known; it is affected by the age composition of the population. I have, therefore, calculated the total fertility rate (TFR) and the gross reproduction rate (GRR). TFR refers to the average number of children that would be born to a cohort of women up to the end of their reproductive period under a situation of no mortality (i e, none of the women dies until the end of the reproductive period). GRR indicates the number of daughters that would replace the mother generation. Of course, a GRR of 1.0 (or unity) does not really ensure full replacement of the generation of mothers because some mothers would die before the end of their reproductive period.

The total fertility and gross reproduction rates for the period up to 1931 can be calculated somewhat indirectly with the help of the mean age of the fertility schedule ($\bar{m}$)[28] and the birth rates estimated from the census age distribution. For the period after the 1931 census, when the age distribution of Parsis is not available to estimate the total fertility or gross reproduction rates, I have used the data provided by the 1962 Survey of the Parsis in Greater Bombay. The estimates from the survey are based on the total number of children ever born to the cohorts of women who had reached the end of their reproductive period.

Women in the age group 65-69 at the time of the survey were in their prime reproductive period (ages 25-34, given the relatively late entry into marriage) around 1921-31, while the next younger cohort 60-64 can be considered in its prime reproductive period during 1926-36, and so on. The average parity of women in the age group 65-69 in 1962 is expected to approximate the total fertility rate for the period 1921-31.[29] On the same basis, one can attempt to estimate the total fertility rate for a period of 20 to 25 years after the 1931 census.[30]

The TFR and GRR values estimated from the census data as well as the survey data are shown in Table 4. It is noteworthy that the total fertility of women in age cohorts 65-69 and 60-64 appears to be very close to that estimated for the inter-censal period 1921-31. Such agreement strengthens the credibility of indirect estimates of GRR from census age data. These relatively refined estimates confirm the century-long process of decline in the fertility of Parsi women.

† Estimates based on the data collected under the sample registration scheme in rural India only.

Sources: Same as Table 3.

Between 1881 and 1931 the GRR dropped from 2.15 to 1.43, representing a decline of 33 per cent in fertility in 50 years. From the cohort data for Parsis in Bombay it is clear that this decline has continued. Women who reached the end of their reproductive period around 1961 — the age cohort 45-49 — did not even replace themselves; their GRR was barely one (0.98). The younger cohort in age group 40-44, which had nearly completed its fertility around 1961, had an even lower gross reproduction rate of only about 0.85.

A study of Parsis of Karachi by Elizabeth Gustafson provides some interesting data on the fertility of Parsis in Karachi in 1965.[31] According to this study, the total fertility of ever-married Parsi women in the age group 45-54 was 2.45 (implying a GRR of about 1.2); for the older cohort 55-64, it was 3.78 (GRR $\simeq$ 1.8). These estimates also suggest a substantial decline in the fertility of Parsis. Unfortunately, the data do not show the proportion of single women in the age group 45-54,[32] but if one assumes it to be about 15 per cent, the total fertility of all women in the age group 45-54 would be only about 2.1, implying a GRR barely above unity. The fertility of Parsis in Karachi appears to be very low, though perhaps somewhat higher than that of the Parsis of Greater Bombay.

Factors Responsible for Declining Fertility

The factors responsible for the low fertility of the Parsis can be understood by reference to the proportion of persons who get married and the level of their marital fertility. These two factors determine the overall fertility of any population in which illegitimacy is insignificant or non-existent. Both these factors can be evaluated by comparison with the fertility of Hutterites, members of a small community living in North America,[33] who do not use any contraception and who had the highest recorded marital fertility during 1921-30. An index of the proportion married (denoted symbolically as I_m), developed at the Office of Population Research of Princeton University, indicates the extent to which actual fertility would fall short of the highest

potential level because of non-marriage.[34] A value of 1.00 (unity) would indicate universal marriage between ages 15-49, and can theoretically be attained by a population in which every woman marries at age 15 and remains married up to age 50. Very low mortality during these ages and/or remarriage of widows are also necessary conditions. At the national level, this index has been observed to vary between the high value of 0.91 in Korea during 1935 and a low value of 0.31 in Ireland during 1900. The corresponding figure for India as a whole was 0.88 in 1961. As indicated in Table 5, for the Parsis in the Indian subcontinent, the value of this index declined from an average of 0.80 during 1881-1891 to 0.53 during 1921-1931; and among Parsis in Greater Bombay enumerated by the 1961 and the 1971 censuses, it stood at 0.48 and 0.50, respectively. In other words, because of late marriage or non-marriage the births to Parsi women resident in Greater Bombay in 1961 were only 50 per cent of the number that would have occurred if every woman were married throughout her reproductive period. Since about 1931 the index of marriage (based on currently married) has not fallen much. In part, the trend towards late marriage and non-marriage has been offset by the decline in mortality. The Greater Bombay data for 1961 and 1971, show proportionately fewer widows at each age compared to the earlier period.[35]

The decline in the value of I_m up to 1931 for the Parsis reflects a sharp change in the age of marriage as well as the proportion of women who remained never-married up to or beyond the end of their reproductive period. While in 1881, about 74 per cent of the Parsi girls aged 15-19 in the Indian subcontinent were married, the corresponding percentage was 19 in 1931 and only about 2 per cent in 1961 and 1971 in Greater Bombay. On the other hand, the proportion of women who remained unmarried until the end of the reproductive period (i e, up to reaching ages 45-49) increased from less than one per cent in 1881 and 1891 to nearly 10 per cent during 1931 and to over 18 per cent among the Parsis of Greater Bombay in 1961. This proportion was 17 per cent in 1971. If the 1971 data for Greater Bombay, based on the 20 per cent sample are considered fairly representative, the trend towards a decline in the proportion marrying seems to have been halted.

The shift in the age-pattern of marriage is reflected in the mean age at marriage of Parsi women; it increased from about 19 years around 1881 to 24 years in 1931 and to nearly 27 years in 1961 and 1971. It is, of course, likely that the postponement of marriage to an advanced age increases the chances of one's remaining a bachelor or a spinster. It is important to understand the reasons for delaying marriage or eventual non-marriage. In response to the questions related to reasons for non-marriage, during the 1962 survey, about 51 per cent of the unmarried men in the age group 20-69 reported low income and/or lack of accommodation as the main reason that had "stood in the way of" their getting married. Only 6.1 per cent reported a "dislike of married life" and 3.9 per cent were in that situation out of "consideration for the needs of the mother and/or other relatives." Among unmarried women, 16.7 per cent, disliked married life, and an almost identical proportion reported low income and/or lack of accommodation as the reason for their non-marriage; 11.4 per cent of the spinsters reported a "difficulty in finding a suitable match".[36]

It is sometimes suggested that the average level of education among Parsi women tends to be higher than among Parsi men and that this causes difficulty in finding a "suitable match". However, the 1961 and 1971 census data on the Parsis in Bombay suggest that the number as well as proportion of matriculates as well as degree holders was much higher among men than among women. Pursuit of higher education by members of both sexes would raise the age of marriage but would not necessarily lead to non-marriage altogether, unless the socio-cultural climate is conducive to it. The primary reason for non-marriage as well as late marriage appears to be related to the acceptable minimum standard of amenities for raising a family.

If one considers the fertility of only those who married before the end of their reproductive period, the number of children born to the married Parsi women during 1881-1931 appears to have been stable around 44 to 46 per cent of the number that would have been born if they had reproduced at the rates recorded for married Hutterite women. Thus marital fertility among the Parsis was substantially below the recorded maximum even around 1881. After 1931, it declined further; the 1962 data for Parsi women in Greater Bombay showed marital fertility of the order of only about 26 per cent of the maximum potential.[37]

It is difficult to provide any firm explanations for the low marital fertility observed around 1881. It would be difficult to attain marital fertility that is less than 50 per cent of the Hutterite level without some form of deliberate birth control. The explanations offered for the apparent relatively low fertility of Indian women in general (estimated to be around 60 to 70 per cent of Hutterite level during 1891-1931) include factors such as prolonged lactation, frequent separation of spouses, taboos on sexual intercourse on several ceremonial occasions.[38] The contribution of such factors to the reduction of marital fertility of the Parsi women seems unlikely to be significant. As for the possibility of voluntary control of fertility, the only available evidence is based on the data collected during the 1962 survey. According to the survey data, 96 per cent of women in age group 65-69, 94 per cent of those in ages 60-64 and 55-59, and 89 per cent of those in ages 50-54 and 45-49 reported that they had never practised any contraception or planned any pregnancy.[39] The data cannot be accepted at their face value. It is likely that the respondents did not answer the questions seriously. Perhaps the questions on contraceptive practice were not sufficiently probed and the use of non-mechanical means of birth control, such as coitus interruptus, may have been under-reported. Significantly, however, nearly 33 per cent of the women in the age group 30-34 reported some practice of contraception; this proportion was much higher than for the other segments of the Indian population.[39A]

Literacy and education are observed to be important correlates of not only delayed marriage but also of a reduction in marital fertility in almost all societies. The Parsis have enjoyed almost universal literacy for nearly five to six decades now. Further, the proportion of those educated up to high school has also steadily increased. Out of every 100 Parsi males aged 15 and over, nearly 55 in 1961 and 68 in 1971 were educated at least up to matriculation level. For females, the corresponding figures were 33 and 49 per cent in 1961 and 1971, respectively.[40] According to these data, in recent years higher education has spread faster among Parsi women than among males and therefore the gap between them has been narrowing. In fact, according to the 1971 data for Bombay, the percentage of Parsis educated up to matriculation level or beyond was almost identical among males and females aged 20-24; it was 85.2 and 84.4 per cent, respectively. Such widespread education plays an important role in raising the aspirations of the Parsis about the living standards or the quality of life to be provided to children and thereby in the promotion of the small family ideal. It also encourages a rational view of life, and an awareness and use of contraceptive technology to achieve family limitation. Even though the 1962 survey did not confirm a high level of practice of contraception, it is believed that conscious family limitation is widely prevalent among the Parsis.

Another possible reason for low marital fertility may be mentioned. The 1962 survey data indicated that among the ever-married cohorts, which had completed their fertility, between 13 and 16 per cent of the women did not produce any live birth. (In many other populations the percentage of such women is around 5.) One cannot infer what proportion of childlessness was due to voluntary control, i e, a conscious decision not to have any children, and what proportion was involuntary, i e, due to subfecundity or sterility. If the latter has been the case, it raises questions about the reasons for the high incidence of subfecundity or sterility. One factor which has been alluded to is the prevalence of consanguineous marriages or inbreeding. The survey data indicated that 14.3 per cent of the ever-married women had married their "own blood relations".[41] The incidence of consanguineous marriages among the older cohorts was somewhat higher than among the younger cohorts. The data do not show whether childlessness was higher among those couples who were related to each other than among non-related couples. However, the subject needs to be pursued further.[42]

Thus a decline in the proportion of married women as well as marital fertility has contributed to the remarkable decline in the fertility of Parsis. The product of these two factors, which indicates the level of overall fertility, suggests that the fertility of Parsis dropped from about 37 per cent of the maximum potential of Hutterite level in 1881-91 to about 13 per cent in 1961; a decline of 65 per cent in about 80 years.

On the whole, therefore, the transition among Parsis from moderately high level of fertility to low level appears to have been achieved first by a drop in marital fertility even prior to 1881, then by a shift in nuptiality or marriage patterns between 1881 and 1931; and since 1931 by a slow downward trend in both. Thus, the Malthusian methods of late marriage and/or non-marriage explain only a part of the downward trend in the fertility of the Parsis. The neoMalthusian limitation (low fertility through birth control) appears to have been prevalent among the Parsis even prior to 1881. It is clear that a large segment of the Parsi population in the 19th century had controlled its fertility without recourse to modern contraceptives. Since their mortality was effectively and progressively brought under control in the 19th century, the parents must have been able to perceive the effect of rapidly declining mortality in terms of survival of children. Given the 'Western' outlook of the members of the community and their high level of education, the parents perhaps desired fewer children to whom they would be able to give better opportunities for health, education and advancement in life. In a closely knit community these values became universally accepted and conscious and effective family limitation probably spread.

On an over-view it appears that the reasons for the recent decline in the size of the Parsi population of the subcontinent are a low mortality level matched by even lower fertility level as well as some emigration. These trends have led to very low dependency burden on the community as far as the young are concerned, but the proportion of the elderly in the population has been steadily increasing. Despite the general relative prosperity of the community, the aged have to depend to a great extent on the community charity, and continue to cause concern to the members of the community.

However, even greater concern is expressed about the dwindling size, and whether the community can check the downward trend through some pre-natal measures. Some leading Parsis have attempted to publicise the possibility of a total extinction of the community if the present trends continue into the future. However, if the population continues to decline at the annual rate of one per cent observed during 1951-71, it would reach one-half its present size around the year 2040, and one-fourth of the present size in the year 2110. Its eventual extinction, therefore, appears a distant although a distinct possibility.

Perhaps no great significance would be attached to such a possibility, but a reversal of the recent trends seems to be contingent upon a sharp alteration of the prevailing attitudes and values of Parsi young men and women. For the elderly Parsis or those in positions of leadership, a perpetuation of the separate identity of the community is likely to be a matter of more than sentimental importance. However, there is very little that they can do except perhaps to alter the restrictions relating

TABLE 5: ESTIMATE OF I_f, I_M AND I_g SINGULATE MEAN AGE AT MARRIAGE OF PARSI FEMALES IN INDIAN SUBCONTINENT IN BOMBAY: 1881-1931 AND 1961 AND THOSE BASED ON 1962 SURVEY OF PARSIS IN GREATER BOMBAY

Period	Indian Subcontinent				Bombay City			
	I_f	I_m	I_g	SMAM	If	Im^*	Ig^{**}	SMAM
1881-1891	37	.79	.46	19.13				
1891-1901	.35	.68	.52	22.06		.62		22.56
1901-1911	.27	.58	.46	24.21	.25	.54	.46	24.87
1911-1921	.25	.56	.44	24.44	.24	.55	.44	24.94
1921-1931	.24	.53	.45	24.43	.20	.55	.37	24.62
1961					.12	.48	.26	26.74
1971					.13	.50	.26	26.57

Cohort	Estimates Based on 1962 Survey Data			
	If	Im	Ig	SMAM
65-69	.24	.60	.40	22.52
60-64	.22	.57	.38	23.35
55-59	.19	.52	.37	23.73
50-54	.18	.50	.35	24.18
45-49	.16	.53	.31	24.18
40-44	.14	.50	.28	24.36

I^f = Index of overall fertility
I_g = Index of marital fertility
I_m = Index of proportion married
($I_f = I_m I_g$)

SMAM = Singulate mean age at marriage

* Martial status data for Bombay City in 1881 are not known, hence I_M for 1881-1891 could not be calculated.

** Annual births are known for the period 1901 onwards, hence no I_g values for the period 1881-1891 and 1891-1901.

Source : Leela Visaria. "Religious and Regional Differences in Mortality and Fertility in the Indian Subcontinent", Ph D Thesis submitted to Princeton University, March 1972. Unpublished.

to religious affiliations of the children born to Parsi women married to non-Parsis and to accept new converts to the faith. The possible impact of the latter measure is unlikely to be significant in view of the general trends toward a secular society in which religious rituals are found highly unattractive.

Another possible way of restoring some growth is by encouraging the young men and women to enter into marriage at an early age. A modest rise in the proportion of women marrying or some decline in the mean age at marriage might contribute to increasing the birth rate. In fact, in designing the 1962 survey schedules canvassed among the Parsis in Greater Bombay, the main objective was to understand the reasons for the increasing proportions of 'never married' persons among the Parsis. A variety of reasons such as financial problems, need to care for aged parents, non-availability of "suitable match", problems of living accommodation were put forward by young men and women as causing postponement of marriage. This knowledge of factors which lead to postponement and/or avoidance of marriage might help the community members to take remedial measures. The continuing trend towards increase in age at marriage of women and the proportion of women remaining single until the end of their reproductive period appears to have been halted between 1961 and 1971. This could be due to sampling errors in our 1971 census data, but if it is true, then the appeals and/or remedial measures of the community leaders seem to have some effect. Whether the age at marriage will actually decline or not in the future remains to be seen. An even more important determinant of the future trends in the size of the Parsi population would be the fertility of Parsi women who marry within the community.

Notes

26 For several decades now, the Panchayat has been collecting data on births from municipal records. However, in recent years, the Bombay Municipal Corporation has not been tabulating births by religious community. So the Panchayat appoints someone to go and collect information from the ward offices. It is possible, therefore, that some births are omitted or escape the attention of the recorders, although the error of omission is believed to be negligible.

27 The Government of India had set the target of birth rate of 25 for the Indian population to be attained by 1981. However, under the Fifth Five-Year Plan, the new target has been set at 30 birth rate to be obtained by 1980.

27A The number of marriages in which one spouse was non-Parsi increased from 3 such marriages per 100 marriages in 1950-1952 to nearly 11 per cent in 1968-1970. In recent years, the number of Parsi females marrying outside the community has tended to exceed that of Parsi males marrying non-Parsi females.

28 The mean age of the fertility schedule indicates whether fertility starts early or late among women in child-bearing ages. In the absence of data on the age pattern of fertility, the mean age of the fertility schedule can be estimated indirectly on the assumption that marital fertility follows a standard pattern. The standard fertility schedule for ages 20-49 is based on the average experience of a number of populations in which little or no birth control is practised. Since the censuses of the subcontinent have tabulated marital status by age, the age pattern of fertility can be calculated by multiplying the standard marital fertility schedule by the proportions of married women in each age group. For an extended discussion of the standard fertility schedule see: UN Manual IV, *op cit*, p 24.

29 Admittedly, the data pertain to the reproductive history of only those women who have survived to advanced age of 60 to 69. This might introduce an element of bias in the sense that their reproductive history might be different from that of those who did not live up to this age. However, according to the life table for 1960-62, 79 per cent of females are expected to live to age 65, so the bias, if any, is believed to be very small.

30 According to an analysis of the births that occurred during March 1, 1960 to February 29, 1962 in the Parsi General Hospital and the Parsi Lying-in Hospital in Bombay, none of the mothers was in the age group 40 and over. Quite probably, therefore, the effective reproductive period of the Parsi women ends by age 40.

31 Elizabeth B Gustafson, "A Demographic Dilemma : The Parsis of Karachi", *Social Biology*, Vol 16, No 2, July 1969, pp 115-127.

32 Data for marital status were presented in very broad age groups. Gustafson reported 21 per cent of the women in the age group 35-50 to be single.

33 For an account of the demography of Hutterites see: J W Eaton and A V Mayer "Man's Capacity to Reproduce: The Demography of a Unique Population", *Human Biology*, Vol 25, No 3, 1954.

34 Similarly, indices of marital fertility (I_g) and overall fertility (product of index of proportion married and index of marital fertility) (I^f), to which reference will be made later, can be calculated. For a discussion of the indices see: Ansley J Coale, "Factors Associated with the Development of Low Fertility: An Historic Summary", in United Nations, Department of Economic and Social Affairs, Proceedings of the World Population Conference, Belgrade, 30 August-10, September 1965, Vol II, New York: United Nations, 1967, pp 205-209.

35 Among the ever-marrying women, the proportion widowed and divorced during 1931, 1961 and 1971 in Greater Bombay was as follows:

Age	1931	1961	(per cent) 1971
20-24	1.9	2.5	—
25-29	3.3	1.8	0.5
30-34	5.1	3.6	4.0
35-39	12.1	4.8	3.2
40-44	17.0	7.6	5.4
45-49	31.5	13.8	10.4

36 Census of India, 1961, Vol X, Part X(1-D), *op cit*, p 22. The report does not show the total number of respondents to the relevant question.

37 The lowest marital fertility on record for any nation is that of 24 per cent of the maximum Hutterite rate for Sweden and Bulgaria in 1960. But both these countries attained this level in marital fertility when their index of proportion married (I_m) was above .60.

38 For an extended discussion see: Leela Visaria, *op cit*, Chapter IV.

39 Census of India, 1961, Parsis of Greater Bombay, *op cit*, p 25.

39A The percentage of Indian married women in the age group 15-44 using contraceptives was estimated to be 8.0 in 1969 and 13.6 in 1973. (According to the 1962 survey, the corresponding figure for Parsi women was 25.5 per cent.) The proportion using contraception in urban areas alone would, however, be higher than the all-India average. Source for figures for India: International Bank for Reconstruction and Development, "Population Policy and Economic Development", Baltimore, The Johns Hopkins University Press, 1974, p 196.

40 For the total population of Greater Bombay, only 20 and 73 per cent of the males and females, respectively, had received education up and beyond matriculation level in 1961. Similar proportions based on 1971 census are not yet available.

41 Marrying a person of "one's own blood relations" meant marrying relations as close as 'own mother's brother's or sister's son', 'own father's brother's son', 'own mother's father's sister's son', etc. See: Census of India, 1961, Parsis of Greater Bombay, pp 23-24.

42 One possible means of studying this subject might be a comparative study of Parsis having non-Parsi spouses. The requisite field study deserves serious consideration.

LOOK CLOSELY AT AMERICA!

SPAN does, every month. And you can, too. Through SPAN's eyes. Because you get the full story, pictures and color. Fifty-two pages each time.

Who writes for SPAN? Economists like Paul Samuelson, John Kenneth Galbraith and Milton Friedman.

For bold ideas, facts and expert opinion, look to SPAN. For stories about joint Indian-American business ventures, for developments in bilateral trade, for stories on what can be done about the world's food and energy crisis, for the American reaction to foreign investment in the United States, for all this and more—in the arts and sciences too—it pays to look to SPAN.

It's so easy to subscribe to SPAN Magazine. When you do you'll find out for yourself that America isn't just another country—it's another world.

Maharashtra's incentive package unwrapped

The Package Scheme of Graded Incentives makes all areas equally attractive.

"Grading"—an added advantage

Maharashtra's Package Scheme of Graded Incentives divides the State into 4 zones —the developed areas and the developing areas. All developing areas are graded according to existing circumstances and higher scales of benefits apply in areas which are relatively less favourably placed. For instance the Sales Tax Refund is offered for 6 years in certain areas but for 10 years in other areas.

Similar gradations apply to incentives like relief from incidence of certain rates (electricity tariff, octroi, water royalties, and non-agricultural assessment) and preferential treatment under the Government purchase programme.

And assistance—SICOM style

This scheme is implemented by SICOM —the people who work hard with expertise and guts. What's more, you can take advantage of SICOM's flexible financial assistance and plant location, project investigation and project implementation services. All given to you in SICOM style.

Avail of the Maharashtra Government's Package Scheme of Graded Incentives. Now!

For major maintenance, pull out the individual chassis and attend to it without affecting the rest of the motor control centre. You can even slip in a spare chassis to recommission the feeder. Downtime problems shrink instantly. Chassis of standard sizes are easy to order. Stock them for use when required. Type CA 1200 motor control centres are specially designed for process industries, power stations and large industrial plants.

FEATURES • Totally safe • Designed for aluminium cables • Very compact • Incorporates a complete range of L&T starters.

For more details please ask for leaflet SP 50055

"Somebody finally made Madras the perfect venue for residential conferences....."

For the first time, you can mix business with pleasure in Madras. The Taj Coromandel offers you all the facilities of a good hotel to make your conference a success. Then it goes one step further. It places the 8 th century heritage of Southern India within easy reach.

Everything is laid on for you. 240 comfortable rooms. A ballroom that takes upto 2,000 people. Two conference rooms. Bars and restaurants. Plus audio-visual equipment, microphones and display boards...everything right in the heart of the city.

There's something to do even after the conference is over. You can take time off to explore Southern India. Visit Tirupati, for instance. You'll be surprised how many people have always wanted to! Incidentally, only the Taj Coromandel can put even 100 rooms at your disposal at short notice. Which is more than other hotels can do. So come to Madras... before everyone else does.

Madras is connected to all important cities of India by direct flight. Calcutta, Bombay, Delhi, Bangalore...You've had conferences all over India. Now is your chance to have one in Madras.

Instant Reservations for the Taj Coromandel can be made through Hotel Reservation Service:

Delhi: Telephone: 44655. Telex-TAJ ND 2117.
Calcutta: Telephone: 443721. Telex-021-2185
Bombay: Tel. 292329. Telex-BY 2442.
Madras: Taj Coromandel Hotel, 5 Nungambakkam High Road, Madras. Telephone: 810441. Telex-041-7194

I have wounds on my body
which no one will heal.
But I have staffed
the world with doctors.

I rejoice to hear the
cry of a baby borning.
But I have heard it become
the whimper of hunger.

I walk in slush and mud
where no roads go.
But I have bound together
a nation with highways.

I flee my mud hut that
floodwaters crumble.
But I have taught man
to build
with prestressed concrete.

I am surrounded by children
with malnourished minds.
But I have given man
his first philosophy.

I watch my cattle die
when monsoons fail.
But I have dammed half
hundred rivers.

I was beaten down
by the invader.
But I have risen up
and embraced him.

I live in the fear
and crime of my slums.
But I have policed
peace in the Congo.

I speak in tongues that
number in their hundreds.
But the world has called
me a name: India.

I am sad.
But I am glad.
I am.

Where fastening is critical
'TVS' fasteners are the first choice

'TVS' high tensile precision fasteners are cold forged on the most modern machines.

They are heat-treated in a sophisticated atmosphere-controlled furnace — the first of its kind in India for heat treating fasteners — to ensure against scaling and surface decarburisation during process.

The 'TVS' fastener plant is the centre for pioneering indigenisation of the most critical fasteners hitherto imported into India.

Whether you order 'con-rod' bolts and 'counter-weight' bolts to be specially engineered to your design or 'collar screws' and 'studs' to specific ASTM standards for high temperature, high pressure applications or any fastener to meet critical dimensional, physical and metallurgical properties, specify 'TVS' — the most trusted high tensile fasteners in India today.

A Matter of Credibility

WITH the presentation of the supplementary budget on the last day of July, the current official flurry of what had been tom-tommed as anti-inflationary measures is evidently over. The contents of this so-called budget have revealed, as nothing else has, the basic cynicism of the authorities in tackling what is certainly the gravest crisis of the Indian economy since Independence. Despite the long preamble on the impelling need to counter inflationary forces — which took the Finance Minister at least six to eight minutes to read out —, not one element in the supplementary budget could even remotely be claimed to help restrain prices: the impact is likely to be of a quite contrary kind. Official spokesmen have admitted as much — that there would be a certain price increase following the presentation of the budget, even though they were too cagey to quantify the extent of the increase. The official spokesmen however have not stopped there. They have gone ahead and confided that the purpose of the budget was not to contain prices at all, thus at one stroke making nonsense of the Finance Minister's rambling discourse.

It is as well that the veil so assiduously sought to be drawn by the Finance Minister has been torn asunder by his own men. The objective of the supplementary budget was altogether narrow and short-term. The government is obsessed by an anxiety not to let the fiscal deficit for the current year exceed the figure mentioned in the regular budget presented in February, namely, Rs 126 crores. In the five months since then, several things have happened, and the general price index has jumped by close to 15 per cent. Food subsidies would now cost much more than was originally contemplated; the burden of various other items of expenditure on the current account would also be considerably in excess of earlier estimates; on the other hand, because of the near-stagnancy of the economy, revenue receipts have tended to fall off; the brutal crushing of the railway strike has been a pyrrhic victory and has only worsened the state of the Railway Board's parlous accounts. All these facts have forced the government to launch a series of exercises to slash public expenditure. Apart from certain symbolic reductions here and there, no sizeable cut in non-developmental outlays is evidently possible. It is a different matter with Plan expenditure, which will be subject to heavy reduction. Even that might not however save the day. Tapping the capital market via the captive banks and public financial institutions could of course be done, and the experiment repeated a number of times; still, that would be small beer. Little is going to be achieved in the way of financially disciplining the states; despite periodic admonitions, their drawal on the Centre's resources is bound to continue, political realities being what they are. In the circumstances, provision had to be made for some extra revenues. Hence the compulsion of the supplementary budget with its limited aim of raising a certain quantity of additional resources, never mind how.

Other constraints too are at work. Direct tax rates were lowered in the budget passed in the month of May. It would be awkward to go back on that now. The supplementary budget thus had to steer clear of direct taxes. The proposed enhancement in the rates of capital gains taxes is in any case not to be operative before April 1975; even then, the additional realisation would be only Rs 5 crores per annum. If one leaves out this one, there is not another item in the entire supplementary budget which could be described as a genuinely non-inflationary means of raising

has been on further indirect levies, mostly on key intermediate commodities. Even the 7 per cent impost on interest earned by banks from advances is to be passed on to borrowers. Official spokesmen have admitted that these indirect taxes are going to raise prices, but have added the rider that, in certain instances, middlemen might be persuaded to bear the additional levy either wholly or in part. This is a futile hope. By now, normal economic discipline has completely collapsed around the country. Those currently chalking up excessive margins from the distributive trade are in no mood to take a cut in their rate of profit-taking; consumers and users, given the pervading state of scarcity, are also perfectly willing to pay whatever price is demanded for commodities that are, or are likely to be, in short supply. The general impact of the indirect taxes introduced through the supplementary budget cannot therefore but be to raise prices across-the-board.

The authorities are unlikely to be unnerved by the prospect. They had set for themselves a limited goal, namely, to reduce the fiscal gap in the immediate period by a certain proportion. Since the new fiscal measures will jack up prices over the entire economy, the inflationary forces, now on rampage, will however not be restrained in the least; this being the case, even the government's narrow budgetary calculations will be set further awry in a few months. But such an outcome apparently is not worrying the government, which is now living from day to day and hour to hour.

Several conclusions would seem to be in order on this particular theme. The first concerns the fact of a conspicuous decline in administrative competence, for otherwise a more cogent attempt would have been made to bridge the inconsistency between what the Finance Minister stated in his speech introducing the supplementary budget and what official spokesmen had to say subsequently. A more important element to which attention is inevitably drawn is the overall drift of the government's package of measures announced in the past few weeks. In terms of fiscal impact, the major decision has been the one impounding one-half of additional dearness allowances becoming due and all fresh wage increases to be negotiated. The rest of the measures, including the freezing of dividends above a certain range and the re-introduction of compulsory savings, are in the nature of cosmetics, for the net withholding of funds would be only the inflation has been almost entirely foisted on the shoulders of the organised working class. Despite the many noises made at various official levels, there is not one measure for regulating the untrammelled flow of so-called black money, nor has there been any attempt to tap the huge excess profits currently being garnered by surplus farmers, traders and other professional groups, including contractors. It was announced with much fanfare that the big borrowal accounts of the major banks were being scrutinised. But no information has been forthcoming about the results of the scrutiny; no blanket order has gone out to slash these accounts by a certain percentage. The perfunctory rise in the lending rates will not even be an irritant. The stray raids organised by income tax officials have unearthed a paltry crore or two of hidden income, and that is about all.

The Prime Minister has gone on record that she is not thinking in terms of price controls because such controls are not enforceable. It all depends upon the definition of enforceability, and the degree of enforcement one is looking forward to. On several occasions in the past, maximum prices were clamped down with respect to a wide number of commodities. Everybody knew that these ceilings on prices could not be enforced to the hilt; their mere existence however helped to create an environment of restraint. Even where breaches took place, they did not assume a runaway character. In contrast, one has only to refer to the kind of extraordinary things currently happening in the country with regard to the prices of foodgrains, vanaspati, sugar, cement, steel, paper, textiles, soap and so on. The government has simply withdrawn from normal economic administration; traders and manufacturers are being allowed to charge whatever they like. It is a complete free for all.

Even if only for the sake of record, the government has to be told that it is altogether on the wrong track in its search for instant solutions to the problem of inflation, and that the kind of disciplining of demand it is bent upon will not even touch the fringe of the problem till as long as there is no disciplining of the elements operating on the supply side of the phenomenon. It has also to be told that its pretensions of controlling prices cannot but sound hollow in a context where it itself, through its own acts and decisions, stokes the fire of inflation; there must be a modicum of internal consistency among the measures it initiates before it can either attain its goals or even succeed in convincing others that it is

In recent weeks, a number of statements have been made by important political functionaries, beginning with the Prime Minister, stressing the imperative need to raise the direct impost on agricultural incomes. But nothing concrete has been done to bring recalcitrant state politicians in line. Already the Punjab, Haryana, Tamil Nadu and Maharashtra chief ministers have reportedly conveyed their sense of dismay to New Delhi at the loose talk going on of taxing agriculture, as that might, according to them, adversely affect incentives. For public relations reasons, one or two states might be persuaded to raise a few crores of rupees through adjusting the rates of land revenue or irrigation levies. The totality of the problem would still remain what it always has been. And yet, on a rough reckoning, simply as a result of the rise in farm prices in the past two years or so, the net additional incomes that have accrued in the hands of surplus farmers and traders handling farm products must be in the neighbourhood of Rs 5,000 crores. These are incomes which have partly gone to swell the flow of so-called black money in the system. These funds are also increasingly being used to ensure that stocks are held back from the market, thus further raising farm prices. To siphon away, through tax measures, a part of this pile of rural income would thus not only lead to an accretion of public revenue; it could also strike a major blow for the containment of inflation by restraining the reserve demand for farm products, particularly foodgrains, which is at the root of the current price spiral.

The burden of direct taxation on agriculture, which ten years ago was at least above 1 per cent of income, has now touched the low level of barely 0.6 per cent. Even were the Raj Committee's recommendations to be shoved aside, it is not at all impossible to evolve a graded system of land revenue which could raise this proportion, at one go, to 2 to 3 per cent of aggregate farm income. This relatively simple operation could have yielded something like Rs 300 to 400 crores of additional income annually to the government, and to that extent put some purchasing power out of harm's way. Any such measure would also have helped to restore the credibility of the government. At the moment, nearly everybody, beginning with the surplus farmer down to the poorest consumer, is convinced that the authorities will not lift one little finger to restrain the rich agriculturist-cum-trader. And in this matter, the Union government is not as helpless as it professes to be. With the exception of Tamil Nadu, practically all other chief ministers in the country occupy their offices at the pleasure of the Prime Minister; she can insist that they do something substantive in the way of rural taxation. Moreover, the Prime Minister herself has stated that the current Emergency is in the nature of an economic emergency. Under Article 353 of the Constitution, during an emergency, notwithstanding anything else in the Constitution, the executive power of the Union could be extended to giving directions to the states as to the manner in which the executive powers of the latter are to be exercised, and, furthermore, the power of Parliament to make laws could include power to make laws in respect of even such matters as are not enumerated in the Union List. Given the provisions of this Article, it is well within the prerogatives of the Union government simply to direct the states to raise the impost on agriculture severalfold; no legal impediments stand in the way.

The Prime Minister has made a declaration of intent to raise farm taxes. In terms of Article 353, nothing prevents New Delhi from translating this intent into reality. It could be maintained that, even were the Union government, under the powers given to it by the emergency provisions, to legislate for increasing sharply the rates of agricultural taxation, since the state governments are to collect the proceeds of the taxation, their reluctance could make the endeavour infructuous. Attention could be drawn in this connection to the fiasco of the take-over of wheat trade last year. Ultimately, therefore, the issue resolves itself into the willingness of the government to have a political confrontation with the rural rich. The Union government has given ample evidence that it is not at all reluctant to have a confrontation with the organised working class; it has also provided ample evidence that it is not overly concerned with the plight of the landless labour, the small peasantry and even the fixed income-earning middle class. The community has waited long enough for similar evidence that it is not scared of a confrontation with the entrenched power structure in the countryside, consisting of those who are reluctant to pay taxes and equally reluctant to hand over to the state even a minuscule proportion of the grains they raise with the help of bounties offered them by the state itself in the first place.

The key to the containment of inflation in an economy such as India's, where the food budget still overshadows the cost of living, lies in the regulation of foodgrain prices as well as in taxing away the excess profits in agriculture. The regulation of foodgrain prices, in its turn, depends upon a realistic policy of procurement prices and a determined bid to procure a crucial quantity of the grains for being funnelled through the public distribution system. The Prime Minister owes it to herself as much as to the electorate to find out how is it that, despite the considerable strides made in foodgrain production and the considerable rise in procurement prices, the proportion of public procurement has steadily declined in the course of the past decade. If she really so intends, it would also be easy for her to identify the measures needed to revive the procurement effort. What is however most called for is a recognition that the various policies for restraining prices — and stimulating growth — have to be integrated with one another. For taxing rural resources belongs to the same genre of problems as enforcement of a realistic public distribution policy. A government which fails in the pursuit of the one will also fail in the other. At this juncture, therefore, the rationale of a policy of growth is identical with the rationale of containing inflation, and both converge on a policy of containment of the privileged sections.

Balance of Payments Quicksands

IN the first half of 1973 any forecast of a serious foreign exchange crisis would have been regarded as an example of scare-mongering. The suggestion, made in these columns in last year's Special Number (pp 1375-9), that we would soon be forced to draw heavily on the IMF might have sounded unnecessarily alarmistic. But, as things have turned out, we have borrowed from the IMF to the tune of Rs 370 crores; also, it is becoming clear that even the foreign exchange reserves thus augmented would be inadequate to meet the demand for imports. The gravity of the balance of payments situation has not altogether escaped the government, as is evident from its attempts to keep in check imports of a number of commodities, especially petroleum crude and products.

The government's public stance, however, continues to be that the foreign exchange position is quite comfortable and that it would be possible to see the current year through without much difficulty. The export figure of Rs 2,450 crores for 1973-74, showing a growth of over 25 per cent over the previous year, may seem to lend substance to this confidence. Since the growth of exports in 1972-73 had been almost as high, at over 22 per cent, it might be tempting to conclude that the export sector has achieved a breakthrough in terms of sustained high rates of growth. Data for the first three months of the current year, i e, April-June 1974, show a further nearly 40 per cent rise in exports to Rs 643 crores as compared with Rs 460 crores in April-June 1973.

Considering the overall performance of the economy, the surge in exports, it is true, is about the only silver lining on the horizon. Even so, the export figures call for a second look. First, the accuracy of the export data is still in doubt. None of the series of committees appointed to examine the export data has pronounced judgment on whether the data as compiled and published by the DGCIS can be taken at face value and, if not, by what margin they should be deflated to give a reliable idea of export performance. The Reserve Bank's balance of payments data, which should have served as a check, have been getting more and more delayed; the latest data we have are over two years old. Second, DGCIS figures for the first 11 months of 1973-74 show exports to Bangladesh, which are mostly financed by loans and grants, of only about Rs 50 crores. The DGCIS, it may be recalled, had recorded exports to Bangladesh of only about Rs 70 crores in the first 11 months of 1972-73 while for the whole of 1972-73 these exports were placed at Rs 157 crores. It would be possible to assess the inflation of the export figures for 1973-74 on account of exports to Bangladesh only after the details of country-wise exports become available. Finally, there is a significant element of inflation in the value of exports because of the devaluation of the rupee; the trade-weighted depreciation of the rupee during 1973-74 is unlikely to have been less than 5-6 per cent over 1972-73.

As in 1972-73, the striking export growth in 1973-74 was largely made possible by the sharp rise in the unit values of exports. Exports of cashew, for instance, at 52,323 tonnes were actually lower by 13,955 tonnes than in 1972-73, but in value terms they were higher by about Rs 6 crores. Similarly, exports of coffee increased by about 4 per cent in quantity and by over 35 per cent in value. Exports of spices in 1973-74 were 81 per cent higher in value and 26 per cent in quantity. Ex-

ports of marine products touched an all time high in 1973-74 of 52,279 tonnes valued at Rs 89.2 crores as against 38,903 tonnes valued at Rs 59.7 crores in 1972-73. Frozen shrimp was mainly responsible for this spectacular export growth of 34 per cent in quantity and nearly 50 per cent in value. Exports of cotton textiles were substantially higher at Rs 238 crores in 1973-74 as against Rs 160 crores in 1972-73. Unit value realisation of most cotton textile goods was markedly higher — especially of piecegoods, the unit value of which was almost 40 per cent higher. However, sugar is perhaps the most outstanding example of rise in prices. Exports during October 1973-April 1974 amounted to nearly 1.5 lakh tonnes as against only 33,000 tonnes during the corresponding period of the previous year. The free market prices, at which a large proportion of Indian sugar exports were made, were on average four to five times the support prices earlier offered by the UK under its Commonwealth sugar quota. These few cases bring out the extent to which the inflation in world commodity prices has benefited our exports. Taking all exports, the rise in unit value realisation was about 11 per cent in 1971-72; in 1973-74 it is unlikely to have been less than 15-17 per cent.

It needs to be added, however, that if the growth in India's exports in 1973-74 is viewed against the growth of overall world trade, the picture is not all that attractive. India's share in world trade has been consistently declining for many years and this trend continued in 1973. While world exports increased by a record 37 per cent in 1973, Indian exports rose by 25 per cent in 1973-74. Similarly, the rise in average unit value of exports (in dollars) was about 20 per cent for Japan and Western Europe, whose exports consist almost entirely of manufactured products, and about 18 per cent for all developed market economies. India's exceptional export growth in 1973-74 was thus largely the result of a spectacular growth in world trade, both in terms of quantum and unit value.

The continually falling trend in our exports as a proportion of world trade points to the country's weak response to the emerging opportunities for export. India is nowhere near Japan or most of the West European economies that have achieved tremendous growth in their foreign trade over the last two decades and in whose case foreign trade has been an engine of growth of considerable importance. The growth in India's exports in the last two years is very largely the result of fortuitous circumstances, in addition to aid-financed exports to Bangladesh and some statistical manipulation by the DGCIS. Our performance in jute exports, for instance, has been largely the result of setbacks suffered by the jute industry in Bangladesh and the steep rise in petroleum prices which has made synthetic substitutes less competitive. Our jute exports may well cross the Rs 300-crore mark in 1974-75, but that would be entirely due to lower acreage under jute in Bangladesh and the floods that have damaged a part of even this smaller crop. To take another example, the rise of 40 per cent in total exports was almost entirely due to the Rs 171 crores worth of sugar exports since April 1974. Exports of oilcakes in 1973-74 were similarly aided by the poor world crop of oilseeds and the Peruvian fish meal crisis. Both these had profoundly influenced the world protein market last year but are unlikely to be operative in the current year. No country can, however, afford to depend on fortuitous circumstances to earn the foreign exchange needed to finance not only the so-called essential 'maintenance' imports but now increasingly also larger quantities of foodgrains and edible oils as well as petroleum products and fertilisers.

However, most of the government's efforts to strengthen the export sector of the economy have all along lacked an effective strategy. What passes now for export promotion suffers from the absence of any sense of direction and is largely an arrangement for sharing spoils which are appropriated by a few parties who heavily influence the government's export promotion policies. Cash subsidies, import replenishment, export promotion tours abroad and numerous other wasteful activities financed by the Commerce Ministry's market development fund have cost the country several hundred crores of rupees in the last two decades without resulting in any corresponding increases in exports of the products concerned. It is time the government realised that the investment costs and gestation periods involved in promoting exports of highly sophisticated manufactured products are much higher than those involved in promoting exports of such items as marine products, leather manufactures, clothing and fruits and vegetables. With a relatively small investment and within a short period, exports of marine products increased almost three-fold from Rs 31 crores in 1970-71 to Rs 89 crores in 1973-74. Similarly exports of garments have risen spectacularly from a mere Rs 7 crores in 1969 to about Rs 87 crores in 1973-74. Had the government spared even one-half of the amount of foreign exchange annually allocated for import replenishment licences for engineering goods exporters, exports of marine products would have been considerably higher than even the current levels. Besides, some export activities, like marine products and clothing, being relatively more labour intensive have the added advantage of being employment-oriented. While continuing its efforts to develop exports of manufactured goods on a long-term basis, the government should turn its eyes to quick and high-yielding export sectors. Given that investible resources would continue to be scarce, thereby keeping the overall growth of the economy as well as exportable surpluses at low levels, the least that the Commerce Ministry can do is to channel the limited resources at its disposal to stimulate those export sectors which require relatively low levels of investment, imported inputs and cash subsidies and are also characterised by shorter gestation periods.

Turning to the foreign exchange prospects for the current year, the situation is fairly grim. Foreign exchange availability has no doubt been strengthened by three drawals on the International Monetary Fund under the compensatory financing facility, the gold tranche and the first credit tranche. At the current exchange rate, the addition to foreign currency reserves has been slightly over Rs 370 crores. The Reserve Bank's holdings of foreign currency reserves in August 1974 were around Rs 680 crores and if the government's holdings are added to these, total foreign currency reserves are likely to be in the range of Rs 750-780 crores or roughly Rs 280-300 crores higher than at this time last year. To this may be added net accrual of foreign assistance after meeting debt liabilities. According to a recent assessment by the Ministry of Finance, "judging by the encouraging aid trends, foreign aid availability this year would be higher by Rs 50 crores than the budget estimate of Rs 552 crores". It is not clear, however, whether this figure of Rs 602 crores includes the short-term credits made available by Iran and Iraq for imports of crude oil. Even by optimistic accounts the total saving of foreign exchange on account of these short-term credits is unlikely to exceed $ 200 million during the current year. Thus net availability of aid, after meeting debt obligations, is unlikely to exceed Rs 250 crores this year.

According to the preliminary DGCIS figures, imports in 1973-74 at Rs 2,636 crores rose by 44.3 per cent over 1972-73, resulting in a big trade deficit of Rs 220 crores. Actual imports in 1973-74 are expected to be even higher as the final figures of imports of petroleum and petroleum products were not yet available when the above figure of imports was announced. According to informed estimates, the final import figure is expected to be around Rs 2,850 crores, reflecting an increase in imports of nearly three-fifths over the previous year and revealing a huge trade gap of Rs 400 crores.

That the drawals on foreign currency reserves in 1973-74 were rather lower than indicated by the trade deficit is primarily on account of three factors. First, the trade surplus with the East European countries came down sharply in 1973-74, reflecting increased import reliance on these countries. While exports to these countries increased marginally from Rs 419 crores during April 1972-February 1973 to Rs 428 crores during April 1973-February 1974, imports from them increased from Rs 194 crores to Rs 312 crores. Secondly, it is likely that a part of the steeply enhanced payments for crude imported by the foreign oil companies might have spilled over into the current year. The situation on this account is now likely to become difficult as the oil companies have refused to import crude on credit and are insisting on payment much before the oil lands in the country. Lastly, an appreciable amount of foreign exchange that usually leaks into the financing of activities like smuggling appears to have flowed into official channels, as profits in these activities, and gold smuggling particularly, have come down.

Imports in the current year are likely to go up further for several reasons. Procurement of foodgrains from the summer crop has been miserably low at about 1.6 mn tonnes as against 4.5 mn tonnes last year. Taking into account the present meagre stocks of foodgrains with the government and the uncertain prospects of the winter crop, imports this year will have to be at least of the order of 4-5 million tonnes. The government has, since April this year, already purchased abroad 1.52 million tonnes of wheat and 0.43 million tonnes of milo at a cost of about Rs 225 crores. Including freight charges, the landed cost of this grain would be around Rs 285 crores. Foodgrain prices abroad are unlikely to come down further and import of an additional 2.5 million tonnes would cost around Rs 375 crores, including freight. Thus imports of foodgrains would cost over Rs 650 crores this year, or Rs 200 crores more than last year.

Imports of petroleum crude and petroleum products will cost around Rs 1,000 crores in 1974-75 so that the additional foreign exchange cost under this head would be around Rs 50 crores. Though because of the worldwide shortage, fertiliser imports on the required scale may not materialise, the steep rise in international fertiliser prices might involve an additional foreign exchange outgo of about Rs 150 crores. According to a recent government statement in Parliament, imports of steel against orders already placed would be 1.13 million tonnes during the year. Steel imports would be thus around Rs 350 crores this year or about Rs 100 crores more than last year. Though non-ferrous metal prices have come down from their recent high levels, the actual import bill is unlikely to come down very much as the prices that are likely to rule this year are unlikely to be much lower than the average prices paid in 1973-74. Moreover, the MMTC has a number of long-term import deals at already agreed prices.

BARODA RAYON

INTRODUCE

NYLON YARN

Baroda Rayon Corporation, have taken rapid steps ahead, adding a turnover of 2,100 Tonnes of the World's finest quality nylon yarn. In collaboration with the world famous Snia Viscosa of Italy, one of the most modern nylon plants is now set up at Udhna under the supervision of foreign experts, manned by a team of Indian Engineers trained abroad.

To Baroda Rayon, it is like another sword in their sheath, next to their rayon plant in collaboration with Asahi Chemical Industry Co. Ltd., of Japan. Baroda Rayon are the first to produce 30 and 40 denier rayon yarn in the world with entirely indigenous know-how.

BOMBAY - 400 001.

Considering the trend of prices in the developed countries as projected by the OECD, the cost of import of manufactures would go up by at least 10-15 per cent, even without any increases in the quantities imported. The domestic trends in production of a number of important products such as oilseeds, cotton, etc, are not favourable and so one should not rule out the possibility of an added burden on account of imports of these commodities.

Though actual imports during the current year will finally depend on the availability of foreign exchange, the above tentative and crude exercise indicates that if imports are to be maintained even at the present levels or at levels calculated to ensure the minimum domestic supplies of some of the essential goods, total imports during the current year would be around Rs 3,800-4,000 crores. Against this export realisations are likely to be around Rs 2,600 crores, according to the Commerce Ministry's targets for 1974-75. This would leave an uncovered gap of about Rs 1,200-1,400 crores. As noted above, net aid this year is unlikely to be more than Rs 250 crores, leaving a trade gap of Rs 950-1,150 crores which is much larger than the current levels of the government's foreign currency reserves.

It is obvious, therefore, that the government would be forced to resort to further drawings from the IMF both under the second credit tranche and the cost of oil facility. However, it would be better to ask for a standing credit from the IMF as borrowing under this would not be as costly as under the oil facility. Whatever be the manner in which the government finally decides to meet the grave foreign exchange crisis, the situation demands serious rethinking by the government of its economic policy. How long can it pursue policies that are pushing the country into ever-increasing international indebtedness of a type that would soon kill the nation's will to survive through its own efforts and achieve self-reliance?

PERSPECTIVES

Maze of Manipulative Politics

(Contributed)

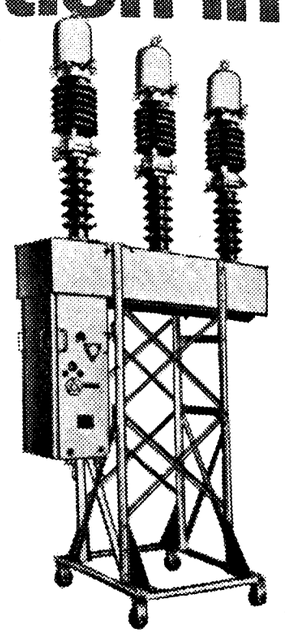
THE outcome of the Presidential election was predictable. As events have begun to turn out, all elections in the country are reduced to inconsequential episodes. Across the country, there is a phase of suspended animation as low-order manoeuvrings circumgyrate such elections. That phase soon ends, and a left-over of unspent passion fills the air. The Presidential election just ended falls into the same pattern. It would provide no catharsis for choked political emotions; as the result is announced and the new incumbent moves into Rashtrapati Bhavan, the course of Indian politics would remain what it has been during these past years.

By now the Congress party is an entity pivoting around a single individual. This is an extraordinary situation — and an unprecedented one. Not even during the hey-days of Jawaharlal Nehru was his dominance over the party so complete and awesome as it is today in the case of his daughter. One could go some decades further back into history: not even Mahatma Gandhi during the 1920s and 1930s could exercise such a total command over the Congress organisation as Indira Gandhi is currently exercising. The tragedy, from the point of view of the nation, lies in the fact that this authority is being wielded for a purpose which is totally vacuous. Mahatma Gandhi's dominance over the Congress half a century ago coincided with the emotional peaking of the Indian national movement. Throughout the 1950s, the charisma of Jawaharlal Nehru was utilised to articulate a bold new framework of international relations and to propagate, however imperfectly, the postulates of planned economic growth in the domestic sector. In contrast, Indira Gandhi's absolute supremacy in Indian political affairs is being deployed with an altogether negative intention in mind. It is the only bulwark preventing the Indian National Congress and its wobbly super-structure from being swept aside by the tidal discontent of the masses.

However hard the Prime Minister might now try to reverse the image of her party, it is perhaps already too late. She herself is trapped by the maze of manipulative politics which thrives on an intricate arrangement of spoils. It is not necessary to question her personal credentials. It nonetheless needs to be pointed out that the kind of political opportunism she has sought to make respectable is disastrous for economic management. The worst features of parliamentary democracy have become the stock-in-trade of her system of operations. It is a syndrome of political privilege and economic power crudely exchanging for money. Once you are waylaid by it, the manoeuvrability for economic growth is irretrievably lost. For the processes of the government are then used, nearly exclusively, to placate particular interests, for example, through lowering or abolition of taxes, or through assorted programmes of loans and subsidies, or through doctoring the terms of trade in favour of select groups and sections. This arrangement is, to say the least, corrosive of national economic discipline, including the discipline necessary for fostering and advancing national savings. Since it has also led to a decline in national ethics the sustenance of the Indian National Congress in power has resulted in a grim pay-off for the nation.

Till as long as the Prime Minister cannot be weaned away from her current predilection for shot-gun politics, the pull of her personality will continue to be exercised for frivolous causes, and not for any concerted programme for either accelerated economic growth or for a greater egalitarian order. Unfortunately, the alternatives available to the community at large are equally uninviting. Parties further to the right of the Indian National Congress have little prospect of flourishing in Indian conditions, for it is impossible to negate the objective laws. Given the present structure of economic and political institutions, the *deus ex machina* of *laissez faire* will not only fail to attract the loyalty of the large masses of the Indian electorate; it will also be incapable of realising the minimum economic and social objectives that the nation might set for itself. The leaders of the Jan Sangh have understood this point well, and have tried to substitute a blend of obscurantism with a cosmetically more elegant economic programme. Even that is unlikely to capture the imagination of the electorate on a national scale, and the party will find it enormously difficult to get rid of its identity of association with the Hindi belt. The rest of the parties belonging to the right echo individual or sectional interests and lack the genius to sustain themselves either over time or over space. Repeated attempts at rightist consolidation — such as the one currently being spearheaded by Charan Singh — are bound to fail for precisely this reason: there can be no permanent binding of these disparate personal or sectarian ambitions.

The hinterland was much more propitious for a purposive push by the leftists. The various shades of political attitudes ranging between those of the Congress and of the Communist Party never constituted a substantive element in the Indian political milieu, apart from those who, once upon a time, decided to follow the flag of Ram Manohar Lohia. The latter represented a mixed-up category, combining their fierce allegiance toward populism with obscurantist ideology often resembling those propagated by the Jan Sangh. As the underlying economic issues gradually got clarified, many of them drifted to their natural habitat, either in the Congress or in parties even more conservative. Some of the rest, who genuinely adhered to the ideological left, would — one could have expected — soon have found themselves in the Marxist camp. This would have been the normal denouement if only the mainstream of the left movement spearheaded by the two communist parties could exhibit a greater integrity in thought and action. A certain streak of nihilism would however seem to have affected the communist movement right from the moment when its potential for growth and consolidation ought to have attained the peak following the rapid deterioration in the nation's economic conditions in the early 1960s. From that point on, it should have grown at an exponential rate; instead, it bogged down and splintered itself following a crisis of identity. This crisis coincided with its endeavour to define with precision its national and international roles. When the CPI(M) separated from the CPI in 1964, the rupture was basically on an international issue; it is only because of subsequent developments that the Marxists now find themselves reduced to the status of a genuinely national party free from external commitments. One is not sure that the party is deriving any particular serindipity from this development; for if the Marxists are today bereft of any international links, it is not on account of any lack of trying on their part. Be that as it may, their present status should enlarge the possibility of the Marxists formulating independent attitudes on foreign as well as domestic issues exclusively in terms of the interests of the Indian working class.



The situation in which the Communist Party of India finds itself is much more complex, as vividly exemplified by the contortions it has had to undergo in connection with the Presidential election. Its affiliation to Moscow remains as strong as ever. Therefore, it is unable to relegate to the background the international implications — more specifically, the implications for Soviet foreign policy — of any decision it might be called upon to make on a domestic issue. The party has made up its mind that the programme of a national democratic front is worth being persevered with. In its judgment, the split in the ruling party in 1969 has opened up the possibility of a gradual convergence between the ideologically progressive sections of the Congress and the left movement in the country. Once one grants such a prospect, one also has to reorganise the distinct possibility of a convenient telescoping of the national democratic revolution. This is an option which, according to the party, must by all means be kept open. Its reluctance to combine with the other left groups in the country for resisting the current bout of onslaught against the working class unleashed by the Prime Minister is explained by this dilemma of decision-making. The CPI is hoping that the Prime Minister's drift to the right is a temporary phase which is bound to pass away and that objective circumstances will once more compel her to turn to a leftward economic policy. It could indeed be that, in arriving at their decision, the leaders and cadres of the CPI have not sacrificed the integrity of their dialectical judgment. There is however scope for a lurking suspicion that if the CPI's international affiliations were not what they are, its attitudes on domestic issues and lines of action would perhaps have been somewhat different. For there is hardly any getting away from the proposition that, because of the compulsions of its foreign policy, Moscow cannot for the present afford to alienate Indira Gandhi and her Government, and because Moscow cannot afford it, the CPI too has to fall in line.

When the annals of India's political evolution in the 1960s and 1970s are written, this phenomenon will no doubt be widely commented upon for, since hindsight could only confirm the fact of the great opportunity surrendered by the communist movement in the country during this period. Whether the CPI's perseverence with the national democratic front will be appropriately rewarded remains a wide open question. At least, some of the recent trends within the Congress party strongly suggest that the prospects are otherwise: a party given to crass worship of the mammon is an altogether unlikely vehicle to ride for ushering in a meaningful social revolution. In contrast, if only the two communist parties had combined, there was a time in the late 1960s when they could have provided a viable national alternative to the Congress. In 1969, the two parties, either on their own or with the support of their very close ideological allies, had a majority in the state legislatures in Kerala and West Bengal. If they could have forgotten their respective international commitments as well as their mutual, largely subjective, animosities, it was given to them to blaze a trial, and establish an ideologically-oriented model of administrative behaviour in the two states. The rest of the nation would then have taken up the cue. For once they had launched along this direction, the Indian National Congress, then badly split down the middle, would have been unable to stem the tide. Given her as yet precarious hold at the Centre, Indira Gandhi would have been left with little alternative, and would have accepted the arrival of the communist experiment along these shores. Besides, in the Indian climate, nothing succeeds as much as mythology. Once the story of an alert, effective, honest-to-the-core administration run by the communist parties in the states of Kerala and West Bengal had spread across the land, an emotional upsurge all over was distinctly conceivable, and even the strongest citadels of backwardness and obscurantism could have fallen. Such an opportunity is rarely if ever repeated in history. Those who are enamoured of theses imported from outside, and those who abhor the sharing of power with certain hypocrites, could very well ponder over the particular tragedy that has overtaken the Indian masses by virtue of the sectarian stances struck by them.

Frustration manifests itself in several ways. The adventurism the Naxalites broke into merely contributed another droll episode to the Indian political scene. Despite their many sacrifices, by now that too is a minor, fading footnote to history. Jayaprakash Narayan's current effort represents yet another facet of desperate romantic strivings to salvage the polity. But one still fails to see it as a credible, viable, alternative course for redeeming the nation and reviving its urges. The groping continues; as of now, no light is to be seen beyond the tunnel.

MOST SOUGHT AFTER CIRCUIT BREAKER!

More than 1300 MEI 33kV OCBs are in operation in India alone!

MEI 33kV Minimum Oil Circuit Breakers are the largest selling breakers of their type in India! Why? Because, each MEI 33kV Circuit Breaker houses an efficient, compact operating mechanism made up of easily replaceable parts for quick overhaul and maintenance. Consuming less oil and competitively priced MEI 33kV Circuit Breaker is the prime choice of Electricity Boards and Industrial Establishments in India.

With their exports to countries like Sudan, Kenya, etc., MEI 33kV Circuit Breakers have established global acceptance!

MEI *safest for everything in electric power control*

Manufactured by:
THE MYSORE ELECTRICAL INDUSTRIES LTD.,
Bangalore.

Sales & Service:
I.A.E.C.
BOMBAY PVT. LTD.
43, Dr. V. B. Gandhi Marg, Bombay-400 023.
Branch: New Delhi.
Associate Offices. • Bangalore • Calcutta (Branch: Gauhati) • Hyderabad • Madras (Branches: Madurai & Ernakulam).

Calcutta Diary

A M

DO I dare forsake my faith, do you dare forsake yours? Two-thirds of the nation, a minister apologetically confesses in Parliament, have now slipped below the so-called line of poverty. A decade ago, barely one-half were below this line. Nonsense, says the Prime Minister, stepping in to correct her somewhat awestruck colleague: She constantly travels and addresses crowds all over the country and those flocking to her meetings invariably look better fed and better clothed than they did in the past. The public distribution system, you and I see, has all but flopped, which is why food prices keep soaring. Nonsense, says the Union Cabinet minister, we are running the show all right — even though there has been little domestic procurement — with the help of imported grains; nonsense, echoes the Prime Minister, the current crisis has nothing to do with the failure in food distribution, it is all because of a genuine deficiency in output. There is great distress in the countryside. Men, women and children are trekking towards urban pockets in search of food, a large number of deaths from starvation have taken place, claim those who are politically arrayed against the Government. Nonsense, says the Government spokesman, only a trickle are coming to the towns and cities; besides, some distress about this time of the year is normal in the countryside, the reported deaths from starvation are nothing of the kind, they are only fatalities induced by malnutrition, and, anyway, committees are being set up to investigate these reports. An unemployed stenographer chooses death to the pangs of hunger; he slashes the throats of his children, feeds poison to his wife, and swallows it himself: please feel assured, the police have registered a case of murder and attempted suicide against both husband and wife. Unless prices are held back, ruination stares the nation in the face, argue the part-time economists and the wholetime housewives; wrong, the ministers patronisingly point out, you cannot simply apply a brake on prices: that is neither feasible, nor healthy, for haven't you heard the Prime Minister say that if prices fall, unemployment will increase? Rather, you have to attack the problem from the other end, by controlling income and demand. But you are controlling the demand and the income of the wrong people, bitterly complain the trade union leaders.

The issue is thus joined. These leaders lack foresight: they are, in addition, self-seeking and unpatriotic. Who says so? I, says the minister, and the henchmen applaud from the sidelines. Clarify your postulates, how do you define what patriotism is? Don't you know, says the ruling politician, my definition by definition is superior to yours; besides, an emergency is on and when an emergency is on my postulates have to be taken for granted by you — such as that imports are necessary to accelerate growth and self-reliance and that exports are necessary to make imports possible; but, in order to export, you must first import, may be essential raw materials and intermediate products, and never mind if the value of your imports exceeds the f o b value of the resulting additional exports. This tongue-twister does not make sense, it smacks of a racket, the critics cry themselves hoarse. Obviously, they have not read the draft of the Fifth Plan; moreover, an emergency is on. Thus that ends that particular argument.

Because of the emergency and the rampant inflation, expenditure has to be curtailed and the Plan has necessarily to be cut back, so decide the authorities; the outlay on the defence forces and on the police has nevertheless to rise. It is the same emergency which, in one instance, provides the alibi for curtailment of expenditure, and in another, becomes the *raison d'etre* for spending very much more. Your finance minister, no less, rails against the fact that the nationalised banks continue to favour the big industrial and business houses; however, the moment even a symbolic reduction is effected by this or that bank in any of these big accounts, an admonitory telephone call goes out immediately from the office of this or that Cabinet minister: how dare the banks choke the working of industry and trade? The banks are condemned for their proven incompetence to offer succour and support to the poor and the weak; yet, when key appointments are to be made in the world of banking, care is taken to weed out those who might feel ideologically inclined toward the underprivileged and the choice falls on established hucksters. This, the authorities say is slander: Appointments are always made on the basis of merit. But merit is as merit does. If the decision tilts in your direction, the one making the decision is meritorious; if they tilt toward the direction of thine sworn enemy, he is a rogue and an imposter. A certain lucidity is thereby introduced in the controversy. It is a value-loaded universe: preferences are the outcome of systems of values; even facts are mere veils; reality is what I consider it to be; my notion of reality collides headlong with yours, or our next-door neighbour's; there is confusion, uproar, a state of near-anarchy. Once this happens, non-alignment has no role to play. Even an umpire cannot detach himself from his own set values; so why bother to call him in? Thieves and charlatans no longer have to justify themselves to anybody. All they have to do is to re-define murder and pillage as patriotic ventures.

This is an impasse. The only way to get out of it is to arrange an explosion. There is, however, a nodal law according to which explosions are supposed to take place, a law which has to conform to the processes of history; one cannot bypass history. Up to a point, it should still be possible to telescope it, squeeze it within a narrower expanse, hustle it, hasten it. Everything hinges upon the qualifying expression: one can play hokey-pokey with history, but *only up to a point*. But in this interregnum, Adam Smith's much-vaunted invisible hand fails to put in an appearance. Each pursues his or her own self-interest; but no economic optimisation ensues. Rather, there is an erosion of national possibilities. The philosophy of the grab turns into the dominant moral thought. As the sectarian happiness of some cuts across the primrose path for the community as a whole, nearly each and all assume the world to be bereft of internal and external economies. The endowment of resources is taken to be static; which causes panic. What you do not grab at this instant will, it is felt, be denied to you forever. The decision then becomes easy: you are no longer prepared to play the role of the romantic exile; you wave, with impatience, the flag of the certified *khadi* and arrive instantly.

Having arrived, intimations of immorality seize you. It is an eerie erotic zone, from where there is no question of voluntary departures. History will have to wait, for, meanwhile, you give yourself over to hallucinations. The notion that the processes of history can be made to turn back, perhaps

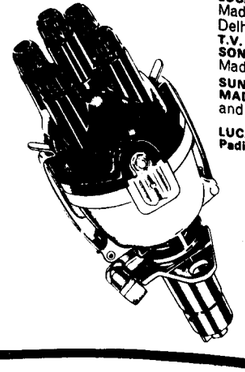
emerges as one of the major outcomes of such hallucinatory experience.

In the United States of America, by one swift stroke, the hallucination has been brought to its end. Snobbery of a kind was recently abroad. Deriding the modalities of American democracy, making fun of the honest ploddings of Dicey and all that, was in danger of becoming habit-forming. The Americans have now re-established at least the point that those who laugh last laugh best, and this despite the fact that what struck them was no laughing matter. It all started, very humbly, with a coloured night-watchman and two cub reporters. They decided they must overcome, and they did. If any homage is due, it ought to reach to those who, despite the Ehrlichmans and the Haldemans, do not give up, but decide to explore the roots of integrity — or the lack of it.

In India, such explorations will be frowned upon. Integrity has gone out of fashion. China's cultural revolution has been the butt of unending Indian jokes. It is hardly surprising that this has been so. A commitment to the fact that human beings can stay, the entire stretch, wedded to norms of integrity and simple living will, of course, not go down with those who see no evil in the Bharat Sevak Samaj, or, for that matter, in Maruti. Such people will shed genuine tears at the departure of Richard Milhous Nixon. For Watergate was their international alibi: why cavil at them when Nixon and his gang could get away with much, much worse?

The citizenry of this country have honestly no way of knowing whether the crimes being perpetrated on their native shores are less or more heinous than the ones indulged in by the conspirators who occupied that terminal building on Pennsylvania Avenue. The magnitude of the outrages committed here, you or I might say, is much, much greater, but that would only be our guess versus our neighbour's. This, in any case, is dangerous terrain, what with the emergency and the considerably augmented outlay on defence and security forces. And it will hardly do to forget that people have a way of disappearing here, something which did not quite happen in Nixon's America. They disappear behind prison bars or, what is much worse, are simply not heard of or given a bad name and shot point-blank. Sometimes they die, because, the Government's police will confide to you in case you happen to come down to Calcutta, they have a habit of choking on their food — the food which they consumed three or four hours earlier — even as they watch an open air dramatic performance. Those who are given to indulging in hallucinations about their own grandeur are also the ones peculiarly adept at weaving fairy tales. This is perhaps what is commonly described as double jeopardy.

With a Lucas-TVS distributor your engine will never lose heart.



As you know a distributor is the heart of the engine, whose heart beat distributes the sparks to the right cylinders at the right time.

A Lucas-TVS distributor works on and on for a lifetime to make sure your engine never loses heart.

No wonder, over 300,000 vehicles on the road are fitted with Lucas-TVS distributors, a large percentage of them as Original Equipment.

A Lucas-TVS distributor is made up of many components. When any one of them needs to be replaced, make sure to fit a genuine Lucas-TVS service part. You could avoid pointless risks and heavy expenditure.

For at Lucas-TVS, we make not only individual units, but the entire integrated electrical system, tailor-made to a high degree of technical excellence to match the needs of every vehicle.

Sold and serviced by —

The Twilight of a Political and Administrative System

Romesh Thapar

WITH Nixon a thing of the past, yet to be convinced that he should have told the truth, and our own Nixonians still confident that they will never be confronted, the hope is nevertheless expressed every now and then that this tired, timid, society might yet have the gumption to halt the rot. The clues continue to be highlighted to arrange a presidential or prime ministerial scandal, but the empirical evidence suggests no action. There is a lazy acceptance of illegal ways, a kind of exhausted *rationale* for survival. Indeed, even when the anger gathers, it soon dissolves in helplessness. No viable alternative has yet crystallised — that's probably the reason for do-nothing attitudes.

Cynicism is understandable in such a situation. A recent jamboree in the Capital, of some 30,000 youthful rowdies of the ruling party, brought together at considerable cost by train and truck, and fed despite strict regulations to the contrary, was clearly a futile exercise. Normally, there would have been considerable talk about the significance of the demonstration. Now, only competing politicians bother to get hotted up about it. Maybe later we will, when we realise more fully the method in the madness. As for the local University, it gave the Jan Sangh a landslide win in the student elections following the rally.

In the Capital, ribaldry has replaced sobriety in comments on the current scene. Not a single section of the population of the Capital — a few morons notwithstanding! — has any faith in the capacities of the government of the day. Even promises of a massive shake-up of the ministerial mess do not excite the observer. He is bored at the prospect of another team of yes-men without individual capacity for leadership.

The Only Insurance

Ordinances and budgets show no signs of holding the price bounce. Black money operations and hoarding (the conversion of black money into goods!) continue to enjoy a charmed existence, despite protestations from public platforms. If the breed of politicians is thoroughly discredited, so are the slogans and catchwords by which politicians have lived these 25 years or more. In a sense, all this is to the good. It marks a growing up. But — and here's the rub — somehow a corrupt ruling elite has engineered a desperate desire among all and sundry to enjoy power or be associated with it in some capacity. An insurance, no doubt, in these very uncertain days.

Possibly, this is why, like the proverbial bullocks at the well, we keep going round and round the same spot. If the presidential election is a silly fix and degrades the office, there is still the excitement of being told by an angered Congressman that dear old Fakhruddin Ali Ahmed and family are allegedly among the tiny crust of 'the super rich'. And so we move on, from Giri's bombast to Fakhruddin's pukings. And, then, to the prospects of ministerial shuffle. Meaningless, yes; but what's to prevent a little excitement about the possibility that a *maha katal* is being planned.

The Nab's in the System

Fresh and relevant thinking on our critical condition is not possible without questioning the political and administrative system which has designed our life during the past 25 years. The organised elite embedded in its own interests, will refuse to question the system. Indeed, it attempts to spread the false impression that anyone who does so is against the democratic process! Will our morons realise that there are various ways in which the democratic will can be expressed — and we certainly have not discovered the ideal way.

Under the present political and administrative system, it is impossible to register any solid improvement in our condition. This is not an attempt to evade critical issues. What is the point of fulminating against corruption, as opposition politicians do, when the very election system which they continue to opt for creates the base of corruption? What is the point of denouncing the parallel economy, when its captains are the financiers not only of the ruling party, but also of those who see themselves as alternatives? What is the point of agitating about increased productivity, when controls and licensing procedures (also a part of political manipulation!) have made us captives of scarcity situations? What is the point of appealing to students and the working force to work with discipline, when orders are out to topple unions and leaderships to make political life even more manipulative? What is the point of projecting alternatives, when those who control the levers are determined that thinking must be within the *status quo*? Take any popular speech of President, Prime Minister, or Minister: It can be torn to shreds by references to the reality around. In fact, an enterprising record-pressing company could make a killing with a selection of the banalities that are dished out daily.

Unless the political and administrative system is structurally altered, we will not be able to cut our way through the jungle we have created. Naturally, this exercise has to be based on lessons drawn from the past 25 years. The Indian federal policy is viable. The mammoth unilingual states are not. They will have to be further divided into more compact areas, geographically and language-wise. A federation of some 50 or more states is likely to strengthen the processes of democratic decentralisation and federal coherence. We should not allow ourselves to be silenced by the ugly Congress politicians of Uttar Pradesh and Bihar.

If, with the physical reorganisation of our federal polity, we are also able to replace the present, very British, system of elections (with its stress on personalities!) by the more European system (built on proportional representation) geared to parties and programmes, cutting out those which poll below a minimum, we might be able to introduce election-financing measures by the State which would end the power of private, corporate and black money. There is no problem which is beyond solution, if we bring intelligent thought to bear upon it and the sustained will to resolve it. The trouble is that both these qualities are now lacking in our public life.

Pawns Don't Make Chess

And, so, we are lost in gossip: Fakhruddin's Rs 50 lakhs worth of assets, the fate of Cabinet ministers whom rumour-mongers believe to be on the verge of axing, D P Dhar, Bhola Paswan, Raj Bahadur, Tripathi, Chattopadhyaya, Karan Singh, L N Misra, and lesser fry like Raghunath Reddy,

Khadilkar and such like. Counter rumours warn that the 'Lefties' will be retained to cover the rightward 'tilt', or that Dhar and Karan Singh will survive as pawns to balance the new position of Sheikh Abdullah who is expected to take over in J and K soon. Yet, when all the play has been explored, all that appears to be removable is a Bhola Paswan or a Khadilkar. And who the hell cares.

Perhaps, Indira Gandhi does. In fact, she had better do so now that her gaze is fixed inextricably on the 1976 general elections. The lady at 1, Safdarjang Road, knows that corruption, inflation, and shortages have wrecked her image in the towns as a leader capable of delivering the goods. In the countryside, things are not so bad and will take time to visibly deteriorate. Will she play 'ministers' or will she play 'programmes'? The betting is that programmes require far too much sustained, hard, work for a party based on perks and privileges. So it will be the game of ministers. A big purge, or small purge? It's the last gambit before the next general elections which will be joined by the end of next year.

If only the ruling party could turn its back on cynical and meaningless political gimmicks and focus on a quick operation to restructure the political and administrative system, it would yet be possible to win back the initiative and to attempt a fundamental programmatic approach to the problems of national poverty. We would move away from speechification and concentrate on action where it matters.

The sad fact remains that, at this moment of writing, not a voice rises either within the ruling party or outside to demand the fundamental restructuring of our polity and its basic policies. The politicians of the Right and the Left are content to be the captives of the *status quo*. The high-sounding slogans, whatever their flavour are a cacophony to hide the absence of integrity, sovereignty and dynamics in thinking. Verily, the politician has become a despicable creature even as he enjoys immense patronage — and power, too, in his den.

The initiative for change passes to men respected for their long and dedicated espousal of the people's cause. And so, Jayaprakash Narayan becomes a kind of symbol, of renewal and faith. But the spark is shortlived. Whatever the Gandhians and pseudo-Gandhians may imagine, *gramdan* is no alternative. It is fuzzy and unworkable as experience has shown. Gandhi's heirs betrayed him long ago. A few remain integral, but unable to master the reality around.

The attention of a long-anguished people, seeking some relief from the *presssures of today*, is drifting. Gujarat and Bihar, and Bengal and Tamil Nadu before them, suggest that in desperation support will probably begin to crystallise for local parties — which are narrow and chauvinistic, but also more responsive to local pulls and able to unite wider sections on limited programmes. Whether this implies two levels of political consciousness or dependence on tenuous coalitions at the Centre, remains to be seen. These trends will sharpen as wider and wider sections despair of the capacity of national political formations and of the ruling Congress party in particular.

On the twenty-seventh anniversary of the transfer of power, we are certainly witnessing the twilight of a political and administrative system that is rooted in our colonial past. It cannot work, despite all the invocations. It has to be shaken and drastically restructured. Whoever mobilises for the purpose, will win.

Tailpiece: Here is some compulsory reading for the Council of Ministers: the US best-seller "All the President's Men." And for the Opposition : "Gulag". Two books to stir us and cheer us.

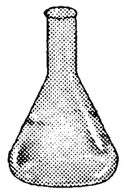
NEW DELHI

Fumbling in Peril

B M

PRIME Minister Indira Gandhi's ritual address from the ramparts of the Red Fort on August 15 was unusually subdued. Her supporters have commended it for its honest admission of the grave difficulties which engulf the country. Her critics, however, were struck by the fact that for the first time her Independence Day speech contained no tall promises and implied no aggressive posturing. It really indicated the present undercurrent of frustration and failure in the entire government leadership and top administration. For a while, during July, there had been a sudden rash of activity within government which yielded the anti-inflationary 'measures'. By the time the final measure of the claimed 'package' to fight the inflation had emerged — in the form of the Supplementary Budget — and no real effective option seemed open any more, it was clear that even politically the leadership had failed to carry conviction with the masses. Nor could the measures help to arrest the 'inflationary psychology' which was resulting in hoarding and in aggravating the inflationary pressures, since those who were making windfall profits from the situation knew the innocuousness of the government's 'anti-inflationary measures'. Indeed, the government now ruefully admits its general failure to get a grip on the situation.

But the question remains, where will the government go from here? One should not blink away the fumbling and the groping at all levels of the government and administration. Inevitably, such optimism as there is, is based on the slim fact that the worst period will last another two months till the kharif crop comes in. This period has, therefore, to be tided over by arranging for sizeable imports of foodgrains in whatever way possible. While concessional imports, whether from the Soviet Union or the US, would be most welcome, there is little hope of getting them. Commercial imports will, therefore, have to be arranged. Foreign exchange availability is not, at least this year, seen as the major bottleneck, and in any case the managers of the foreign exchange economy cannot afford to worry overmuch about next year's balances. At least, the political leadership seems to have realised that it is unwise to write off public distribution of foodgrains. The key issue, therefore, is whether the government will maintain or increase the procurement prices for the coming kharif crop. After the whopping increase of 25 per cent that wheat prices were given earlier this year, there may be continued hopes and pressures on government for further increases — which, if resisted might offend, or at least disappoint, the surplus farmers.



The price spiral has hit very hard the fixed-income groups and the urban middle class. The political loyalty of this section for the established leadership was already on the wane. Now it has well-nigh disappeared. The government had calculated that there could be no additional risk in attempting to pass on the burdens of the gathering economic crisis to this section alone. It also believed that the organised urban working class — blue collar and white collar — had managed to secure their position and were draining off the surpluses in the economy without working hard enough, and that much of the trouble with industrial production was therefore on this account. The leadership thus thought it possible — almost necessary — to dispense with the political support of this section as well as of the urban middle classes. The success in crushing the railwaymen's strike in fact emboldened it to impose the partial wage and DA freeze. The leadership was, on the other hand, very reluctant to do anything to alienate its widely enmeshed rural base. This was made very explicit at the full meeting of the Planning Commission in May, when the question of raising additional resources — more specially from the farm sector — was pointedly raised. Indira Gandhi severely admonished the planners and the economic experts for ignoring the political constraints in all their glib talk of taxing the farm sector. However, with the further deepening of the economic crisis and its options closing in on it, the leadership, it seems, has been forced to reconsider its stand.

The reconsideration follows the laborious exercises to find some way of keeping the Fifth Plan at least partially afloat — for which purpose the government must be seen to have made at least a partial dent on the price situation. The Finance Ministry had agreed only most reluctantly to the credit squeeze on the private corporate sector and to the introduction of the supplementary budget. The Finance Ministry's argument was that the stifle radicalism which had ruled policy-making by Yojana Bhavan over several years and which had throttled the productive forces in the private sector must be cast aside and the private sector be unfettered to allow for greater economic activity. It was this view of the economy which was embodied in the main budget of the current year. A harsh supplementary budget and credit squeeze were, therefore, regarded by the Finance Ministry as going counter to the main thrust of its policy. But the economic situation has deteriorated so rapidly in recent months that it is now admitted in Finance Ministry circles that stagnation in industrial investment and production will remain for at least two or three years to come. First priority will, therefore, have to be given to making the public sector more productive and to improving the infrastructural facilities for private enterprise. It thus comes back to the problem of finding resources for public sector investment — and these are nowhere in sight.

Controversy between the Finance Ministry and the Planning Commission has hence become meaningless. The two are even beginning to act in concert in several respects: Both have, for instance, agreed that the definition of the core sector will have to be revised for operational purposes. The core sector has been narrowed down to power, coal, and fertiliser. Since the scope for having any significant impact on fertiliser availability is limited, the core sector effectively means only power and coal. Steel and several other industries which in better times might have been regarded as being in the core sector are certainly out. Both the Planning Commission and the Finance Ministry are also labouring enthusiastically to locate resources for the agreed plan investments for the core sector. Here there are differences, but they are minor ones: the Planning Commission has talked of an across-the-board cut of 10 per cent in non-Plan expenditures, while the Finance Ministry has advocated an across-the-board cut of 10 per cent in the non-core sector of the Plan. However, when the so-called economies in government expenditures were explored, it was agreed that neither of the two alternatives was feasible!

Since not much had been *committed*, anyway, to non-plan expenditure, little could be saved there: rising defence expenditure and even more sharply increasing expenditure on the police were simply not amenable to cuts. Economies elsewhere were contingent upon large-scale retrenchment of government

no matter what you do

we have something to do with you

Prescribe a pill or cut a suit. Swing in suede or wield a lipstick. Our business is with you.

Never heard of us? Then listen now. Coz you might need us. Minus HICO, that cloth and leather and cosmetic and medicine — would not be so good. We manufacture chemicals — may be just one vital chemical — that could make all the difference. We were a name behind the scenes — but now you know better.

staff, which was politically impossible. What remains is hardly Rs 900 crores out of a total non-plan budget of Rs 4,400 crores. Tinkering with this sum too would involve further reductions in salary and DA bills of the employees. The only area, then, for effecting economies can be the provision of Rs 26 crores for travelling allowance to officers and Rs 45 crores for stationery and other office expenses! Ironically, the Finance Ministry can claim to have already effected the maximum economy on these counts, and saved the princely sum of Rs 50 crores — as against the yet gaping deficit of Rs 600 crores in the budget. According to present calculations, a deterioration of Rs 250 crores is attributable to the railways, Rs 125 crores to defence, Rs 225 crores to food and fertiliser subsidies, and another Rs 60 crores to DA instalments (without taking into account the sum that will be immobilised, while figuring as expenditure in the books of the Central government). This aggregates nearly Rs 750 crores. The supplementary budget will provide only Rs 136 crores. Though industrial production will remain stagnant, revenue from excise duties and customs duties is not expected to deteriorate — as happened last year — and might even improve because of the sizeable price increases of industrial goods and the *ad valorem* duties on these. Thus a gap of Rs 600 crores remains. If the commitment to contain deficit financing within the originally budgeted figure of Rs 125 crores is to stand, there will be no escape from cutting the Plan outlay. As against the suggestion of the Finance Ministry to straightaway cut 10 per cent of the non-core plan outlay, the Cabinet Secretary who headed the committee for examining the plan outlays has proposed, as a compromise, its diversion of Rs 150 crores from the non-core to the core sector of the plan. All this is, of course, jugglery.

The question of raising additional resources from the farm sector has thus been pushed back to the centre of the stage. At the same time, it is suggested that it is always open to the governmen to resile from the commitment on deficit financing. If the kharif prices are not raised, if the foreign trade position remains somewhat stable, and if there is no repetition of shocks to the balance of payments from abroad, such as resulted from the hike in oil prices, it may indeed be possible to absorb a larger dose of deficit financing. It is also argued that, since the credit squeeze will hold rigorously for the private sector, there will be greater room for using created money in crucial areas of activity in the public sector.

Meanwhile, though the need to recover resources from agriculture is accepted in principle, the crucial question that remains unclarified is how the farm situation can be stabilised and investment and production on the farms encouraged particularly by those who produce and control the surpluses for the market. It is being urged on the leadership that it should take some risk here and halt the hike in the prices of agricultural commodities while at the same time recovering revenues from the farm sector by all available means. After all, it is suggested, marketed surpluses both of kharif and rabi come from only a small part of the country — Punjab, Haryana and Western UP — which are also the regions posing the least political risks.

The Great Disorder under the Heavens:

China's View of the World Today

G P Deshpande

EVER since the fall of Lin Piao in 1971, China's view of the world had been a little hazy. The confidence with which the ninth Congress of the CCP in 1969 proclaimed the imminent doom of imperialism seemed to have disappeared into thin air. Lin Piao's fall created serious problems for the Chinese Communist Party in every sphere. It was, of course, to be expected that the Chinese world-view would reflect the inner tensions of the Party. The tenth Congress, therefore, made a very provisional assessment of the world situation, by giving a hearing to and endorsing Chou En-lai's speech talking of 'disorder' everywhere. It must have endorsed with utmost hesitation, however, his further observation that disorder was good; for, though the disorder within China since the anti-Lin Piao and the anti-Confucius campaign was of manageable proportions, it has always threatened to be menacing. The search for right solutions, the 'right way', had been on for some time. Lin Piao's legacy had to be lived down as much in domestic affairs as in foreign affairs.

The most notable contribution of Lin Piao was his famous 1965 essay "Long Live the Victory of the Peoples' War". The scenario there was of the world divided into 'cities', 'countryside', and the 'intermediate zones.' The idea was that the countryside would ultimately triumph over the cities. So far, in the anti-Confucian and anti-Lin Piao campaign, no attacks have been made on this essay. The tenth Congress, which spoke of the increasing disorder everywhere, neither challenged the political report of the ninth Congress (presented by Lin Piao), nor offered an alternative view of the world.

Now it appears that an alternative view of the world is slowly emerging. It is not an alternative so much as it is a further elaboration — or rather revision — of the 1965 thesis; and more categorical perhaps, Lin Piao seems to survive even in condemnation! The problem with the 1965 thesis was the rather ambiguous position it assigned to the 'socialist camp'. It clearly implied the increasing importance of the world-countryside and the comparative receding of the 'socialist camp'.

With 1968, China moved one step forward. Following the Soviet intervention in Czechoslovakia, the concept of 'social imperialism' came to the fore. The implication, then, was that 'social imperialism' was the last stage of revisionism. Nevertheless, the ideological formulations on 'social imperialism' remained a little obscure compared to the tensions in Sino-Soviet State-relations. The attacks were unsparing. The style of diplomacy was shrill and noisy. But the Chinese appeared to have no time or inclination for ideological questions. The ideological polemics of the early sixties appeared to have been replaced by inter-State quarrels. The Ussuri crisis of 1969 underlined the security and territorial aspects of the Sino-Soviet dispute.

The Cultural Revolution was an assault on revisionism at home. Yet, throughout 1966-69, we do not find any sustained effort on the part of the Chinese to relate 'social imperialism' with the 'return to capitalism' within the Soviet Union. The Chinese preoccupation with the domestic turmoil probably prevented that.

The first serious attempts to relate 'social imperialism' to what the Chinese describe as 'return to capitalism' were made only a year and a half ago. In September last year, *Peking Review* carried an article commemorating the anniversary of the publication of Lenin's thesis on imperialism. This article quoted Lenin to show that, after a certain stage of development, capitalism will cover in its expansionist sweep even the industrially advanced States. In the Chinese view, the Soviet 'expansion'

in Czechoslovakia was clearly an example of this trend. The article talked of two expansionist capitalisms: Monopoly capitalism of the US and State capitalism of the Soviet Union, leading to two imperialisms: capital imperialism of the USA and social imperialism of the USSR.

The direction of Chinese thought was now more definite. Chinese thinking was inexorably leading towards the conclusion that the socialist bloc was now a misnomer. The Soviet Union was not a socialist State. The socialist bloc had once existed. Now it was disintegrating. It was a question of time as to when it would finally disappear. This does not mean that there will never again be a socialist bloc. It will surely rise again, like a phoenix, but the Chinese might argue that the phoenix will be reborn out of the ashes of the present-day revisionists!

Meanwhile, the world has to contend with capitalism and the consequent imperialism. When Kenneth Kaunda was in Peking, the new line was officially proclaimed. The problem, the Chinese argued with their guest, was the greedy drive of capitalism for neo-colonies and markets. The communique, interestingly, did not make any distinction between the two varieties of imperialism. The Chinese insisted that 'imperialism' was the enemy. 'Capital imperialism' and 'social imperialism' were two aspects of one phenomenon.

In April, this year, the Chinese have gone a step further to make explicit their perception of world reality.

Teng Hsiao-ping, the former General Secretary of the Chinese Communist Party who was discredited during the Cultural Revolution, and who has now reappeared on the Chinese political scene, went to New York to participate in the special session of the UN on raw materials and development. He spoke there on April 10. The speech is important, because it stated the Chinese view of the world in very definite terms.

Teng Hsiao-ping began by saying that "the whole world is in turbulence and unrest .... In this situation ... all the political forces in the world have undergone drastic division and realignment through prolonged trials of strength and struggle ...".

What are the special features of this situation of what Teng described using a traditional Chinese phrase as "the great disorder under heaven"? First, "the socialist camp is no longer in existence". It did exist, Teng conceded, for a short period of time after the Second World War. He, of course, avoided saying when the disintegration of the socialist camp began and ended. What mattered to him was that its disintegration was now an accomplished fact.

Secondly, the Western imperialist camp' is likewise disintegrating. Evidently, the process of disintegration was not complete. This would clearly mean that, while the organised 'camp' strength behind the Soviet Union is no longer in existence, the US is still not entirely without allies — which in turn implies that the Soviet position is comparatively vulnerable.

Teng did not bother to elaborate on the implications of his position. The reason why the Chinese would not talk of this goes back to the late fifties. It was then that the consolidation of 'socialist power' led both Khrushchev and Mao to draw exactly opposite and partially false conclusions.

While Khrushchev thought the new Soviet power gave him a position of advantage in dealing with the US and the Western bloc, the Soviets have probably now realised that Khrushchev was clearly painting a rosier picture than the situation warranted. The so-called detente has only resulted in further consolidation of American power everywhere: from Bolivia to Cyprus. The Soviet Union, on the other hard, needs the detente badly, and yet cannot really turn it to its advantage.

Mao and his comrades too misread the 'power' of the socialist camp. In 1958, it was too early to proclaim that 'the East Wind was blowing over the West Wind'. This was then (and probably still is) at best a hope, and could have scarcely been the basis of a viable foreign policy of the socialist bloc.

However, Mao still erred on the safe side. Khrushchev did not. The result has been the pathetic attempts of Soviet commentators to explain away almost everything which would be a barrier between the USSR and the US. It has become a habit: even the Watergate affair has to be no more than a "Democrats' conspiracy". The utter dependence of the Soviet Union on American goodwill is now complete.

But equally, the contradiction between the USSR and the US has been and will get more and more acute, emphasising the receding Soviet position in international relations. Teng Hsiao-ping is in effect arguing that the 'revisionists' are now locked up in a love-hate relationship with the US. They, in short, represent the 'exploiters and oppressors' of today's international system. The socialist camp, therefore, naturally does not exist. It is dead. The certificate can be obtained from Teng Hsiao-ping.

Chinese foreign policy is in a sense harking back to the period when the only socialist State was threatened by 'international imperialism'. One reason why international imperialism was unable to damage the newly-born socialist State of Russia was that, as Lenin said in 1918, "they had no time for us ... because international imperialism had split into two predatory groups which were at each other's throats". In other words, the contradictions within 'international imperialism' prevented the onslaught on Russia. Evidently, China, too, hopes to escape the onslaught today.

The countries of Asia, Africa, and Latin America, which constitute the third world, have to get together and unite. China is one of them and, Teng assured the General Assembly, will remain one of them. If anything, China is a developing *socialist* State as against some developing *non-socialist* States. Chou En-lai, at the banquet in honour of King Birendra in December last year, said: "China is a developing socialist country and belongs to the Third World".

The two worlds thus are clearly defined. China belongs to the third world. The US and the USSR constitute the first world of 'oppressors and exploiters'. Who constitutes the second world?

Here a significant departure from Lin Piao's position is in evidence. While Lin Piao talked of two intermediate zones, Teng Hsiao-ping does not. For him, the imperial powers and the developing powers are separated by the developed powers. The relationship between the second and the third world is a 'complicated one'. Teng goes on to add:

> "Some of them still retain colonialist relations in one form or another within the Third World countries — at the same time, these developed countries are in varying degrees controlled, threatened, or bullied by the one super-power or the other. Some of them have in fact been reduced by a super-power enslavement or control and safeguarding their national independence and the integrity of their sovereignty".

The Second World, thus, is as much a victim of super-power dominance as is the Third World. The new Chinese perception therefore postulates the principal contradiction between the two super-powers which constitute the First World and the two other Worlds of the developed States and the developing States.

There was enough evidence that the Chinese were working on this assumption. Between Chou En-lai and Teng Hsiao-ping the new formulation has now been formally proclaimed. The new directions in China's foreign policy have now been rather clearly defined. Was it not Mao who said that the first task of a revolutionary is to find out who is his enemy and who is his friend? He seems to have answered the question in clear categorical terms now.

Some Aspects of Inter-Sectoral Resource Flow

Ranjit Sau

This paper reports some preliminary findings on the flows between agriculture and industry, or rural and urban sectors, on both current capital accounts. It gives an estimate of the consumption of 'industrial' and 'agricultural' goods in rural and urban areas over the years from 1952-53 to 1964-65. With these figures it would be possible to construct a major part of the trade between agriculture and industry, or between rural and urban sectors.

Apart from shedding light on the issue of inter-sectoral flows, this paper shows that the market for industrial consumption goods in India is, in a sense, shrinking: the percentage of per capita consumer expenditure spent on industrial goods is declining over the years, rather sharply in rural India and mildly in urban. Among various fractile groups of population, the ones at the bottom are increasingly withdrawing from the market for industrial consumer goods. In a word, Indian industry is fast approaching the walls of a restricted market. Although the data presented here cover the period upto only 1964-65, there is no reason to believe that the trend has been arrested since then; in fact, it might have been accelerated further.

THE early phase of industrialisation in Japan as well as in the Soviet Union is believed to have been sustained by a net resource flow out of the agricultural sector into industry. By sharp contrast, the position today in China and India is claimed to be just the reverse: resources are flowing into agriculture from industry.[1]

The modality varies. Japan extracted capital from agriculture mainly through fiscal means; while England worked through the terms of trade. During the period 1700 to 1850, redistribution of income in England came about intermittantly through unfavourable terms of trade for agriculture.

It is but a short step to shift from the axes of 'agriculture-industry' to the co-ordinates of 'rural and urban', and then to correlate the inter-sectoral flow of resources with the exigencies of the prevailing political system. Before doing such an exercise in political correlation analysis one should however look into the flows between agriculture and industry, or rural and urban sectors, on both current and capital accounts. This paper reports some preliminary findings in this respect. It gives an estimate of the consumption of 'industrial' and 'agricultural' goods in rural and urban areas of India over the years from 1952-53 to 1964-65. With these figures it would be possible to construct a major part of the trade between agriculture and industry, or between rural and urban sectors.

Apart from shedding light on the issue of intersectoral flows, this paper shows that the market for industrial consumption goods in India is, in a sense, shrinking: the percentage of per capita consumer expenditure spent on industrial goods is declining over the years rather sharply in rural India, but mildly in urban. Among various fractile groups of population, the ones at the bottom are increasingly withdrawing from the market of industrial consumer goods. In a word, Indian industry is fast approaching the walls of a restricted market. Although our data cover up to 1964-65, there is no reason to believe that the trend has been arrested since then; if any thing, it might have been accelerated further.

I
Methodology

National Sample Survey (NSS) is the main source of our data. It gives itemwise consumer expenditure for the following: (a) foodgrains, (b) milk and milk products, (c) meat, egg and fish, (d) edible oil, (e) sugar, (f) salt, (g) other food, (h) clothing, (i) fuel and light, (j) miscellaneous, (k) rent, and (l) taxes. By *industrial goods* we mean items (d) to (j), except that only three-fourths of item (g), namely, other food, is included under this category, the remaining one-fourth of it being considered as non-industrial, that is, agricultural product.[3] Agricultural goods

Ever since it became increasingly available in India, aluminium has contributed in no small measure to the industrial and agricultural growth of the country. Being the right substitute for metals like copper and steel, it is an ideal material for import substitution.

A large part of the country's aluminium requirements is being met by Indal. Indal awaits power supply to add another 40,000 tonnes to its current level of about 75,000 tonnes of annual metal production. Indal delivers the metal in more forms than any other supplier to meet the country's ever-growing needs in the field of power transmission, defence, transportation, packaging, construction, machine building, and a host of other uses.

In the field of exports, too, Indal has helped earn several crores worth of foreign exchange —further proof of the Company's increasing contribution to India's economy.

is defined to consist of the first three items together with one-fourth of item (g).

Industrial goods as defined above are not necessarily produced in a factory, nor can they be always identified as urban products, Sugar which is here classified as an industrial good, for instance, consists of gur, sugar candy and sugar. But gur is typically produced in rural areas. Similarly, clothing includes cotton (mill-made, handloom and khadi), wool and silk clothing and bedding and upholstery. Handloom and khadi in particular are supplied by the small-scale cottage industry of rural India. If neither the production in a factory nor the location of their origin in urban areas is the common characteristic of the items classified here as industrial goods, what then is their specificity? The single thread which binds them together is that they are not a direct product of agricultural activity as such.[4] Perhaps a more appropriate term would have been 'non-agricultural goods'. But convenience of expression has dictated our choice. These industrial goods, even if they are not all produced in factory today, could be conceivably organised under factory production. If the onslaught of capitalism continues further, in due course they would be brought under the factory system. Although the classification adopted here is therefore crude from the operational point of view, it is quite clear conceptually.

NSS data are available for twelve expenditure groups.[5] For each expenditure group the percentage of per capita consumer expenditure spent on industrial goods is computed. Next, the per capita consumer expenditure of various fractile groups of population is calculated.[6] Now, for matching the NSS expenditure groups with fractile groups of population the per capita consumer expenditure is used as the indicator. In 1964-65, for instance, the rural population fractile group 70-80 had a per capita monthly consumer expenditure of Rs 30.91; while the expenditure group Rs 28-34 in NSS 19th Round (July 1964/June 1965) had Rs 30.51. So we shall say that the consumption pattern of the former is similar to that of the latter. The expenditure group of Rs 28-34 spent 39.28 per cent of its per capita consumption on industrial goods. Accordingly, it is assumed that the fractile group 70-80 also did the same.[7]

Where such close correspondence between the two figures of per capita consumption was not found, interpolation was resorted to, by simple average of the percentages in the two adjoining, relevant expenditure groups.

In a few later years the per capita consumer expenditure of the richest 5 per cent of urban population was well above that of the top expenditure group, namely, Rs 55 and above, or Rs 75 and above as the case may be.

Total Engineering for the Steel Industry

To us "Total Engineering" means the complete technical services from picking a site, selecting processes, writing specifications and placing orders, systems designing, preparing construction drawings and site supervision, right through commissioning and management advice on the project.

We started steel plant consultancy services in India and continue to be in the forefront—of new technologies like sponge iron, electric furnace steel-making and continuous casting; also, net-work planning for expediting construction.

We are independent, which means you get objective advice on processes and equipment best suited to your needs, without being tied-down to any particular process or equipment.

We are international, which means you get the most modern technology, adapted to your requirements.

In these cases the percentage of consumer expenditure spent on industrial goods by the former has been derived by adding certain percentage points to that of the latter.

Per capita consumer expenditure, and the proportion of expenditure on industrial goods thus having been known, the calculation of the absolute amount of industrial goods consumed, at current prices, is a straightforward matter of arithmetic.[8]

II

Shrinking Home Market for Industry

Rural India is gradually reducing the fraction of total expenditure it spends on industrial goods. The decline is far more noticeable for the poorer fractile groups. The lower six deciles spent around two-fifths of their expenditure on industrial goods in 1952-53; twelve years later the ratio was hovering near three-tenths (Table 1). The trend in urban India is very much the same (Table 2).

In the annual aggregate consumption of industrial goods of rural areas, the lower six deciles had lost ground, proportionately (Table 3). The relative position of various fractile groups in urban areas appears to be quite volatile (Table 4). However, the richest 10 per cent of population accounts for 30 to 40 per cent of such consumption in both rural and urban areas.

The base of the market for industrial consumer goods in India is narrowing, despite the rapid growth of industrial production in the country over the last two decades. The concentration of industrial consumer goods is rising at the thin, top layer of the population.

III

Rural-Urban Trade

Tables 5-8 give the estimates, at current prices, of consumption of agricultural and industrial goods in rural and urban areas. For all practical purposes, agricultural goods can be characterised as having its origin in the rural sector alone; but no such identification between industrial goods and the urban sector is permissible, for some of such goods are generated in the rural areas as well.

The rural market for industrial goods is of the order of Rs 3,000 crores to Rs 4,000 crores whereas the corresponding urban market is in the range of Rs 1,000 crores to Rs 1,900 crores (Tables 5 and 7). The preponderance of the rural market is of course largely due to the overwhelming weight of the population it bears and despite the low rate of intake per capita.

The urban market for agricultural goods had more than doubled, from Rs 760 crores in 1952-53 to Rs 1,700 crores in 1964-65, whereas the rural market for industrial goods increased much less from Rs 3,500 crores to Rs 4,500 crores during the same period (Tables 5 and 8). Now if it is assumed that rural India produces industrial goods to meet, say, one-third of its own consumption of industrial goods (and does not export much of industrial goods to urban India), it follows that the rural sector is incurring huge deficit in its trade with the urban sector insofar as consumer goods are concerned. That is to say, the net flow of consumer goods is from the urban to the rural sector in India.

To complete the picture of rural-

The largest, best-equipped Convention Hall in Asia is at the Ashoka Hotel, New Delhi

An international conference for 2400.
A glittering buffet for 1000 guests.
A formal, elegant sit-down dinner for 750.
A quiet seminar. A distinguished fashion show. A dance or music recital.
For any of these functions, the Ashoka Hotel provides the perfect venue.
Every detail is meticulously supervised to delight the most fastidious guest.

Insulated walls in the Convention Hall and concealed loudspeakers provide high-fidelity sound. Secretarial facilities, simultaneous translation into 6 different languages make it the ideal focus for international gatherings.

Whatever the occasion, the Ashoka makes it unique.

urban trade, one of course has to consider other flows also such as jute, oilseeds, cotton, cement, fertiliser, machinery and so on. But these magnitudes are not likely to change the qualitative nature of the balance of trade. In any case, work is in progress to quantify these flows.

IV

In Lieu of Conclusion

Our definition of industrial goods in terms of the NSS items of consumer expenditure is broad enough to include all non-agricultural products, from home-spun khadi to the motor car that is produced in the most sophisticated factory. Yet, the rural and urban consumers are found to be reducing the proportion of their expenditure on such industrial goods. Could it be that, foodgrains being the first charge on a consumer's budget, the relative rise in foodgrains prices is eating into the market for industrial goods? Indeed the close association between the upward movement of foodgrains prices and the slump in the demand for cotton textile has been observed many a time. Secondly, there is the inequality of income distribution, which stands in the way of expansion of the market for industrial goods at the lower stratum of the population.

Factory production has been replacing cottage and small-scale operations for many a consumer item. Some of the items included in the definition of industrial goods here yet continue to be allied with the agricultural activities of a family. But in principle they can be separated from agriculture and brought under the system of factory production; in course of time it may actually so happen. The category of industrial goods adopted here is broad enough to encompass all non-agricultural products. Should the classification be narrowed down to only factory-made goods, the decline in the proportion of expenditure on industrial goods may even be all the more glaring. For, in case foodgrains become more expensive and thus erode a consumer's budget for industrial goods, the axe falls first on factory-made goods before it cuts into the demand for the produce of a form- or family-related activity. If he has now less to spend, the consumer would switch from sugar to gur, for example.

It is widely held that NSS data under-estimate the consumption of the richer section of the population. If so, the increasing degree of concentration that is observed in the consumption of industrial goods may even be actually higher than what is reported here.

There are discrepancies between the NSS and the Central Statistical Organisation of the Government of India insofar as the estimate of the private consumer expenditure is concerned. We are now doing alternative calculations with the CSO data as well. But the general conclusions reached so far are not going to be affected.

The importance of this issue in India has been also highlighted by S Chakravarty, "Reflections on the Growth Process in the Indian Economy", *Indian Left Review* (June 1974).

2 See Ashok Mitra, "Class Relations and Growth of Output", in B Singh and V B Singh (ed), "Social and Economic Change" (1967) and M Lipton, "Strategy for Agriculture: Urban Bias and Rural Planning", in P Streeten and M Lipton (eds), "The Crisis of Indian Planning" (1968).

3 'Other food' includes pulses and products, vegetables, fruits and nuts, spices, beverages and refreshments. 'Miscellaneous' includes pan and supari, tobacco and products, drugs and intoxicants, amusements and sports, education, medicine, toilets, sundry goods, consumer services, conveyance, ceremonials, furniture, musical instruments, ornaments, domestic utensils, footwear and other durable and semi-durable goods and their repairing expenses including the maintenance of residential houses.

4 This is subject to the qualification that the presence of pan and supari in "miscellaneous items" of consumer expenditure would lead to slight over estimation of industrial goods.

5 The groups are as follows: Rs 0-8, 8-11, 11-13, 13-15, 15-18, 18-21, 21-24, 24-28, 28-34, 34-43, 43-55, and 55 and above. For some later years, further breakdown in the form of Rs 55-75, and Rs 75 and above, are given.

6 Source: Planning Commission, Government of India, Report of the Committee on Distribution of Income and Levels of Living: Part II (1969); NSS Reports on Consumer Expenditure and B S Minhas, "Rural Poverty, Land Redistribution and Development Strategy: Facts and Policy", (Table 1), *Indian Economic Review* (1970). For the methodology see also Ranjit Sau, "Indian Economic Growth" (1973), pp 30-31.

7 In all calculations the following correspondence between NSS rounds and the financial years is assumed: 1964-65 (19th round: July 1964/June 1965), 1963-64 (18th round: February 1963/January 1964), 1961-62 (17th round: September 1961/July 1962), 1960-61 (16th round: July 1960/August 1961), 1959-60 (15th round: July 1959/June 1960), 1957-58 (13th round: September 1957/May 1958), 1956-57 (11th round: August 1956/February 1957), 1955-56 (10th round: December 1955/May 1956), 1954-55 (8th round: July 1954/March 1955), 1953-54 (7th round: October 1953/March 1954), 1952-53 (4th and 5th rounds combined: August-September 1952, and December 1952/March 1953 respectively).

Exception: The consumption patterns of expenditure groups of 10th and 11th rounds are applied on the estimates of monthly per capita consumption of fractile groups as of 9th round (May-November 1955) and 12th round (March-August 1957) respectively for computations relating to the years 1955-56 and 1956-57, for both rural and urban.

For the comparability of data of various rounds see Uma Datta Roy Chowdhury, "Study of Trends in Consumer Expenditure, 1953-54 to 1960-61", *Indian Economic Review* (1967).

8 We have taken census figures of rural and urban population for 1951, 1961 and 1971; the figures for the years in between have been estimated according to the observed growth rate over the decade. Then three-quarters of one year's figure has been added to one quarter of the following year's to convert the data from calendar year to fiscal year.

United Commercial Bank

UNITED COMMERCIAL BANK outdistanced other nationalised banks in 1973 in branch expansion by opening 139 branches. Only two other public sector banks crossed the 100-figure mark. By the end of 1973, UCOBANK had 670 branches in India and 6 branches overseas; 64 per cent of the branches were in rural and semi-urban areas.

Deposits and other accounts of the Bank at the end of 1973 stood at Rs 480.65 crores as against Rs. 416.14 crores in 1972. The contribution of the rural and semi-urban branches was Rs 19.53 crores, forming nearly one third of the total increase in deposits. The advances of the Bank at the end of 1973 was Rs 315.28 crores as against Rs 243.68 crores at the end of 1972. The Bank's advances to the priority and preferred sectors stood at Rs 79.40 crores. Of this, agriculture accounted for Rs 21.60 crores, small-scale industries including transport Rs 26.59 crores, retail trade, professionals, etc, Rs 9.11 crores and exports Rs 22.10 crores. The percentage of advances to priority sector to total Bank advances rose from 24.8 in 1972 to 27.75 in 1973.

Socio-Political Factors and Agricultural Policies

C H Hanumantha Rao

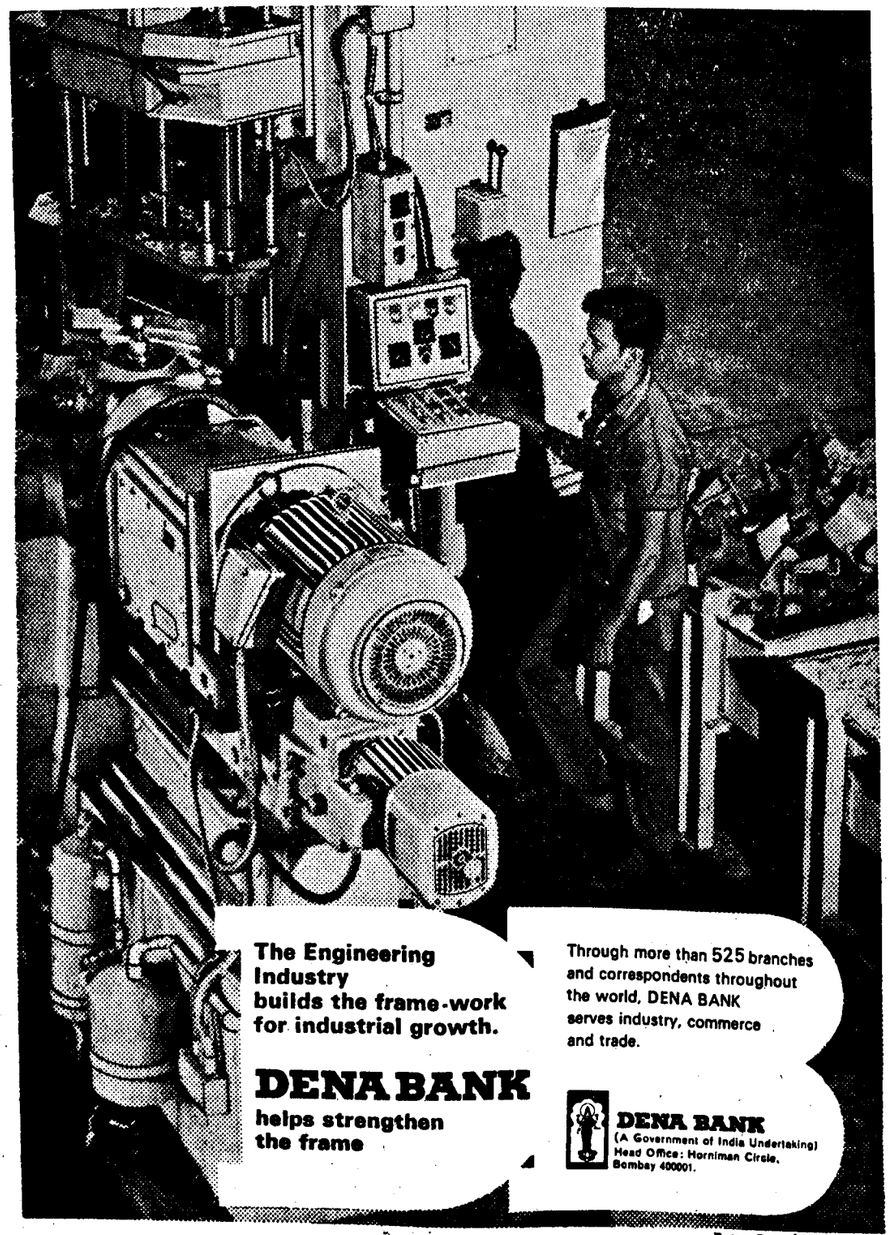
The concept of 'trade-off' between growth and improved distribution is used not only to rationalise and perpetuate the prevailing unequal distribution of agricultural land but also to justify the intensive use (per acre) of scarce inputs like fertilisers and water on large farms and in the developed regions when the social product would be greater by spreading such inputs relatively thinly over a larger number of farms in a wider area. In view of their greater capacity to invest and bear risk, large farmers and the developed regions intensify the use of such inputs producing less than socially optimum output.

With the introduction of High Yielding Varieties, the divergence between the private and the social optimum is likely to have increased because it is now privately profitable to apply fertilisers in much higher doses than before. A similar argument may apply to the use of irrigation water. The concept of 'productive irrigation' which has become popular after the introduction of HYV can be used for rationalising the appropriation of water by the influential sections in water-scarce regions even when it is socially more profitable to spread the use of water relatively thinly. This suspicion arises because in certain cases 'protective irrigation' practised under traditional irrigation systems has been found to be socially productive as it yields a larger total output.

The failure of the current strategy to bring about the promised agricultural growth and employment through the necessary public investments and the redistribution of resources within the agricultural sector has accentuated the problem of unemployment and underemployment in rural areas, particularly because growth of output and employment in the non-agricultural sector has also been slow. The elite has begun to see in this a threat to the existing political system and has, therefore, come out with several ad hoc *crash programmes, such as the Crash Schemes for Rural Employment. Such programmes usually fritter away scarce investible resources and thus widen the resource-gap for developmental programmes.*

Apart from the growing concern with the problem of unemployment, the proliferation of such crash programmes owes very much to their political suitability for the elite. Unlike lumpy investments in projects like major and medium irrigation which are location-bound and which have a long gestation period, Rural Works Programmes offer the promise of immediate gain to a large number of people in wide areas. Secondly, these programmes help those in power to distribute patronage to a large number of middlemen who have to be rewarded and whose services need to be ensured for future.

I



Features of the Prevailing Agricultural Strategy

AGRICULTURAL output has been growing at about 2.5 per cent per annum in the post-Independence period as against a decline in foodgrains output in the 15 years preceding Independence.[1] However, the performance in the post-Independence period should be judged in relation to the requirements as well as the social goals set and not by comparing it with the experience in the colonial past. Besides, a good part of agricultural growth in the post-Independence period is traceable to autonomous factors which are not attributable to conscious public policies. Rather, the latter were very much influenced by the forces generated by the former.

The two major factors accounting for such spontaneity in agricultural performance are the growth of population and the rise of agricultural classes to political power. Population growth has meant an increasing agricultural labour force that is younger and healthier. This contributed to a better exploitation of land through intensive cultivation involving greater use of labour for augmenting irrigation and for multiple cropping, etc.[2] Political power wielded by the rural rich at the district and state levels has meant increasing use of the state machinery and resources for agricultural betterment. This was reflected, for instance, in a significant expansion of credit facilities, though big farmers benefited proportionately more in this process than the small ones. The extension of traditional techniques of farming as well as the adoption of new techniques was very much induced and sustained by the growing demand for agricultural commodities consequent on population growth and urbanisation. This was reflected in the favourable terms of trade that agriculture has enjoyed over a greater part of the plan period.

The deficiency of public investment in agricultural infrastructure,[3] especially in irrigation and land reclamation, is a glaring feature of the prevailing strategy. This deficiency is indicated by the realised growth falling very much short of the targets set in regard to output and the steep rise in the relative prices of agricultural commodities.[4]

Big farmers, who are unable to make intensive use of their available land, are interested not so much in public investment for reclaiming new land[5] as in making intensive use of their available land through greater investment in private wells, fertilisers and farm machinery by using public resources, for example, from credit institutions. Although big farmers from the dry regions have actively worked in the past for major and medium irrigation projects, such efforts seem to have very much slowed down in the recent period. This is because, in the first place, the groups wielding power in quite a few states belong to the prosperous irrigated regions and are not immediately interested in expanding public irrigation to new areas. Secondly, even where dry regions predominate, those in power — who come mainly from the rich farmer class — seem to be reconciled to the paucity of investible resources, because expansion of resources would necessitate, among other measures, taxing

the rural rich. Thirdly, even the available resources tend to get allocated to projects which yield greater benefits for the elite, especially because new technology and rising prices provide profitable alternatives for big farmers such as investment in private wells, fertilisers, etc, by using institutional credit.[6]

This strategy suits the urban elite as well, because they spend a small proportion of their income on food and the loss in their real income as a result of the rise in the prices of agricultural commodities could be more than compensated by the availability of non-agricultural goods and services made possible through greater priority assigned to them in relation to agriculture. The losers in the process are the urban as well as the rural poor, because they spend the bulk of their income on food. So far as investment for any particular sector such as agriculture is concerned, the problem is not so much the paucity of total investible resources as the allocation of the available resources. However, the 'paucity' of resources as well as insufficient allocation to agriculture from the available resources are traceable, in a large measure, to the increase in non-essential consumption by the elite.

The urban elite is, nevertheless, interested in the assured supplies of marketed surpluses of foodgrains and agricultural raw material at 'reasonable' prices. It seeks to solve the problem of shortage of foodgrains arising from insufficient investment in agriculture partly through the public distribution system involving compulsory levies and administered prices — which its rural counterpart has been able to undermine to a large extent[7] — and partly through the concentration of resources, e g, fertilisers in the developed irrigated pockets and large farms where the results are quick, substantial and assured. This is how slow growth of agriculture and the unevenness of gains are interrelated. The two facets of this strategy, *viz*, deficiency of public investment in broadening agricultural base and concentration on prosperous segments, reinforce each other.

II

Role of Economists

Although, the socio-political factors outlined above are mainly responsible for the relative neglect of agriculture, the prevailing thinking among a large body of economists has not been favourable to adequate public investments in agriculture. These economists have naturally been impressed by the experience of countries showing a very high rate of growth in a relatively short period, e g, Japan, Soviet Union and China. They systematise with a considerable degree of sophistication the relationships between the key economic variables in these high-growth economies and then use these models — overlooking the institutional and political framework within which such a high rate of growth was achieved — to prescribe economic policies for developing countries like India. They easily ignore that, unlike these countries, India was embarking upon planned economic development with a much poorer agricultural base, rapidly growing population and a socio-political framework which ruled out concentration of decision-making and compulsion.

For such economists agriculture provides interest mainly as a source of cheap labour, marketed surpluses and tax revenues.[8] Their accent is more on mobilising such resources from agriculture through appropriate institutional devices than on generating surpluses through significant increases in agricultural productivity,[9] as the latter would involve the diversion of scarce investible resources from the 'priority' sectors such as heavy industry.[10] They seldom regard the growth of agricultural sector *as such* as a major source of national income growth or of general welfare.

III

Redistributive Reforms

Policies on land reform, taxation, credit and prices have also been heavily biased towards big farmers who wield considerable political power at the state level and who influence the formulation as well as implementation of such policies. Unlike the Zamindars and the Jagirdars, these rich farmers are rooted in the villages and display considerable drive for modern farming. They wield considerable influence over the peasantry and constitute the social base and 'vote banks' for the ruling party as well as for many of the opposition parties. They neither have the political courage nor feel the need to openly oppose the Central leadership on several schemes of agrarian reform. They, in fact, vote for some of these radical measures but see to it that they become infructuous in implementation. Agriculture being a state subject, they have been in a position to undermine, if not reject, measures which go against their interests and to mobilise state power and resources to subserve their interests.

Owing to the growth of population and to the resulting sub-division of holdings, the amount of land potentially available for redistribution after the imposition of ceilings is not significant, even if the ceilings are not evaded, and the requirements of uneconomic holdings and the landless are too great to be capable of adjustment with any reasonable level of ceilings.[11] The contribution of legislation on ceilings on landholdings so far sonsists not so much in the 'surplus' land that is made available for redistribution as in arresting or slowing down the growth of large-scale (capitalist) farming in agriculture.[12] A substantial contribution of the drive for ceilings is to be found in the sale of land by the big landowners and in their reluctance to acquire more land in future. In such a situation, the land market could have been tilted in favour of the landless and the marginal holders by extending to them long-term, interest-free loans from the public financial institutions, e g, nationalised banks, for the purchase of land. The elite being avowedly committed to the 'free distribution' of land could not take to such a course, nor was it necessary for it to do so because land could be sold at remunerative prices to those who already owned some land.

Likewise, tenancy reforms, e g, security of tenure and the regulation of rents have been, by and large, ineffective. In the absence of effective implementation and owing to the scarcity of land in relation to demand, such legislation has contributed mainly to driving tenancy underground. Attempts to regulate rents without the effective regulation of wages have proved to be self-defeating, because, when the wages are not raised, it is more profitable for landowners to resume land for self-cultivation through hired labour instead of accepting lower rents. Also, they could resume land in many cases by resorting to tractorisation. However, regulation of rents and wages has been difficult in the absence of effective ceilings and redistribution of land. Performance has been dismal on all these counts because of the common socio-political factor, *viz*, the dominance of big farmers.[13] Given the structure of landholdings, however, the practice of tenancy has contributed to efficiency in resource-use and consequently to higher output and employment, because output and employment per acre on

tenanted farms is greater than on large owner farms. At any rate, this practice has not been inequitous in every case because a good part of the land leased out belongs to the small landowners who cannot undertake self-cultivation.

Whereas the rural rich have been arguing against ceiling on landholdings on the plea that there is no similar ceiling on urban property or income, they have not been prepared to accept the tax burden on par with their urban counterparts. Despite the ceiling on the ownership of agricultural land, there are a large number of farmers, especially in the irrigated pockets where technological changes have made an impact, whose incomes exceed Rs 5,000 per annum. Whereas the corresponding income groups in the non-agricultural sector are required to pay Income-Tax, the rural income groups pay direct taxes at present in the form of land revenue which constitutes only about 1 per cent of their farm business income.

Big farmers appropriate institutional credit more than proportionate to their share in land. Small farmers depend essentially on moneylenders including agricultural moneylenders (big farmers) who relend institutional credit to small farmers at high rates of interest and whose advances have increased very much. Contrary to the general belief, big farmers have been greater defaulters in respect of repayment of loans than small farmers: In the case of small credit societies, where big farmers wield considerable influence and power, the percentage of overdues to loans outstanding has been significantly higher among large farmers as compared to small farmers.[14]

The real need of small farmers has been an adequate availability of institutional credit rather than lower interest rates, as the rates charged by these institutions are already much lower than those at which small farmers have to borrow from moneylenders. Yet, instead of rationing the institutional credit for ensuring equitable distribution, attention has been focused recently more on lowering lending rates for small farmers through a scheme of differential interest rates. Another issue which has been debated very much recently is that small farmers might use the money so borrowed for relending at high rates of interest. Institutional credit constitutes only a fraction of the total borrowings of small farmers and the rates of interest on borrowings from private sources exceed the 'higher' interest rates to be charged to the richer sections by the institutional sources, so that the poorer sections stand to gain by substituting institutional credit for credit from private sources instead of relending to the richer sections. In any case, the scheme of differential interest rates cannot be expected to succeed in the absence of credit rationing, because so long as large farmers are able to corner a substantial proportion of credit and small farmers are denied their due share from institutional sources, it would be possible for the agricultural moneylenders (large farmers) to shift the burden of high interest rates (at which they borrow under the scheme of differential interest rates) to the small farmers by raising market rates of interest because the demand for such loans is relatively inelastic.

IV
Price Policy

In view of the shortage of agricultural commodities and the rising prices, it was expected that agricultural price policy would be directed to ensure adequate supplies of foodgrains to the consumers at reasonable prices and to prevent unduly favourable terms of trade for prosperous agricultural regions and big farmers. However, big farmers have always succeeded in getting higher procurement prices than those recommended by the Agricultural Prices Commission and have evaded the producer levies.[15] Whenever some compulsion became inevitable for the sake of procurement, they often opted for the zonal system — whereby surplus zones are cordoned off for purposes of procurement — as, unlike the levy on large producers, this system spreads the incidence of 'lower' procurement prices on all classes of farmers even when there is a levy on traders and millers. The grain so procured has been used by certain surplus states to contain consumer unrest in their own deficit pockets, even when it means greater hardships for the consumers in the deficit states, and as a bargaining counter with the Central government and the deficit states. Despite the existence of significant interregional differences in free market prices approximating to costs of transportation and distribution from the surplus to the deficit states, the practice has been to fix uniform procurement price for wheat all over the country, which, in any case, has to cover the cost of production in the high-cost regions. Such a policy could result in added gains to the producers in the surplus states, misallocation of resources in such regions,[16] and heavy subsidies on public distribution,[17] the burden of which would ultimately fall on the community as a whole.

V
Distribution of Inputs

The concept of "trade-off" between growth and improved distribution[18] is used not only to rationalise and perpetuate the prevailing unequal distribution of agricultural land but also to justify the intensive use (per acre) of scarce inputs like fertilisers and water on large farms and in the developed regions when it is clear that the social product would be greater by spreading such inputs relatively thinly over a large number of farms in a wider area.[19] Considerations of private profitability dictate that such inputs be applied upto the point where the marginal value product is equal to the price of input whereas maximisation of social product from such scarce inputs requires that they be spread among different farms in such a way that the average product is maximum. In view of their greater capacity to invest and bear risk, large farmers and the developed regions intensify the use of such inputs producing less than socially optimum output.[20] With the introduction of High Yielding Varieties, the divergence between the private and the social optimum is likely to have increased because it is now privately profitable to apply fertilisers in much higher doses than before.[21]

A similar argument may apply to the use of irrigation water. The concept of 'productive irrigation' which has become popular after the introduction of HYV can be used for rationalising the appropriation of water by the influential sections in water-scarce regions even when it is socially more profitable to spread the use of water relatively thinly. This suspicion arises because in certain cases, 'protective irrigation' practised under traditional irrigation systems has been found to be socially productive as it yields greater total output than when applied in larger quantities per acre.[22]

Even in regard to the allocation of resources as between different sections among the poor, preference is given to the relatively better-off among them. One of the arguments advanced in justification is that productivity of inputs as well as surplus generation for the given investment would be higher among such sections. Small Farmers Development Agency (SFDA) is one such

scheme under which small farmers who are not presently viable in terms of certain income norm but who can be made viable with the application of new technology are to be provided necessary credit and inputs.[23] Those owning below this holding are kept out of this programme and are to be taken care of by other programmes such as the one for Marginal Farmers and Agricultural Labourers (MFAL) designed to provide employment mainly through non-crop enterprises. For an essentially anti-poverty programme like this, the exclusion of marginal farmers does not seem equitable because, it is unlikely that, for a long time to come, alternative non-crop avenues can be provided for raising the incomes of these potentially non-viable farms so as to bring them on par with the viable farms. Considerations of productivity[24] as well as of equity require that the scarce inputs be allocated to the small and marginal farms at least in proportion to the cultivated area held by them.

VI
Programmes for Rural Employment

The failure of the current strategy to bring about the promised agricultural growth and employment through the necessary public investments and the redistribution of resources within the agricultural sector has accentuated the problem of unemployment and underemployment in rural areas, particularly because growth of output and employment in the non-agricultural sector has also been slow. The elite has begun to see in this a threat to the existing political system and has, therefore, come out with several *ad hoc* crash programmes such as the Crash Schemes for Rural Employment (CSRE) as part of the Rural Works Programme.[25] Such programmes usually fritter away the scarce investible resources and thus widen the resource-gap for developmental programmes.[26]

If agricultural output did in fact grow at the rate of about 4 per cent per annum — the minimum envisaged in the Five-Year Plans — employment in the production of agricultural commodities alone would have grown by about 3 per cent per annum, as the labour co-efficient (i e, percentage increase in labour input as a result of a 1 per cent increase in output) is likely to be around 0.75 for all the techniques (e g, irrigation, multiple-cropping and HYV, etc) taken together.[27] This is in addition to the employment that would have been generated in marketing and distribution of additional output, in the production and distribution of additional inputs and consumption goods and in the service sector. This growth in employment would have been sufficient to absorb not only the growing labour force in agriculture but would have been sufficient to absorb not only the growing labour force in agriculture but would have also helped to clear much of the backlog of rural unemployment and underemployment. This is because, the growth of labour force in the rural sector woud be significantly less than the growth of population owing, among other factors, to the migration to the urban sector and to the fact that in the initial phases of development in the low income countries, as the income level increases, the participation rate of unskilled labour, particularly females, declines significantly.

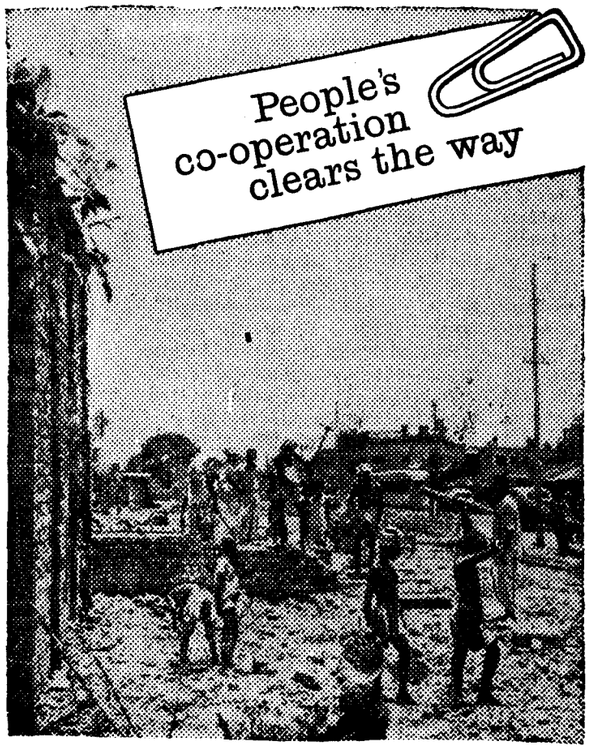
A Rural Works Programme designed to strengthen the capital base of agriculture, e g, soil conservation and minor irrigation through consolidation of holdings as part of the Plan for achieving the targeted growth of agricultural output would be non-inflationary in character and would provide the basis for the sustained growth of output and employment as and when such works are completed.[28] But the Rural Works Programme envisaged essentially as a means of providing employment because growth of output has been slow and is likely to be slow would have an inflationary potential.[29] Indeed, the Programme as it has been actually operating, may have been inflationary.[30] It is difficult to conceive how adequate employment can be generated and poverty mitigated despite the slow growth of a key wage-goods sector like agriculture and when the bulk of even these small gains in output are appropriated by the richer sections.

Apart from the growing concern with the problem of unemployment, the proliferation of such crash programmes owes very much to their political suitability for the elite.[31] Unlike lumpy investments in projects like major and medium irrigation which are location-bound and which have a long gestation period, the Rural Works Programmes offer the promise of an immediate gain to a large number of people in wide areas.[32] Secondly, these programmes help those in power to distribute patronage to a large number of middlemen who have to be rewarded and whose services need to be ensured for future.

Notes

1 On account of this, M L Dantwala disagrees with the proposition that agriculture has not received adequate attention by planners in India. See his "From Stagnation to Growth", Presidential address to the 53rd Annual Conference of the Indian Economic Association, *The Indian Economic Journal*, October-December 1970.

2 This implies that the marginal productivity of labour was positive and significant at least for a sizeable segment in Indian agriculture. That this was indeed so has been indicated by several empirical studies on production functions in the recent period. For an incisive analysis of how, historically, population growth has induced the adoption of labour-intensive techniques contributing to an intensive use of land, see Ester Boserup, "The Conditions of Agricultural Growth: The Economics of Agrarian Change Under Population Pressure", George Allen and Unwin, London, 1965.



3 Michael Lipton, among others, has been focusing on this deficiency in Indian Planning. See his "India's Agricultural Performance: Achievements, Distortions and Ideologies", in "Society and Development in Asia", Martin Rudner, (ed), Asian and African Studies, Volume 6, Jerusalem: The Israel Oriental Society, 1970. This is reproduced in, "Agricultural Development in Developing Countries — Comparative Experience", The Indian Society of Agricultural Economics, Bombay, 1972.

4 A measure of the optimal rate of public investment for agriculture should take into account the demand for agricultural commodities, productivity of investment and the social goals regarding income distribution, etc. Therefore, the observed trend in the ratio of investment allocations for agriculture to the overall investment serves at best as a rough indicator of the importance given to agriculture.

5 According to Gunnar Myrdal, landowners, having an interest in high rents and low wages and in preventing soil erosion, display little enthusiasm for an expansion of cultivated area, even though there is considerable scope for reclaiming new land. See his, "Asian Drama", Vol II, Part Five, p 1266.

6 When irrigation water comes to a region through public canals, all classes of farmers are benefited in proportion to the area held by them and 'big farmers', who are the effective decision-makers in regard to public investment at the state level, may not account for more than 20 per cent of the area held in a region benefiting from public irrigation. There are, however, some exceptions such as the Kosi area in north Bihar.

7 While taking issue with Michael Lipton, M L Dantwala concedes

Widening of Diamond Harbour Road goes ahead

On June 4, 1974, the owners of 300 shops and houses on Diamond Harbour Road helped to demolish their own establishments and voluntarily yielded right of possession to CMDA. Thanks to their co-operation the narrow, cramped Diamond Harbour Road will now be a 120 ft. wide highway. This is a testimony of the people's faith in the cause of Calcutta's development.

Diamond Harbour Road is one of the many major arterial roads that are being widened and improved by CMDA. The present 45 ft. width, which will be 90 ft. wide after the first phase of work, will finally be almost trebled to 120 ft. throughout the five-mile stretch with 3-channel traffic lanes on both sides of the tram tracks. Work on the first half mile is now complete.

Our deep appreciation of those who gave up their premises to make way for the new Diamond Harbour Road. For the success of this and all other projects, we bank on the people's understanding and co-operation.

CMDA

CALCUTTA METROPOLITAN DEVELOPMENT AUTHORITY

CMDA-37R

big farmer bias in agricultural policy but denies urban bias. He is right when he says that agricultural prices are unduly high, which undermines the objective of removal of poverty. But it is difficult to reconcile this with his assertion that investment allocation for agriculture is all right. See his Preface to "Agricultural Development in Developing Countries — Comparative Experience", *op cit.*

8 These economists have been largely responsible for the view, which has persisted throughout the planning period in India, that there are significant revenue prospects from the taxation of agriculture. Recently, however, the Committee headed by K N Raj on Taxation of Agricultural Wealth and Income found that additional revenues through the progressive taxation of holdings with rateable value of Rs 5,000 and above would amount to only about Rs 150 crores per annum. The net addition would be much less if land revenue on holdings with rateable value below Rs 5,000 per annum is abolished. Thus, instead of focusing on the 'equity' aspect of agricultural tax reform, these economists have been emphasising the 'revenue' prospects from taxing the agricultural sector as a whole. Incidentally, big business in the country, in its attempt to divert attention, has always pointed to the 'revenue prospects' from agriculture. Our study, "Taxation of Agricultural Land in Andhra Pradesh" (Asia, 1966) showed that whereas the tax incidence was regressive, a restructuring of the tax system may not result in a significant net addition to the revenues.

9 When it comes to public investment in agriculture, these economists overlook the usual and well accepted criteria of investment and regard the net resource flow into or from agriculture (i e, public investment in agriculture minus the tax revenues from agriculture) as a basis for investment decision. Bruce F Johnston who was a strong exponent of this approach has recently been emphasising the complementarity between agriculture and the non-farm sectors and the need to maximise the positive interactions between these two sectors for accelerating overall economic growth. See Bruce F Johnston and Peter Kilby, "Agriculture and Structural Transformation: Economic Strategies in Late Developing Countries" (forthcoming).

10 Those still committed to the 'heavy strategy, within the prevailing social structure overlook the fact that the output from heavy industry, e g, steel and cement, is not ploughed back into the 'heavy sector', as visualised' by them, but is instead used essentially for supporting elitist consumption, e g, luxurious residential construction in preference. for example, to irrigation projects which produce foodgrains for mass consumption.

11 Calculations made by V M Dandekar and N Rath in their "Poverty in India" (Indian School of Political Economy, 1971) support this proposition.

12 However, despite a ceiling on ownership holdings, a capitalist farmer can enlarge his operational holding to some extent by leasing in land.

13 Dandekar and Rath ('Poverty in India', *op cit*) recommend the "abolition of tenancy altogether rather than regulation" (p 64). It is not possible to abolish tenancy altogether, assuming that it is proper to do so, when even the regulation of rents has proved to be politically infeasible.

14 C H Hanumantha Rao, "Farm Size and Credit-Policy", *Economic and Political Weekly*, Review of Agriculture, December 26, 1970.

15 K Subbarao, "Market Structure in Agriculture (A Study of the Economic Efficiency of Paddy/Rice Marketing System in West Godavari District, Andhra Pradesh)", Ph D dissertation, University of Delhi, 1973.

16 The procurement prices of wheat have been pegged at levels higher than free marget prices in Punjab for a few years which may have resulted in the diversion of resources away from other crops. Alternatively, uniform procurement prices approximating to the cost of production in the low-cost surplus regions would cause misallocation of resources in the deficit regions by moving resources away from the crop concerned, because free market prices in such regions can be expected to approximate to the cost of production in the surplus regions plus thhe cost of transportation and distribution.

17 This is because, consumer prices in the deficit states cannot be raised so as to cover the cost of distribution including transportation from the surplus state — which would be quite high in a large country like India — as this would raise the retail prices far out of proportion to the local procurement prices which are the same as in the surplus region.

18 According to this concept, even though redistribution of land from the large to the small farmers or the landless may increase output and employment in the short-run, the growth of output and employment may slow down in the long-run owing to the reduction in savings and investment as the small farmers consume away a larger proportion of their income than do the large farmers.

For a presentation of "the possibility of a conflict, in densely populated agrarian economies, between the long-term objectives of an overall employment strategy on the one hand, on the other the limited though immediate benefits derived from redistributing land so as to constitute small farms", see J N Sinha, "Agrarian Reforms and Employment in Densely Populated Agrarian Economies: A Dissenting View" *International Labour Review*, November, 1973.

For a critical examination of this concept see C H Hanumantha Rao, "Ceiling on Agricultural Land Holding: Its Economic Rationale", *Economic and Political Weekly*, Review of Agriculture, June 24, 1972.

19 B S Minhas and T N Srinivasan had shown that even with the use of high-yielding varieties, it would be socially profitable to spread the use of fertilisers relatively thinly over a larger area for old as well as new varieties instead of concentrating them in limited pockets. See their "New Agricultural Strategy Analysed", *Yojana*, January 26, 1966.

In view of the impending shortage of fertilisers consequent on oil crisis, V K R V Rao recommends that countries in Asia should try to maximise the returns from the available quantity of fertilisers by spreading them relatively thinly over larger areas. See his "Growth and Social Justice in Asian Agriculture: An Exercise in Policy Formulation", (forthcoming), United Nations Research Institute for Social Development, Geneva.

20 Incidentally, small farms using less quantity of fertilisers per acre may be nearer the social optimum so long as the average product (for fertilisers) among them is higher than that among large farms.

21 Taxing fertilisers so as to raise their price relative to those of products may contribute to a restricted use among the prosperous segments, apart from appropriating, to the exchequer, the black market margins, but such a policy may discourage their use among the weaker segments also. Equitable distribution of such inputs through rationing would, therefore, be a better alternative. However, an increase in the divergence between the private and the social optimum owing to the scarcity of inputs or to technical change or to the rise in the relative prices of output would render rationing more difficult and has a greater potential for misallocation. The recent rise of about 90 per cent in the price of fertilisers may, therefore, be regarded as being in the right direction as, essentially, it restores the product-fertiliser price ratio obtaining a few years ago.

22 Deepak Lal, "Wells and Welfare: An Exploratory Cost-Benefit Study of the Economics of Small-Scale Irrigation in Maharashtra", OECD, Paris, 1972, p 135.

23 The evidence so far suggests that the progress with this programme has been very slow and much of the benefits are appropriated by those who are already viable. See, for instance, D P Gupta, "Small

Farmers' Development Programme — An Evaluation of Progress and Problems", (mimeographed), Agricultural Economics Research Centre, University of Delhi, 1973.

24 Owing to the greater availability of labour and other complementary inputs such as irrigation among small and marginal farms, a rupee spent on current inputs, say, fertilisers, brings forth higher returns than on big farms. According to G R Saini's Study for Uttar Pradesh and Punjab covering two years (1955-56 and 1956-57), the marginal productivity of a rupee invested in fertilisers ranged between Rs 2.04 and Rs 2.44 among small farms as against Re 0.99 and Rs 1.84 among large farms. See his "Resource-Use Efficiency in Agriculture", *the Indian Journal of Agricultural Economics*, April-June, 1969. It may be noted, however, that the marginal productivity of working capital as such is likely to be lower among small farms owing to the inclusion of the imputed value of family labour as part of working capital. Even in regard to fertilisers, the position may be reversed if the rate of adoption of new (HYV) technology is higher among large farms owing to their better resource position which, however, cannot be attributed to farm size as such.
The fact of lower fertiliser-use per acre and its higher marginal product among small and marginal farms with the given technology, contradicts Dharma Kumar's hypothesis that "since labour-land ratio is lower in the commercial sector, more fertiliser per acre will be applied in the family sector ... this unequal distribution of both labour and fertilisers must yield an output less than the maximum possible", See her "Technical Change and Dualism within Agriculture in India", *The Journal of Development Studies*, October 1970. Thus, her recommendation that "the correct policy would, therefore, be to encourage the use of fertiliser in the commercial sector whether by subsidy or by direct distribution" may produce opposite results in regard to output and employment for the additional reason — that cheaper fertilisers for large farms may induce the adoption of techniques which economise on labour rather than induce more employment in this sector, as visualised by her on the assumption of complementarity between labour and fertilisers.

25 Amartya Sen in his book, "Employment Policy and Technological Choice" (ILO, Geneva, 1973) has made a critical evaluation of these schemes and has expressed serious doubts about the productive contribution as well as the egalitarian impact of these programmes.

26 For instance, the Rural Works Programme envisaged by Dandekar and Rath (See "Poverty in India", *op cit*, p 134) is estimated to cost between Rs 800 and Rs 1,000 crores annually, constituting between 20 and 25 per cent of public revenues to be employed in the Fourth Plan. Since many of the developmental programmes such as irrigation projects are held up owing to the shortage of resources, a cost-benefit analysis of Rural Works Programme versus the proposed irrigation projects is very much in order.

27 C H Hanumantha Rao, "Employment Implications of Green Revolution and Mechanisation in Agriculture in Developing Countries: A Case Study of Punjab (India)", presented at the International Economic Association Conference on Place of Agriculture in the Development of Underdeveloped Countries, Bad Godesberg, West Germany, 26 August-4 September, 1972.

28 The Rural Works Programme envisaged by B S Minhas (see his "Rural Poverty, land Redistribution and Development", *Indian Economic Review*, April, 1970) was of this type, although its demands on organisation (administrative preparedness as well as public response) are too onerous to make the programme immediately practicable in areas like the Eastern Zone where poverty is most widespread and where such works appear to be most needed.

29 The Rural Works Programme advocated by Dandekar and Rath is clearly of this type, as, according to them, it would be difficult to make a dent on unemployment and poverty though the process of economic development "firstly because, judging by the experience of the last decade, the rate of growth attainable in the coming decade is likely to be small and inadequate for the purpose, and secondly because, again judging by the experience of the last decade, the small gains of development will most likely accrue, in large measure, to the upper middle and the richer sections of the society". See, "Poverty in India", *op cit*, p 137. They recommend taxation of the rich for financing this programme, but experience has shown that politicians are reluctant to tax the rich and push through these programmes by resorting to deficit financing.

30 This programme needs to be distinguished from the famine relief programmes undertaken in specific areas for specific periods. Such programmes are necessary, rigation would indute migration from drought-prone areas thus reducing the incidence of famines.

31 The attitude of the civil servant towards the peasant comes in quite handy in such a situation: He finds it prudent to uplift the rural poor through several ingenious schemes sponsored and administered from above. Rooted as he is in secure urban environment, he rarely has an opportunity for a comprehension of the genuine requirements of the farmers.

32 Given the diffused character of such programmes, it is difficult to make them productive, partly because productive works are not usually available in many areas to which the programme has to be extended and, even when such works are available, funds are not sufficient to complete them. Those that are undertaken are executed badly because of administrative deficiencies as well as malpractices.

World Armaments

THE SIPRI Yearbook 1974, the fifth annual survey of world armaments and disarmament prepared by the Stockholm International Peace Research Institute, describes the major advances in worldwide arms developments in 1973. In 1973 alone at least 29 nuclear tests were conducted by present nuclear-weapon powers: 14 by the USSR, nine by the USA, five by France and one by China. Over 950 tests have been conducted by these four countries and the UK since 1945.

The United States and the Soviet Union continued to take giant steps forward in their advanced nuclear weapon programmes in 1973, both quantitatively and qualitatively. Ongoing US deployment of land- and submarine-based missiles with multiple individually targetable re-entry vehicles (MIRVs) brought the number of independent warheads on US strategic missiles to nearly 6,000. Moreover, the US announcement that it would emphasise a counterforce strategy (one aiming strategic weapons against military targets) as a strategic option increase the likelihood of procurement of strategic missiles capable of being targeted with very great accuracy.

The Soviet Union, which has about 2,200 independent strategic missile warheads, tested four new prototype ICBMs in 1973, three of which incorporated MIRV warheads with four to seven re-entry vehicles. Soviet development of a very long-range (4,200-nautical mile) submarine-based missile moved forward, and new missile-firing submarines were produced at a steady rate.

On Life and Death Questions

Pranab K Bardhan

Most of the recent discussion on the assessment of poverty and levels of living in India is based on evidence provided by household consumption data. It is usually made with reference to either some minimum nutritional norms for food consumption or some general 'poverty line' defined in terms of a bare minimum level of private consumer expenditure.

Seldom is the discussion related to the crucial question of disparities in the vital rates in India — particularly in the rates of mortality and morbidity. Reliable information, on the disparities in these vital rates as between the various socio-economic groups or on their link with the specific health and nutrition status of these groups, is very scanty.

The limited aim of this paper is to draw attention to some of these disparities — particularly to their regional variations.

I

MOST of the recent discussion on the assessment of poverty and levels of living in India is based on evidence provided by household consumption data. It is usually made with reference to either some minimum nutritional norms for food consumption or some general 'poverty line' defined in terms of a bare minimum level of private consumer expenditure. Seldom is the discussion related to the crucial question of disparities in the vital rates in India — particularly in the rates of morality and morbidity. Reliable information, on the disparities in these vital rates as between the various socio-economic groups or on their link with specific health and nutrition status of these groups, is very scanty. The limited aim of this paper is to draw attention to some of these disparities — particularly to their regional variations.

Let us start with the regional distribution of nutritional inadequacy in India. If one takes 2,250 calories as the minimum daily per capita requirement, one finds from the estimates in Table 1, column (2), that the states where the average daily calorie intake per capita is below this minimum are: Andhra Pradesh, Kerala, Maharashtra, Tamil Nadu and West Bengal. The states where this average intake is significantly *above* the minimum requirement are: Punjab (including Haryana), Rajasthan, Jammu and Kashmir, Uttar Pradesh and Madhya Pradesh. Columns (3) and (4) in Table 1 gives the Dandekar-Rath estimates of the percentage of population in rural and urban areas, within each state, which cannot afford the minimum-calorie diet. It is seen that the states where the percentage of such people is significantly above the All-India average are: Andhra Pradesh, Assam, Kerala, Maharashtra, Orissa, Tamil Nadu and West Bengal; thus except for Maharashtra, the other states with a high percentage of calorie-deficient population are in East or South India. The corresponding percentages are significantly below the all-India average in Punjab, Rajasthan, Jammu and Kashmir, Uttar Pradesh and Gujarat — i e, mostly in North or West India.[1]

Of all the states, the nutritional situation seems to be by far the worst in Kerala. This is so, even if one allows for the probable underestimation, in National Sample Survey data, of the consumption in Kerala of items such as coconut. It is therefore striking to note from column (2) in Table 2 that the expectation of life at birth is the highest in Kerala among all states in India — higher even than in Punjab or Rajasthan where the intake of calories is among the best in the country. Maharashtra and West Bengal are significantly below the Indian average in terms of nutritional adequacy, and yet they are significantly *above* the Indian average in terms of life expectancy. On the other hand, in Uttar Pradesh, Madhya Pradesh, Gujarat and Karnataka, where the percentage of calorie deficient people is below the Indian average, the life expectancy is *below* the Indian average.

Of course, the relationship between nutritional inadequacy and life expectancy or mortality is extremely complex. But it is generally admitted that maternal malnutrition often leads to the birth of premature, underweight, babies; also poor nutrition reduces resistance to infection, particularly among children, and the various infections in turn reduce the nutrient absorption capacity of the body.[2] Consequently, a child, seriously malnourished because of deficiency either in its own diet or in that of its mother at pregnancy and lactation, has much lower chances of survival than otherwise. It must also be remembered that the average household food consumption data, which form the basis of calculations about nutritional adequacy, quite often understate the extent of malnutrition among children. This is so because, the way the data are usually collected, precludes any insight into the pattern of *intra-family* distribution of food. In much of India's food culture, the allocation of food is quite often in accordance with the two-dimensional size of the different family members (i e, height and width);[3] there is thus relative lack of perception of the additional food needs of the nutritionally most vulnerable member of the family, *viz*, the weaned infant or, more generally, the pre-school child.

Nevertheless, whether one looks at the life expectancy data or the infant mortality data [see Table 2, column (3)], the best position among the states is occupied by Kerala which is nutrition-wise the poorest state. It is even more remarkable that Kerala, which is probably one of the world's poorest and most densely populated regions, had a total death rate of about 9 per thousand as in 1971 — approximately equal to the death rate in the US and lower than that in the UK or Germany. From the point of view of infant mortality the worst states in India are Uttar Pradesh, Rajasthan and Gujarat, which are among the nutritionally better-off states. Even in Punjab and Haryana, the infant mortality rate is very much above that in Kerala.

A part of the explanation for this overtly paradoxical regional variation, may be the better private health and sanitation practices in Kerala compared to those in several other parts of the country. This is consistent too with the fact that the literacy rate (or any other index of general education) in Kerala is way above the Indian average.[4] The literacy rate is on the other hand very low in some of the nutritionally better-

IOL continues its advance on the technological front

and here are the facts

*A Centre is being set up in Bombay for the production of a range of gases of ultra high purity and special mixtures for the electronic and other industries. Hitherto these were being imported.

*MIG 400, a more sophisticated form of metal inert gas welding set from IOL, will soon be in the market.

*IOL has won the first 1200 cubic metre/hour Oxygen Plant contract for a mini-steel project of the Maharashtra Government. This is the forerunner of a series to be manufactured by IOL in the near future.

*For the first time in India IOL will produce indigenous tubular hard facing electrodes—"Cobalarc"

*Also for the first time in India IOL has established facilities for producing special purpose automatic welding machines.

Meeting national objectives

IOL Indian Oxygen Limited

TABLE 1 : INCIDENCE OF CALORIE INADEQUACY IN DIFFERENT STATES IN 1961-62

States	Average Daily Per Capita Calorie Intake	Percentage of Rural Population Lying Below the Expenditure Level at Which the Minimum Diet of 2,250 Calories Is Reached	Percentage of Urban Population Lying Below the Expenditure Level at Which the Minimum Diet of 2,250 Calories Is Reached
(1)	(2)	(3)	(4)
Andhra Pradesh	2147	62.14	58.11
Assam	2336	47.67	23.37
Bihar	2514	37.38	41.28
Gujarat	2387	19.09	50.50
Jammu and Kashmir	2933	13.69	42.30
Karnataka	2598	26.92	57.39
Kerala	1606	90.75	88.89
Madhya Pradesh	2789	25.79	51.62
Maharashtra	2195	61.04	58.18
Orissa	2362	43.88	55.57
Punjab (including Haryana)	2891	13.98	52.09
Rajasthan	3020	13.29	21.84
Tamil Nadu	2144	55.19	70.78
Uttar Pradesh	2716	18.13	37.65
West Bengal	2152	44.09	48.53
India	2445	38.00	54.00

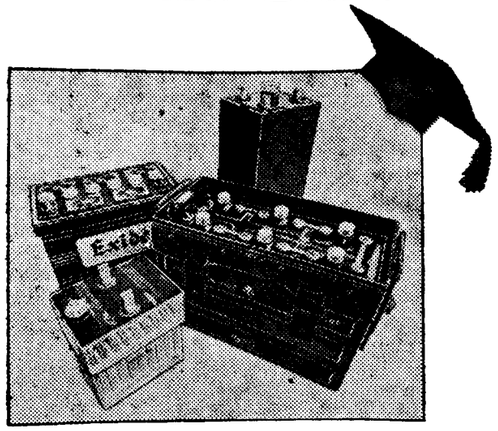
Notes : Column (2) is taken from the estimates presented in T N Krishnan and N N Krishnaji, "Inter-and Intra-State Disparities in Food Consumption : An Analysis", unpublished. They are based on the quantity of consumption data given by the NSS 17th Round (1961-62). Columns (3) and (4) are taken from V M Dandekar and N Rath, "Poverty in India", 1971. The Dandekar-Rath estimates are also based on the same NSS Round data.

TABLE 2 : INFANT MORTALITY AND LIFE EXPECTANCY AT BIRTH

State	Life Expectancy at Birth in Years (1951-60)	Infant Mortality Rate (Rural) in 1969
(1)	(2)	(3)
Andhra Pradesh	36.9	128.9
Assam	36.8	129.5
Bihar	37.6	na
Gujarat	40.0	165.2
Haryana	—	79.7
Jammu and Kashmir	na	102.9
Karnataka	40.2	109.6
Kerala	48.3	56.8
Madhya Pradesh	40.6	na
Maharashtra	45.2	106.9
Orissa	40.9	na
Punjab	47.5	97.6
Rajasthan	46.8	168.8
Tamil Nadu	39.8	112.5
Uttar Pradesh	38.9	178.7
West Bengal	44.3	na
India	41.2	139.9

Notes : Column (2) is taken from "Life Tables, 1951-60", *Census of India*. The figures in Column (2) are reported to be estimaed on the basis of Quasi-Stable Population Model assuming the intermediate series of age-specific mortality and fertility rates adopted by the United Nations in calculating Model Stable Populations. One problem of the Census data used in preparing life tables is that they are inadequately adjusted for under-enumeration and age misreporting at the youngest ages. Column (3) is taken from 'infant Mortality in india", Office of the Registrar General of India, 1972. These infant mortality rates based on the Sample Registration System are supposed to be more reliable than the NSS estimates which are available for a somewhat larger number of states. The all-India infant mortality rate presented is an estimate from the pooled data of the 12 states mentioned. We do not present the infant mortality rates for the urban population, since Sample Registration System data on them were available only for a limited number of states.

off states such as Haryana, Jammu and Kashmir, Rajasthan and Uttar Pradesh.



But a more important explanation may be the better access to medical facilities and public health services in states such as Kerala than in the other states. From column (2), Table 3 it may be seen that, in 1963-64, per capita Government expenditure on medical and public health measures in Kerala was one of the highest in the country and much higher than for instance in Punjab. The corresponding expenditure for Uttar Pradesh was the lowest, and it may not be a mere coincidence that the infant mortality as well as the general death rate is the highest in this state despite poverty in terms of calorie inadequacy being one of the lowest in the country in this state (as is to be seen in Table 1).

Table 3, column (3), shows the number of beds in hospitals and dispensaries per 1,000 population in the different states. Again, this number in Kerala is one of the highest in the country and is much higher than in Punjab or Rajasthan. The figure for Uttar Pradesh is among the lowest in the country. Earlier, we have cited Maharashtra and West Bengal as being significantly below the Indian average in terms of nutritional adequacy but significantly above the Indian average in terms of life expectancy. Now we can see that they are also significantly above the Indian average in bed-population ratio and per capita Government expenditure on medical and public health. In terms of patient visits per capita to the outdoor departments of hospitals and dispensaries, again, the figure for Kerala is among the highest in the country — higher than for Punjab or Rajasthan. In terms of percentage of total number of villages provided with protected water supply, too, Kerala is by far the best in the country.[5] According to NSS 18th Round (1963-64) data, the proportion of villages reporting tanks, ponds, rivers, lakes, springs, etc, as the source of their drinking water in Kerala is the lowest in the country (i e, the proportion of taps, wells and tubewells, as sources, is the highest in the country).

What may be of more direct relevance to infant mortality (or maternal deaths) is the percentage of total births which are attended by trained *dai*, midwife, physician or qualified nurse. Table 3, column (4) shows that the highest percentage of births attended by such qualified personnel in rural India

In all humility, we confer upon ourselves a new degree:

C. Tech.

C. Tech. stands for Chloride Technology.

It is a degree we have earned ourselves —and ourselves alone.

And Chloride Technology shows itself in the performance of our wide range of rechargeable batteries. It is the wealth of technical know-how, resources in men, machines and materials.

Chloride Technology grows out of our modern storage battery plants at Chinchwad and Shamnagar.

You can see it working on city roads and highways of a growing nation.

In far-flung forward areas, our soldiers keep in touch with base—thanks to the excellent performance of our telecommunication batteries.

When the lights go off during a surgery, our stand-by power puts them on again instantly.

And it is Chloride Technology that has resulted in the acceptance of our products overseas—to the extent of earning over Rs. 1 crore in foreign exchange last year.

The list goes on—and wherever you find our product, you will find Chloride Technology has resulted in peak efficiency and performance.

At a crucial period in our nation's growth, involvement is a nice feeling indeed.

CHLORIDE *Chloride Technology makes us more involved than you think!*

in 1964-65 was in Kerala. This percentage in Kerala is very much above that in Punjab, Haryana or Rajasthan. The lowest percentage in the country is in Uttar Pradesh, where we have seen that infant mortality is the highest.

Most of what we have said above, about the regional variations in the relationship between nutritional inadequacy and life expectancy or infant mortality, holds also if we confine ourselves to aggregative comparison between rural and urban India. It is clear from the Dandekar-Rath estimates that poverty, in terms of calorie inadequacy, afflicts a significantly larger proportion of the population in urban India compared to in rural India. This is the case for most of the states too. Yet, according to the Sample Registration Scheme data, issued by the Office of the Registrar General, the crude death rate per 1,000 population was 9.7 in urban India in 1971, which is significantly above the figure of 16.4 for rural India; similarly, the infant mortality rate is estimated to be 81 in urban India in 1971 compared to 131 in rural India.

It is not difficult to list the factors which may explain this rural-urban variation. The literacy rate in urban areas is more than twice that in rural areas. Also, about two-thirds of the total number of doctors and nurses in India are to be found in the urban areas. The hospitals are concentrated in urban areas. According to National Sample Survey (19th Round) data, 46 per cent of all births in urban India are attended by trained medical personnel, compared to 9 per cent in the rural areas. The NSS 19th Round household consumption expenditure data also show that the average private monthly expenditure on medicine and medical services per capita is Rs 1.01 in urban India which is about twice the corresponding figure for rural areas. While more than 40 per cent of India's towns have protected water supply, only about 5 per cent of the total number of villages have this facility. All these facts may go to explain the better urban situation in the incidence of death, despite poorer nutrition and greater possibility of respiratory diseases on account of congestion and inferior housing conditions in towns.

Going back to inter-state variations (as distinct from urban-rural variations) we have so far tried to point to high-poverty states which have managed to keep above-average life-expectancy or below-average infant mortality rates and on the other hand to nutritionally better-off states which have performed miserably in terms of infant mortality or life expectation.

We can now refer to states such as Andhra Pradesh, Tamil Nadu, Assam and Orissa, where the incidence of poverty is high and where the life expectancy at birth too is below the Indian average. In all these four states, the number of beds in hospitals and dispensaries per 1,000 population is below the Indian average. Except in Tamil Nadu, even the literacy rate is below the Indian average. Except in Andhra Pradesh, the proportion of villages with protected water supply is insignificant. According to NSS 18th Round data, nearly half of the total villages in Orissa and Assam reported tanks, ponds, rivers, lakes, springs, etc, as the source of their drinking water in 1963-64.

Now consider Bihar. According to the Dandekar-Rath estimates, the incidence of poverty in Bihar is about the Indian average. But life expectancy in this state is one of the lowest in the country. Also, the literacy rate is extremely low. Per capita Govern-

TABLE 3 : SOME HEALTH STATISTICS FOR THE STATES

States	Per Capita Government Expenditure on Medical and Public Health Measures in 1963-64 (Rs)	Number of Beds in Hospitals and Dispensaries per 1,000 Population in 1964	Percentage of Total Births in Rural Households Attended by Trained *Dai*, Midwife, Physician or Qualified Nurse in 1964-65
(1)	(2)	(3)	(4)
Andhra Pradesh	2.88	0.53	12.24
Assam	3.28	0.45	12.88
Bihar	1.72	0.24	2.78
Gujarat	2.24	0.53	9.69
Haryana	—	—	15.32
Jammu and Kashmir	4.13	1.01	6.10
Karnataka	2.58	0.75	15.83
Kerala	3.70	0.94	25.72
Madhya Pradesh	2.27	0.41	5.14
Maharashtra	2.96	0.81	7.52
Orissa	3.21	0.43	6.79
Punjab	2.57	0.67	14.27
Rajasthan	3.80	0.52	4.07
Tamil Nadu	3.03	0.48	21.92
Uttar Pradesh	1.49	0.38	2.51
West Bengal	3.32	0.85	12.68
India	2.58	0.57	8.81

Notes : Columns (2) and (3) are taken from "Health Statistics of India", Ministry of Health, Government of India. Column (4) is calculated from estimates given in NSS Report No 177 for the 19th Round (1964-65). For columns (2) and (3), Punjab includes Haryana.

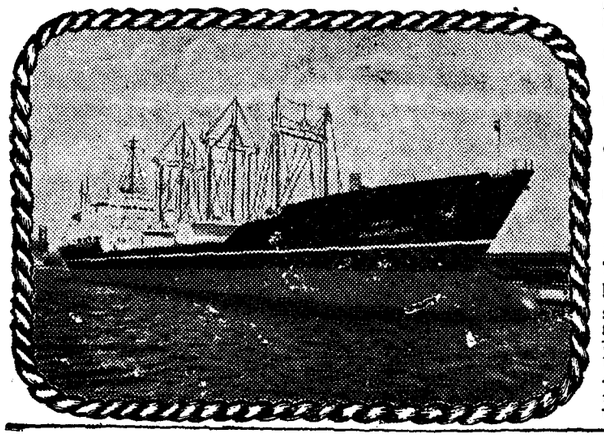


TABLE 4 : DISPARITY OF THE DISTRIBUTION OF VISITS TO OUTDOOR DEPARTMENTS AND OF STAYS IN INDOOR DEPARTMENTS OF HOSPITALS AND DISPENSARIES IN WEST BENGAL BY FRACTILE GROUPS, 1964

Fractile Groups of Population (per cent)		Percentage Shares in Total Number of Visits to Outdoor Departments of Hospitals and Dispensaries	Percentage Shares in Total Number of Free-Bed Days Stayed in Hospitals and Dispensaries
(1)		(2)	(3)
Bottom	Two Deciles	24.8	16.0
Next	Three Deciles	31.5	17.3
Next	Three Deciles	25.9	49.0
Top	Two Deciles	17.8	17.7

Notes : This Table is worked out from the estimates presented in T Maitra, B Dey and N Bhattacharya, "An Enquiry on the Distribution of Public Education and Health Services in West Bengal", *Sankhya*, Series C (Quantitative Economics), June 1974, forthcoming. The sample size was 959 rural and 766 urban households in West Bengal. The authors caution in their article that the estimates are subject to large margins of error.

TABLE 5 : DISPARITIES OF FOOD CONSUMPTION AND MORTALITY RATES OF AGRICULTURAL LABOUR HOUSEHOLDS VIS-A-VIS THE GENERAL RURAL POPULATION, 1963-64

States	Ratio of Death Rate in Agricultural Labour Households to the Average Death Rate of the Rural Population	Ratio of Food Consumption Expenditure Per Capita in Agricultural Labour Households to that for the Rural Population
(1)	(2)	(3)
Andhra Pradesh	1.07	0.93
Assam	1.23	1.21
Bihar	1.22	0.90
Gujarat	1.23	0.85
Jammu and Kashmir	2.53	1.52
Karnataka	1.21	0.92
Kerala	0.99	0.83
Madhya Pradesh	1.24	0.89
Maharashtra	1.26	0.95
Orissa	1.16	0.89
Punjab (including Haryana)	1.14	0.89
Rajasthan	1.57	0.95
Tamil Nadu	1.16	0.88
Uttar Pradesh	1.05	0.92
West Bengal	1.03	0.83
India	1.09	0.91

Notes : Column (1) has been calculated from the estimates given in NSS Report No.175 for the 18th Round (1963-64). Column (3) gives a ratio, the denominator of which is taken from NSS 18th Round data on household consumption expenditure, and the numerator from the NSS 18th Round data for the Rural Labour Enquiry relating to agricultural labour households.

ment expenditure on medical and public health is the second lowest in the country. The bed-population ratio is the lowest in the country. The number of patient visits to the Government health network is among the lowest in the country. In terms of percentage of births attended by trained medical personnel the state is second lowest in the country. The proportion of villages in the state with protected water supply is extremely low. In the four years, 1969-72, of the total number of notified deaths from cholera in India nearly half took place in Bihar. In the current year, the severest incidence of small pox in the whole world has been in Bihar.

In Madhya Pradesh, Karnataka and Gujarat, the incidence of calorie inadequacy is significantly below the Indian average, but average life expectancy at birth is about the same as, or slightly below, the Indian average. Per capita Government expenditure on medical and public health is somewhat below the Indian average in Gujarat and Madhya Pradesh. Bed-population ratio is below average in Gujarat and significantly below average in Madhya Pradesh. The percentage of births attended by trained medical personnel is significantly below average in Madhya Pradesh. The percentage of villages provided with protected water-supply is below average in Karnataka.

II

In the preceding discussion, we have tried to assess the relative importance of nutritional status, general educational level (particularly) as it influences health, sanitation, and child-feeding practices), and availability of public health facilities. It should be noted that, even when the latter facilities exist, their accessibility to the poor differs from region to region. For example, a recent study[6] of the impact of rural health services notes :

> "The overall image of the ANM (Auxiliary Nurse Midwife) or the LHV (Lady Health Visitor) in villages in North India is that of a person who is quite distant from them — meant only for special people or for those who can pay for her services. She is not for the poor. She is not expected to visit them during the pregnancy or after the delivery. In the villages in the South, the position is (only) relatively better."

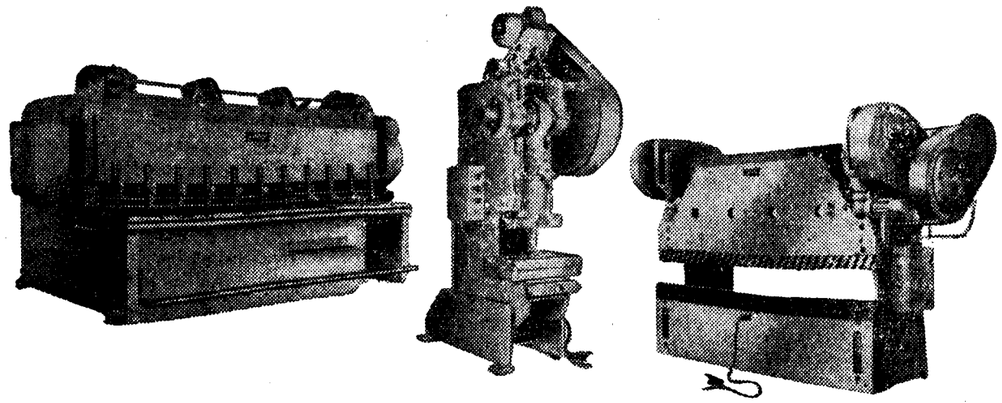
A survey[7] of the distribution of public health services in West Bengal in 1964-65, shows that the poorer groups were reporting somewhat larger shares in the total number of visits to outdoor departments of hospitals and dispensaries, but that the distribution of free-bed days in hospitals and dispensaries disfavoured the poorest groups : the evidence is cited in Table 4.

Very little data exist on the impact of the differential access to nutrition, education, and public health facilities for the different socio-economic groups within a region on the differential incidence of morbidity and mortality among these groups. In fact, is is difficult even to find any reliable country-wide survey on the differential mortality rates for the different socio-economic groups. The only available country-wide survey results, relating to this, are those of the National Sample Survey from a few Rounds. But there are reasons to believe that the NSS estimates of mortality for the poorer groups are serious underestimates — possibly due to the recall lapse for the fairly long reference period used in the surveys (apart from possible cases of reluctance to report still-births or deaths of pregnant women in the household).

Since there is no other source of data on this crucial question, let us assume (though it is not a satisfactory assumption) that the extent of under-reporting in the case of the poorer groups is roughly the same across the states. Table 5, column (2), presents the *ratio* of death rates in agricultural labour households to the average death rates of the population in different states of rural India in 1963-64, as estimated from NSS 18th Round data. For rural India as a whole, the death rate for agricultural labour households seems to be only 9 per cent above that for the general population. Obviously, this is an underestimate of the differential, but let us go ahead with the *inter-state* comparison for what it is worth. It seems that, in Kerala and West Bengal, the death rate in agricultural labour households is about the same as that in the general rural population. On the other hand, Table 5, column (3) tells us that the *ratio* of total food consumption (expenditure) per capita for agricultural labour households to that for the general rural population is the *lowest* in the country in Kerala and West Bengal in 1963-64 according to the NSS 18th Round data. In contrast, in Jammu and Kashmir — and Assam — food consumption per capita for agricultural labour households seems to be actually *higher* than that for the general rural population, yet the death rate for agricultural labour households in Jammu and Kashmir is about 2.5 times that for the general rural population — and for Assam too it is significantly higher than that for the general rural population. In Rajasthan, the death rate for agricultural labour households is nearly

Godrej sheet metal working machines. We'll give you the tonnage you want.

Godrej presses, press brakes and shears are built with the famous Godrej dependability to your specific needs.



Godrej's experience with sheet metal forming machines goes back to 1942. In that year Godrej gave India its first power press and press brake. Like all Godrej products they had that built-in dependability which Godrej products are famous for.

Today Godrej make a wide range of presses, press brakes and shears in tonnages and capacities to suit your manufacturing needs —from as low as 10 tonnes to as high as you'd like to go. You can select from a variety of stroke, speeds, shut height, throat depth and table area.

All Godrej machines surpass generally accepted standards of excellence. You can depend on them to make your tooling ideas come true. Our machines assure you of dimensional accuracy and long tool life and fewer regrinding interruptions.

That's why Godrej machine tools are used by India's leading manufacturers who are known to maintain the very highest in standards. Godrej machine tools made in India have in fact, proved that dependability is a result of experience—not collaboration.

For details or help in selection and tooling, write to:
Godrej & Boyce Mfg. Co. Pvt. Ltd.,
Godrej Bhavan
4A Home Street, Bombay 400 001

We're more experienced, so we're more dependable Godrej

TABLE 6 : LIFE EXPECTATION AT BIRTH IN INDIA—1872-1971

Decade	Expectation of Life at Birth in Years	
	Males	Females
(1)	(2)	(3)
1872-1881	23.7	25.6
1881-1891	24.6	25.5
1891-1901	23.6	24.0
1901-1911	22.6	23.3
1911-1921	19.4	20.9
1921-1931	26.9	26.6
1931-1941	32.1	31.4
1941-1951	32.4	31.7
1951-1961	41.9	40.6
1961-1971	47.1	45.6

Notes : These are based on Census Actuary estimates.

60 per cent above that for the general rural population; yet the ratio of food consumption per capita for agricultural labour households to that for the general rural population is ***above*** the average for rural India as a whole.[8]

If these results are not entirely due to the quirks of NSS mortality data, they point, once again, to the importance of factors such as access to public health facilities and education for the poor, which is probably the best in Kerala and West Bengal than in many other parts of the country.

III

Talking of inter-group differentials in mortality, one of the most striking features of Indian demographic data is — and has been for quite some time — the male-female differential. Census data since 1931 suggest that female life expectancy is lower than male in India, contrary to much of the international experience (see Table 6). There exists a significant literature[9] on this phenomenon. In this paper, we are more interested in analysing its regional variations within India.

Table 7 presents the *ratios* of projected values of expectation of life at birth in 1966-70, for males and females, in the different states. We find that the female life expectancy is ***higher*** than the male in all the four major states of East India: Assam, West Bengal, Bihar and Orissa. In contrast, the female life expectancy is substantially *below* the male in Punjab and Rajasthan. The 1951-60 Life Tables, estimated by the Census Actuary, present zonal life tables which also show that female life expectancy is higher than the male in the Eastern Zone, and it is substantially lower than the male in the Northern Zone consisting of Punjab and Rajasthan.

Table 8 provides the *ratios* of female to male death rates for age-group 0-4 years and for all age-groups put together in the rural areas of the 12 states in 1969, based on Sample Registration System data provided by the Office of the Registrar General. It is seen that the female child (up to 4 years) has a death rate of about 50 per cent higher than the male child in Punjab and Uttar Pradesh, and it is about 20 per cent higher in Rajasthan and Gujarat. By contrast, in Assam, Jammu and Kashmir, Kerala and Karnataka, the female child has a *lower* death rate than the male and the sex-differential is rather insignificant in Andhra Pradesh, Tamil Nadu and Maharashtra. Taking all age-groups together, the female death rate is significantly higher than the male death rate in Uttar Pradesh, Gujarat, Rajasthan, Punjab and Jammu and Kashmir. In contrast, in Kerala, Karnataka, Andhra Pradesh and Assam, the female death rate is *lower* than the male and the sex-differential is rather insignificant in Maharashtra and Tamil Nadu. The Sample Registration System data for 1969 do not include figures for Bihar, Orissa, Madhya Pradesh or West Bengal. For a more complete coverage we could refer to the National Sample Survey 18th Round (1963-64) data, given in NSS Report No 175, although the data are subject to probable under-reporting of deaths, particularly female deaths. If the extent of understatement of sex-differential in mortality in NSS data is roughly the same across the states, we find that the ratio of the female death rate to the male is significantly ***above*** the all-India average in Punjab, Jammu and Kashmir, Rajasthan and Uttar Pradesh and the ratio is significantly ***below*** the all-India average in Assam, Karnataka, Tamil Nadu, Orissa, Andhra Pradesh, Maharashtra and West Bengal.

In general, it seems that the female relative disadvantage in chances of survival is significantly higher for the North and North-Western regions of India; and it is much smaller for East and South India. It is difficult to be sure of the factors underlying this type of regional variations.

Regional variations in the nutritional intake by women is not likely to be an explanation. Even if one makes the realistic assumption that the intra-family distribution of food is highly biased in favour of the males to an extent unjustified by the additional energy requirements of the working adult male (let alone the special needs of women in pregnancy and lactation), the impact of this inequitable distribution is likely to be more severe in areas where the per capita availability of food is less than where it is more. Where there is more food to go around in the family, the female may have better chances. But compared to most of East and South India, in North and North-West India the average per capita availability of food *is* in general higher even for the relatively poor households. And we have already seen from Table 1 that the incidence of calorie inadequacy is the least in North and North-West India.

Apart from nutritional factors, frequency of child birth and too early child-bearing may be important causes of maternal or general female deaths. From Table 9, column (2) it appears that the average number of children per woman in Punjab, Gujarat and Jammu and Kashmir is significantly higher than the Indian average and substantially higher than in the South Indian states or most of East India (except Assam). From Table 9, column (3), it also seems that the median age at marriage for women in Uttar Pradesh and Rajasthan is among the lowest in the country, whereas the corresponding median ages for Kerala and Tamil Nadu are among the highest.

TABLE 7 : FEMALE-TO-MALE LIFE EXPECTATION RATIO IN THE STATES, 1966-70

States	Ratio of Female Life Expectation at Birth to Male, 1966-70
(1)	(2)
Andhra Pradesh	0.964
Assam	1.029
Bihar	1.001
Gujarat	0.969
Karnataka	0.961
Kerala	0.960
Madhya Pradesh	0.977
Maharashtra	0.968
Orissa	1.008
Punjab	0.918
Rajasthan	0.917
Tamil Nadu	0.963
Uttar Pradesh	0.978
West Bengal	1.007

Notes : The ratios are calculated from the projected values of life expectation separately for males and females for different states as cited in Statistical Abstract of Punjab 1972, Government of Punjab.

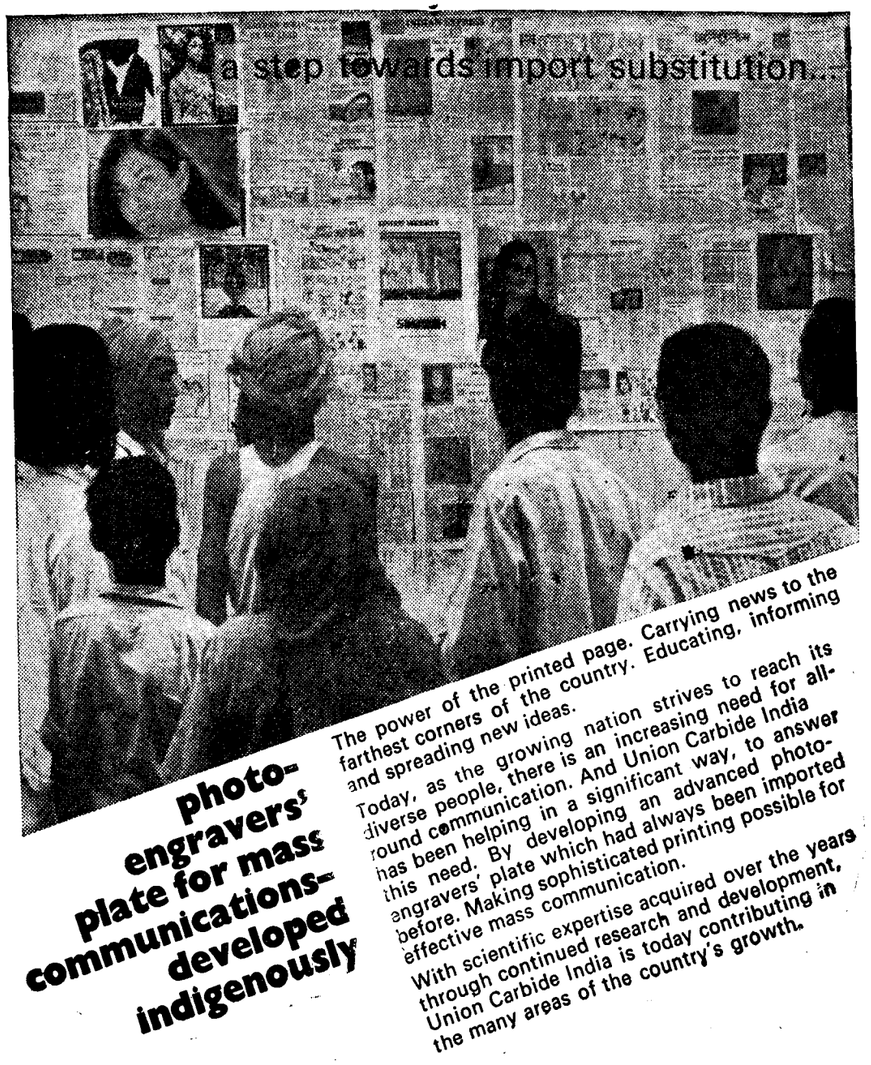

TABLE 8 : FEMALE-TO-MALE MORTALITY RATIOS IN RURAL INDIA 1969

States	Ratio of Female to Male Death Rates	
	For-Age Group 0-4 Years	For All Age-Groups Together
(1)	(2)	(3)
Andhra Pradesh	1.00	0.97
Assam	0.81	0.97
Gujarat	1.19	1.10
Haryana	1.14	1.05
Jammu and Kashmir	0.91	1.06
Karnataka	0.94	0.96
Kerala	0.93	0.89
Maharashtra	1.03	0.99
Punjab	1.53	1.06
Rajasthan	1.19	1.07
Tamil Nadu	1.03	1.02
Uttar Pradesh	1.49	1.31
(Pooled Estimate for 12 states)	1.20	1.10

Notes : These ratios are calculated from the age-specific death rate data on the basis of the Sample Registration Scheme as presented in "Measures of Fertility and Mortality in India", Office of the Registrar General of India, 197.2

A factor that is important in governing health and sanitation practices as well as food habits of women is their general education level. Illiteracy and superstition among females often lead also to their resorting to exorcists for disease cure, to their tardiness in approaching public health facilities even when they are accessible, and to their premature stopping of medical treatment. Kerala is the only state in the country where the majority of the female population are not illiterate. Next comes Tamil Nadu. The female literacy rate is extremely low in the North and North-Western states of Uttar Pradesh, Jammu and Kashmir, and Rajasthan.

On maternal medical care, we have already noted in Table 3, column (4) that, in 1964-65, the percentage of all births in rural households attended by trained personnel (like a trained *dai*, midwife, physician or qualified nurse) in Kerala and Tamil Nadu was the highest in the country. This percentage is extremely low in Uttar Pradesh and Rajasthan. Similarly, the same NSS 19th Round data suggest that the percentage of all births in rural households which take place in hospitals, maternity homes, and other medical institutions, is the highest in the country for Kerala and Tamil Nadu. On the public health facilities, we may work out, from the figures given in columns (2) and (3) of Table 3 and from the relevant population figures, that the per capita Government expenditure on medical and public health measures as well as the average number of beds in hospitals and dispensaries per 1,000 population is higher in East and South India (taken together) than in North and North-Western India (Punjab, Rajasthan, Jammu and Kashmir, Uttar Pradesh and Gujarat) taken together.

Going back to Table 8, it seems that, in the areas of relatively high female death rates, such as Uttar Pradesh, Punjab, Rajasthan and Gujarat, the female-male *ratio* of death rates is higher for the age-group 0-4 years than for all age-groups taken together. This may indicate that what may be more important than maternal deaths in governing the sex-differential in mortality is the general neglect of little girls. Historically, the practice of female infanticide has been known to exist in North and North-West India. The 1911 Census Report points out that the practice "was found to be extremely prevalent in the United Provinces, the Punjab and Rajputana amongst various sections of the population before about the third quarter of the nineteenth century". The practice has died out, but the long-run legacy of general neglect (conscious or unconscious) of undernourished and exposure to infections for the female child may have persisted in this region to a larger extent than in East or South India.

The question, of course, remains as to why, historically, this general neglect of females (including the extinct practice of female infanticide) came to be more prevalent in this part of India. This is obviously a complex subject where historical, cultural, ecological and sociological factors may interact and easy answers are not possible, nor it is within the scope of the present paper to attempt this. Let us only mention a factor or two at the level of sweeping generality.

It is often suggested that the North and North-Western parts of the Indian subcontinent are an extension of the broad cultural region of West Asia, and the impact of Islamic culture had been consolidated there over the centuries of Muslim rule. This, allegedly, may have resulted in the lower status of women and the higher incidence of female child mortality. It is difficult to test this proposition, but one of the few country-wide surveys of infant mortality rates by religious groups we are aware of, does not seem to support the presumption of higher female-to-male infant mortality ratio among Muslims. The National Sample Survey 19th Round (1964-65) data have been tabulated to give us religious, group-wise, infant mortality rates (see NSS Report No 177). In fact, it seems from the data that the ratio of female to male mortality rate is somewhat higher for the Hindus than for the Muslims in rural India (although it is the opposite in urban India). It is possible that under-reporting of female infant deaths may vary across religious groups, but suffice it to say that the presumption of higher female-to-male infant mortality ratio among Muslims is yet to be established.[10]

There are some reasons to believe that the strength of the custom of 'purdah', the associated low status of women, and the exaggerated concerns about their 'honour' and safety in public, is more likely to be region-specific than religion-specific.[11] That this is more prevalent in the North-Western part of our subcontinent may have something to do with the frequency of foreign invasions in this region throughout Indian history. But this historical fact, by itself, cannot explain the sex-differential in child mortality rates in

TABLE 9 : FERTILITY AND MARRIAGE AGE OF WOMEN

States	Average Number of Children Per Woman, 1951-61	Median Marriage Age (in years) in 1951-61
(1)	(2)	(3)
Andhra Pradesh	5.23	17.5
Assam	6.79	19.6
Bihar	5.82	16.6
Gujarat	6.17	19.3
Jammu and Kashmir	5.94	18.2
Karnataka	5.53	18.4
Kerala	5.10	22.0
Madhya Pradesh	5.78	16.3
Maharashtra	5.47	17.9
Orissa	5.35	18.4
Punjab	6.03	19.8
Rajasthan	5.70	16.6
Tamil Nadu	4.57	20.6
Uttar Pradesh	5.51	16.8
West Bengal	5.74	17.8
India	5.53	18.0

Notes : Column (2) is taken from Life Tables 1951-60, Census of India. Column (3) is taken from Kumudini Dandekar, 'Age at Marriage of Women', *Economic and Political Weekly*, June 1, 1974.

this region — compared to in East and South India. Of course, the male child is a potential source of economic support and gets the lion's share of parental attention and nourishment. But this should be true of all gions. Why is the neglect of female children supposed to be more acute in North and North-West India compared to in East and South India? Why is the male offspring more valued in the former region compared to in the latter?

This is wild guess, but it is worth noting: In all the states of East and South India (except Karnataka) the predominant crop is paddy which — unlike wheat and other dry-region crops — tends to be relatively intensive in female labour. Transplantation of paddy is an exclusively female job in the paddy areas; besides, female labour plays a very important role in weeding. harvesting and threshing of paddy. By contrast, in dry cultivation and even in wheat cultivation, under irrigation, the work involves more muscle power and less of tedious, often back-breaking, but delicate, operations (of which transplantation is an example). Could it be that, in areas with paddy agriculture, the economic value of a woman is more than in other areas — so that the female child is regarded less of a liability than in, say, North and North-West India?

This is a wild conjecture[12] and needs considerable detailed empirical work to give it some chance of verification. It is stated here only with the hope of provoking more work in this area. The specific conjecture in its narrow form may turn out to be false, but in general the question of the social and economic value of the woman is likely to be related to the ecological conditions and production relations of a particular region. It is our guess that the male offspring will be valued more in arid (or hilly) areas, where occupations like hunting, grazing and dry cultivation are chief sources of livelihood, than in areas where female participation may be just as useful as male. It is worth investigating if the so-called West Asian culture syndrome of male dominance and virility (which may have infected the social mores of the North and North-Western part of our subcontinent) does not originate in production conditions in which female labour would be less useful.

Notes

1 It is possible that in North India the minimum calorie requirement is also higher than the national average on account of climatic factors and larger body weights, but this is unlikely to change the quantitative conclusion drawn above.

2 See, for example, N S Scrimshaw, C E Taylor and J E Gordon, "Interactions of Nutrition and Infection", WHO Monograph Series, No 57, Geneva, 1968.

3 In the "Tamil Nadu Nutrition Study", USAID Report, 1973, this is described as the face-on-body "silhouette hypothesis" of intra-family distribution of food.

4 Estimates from the data contained in a fertility study of Greater Bombay, 1966, show that the educational level of the mother was the single most effective factor determining the level of infant mortality, See L T Ruzicka and T Kanitkar, 'Infant Mortality in Greater Bombay', *Demography India*, June 1973.

5 See "*Health Statistics of India*", Ministry of Health and Family Planning, Government of India.

6 See D Banerji, 'Health Behaviour of Rural Populations : Impact of Rural Health Services', *Economic and Political Weekly*, December 22, 1973.

7 T Maitra, B Dev and N Bhattacharya, 'An Enquiry on the Distribution of Public Education and Health Services in West Bengal', *Sankhya*, Series C, June 1974, forthcoming.

8 In Rajasthan and Jammu and Kashmir, however, the agricultural labour households form a very small part of the total rural households. This might lead to large random errors in the results.

9 For a good account see Pravin M Visaria, "The Sex Ratio of the Population of India", Census of India 1961, Monograph No 10, Chapters 8 and 9. See also M A El-Badry, 'Higher Female than Male Mortality in Some Countries of South Asia: A Digest', *Journal of the American Statistic Association*, December 1969.

10 It is possible that the seclusion of women within the household might be a factor making Muslim women more susceptible to tuberculosis mortality, Visaria, *op cit*, points to some evidence on higher incidence of tubercular infection among Muslim girls compared to their Hindu counterparts in the same age group as cited in J B McDoughall, "Tuberculosis: A Global Study in Social Pathology", Baltimore, 1949.

11 It will be interesting to compare the social customs in this respect of Muslims (and Hindus) in North-West India with those of Muslims in Kerala or in Bangladesh.

12 One immediate counter-example comes to mind. Comparing West Pakistan with East Pakistan for 1962-64, F Yusuf estimates that the life expectation at birth was 48.4 years for males and 46.0 years for females in East Pakistan and it was 51.5 years for males and 48.6 years for females in West. The male-female life expectation ratio seems to be about the same between the predominantly paddy-growing Eastern part and the predominantly wheat-growing Western part of erstwhile Pakistan. One has to examine this case more closely from the point of view of regional differences in access to nutrition, education and public health facilities as well as in other demographic particulars. Yusuf's estimates of life expectation are cited in Visaria, *op cit*, p 47.

World Economic Growth

WORLD gross domestic product in 1972 increased by 5.3 per cent over 1971, according to the UN's "Statistical Yearbook, 1973". World industrial production resumed its robust growth in 1972 after a two-year period of sluggishness beginning in late 1969. The index numbers indicated that industrial production of the world rose 7.3 per cent in 1972, which reflected increases of 7.9 per cent for the centrally planned economies and 7.1 per cent for the market economies as a whole. The corresponding figures for the developed market economies and for the developing market economies were 7.2 and 7.9 per cent, respectively. For individual branches of industry the largest percentage increase in the output was reported in chemicals, petroleum and coal products. It increased by 9.3 per cent in 1972. Other industries with substantial increases included electricity, gas and water by 8.9 per cent; metal products, 8.3 per cent; and basic metals, 7.8 per cent.

The world crops of main cereals in 1972 showed a decrease following the record crops harvested in 1971. The output of oats in 1972 declined by 11 per cent, rice by 4 per cent, wheat by 2 per cent and maize by 1 per cent. Substantial reduction was registered in the output of cocoa, coffee and potatoes. Production of soyabeans, tea, tobacco, cotton, milk and meat was higher than the 1971 level.

World exports in 1973 reached an all-time high of $ 565 billion, a staggering increase of about 37 per cent over the 1972 figure of $ 412 billion. However, an important part of this increase was due to the devaluation of the United States dollar in terms of which the value data are reported as well as the floating of many major currencies.

Reactionary Role of Usurer's Capital in Rural India

Pradhan H Prasad

The semi-proletariat of the agricultural sector constitutes the bulk of the rural poor. They comprise households who cultivate land mainly with the help of their family labour and at the same time supply labour to other cultivating class. Some of them own some cultivable land; quite a significant number lease in land mostly on crop-sharing basis; a sizeable section is landless agricultural labour.

Almost all the semi-proletariat households are deficit ones in the sense that their bare minimum consumption expenditures exceed their incomes. They are thus forced to take consumption loans both in cash and in kind from the big landowning class. The stipulated rates of interest on these loans are very high and, leave aside the loan, even full payment of interest is beyond the means of the semi-proletariat.

The big landowning class, however, does not insist on full payment even in the long run. It often forces the debtors to sell their assets (mostly land) but rarely for complete discharge of the debt obligation. It uses the debt obligation to force upon the direct producers in agriculture a system of unequal exchanges, thereby deriving enormous economic benefits in such forms as cheap and assured labour and better terms for leasing out land.

IN the course of our research work, we have come into intimate contact with some of the rural areas in Bihar.[1] This is the basis of the profile of the semi-proletariat that we present below. The bulk of the rural poor happen to be the semi-proletariat of the agricultural sector. They comprise households who cultivate land mainly with the help of their family labour and at the same time supply labour to other cultivating classes. They are the tillers of the soil in the real sense of the term who are the most oppressed among rural classes in the existing institutional set-up. Some of them own some cultivable land. Quite a significant number lease in land mostly on crop sharing basis but in some cases on terms requiring payment in cash or labour services. But there are others who do not own even homestead land. A sizeable section is landless agricultural labour. Almost all the semi-proletariat households are deficit ones in the sense that their bare minimum consumption expenditures exceed their incomes. They are thus forced to take consumption loans both in cash and in kind from the big landowning class who are the main constituent of the rural rich. The stipulated rates of interest on these loans are very high, often as high as 100 per cent per annum. Leave aside the loan, even the full payment of interest is beyond their means.

The big landowning class, however, does not insist on full payment even in the long run. It often forces the debtors to sell their assets (mostly land) but rarely for complete discharge of the debt obligation. It uses this debt obligation to force upon the direct producers a system of unequal exchanges, thereby deriving enormous economic benefits such as cheap and assured labour for its own cultivation and better terms for leasing-out land. It, thus, appropriates almost the entire surplus value to itself.

The characteristic feature of this set-up which we may call semi-feudal, is that an indissoluble bond between the semi-proletariat and his overlord is maintained by resort to usury. It is precisely because of this that the landless agricultural labourers have been categorised here as semi-proletariat. The proletariat as a class is found in a capitalist set-up where it is free to sell its labour power. On the other hand, in a semi-feudal set-up *de facto* it is not free to sell its labour power. Only in a very narrow legal sense of the term can it be said that its involvement in the labour market is voluntary. As no system can afford to give less than subsistence to its direct producers, the big landowning-cum-usurer class does not stop lending even when he knows it to be beyond the capacity of the debtor to pay it back in the narrow legal sense of the term. Often the loans outstanding exceed the total value of the assets of the debtors. The enormous economic power which gets concen-

TABLE 1: PERCENTAGE OF CONSUMER EXPENDITURE TO TOTAL NET RECEIPT BY 'ANNUAL TOTAL' RECEIPT CLASS IN RURAL AREA

trated in the process in the hands of the big landowning class not only allows it to dominate over the economic activities of the area but also makes it politically very powerful. And it is this class which shuns rapid development because it is likely to improve the economic condition of the semi-proletariat who can thereby free itself from the bondage. This, as such, would be against the interest of the big landowning class. That is why they approach the whole process of production and distribution mainly with a view to perpetuating this semi-feudal bondage rather than allowing rapid rate of investment and intensive use of available means of production in the rural areas. Here the usurer's capital plays a historically reactionary role which is not only responsible for low use of means of production and inimical to net investment in the agricultural sector but is also responsible for widespread poverty, debt-slavery and semi-feudal bondage.

So far the sample from which we have drawn our data is too small for any generalisation for the country as a whole. But there are facts which lend support to the thesis that the aforesaid semi-feudal model (but for variations in details) is, by and large, valid for most part of the rural India. Empirical evidence in support of widespread rural indebtedness is available in the All-India Rural Credit Survey Report for the period 1951-52, All-India Rural Debt and Investment Survey Report for the period 1961-62 and All-India Rural Household Survey for the mid-sixties period carried out by National Council of Applied Economic Research. The 25th Round National Sample Survey for the period July 1970-June 1971 provides further evidence in support of the thesis. This is the survey of the weaker section of the rural population which has been divided into two categories, namely, the lowest 10 per cent of the rural households having cultivated land and non-cultivating wage-earner rural households. If one accepts the time disposition criteria for determining the occupation of the sample, it would be evident that the class character of the sample is that of semi-proletariat of the agricultural sector (Table 3). It would be also evident from Table 1 that the vast majority of households remain deficit ones. In some cases consumption expenditure is over ten times the net receipt. So acute is the deficit that the repayment of loans invariably remains much less than the loans taken during the year (Table 3). In the case of the

lowest asset group, that is, those having total assets of less than Rs 100 the loans outstanding in most of the cases remain much more than the value of their total assets (Table 3). Continuation of such an absence of capitalist commercial relation between debtor and creditor can only be explained in terms of debt-bondage and debt-slavery.

It gives rise to a system of 'unequal exchanges' with the result that the economically weak households find themselves at a disadvantage in the context of the terms for leasing-in land, hiring bullocks and irrigation charges. This is not all. They are left with little option but to make distress sale almost just after the harvest. The little that is left after the sale is used up before the start of the next cultivating season. Often, they find that they do not have even seed for the next round of cutivation. They have no other option but to borrow cash at a high rate of interest and purchase seeds when prices are at their peak.[2] Thus, those faced with such 'unequal exchanges' would find that the proportion of paid out cost (i e, disbursement) to the gross output would be higher in their case than that of the others even when they may be economising on hiring labour and other inputs such as fertilisers and improved seeds, etc. A statewise comparison between Tables 1 and 2 shows that the higher the extent of deficit, the higher is the percentage of disbursement to gross farm income. The correlation co-efficient between them in a majority of cases is quite high and statistically significant (Table 3). That this has resulted in the semi-proletariat of the agricultural sector being gradually deprived of their land is evident from the facts contained in the First (1950-51) and Second (1956-57) Agriculture Labour Enquiries and the Rural Labour Enquiry (1964-65). The self-employment among the agricultural labourers has been steadily declining from 65 days in 1950-51 to 33 days in 1956-57 and to 25 days in 1964-65. In the Indian context, self-employment in the case of agricultural labour mostly means self-cultivation. What other conclusion can be drawn from this except that the semi-proletariat has been slowly losing land? The high rate of growth of agricultural labourers, higher than the rate of growth of the rural population, during the period 1961-71 also points to the same situation.[3]

The inefficiency of the semi-feudal set-up is well illustrated by the findings of Aparajita Chakravarty and Ashok Rudra.[4] Whereas in the small-sized group the owner-farmers' economic performance is better than those of the tenant farms, no such difference in economic performance is visible in case of the large-sized group, maybe because the big landowning class is more interested in using the usurers' capital for perpetuating and strengthening the semi-feudal bondage rather than in improving the economic performance of their farms. We can take yet another illustration. The declining consumption of energy per energised irrigation pump (Table 4) in a situation where hardly one-fifth of the rural areas were electrified, is an illustration of wasteful use of available means of production.[5] By 1971 there was no shortage of power which could explain this. It may partly be explained by an argument that rural electrification has been effected in areas where the need for irrigation is low or the availability of groundwater resources inadequate. But even this irrational approach to rural electrification can be traced to the enormous political power of the big landowning class. More often, the priority in rural electrification is accorded to areas where big landowners live irrespective of the consideration whether the need for irrigation in the area is high or the availability of groundwater resources adequate. Argued in either fashion the end result is the same. The semi-feudal set-up remains inimical to development. What else can be concluded from all that has been said above except that usurers' capital continues to play its historically reactionary role in most parts of rural India.

Notes

3 The number of agricultural labourers in India between 1961-71 shows an average annual rate of growth of about 5.11 per cent. It should, however, be noted that the available 1971 Census data relate to a narrower concept of 'worker' than the earlier one and, therefore, the aforesaid estimate of rate of growth is probably an underestimate.

Farm Efficiency under Semi-Feudalism

A Critique of Marginalist Theories and Some Marxist Formulations

Nirmal K Chandra

Are small farmers more efficient than large ones? Are 'capitalist' farms cultivated in the main by hired labourers less efficient than family farms working with the help of family labour? Does crop-sharing depress productivity? These are the questions which we hope to answer in a specific historic context characterised by technological backwardness and massive unemployment, as one finds in West Bengal and most other parts of India.

Economists concerned with agriculture have debated these issues for at least two centuries. Among the marginalists there has been a spate of discussion in recent years triggered off by Georgescu-Roegan. In the first part of this essay from section 1 to section 5, we shall examine these writings from a theoretical standpoint but within the above-mentioned context.

The second part of the article, section 6 to 8, is devoted to an empirical verification and a critique of the marginalist theories. Our hypotheses regarding the issues in debate are also speeled out, based on our findings.

Although Marxists employ an entirely different analytical framework some of the questions asked are no different from those in bourgeois economics. Hence at the beginning of the final part a brief sketch of established Marxist ideas on the subject is given. It is followed by a rapid scrutiny of historical evidence available for West Bengal or for India as a whole. In the final section we seek to explain the apparent inconsistencies between the established Marxist ideas and the historical trends. These inconsistencies are traced to the existence of semi-feudalism, the basic features of which are also analysed.

ARE small farms more efficient than large ones? Are 'capitalist' farms cultivated in the main by hired labourers less efficient than family farms working with the help of family labour? Does crop-sharing depress productivity? These are the questions which we hope to answer in a specific historic context characterised by technological backwardness and massive unemployment as one finds in West Bengal and most other parts of India.

Economists concerned with agriculture have debated on these issues for at least two centuries. Among the marginalists there has been a spate of discussion in recent years triggered off by Georgescu-Roegen. In the first part of this essay from section 1 to section 5, we shall try and examine these writings from a theoretical standpoint but within the context just mentioned.

The second part, sections 6 to 8, is devoted to an empirical verification and a critique of the marginalist theories. Our hypotheses regarding the issues in debate are also spelled out, based on our findings.

Although Marxists employ an entirely different analytical framework some of the questions asked are no different from those in bourgeois economics. Hence at the beginning of the final part a brief sketch of established Marxist ideas on the subject is given. It is followed by a rapid scrutiny of historical evidence available for West Bengal or for India as a whole. In the final section we seek to explain the apparent inconsistencies between those ideas and the historical trends. These inconsistencies are traced to the existence of semi-feudalism, the basic features of which are also analysed.

I

"Standard" Marginalist Theory

We may begin with what might be regarded as the "standard" marginalist theory as it was first developed by Chayanov[1] but was expressed much more cogently and lucidly by Sen.[2] Given land and other non-labour inputs, output is a function of labour along with the usual characteristics, namely

(1) $Q = Q(L)$, Max $Q = (\bar{L})$
$Q'(L) > 0$ for $L < \bar{L}$
and $Q'(L) = 0$ for $L \geqslant \bar{L}$
$Q''(L) < 0$ for $L < \bar{L}$
and $Q''(L) = 0$ for $L \geqslant \bar{L}$

where Q is output and L is labour.

Utility, U, is a function of income[3] which in a one-commodity world is equal to the output-received and has again the usual properties, i e,

(2) $U = U(Q)$, with $U'(Q) > 0$
and $U''(Q) < 0$.

The disutility from labour is V which is another increasing function of labour; marginal disutility is also non-decreasing, i e,

(3) $V = V(L)$, $V'(L) \geqslant 0$, $V''(L) \geqslant 0$

Every economic agent is supposed to maximise his welfare (H) which is defined as

(4) $H = U - V$.

The owner cultivator will reach equilibrium at a point (L_s, Q_s)

where

(5) $Q'(L).\ U'(Q) = V'(L)$.

i e, the marginal utility of income from work equal the marginal disutility from work. For the capitalist farmer the corresponding equilibrium point $(L_e, Q_e$ will be given by the condition

(6) $Q'(L) = W$

where W is the market wage-rate. Since the capitalist farmer does not till the land himself, for him $V = 0$, and he will maximise his surplus (i e, output minus wage-bill) which will *ipso facto* maximise his utility as well as welfare.

It seems highly plausible that in backward agrarian economies with widespread underemployment $\frac{V'(L)}{U'(Q)} <$ W for the relevant range of values of L, i e, cultivators will be willing to till lands possessed by themselves for marginal earnings significantly below the wage-rate. More accurately, if we define the "real cost of labour" at the equilibrium point as

$$(7)\quad X = \frac{V'(L)}{U'(Q)} = Q'(L),$$

there is a strong presumption that $X < W$. This very crucial assumption can be justified along the following lines. Even if agricultural wages are

pegged to the subsistence minimum, wage rates for casual or daily labour may be a little higher to allow for a large proportion of jobless days in the year. The "real cost" at the margin for a cultivator is somewhat nearer the subsistence level since he has in general a more regular employment throughout the year.

Coming to the issue of relative efficiency, it will be seen below that, the owner-cultivator will put in more labour on and extract a higher output from land than the capitalist farmer.

In Figure I two different possibilities are shown.[4] $\overline{CAL}$ is the marginal product curve intersecting the wage-line EA at A and L_c is the equilibrium quantum of labour to be engaged by the capitalist farmer. V'(L) is indicated by the line DF. The equilibrium amount of labour to be put in by the owner-cultivator will depend on the position of the marginal utility curve corresponding to the marginal product line. Two possibilities are shown, namely, $B_1\ \overline{L}$ and $B_2\ \overline{L}$; the corresponding equilibrium labour inputs would be L_{s1} and L_{s2}. In both the cases production and labour inputs in the family farm are higher than in the capitalist farm.

Share-cropping, as long as the share is fixed by convention and the actual tiller is free to determine the quantum of labour inputs at any level he may like, will in general be less efficient than ownership cultivation. In this case, the labour disutility function remains the same as before, but the marginal product curve will be consistently lower except at the point $\overline{L}$. If (1 — r) is the tenant's share, then (1 — r). Q'(L) is indicated by $\overline{GL}$ in the Diagram; the marginal utility curve, i e, r.Q'(L).U'(Q) will invariably lie below the owner-cultivator's marginal utility curve. (The former is not shown in the Diagram.) Consequently, the equilibrium amount of tenant labour, L_T is less than L_s and also $Q_T < Q_s$. Hence by any yardstick, the volume of output received or welfare, self-cultivation (as long as it is feasible) is more desirable for the owner than leasing out on a share-rent basis.

If V'(L) lies much below the wage-line and has a gently rising slope,[5] then both $L_T > L_c$ and $QT > Qc$. Thus share-tenancy can be more efficient than capitalist farming; but this assertion is much weaker than the two earlier ones indicating the superiority of ownership cultivation *vis-a-vis* the other two types of farms.

Georgescu-Roegen[6] discards all the utility calculus so that for him U'(Q) = 1 and V'(L) = 0 for all the relevant values of Q and L. In this "special" case, as Sen puts it, equilibrium both under tenancy and under ownership-cultivation, takes place at $\overline{L}$. Thus $L_s = L_T = -\overline{L} > L_c$.

The capitalist farm is inefficient, the other two ensure operation at maximum efficiency.

Whatever be our reservations to be explained later, there is little doubt that the propositions made out so far do not strongly militate against commonsense. These seem to explain successfully the relative paucity of capitalist farms and the strong preference for self-cultivation among small and medium landowners.

II

A Challenge

A refreshing challenge against these "orthodox" conclusion came from S N Cheung[7] who sought to demonstrate that productive efficiency is invariant as between the three types of farms. Like Georgescu-Roegen he also discards the utility aspects and assumes that each economic agent maximises his income or net income subject to some constraints.

The landowner while he gives out land on share-tenancy, maximises his income and in the process determines the sharing ratio and the amount of labour to be put in by the tenant; the only constraint he is faced with is a perfectly elastic supply of tenant labour at the existing market wage-rate. Thus we have :

(7) Max r. Q(L)

Subject to w.L = (1—r). Q(L)

where the variables are as defined before. The solution to (7) will give equilibrium values of Q, L and r. Given an identical labour supply function for the capitalist farmer as well as for the owner-cultivator, it will be readily seen that $L_c = L_T = L_s$ and that the land owner's rent will exactly equal the capitalist farmer's surplus.

If such is the tenant labour supply function, the tenant also "maximises" his income from the land assigned to him by working upto the point L_T. To this extent the comment by Bardhan and Srinivasan[8] is a little misplaced when the latter allege that in Cheung's scheme the tenant has no decision-making role: the two critics are undoubtedly correct insofar as the tenant cannot choose the amount of land to be leased in by himself. But surely the landowner's decision in this context is more important in countries with a very high population pressure on land.

Precisely in such countries, however, Cheung's labour supply function is questionable. The few quotations he gives lay down, in our view, the

minimum amounts of labour and other inputs that the tenant is *obliged* to provide; nowhere in the contracts is the latter debarred from supplying extra inputs.[9] Following on our earlier discussion, there is a much stronger case for the labour supply function to lie below the wage line. Besides, an impressive volume of evidence has been presented over the decades by Kautsky, Lenin, H Levy and Chayanov[10] which show that the average rates of actual remuneration per work-day in family farms are often lower than the ruling agricultural wage rates at the same time and place. If the tenant is free to provide more labour than the minimum stipulated by the landlord in accordance with the system (7), and the tenant's labour supply curve lies below the wage-line, the tenant will tend to use the option, thereby increasing gains both for himself and the landlord. Cheung's results no longer hold good and we are back to Georgescu-Roegen's position.

Apart from its implausibility, there are also some logical gaps in Cheung's labour supply function. It can be retained if the tenant has a number of alternative job opportunities at the prevailing wage rate. Implicitly then there is labour scarcity. In such a situation, however, the criticism of Bardhan and Srinivasan becomes valid. The tenant should also have a say in determining the amount of land to be leased in; the one-sided maximisation process for the landlord alone will not be sufficient to ensure a stable equilibrium. More importantly, if the tenant's remuneration per work-day is no higher than the wage rate and if there is no difficulty in obtaining a labourer's job, a rational person should always prefer to be an agricultural labourer with fixed wages than a share-tenant who has to shoulder the risks as well as managerial responsibility.[11] He can be forced to take up tenancy only if other avenues of employment are restricted. Here lies an inescapable contradiction undermining the whole theoretical basis of Cheung's proposition.

Perhaps the worst drawback of the models of Cheung and of Bardhan and Srinivasan is their ahistorical character. Share-cropping is universally recognised to be a pre-capitalist institution that has not survived the development of capitalism except for limited periods, and that, too, in the stagnant backwaters of such an economy. Yet one seeks to probe the functioning of share-tenancy with text book assumptions of a perfectly competitive capitalist system with full employment!

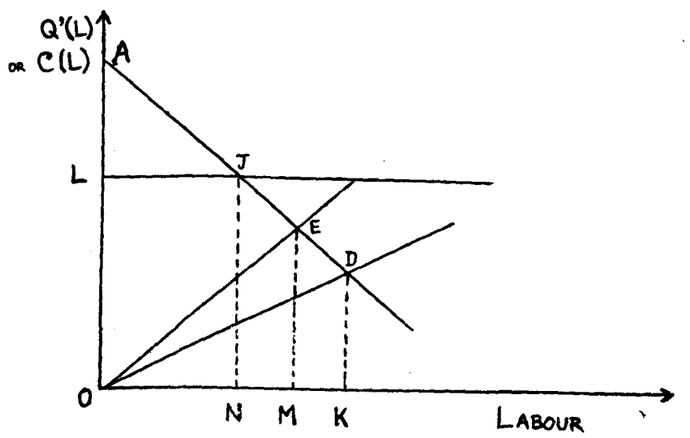
III

A Theoretical Counter-Revolution?

Lastly we come to Sau's[12] attempt to stand capitalist logic[13] on its head by proving that share-tenancy is more efficient than *ownership-cultivation* which, in its turn, is superior to capitalist farming. He makes use of the "standard" formulations given by the system (1)-(5) above. However, he takes the following labour supply function for non-capitalist farms:

$$(8)\quad C(L) = \frac{V'(L)}{U'(Q)} = \frac{dY}{dL}$$

where Y is the income. [For the owner-cultivator Y = Q, but for the tenant Y= (1—r). Q]. The function C(L) also indicates "the marginal rate of indifferent substitution between income and labour".



In Figure II AJED represents Q'(L), and OD is the tenant's C(L). Hence equilibrium will be at point D with the rental share r = OAD/OADK.

It is presumed that the landlord can by contract enforce a minimum amount of labour to be provided by the tenant. At the point D the former's income is maximised; the tenant, too, has no incentive to go beyond this.

Now since for any given L, the owner-cultivator will have a higher income than the tenant, the corresponding U'(Q) for the former would also be lower. Thus the labour supply function for the owner-cultivator will lie above that of the tenant. It is shown as OE so that equilibrium occurs at E. For the capitalist farmer J is the equilibrium point on the wage-line indicated by LJ.

If Sau were correct, there should be no capitalist farms as the landowner's net income, OAD, exceeds the capitalist surplus, LAJ. Further, leasing out land would enhance welfare compared to self-cultivation. The self-cultivator's total income and total utility may be higher than the landlord's, but considering the disutility of labour and the declining marginal utility of income, the landlord's welfare function would have a higher value. Looking simply at the 'net income', i e, total output minus payments to the tenants in the case of the landlord, and total output minus the portion that compensates for the disutility of labour in the case of the self-cultivator, the landlord is better off. On the other hand, this theoretical conclusion is completely at variance with the widely observed phenomenon of the peasant's preference for self-cultivation; if the theory were indeed true owners of any piece of land should always lease it out to share-tenants — rather than till it themselves.

FIGURE II

However, Sau's theoretical construct involves a serious logical contradiction. If, as Sau says, for any L, the tenant's marginal utility is higher than that of the self-cultivator, then the former's total utility (which is an integral of marginal utilities) is necessarily higher, too. But, for any L, the tenant's total income is less so that he is deemed to derive a greater utility from a smaller income than the self-cultivator. A misspecification of the latter's labour supply function is at the root of this trouble; for in (8) the whole of the self-cultivator's income enters into the picture. This income has, in fact, two components — one due to labour and the other due to land-ownership. This imputed rent cannot obviously affect the supply of labour. For the sake of consistency one should rewrite the marginal labour supply function as

$$(9)\quad S'(L) = \frac{V'(L)}{U'(Q_1)}$$

where Q_1 is the income from labour alone. In this way we obtain an identical labour supply curve for the tenant and the self-cultivator, which is as it should be. (We may also note that S'(L) coincides with Sau's C (L) for the tenant.) However, this S'(L) has little relevance for the owner-cultivator who, as before, will reach an equilibrium only when the marginal disutility from work equals the marginal utility from total income.

S'(L) can be relevant for the income-maximising landlord *only if* he is a monopsonist in the market for tenant-labour, i e, he has a monopoly in the market for land (more precisely, land to be rented out). It must be said to the credit of Sau that in effect he has been one of the first to introduce a monopoly element[14] into this kind of theoretical discussion — although he himself avoided the term and emphasised the fact of competition among the tenants! The importance of this factor (monopoly) in real life cannot be overemphasised.

Now assuming monopsony in the market for tenant labour, and the landlord's ability to fix the rental share as well as the quantum of labour in accordance with S'(L), the equilibrium output (Q_{Tm}) may or may not be higher than that under self-cultivation (Q_s). For obvious reasons Q_{Tm} will correspond to the intersection of S'(L) and Q'(L), whereas Q_s will be obtained, as before, from the intersection of V'(L) and U'(Q). Q'(L). As it was explained earlier, one does not know *a priori* whether U'(Q). Q'(L) would lie below Q'(L); by the same token the relative positions of V'(L) and S'(L) are uncertain. If V'(Q) = 1 throughout, then $Q_s = Q_{Tm}$; in all other cases the outcome is indeterminate. (A diagrammatic treatment is eschewed because it would be even clumsier than our Figure I).

Finally, we may note that the results of Georgescu-Roegen are unaffected by the introduction of monopsony. For, now that utility and disutility are removed from the scene, the tenant's labour supply curve (both the average and marginal) coincides with the L-axis in Figure I.

IV

Recapitulation

We may now briefly recapitulate the discussion so far.

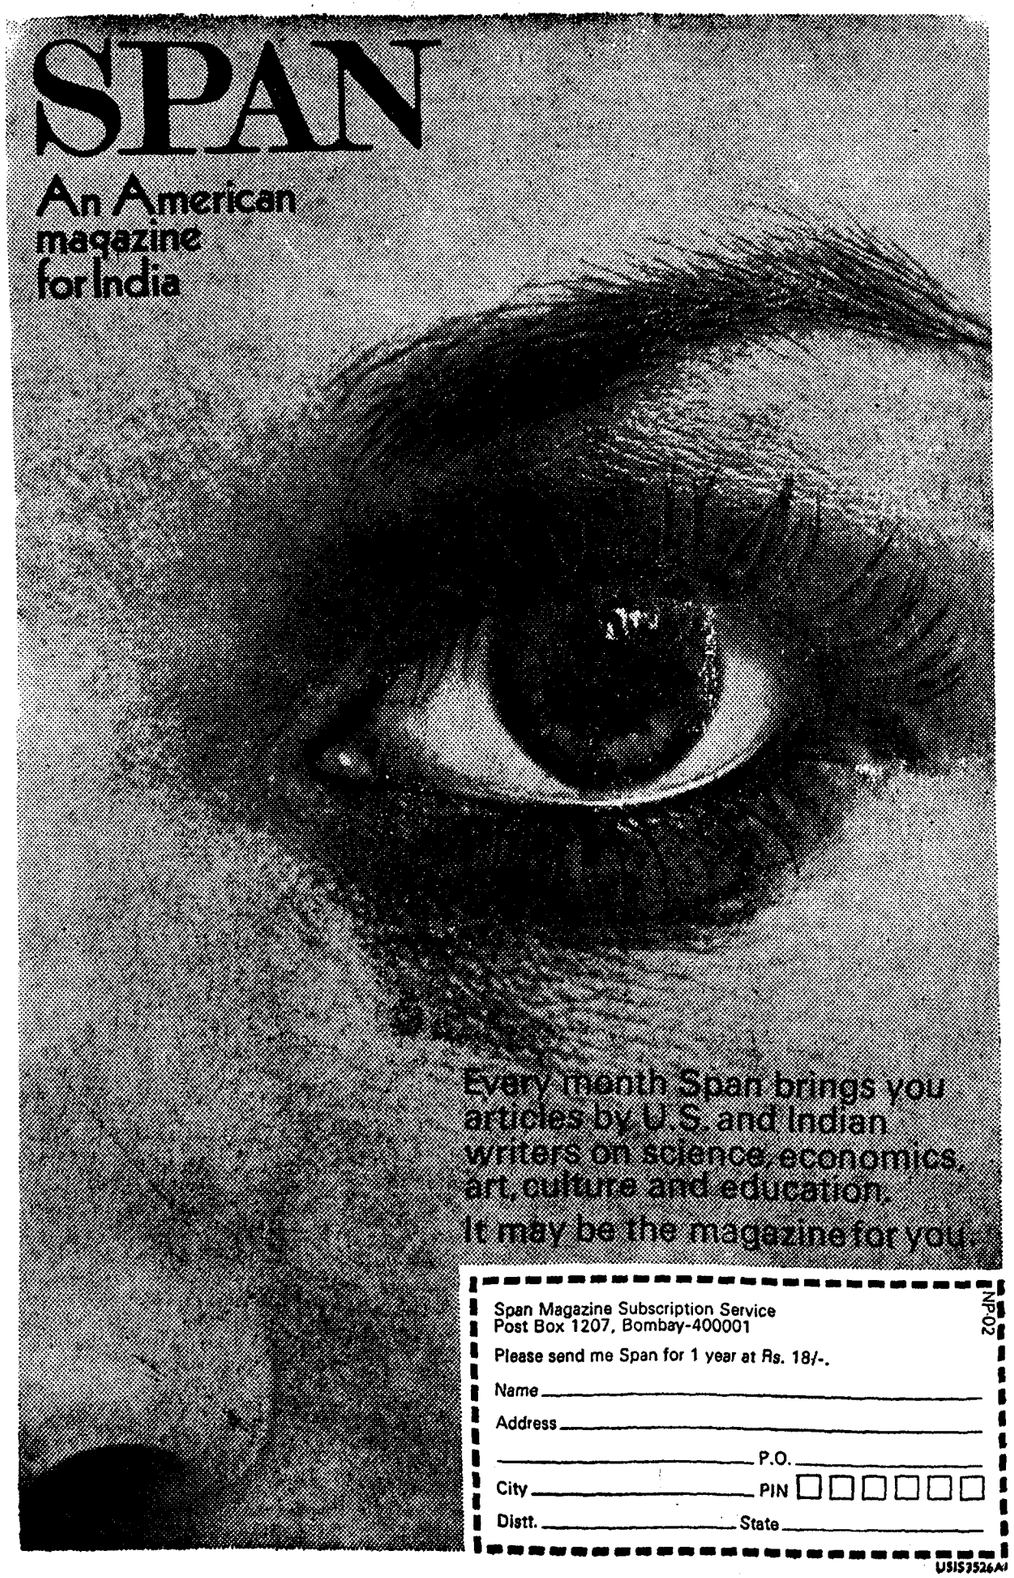


TABLE 2 : TWO-WAY ANOVA—SUMMARY TABLE SHOWING THE LEVELS OF SIGNIFICANCE OF THE MAIN FACTORS AND THE INTERACTION

Factor :
V : Village; S : Size of farm; H : Proportion of hired labour to total labour;
T : Proportion of tenanted land to total land;
V × S : Interaction between village and size;
V × H : Interaction between village and proportion of hired labour to total labour;
V × T : Interaction between village and proportion of tenanted land to total land.

(1) If all are income-maximisers, disregarding utility and disutility, then *share-tenancy* and self-cultivation both ensure maximum output while capitalist farming produces less. For one who owns the land, self-cultivation as long as *it is feasible*, should yield the maximum income, between leasing-out on a share basis and capitalist farming, however, it is not possible to say whether 'feudal' rent would be higher than capitalist profit.

(2) In the "standard" case of welfare maximisation, self-cultivation is most efficient; both the level of output and owner's welfare are highest. Share-tenancy would probably give rise to greater output than capitalist farming; but feudal rent need not be higher than capitalist profit.

(3) If we again assume everyone to be a welfare-maximiser and if the tenant labour market is monopsonistic, the tenant's output may not be lower than that of the owner-cultivator; a similar uncertainty reigns if the landlord's welfare is compared to that of the owner-cultivator. Capitalist farms will have the lowest output and the corresponding level of the capitalist's welfare will probably be low as well.

It thus follows that under each consistent set of assumptions, there are differences in the efficiency levels of the three types of farms. In every case self-cultivation comes out superior to capitalist farming, but otherwise the ranking varies.

V

What Is to be Tested?

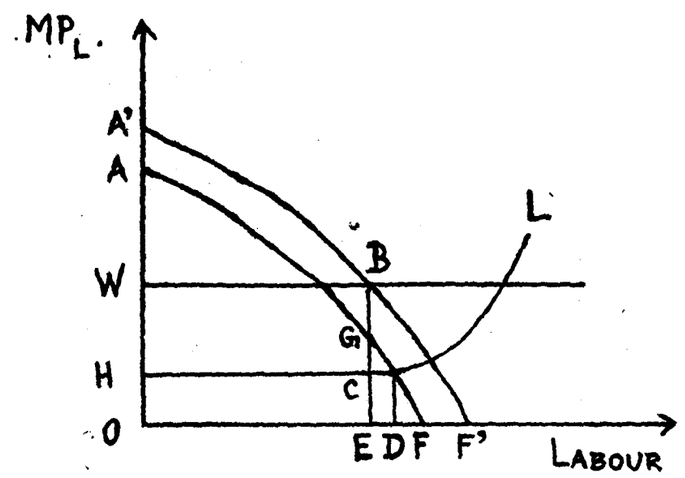
Most of the empirical literature investigating into the productive efficiency of different groups of farms confine themselves to a study of holding size and productivity. If one is interested in testing the validity or otherwise of the marginalist analysis of farm behaviour as outlined in Section IV, these are somewhat beside the point. For essentially, these tests are about the presence or absence of scale ecqnomies. In terms of that theory there are only two criteria for distinguishing between individual farms: the extent of hired labour used in the farm and the extent of leased-in area on a share-cropping arrangement in the total farm area. It may indeed, be true that in India small farms generally use little, if any, of hired labour (except under special circumstances). But there are undoubtedly many large families in our rural areas who cultivate their relatively large holdings primarily with family labour. There are also many small farms where owners are unable to till the soil for one reason or another and get it done by others. Further, the factor of tenancy is rarely taken into account in statistical tests. If the incidence of share-tenancy is unevenly distributed as between different size-groups of farms, and if tenancy has a negative impact on efficiency, then a straightforward size-productivity relationship (unadjusted for tenancy) loses a great deal of its significance.

There is a further problem if one compares merely the output per acre as between different types of farms. one needs the additional assumption that material inputs per acre are the same for each type of farm. Thus we may have the situation as depicted in Figure III. Let the hired labour (large) farm apply more of material inputs than the family labour (small) farm so that A'F' and A'F are the respective marginal productivity curves. As before WB and HL are the labour supply functions.[15] Hence equilibrium will be at B and C respectively. If the areas AA' BG and EDCG are equal to each other then output per acre remains the same. But the labour inputs per acre are still lower in the hired labour farm by the amount ED. Thus the latter is apparently substituting other material inputs for labour. If,

however, labour inputs per acre are also the same as between these two farms, the marginalist theory would seem to break down.

On the other hand, comparing only labour inputs per acre on the two farms is not sufficient as shown in Figure IV. As before let there be two different marginal productivity curves and labour supply functions for the two farms. It may, indeed, happen that C, the point of intersection between HL and AF lies directly below B, the point of intersection between WB and A'F'. Hence OD is the labour input in both farms, but total output in the hired labour farm is higher by the area AA' BC. Hence to test the theory adequately one must simultaneously compare output per acre and labour inputs per acre for the two farms.

It is not difficult to show how a simple comparison of only output (or labour inputs) per acre as between self-cultivated and tenanted farms can be vitiated in a similar fashion by the differences in the use of other material inputs. Could we not test it directly by introducing material inputs as one of the explanatory variables. We are reluctant to do this for two reasons. Firstly, from our limited knowledge of the manner in which farm data are collected, we believe that the accuracy of the data for different material inputs (except for some important cash-purchased items like fertilisers, etc) is considerably less than that of the data on holding size, labour inputs and output. Far more important is the reason that home-produced material inputs should not be valued at the market prices from the viewpoint of "standard" marginalist theory. Nor is it permissible from a Marxist point of view if pre-capitalist relations of production predominate. [15a]



VI

The Nature of the Data

Our data are taken from the Study on Farm Management and Cost of Production of Crops: West Bengal, (briefly, the Study) published by the Socio-Economic and Evaluation Branch of the Department of Agriculture and Community Development, Government of West Bengal in six separate volumes[16] in the middle and late 1960s. A total of thirty villages from 5 districts in the central part of the state was chosen for the agricultural years 1962-63, 1963-64, and 1964-65.

The Study had two purposes: (a) to estimate the costs of production of various crops and (b) to find out the effect

FIGURE III

of 'treatment'. The 'treated' villages received 'advice and investment', i e, the farmers were told about "scientific methods of cultivation" and also got "additional investment in the form of fertilisers, improved seeds, plant protection chemicals, improved implements, etc, which the cultivator may ask for after he has received education in improved methods of cultivation." Consequently, the villages were chosen pairwise, one 'treated' and the other 'non-treated'; usually these were 5-10 miles away from each other.

The Study concentrated on the irrigated zones, along both sides of the Bhagirathi. Of the 30 villages, 12 were canal-irrigated, 8 were tubewell-irrigated, while the remainder was unirrigated.

The villages were so chosen that they represented a particular region in terms of soil quality and climate. The kind of crops grown was another factor. Further, the willingness of the village people to co-operate and the accessibility of the village throughout the year were also taken into account. Normally, six villages were chosen from each district; but considering different sizes of the districts 8 were chosen from Burdwan and only 4 from Hooghly.

Within each village 8 farms were selected. Usually, there was one farm from the 2-3 acre size group, 4 from the 4-6 acre group, 2 from the 7-10 acre group and 1 from the group with 10 acres or more. There were, however, many departures in this respect as it can be seen from Table 1.

The method of collecting data was quite rigorous. A regional centre with an agronomist at its head was responsible for every group of 6 villages. In each village there was a well-trained and experienced investigator who stayed within the village and paid daily visits to the responding farms.

The normal procedure was followed in measuring the physical volumes of inputs and outputs. Labour-days were recorded in units of quarter-days. We are not clear how the crops were valued. Family labour days were valued at the mean wage-rate (for casual labour) for the whole month during which the family labour was spent. For hired casual labour the actuals were taken. For permanent farm labour the implicit wage rate was calculated by dividing total annual payments, in cash or in kind, by the total number of days worked; labour expenditure for a particular crop was then obtained by multiplying such implicit wage rate by the number of days devoted to that crop.

For our purposes the Study data have some limitations. (a) At no stage was the principle of random sampling applied to make the data representative either of the region or of the village or of the size-classes within the villages. Hence one must be wary of generalisations. (b) The preponderance of irrigated villages makes the data somewhat unrepresentative. (c) The typical farm chosen belongs, by West Bengal standards, to the 'middle' or 'large' size groups. Very small farms (below 2.50 acres) are few and far between, although a majority of holdings in West Bengal is of this kind. (d)

Productivity
Science fulfils its function only when it aims at the greatest good for the greatest number.

* . Significant at 5 per cent level.
** : Significant at 1 per cent level.
NE: Regression co-efficient is not equal to zero.
GT: Regression co-efficient is greater than zero.
LT : Regression co-efficient is less than zero.

While there are many tenanted farms in the sample there is a considerable underrepresentation of this group as compared to the overall situation in the State. (e) The presence of 'investment and advice' can rightly be considered to be a disturbing element.

With all these caveats thrown in, we nevertheless believe that an analysis of such a large number of observations, 648 in all, would not be worthless. Systematic tendencies, as postulated in marginalist theories, should reveal themselves if, indeed, they are present at all. Besides, most other farm management data have their own limitations as well.

Finally, we may note — although the Study does not make it explicit — that the technology of cultivation was fairly rudimentary in the sample farms. Canal irrigation made some dent, but apparently it was less than in some other parts of India. Similarly, the region was characterised by the existence of a lot of surplus labour.[17]

VII
Statistical Test

A series of tests was performed on the data which are now described. Although the Study contains information on many crops we have concentrated on 'all crops' and *aman* paddy. The former needs no justification. The reason for choosing the latter is that it is the most important single crop for every farm and indeed for the whole of West Bengal accounting for about two-thirds of the net cultivated area in the state. Of the other crops only jute (the most labour-intensive) and potato (the most capital-intensive) were chosen for regression analysis.

Test I: The underlying model for the two-way analysis of variance (ANOVA) is the standard one where the study variable is either output or labour per acre. The main factors are: (a) village and (b) any one of the 'other factors' like size, labour-type and tenancy. Only two crops were considered — 'all crops' and *aman* paddy. Corresponding to each crop, each study variable and each volume of the Study, we had three ANOVA tables corresponding to the three 'other factors'; thus there were 72 tables in all.

Three levels of the size factor were allowed. In the 'all crops' case these were given by the overall values of crop production — less than Rs 2,000, between Rs 2,000 and Rs 8,000, and over Rs 8,000. For *aman* paddy the three size-groups were — less than 3 acres between 3 and 7 acres, and over 7 acres. For labour type only two levels were considered: whether or not the proportion of hired to total labour inputs exceeded 50 per cent. Similarly, two levels of tenancy were reckoned with: whether or not the proportion of tenanted to total cultivated land exceeded 50 per cent; since we have no information on *aman* acreage leased in the same data as for all crops are used. The variable output per acre was consistently measured in Rs/acre. Labour inputs per acre were measured in Rs/acre for 'all crops'; for *aman* paddy the unit was labour days per acre, assuming that the conversion co-efficients for male, female and child labour were respectively 1.0, 0.8, and 0.5.

In order to save space the results of the analysis[18] are given in a summary form in Table 2. From these we find that (a) the village factor is uniformly significant at the 1 per cent level; (b) none of the other factors are significant; and (c) the interaction term is significant only in 8 cases of 72. From these one may infer that:

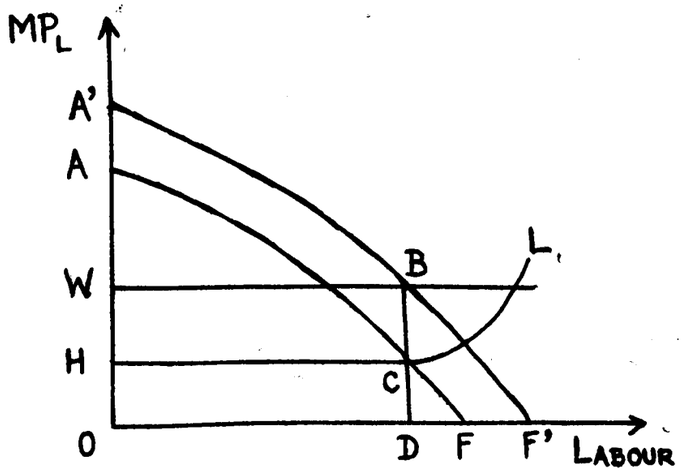
(i) inter-village differences are extremely important[19] so that any kind of statistical exercise must eliminate this factor before other factors are considered; and
(ii) none of the other factors like size, labour type or tenancy, taken separately, appear to have any impact on output or labour per acre.

On the other hand, there are two possible criticisms. Firstly, in our exercises the three 'other factors' are taken into account individually whereas in real life they appear simultaneously. Secondly, from the standpoint of the 'standard marginalist theory' it may be argued that the inter-village differences reflect not so much variations in the productivity of land as those in the real cost of labour. Hence one should at least consider a group of villages so that between them these real costs of labour may vary. Hence we pass on to the next test.

Test: II: The regression model may be stated as follows:

$$Y = \text{const.} + b_1X_1 + b_2X_2 + b_3X_3 \quad (10)$$

where Y is output or labour per acre;



X_1 is the size of the farm; X_2 is the proportion of hired to total labour; and X_3 is the proportion of tenanted to total cultivated area. b_1, b_2 and b_3 are the parameters. As before, output is measured in rupees, labour inputs in rupees for 'all crops' and in days for three individual crops (*aman*, jute and potato), and size for 'all crops' in value of output and for the individual crops in acreage planted. Regarding X_2 we have separate crop-wise farm-wise data, but for X_3 we have only farm-wise data which are used for all the crops.

Since inter-village differences are important, a separate regression was run for each village in every year. Thus for analysing, for instance, the behaviour of *aman* output per acre we have run a total of 79 regressions and an equal number for labour days per acre in *aman* production. Now for each of these regressions we have only 8 observations but 3 independent variables so that there are only 4 degrees of freedom. It is quite likely that most of the regression co-efficients at the village level are non-significant; had there been more observations per village some or all of these co-efficients might turn out to be significant. Fortunately there is the P-lamda test[20] that enables us to pool, for instance, b_1 for all the villages and find out whether or not it is significant for the totality of these villages. In Table 3 we give the P-lamda values, combining all the volumes in the Study. Table 4 gives a summary for each crop and each volume, indicating only the levels of significance of the P-lamda values.

In our tests we have allowed for three possibilities of a regression co-efficient being not equal to zero (NE), greater than zero (GT) and less than zero (LT). Here we may point to two curious cases in Table 4 column (3) and the rows for volumes III and IV under potato : it is seen that *both* the hypotheses of increasing *and* decreasing scale are valid for potato output per acre. We leave it to the statisticians to tell us its statistical implications.

Looking at Table 3 we find that the tenancy co-efficient is never significant. In regard to b_1 and b_2 the evidence is contradictory. (1) For all crops b_2 is negative whether output or labour per acre is considered, implying that hired labour is less efficient than family labour. For, the individual crops, however, it is non-significant in two cases and positive in four others. This would appear to contradict the earlier inference. (2) As for b_1, this scale factor is positive for 'all crops' when output per acre is the regressand, but non-significant in the case of labour per acre. Both for *aman* and jute b_1 is not significant when output per acre is considered; but larger farms seem to economise on labour. Only for potato, the most capital-intensive crop, does b_1 behave systematically; the larger farms are more efficient both in respect of land-use and labour-utilisation.

FIGURE IV

One may enquire why only a linear regression model was used and not some logarithmic form as has been successfully tried out by Bhattacharya and Saini,[21] for example. A moment's reflection will show that the three variables we have considered cannot be combined in a meaningful way if we take the logarithms of all variables. However, a semi-log model could be attempted where the regressand only takes the log form.

We have one reservation regarding the regression models, namely, that these leave out all scope for interaction among the variables. As we saw in Table 2, this may at times be important. Besides, once again this model does not allow for real labour costs to vary. Hence we pass on to the next test.

Test III: For the three-way analysis of variance the standard model is used once again where the three factors are X_1, X_2, and X_3 defined as in the previous Test II. The study variable is also the same as before.

The design of the present exercise is quite different from that of Test I. As there does not exist any convenient computational method for 3-way ANOVA with unequal numbers of observations per cell, we took several steps to make the problem manageable. First, we used the trial and error method to classify the villages in every volume into homogeneous groups. By means of one-way ANOVA we ensured that there were no significant differences between the villages with respect to the study variable (output or labour per acre) in question. Excepting in one case (see Table 5) we succeeded in grouping at least 4 villages as homogeneous, giving us a minimum of 32 observations. Second, by trial and error method again, we managed to find two levels for each of the main factors (X_1, X_2 and X_3) such that there were *at least* two observations per cell. Third, whenever a cell contained more than two observations a random sample of two was taken. In this way we could use the standard computational procedure since each cell contained an equal number of observations.

In Tables 5 and 6 are given the results of computation for 'all crops' and *aman* respectively. Very often more than one set of 'homogeneous' villages were found and analyses carried out; but these are not reported here merely to save space. The results are really striking; none of the main factors are significant at all and there is no exception to this proposition.

The possible marginalist objection to the two-way ANOVA mentioned earlier, does not apply here. Since a number of villages are lumped together some of which are located in different districts, it would be rather difficult to posit that there are no differences in the real costs of labour as between these villages.

TABLE 4 : P-LAMDA VALUES—SUMMARY TABLE INDICATING LEVELS OF SIGNIFICANCE FOR THE REGRESSION CO-EFFICIENTS WITH THEIR SIGNS

OVER-VIEW

Our tests so far have one serious drawback. It is generally accepted that apart from the three explanatory variables discussed, irrigation is a crucial factor. Even if it does not always raise crop-wise productivity of land, it often enables more than one crop to be raised from the same plot of land. Unfortunately, our data source does not provide farm-wise statistics on the area irrigated. This lacuna is partly obviated by the fact that most villages in the sample are irrigated either by canal or by tube-wells as can be seen from Table 1. On the other hand, one may observe that most of the clusters of 'homogeneous' villages in Tables 5 and 6 contain at least one unirrigated village. This leads to the conjecture that even if we had detailed farm-wise information on irrigation, our results might not be affected. We might also concur with the widely held view that all types of irrigation need not have the same impact. Tube-wells, for example, are far more reliable from the individual cultivator's point of view than either old-fashioned tanks or government canals. That this will necessarily be reflected in differential productivity of land is, however, by no means self-evident.

We may briefly mention that we have also carried out certain tests on the 1970-71 farm-data collected in the course of the Farm Management Scheme under the Visvabharati University covering a 'properly' selected sample of 150 farms from 15 villages. Regarding HYV paddy we found that (a) small and tenants farms have taken to it on a large scale and (b) none of the three explanatory variables we have been considering are significant. Since irrigation is a *sine qua non* for HYV paddy, we felt no need to introduce it as a variable. Regarding other crops we have had some difficulties in carrying out all the tests that we want to and hence the presentation is postponed.

VIII

A Critique of Marginalism

We find that in the context of West Bengal in the early 1960s characterised by (i) a backward traditional technology in agriculture and (ii) a huge reserve army of underemployed in the rural areas, "standard" marginalist theories generally run counter to facts. Observations do not reveal any marked and systematic differences in the relative efficiency of capitalist, ownership or tenanted farms. Cheung's salvage operation fails, for it makes an implausible assumption regarding cultivators' labour supply function; but if that assumption is retained it leads to logical contradictions.

At the very root of the trouble, in our view lies that twice-differentiable production function[22] — the kernel of the neo-classical counter-revolution in economics. Except in the fantasy world of the ardent believers and practitioners of the Cobb-Douglas functions, including some of its more recent progenies with rather ugly but imposing names, such input-output relations do not appear to exist anywhere; at least we are yet to come across a single convincing empirical demonstration in its favour — either in manufacturing or in agriculture.

Apropos agriculture Viner has put a rhetorical question whether in fact there is any farm "on which, other factors of production being held constant in quantity and in form as well, it would not be possible by known methods, to obtain some addition to the crop by using additional labour in more careful selection and planting the seed, more intensive weeding, cultivation, thinning, and mulching, more painstaking harvesting, gleaning, and cleaning of the crop."[23] There is a certain ambiguity in the term "known": to the farmer? or to the experts? If it is the latter, then such "knowledge" does not have any bearing on the issue in debate. If it is the former, the question inevitably arises as to why is the farmer neglecting such known me-

thods. We have not seen any American farms but we doubt if many beggars "imported" from poorer lands and let loose on American fields after harvesting could eke out a subsistence from grain-picking alone. The suggestion seems singularly inappropriate in the context of countries with 'disguised' unemployment; the Indian poor peasants, one would then have to believe, are the first cousins of Oblomov, that famous Russian character who preferred staying in bed so much that he could not eventually move out as illness overtook him.

Indeed, no observer of Indian agricultural practices has complained about the inadequacy of labour used or of any significant wastes that could be picked up by bare hands alone. In that standard work on "Rice in India"[24] there are many suggestions on how to improve the yield. But a marginal increment to labour inputs is not one of these. Other co-operative factors have to be brought into the picture.

The recent trend towards the high-yielding varieties of paddy may create a new situation. In this situation the age-old fixed proportions surely do not apply. There is little doubt that given sufficient water the yield can rise dramatically in response to new seeds, fertilisers, etc. There are numerous available estimates of the reaction rate of crops to fertilisers; but in all such studies labour and other inputs are allowed to vary simultaneously.[25]

We may thus conclude that marginalist theories have very little to offer by way of explaining farm behaviour in a backward labour surplus economy. It is doubtful too whether these can provide useful pointers that are now taking place under the impact of the New Agricultural Strategy. Quite often these may lead to objectively reactionary policy proposals.

IX

Established Marxist Formulations

The issues that we have raised so far cannot, in our view, be answered in a definitive manner by statistical analysis of the type that we have employed. Far more important is to enquire how far our conclusions fit in with historical realities, or to use a fashionable phrase, the stylised facts of history. Should the latter contradict us, we should conclude, not that history has behaved erratically or that economic agents have acted irrationally, but that we have failed to pose the questions in their proper perspective, or, to use a jargon once again, that our econometric model has been misspecified.

Let us start with the stylised facts of agrarian evolution as depicted by Kautsky and Lenin,[26] which have since become the staple diet for all Marxists. Working independently on the problems of Germany and Russia respectively, both the authors viewed agriculture as part of the national economy that was undergoing capitalist transformation. Industries were coming up at a high rate employing a growing proportion of the national workforce. On the one hand, industrial development provided new inputs to agriculture in the form of machinery and chemicals, unleashing new productive forces in agriculture. On the other hand, rising agricultural prosperity created new markets for industrial consumer goods. Simultaneously, the growth in the production of commercial crops not only helped industrial development by supplying the raw materials, but also brought in extra cash for the agricultural population a part of which is spent on industrial goods. The whole process is thus characterised by the interaction of industry and agriculture in the mutual interest of both these sectors. Of course, there may be periods when through unequal exchange agriculture as a whole may suffer; but over the long haul, nearly all the surviving classes are better off, even if the distribution of gains is highly inegalitarian.

Viewed against this perspective Kautsky and Lenin formulated the following laws of motion for agriculture:

(a) The law of increasing returns to scale operates as much in agriculture as in industry so that large-scale farms are superior to small-scale ones.

(b) As a consequence of (a), there is a continuous differentiation among the peasantry, i e,

(i) land gets increasingly concentrated in the hands of fewer and fewer persons; and

(ii) the ranks of agricultural workers get swelled so that they form an even larger proportion of the total agricultural population.

(c) The extent of share-cropping declines over time. For, this kind of tenancy is precapitalist in nature and obviously does not suit the interests of the big farmers.

(d) Alongside (b), agricultural production is increasingly oriented, not towards the cultivator's self-consumption, but towards the outside market, whether in the form of food or cash crops.

Of all these, the law (b) occupies the centre of the stage as it were. The reason is entirely political. For, (b) practically defines the dominant form of class struggle in the countryside, the predominant mode of production in the given epoch. Older modes of production may exist over vast territories, but they are already doomed to extinction.

Most writers on the Indian economic scene using the Marxian framework, have put the accent on law (b). Thus in his "India Today and Tomorrow",[27] a work that in our view is still unsurpassed after nearly four decades, R Palme Dutt refers to the whole process of deterioration, expropriation and increasing class differentiation among the peasantry that went on from the early twentieth century to the end of the Second World War. He also approvingly uses S J Patel's figures to show that agricultural workers constituted an increasing part of the total agricultural population (pp 85, 91). In an erudite study of the economic structure of Bengal villages during the British period, Ramkrishna Mukherji mentions increasing concentration of land-ownership. Since, in Mukherji's view, the absence of irrigation precluded other kinds of capital investment in agriculture, there were no special advantages of large-scale farming and sharecropping was more widespread than large farms based on hired labour.[28] Then Bhowani Sen, not only a brilliant theorist but also a leading spirit behind the communist-led Tebhaga movement of the Bengal sharecroppers against their landlords, has echoed the arguments of Palme Dutt. Since the beginning of this century land was passing out of the hands of the tillers who now became agricultural labourers, accounting for a rising part of the agricultural population. Sen also believed that capitalist relations are growing, although it is a "rickety" capitalism.[29] Neither Dutt nor Sen make any reference to the superiority of large-scale over small farms in India. Recently, Utsa Patnaik, on the basis of a study of 66 large farms scattered all over India, has forcefully argued that all the laws of motion propounded by Kautsky and Lenin are fully valid in the context of our country in the 1960s, if not earlier, and that a vigorous capitalist development is indeed taking place.[30]

X

Historical Evidence

Let us now turn to the relevant historical facts, beginning with land concentration. As is well known, there are hardly any reliable tables on land-distribution either for the country as a whole or for any part of it, extending over a long period of time. Hence any conclusion is necessarily tentative and conjectural. (i) Rajat and Ratna Ray have given us estimates of the land distribution in Dinajpur in 1808 based on Buchanan's "Geographic Description of Dinajpur". Comparing these with the Floud Commission figures for 1940, one does not notice any polarisation.[31] (ii) N K Ghosh has compared the data for West Bengal in the years 1940, 1953-54 and 1961-62, taken respectively from the Floud Commission, NSS 8th Round and NSS 17th Round. The Lorenz ratio of concentration of land-ownership remained unchanged over the period as a whole.[32] (iii) Reworking on Ramkrishna Mukherji's data on six Bogra villages between 1920 and 1942, Rajat and Ratna Ray point out that the jotedars, the rich farmers, increased their holdings by 1.3 per cent, against self-sufficient raiyat's gain of 3.2 per cent and a loss of 0.16 per cent by the share-croppers. In the same vein they quote from Hashim Amir Ali's study of a few villages near Santiniketan between 1933 and 1958.[33]

A secular stability in land distribution is by no means incompatible with cyclical fluctuations. During the Great Depression of the 1930s about 7 per cent of land was sold in Bengal, a good third of which may have gone to non-agriculturists families.[34] A large amount of similar data from different areas of Bengal and other parts of India for the period 1920-44 has been marshalled by Karunamoy Mukherji to show that the crises of the 1930s and 1943 led to large-scale land-transfer.[35] However, the sellers were not always small farmers; the purchasers too did not always come from the class of jotedars.[36]

Although data on the occupational structure of the agricultural population are available for every census since 1872, inter-censal changes in definitions make any conclusion nearly as tentative as that on land distribution. (i) Rajat and Ratna Ray in their study mentioned earlier found that the proportion of sharecroppers and agricultural labourers declined from around one-half to one-third of the agricultural population between 1808 and 1938 in the districts of Dinajpur and Rangpur. Including the category of "cultivators owning part, renting part, and working for hire" which appeared for the first time in the 1961 Census for East Pakistan, the overall proportion of these three occupational classes in 1961 as compared to the year 1808, was somewhat less in Dinajpur but considerably so in Rangpur. The authors make a negative point: the proportion did not go up. (ii) S J Patel reworked the Census data from 1871-72 to 1931. For India he finds a steady increase in the proportion of agricultural labourers and their families to the agricultural population from 13 per cent in 1891 to 22 per cent in 1911; agricultural labourers as a proportion of the working population in rural India went up from 26 per cent to 38 per cent in 1921-31. Patel included all unspecified labourers in agriculture in the category of agricultural labourers. For Bengal the corresponding percentages were 4.8 and 10.0 in 1901 and 1911, and 17.7 and 33.2 in 1921 and 1931.[37] (iii) According to J Krishnamurty, however, the percentage of male agricultural workers in male agricultural workforce remained fairly static for India between 1901 and 1961.[38] It may be no higher in 1971.[39] He distributed all 'unspecified labour' *pro rata* between agricultural labour, construction and certain branches.

A related question is that of 'deindustrialisation', i e, an ever smaller part of the working population being engaged in manufacturing. Unadjusted Census estimates upto 1931 would support such a contention. However, the Thorners have contested this; by lumping together manufacturing and many categories of vendors they find a rather stable ratio.[40] Krishnamurty in his paper cited above finds a slight fall till 1931 and increases in 1951 and 1961 when the ratios were above the 1911 level.[41] The Thorners made the heroic assumption that any loss in the handicraft sector was just made good by a corresponding rise in the 'modern' sector. Krishnamurty believed that "factory employment grew partly at the expense of non-factory employment."

In view of these controversies we cannot arrive at a "reasonable" conclusion; the assumptions made by different authors are questionable. In the absence of more definitive data one may presume that (a) agricultural workers as a proportion of the agricultural workforce may have gone up somewhat and (b) a part of this rise may have been caused by the disappearance of village industries. At least in the West Bengal villages one often hears of dying crafts and trades, yet Krishnamurty's computation showed that the manufacturing population in the total male workforce went up from 9.8 to 14.7 per cent in 1951-61. Even allowing for the growth of the urban large- and small-scale industries this seems to be too large.

Coming next to the problem of sharecropping, at least in the context of Bengal, no one has suggested that it is a dying institution, even less that it is substituted by hired-labour farms. In the years since the fall of the second UF Government in West Bengal in 1970, there are reports of widespread eviction of sharecroppers. The basic reason is "extraneous": the landowners are afraid that sharecroppers may acquire permanent occupancy rights sooner or later. Quite often the sharecropper is merely shifted from one plot of land to another belonging to the same landowner; in other cases a new tenant replaces the old one. Rarely does the landlord himself take to cultivation hiring field labourers under his own supervision. Rack-renting through sharecroppers arrangement has generally been found at least as lucrative as farming with hired labour.

Regarding the final point of the Kautsky-Lenin theses, once again a question mark hangs. Firstly, to what extent has production of crops for the market superseded production for self-subsistence? From Irfan Habib's study of the late Moghul period, one finds that "the total net amount of produce annually lost by the countryside, without any return, must have amounted to a very large proportion of the total — at least a fourth of it, if not a third or a half". Further there was a large area under the *khud-kasht* system which was organised for commodity production. Large investments on these lands were made by the superior classes who hired agricultural labourers for cultivation.[42] One cannot be too confident that the proportion of total agricultural output actually marketed was much higher at the end of the British rule than towards the end of the Moghul era. Secondly, a good part of the actual expansion of commercial agriculture at different points of time under the British Raj, was carried out involuntarily by the peasants. Brute force, fear of hunger, the *dadan* (credit) system and an attempt at spreading risks as between different crops — all these were combined in varying degrees to produce the actual results.[43] The small peasants took part in commercial agriculture as much as the big farmers. The former, however, benefited relatively little, often receiving no more

A dream today, a reality tomorrow

Today at Mithapur, young India, conscious of the past, urged on by the present, confidently dreams of a glorious tomorrow.

Their immediate dream is of a new complex—massive, self-sustaining, long-range and innovative—harnessing the sea, the sun and ultimately the atom to banish hunger from their land and to generate greater economic self-sufficiency, more and more independence.

There is a beginning but there is no end to the work of bringing purposeful prosperity to the people of India. Harness the sea, the sun, the atom and from Okhamandal—the land of salt—fertility will flow to the entire country.

TATA CHEMICALS LIMITED

TATA CHEMICALS

CMTC-18-284

than half the market price and were therefore unable to invest on land.[44] Hence the limited spread of commercial agriculture did not have the catalytic role that it did in other socio-economic milieux.

These historical tendencies, if we have understood them correctly, are in agreement with the results of our statistical exercises. If the size of holding, labour type and tenancy do not affect farm efficiency, then there should be no general trend towards land concentration, no reason for hired labour farms to be replaced by family farms (or *vice versa*) or for tenancy arrangement to disappear.

Thus we find that none of the laws of motions as formulated by Kautsky and Lenin seem to apply to India or West Bengal, at least in the form in which they are supposed to. It leads us to suspect that the country has not been going through capitalist transformation at all, that there are important socio-economic forces that impede such a transformation.

During the British Raj colonial rule undoubtedly constituted the biggest single obstacle.[45] As a natural ally it greatly strengthened feudal or semi-feudal elements in the countryside that are primarily responsible for the indifferent progress in the post-colonial era even though the imperial yoke has been lifted.

XI

Semi-Feudalism?

What is this semi-feudalism and how does it stifle incipient capitalism? The basic features of this mode of production as it operates in the West Bengal countryside are most lucidly and cogently described by A Bhaduri.[46] These are: (1) An extensive non-legalised sharecropping system. (2) Perpetual indebtedness of the small tenants. (3) The "ruling" class in rural areas operates as *both* landowners *and* lenders to small tenants. (4) Small tenants have incomplete access to the rural "markets" and are forcibly involved in involuntary exchange through the peculiar organisation of this sort of "markets". This system also prevents capital investment in agriculture, for such investments would increase production and if the tenant's *share* remained constant, the tenant might get out of his debts. The landowner could lose economically if the loss of his interest income were not compensated by higher income from the greater output. Politically, he could lose even more insofar as the tenant freed himself from all the extra-economic consequences of the debt-bondage.[47]

Bhaduri, we feel, has somewhat overstated his case with which we are in basic agreement. For, technological improvements have taken place on share-tenanted land in different parts of West Bengal with working capital often provided by the landowner.[48] If one allows for a variable share-cropping ratio, then semi-feudal relations of production can persist even after the new high-yielding varieties of crops have been introduced. By lowering the tenant's share, the landowner can keep him as poor as he always was. That this may have happened is corroborated by the field reports of W Ladejinsky, F Frankel among others.

The missing element in Bhaduri's analysis is that of massive underemployment in our countryside. In several ways it helps to explain the stability of the semi-feudal relations as outlined above. (a) The value of labour power is pegged at the lowest possible levels so that the real income of a share-tenant is no greater than that of a hired agricultural worker both of whom remain close to the subsistence standard of wage. Hence there is neither any incentive nor any possibility for an inter-change between these categories of labour. Conversely, from the landowner's point of view the net surplus to be extracted is the same under the one or the other system. (b) Given the weak bargaining position of labour, the landowners can *arbitrarily alter the* share-ratio in their own favour in case new production possibilities appear. Should the tenant disagree, the ultimate threat of eviction is there.

The criticality of the unemployment factor can be underlined if the following question is raised: can contemporary semi-feudalism survive in the absence of surplus manpower? Our answer is in the negative. (i) The landowner through usury appropriates a part of the tenant's share of output of which a part "comes back" to the tenant in the form of consumption loan. If jobs are freely available, the tenant can simply flee from his present tormentor and find some work with another employer or landowner. Until not very long ago, the zamindars in various parts of India were often obliged to be more human to their tenants for fear of losing them altogether. Thus with near full employment the stranglehold of the usurious jotedar could not continue in its present form. (ii) If somehow through some external "shocks" capital investments could be made, it could have chain repercussions leading to the ultimate disintegration of the system. The introduction of new and more labour-intensive crops with external demand, the growth of industries even on a limited scale, etc, — any of these could trigger off fresh demands for labour leading to a further weakening of usurious capital. In either case extra-economic coercion in the form of political and social pressure would be needed to maintain the old system. But competition between landlords would weaken such pressures.

If semi-feudal relations are seen in the wider context of a national economy with an underdeveloped industry, the importance of large-scale unemployment becomes clearer still. For, the latter greatly delimits the market for industrial products. For a time and up to a certain point, industry can forge ahead despite such limited markets. Export markets, demand for military wares, the development of State capitalism, the artificial creation of a growing urban "middle class" — all these may enable industrial capital to expand. But as these markets get saturated, stagnation sets in. If the process had started with relatively full employment, the expansion could have continued much longer.

Our critics may argue that unemployment is endemic to capitalism. We agree, but about the rate of unemployment, there may well exist something like a critical mass. The long controversy on the breakdown of the capitalist system in Marxian literature was partly around it; the other issue was whether existing capitalist societies would ever reach that critical point. The fact that capitalism survived the worst ever crisis of the 1930s does not finally dispose of the question. As H Magdoff has recently shown, the US did not get out of the rut merely through the New Deal measures; orders from the military on an unprecedented scale since 1937 revitalised the durable producers' goods sector and this finally lifted the economy out of the gloom.[49] More relevant for us, however, is to look at the early history of capitalism.

In the early stages of industrialisation the labour market was *rather* tight in most countries though not uniformly. (i) Hobsbawm writes: "The average English income probably increased substantially in the first half of the eighteenth century, thanks, if anything, to a stagnant population and labour shortage, so that this period is rightly described in the Vicar of Bray's song as 'pudding time'".[50] The labour short-

age probably accentuated from the late 18th or the early 19th century so that England began to import Irish workers. Engels wrote: "The swift expansion of English industry could not have taken place, if it had not had a reserve to call on from the numerous and poor population of Ireland".[51] (ii) France, too, did not seem to have large-scale underemployment. Once the peasants got land after the Revolution of 1789 they were busy cultivating their own farms. Even the agricultural labourers usually had small farms "large enough to keep them from destitution". Around 1815 there was the "widespread complaint of the large proprietors that the existence of peasant prosperity led to idleness and prevented them from getting all the labour that their estates required."[52] (iii) In the USA it is too well known that labour was never too abundant so that even at the beginning of the nineteenth century "American equipment was, in some sense, superior to the English."[53] (iv) In Germany the situation was somewhat different. As Immerman, the most important novelist of the period of Industrial Revolution wrote: "Of course the core of the nobility has rotted away, but the hard outer casting still stands and one can go on cracking one's head against it." In another novel, the hero says: "The second reason for my trip to Germany was that I wanted to engage another good servant ... every country has its own special products which one cannot obtain elsewhere in the same excellence. Spain has its wines, Italy its songs, England its constitution, Russia its Muscovy hides, France has the Revolutions and in Germany the servants turn out to be the best."[54] Because of semi-feudalism agricultural labourers did not quite exist as a class; there were only individuals — rare in the western parts, "not so rare" across the Elbe.[55] Social distress in the early 19th century was pretty high indicating the existence of a rather large labour surplus. But population increased from 24.5 m in 1801 to only 31.7 m in 1850 and that, too, over an expanded territory.[56] This slow rise was largely due to a high rate of immigration, between 1815 and 1870 as many as 2.5 m emigrated to the USA. In the two particularly bad years of 1816 and 1817 alone more than 1 per cent of the total population emigrated. From the 1850s, however, the character of emigration changed. "No longer a case of desperate families escaping from hunger", they went in search of a better life.[57] According to Clapham again, upto 1850 industrial growth was tardy while agriculture was the growth-leader; the respective roles were reversed since 1850.[58]

Thus capitalist development and surplus labour are dialectically related. In the initial phase too much of the latter may choke up growth.[59] Once the development process gathers momentum, immigration of foreign workers may be necessary. But capitalism also creates a Reserve Army of Labour the size of which follows a cyclical pattern. If this size grows too large, however, as in the 1930s, the 'self-correcting' mechanism of 'normal' peace-time capitalism again fails to operate.

We may then infer that labour surplus on a scale that is probably unparalleled in human history, is perpetuating the semi-feudal set-up. Limited progress along the road to 'modernisation' cannot be ruled out.[60] Without vigorous measures to reduce considerably that surplus, we fail to see how one can get out of the vicious circle, or how capitalism can strike deep roots. But how and by whom can such measures be undertaken?

Industrial capital in this country, including the forces of State capitalism, is extremely weak in the relative sense. It seems to have no option but to rely on foreign capital and foreign technology which themselves create almost insuperable barriers to industrialisation on a wide front.[61] Nor does it have the power or the stamina to fight the trading community which, in every single crisis, has made the situation worse thereby blocking or at least delaying, whatever little progress that is still possible.

Since we cannot envisage how (with the confines of the present socio-economic formation) things might radically improve either on the industrial front or in respect of surplus labour, we cannot visualise when productive capital will dominate over usury capital in our agriculture or when the pre-capitalist crop-sharing system will disappear. Until we see new indications to the contrary, we believe that it would be more useful to characterise our agrarian production relations as 'semi-feudal' than 'lumpen-bourgeois' or 'rickety capitalist'.

Before concluding we should in all honesty underline the limitations of our analyses so far. As we saw, there are now three competing hypotheses seeking to explain our agrarian structure. The first one, based on "standard" marginalist theory, would call it a 'peasant economy'. The second is the established Marxist theory positing capitalist development. The final one, derived again from Marxian analysis, would characterise the system as semi-feudal. For the sake of brevity let these be designated by P, C and S.

Our statistical tests on the static efficiency of a sample of West Bengal villages reject P, but agree with S. These do not disprove C. For, larger farms can expand even in the absence of economies of scale. Greater financial power plus a certain amount of political leverage may make it worthwhile for rich peasants to grow even if there were minor diseconomies of scale. Our finding that hired labour is not inefficient removes another artificial barrier to expansion erected by the marginalists.

Historical evidence is too tentative to offer scope for a strong assertion. The weight of it on the whole would seem to go against C, but is compatible with either P or S.

Considering the fragmentary pieces of information (that we have not systematically analysed) on the current agrarian scene, these would appear to run counter to P but would be consistent with both C and S. (a) If we are not mistaken, P postulates a random process by which an ownership farm comes into being, expands, levels off and then gets partitioned at the death of the old owner; the cycle continues with the sons of the dead man. Implicitly, then, anyone by dint of hard work can acquire a farm and grow till he is just contented. Functionally speaking, it is a world without *jotedars* and *bargadars*, capitalist farmers and agricultural workers; all owner-peasants are more or less equal. A casual acquaintance with our countryside will reveal that this is hardly the case. (b) *A priori* one should not, in our view, reject C just because there is widespread share-cropping, a lot of usury and commercial capital, and a great amount of extra-economic (social, political, religious, etc) coercion exerted by the ruling classes. The English worker was not born free; for decades together he had to struggle against the Poor Law, the truck shops, and anti-trade union measures that often took a most violent form. The absolute victory of industrial capital over earlier forms of capital is usually dated to the repeal of the Corn Laws that came a full century after the onset of the Industrial Revolution.

Moving to the industrial scene, the preponderance of foreign capital and technology would seem to be at variance with C to the extent that indigenous capitalist development is thereby thwarted. However, as we argued earlier, it is closely tied up with S. As for P, it may not be affected either way by this factor.

Mass-based political movements could have a significant impact on the structure. Radical land reforms carried out under the auspices of the village poor and militant organisations of sharecroppers and agricultural labourers could bring about a qualitative change weakening the semi-feudal base. The change, were it likely, would strengthen the case for both P and C. We submit, however, that a transformation along these lines is not on the cards, at least for the foreseeable future.

In the light of all these considerations we find that the assumption S is the most plausible one. But one needs to explore many more facets of history, economics, politics, etc, before one can positively assert that semi-feudalism is the dominant mode of production in Indian or West Bengal agriculture.

Notes

[This is a substantially revised version of the paper presented to the seminar on the Political Economy of Indian Agriculture held in Calcutta in March 1973. I have benefited greatly from many useful discussions with Amiya Bagchi and N Krishnaji. I am particularly grateful to Amartya Sen for his sharp criticisms and for having corrected some of my errors. Obviously none of these friends bear any responsibility for the mistakes that remain. To Chandan Mukherji and Rohitaswa Das I owe a special debt of gratitude for painstaking computation as also for discussions on statistical problems. The authorities and workers of the Indian Statistical Institute, Calcutta, have very kindly enabled me to use their computer facilities free of charge, which would not have been possible without the persistence of Nikhilesh Bhattacharya.]

2 "Peasants and Dualism With or Without Surplus Labour", *Journal of Political Economy*, October 1966.

3 For the sake of simplicity in exposition we assume in the theoretical sections that for every farm there is a single-member family and that the person is both a worker and a consumer.

4 We presume that U and V can be expressed in terms of equivalent income or output received, i e, these can be shown along the same coordinate as Q.

5 This last condition would be easily satisfied if the tenant has a relatively small patch of land for himself.

7 "Private Property Rights and Sharecropping", *Journal of Political Economy*, December 1968. Also, "The Theory of Share Tenancy", Chicago, 1969.

8 "Crop-sharing Tenancy in Agriculture: A Theoretical and Empirical Analysis", *American Economic Review*, March 1971.

9 S N Cheung, "The Theory of Share Tenancy", Chicago, 1969, pp 76-77

10 Back in the eighteenth century when 'engrossing of farms' was going on full-steam, Arthur Young noted that the small farmers laboured "without intermission like a horse" and concluded that the lot of a wage-labourer was at least as good if not better. His early nineteenth century critic, William Mayor, contested the statement not from a materialist, but from a psychological point of view; for, the small farmer's toils "are sweetened by the reflection — that he is to reap the fruits of his own industry". Then early in this century when there was a limited revival of small farms in England, the official Small Holding Report of 1906 talked of the 'magic of property' being such that "a small occupied freeholder will gladly do the work of two labourers for the earnings of one". (These quotations are taken from H Levy, "Large and Small Holdings: A Study of English Agricultural Economics", 1911, reprinted in 1966 by Frank Cass, London, pp 35, 135.)

Karl Kautsky was well aware of the phenomenon and entitled one section of his classic as "Overwork and Undernourishment in Small Farms"; but he provided only indirect evidence from Germany of the late nineteenth century. (*La Question Agraire*, Paris, 1900, pp 160-176, especially, p 167.)

Lenin gave the most direct evidence. Between 1881 and 1891 in Voronezh Gubernia the average pay of a farm labourer hired by the year was 99 rubles against the total earnings of 78 rubles for a horseless peasant family and 98 rubles for a one-horse peasant family. ('The Development of Capitalism in Russia' in "Collected Works", Volume 3, p 168).

A V Chayanov, another keen observer of the agrarian scene in post-Reform Russia, noted that through "reduced well-being" family farms can often be viable when capitalist farms are not. (*Op cit*, pp 89, 231.)

11 Exactly the same criticism can be made against the model of Bardhan and Srinivasan (*op cit*). For, as P H Prasad pointed out in a private communication, the tenant's income is the same whether he chooses to be a tenant or a labourer.

12 R K Sau, "Land Tenancy, Rent and the Optimal Terms of Trade", *Oxford Economic Papers*, November 1971.

13 The position of Chayanov, Sen and Georgescu-Roegen tantamounts to an endorsement of petty-bourgeois interests in agriculture, although the first two were in favour of co-operative farming. Elsewhere in his writings Sau, too, has taken a forthright and progressive stand on socio-economic issues.

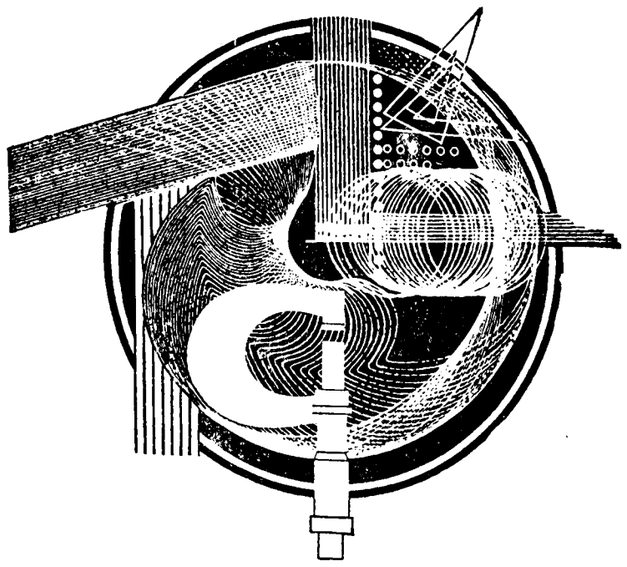
14 In a related context A K Bagchi makes it one of the focal points of his analysis in "Notes Towards a Theory of Underdevelopment", *Economic and Political Weekly*, Vol VI, Annual Number 1971.

15 For the sake of simplicity we are here assuming that U'(Q)=1 but V'(L) remains as before.

15a In this case the "value" of a commodity rather than its "price of production" would be more appropriate. In exchange between pre-capitalist societies "value" provides the norm for equivalent exchange, according to Marx. ("Capital", Vol III, Moscow, 1959, p 174). The problem is complicated; in the case of an exchange between a precapitalist and a capitalist economy Marx's yardstick is ambiguous (*ibid*, p 654). It is obvious that the same ambivalence prevails within an economy where two modes of production co-exist at the same time.

16 There are many more but we have not analysed them.

17 Some data for West Bengal are given in S Mehra, "Surplus Labour in Indian Agriculture", *Indian Economic Review*, April 1966 and in A Rudra, "Direct Estimation of Surplus Labour in Agriculture", *Economic and Political Weekly*, Annual Number 1973. For the most interesting all-India estimate, see S K Rao, "Measurement of Unemployment in Rural India", *Economic and Political Weekly*, September 29, 1973.



18 The computational method for these 2-way ANOVA with unequal numbers of observations per cell was taken from H Scheffe, "The Analysis of Variance", New York, 1961, Ch 4, Section 4.

19 One of the first to demonstrate convincingly the importance of inter-village productivity differences was A Rudra in his "Farm Size and Yield Per Acre", *Economic and Political Weekly*, Special Number 1968.

20 It is described adequately in N Bhattacharya and G R Saini, "Farm Size and Productivity: A Fresh Look", *Economic and Political Weekly*, June 24, 1972. One may refer to further references cited therein as also to C R Rao, "Advanced Statistical Methods in Biometric Research", New York, 1962, pp 44, 217-18.

21 *Op cit.*

22 Strictly speaking, the differentiability property is not required. If the incremental output from successive additions to the labour inputs monotonically declines, i e, if, for example, the corresponding function is piece-wise linear, one may obtain the results of the margi-

Building up a cadre of technicians

A nation's task force is its technical manpower. Without skilled workers, the finest machines will rust and raw materials will remain unutilised.

Right from the inception thirty years ago, Hindustan Motors realised that it was not enough to put up a modern automobile plant. They knew that they had to build up a balanced cadre of technicians—fitters, welders, electricians, draughtsmen, engineers, foremen, supervisors, researchmen and technologists—not merely to run their own industry but also to provide the manpower required by others.

During the past thirty years, Hindustan Motors have helped to train no less than 1,50,000 men to acquire a high degree of skill and precision. As the industry develops, thousands of others are being trained every year.

Building up a vast pool of technical manpower—this is one of the many ways in which Hindustan Motors keep India's economy moving and growing.

nalist theories. However, if there is a sharp kink in the piece-wise linear function, the outcome is indeterminate. Hence one must impose the restriction that such kinks do not occur within the relevant range. This last along with the monotonicity property just mentioned, hardly lead to a *significant* relaxation of the underlying assumptions as compared to the more 'traditional' production function. Not only in this particular case of relative farm efficiency, but in practically every other major area of pricing, distribution theory, etc, the basic propositions of bourgeois economics hardly hold water once one moves away from the usual production function to some variant that is much less restrictive. That is why we consider the law of diminishing marginal returns to be the core of marginalist economics. To put it differently : the production process cannot be easily fitted into the *ceteris paribus* straitjacket; if one tries to break out of it into a new frame, e g, that of *mutatis mutandis* which is far more plausible, marginal economics has precious little to offer.

23 J Viner, "Some Reflections on the Concept of 'Disguised Unemployment'", *Contribucoes a Analisa do Desinolvimento Economico*, 1957, quoted in A K Sen, *op cit*.

24 Compiled by R L M Ghose, *et al*, and published by the Indian Council of Agricultural Research, New Delhi, 1960.

25 Production functions can surely be fitted into these as well as other data without clarifying the picture at all. See in this connection A Rudra, "Allocative Efficiency of Indian Farmers: Some Methodological Doubts", *Economic and Political Weekly*, January 20, 1973.

A very strange case is that of C H H Rao who finds strong multicollinearity between land, labour and material inputs. Instead of rejecting on this basis the neoclassical production function, he proceeds to regress production on land alone. The estimated regression co-efficient is termed the marginal product of land. Rao seems to have overlooked the elementary condition that since the marginal product of a factor can only be defined when other factors are held constant, the single variable model does not fulfil this *ceteris paribus* criterion; or else, one has to fall back on the nonsensical assumption that land in itself produces output. See Rao's "Uncertainty, Entrepreneurship and Sharecropping in India", *Journal of Political Economy*, May/June, 1971.

33 *Op cit*.

34 Quoted from the Floud Commission by Sunil Sen, "Agrarian Struggles in Bengal, 1946-47", New Delhi, 1972, p 8.

35 "The Problem of Land Transfer", Visvabharati, 1957.

36 B B Choudhury, "The Problem of Alienation of Peasant Holdings in Eastern India, 1890-1945: Some Unsolved Problems", 1973 (mimeo). These would once again seem to contradict the thesis of Ramkrishna Mukherji that land was passing from the hands of the small peasants into those of other classes. In the South Indian context Dharma Kumar has also attempted to refute it for the late 19th Century. See her "Land and Caste in South India", Cambridge, 1965, pp 176-9.

37 "Agricultural Labourers in Modern India and Pakistan", Bombay 1952, pp 14-6. Patel, however, warned against a hasty generalisation that our agrarian economy was being transformed from a feudal into a capitalist one (p 144).

38 "Long-term Changes in the Industrial Distribution of the Working Force in the Indian Union and the States: 1901-61", in Report of the Committee of Experts on Unemployment Estimates, New Delhi, 1970.

39 Although published Census figures indicate an exceptionally sharp rise from 16 to 25 per cent for the whole country and from 20 to 33 per cent for W Bengal in 1961-71, many lacunae in the Census methods make it difficult to make a direct comparison. *Cf* J Krishnamurty, "Working Force in 1971 Census", *Economic and Political Weekly*, January 15, 1972 and "Working Force in 1971 Census", *Economic and Political Weekly*, Special Number 1973.

40 Daniel and Alice Thorner, "Land and Labour in India", Bombay, 1962, pp 76-81.

41 See fn 38. In the second half of the 19th Century, according to D Kumar, the proportion of manufacturing population somewhat declined. *Op cit*, p 181.

42 "Potentialities of Change in the Economy of Mughal India", *Socialist Digest*, September 1972.

43 B B Choudhury, "Growth of Commercial Agriculture and Its Impact on the Peasant Economy", *Indian Economic and Social History Review*, March and June, 1970, gives an admirable account for the second half of the nineteenth Century.

44 Quoted from the unpublished Ph D dissertation by Saugata Mukherji in A Bhaduri, "A Model of Forced Commercialisation of Agriculture" (mimeo). Bhaduri's model depicts how a semi-feudal system can over time *oblige* the small tenant farmer to enter the cash economy even when his bare necessities remain unfulfilled.

45 We would wish to draw the reader's attention to two modern classics analysing the impact of British colonialism on agriculture and industry respectively. E Whitcombe, "Agrarian Conditions in Northern India", Volume I: "The United Provinces under British Rule, 1860-1900", California, 1972, and A K Bagchi, "Private Investments in India, 1900-39", Cambridge, 1971.

46 "An Analysis of Semi-feudalism in East India", *Frontier*, Autumn Number 1973.

47 This is argued at length in Bhaduri's "A Study in Agricultural Backwardness under Semi-feudalism", *Economic Journal*, March 1973.

48 Since working capital requirements are much higher with the new as against traditional crops, the landlord actually augments his income *both* from usury and from crop production. Generally, the small tenant is hardly any better off.

49 "Militarism and Imperialism", *American Economic Review*, May 1970.

50 "Industry and Empire", London, 1969, p 45. He also notes: "It [cheap labour] may produce merely distress and stagnation, perhaps catastrophe, as in Ireland and the Scottish Highlands in the early nineteenth century. Cheap labour may actually retard industrialisation." (p 44).

51 From the "Conditions of the English Working Class", quoted in J Kuczynski, "The Rise of the Working Class", London, 1967, p 150.

52 J H Clapham, "The Economic Development of France and Germany, 1815-1914", Cambridge, 1936, p 18.

53 Kuczynski, *op cit*, p 183.

54 Quoted in *ibid*, pp 200-2.

55 Clapham, *op cit*, p 38.

56 D V Glass, "World Population, 1800-1950", in H J Habakuk and M Postan (eds), "The Cambridge Economic History of Europe", Vol VI, Pt I, p 61.

57 W O Henderson, "The Industrial Revolution on the Continent", London, 1961, pp 43-4.
58 *Op cit*, pp 82-96.
59 We do not wish to give the impression that our quotations above have definitely proved that no surplus labour existed in any of these countries in the initial phases of capitalist development, either in the rural or in the urban sector. More systematic information is required. Besides, we have not considered Japan. The case of Russia which presumably had a great deal of surplus labour is quite problematical. For, although there were developments along the capitalist lines till 1913 it was not exceptionally fast compared to other capitalist countries; further, foreign capital monopolised some key sectors and drained away a substantial part of the economic surplus generated by industry and trade. It is by no means certain that Russia would finally grow into a full-fledged capitalist state in the absence of the Bolshevik Revolution. Some of the basic data are admirably marshalled by Alec Nove in "An Economic History of the USSR", Penguin 1972, Ch 1, who argues, somewhat dogmatically in our view, that Russia would indeed become a capitalist state.
60 When an existing mode of production assimilates technical progress, it gets reinforced. However, beyond a certain point such changes have a cumulative impact tending to alter the mode itself. One cannot draw a dividing line on an *a priori* basis.
61 This is argued at length in the present author's "Western Imperialism and India Today", *Economic and Political Weekly*, Annual Number 1973. It follows from our argument that contemporary semi-feudalism and neo-colonialism are organically linked to gather; one cannot conceive of the one without the other.

SAVE THAT TIGER!
SAVE THOSE RUPEES, TOO!!

The Indian Government has launched a scheme to save the tiger — a fast dwindling species. For years, the Bank of Madura has been encouraging a different kind of saving — the saving of your hard-earned rupee! Which also would dwindle fast but for such schemes encouraged by the Bank of Madura.

Savings Account. Dinasemi (Daily Saving Scheme) Minor Saving Account. Recurring Deposit Account. Fixed and Short-term Deposits. Cash Certificate. The Bank also offers a Safe Deposit Vault for your valuables. We are the only Bank in Tamil Nadu to regularly float properly-conducted Chit Funds. Our deposits soared more than three times in the last three years. The number of our branches also have gone up to 137 from just 80 in 1970. An increase of 70 per cent. And plans for our further growth are underway. Reasons why we're the top non-nationalised bank in Tamil Nadu. A vote of confidence on the part of our constituents, we'd say.

So come bank with us for prompt, courteous service and the expert advice you've come to expect from the bank you can rely on.

For details of our Saving Schemes, contact our nearest Branch.

BANK OF MADURA LTD.
(Estd. 1943)
Regd. Office: 82-83, East Avanimoola Street, Madurai-625001
Central Office: 33, North Chitrai Street, Madurai-625001
Metropolitan Offices: Madras, Bombay, Calcutta, New Delhi.
Branches: Tamil Nadu, Kerala, Karnataka, Maharashtra and West Bengal.
Offices soon in: Ahmedabad and Hyderabad.

PADA-BM-105

Social and Cultural Foundations of Health Services Systems

D Banerji

The new leadership of the health services system after Independence readily committed itself to providing good health services to the vast masses of people of the country, but for this it did not consider it necessary to bring about any basic changes in the system. The colonels of the Indian Medical Service, by then greatly depleted by the withdrawal of the British, and the Brown Englishmen were assigned the very much more challenging task of building the new health services system for India.

Medical colleges grew very rapidly and poured out large numbers of physicians who were mostly alienated from the masses of the people. A number of hospitals were opened in the urban areas. Out of the limited resources that were made available for providing preventive services for rural areas, the colonels, with strong "persuasion" from foreign consultants, set aside big chunks for running mass campaigns against specific diseases — malaria, population growth, small-pox, leprosy, trachoma and filariasis.

Not only have these campaigns hindered the development of a permanent health services system in the rural areas but almost invariably they have also failed to achieve the set goals. The country was persuaded in the late fifties to invest about Rs 1,010 mn to eradicate malaria by 1966, but after an investment of over Rs 3,500 mn the prospect of doing so by even 1979 do not appear to be particularly bright. The campaign against population growth has turned out to be a similar costly blunder.

Social scientists and health educators from abroad helped the colonels to divert attention from the basic malady of the system by raising the bogey of resistance of the villagers to acceptance of the Western system of medicine. Following that reference model, their counterparts in India dutifully echoed their findings and a large number of positions were created to accommodate such professional health educators and social scientists within the system.

Findings of a carefully conducted empirical study of health behaviour of rural populations of India have, however, underscored the fact that there is considerable active interest among villagers in acquiring both curative and preventive services. Mostly it is the services which have let the people down, rather than the reverse. Not only are the rural health services very much below what the Bhore Committee's short-term programme had in 1946 described as the "irreducible minimum requirements" and much below the actual demands of the people, but even these very limited services are working at an alarmingly low level of efficiency — one of the main causes for this being the alienation of the health workers and of the institutions for education and training of such workers from the masses of the people.

I

Health Practices before British Rule

EVERY community has a health culture of its own—its own cultural meaning of its health problems, its health practices and its corps of practitioners. As a component of its overall culture, the health culture of a community is shaped by the interplay of a number of social, political, cultural and economic forces.[1] The history of the health services system in India provides an account of the influence of such forces in giving shape to it. Henry Seigerist[2] has drawn attention to this important aspect by contrasting the manifestly high standards of environmental sanitation of the Indus Valley period with the level of sanitation that exists in India today.

Describing the five-thousand-year old planned city of Mohenjo Daro, Marshall[3] has remarked that the public health facilities of the city was superior to those of all other communities of the ancient Orient. Almost all households had bathrooms, latrines, often water closets and carefully built wells. The elaborate nature of the Indus Valley public health organisation provides an indication of the extent of health consciousness among the ancient Indian people. It is difficult to conjecture the nature of the health problems of those days, but the great emphasis on the preventive aspects of disease indicates a fairly mature attitude of the society towards the health problems that might have been prevailing at that time.

The Vedic medicine that developed after the advent of the Aryans to the Indus Valley (during the second millennium BC) had begun to show a tendency to develop rational methods of approaching health problems at quite an early stage.[4] Even in the Vedic Samhitas, purely religious books, are found reflection of anatomical, physiological and pathological views which are neither magical nor reigious and there are references to treatments which are impressively rational.

Furthermore, there exists the famous decree of Emperor Ashoka Maurya (279-236 BC) in his second Rock Edict (257-236 BC) "celebrating the organisation of social medicine shaped by the Emperor along the lines of Buddhist thought and kindred ethics (*dharma*)".[4] The works of the famous Charaka of the first century AD and of Susruta of the fourth century AD laid the foundation of the highly developed science of medicine which flourished in the tenth century after Christ—a period of all round social and economic progress, often called the age of Indian Renaissance. There is also epigraphical evidence indicating that social medicine was practised in medieval South India.[4]

During the subsequent centuries, a series of political, social, and economic changes profoundly disrupted the ecological balance in Indian society. Perhaps the lowest point of this ecological crisis was reached during the decline of the Mughal Empire, a situation which set the stage for the British

conquest of India. Even during this period the system of Indian medicine had retained some fragments of its past heritage; for example, the surgeons of the British East India Company learnt the art of rhinoplasty from Indian exponents of surgery.[6] It is noteworthy that during the early period of British rule in India, the Western system of medicine, which was still dominated by such procedures as purging, leeching, scarification and blood-letting, could not be considered to be any superior to the prevailing methods of the Indian systems of medicine.

II

Health Practices during British Rule

The social, cultural, economic and political changes that followed the introduction of British rule in India dealt an almost fatal blow to the practice of the Indian systems of medicine. With the imposition of the British rule, almost every facet of Indian life, including the medical and public health services, was subordinated to the commercial, political and administrative interests of the Imperial Government in London. In developing health services for certain limited purposes (for example, for the army), the patronage was shifted from the Indian systems of medicine to the Western system. The decision to make this shift appears to be amply vindicated by the spectacular advances in the different branches of Western medicine during the nineteenth and twentieth centuries. As a result of these changes the already stagnant Indian systems of medicine got caught in a vicious circle: its very neglect accelerated its further decline and the decline, in turn, made it increasingly difficult for it to compete with the highly favoured and rapidly flourishing Western system in capturing the imagination of the educated population of India. In the long run, therefore, not only did the profession of the Indian systems of medicine get infiltrated by various kinds of quacks, but the very basis of the sciences got considerably eroded by forces of superstition and of beliefs in supernatural powers and dieties.[5]

The British had introduced Western medicine in India in the latter half of the eighteenth century principally to serve their colonial aims and objectives. Medical services were needed to support the British army and British civilian personnel living in India. Later on, medical services were made available in a very tiny selected segment of the native population. At the time of Independence, only the affluent and the ruling classes could get adequate medical services. Of the rest, constituting more than 90 per cent of the population, only a small fraction could get some form of medical care from hospitals and dispensaries run by government agencies, missionaries, philanthropic institutions and private practitioners.[7] Similarly, public health services consisted of some form of environmental sanitation in a few big cities. For the rest some public health services were provided only when there was an outbreak of massive epidemics of diseases such as plague, cholera, and small-pox.[7] Because of these conditions, in spite of the availability of knowledge from the Western system of medicine, there was widespread prevalence of such easily preventable diseases as malaria, tuberculosis, leprosy, small-pox, cholera, gastro-intestinal infections and infestations, trachoma and filariasis; Indian was among the countries of the world with the highest infant and maternal morbidity and mortality and gross death rates. In addition, there was the enormous problem of undernutrition and malnutrition. India was among the lowest per capita calorie consuming countries in the world.[7]

At the time of Independence, British India (population 300 million) had 17,654 medical graduates, 29,870 licenciates, 7,000 nurses, 750 health visitors, 5,000 midwives, 75 pharmacists and about 1,000 dentists.[7]

The colonial character of the health services had also profoundly influenced almost all aspects of medical education in India—in shaping the institutions, in developing the course content and, perhaps most important of all, in shaping the value system and the social outlook of the Indian physicians. The first medical college in India was established way back in 1835. It was quite natural that British teachers should have nurtured such institutions in their infancy. However, along with the "scientific core" of medical sciences (which was a most welcome diffusion of a cultural innovation from the Western world), there came certain political, social and cultural overcoatings which were definitely against the wider interests of the country.[8]

Also, opportunities for medical education in these institutions were made available to the very privileged upper class of the society. Additionally, the Medical Council of India accepted the British norms of medical education in order to gain recognition of the Indian medical degrees from the British Medical Council. This enabled some of the physicians, who were "the select among the select", to go to Great Britain to get higher medical education. Acquiring Fellowships or Memberships of the various Royal Colleges was generally considered to be the pinnacle of achievement in their respective fields.

These four considerations—colonial value system of the British rulers, class orientation of Indian physicians, their enculturation in British modelled Indian medical colleges and a more thorough and more extensive indoctrination of future key leaders of the Indian medical professions in the Royal Colleges—provided a very congenial setting for the creation of what Lord Macaulay had visualised as "Brown Englishmen".[8] These Brown Englishmen acquired dominant leadership positions in all the facets of the health services in India. This arrangement proved convenient to both the parties. To the Indian physicians it ensured power, prestige, status and money at home. Their mentors from foreign countries retained considerable influence on the entire health service system of the country by ensuring that the top leadership of the medical profession in India remained heavily dependent on them.

III

Evolution of Existing Health Services Systems

Profile of Policy Formulators and Health Administrators

After Independence, the health services system of the country was shaped by the two key political decisions of the new leadership. Following the political commitments made during the struggle for Independence, provision of plank of the Directive Principles of the people—particularly to those living in rural areas—was made an important plank of the Directive Principles of State Policy of the Constitution.[9] The other political commitment, which turned out to be even more sacred and of overriding importance, was to bring about the desired changes in the health services system without making any basic changes in the then existing machinery of the government.

The personnel of the Indian Medical Service of the British days and the "Brown Englishmen" were called upon by the Indian leadership to provide the initiative in shaping the proposed new health services system for India. These personnel, like those of the Indian Civil Service, belonged to elite

class of administrators. They were former officers of the British Indian Armed Forces who had opted for civilian work. They were also trained in the traditions of the Western countries. Political independence brought to the fore two additional issues which profoundly affected the cadre of the Indian Medical Service. Firstly, the withdrawal by the British officers after Independence caused a sudden vacuum in their ranks. This came as a windfall to a number of not-so-competent officers who were catapulted into positions of key importance simply because they happened to become senior in the cadre as a result of the very large number of vacancies caused by the departure of the British. Secondly, the adhering strictly to the seniority rules, when the health services were expanded very rapidly to meet the requirements of the newly formulated health programmes, the administration drew more and more from the relatively small group of people who had entered the services in, say, 1930-35, 1935-40 or 1940-45 to meet the very rapidly increasing manpower needs for key posts. As a result, a large number of the key posts in the health services got filled by persons, who, even from the colonial standards, were not considered to be bright.

Such a massive domination of the organisation by men who were trained in the colonial traditions and whose claim to a number of vital posts in development administration was based merely on their being senior in the cadre, led to a virtual glorification of mediocrity, with all its consequences.[10] What was even worse, such a setting was inimical to the growth and development of the younger generation of workers. Often these young men had to pay heavy penalties if they happened to show enterprise, initiative and imagination in their work. Conformism often earned good rewards. This ensured perpetuation of mediocrity within the organisation.

Because of their being inadequate for the job, these Brown Englishmen went out of the way to appeal to foreign experts for help and the latter have generously responded to such entreaties. A large number of foreign experts were invited to play a dominant role in almost every facet of the health services system of the country.[11]

Medical Colleges, Teaching Hospitals and Other Medical Care Facilities in Urban Areas

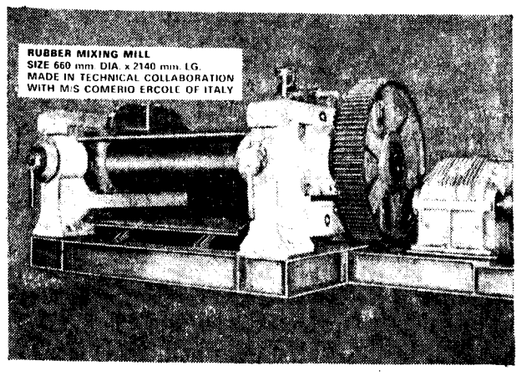
Two divergent forces in the country —availability of relatively very much larger amounts of resources for the health sector and perpetuation by the technocrats, the bureaucrats and the political leadership of the old privileged class and the Western value system of the colonial days—gave shape to a health service system which had a strong urban and curative bias and which favoured the rich and the privileged.

It is significant that when the country had only about 18,000 graduate physicians and about 30,000 licenciate physicians,[7] one of the first major decisions of the popular government of India in the field of health was to abolish the three-year post-matriculation licenciate course in medicine.[12] While recognising "the great lack of doctors", the very large majority of the members of the Health Survey and Development Committee (Bhore Committee), probably "strongly influenced by the recommendations of the Good-enough Committee in the United Kingdom",[13] asserted that resources may be concentrated "on the production of only one and that the most highly trained doctor.[13] The Committee had made elaborate recommendations concerning the training of what it termed as the "basic doctor" and stressed that such training should include "as an inseparable component, education in community and preventive aspects of medicine".[13]

The Medical Council of India, a direct descendant of the Medical Council of Great Britain, which is the statutory guardian of standards of medical education in India, has issued repeated warnings against reviving the licenciate course. The Health Survey and Planning Committee of 1961 (Mudaliar Committee)[12] has also emphatically rejected the idea of reviving such a short-term course because they were "convinced that the proper development of the country in the field of health must be on the lines of what we consider as the minimum qualification for a basic doctor" (p 349). It went on to state: "India is no longer isolated and is participating in all problems of international health. The WHO has laid down certain minimum standards of qualifications. In view of India being an active member, participating in all public health measures on an international basis, we think it will be unfortunate if at this stage once more the revival of a short-term medical course is to be accepted" (p 349).

One of the saddest ironies of the medical education system in India is that resources of the community are utilised to train doctors who are not suitable for providing services in rural areas where the vast majority of the people live and where the need is so desperate. By identifying itself with the highly expensive and urban and curative oriented system of medicine of the West, the Indian system actively encourages the doctors to look down on the facilities that are available within the country, particularly in the rural areas, and they look for jobs abroad and thus cause the so-called brain drain. As if that is not enough, till recently these foreign trained doctors have been pressurising the community to spend even much more resources to attract some of these people back to the country by offering them high salaried prestigious positions and making available to them very expensive supersophisticated medical gadgets. These foreign trained Indian specialists, in turn, actively promote the creation of new doctors who also aspire to "go to the States" to earn large sums of money and to specialise. Emphasis on specialisation, incidentally, causes considerable distortion of the country's health priorities, thus causing further polarisation between the haves and the havenots.

Those who are unable to go abroad, they try to settle down in private practice in the urban areas, often linking their practice with honorary or full-fledged jobs in urban health institutions run by the government. Only some government jobs are non-practising. As a result of such considerations, a desperately poor country like India finds itself in a paradoxical position in relation to the distribution of the doctors in the country: the urban population, which forms 20 per cent of the total, accounts for 80 per cent of the doctors.



To be sure, pretending to follow the recommendations of the Bhore Committe, soon after Independence upgraded departments of preventive and social medicine were created in medical colleges, at the instance of the government and of the Medical Council of India, to act as spearheads to bring about social orientation of medical education in India. However, as in the case of so many other ambitious and morally lofty government programmes, concurrently it was also ensured that the very spirit of this programme was stifled, if not totally destroyed, by actively discouraging in various ways its actual implementation. For instance, instead of mobilising the finest brains in the profession to bring about social

SILK AND KARNATAKA

In Karnataka, stage is set for a major push forward in the field of Sericulture. This labour intensive industry can help small and marginal farmers to supplement their incomes substantially and the Country to earn Foreign Exchange.

Karnataka accounts for 80 per cent of the total production of Mulberry Silk in India and has always been famous for its Silk and Silk Products. During the Fourth Plan period, the annual production of Silk in the State rose from 14 Lakh Kgs. to 30 Lakh Kgs. A major breakthrough in Sericultural Technology has been th successful introduction of bi-voltine hybrid Silk-worm races. They yield a much larger production and Silk that comes to international standards. An ambitious programme to double the Silk Production over a ten year period, has been initiated.

orientation, most of the positions in the departments of preventive and social medicine were filled by the discards, who were often found intellectually inadequate to get into the highly competitive and prestigious clinical disciplines, or even the paraclinical disciplines. This gave enough opportunities to the threatened foreign trained superspecialists to ridicule the entire discipline of preventive and social medicine and bring it down almost to the bottom of the prestige hierarchy of disciplines in a medical college.[15] Significantly, the political leadership — the ministers and legislators, who are beholden to these super-specialists for their personal needs of various kinds — winked at this systematic desecration of the philosophy of social orientation of medical education in the country.[16]

Along with the very rapid proliferation of very expensive teaching hospitals for medical colleges, each having a number of specialities and superspecialities, a number of general hospitals were established in urban areas. The number of hospital beds shot up from 113,000 in 1946[12] to the present figure of 300,000.[14] There has also been a rapid increase in the number of dispensaries for providing curative services to urban populations. There were over 1,807 urban dispensaries in 1966.[17] The development of medical colleges, teaching hospitals and other hospitals and medical care facilities has accounted for a large chunk of the investment in health services in the country's Five-Year Plans.[12] The recurring cost for these institutions accounts for over three-fourths of the annual health budget of a State.[18]

Mass Campaigns against Some Major Health Hazards

The fact that despite their obvious overriding importance, preventive services have received a much lower priority in the development of the health service system of India provides an insight into the value system of the colonels of the Indian Medical Service, the British trained bureaucrats of the Indian Civil Service and, above all, the value system of the political leadership of free India. The colonels did not appear to relish the prospects of dirtying their hands—getting involved in problems which required mobilisation of vast masses of people living in rural areas. The rural population raised in the minds of these decision-makers the spectre of difficult accessibility, dust and dirt and superstitious, ignorant, ill-mannered and illiterate people. Therefore, when they were impelled to do some preventive work in rural areas, characteristically, they chose to launch military style campaigns against some specific health problems.

Undoubtedly, because of the enormous devastation caused by malaria till the early fifties, this disease deserved a very high priority. But the programme became a special favourite of the colonels not only because it required relatively much less community mobilisation, but it also provided them with an opportunity to build up an administrative framework to launch an all-out assault on the disease in a military style — in developing preparatory attack, consolidation and maintenance phases, in having "unity of command", and surprise checks and inspections and in having authority to "hire and fire". Some of the followers of the colonels in fact went so far as to compare the malaria campaign with a military campaign.[19] Another enthusiast for military methods has written an entire book[20] with a preface from the late Prime Minister Jawaharlal Nehru describing the saga of the growth of the health services in independent India as if he were describing a military campaign.

Experience of implementation of India's National Tuberculosis Programme brings sharply into focus the limitations of this military approach to developing a health service system for the people of this country. On the basis of a series of operational research studies,[21] it was demonstrated that it is possible to offer facilities for diagnosis and treatment to over a million and a half of sputum positive cases who are known to be actively seeking help for their illness from over 12,000 to 15,000 health institutions in various parts of the country. But because of failure of the programme administrators to develop a sound health delivery system on a permanent basis for the rural populations of the country, more than a decade after the launching of the programme, less than one-fifth of these sputum positive cases, who have an active felt need, are being dealt with by the programme organisation.[21] This provides an example of how the militaristic urban privileged class value system has come in the way of building a health service system to meet even some of the very urgently felt needs of the people of the country.

After some pilot projects, a National Malaria Control Programme was launched with the help of the United States Technical Co-operation Mission, the World Health Organisation and the United Nations International Children's Emergency Fund (UNICEF) in 1953 to cover all the malarious areas of the country, then involving a population of 165 million.[20] It achieved a phenomenal success; for instance, the number of malaria cases for every 100 persons visiting hospitals or dispensaries declined from 10.2 per cent in 1953-54 to 4.0 per cent in 1958-69.[20] This success emboldened the administrators to think in terms of totally eradicating the disease from the country, once and for all. The danger of the mosquitos developing resistance to the main weapon for malaria control, DDT, was given as an additional reason for embarking on the eradication programme. Besides, pressure was also put on India by foreign consultants from WHO and elsewhere to embark on the eradication programme as it was to become a part of the global strategy propounded by the WHO.[20]

It was also stated, to give economic grounds for the decision, that while the control programme was estimated to cost about Rs 270 mn in the Second Five-Year Plan (1956-1957 to 1960-1961) and Rs 350 mn during the Third Plan (1961-1962 to 1966-1967) and thereafter would continue to remain a heavy item of expenditure, "the cost for the eradication programme was estimated to be Rs 430 mn in the last three years of the Second Plan and Rs 580 mn for the entire Third Plan with the annual expenditure becoming negligible thereafter".[20] The immediate successes of the National Malaria Eradication programme were even more spectacular, but a disastrous snag developed in implementing the maintenance phase of programme.[22] It turned out that, among other factors, because of the preoccupation of the administrators with specialised mass campaigns against malaria and other communicable diseases, they had not paid adequate attention to building a permanent health service system—the so-called health infrastructure—strong enough to carry on the malaria surveillance work effectively at the village level. This has been responsible for a series of setbacks to the National Malaria Eradication Programme, resulting in the reversion, at a very considerable cost, of large segments of the maintenance phase population on to consolidation or attack phases. Instead of getting rid of malaria once and for all by 1966, as it was envisaged in the late fifties, 40 per cent of the population is still to reach the maintenance phase.[22] The National

Malaria Eradication Programme thus continues to drain huge quantities of scarce resources even today, thus making it even more difficult to find resources to develop the health services infrastructure.

During the last four years, for instance, less than 3 per cent of the additional population (9.4 units) has entered the maintenance phase.[22] Meanwhile, the country is forced to set aside huge chunks of its very scarce resources to prevent the programme from sliding still further. As against the envisaged expenditure of Rs 1,015 mn, the National Malaria Eradication Programme has thus far sucked in over Rs 2,500 mn.[23] In addition, Rs 967 mn have been set aside for it for the next five years[22] and even this allocation might have to be raised still further. In spite of this, the chances of eradicating malaria in the foreseeable future does not appear to be very bright. So the country will be compelled to keep on pouring resources into this programme to see that the disease does not come back in an epidemic form as it has happened in some other countries.

Also, following the model of the NMEP, a specialised military style campaign was launched in 1963 to eradicate small-pox within three years.[20] Once again the campaign conspicuously failed to achieve the objective of eradication. Only recently (1973-74) yet another campaign has been launched to eradicate small-pox "once and for all".[22]

A mass campaign to provide BCG vaccination to cover the entire population of the country, and to continue to do so periodically, was the first effort to deal with the problem of tuberculosis in India as a public health problem.[22] This programme has also failed to yield the desired results.[21]

Special campaigns have also been launched against leprosy, filariasis, trachoma and cholera with even more discouraging results.[22]

The health service system of the country had hardly recovered from the consequences of the very costly failures of the mass campaigns against malaria, small-pox, leprosy, filaria and trachoma, when a large bulk of investment in health was cornered by another specialised campaign—this time it was against the rapidly rising population of the country. The Fourth Plan investment in family planning was Rs 3,150 mn as against Rs 4,500 mn for the rest of the health sector of the country.[10] This involved deployment of an army of 125,000 persons.[10] All of them were specially earmarked for doing family planning work only. Significantly, once again, this programme was also developed by officers belonging to the Indian Medical Service—the colonels, with strong backing from foreign consultants from various agencies. Predictably, once again, this campaign also failed to attain the demographic objectives, with disastrous consequences, both to the programmes for socio-economic development as well as to the development of a sound infrastructure of health services for the country.[10]

Recognising, at long last, the weaknesses of the campaign approach, recently the Government of India has veered round to the idea of providing an integrated package of health, family planning and nutrition services with particular emphasis on the weaker sections of the community.[2] This package, in turn, is a part of a bigger package of the Minimum Needs Programmes of the Fifth Five-Year Plan (1974-1979) which is meant to deal with some of the very urgent social and economic needs of the rural populations of the country.[26]

Development of a Permanent Integrated Health Service System for Rural Areas

The Health Survey and Development Committee,[13] which was set up by the British Indian Government in 1943 to draw a blueprint of health services for the post-War British India, had shown exceptional vision and courage to make some very bold recommendations. These included development of an elaborate health service system for the country, giving key importance to preventive aspects with the "countryside as the focal point".[13] To forestall any criticism of practicability, pointing out the achievements in health in the Soviet Union within a span of 28 years (1913-1941), it asserted that its recommendations are quite practical, in fact relatively very modest, provided there was the will to develop the health services of the country.[13] Unfortunately, however, the leaders who took over from the British did not show this will. They had quoted, often out of context, the recommendations of the Bhore Committee to justify abolition of the licenciate course and to establish a very large number of medical colleges with sophisticated teaching hospitals in urban areas. They also invoked the Bhore Committee to justify setting up an even more sophisticated All-India Institute of Medical Sciences in New Delhi on the model of the Johns Hopkins Medical Centre of the USA.[12] A number of other postgraduate centres for medical education were also set up in due course. It, however, took them over seven years even to start opening primary health centres to provide integrated curative and preventive services to rural populations of the country.[28] These primary health centres were a very far cry from what was suggested by the Bhore Committee: they did not have even a fourth of "the irreducible minimum requirements" of staff recommended by the Bhore Committee for a given population (and that too only as a short-term measure).[13] Furthermore, it took more than 10 years to cover the rural populations in the country even with this manifestly rudimentary and grossly inadequate type of primary health centres.

The entry of the National Malaria Eradication Programme into the maintenance phase and concurrent development of an extension approach to family planning provided a transient impetus to providing integrated health and family planning services through multipurpose male and female workers.[29] But the clash of interests of the malaria and the family planning programmes again led to the formation of unipurpose workers for malaria and family planning.[30] What was even worse, application of very intensive pressure on various workers of primary health centres to attain certain family planning targets led to the neglect of whatever health services which were earlier being provided by the PHCs, thus causing a series of further setbacks to different health programmes.[10] Maternal and child health services, malaria and small-pox eradication, environmental sanitation and control of other communicable diseases, such as tuberculosis, leprosy and trachoma, are examples of the services which suffered as a result of preoccupation of health workers with achieving the prescribed family planning targets.

Very recently, following the recognition of the fact that a unipurpose, high pressure military type campaign approach which does not ensure a concurrent growth and development of other segments of health and nutrition services (and growth and development in other socio-economic fields) will not be able to yield the desired results, as pointed out above, decisions have already been taken to integrate malaria, family planning, maternal and child health, small-pox and some other programmes and thus provide an entire package of health, family planning and nutrition services to the community through male and female multipurpose health workers.[25,26]

Indian Systems of Medical Services

There are three major indigenous systems of medicine in India: Ayurveda — the Hindu medical system; Unani — the Greek system of medicine which was brought to India from West Asia by the Muslim rulers of India; and the Siddha system, which can be considered to be a specialised branch of Ayurveda. After Independence, these systems were subjected to two contradictory pulls: their being firmly rooted in the culture of the people of the country for centuries and their rich heritage invoked considerable admiration and even a certain degree of emotional attachment from a large section of the population of the country. At the same time, long neglect of these systems of medicine led to a very sharp deterioration in the body of knowledge, in their institutions for training and research in their pharmacopia and drug industry and in their corps of practitioners. Therefore, while the leaders of independent India built almost the entire health services on the lines of the Western system, they have, from the very beginning, shown sympathy for the Indian systems of medicine and have made available some grants for conducting research in these system, for supporting educational institutions and for providing some services to the community.[31]

IV
Present State of the Health Services

Considering the size of the population and the staggering nature of its health problems, the existing health services are grossly inadequate. Furthermore, the bulk of the expenditure is earmarked for curative services and these services are predominantly situated in urban areas and they are more accessible to the more privileged sections of the society. The privileged population has the additional advantage of being able to pay to avail of private nursing home services and services of private practitioners who are located almost entirely in urban areas. Of the total number of doctors in India 53 per cent are in private practice; another 7 per cent are employed in the private sector;[32] the community spends about Rs 100,000 for the training of one doctor.

India has barely half a bed per thousand population, while the corresponding figure is over 10 for the industrialised countries.[14] Of these beds, 90 per cent are located in cities and towns where only one-fifth of the population lives. Even the 10 per cent of the beds which are primarily meant for rural populations are ill-staffed, ill-equipped and ill-financed.[17] The expenditure for curative services is about three times as much as for preventive services.[18] Again, in terms of the preventive services, while over 90 per cent of the urban population is provided with some degree of protected water, only 4 per cent of villages get piped water supply; while about 40 per cent of the urban population has a sewerage system, it is almost non-existent for the rural population.[33]

Primary health centres and their sub-centres form the sheet anchor of rural health services of India. There are over 5,195 PHCs in the country; there are 32,218 sub-centres attached to these PHCs.[14] Each PHC and its sub-centres are expected to provide integrated health, family planning and nutrition services to a population of about 100,000. Provision of medical care, environmental sanitation, maternal and child health services, family planning services, eradication or control of some of the communicable diseases and collection of vital statistics are some of the functions of a PHC.[28] However, both quantitatively as well as qualitatively the resources made available at a PHC are grossly inadequate for serving the population assigned to it.[34, 35, 26, 59]

There are now 103 medical colleges which have an annual admission capacity of over 13,000.[14] The number of doctors available in India has now increased to 137,930.[14] There are 88,000 trained nurses, 32,000 sanitary inspectors and 54,000 auxiliary nurse midwives.[14]

The government is at present financing about 9,000 dispensaries and 195 hospitals which offer the services according to the Indian systems of medicine. There are 44,460 institutionally qualified and 111,371 non-institutionally qualified Ayurvedic registered practitioners in the country; the corresponding figures for the Unani and the Siddha systems are 6,013 and 18,507 and 625 and 14,785, respectively.[31] The government runs two postgraduate colleges in Ayurveda and one in Unani; there are also 91 Ayurvedic, 10 Unani and one Siddha undergraduate colleges.[31]

That the present health services system of India needs considerable improvement is dramatically brought home by the fact that in the year 1974 India happens to be one of the few countries in the world which has not yet succeeded in eradicating small-pox. Much remains to be done before it will be possible to control such apparently easily controllable diseases as tuberculosis, leprosy, trachoma and filariasis.[23] The fact that the National Malaria Eradication Programme continues to be a very heavy drain on the very limited resources even today, instead of being eradicated by 1966, also provides an indication of the serious weaknesses in the system.

V
Community and Health Services Systems

Health administrators sought to secure some degree of social legitimacy for their actions by getting some not very well defined or even relevant social, cultural and psychological considerations raised by social scientists and health educators. Their appeal was particularly directed towards the then dominant group of social scientists which was engaged in generating social science knowledge to legitimise the existing social structure and social relations.[37,38] The response was generous. Eminent social scientists from the West, such as McKim Marriot,[39] Morris Carstairs,[40] Morris Opler,[41] H A Gould[43] and E Wood[43] came out to draw attention to certain basic cultural and social factors which mitigate against acceptance of modern medical practices in the mostly tradition-bound, caste-ridden, rigidly hierarchical, illiterate and superstitious rural communities of India. Their Indian disciples dutifully carried on the refrain by drawing similar conclusions on the basis of their own "studies". Studies of Hasan,[44] Dhillon,[45] Khare,[46] Kakar[47] and Prasad[48] offer examples of such Indian workers.

The report on the Conference on Social and Cultural Factors in Environmental Sanitation[49] represents an instance of the collective wisdom on this subject of a group of eminent Indian social scientists which was brought together by the Ford Foundation. Ignoring the vital necessity of "distinguishing between the true clinical core of scientific medicine and the surrounding folklore, magic, custom, and faddism that are included in our institution of medicine",[50] they went on to find ways of overcoming the cultural resistance of villagers to installation of sanitary latrines. They overlooked some basic epidemiological, clinical, social, economic and even cultural issues which ought to have called into question the

very rationale of selling such latrines to rural populations.[6],[50] Their deep-seated bias, which perhaps contributed to their inability to take a holistic view of the social, cultural and technological interaction in the sanitation programme, made them behave more like salesmen than like scientists who possess the competence to use the conceptual and methodological rigour of their discipline to make an objective analysis of the situation.[51]

The profession of health education also came in very handy to health administrators in giving a facade of legitimacy to the health service system built by them. As practitioners of social science knowledge which was generated by scholars like Marriot, Carstairs, Hasan and Khare, the administrators found it convenient to assign to them the task of "educating" the community to pave the way for acceptance of the Western system of medicine. When the administrators in India, with strong backing from consultants from abroad, launched a country-wide family planning programme which required acceptance of family planning practices in a poverty-stricken population, with very poor health services, extensive unemployment and social injustice,[10] they once again found it convenient to call upon the health educators to sell this brand of family planning to the masses. It is significant that the leaders of the health education profession, both in India as well as from other countries, willingly allowed themselves to be identified with a programme which involved motivating individuals to accept family planning practices by using persuasion, administrative coercion and monetary enticements.[24]

A carefully conducted sociological study of tuberculosis patients in a rural district in South India[51],[21] revealed that more than half of the these cases visited a government institution of modern medicine, where they were almost invariably dismissed with a bottle of cough mixture. These findings were diametrically opposed to what was forecast by social scientists like Marriot and Carstairs. Again, a number of studies of treatment default among tuberculosis patients getting domiciliary treatment revealed that by far the most important causes of default were attributable to limitations at the technical level and in the field of administration of the services, rather than to the patients' own behaviour.[53],[54],[55] Yet, despite these very clear-cut findings, health educators and community health workers have kept harping on the need for "educating" the public about tuberculosis.[56],[57] They could not think of "educating" the programme administrators to take into account the community health behaviour and accordingly formulate suitable services. They have written numerous accounts as to how the villagers in India refused small-pox vaccination because of their superstitious faith in the goddess *"Sitala"*, but they could not take note of the very glaring fact that a much larger number of persons remain unvaccinated because nobody has cared to offer facilities of vaccination to them.[35]

VI

A Recent Study of Health Behaviour of Rural Populations in India

Taking note of the limitations in social science studies in health fields in India, an attempt was made by the author to narrow this gap by considering the activities of the primary health centre as a purposive intervention to change for the better some aspects of the pre-existing health culture of the community served by it. A research study was designed to examine the current status and the nature of this interaction between the health services that are introduced through the PHCs and the pre-existing culture of rural populations in India. A report on this study has already been published in this journal.[36] Only the broad outline of the study design and the principal findings are being summarised here to draw attention to some aspects of the health behaviour of rural populations which appear to be of significance in shaping the future pattern of the health services system of the country.

In order to get data on health behaviour of rural populations under relatively more favourable conditions, a deliberate effort was made to select, in the first instance, PHCs and villages which are much above the average. The study has been completed in 16 villages, 10 of which also serve as the headquarter village of a PHC. These PHC are from seven states of the country, belonging to seven regions. Considerable attention was paid to developing a methodological approach that is specially tailored for studying the health behaviour of villagers (including their behaviour in relation to the PHC services) against the background of the total village culture. Research investigators lived in these villages for three to five months. Apart from making special efforts to get themselves accepted by all the segments of the village community and collecting data through village informants, the investigators identified informants and some "ordinary" members from each segment of the village community and made observations and conducted depth interviews to understand the health culture of each segment of the village against the background of its total culture. They also prepared case reports to provide a deeper insight into the response of the different segments to health problems in the fields of medical care, family planning, maternal and child health, communicable diseases, environmental sanitation, etc. Documents have been prepared to enable all the investigators to cover uniformly all the major areas in relation to these problems. Their stay in the village also enabled them to make direct observations, followed by depth interviews, of the actual behaviour of the villagers when they encountered certain specific health problems. They could also study the interaction between the PHC personnel and the villagers, both when the former visited the village and when the villagers, both when the former visited the village and when the villagers visited the PHC. Apart from these efforts to ensure that in-depth qualitative data were obtained from all the segments of the entire village community according to well defined work procedures and check lists, a quantitative dimension was given to the main qualitative data by framing an unstructured interview schedule on the basis of these data and administering it to a 20 per cent stratified random sample of the village households.

As an additional safeguard, after completion of the field work in the villages of a PHC, some of the data concerning the health behaviour of the community were cross-checked with personnel at the level of the corresponding seven State Directorates of Health Services. An additional three states were added to the original seven to examine how far the findings from these seven were applicable to the others. These ten states covered 77.8 per cent of the population of the country. Recognising that the complex nature of the subject of this study called for a new and rather exacting methodological approach, special safeguards were adopted to ensure that the data collected by all the investigators were of a minimum acceptable quality.

Taking into account the social and economic status of the people, the epidemiology of health problems and the nature of the health services available,

it is not surprising that problems of medical care should be by far the most urgent concern among the health problems in rural populations. But the surprising finding is that the response to the major medical care problems is very much in favour of the Western (allopathic) system of medicine, irrespective of social, economic and occupational considerations. Availability of such services and capacity of patients to meet the expenses are the two major constraining factors. On the whole, the dispensary of the PHC projects a very unflattering image. Because of this and because of its limited capacity it is unable to satisfy a very substantial proportion of the demand of the villagers for medical care services. This enormous unmet felt need for medical care services is the main motive force in the creation of a very large number of the so-called Registered Medical Practitioners (RMPs) or "quacks". The RMPs are thus in effect created as a result of the inability of the PHC dispensary or other qualified practitioners of Western medicine to meet the demands for medical care services in the villages. It is worth noting that all these RMPs use allopathic medicines rather than ayurvedic or unani medicines. When these RMPs prove ineffective, depending on the economic status of the individual and the gravity of his illness, villagers actively seek help from government and private medical agencies in the adjoining (or distant) town and cities.

There are, however, numerous instances of adoption of healing practices from qualified or non-qualified practitioners of the different Indian systems of medicine and homeopathy and from other non-professional healers. But among those who suffer from major illnesses, only a very tiny fraction preferentially adopted these practices, by positively rejecting the facilities of the Western system of medicine which are more efficacious and which are easily available and accessible to them. Usually these practices and home remedies are adopted (i) side by side with Western medicine; (ii) after Western medicine fails to give benefit; (iii) when Western medical services are not available or accessible to them due to various reasons; and, (iv) most frequently, when the illness is of a minor nature.

Another very significant finding of this study is that the family planning programme has ended up in projecting an image which is just the opposite of what was actually intended. The image of the family planning workers in rural areas is that of persons who use coercion and other kinds of pressure tactics and who offer bribes to entice people into accepting vasectomy or tubectomy. Because of the failure of family planning workers to develop a rapport with the villagers, sometimes the villagers are unable to meet their needs for family planning services. There are several instances of mothers who, failing to get suitable family planning services from the PHC, took recourse to induced abortions to get rid of unwanted pregnancies. This not only points to the failure of the programme to meet their needs for the services but it also draws attention to the failure of the programme to offer suitable abortion services to mothers with unwanted pregnancies, despite the passage of the abortion bill.

Another significant finding of this study is that there is considerable unmet felt need for the services of the Auxiliary Nurse Mid-wife (ANM) at the time of childbirth. Villagers are keen to have the ANM's services because they consider her to be more skilled than the traditional *dai*. Wherever the ANMs have provided the services, the *dia*'s role has become less significant. The overall image of the ANM in villages, particularly in North India, is that of a person who is distant from them—meant only for special people or for those who can pay for her services. She is not for the poor. She can be called only when there are complications and then also she has to be paid. Because of the inaccessibility of the ANMs, the majority of the deliveries even in the villages where the PHC is located are conducted by *dais* and relatives and neighbours. In villages with no PHC, their sway is almost complete. As in the case of the Registered Medical Practitioners, confinement by relatives and friends and by indigenous *dais* is popular among the villagers not because of their intrinsic superiority but because in the absence of suitable services from the ANM/Lady Doctor, they are compelled to settle for something which they consider to be inferior but which is all that is available and accessible to them. They actively seek more specialised services either from the PHC or from the towns and cities when the *dais* are unable to tackle complicated cases.

The only two programmes which can be stated to have reached the grass-roots level in the villages are those concerning malaria and small-pox. Despite several complaints regarding the sincerity of these workers, there is almost a universal agreement among the villagers that these workers do visit the community. A significant finding is that these workers do not encounter any major obstacle in getting participation of the community in these programmes. Except when there are understandable compulsions, such as the prospect of a poverty-stricken mother losing wages for 4-5 days in the peak agricultural season due to the child's vaccination reactions and some cases of orthodoxy, there is general acceptance of small-pox vaccination in village communities. The number of children who are left unvaccinated due to lapses of the parents appear to be a very small fraction of those who remain unvaccinated due to lapses of the vaccinators and their supervisors.

Patients suffering from tuberculosis, leprosy and trachoma get very little service from the corresponding national programmes. It is remarkable that despite this, they actively seek help from elsewhere — from nearby towns or even big cities. Such help is not only much more expensive and bothersome but it is also much less efficacious, both clinically as well as epidemiologically. Other preventive measures, of course, are almost non-existent.

Extensive prevalence of abject poverty, as a result of which more than half of the population is unable to meet even the minimum dietic calorie needs and appalling conditions of sanitation, water supply, housing and education present an ecological setting which is conducive to widespread prevalence of various types of health problems in the community. These health problems form only a small component of the overall gloomy picture of the way of life in Indian villages. Ignorance, superstition, suspicion, apathy and fatalism should thrive in such a milieu. It is, therefore, a tribute to the strength of the culture of the rural populations that, despite these overwhelming odds, their health behaviour has retained so much of rationality.

Because of their urban orientation, workers of rural health and other developmental agencies generally have a strong distaste for rural life. This distaste is for the entire way of life and not simply for the very poor facilities available there. Health workers tend to keep a distance from the rural population as a whole. However, as they are required to work for rural populations, they take advantage of the village power structure and confine themselves, as far as possible, to satis-

COME SEPTEMBER!

Experience the serenity of the three lovely Hill Stations in Tamilnadu at half-the-cost during off-season

Ooty. Kodai. And Yercaud! In fact there is no question of off-season in these places. Bracing climate. Quiet. Inexpensive accommodation. Excellent transport facilities. Come September-till March when all is serene and lovely.

OOTY (537 kms. from Madras)
Botanical Gardens present a panorama of kaleidoscopic colours. Pleasant boating and fishing on the lake. For the outdoor people— Golf and riding on the Ooty downs. Altitude: 2286 metres.

KODAI (512 kms. from Madras)
Enchanting waterfalls. The lake with excellent boating. Vantage points with breathtaking views of lilting landscapes. Altitude: 2120 metres.

YERCAUD (360 kms. from Madras)
Tangy smell of oranges. Pleasant aroma of coffee plantations. Beautiful lake with boating facilities. Picturesque hamlets. Altitude: 1500 metres.

Tamil Nadu Tourism Development Corporation has Tourist Bungalows at Ooty, Kodai, Yercaud. For particulars contact the Managers and also the Tourist officers.

fying the privileged gentry of the village. In doing so they (a) win approbation and rewards from the so-called community leaders who have the ear of their superior officers and of the political leaders at the higher levels; (b) deal with the least disagreeable segment of the village community; and (c) get a free hand to "tackle" the rest of the community.

The findings of this study bring out some of the key issues which are of far-reaching significance for the future development of the health services system of the country:

(1) It brings out clearly that there is no significant cultural resistance to acceptance of modern medicine as long as they are efficacious and are available and accessible to the people. This finding, therefore, seriously calls into question the belief of a very significant section of health administrators, social scientists and health educators that there is considerable cultural resistance to the acceptance of modern medical practices in rural populations in India.

(2) The existing health services are working at a grossly low level of efficiency, which has led to considerable under-utilisation. Priority should, therefore, be given to ensuring that this problem is over come.[59]

(3) There is also considerable scope for bringing about qualitative improvements in the existing health services system in rural areas by bringing it more in tune with the social and cultural setting of the village communities.

(4) Finally, after ensuring a reasonable level of utilisation of the existing capacities quantitatively and after bringing about qualitative changes, there is a strong case for making quantitative expansion of the health services to meet the requirements of rural populations. This will imply rectification of the existing imbalance in allocation of resources, requiring a shift in investment from urban to rural areas, from curative to preventive and from the privileged to the underprivileged.

VII

Summary

There has been a cumulative increase in the knowledge of the medical sciences which has at times grown almost at an exponential rate. However, the actual application of this knowledge to societies is determined by a number of political, social, cultural, economic and technological factors. In ancient India, when these factors were favourable, despite the very rudimentary nature of the available knowledge, the people enjoyed a much higher level of health services than what is available at present. In fact these favourable conditions created a setting which enabled the society to make significant contributions to the body of medical knowledge — through Charaka and Susruta, for instance. The decline of the society in the subsequent centuries saw a decline in the health service system. Colonisation of the country by the British, when every facet of its activities was subordinated to the interest of the Imperial Government in London, dealt almost a fatal blow to the still active Indian systems of medicine. The entire health service system of the country was purposively developed to provide the Western system of medical services to a small privileged group — the armed forces, the British civilians and the Indian gentry. Medical colleges were opened to prepare Brown Englishmen, medical institutions were established to serve the gentry living in urban areas and officers of the armed forces medical services were brought in to administer the health services.

With the advent of Independence, the new leadership readily committed itself to providing good health services to the vast masses of people of the country, but for this it did not consider it necessary to bring about basic changes in the system. The colonels of the Indian Medical Service, by then greatly depleted by the withdrawal of the British, and the Brown Englishmen were assigned the very much more challenging task of building the new health services system for India. Medical colleges grew very rapidly and these colleges poured in a large number of physicians who were mostly alienated from the masses of the people. A number of hospitals were opened in urban areas. Out of the limited resources that were made available for providing preventive services for rural areas, the colonels, with strong "persuasion" from foreign consultants, set aside big chunks for running mass campaigns against specific diseases — malaria, population growth, small-pox, leprosy, trachoma and filariasis. Not only have these campaigns hindered the development of a permanent health services system in the rural areas but almost invariably they have also failed to achieve the set goals. The country was persuaded in the late fifties to invest about Rs 1,010 mn to eradicate malaria by 1966, but, even after an investment of over Rs 3,500 mn, the prospect of doing so even by 1979 do not appear to be particularly bright. The campaign against population growth has turned to be a similar costly blunder.

Social scientists and health educators from abroad helped the colonels to divert attention from the basic malady of the system by raising the bogey of resistance of the villagers to acceptance of the Western system of medicine. Following that reference model,[58] their counterparts in India dutifully echoed their findings and a large number of positions were created to accommodate such professional health educators and social scientists within the system. Findings of a carefully conducted empirical study of health behaviour of rural populations of India have been presented to underscore the fact that already there is considerable active interest among villagers in acquiring both curative and preventive services. Mostly it is the services which have let the people down, rather than the reverse. Not only are the rural health services very much below what the Bhore Committee's short-term programme had called in 1946 the "irreducible minimum requirements" and much below the actual demands of the people, but even these very limited services are working at an alarmingly low level of efficiency — one of the main causes for this being the alienation of the health workers and of the institutions for education and training of such workers from the masses of the people of the country.

UNITS—
An uncommonly good investment for the common man

Unit trust of India provides a safe and profitable investment. It sells units which are like shares. The face value of a unit is Rs 10 and units are sold in multiples of ten at the ruling sale price. Applications for units can be made at the office of the Trust at Bombay, Calcutta, New Delhi and Madras or at almost any bank or post office. Anytime is good time to buy units. You will receive the dividend for the full year irrespective of the date of purchase provided you are a unit holder as on 30th of June.

The Trust invests the money collected through sale of units in selected shares and securities. The income is distributed to unit-holders by way of dividend. An expert Board of Trustees manages the Trust funds and ensures good return to the unit holders. So far, the Trust has sold units worth Rs 150 crores and invested this amount in about 500 companies. The Trust paid a dividend of 8½% for the year 1972-73.

You can apply for units on prescribed form singly, or jointly, guardians can apply for units on behalf of minors. Unit certificates will be sent to you direct by registered post. In times of need, you can sell back your units to the Trust at the ruling repurchase price by completing the form on the reverse of your unit certificate. Units can also be transferred like shares. Banks accept units as security for granting loans. Units also offer you attractive tax concessions.

The Trust offers specific savings Plans as Reinvestment Plan, Children's Gift Plan and Unit linked Insurance Plan for the benefit of the Unitholders.

Standard Mills

STANDARD MILLS is making arrangements for foreign exchange loans and finalising foreign orders to expand capacity for manufacture of caustic soda, from 51,990 tonnes to 86,650 tonnes per annum for which it has got a 'letter of intent'. The company has also secured a 'letter of intent' for hydrogen and is seeking an industrial licence. Meanwhile, the plant for additional production of potassium carbonate, designed, fabricated and erected indigenously, has been giving the designed output rate. The chloromethane plant has also commenced production. The full capacity of the expanded caustic soda plant could be achieved only towards the end of last year owing to delay in the receipt of second rectiformer from Heavy Electricals India. During the year ended March last, sales of the chemicals division (net of excise) were better at Rs 10.62 crores, compared to Rs 9.80 crores during the previous period of 15 months. The textile division had to contend with the fuel crisis and a 41-day strike in the Bombay city units; and net sales were Rs 24.95 crores as against Rs 30.60 crores. Exports of textile products fetched Rs 126 lakhs, against Rs 87 lakhs, and those of the chemical products Rs 98 lakhs, against Rs 28 lakhs. The company has been recognised as an 'export house' for chemicals since March. Additions and replacement of plant, machinery, and buildings in the textile division, cost the company about Rs 67 lakhs, and those in the chemicals division Rs 202 lakhs.

To CAP drink a toast for quality that's the most

CAP offers you a host of chemicals to boost your product quality.

There's a Cap chemical to give your product greater sales appeal...Select from a wide range of terpene-based chemicals manufactured with modern technology...Consistent quality and prompt deliveries assured...Modern technical services and research laboratory to solve your technical problems. CAP CHEMICALS SERVE A VARIETY OF INDUSTRIES: Paints & Varnishes • Pharmaceuticals • Printing Inks Textiles • Perfumery • Soaps • Cosmetics Rubber Goods • Leather Tanning • Boot Polish Insecticides.

Bio-Gas Plants: Prospects, Problems and Tasks

C R Prasad

K Krishna Prasad

A K N Reddy

The initial part of this paper contains a detailed study of whether bio-gas plants will fulfil the demand for a decentralised energy and fertiliser production, particularly in the large number of small villages which, on economic grounds, are going to be by-passed in the rural electrification programmes.

Considering a village of 500 persons, 250 cattle and 100 houses, it is shown that, despite a 75 per cent dung collection efficiency, a low bio-gas yield of 3 cft per lb dry dung will provide a total energy of about 667.5 KWH per day at a generating cost of about 5 paise per KWH. This energy output is over 30 per cent more than the 500 KWH per day now consumed by such villages from both commercial and non-commercial energy sources. Further the bio-gas energy output is sufficient for 10 pumpsets (200 KWH per day), 5 industries (50 KWH per day), one light in every house (67.5 KWH per day), energy for cooking in every house (200 KWH per day), and 150 KWH per day for miscellaneous purposes. In contrast, rural electrification programmes are only targeting for about 100 KWH per day thus compelling the continued use of non-commercial fuels, and as a consequence, the continued loss of fertiliser and forest through the burning of dung and firewood. The items for a cost-benefit comparison of bio-gas energy production vs rural electrification are tabulated, and appear to favour the former.

In addition, the bio-gas plants will produce about 295 tonnes per year of organic manure, corresponding to about 4.4 tonnes of nitrogen per year from which the minimum additional yield of foodgrains may be expected to be about 22 tonnes. This fertiliser output is more than the village's requirements on the basis of current average consumptions of nitrogen per hectare. Further, fertiliser production from bio-gas plants appears to have several advantages over production from large-scale coal-based plants from the point of view of the saving of capital and the generation of employment.

Despite these obvious benefits which are likely to accrue from currently available bio-gas plants, it is stressed that drastic reductions in plant cost must be achieved to prevent the Government plans from being woefully inadequate for exploiting the full potential of bio-gas production of energy and fertiliser.

The concept of solar energy plantations to grow plant matter for fermentation in bio-gas plants is described; and calculations are presented to show that one acre of a water hyacinth plantation can produce in a bio-gas plant about 165 KWH per day in addition to 1.23 tonnes per year of nitrogen in fertiliser and 0.37 tonne per year of edible protein.

The following crucial socio-economic problem will be generated by the installation of bio-gas plants in a village: if the programme is not intended to serve the rural rich only, then the energy demands of villagers who do not own cattle must be satisfied, failing which they will continue burning dung cakes and firewood. The solution to this problem will determine the success of the bio-gas programme from the village and national point of view.

The concluding part of the paper contains a listing of a number of major R and D problems. The range and character of these problems require that they be tackled by major institutions.

(1) Introduction

BIO-GAS plants operate on the principle that the anaerobic fermentation (i e, fermentation in the absence of air) of cellulose-containing organic materials leads to the production of the combustible gas methane. The main emphasis in India has been on the use of 'gobar' (cow-dung) as the fermentable material; hence, the popular name: gobar-gas plants.

Such plants consist of two main parts: a digester (or fermentation tank) with an inlet into which the fermentable mixture is introduced in the form of a liquid slurry, and a gas-holder to collect the gas (50-80 per cent methane, CH_4, and the balance mostly carbon dioxide, CO_2). In the design which is now widespread, the gas collector floats like a bell on the fermentation mix and serves, not only to collect gas, but also to cut off air to the digester (Figure 1). In addition, the gas-holder is provided with a gas outlet, and the digester with an overflow pipe to lead out the sludge which is what the spent slurry is often called. Since the sludge retains all the nitrogen, phosphorus and potassium of the organic material, it can be used as fertiliser.

The case made out for bio-gas plants by organisations such as the Khadi and Village Industries Commission has invariably been presented in macro-terms by calculating the possible benefits on a nationwide scale. For instance, these organisations have often argued* on the lines that the fermentation of 75 per cent of the dung collected from the country's 226 million cattle (1961 Livestock Census) will yield about 195 million MWH of energy per year[1] (which is equivalent to about 24 billion litres of kerosene[2]) and at the same time lead to the production of 236 million tonnes manure.[3] The nitrogen content of this manure will be about 3.5 million tonnes[4] which is more than the nitrogen fertiliser capacity established in the country thus

* See Appendix 1 for the norms used in calculations, and the Notes for calculations.

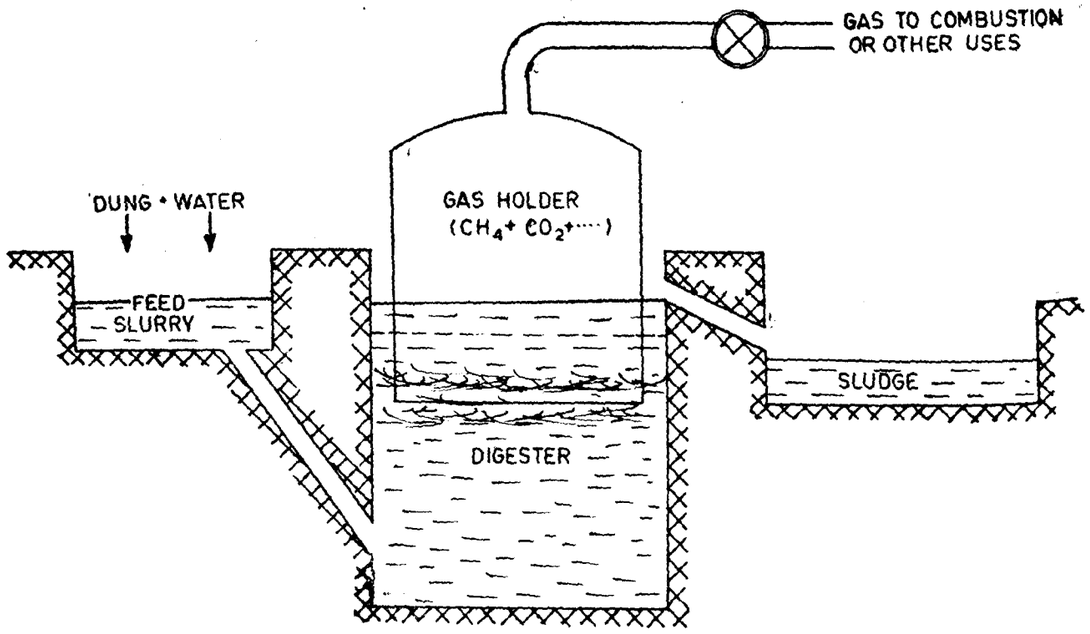

FIG.1. SCHEMATIC OF A GOBAR GAS PLANT, USED FOR OBTAINING METHANE FROM DUNG BY ANAEROBIC FERMENTATION.

far. The naphtha required to achieve this nitrogen content would be about 1.7 million tonnes.[5] Thus, it is envisaged that the large-scale utilisation of dung in bio-gas plants will lead simultaneously to the production of gaseous fuel and organic manure with a corresponding reduction in the country's dependence on electricity/kerosene for energy and on naphtha for fertiliser.

(2) The New Perspective

Though bio-gas plants have been known for several decades their prominence in public discussions of the energy and fertiliser situation is a recent phenomenon. There are several reasons for the growing interest in these plants. Foremost among these is the recent oil crisis which has compelled a desperate search for alternative sources of energy. But, even before the Arab-Israel war of 1973, the acute power shortage commencing in late 1972 had exposed the weakness of Indian energy planning, an essential aspect of which was the dependence on hydroelectric and thermal power to the extent of 8.2 per cent and 33.8 per cent, respectively.[6] The inherent weakness of this approach is that hydroelectric power is at the mercy of monsoons, and thermal power is sustained by the movement of coal for which task the railway transport system is already proving inadequate. It is in seeking an escape from these sensitive dependences that decentralised energy production becomes an attractive, *nay* unavoidable, proposition.

Decentralisation becomes even more attractive when one reckons with the severe electricity transmission losses[6] (the national average is 18 per cent, but the losses are as high as 35 per cent in Tamil Nadu), and extremely low load factors (1 to 14 per cent). These factors which lead to the unfavourable economics of electricity distribution to backward and remote areas, have been largely responsible for the poor progress of rural electrification.[7] It can be seen from Table 1 that only 11 per cent of the villages with a population of *under* 500 have been electrified, despite the fact that about 60 per cent of India's 5,67,000 villages have an under-500 population.

In other words, even the plans do not envisage power for about 2,80,000 villages with a total population of 141 million people (25 per cent of the country's population). And yet energy is an essential requisite for the progress of these villages, and this rural progress has to be the foundation of the country's development.

The energy crisis is only one dimension of the oil crisis; the other dimension involves fertilisers. In 1972-73, the total fertiliser consumption[8] was about 3 million tonnes (2 million tonnes nitrogen). Of this, 40 per cent came by way of imports costing Rs 135 crores[8] at that time. The rapidly escalating price of fertilisers and of the naphtha feedstock for fertiliser plants has made it vital to develop alternative sources of fertilisers. Coal-based fertiliser production, a hitherto much neglected programme, is now being assigned the highest priority. The first plants at Talcher and Ramagundam are expected[9] to be commissioned only in 1976. The implementation of the coal-based fertiliser programme is, therefore, sure to be associated with a lead time of several years at least. Even if successful, it must be remembered that, since coal is available in only a few parts of the country, the transport of coal feedstock or fertiliser output will generate an additional demand by railway engines for either oil or coal resources. Further, a major demand for coal has come up from three independent sources — thermal power plants, rail transport and fertiliser production; and it is to be seen whether the coal industry can meet all these require-

Table 1: Progress of Rural Electrification

Population Range	No of Villages	Electrified	Per Cent
Up to 499	349,995	39,924	11
500-999	118,602	32,378	27
1,000-1,999	65,101	27,775	42
2,000-4,999	26,400	18,179	69
5,000-9,999	3,404	2,739	80
10,000 and above	774	710	92
Total	564,216	121,705	22

ments. From these points of view, the dispersal of fertiliser production down to the level of villages/taluks becomes the obvious strategy.

This then is the perspective in which one must determine whether bio-gas plants will meet the energy and fertiliser demands of villages.

(3) Bio-Gas Potential of Small Villages

To discuss the bio-gas potential of small villages, it is necessary to have exact information on the human and cattle population, the daily yield of night-soil and dung, the efficiency of collection of these two inputs, the availability of water, the gas yield per unit weight of dung and night-soil, the availability of other fermentable cellulosic wastes, etc. The following general formula can be proposed.

$$P = N_A \; x_D \; Y_D + N_P \; x_{NS} \; Y_{NS} + \sum_i W_i \; Y_i$$

where P is the daily production of bio-gas possible in the village, N_A and N_P, the cattle and human population, x_D, and x_{NS}, the average daily collected yield of dung per animal and night-soil per person, Y_D and Y_{NS}, the gas yield per unit weight of dung and night-soil, W_i the total daily available weight of fermentable cellulosic waste of the type i, and Y_i, the corresponding gas yield per unit weight of this cellulosic waste i.

The various parameters in the above equation may vary drastically from state to state and from region to region. For example, whereas the all-India average for the persons to cattle ratio, N_P/N_A, is about 2, this ratio is as high as about 20 in Kerala. Similarly, x_D, the daily yield of dung per animal depends on the average size of cattle, which differs from one part of the country to another. Finally, the availability, W_i, of fermentable cellulosic matter of various types would be quite different in different areas.

Though this fine structure of the problem is vital for decision-making regarding the economics and design of bio-gas plant(s) in a particular village or region, the approach in this paper is to treat a model situation in order to estimate the possible benefits to villages that adopt bio-gas plants.

Consider a village of 500 persons with 100 houses and 250 cattle.[10]

Assuming the national average value of 1.16 tonnes of dry dung per year (i e, 3.2 kg or 7 lbs dry dung per animal per day) arrived at in the detailed study by the National Council of Applied Economic Research, the cattle in the village can be expected to yield 795 kg (1,750 lbs) of dry dung per day.[11] It is reasonable to assume that only 75 per cent of this dung will be collected; hence, the village would have only 597 kg (1,313 lbs) of dry dung available for use in its bio-gas generators.

The yield of bio-gas from the fermentation of dung is known to depend upon the ambient temperature. Lower temperatures result in lower gas yields. A reasonable figure, corresponding to winter (15°C) yields, is cft* of gobar gas per lb of dry dung; this doubles to 6 cft/lb dry dung at 27°C.[12] On the basis of the lower figure of 3 cft/lb (which is used throughout this paper), the village can generate about 3,950 cft of gobar gas per day from cattle dung.

In addition, if the village has latrines connected to gas plants, a further 500 cft of bio-gas will be generated on the basis of 1 cft bio-gas per person per day.

The total daily production of bio-gas in the village can therefore be reckoned at about 4,450 cft bio-gas. This figure excludes the proven possibility of fermenting a number of cellulosic waste materials in bio-gas plants. These materials include poultry wastes (e g, chicken manure), piggery wastes, slaughter-house and cannery wastes, bagasse, etc.

* The metric system is not adhered to consistently because many of the magnitudes are simpler in British units. The conversion factors are 35.31 cft=1 cubic metre and 2.2 lbs=1 kg.

(4) Total Energy Requirements of a Small Village

The total daily production of bio-gas in a village (of population 500) must now be seen in relation to its energy requirements. But, what are these requirements?

Estimate I[7] which is based on data collected from typical villages with a population of less than 500 shows that the actual daily energy consumption is of the order of 500 KWH which is equivalent to 3,333 cft of bio-gas. This consumption is distributed as follows: 200 KWH for cooking; 200 KWH for energising 10 pumpsets of 5 HP working for 5 hours per day, and 1,000 KWH for lighting, entertainment, etc. At present, the villagers obtain this energy by burning cow-dung, firewood, coal or kerosene, and by running pumpsets with diesel or petrol or electricity.

Estimate II of the total energy requirement of the village is based on an analytical approach. The daily per capita requirements for cooking have been estimated by the Khadi and Village Industries Commission (KVIC) to be 12 cft bio-gas per head per day;[13] hence, 500 persons will require 6,000 cft/day (900 KWH/day). For lighting, the 100 houses may be expected to consume 450 cft/day of bio-gas (67.5 KWH/day) on the basis of one lamp per house and of 4.5 cft bio-gas per day for a 100 candle-power lamp.[13] In addition, if one assumes, as the rural electrification authorities do, 75 KWH/day for 10 pumpsets and 20 KWH/day for 2 industries, one gets a total of about 1,065 KWH/day (i e, 7,100 cft/day).

A comparison shows that Estimate II is double the empirical value I mainly because the former takes into account 4.5 times more energy for cooking. (Are the KVIC figures for cooking based on urban eating patterns?)

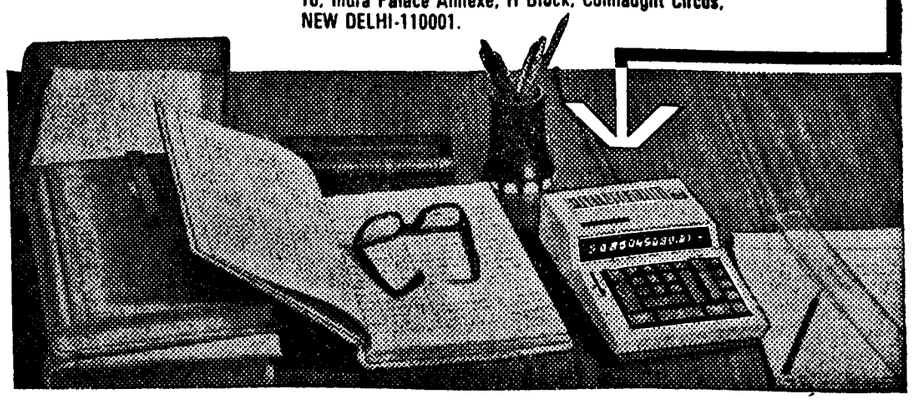
In deciding which estimate to adopt, the following considerations are relevant. The consumption of non-commerical energy (dung-cakes, firewood and wood wastes) in India is about 212.8 million tonnes of coal equivalent per year.[6] The average efficiency with which these fuels are burnt in a village "chula" is about 11 per cent. Assuming that all this non-commercial energy is used in the rural sector with approximately 80 per cent of the country's population, the per capita daily consumption of energy comes out to be 1.145 KWH.[14] Thus, for a village population of 500, an energy of 573 KWH/day is required. This figure is quite close to the 500 KWH/day of Estimate I which will therefore be con-

The SHREESHYLA 450 is a great assistant if you're a financier*

*Also if you're an accountant, sharebroker, banker, estate agent, executive or treasurer.

The Shreeshyla 450 is, first and foremost, a business calculator. With just 24 keys and a decimal place selector, here's what you can do :

- Simple and compound interest calculations.
- Mortgage repayment instalments.
- Foreign exchange/rupee conversions.
- Complex wage calculations with full particulars of E.S.I.S., P.F. and other deductions.
- Composition ratio and percentage with automatic constant.
- Preparation of final accounts and balance sheets.
- Cost calculations.
- True balance in a ledger with two accumulations.
- Invoice preparation.
- Calculation of progressive depreciation for final accounts.



And it takes much less operating time than any other calculator on the market.

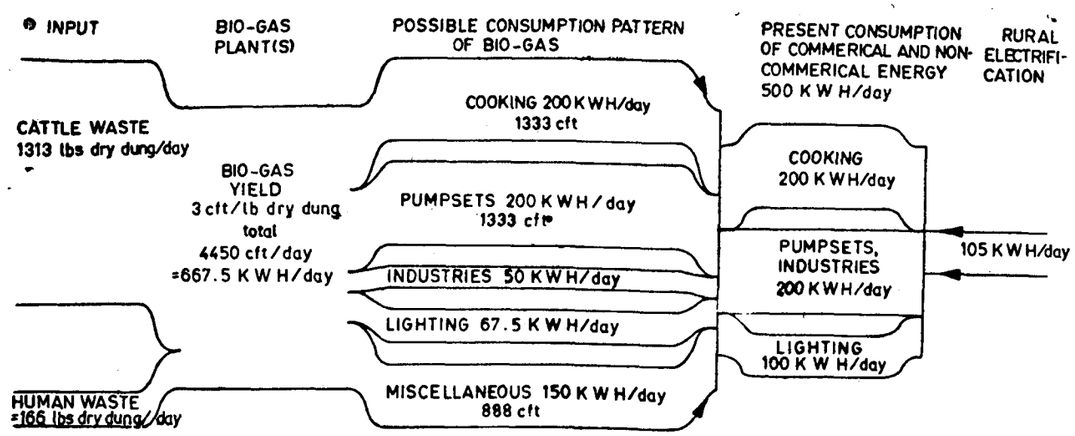

FIG. 2. PRESENT CONSUMPTION OF COMMERICAL AND NON-COMMERICAL ENERGY (500 K W H/day) IN A VILLAGE (POP=500) IN RELATION TO BIO-GAS ENERGY OUTPUT (667.5 K W H/day) AND RURAL ELECTRIFICATION SUPPLY (105 K W H/day).

sidered to represent the present energy demand of a village with a population of 500. Estimate II (1,065 KWHday) will be taken to represent enhanced energy demands of the future to be met by improved energy production systems in the village.

(5) Bio-Gas Plants vs Rural Electrification

The impossibility of meeting even the present energy requirements of 500 KWH/day has led the rural electrification authorities to lower their energy targets and aim only for about 105 KWH/day,[15] i e, about one-fifth the actual consumption. This 105 KWH/day is made up of 75 KWH/day for 10 pumpsets, 20 KWH/day for 2 industries, and about 10 KWH/day for lighting. The provision for lighting is quite elitist: 3 commercial lights, 1 street light and domestic lights in only 15 out of the 100 houses. Even to provide this negligible energy, the rural electrification authorities stipulate that the cost of laying the transmission line must not be more than about Rs 1,000/HP. In practice, this restriction means that the village must not be more than a few miles from a main transmission line, because the extension to the HT line costs about Rs 7,500/km.

Several consequences follow from such an approach.

Firstly, by not providing any energy of cooking, the village is compelled to continue with the practice of burning dung-cakes, firewood and waste for 40 per cent of its energy requirements. Since 45 per cent of the domestic fuel requirements in villages have been estimated to come from burning animal dung, the dung equivalent of this 0.45 x 200 KWH/day = 90 KWH/day is 200 lbs of dry dung per day,[16] which corresponds to 240 lbs (= 109 kg) organic manure per day,[17] with a nitrogen content of about 1.64 kg/day[17] or about 600 kg N/year. Thus, the needless burning of dung in the absence of an alternative source of cooking energy leads to a loss of 600 kg of N per year which could yield the village about 3 tonnes of additional foodgrains per year.[18]

Similarly, it can be shown that in order to obtain the remaining 55 per cent of the 200 KWH/day required for cooking, firewood must be burned at a rate of about 0.4 acres of forest per year[19] — a significant contribution to the deforestation problem.

Finally, the loss of the fertiliser value of the burnt dung must be made up by bringing fertiliser into the village. This fertiliser may add to the foreign exchange bill of the country by way of fuel for transportation as well as by way of imported naphtha.

In contrast, the total village production of 4,450 cft of bio-gas corresponds to 667.5 KWH/day[20] or 244 MWH/year. This energy is sufficient for 10 pumpsets at 20 KWH/day/pumpset, 5 industries at 10 KWH/day/industry, one light in each of the 100 houses at 0.675 KWH/day/house, energy for cooking in every house at 2 KWH/day/house leaving a balance of 150 KWH/day for street lighting, etc, (Figure 2). In other words, bio-gas energy will meet 1.335 times the present demand of 500 KWH/day, and 62.5 per cent of the future demand of 1,065 KWH/day, assuming a reasonable gas yield of 3 cft gas/lb dry dung.

If, however, the gas yield can be stepped up to 4.80 cft/lb of dry dung, the entire enhanced future demand of 1,065 KWH/day can be supplied by the dung (1,313 lbs) and nightsoil (500 cft/day) in the village (Figure 3). (How such increases can be brought about is discussed in section 11.)

Thus, a preliminary consideration of the items which should be considered in the costs and benefits of bio-gas plants vs rural electrification (Table 2) seems to favour the former even when both are possible. In fact, however, it has been stressed that rural electrification is not going to reach 89 per cent of the villages with a population under 500. These villages, therefore, have no choice except to adopt bio-gas plants.

It is relevant at this stage to consider the costs of energy from bio-gas plants. Some calculations (cf Appendix II) indicate that the generating costs are in the neighbourhood of approximately 5 to 8 paise/KWH. This price is competitive with the Electricity Board's generating cost of 4 paise/KWH of electricity which is sold to rural areas at prices which range in Karnataka from about 11 paise/KWH for agricultural purposes to about 30 paise//KWH for domestic consumption.

(6) Fertiliser Production from Bio-Gas Plants

It is well known that bio-gas generators yield organic manure (1.5-2.0 per cent nitrogen) in addition to bio-gas. The quantity and quality of this manure is said to improve if ani-

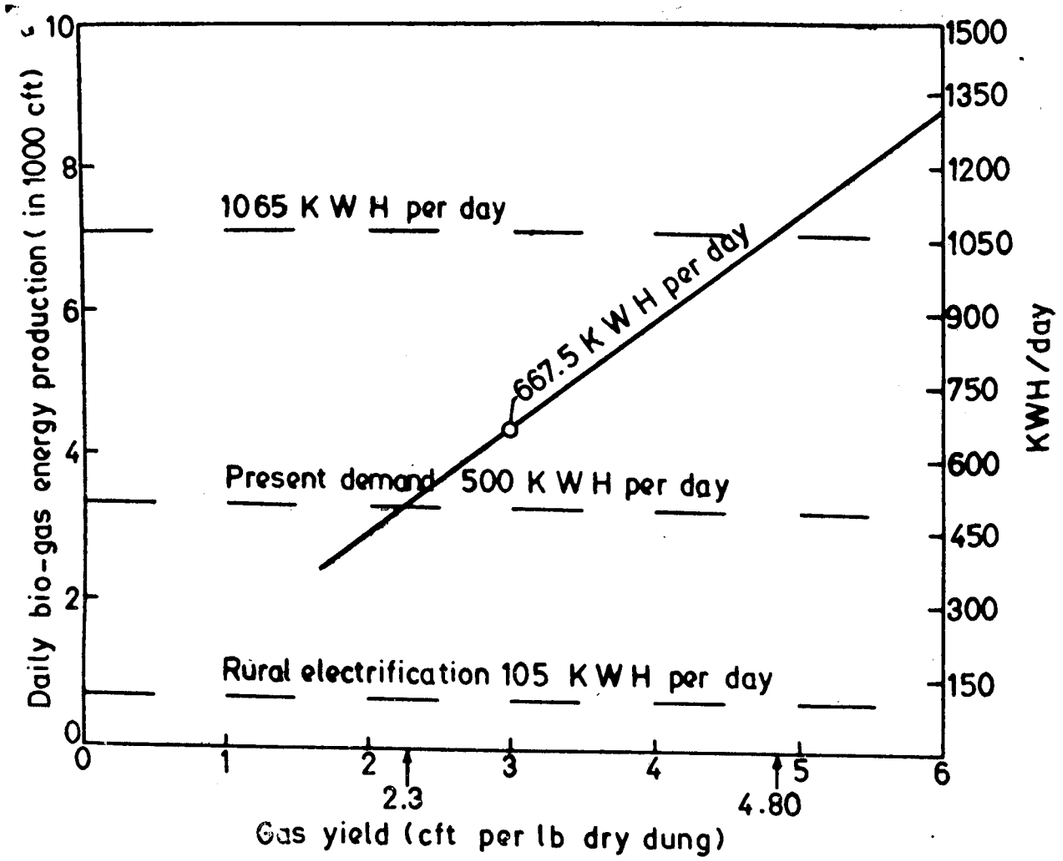

FIG. 3. DAILY ENERGY PRODUCTION IN A VILLAGE (POP. 500) AS A FUNCTION OF THE GAS YIELD AT A GAS YIELD OF 3 CFT/LB, THE ENERGY PRODUCTION IS MUCH IN EXCESS OF THE PRESENT DAILY DEMAND.

mal and human urine is fed to the bio-gas generators along with dung and nightsoil. On the basis of either a manure to dry dung weight ratio of 1.2:1 or a manure to gas ratio of 0.4 lbs manure/cft of gas, the village production of organic manure will be about 0.8 tonnes per day[21] with a nitrogen content of about 12 kg/day,[22] i e, about 295 tonnes of organic manure per year with a nitrogen content of about 4.4 tonnes per year. The retail price of this nitrogen is about Rs 19,140 per year at the June 1974 price of about Rs 4,350/tonne nitrogen. At present levels of consumption in India, *viz*, 12 kg N/hectare, the nitrogen output of the bio-gas plant can be used to service about 370 hectares which is about 27 per cent more than the average cropped land areas of 290 hectares/village.[23] Hence, bio-gas generators should easily be able to supply to the village its fertiliser requirements at present levels of consumption.

Assuming a low productivity of 5 tonnes of foodgrains per tonne of nitrogen, it follows that the fertiliser generated by the bio-gas plants will lead to an additional production of 22 tonnes of foodgrains per year for the village,[24] i e, 44 kg per year per capita.

This benefit is distinct from the other important benefit which will be derived from the saving in naphtha required to produce the fertiliser. This saving occurs to the extent of about 2 tonnes of naphtha per village per year[25] (calculated on the basis of a 2.1:1 ratio of nitrogen to naphtha).

If the manure-forming sludge is composted with refuse, etc, there is an approximate doubling of the yield; hence, the village production of compost can be about 1.62 tonnes/day with a nitrogen content of about 24 kg/day, i e, 590 tonnes compost/year with an annual nitrogen yield of about 8.8 tonnes/year.

An assessment of bio-gas generators viewed as village-scale fertiliser plants can be made by comparing them (Table 3) with large-scale coal-based fertiliser plants of the type now being planned.

The indicative figures given in Table

TABLE 2: BIO-GAS ENERGY PRODUCTION VS RURAL ELECTRIFICATION

Bio-Gas Energy

Costs	Rs	Benefits	Rs
(1) 5,000 cft/day Bio-gas plant	41,000	(1) 667.5 KWH/day: Cooking (200 KWH/day) and lighting (67.5 KWH/day) for 100 houses (free)	nil
(2) Distribution system for bio-gas energy (pipe lines, or generator and LT lines, or compressor and containers)	(4,350 pa) nq*	10 pumpsets at 200 KWH/day (12 paise/KWH)	8,760 pa

	8,486 pa		5,255 pa

* nq = not quantified

3 suggest that the adoption of bio-gas plants to produce fertiliser (a) results in the dispersal of production units to villages, (b) saves capital, (c) saves foreign exchange, (d) generates two orders of magnitude: more employment of much less skilled workers; generates energy rather than consumes it, and (e) produces fertiliser where it is consumed and therefore removes the burden on the transport system in addition to reducing overheads on advertising/marketing. This *prima facie* case is intended mainly to stimulate detailed cost-benefit analysis of the alternatives for fertiliser production.

(7) GOVERNMENT PLANS FOR BIO-GAS PLANTS

It was perhaps an appreciation of the immense possbilities sketched above (Figure 4) that motivated the development of bio-gas plants. In this development work, a number of individuals and institutions have played a key role, but particular mention must be made of S V Desai, N V Joshi, J J Patel and C N Acharya of the Gandhi Smarak Nidhi, Shri Ramakrishna Mutt of Belur, the Planning, Research and Action Institute of Lucknow, the Khadi and Village Industries Commission, the Indian Agricultural Research Institute of Delhi, the Gobar Gas Research Station of Etawah, and the Central Public Health Engineering Research Institute of Nagpur.

Today, plants of about 20 different sizes and capacities are available, ranging from 60 cft/day (1.7 cubic metres/day) to 5,000 cft/day (142 cubic metres/day); and 8,000 plants are in operation in the country. The Agricultural Ministry now has plans to set up about 50,000 plants during the Fifth Plan Period.[26] Thus, after a long period of totally undeserved neglect, the future of bio-gas plants has, thanks to the oil crisis, become rosy.

Three comments however must be made on the government plans. Firstly, it appears, from the approximately Rs 7.5 crore outlay, that the government plans are for the smallest size of plants, i e, the 60 cft/day variety. Even with 50,000 such plants, only 0.08 per cent of the possible bio-gas energy and fertiliser output will be realised,[27] i e, the energy and fertiliser potentialities are being scarcely touched. Secondly, less than 5 per cent of cattle-owners have three to five animals necessary to run the smallest size KVIC gobar-gas plants, and therefore the government plans will benefit only a very small section of agriculturists. Finally, the assumption underlying the plans is that little further development work is required on the plants which have been deemed ready for mass production. It is in this context that one must emphasise some of the problems associated with these plants and indicate some possible lines of development.

(8) COST OF BIO-GAS PLANTS

According to a recent report on the Union Agriculture Ministry's plans, a 60 cft/day plant has been reported as costing Rs 1,500, and a 5,000 cft/day plant, Rs 41,000.[28] The KVIC is an undated pamphlet,[13] "Gobar Gas — Why and How", mentions a 106 cft/day (3 cubic metres/day) plant as costing about Rs 2,500, but the Fertiliser Commissioner furnished[29] on February 12, 1974, the figure of Rs 3,000 for the same plant. These differences can be understood by going into an analysis of the cost of bio-gas plants.

A 64 cft/day plant commissioned in December 1972, cost[30] Rs 1,500 with the following break-up: steel gas-holder, Rs 500; masonry and civil work, Rs 500; pipelines and connections, Rs 300; stoves and lamp, Rs 200. Hence, two-thirds of the total

DREAM OF HANDICAPPED - COMES TRUE IN TAMIL NADU

A young but blind dilly-dallying begs for a few coins;

He takes alms because he is devoid of vision — he sees new rays of hope now and sings:

"I'M HIGH IN THE SKY,
FLYING OVER FIELDS OF RYE
FROM UP HERE I CAN SEE
BOTH THE LAND AND SEA"

This is no soliloquy. The blind, deaf-mute and orthopaedically handicapped now see the day of salvation dawned on June 3, this year. The "Physically handicapped Rehabilitation Project" commenced on this day. Nearly 25,000 will receive training, employment in suitable jobs, this year.

Human compassion, charity, social responsibility and above all love for fellowmen invite you all to join this noble mission for social uplift and amalgamation.

ISSUED BY:

DIRECTOR OF INFORMATION AND PUBLIC RELATIONS
GOVERNMENT OF TAMIL NADU.

DIPR No: 30163.

TABLE 3: LARGE-SCALE COAL-BASED VS BIO-GAS FERTILISER PLANTS

	Large-Scale Coal-Based Fertiliser Plant	Bio-Gas Fertiliser Plant
Annual production/unit	500,000 tonnes urea	590 tonnes compost
Annual nitrogen production	230,000 tonnes	8.8 tonnes
Capital cost/unit	Rs 120 crores	Rs 41,000
Foreign exchange component	about Rs 50 crores	nil
Employment/unit	1,000	5
Sales @ Rs 4,350/tonne N	about Rs 100 crores	Rs 38,280
Capital/turnover ratio	1.20	1.07
To produce 230,000 tonnes N		
(a) Number of units	1	26,150
(b) Capital cost	Rs 120 crores	Rs 107 crores
(a) FE	about Rs 50 crores	nil
(d) Employment	1,000	1,30,750
(e) Energy	about 35 MW consumption	6,350,000 MWH generation

expenditure went towards the masonry fermentation tank and the steel gas-holder. The KVIC estimates for the gas holder, digester and pipelines/appliances are 35 per cent, 55 per cent and 10 per cent. It may also be noted[31] that about 50 per cent of the cost of a 4 cubic metres/day plant is the cost of raw materials; and of these raw materials, the 0.4 tonnes of steel and the 1.0 tonne of cement account for about 78 per cent. In short, steel and cement account for about 40 per cent of the total cost of a bio-gas plant,[31] and it is the price escalations of these raw materials which account for the varying cost figures.

Several conclusions follow from the above discussion.

(1) The initial outlay on even the smallest bio-gas plants is well beyond all except the affluent farmers. Of course, schemes are available for subsidy and interest-free loans, but these do not eliminate the vital necessity of drastic cost reductions to avoid unnecessary investments and a highly skewed distribution of the benefits of bio-gas plants.

(2) Attempts to cut down the cost of bio-gas plants must be directed towards the reduction, if not elimination, of the use of cement and steel.

(3) Apart from the cost of cement and steel, the quantity of these materials which are required is also a pertinent matter. About 10,000 tonnes of steel and 25,000 tonnes of cement are required[32] for the Agriculture Ministry's Rs 7.5 crore-plan for 50,000 of the smallest size (60 cft/day) plants. Since the country is passing through days of scarcity of steel and cement, these requirements can well prove a major obstacle to government plans for the installation of gobar-gas plants.[32] If, however, these requirements are negligible in comparison with the country's steel and cement production, this is only because the government plans are woefully inadequate, as stressed in Section 7. If the government had planned to instal 50,000 plants each of 5,000 cft/day capacity, then the total cost would have been about Rs 200 crores, and the raw material requirements would have been 0.41 million tonnes of steel at 8.2 tonnes/plant and 1 million tonnes of cement at 20 tonnes/plant.[33] Though such a programme would have largely solved the energy and fertiliser requirements of 50,000 villages at a cost which is only 43.5 per cent of the 1972 oil import bill,[34] it is clear that the demand for about 7 per cent of the country's production of steel and cement is rather high.[35]

Taking all these conclusions into consideration, one can think of various strategies for reduction in the cost of bio-gas plants and in the requirements of steel and cement. These strategies can be classified into various categories depending on whether they are based on :

(1) maintaining the present design of bio-gas plants as well as the raw materials used;

(2) maintaining the present design, but developing alternatives to cement and steel; and

(3) changing the design of the plants.

(9) REDUCTION OF PLANT SIZE AND COST

Little detailed information is available on the design calculations for the KVIC and IARI plants. According to an IARI paper,[12] the capacity of the digester has been chosen to hold about 50-60 days input of wet dung and water which must be added in a 1 : 1 or 4 : 5 ratio. Such a design implies, in our opinion, that the volume, V, of the digester should be given a formula of the form:[36]

$$V = \frac{CR(1+D)\ t}{Y\ d}\ F$$

where C is the desired capacity of the plant in cft of bio-gas per day, R is the wet dung/dry dung ratio (usually R = 5), D is the weight of water added to unit weight of wet dung, t_F is the fermentation time in days, Y the gas yield per unit weight of dry dung and d is the density of the dung-water mixture.

Inserting the following values; C = 100 cft/day plant, D = 1.25, t_F = 30 days (the fermentation time according to IARI),[12] Y = 3 cft/lb dry dung, d = 62.4 x 1.1 lbs/cft, the digester volume should be about 165 cft. As against this, the KVIC and IARI have proposed digester volumes of about 240 cft,[37] and 225 cft,[37] respectively. Whether these plants can be concluded to be over-sized (to the extent of about 45 per cent and 36 per cent, respectively) depends on whether conservative figures have been used in arriving at 165 cft. In fact, a yield of 3 cft/lb dry dung is a figure for winter temperatures in North India, and therefore, a 165 cft digester seems quite 'safe' for South and Central India, and for the bulk of the year in North India. At worst, if the yield drops below 3 cft/lb dry dung, the 165 cft design would correspond to a plant load factor of less than 100 per cent.

The design prospects are actually more promising, for the following reason. The digester volume, V, is proportional to (t_F /Y), and an increase in the fermentation temperatures, within a certain range, reduces the fermentation time, t_F, and increases the gas yield, Y. For instance, the Institute of Gas Technology, Chicago, has reported[38] that a residence time of 7-15 days is observed when the process is conducted near-neutral pH at about 35°C; and that, in the 52-60°C region, thermophilic micro-organisms predominate and the fermentation proceeds at a higher rate. Further, IARI have stated[12] that the gas yield doubles from 3 cft/lb dry dung to 6 cft/lb dry dung when the ambient temperature increases from 15°C to 27°C. If therefore one considers t = 12 days and Y = 6 cft/lb dry dung as a realisable fermentation time and gas yield respectively, one can achieve a digester volume of 35 cft for a 100 cft/day plant. In other words, it seems reasonable to expect that the digester volume can be cut to one-fifth the current size.

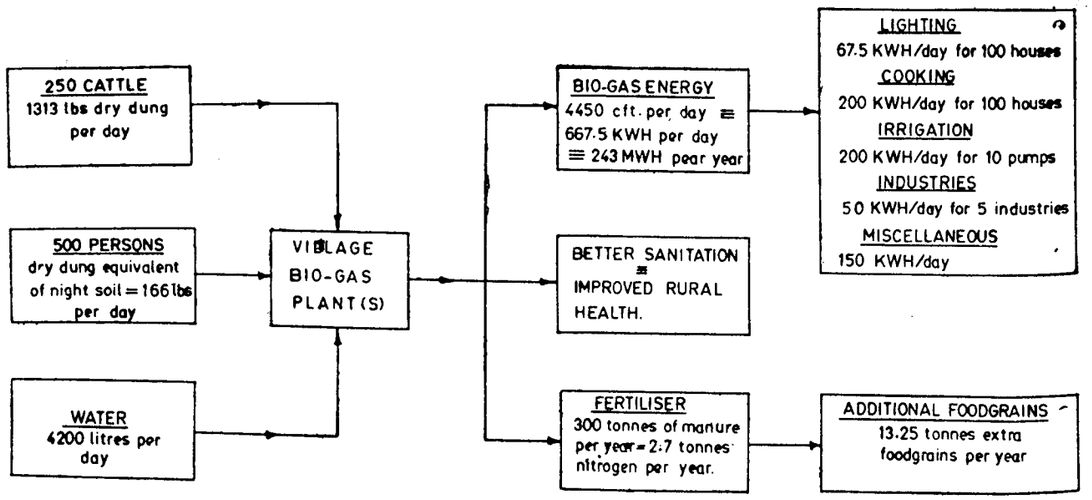

FIG. 4. BENEFITS ACCRUING TO A VILLAGE THROUGH THE ADOPTION OF BIO-GAS PLANTS. A LOW GAS YIELD OF 3 CFT. PER LB OF DRY DUNG IS ASSUMED.

Discussions on the utilisation of digester volume are best carried out in terms of the loading rate, L, which is given by the following expressions :

$$L = \frac{d}{R\,(1+D)\,t_F} = \frac{C}{YV}$$

The 165, KVIC 240, IARI 225 and proposed 35 cft digesters correspond to loading rates of 0.202, 0.139, 0.148 and 0.476 lbs dry dung/day/cft of digester volume. The aim should be to achieve high loading rates around 0.5 lbs dry dung/day/cft digester capacity.[39]

In order, however, to achieve such drastic reductions in digester size, and therefore increases in loading rates, it is essential to collect basic data on :

(1) the fermentation rate as a function of temperature, pH, viscosity and agitation;
(2) the gas yield and composition as a function of various factors including temperature, pH, viscosity, and agitation;
(3) the choice and management of micro-organisms for optimal methane production.[40]

A scrutiny of the IARI and KVIC literature on gobar-gas plants shows that such basic design data have yet to be collected and that the plants have been 'put together', rather than 'designed' for optimum conditions. The attainment or maintenance of optimum conditions would imply very much smaller fermenters, and therefore major reductions in the area of the masonry wall of the digester. Drastic savings in cement can therefore be realised.

If current designs and materials are adhered to, then the only way to reduce the quantity of steel for the gas holder is to take into account, as electricity authorities do, the actual time patterns of energy and power consumption. One can plan for a maximum demand of bio-gas assuming, for example, a pattern of gas demand as in Table 4 according to which both pumping and cooking are done in two one-hour periods : pumping between 6.30 am and 7.30 am and between 12 noon and 1 pm, and cooking between 8 am and 9 am and between 5 pm and 6 pm. On the basis of this pattern of gas demand, Table 4 shows that the gas holder need not be large enough to stock a whole day's gas supply; in fact, at no time of the day need there be a stock of more than 1,600 cft (i e, less than 40 per cent of the day's 4,450 cft of gas production). In short, the analogies with electricity generation and distribution can be used to minimise the cost and installed capacity of bio-gas plants on the basis of detailed studies of the energy demands of consumers.

(10) Alternative to Cement and Steel

A totally different approach to the reduction of the cost of plants based on the present design is to develop alternatives to cement and steel.

As far as cement is concerned, there seems little doubt that carefully constructed earth-work digesters can serve the purpose. It may be necessary, however, to use a suitable lining of perhaps creosote or PVC. Experience in the USA has shown that the costs of special linings can be greatly decreased or eliminated.[41]

Immediate attention must also be directed towards replacement of the mild steel holder, not only in view of its cost, but also because its fabrication requires skills not normally found in a village. In addition, its corrosion has been stated to be a problem, though no statistics are available on this point. Many materials, have been suggested[42] as candidates for the gas holder : ferro-cement, treated wood or plywood, plastic, glass/jute fibre-reinforced plastic, polythene with a bamboo-basket reinforcement, discarded oil drums, stoneware (fireclay); but only extensive technical trials and economic analysis can help in the choice of a material to replace mild steel.

(11) New Designs of Bio-Gas Plants

The gas holder and digester are coupled into one unit in bio-gas plant designs currently adopted in India. As a consequence, the necessarily large

TABLE 4: A SCHEMATIC PATTERN OF BIO-GAS DEMAND IN A VILLAGE

(cft gas)

Period	Production	Consumption	Gas in Holder
9.30 pm- 4.00 am	1,205	—	1,205
4.00 am- 6.30 am	464	100(L)	1,569
6.30 am- 7.30 am	185	667(P)	1,087
7.30 am- 8.00 am	93	—	1,180
8.00 am- 9.00 am	185	667(C)	698
9.00 am-10.00 am	185	—	883
10.00 am-12.00 pm	371	132(I)	1,122
12.00 pm- 1.00 pm	185	667(P)	640
1.00 pm- 2.00 pm	185	—	825
2.00 pm- 5.00 pm	556	200(I) +400(M)	781
5.00 pm- 6.00 pm	187	667(C)	301
6.00 pm- 9.00 pm	556	300(L) +500(M)	57
9.00 pm- 9.30 pm	93	50(L) +100(M)	0

L = Lighting; P = Pumping; C = Cooking; I = Industries; M = Miscellaneous.

diameter of the gas holder may needlessly increase the diameter of the digester since the former has to provide the air-seal for the latter. The probability of this situation will increase as the digester volume is reduced by design for higher loading rates.

One can, therefore, consider the separation of the two components so that a smaller digester can feed gas through a pipe into a larger gas collector. The question then arises as to whether the cover of the digester should be fixed or floating. A floating cover offers several advantages:[39] (1) there are less problems with scum because solids are constantly submerged; (2) when fresh slurry is added, or digested sludge is withdrawn, there is no need to add an equal volume of slurry, as must be done in a digester with fixed cover; (3) the danger of oxygen entering and mixing with the bio-gas to form explosive mixtures is reduced.

If a floating cover is used along with a separated gas holder design, then the gas holder can be made out of light, and even collapsible, material. Further, when the gas piped from the separated digester is collected by bubbling through a liquid, the latter can be chosen to separate out the CO_2 from the bio-gas. Thus, pure methane with 100 per cent to 25 per cent greater calorific value than bio-gas can be collected (see Section 13).

With regard to the design of the digester itself, there are two main problems with the current Indian designs : (1) the lack of adequate agitation of the fermentation mix and (2) the absence of proper temperature control. When slurry is not adequately agitated, a stratification takes place with the sludge settling under a thick layer of supernatant liquid on which floats the scum layer. The minimisation of stratification increases the gas yield, and therefore some method of mixing has to be introduced, for example, mixing by re-circulating the bio-gas,[43] by intermittently operated manual stirrers or by wind-mill-driven agitators.

When a mixing device is incorporated into the digester, it may become necessary to lead the mixture to a settling tank before the digested sludge is tapped out. The provision of such a second tank permits a re-circulation of part of the biologically active material to the primary digester. This re-circulation becomes important when the fermentation time is reduced to values comparable with the growth rate of the methanogenic bacterial population.[39]

If the fermentation temperature is left to be decided by the ambient temperature, then optimum conditions are more a matter of chance than of design. Temperature control in the digester is a necessary step in the evolution of new designs.

The suggestion has often been made of incorporating solar heating into the bio-gas generator. If this is to be done with tubes (carrying solar-heated water) introduced into the fermentation tank, then an auxiliary water pump has to be used because the conventional thermal convection of solar water-heaters will not work, the fermenter being at a lower level than the solar-energy collector. Instead, if one uses the separated digester design, the roof can be made to serve as a solar-energy absorber. The trouble here is that one will have no control on the temperature of the fermentation, and there would be diurnal as well as seasonal variations in the gas yield.

Another approach is to use a part of the bio-gas for heating the fermenter to the optimum temperature. Calculations[44] show that with a 35 cft digester for a 100 cft/day plant, only 10 cft of gas per day will keep the temperature at 27°C when the ambient temperature is 15°C, i e, only 10 per cent gas is utilised to achieve a 100 per cent increase in gas yield.

(12) Economic of Various Plant Sizes

In discussions on the use of bio-gas generators in villages, not enough attention has been paid to the comparative economics of various sizes of plants. The pioneering study of Parikh[45] on this subject needs to supplement with further studies which take into account the geographical distribution of houses in a village and on this basis the comparative costs of larger single plants involving the problem of gas distribution and of smaller plants servicing separated clusters of houses. There is a rich field here for cost-benefit analysts and village demographers, but until some answers are forthcoming on the economic sizes of plants, the technologists will not know what plant sizes to design.

In this context, it must be pointed out that there are definite economies of scale in bio-gas plants. For instance, if the energy of the bio-gas is stated in electrical terms, then the energy costs is 8.572, 8.571 and 4.954 p/KWH for 60, 100 and 5,000 cft/day bio-gas plants on an investment of Rs 1,500, Rs 2,500 and Rs 41,000, respectively (Appendix II). These figures include the cost of labour for running the plant, but exclude the proceeds from the sale of fertiliser. Thus, if a decision is made to instal one 5,000 cft/day plant for the entire village, then the capital investment is about a half what it would be for fifty 100 cft/day plants.

However, along with this saving in capital cost by going in for a village-scale, rather than family-scale, plant, one should also consider the question of the cost of distributing the bio-gas energy.

(13) Distribution and Storage of Bio-Gas Energy

One can think of three ways of distributing bio-gas energy :

(1) the bio-gas can be distributed through pipelines (GI pipe or poly-

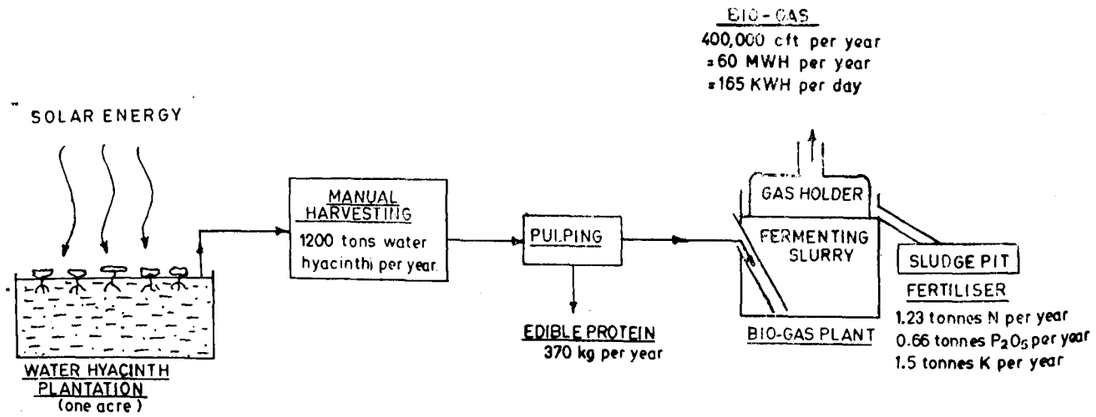

FIG. 5. SOLAR ENERGY PLANTATION-BIO-GAS PLANT

thene/alkathene tubing);

(2) the bio-gas can be used to run an internal combustion engine which drives a generator set, and the electricity thus produced can be distributed in the conventional way;

(3) the bio-gas can be stored in containers which can then be transported to the consumers.

The pipeline distribution of bio-gas over long distances (50-100 metres) requires compressors/booster pumps owing to the low pressure (about 4" water) at which the gas is generated.

The bio-gas-to-electricity method will need considerable R and D work on methane engines though it has been reported[16,17] that, with slight modifications, diesel and petrol engines can be (and have been run) on bio-gas.

The major problem in the storage of bio-gas with its 50-80 per cent methane is that the gas cannot be liquefied at ambient temperatures (the boiling point of methane is 161.5°C, the critical temperature is 82°C, and the critical pressure is 42 atmospheres) — this is the greatest disadvantage of bio-gas compared to liquefied petroleum gas (LPG). The storage of bio-gas must therefore be in the gaseous state, in which case pressures of the order of 5,000 psi[18] have been used to minimise the volume of gas for a given weight. To give an idea of the storage volumes at 5,000 psi, a container of 5.3 cft volume is required to store the bio-gas supply for a month's cooking energy for a family of five.[49]

Unfortunately, storage of bio-gas under such high pressure involves the problem of special steel cylinders which are not being manufactured in the country. To avoid the need for such special cylinders, the indigenously available cylinders used for LPG can be used, but these are designed for about 1,500 psi, which means that the gas supply for the family's cooking will only last about 10 days. If this situation is either unsatisfactory or uneconomic, there may be no alternative, where large volumes are not precluded, to the use of rubber/neoprene/polythene balloons for the storage under low pressure. If such balloons are double-walled, then the inner wall can be pumped in with a bicycle pump to compress the bio-gas to a small extent.

The storage of bio-gas is of great importance from two other points of view. Firstly, it is very likely that, within the next decade, a methane battery (fuel cell) will be developed to work at far lower temperatures than the present 700°C, Such methane batteries would enable the direct conversion of chemical to electrical energy without the efficiency limitations involved in going through the conversion *via* heat energy. Secondly, automobiles and tractors have already[50] been run on methane, and therefore one can look forward to further developments in this direction, in which case compact storage becomes an essential requirement.

There is one further aspect of the distribution and storage of bio-gas which deserves mention. This aspect is connected with the fact that bio-gas is a mixture of methane (50-80 per cent) and carbon-dioxide (CO_2); the extent of the small traces of hydrogen sulphide (H_2S) depends upon the fermentation conditions. The bio-gas mixture has an energy of 0.15-0.23 KWH/cft (500-800 BTU/cft or 126-202 kcal/cft); if, however, the carbon dioxide (and H_2S traces) are separated out and pure methane is obtained, then the energy content becomes about 0.29 KWH/cft (1,000 BTU/cft or 252 kcal/cft). For many applications, such as internal combustion engines, the purification of bio-gas, by the removal of CO_2 and H_2S is essential. The question arises as to what can be done with the CO_2 and H_2S. One suggestion consists of producing chalk by the reaction between CO_2 and lime. It is much more interesting, however, to pipe the CO_2 to green-houses to obtain very much enhanced yields of vegetables or fruits — as is being done in Israel. In the case of large bio-gas plants (4-9 million cft/day), a system for the recovery of elemental sulphur is incorporated into the raw bio-gas treatment process.[38]

(14) Water Requirements of Bio-Gas Plants

The adequacy of water supplies for bio-gas generators is another matter which has not been discussed in the publicity literature on these units. On the basis of a wet dung to dry dung ratio of 5 : 1 and a wet dung to added water ratio of 4 : 5, it turns out that 4,200 litres of water (935 gallons) are required per day for the village to run its bio-gas generators and produce 4,450 cft of bio-gas daily.[51] The *magnitude* of this water requirement has not been highlighted in descriptions of the possible benefits of bio-gas plants. If this water demand is excessive, as it surely will be in most backward villages, then attention must immediately be turned to achieving a "drier" process which requires less water for the fermentation.

Available data indicate a 40 per cent decrease of gas production when the water to dung ratio is reduced by about half,[52] but this reduction must be viewed against a possible 100 per cent increase when the fermentation temperature is increased from 15°C to 27°C. Thus, operation of bio-gas plants at higher temperature will permit lower water supply requirements. Whether this is an adequate answer to the water problem is a matter that must be scrutinised.

Otherwise, one may have to think of designs in which a settling tank permits re-cycling of a major fraction of the water/supernatant to the digester. Such re-cycling of water will reduce the volume of digested sludge to be handled for fertiliser production.

(15) Design of Latrine-Cum-Bio-Gas Plants

Though latrines have been coupled with bio-gas generators, it cannot be denied that there is great scope yet for an aesthetically architectured, efficiently-engineered latrine-gas generator units. Such units will not only contribute to the production of energy and fertiliser, they will play a major role in improving village sanitation and preventive health programmes. Many doubts have been raised regarding the social acceptability of such latrines, but the best way forward is to instal such plants and assess their acceptability, particularly amongst the underprivileged.

(16) Large-Scale Urban Sewage Plants

Another urgent need arising from the energy crisis is the development and erection of large-scale bio-gas plants for towns and cities. The pre-World War II sewage treatment plant at Bombay provided piped bio-gas for homes and was one of the first of its kind in the world. Since its installation, little progress has been made in the country.

Considering that 20 per cent of the country's population lives in towns and cities, it can be shown that about 6 million MWH of energy can be realised from urban nightsoil alone.[53] This corresponds to about 740 million litres of kerosene, i e, a per capita production of 7.75 litres of kerosene equivalent per year.[53] For instance, the sewage treatment plant installed by the Bangalore Water Supply and Sewerage Board will serve 492,000 persons and produce about 450,000 cft of bio-gas per day. This works out to a per capita production of about 1 cft/day, i e, about 0.15 KWH/day, and will meet the cooking requirements of about 7,500 families or 37,500 persons.[53] These figures are low compared to American reports,[38] according to which the bio-gas production from urban wastes in about 10-20 cft/day/person, but the discrepancy only means that the generation of refuse and garbage is a measure of 'progress'. Nevertheless, the utilisation of large-scale sewage plants to produce bio-gas is an imperative step because, in addition, these plants will produce fertiliser.

(17) Total Energy View

From a consideration of the dung production and present energy needs of a typical village, it was concluded that bio-gas plants are the answer to the energy problem. When it comes to implementation, however, one has to examine the characteristics of each particular village — the actual energy demand, the number of cattle in the village, the amount of dung which can actually be collected, the availability of water, the distribution of houses and lands, etc. Such detailed considerations may lead to the conclusion that bio-gas plants are only a partial answer to the present energy needs of the particular village. In such situations, one has to proceed with a total energy concept and take an integrated view of all possible sources of energy. Such a view will also be necessitated by the enhanced energy demands of the future.

Working on the principle that the village must be as self-sufficient as possible with regard to energy, it is obvious that the village must make claims on petroleum products and electricity only after exhausting its own resources. In other words, the fullest possible utilisation of solar and wind energy must be made.

(18) Windmills

Windmills can be directly used for pumping water; when they are used to provide motive power, their disadvantage is that the storage of wind energy in batteries is an uneconomic proposition today. A futuristic method of storing wind energy is by converting it into electricity and using this electricity to generate hydrogen by the electrolysis of water. This hydrogen can be converted into electricity in hydrogen-oxygen fuel cells. Another approach to the use of the wind-generated stored hydrogen is to lead it into the digester of a bio-gas plant. This hydrogasification of dry dung is a far more efficient process than the conventional anaerobic fermentation because in general the organisms responsible for the fermentation utilise molecular hydrogen and carbon dioxide.[41] In such a hydrogasification process, the methane content of the bio-gas increases considerably above the normal 50-60 per cent.

(19) Solar Energy Plantations for Bio-Gas Plants

A wholly different approach to methane production in bio-gas generators is through solar energy plantations. The main idea is to use solar energy for the photosynthetic production of plant matter which is then fed into a bio-gas generator and fermented there to produce methane (Figure 5). In these solar plantations, plant matter is grown with the specific objective of bio-conversion to methane, and therefore one seeks the highest yields. The following is an indication of the type of yields obtained: grasses 13-15 tons/acre/year; algae 20-30 tons with a peak value of 50 tons dry matter/acre/year; floating water plants 55-65 tons with a peak value of 85 tons dry matter/acre/year.[54]

Any one of these types of plant matter can be used in solar energy plantations, and algae have been suggested quite often. In India, however, there has been little work on the management of algae farms. In contrast, floating water plants, particularly water hyacinths and African payal, are a major aquatic pest precisely because they proliferate without management.[55,56] Attempts should therefore be made immediately to utilise them for bio-conversion to methane.

The gas yield by fermenting water hyacinths harvested from one acre of water is likely to be of the order of 400.000 cft year corresponding to 60 MWH/year, i e, 1.100 cft/day corresponding to 165 KWH/day,[57] which is more than what rural electrification offers. In addition, the sludge obtained from the fermented water hyacinth is rich in potassium, phosphorous and nitrogen. The annual sludge yield from one acre of water hyacinth contains about 1.5 tonnes K, 0.66 tonnes P_2O_5 and 1.23 tonnes N.[58] In addition, an edible protein is also obtained to the extent of about 370 kg/acre/year.[59] Considerable work has been done on the harvesting of water

hyacinths, and manual methods involving pitchforks, scythes and sickles are available.[60]

In considering solar energy plantations of the type discussed above (Figure 5), one must examine whether the returns on these plantations are greater or less than they would have been if the land and water had been used instead for growing conventional food and cash crops. That is, one has to carry out the cost-benefit analysis of the two possibilities of using the same land and water. Obviously, water-weed plantations will not be economic in areas where water is not plentifully available. One will have to turn there to plants which survive in hot and arid environments. The herbacious perennials of the amaranth family, e g, pigweed, have evolved unusual photosynthetic pathways[61] with a very high yield. These are the obvious candidates for solar energy plantations in arid areas.

(20) Socio-Economic Aspects of Bio-Gas Plants

Notwithstanding all the benefits likely to accrue to a village if it adopts bio-gas plants, the implementation of plans to produce and distribute bio-gas energy will be frustrated if the economic inequalities and the property structures in villages are ignored. The basic issue is the following: what happens to those villagers who do not own cattle? Are they to be supplied energy for cooking and lighting? If so, on what basis? Today, their energy needs are met by collecting dung and firewood and burning dung cakes and firewood. If the burning of dung and firewood is banned as a wasteful practice, and the villagers are in no position to buy bio-gas, then they will end up with no fuel at all — in other words, their position will be worsened by the introduction of bio-gas plants. In this situation, one has to compare in detail, on the one hand, the cost incurred by the nation when (a) firewood is burnt and deforestation is accentuated, and (b) dung is burnt as fuel instead of being used in bio-gas plants to produce fertiliser and save on imported naphtha, and on the other hand, the costs of supplying energy free to all the houses in the village. In this comparison, one can consider setting off the cost of the energy supplied to a family which does not own cattle against the payments to this family for the collection of dung. Even this may not be the answer, because as bio-gas plants become more popular, one can expect an increasing tendency to have stable-bound cattle to augment the collection of dung and urine. Such a tendency may lead to a resistance on the part of cattle-owners to surrender bio-gas to those who do not own cattle. A similar problem is likely to arise with bio-gas plants located for capital-saving reasons amidst clusters of houses which do not own cattle. Tentatively, it appears as if the best approach is for the panchayat to deem it a prime responsibility to supply energy for cooking and lighting to all the houses. As a sort of "development rebate", this gas can be supplied free for a couple of years until purchasing power picks up. The point is that there is a need to evolve a pricing policy for bio-gas energy and fertiliser keeping in mind social costs and benefits.

It should be clear from these sketchy considerations that much careful thinking needs to be done to see that private ownership of cattle, land and water does not inhibit the introduction of communal, rather than family, bio-gas plants. The present plans are wholly inadequate because they envisage no solutions to the energy demands of villagers who own no cattle. These plans will turn out to be solely in the interests of the cattle-owning rural rich. It may be mentioned here that 70-80 per cent of cattle-owners have only one or two animals, and less than 5 per cent of them have the four animals which are required to run the smaller size gobar-gas plants produced by the KVIC.

(21) Some Tasks for Research and Development

The detailed consideration of bio-gas plants which has been presented above highlights the immediate needs for research and development on a large number of problems. Some of these problems are listed below:

1 *Techno-economic problems*

1.1 Comparison of social costs and benefits of bio-gas plants and rural electrification.

1.2 Comparison of social costs and benefits of solar energy plantations and use of the same amount of land and water for conventional agriculture.

1.3 Comparison of social costs and benefits of small number of large-size bio-gas plants vs a large number of a small-size plants, taking into account economies of scale and village demography.

1.4 Methodology and techniques for routine decision-making regarding optimum location(s), size(s) and number of bio-gas plants in a particular village depending upon its cattle and human population, distribution of houses, etc.

1.5 Comparative economies of various ways of distributing bio-gas energy, *viz*, pipeline distribution of bio-gas, distribution of electricity produced from bio-gas and gas distribution in containers.

1.6 Formulation of schemes for ownership, control and distribution of bio-gas and fertiliser to villagers and appropriate safeguarding of interests of non-owners of cattle.

1.7 Nature of extension services required for popularisation of bio-gas plants.

2 *Fermentable materials*

2.1 Technology of the collection, and if necessary preparation, of various fermentable materials other than dung — poultry wastes, agricultural cellulosic wastes, e g, bagasse, cannery wastes, etc.

2.2 Technology of management of solar energy plantations — algae, water hyacinths, etc, including techniques of harvesting and preparation.

2.3 Design of latrines from the point of view of aesthetics, hygiene and non-manual introduction of human wastes into bio-gas plants.

3 *Fermentation research and technology*

3.1 Study of fermentation parameters (rate, gas yield, gas composition, etc) as a function of variables such as temperature, pressure, pH, viscosity, agitation, etc, for various input materials (dung, faeces, poultry and agricultural wastes, algae, water hyacinths, etc).

3.2 Study of the fermentation chemistry and microbiology with emphasis on the choice and management of micro-organisms for optimum methane production.

3.3 Optimisation of fermentation process for villages where water is scarce, i e, development of "drier" processes, and water re-circulation systems.

3.4 Development of cell-free enzyme processes for methane production.

4 *Plant design*

4.1 Detailed chemical engineering design of the bio-gas plant with maintenance of optimum conditions for methane production.

4.2 Development of nomograms for extension service workers to furnish on-the-spot designs to suit locally available fermentable materials, gas yields required, etc.

4.3 Research and development on alternative linings (polythene, creosote, earthwork, etc,) for the digester.

4.4 Research and development on alternative materials (ferro-cement, treated wood/plywood, polythene, glass-fibre or jute-fibre re-inforced plastic, polythene with bamboo-basket reinforcement, oil drums, stoneware, etc) for the gas holder.

4.5 Development of simple gas purification methods including utilisation of CO_2 in chalk industry or in greenhouses, and H_2S for elemental sulphur production.

4.6 Incorporation of auxiliary heating systems using solar heating for example.

4.7 Incorporation of agitators to stir the fermentation mix.

4.8 Study of safety hazards and design of safety procedures for plant operation and for handling and storage of methane.

5 *Fertiliser from bio-gas plants*

5.1 Study of the fertiliser characteristics of the sludge obtained from the fermentation of various inputs (animal, human and agricultural wastes, products of solar energy plantations).

5.2 Optimisation of composting techniques.

5.3 Study of the loss of fermentable solids into the sludge as a function of various factors.

5.4 Study of fortification of bio-gas fertiliser with chemical fertilisers.

6 *Bio-gas storage, distribution and utilisation*

6.1 Methods of storage of bio-gas including compression into cylinders, materials of construction of containers, e g, balloons.

6.2 Design and development of methane engines to drive electricity-generators and vehicles.

6.3 Development of methane fuel cells.

6.4 Design of auxiliary equipment for use of bio-gas for cooking, lighting and engines.

6.5 Development of Humphrey water-piston water-pumps running directly off bio-gas.

(22) Challenge of Bio-Gas Plants

The vast range of problems indicated above shows clearly that their solution can only come from advanced scientific and engineering inputs and from a multi-disciplinary R and D effort. Such capabilities lie today in the major scientific and technological institutions which must therefore take up the challenge. Unfortunately, it is precisely such institutions which have thus far ignored the science and technology of bio-gas generators.

This was not always the case. As far back as 1923 (over half a century ago) a classic paper[62] on the fermentation of cellulosic wastes was published from the Indian Institute of Science, Bangalore. The introduction to this paper shows clearly the motivation of the authors to contribute to the energy problem. Indian work continued to be in the forefront until around 1952 — the designs of various types of small bio-gas plants were first accomplished in this country.

Then, for some odd reason, for two decades bio-gas plants were denied the type of attention that they needed and deserved. Was this due to the large influx of foreign-trained scientists who used western criteria to influence the choice of R and D problems?

During this long period of neglect, institutions like the Khadi and Village Industries Commission and the Indian Agricultural Research Institute persevered with their interest in bio-gas plants. This commitment has now been fully justified by the logic of the oil crisis.

The time has now come for major R and D institutions to contribute their share. To discharge that responsibility, they must realise that there are as many scientific and technological challenges in the fermentation of dung as in the fission of nuclei. Or, will these institutions wait till bio-gas technology becomes fashionable in the West, as it will soon become?[38,63]

Notes

[This paper is very much the result of the new wave of interest amongst Indian scientists in alternative technologies, of which decentralised power production in a crucial aspect. Of those who came forth freely with informed criticism, ideas and literature, the authors would particularly like to thank L W Baker, V G Bhide, B Bowonder, M Jayaprakash, Ashok Khosla, G J Mohan Rao, M V Narasimhan, G L Patankar, N J Paul, V Radhakrishnan, K N Raj, S Ramaseshan, Narottam Shah, V R Sonti, A R Vasudeva Murthy and T R Venkatasubramanian. The authors are also grateful to the Centre for Development Studies, Trivandrum, for having arranged an extremely useful discussion on the first draft of this paper.]

1a (226 x 10^6 animals) x (7 lbs Dry Dung/animal/day) x (75 per cent) = 1.187 x 10^9 lbs DD/day.

1b (1.187 x 10^9 lbs DD/day) x (365 days/year) = 4.331 x 10^{11} lbs DD/year = 196 x 10^6 tonnes DD/year.

1c (1.187 x 10^9 lbs DD/day) x (3 cft gas/lb DD) = 3.559 x 10^9 cft gas/day.

1d (3.559 x 10^9 cft/day) x (0.15 KWH/cft) = 5.339 x 10^8 KWH/day.

1e (5.339 x 10^8 KWH/day) x (365 days/year) = 195 million MWH/year.

2 (3.559 x 10^9 cft/day) x (365 days/year) x (1.841 x 10^{-2} litres kerosene/cft) = 28.92 billion litres kerosene/year.

3 (196 x 10^8 tonnes DD/year) x (1.2 tonnes manure/tonne DD) = 236 x 10^6 tonnes manure/year.

4 (196 x 10^6 tonnes DD/year) x (1.2 tonnes manure/tonne DD) x (0.015 tonnes N/tonne dry sludge) = 3.540 x 10^6 tonnes N/year.

5 (3.540 x 10^6 tonnes N/year)/(2.1 tonnes N/tonne naphtha) = 1.687 x 10^6 tonnes naphtha/year.

Appendix I: Norms Used for Calculations

1 Wet dung to dry dung ratio=5:1.
2 Average dry dung yield=7 lbs Dry Dung (DD)/animal/day=3.18 kg DD/animal/day=1.16 tonnes DD/animal/year.
3 Average daily bio-gas yield from human waste=1 cft/person/day.
4 Average gas yield=3 cft gas/lb DD at 15°C=0.187 M^3 gas/kg DD at 15°C.
5 Energy content of gas (assuming 50 per cent methane)=500 BTU/cft gas=0.15 KWH/cft gas=126 kcal/cft.
6 2.93×10^{-4} KWH/BTU.
7 860 kcal/KWH.
8 Kerosene equivalent of gas=1.841×10^{-2} litres kerosene/cft gas = 0.65 litres kerosene/cft gas.
9 Manure yield=1.2 tonnes manure/tonne DD=0.4 lbs manure/cft gas.
10 Nitrogen to manure ratio=0.015:1.
11 Nitrogen to naphtha ratio=2.1:1.
12 Naphtha to dry dung ratio=0.005142:1.
13 Foodgrains to nitrogen ratio=5:1.
14 Calorific value of firewood=2,000 kcals/lb firewood.
15 20 tons firewood/acre forest.
16 Gas requirement for cooking= 12 cft/person/day (urban eating patter pattern?).
17 Gas requirement of lighting=4.5 cft/100 cp lamp/day.
18 Wet dung to added water ratio=4.5.
19 Yield of dried water hyacinth=60 tons DWH/acre/year=1,200 tons fresh water hyacinth/acre/year.

Appendix II: Generating Costs of Bio-Gas Energy

Assumptions:

1 The costs have been computed for three sizes of the plant: 60, 100 and 5,000 cft/day.
2 The capital costs, I, have been assumed[28, 13] as Rs 1,500, 2,500 and 41,000 respectively.
3 A life span, n_e, of 30 years has been assumed. This value which has been suggested by Parikh,[45] appears reasonable if the plant is made of cement and steel and the steel is painted regularly.
4 An interest rate, i, of 10 per cent has been assumed and is reasonable for this type of investment.
5 The plant is expected to be painted once in two years ($n_m = 2$). This will cost approximately Re 1 per cft of the plant.
6 An operator is necessary for loading the dung and clearing the slurry into drying beds. It is assumed that five full time operators would be necessary for operating a 5,000 cft/day plant. In Karnataka, the village wages are about Rs 3/- per day for unskilled labour.
7 A 10 per cent downtime has been assumed for the plant.
8 The sale of fertiliser from the plant will more than offset the cost of dung collection.
9 The annual capital cost has been worked out using the formula

$$C = I \frac{i(1+i)^{n_e}}{(1+i)^{n_e} - 1}$$

Where C=annual cost
I=Investment
i=interest rate
n_e=life span

10 The Annual maintenance cost has been worked out using the formula

$$M = S \frac{i}{(1+i)^{n_m} - 1}$$

Where S is the sum to be accrued at the end of $n_m = 2$ years for painting, e.g, S=Rs 60, 100 and 5,000 for the 60, 100 and 5,000 cft/day plants.

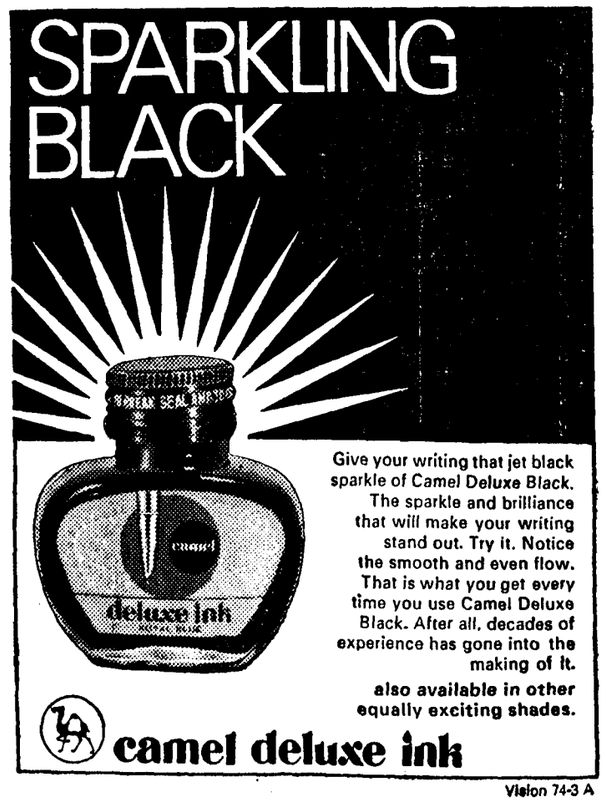
11 The annual labour cost, $L = n_L \times W \times 365$.

Where n_L =number of men required to operate the plant =5 for a 5,000 cft/day plant, and W=daily wage. The annual labour costs of the 60 and 100 cft/day plants have been taken on a proportional basis, i e, (60/5,000) and (100/5,000) of Rs 5,475.

12 The net annual electrical energy/cft of gas is calculated thus:
E=(0.15 KWH/cft gas) x (365 days) x (0.9 operating duration)
=49.275 KWH/cft

13 The energy cost, e, is given by

$$e = \frac{(C + M + L) \times 100}{49.275 \times Q} \text{ paise/KWH}$$



Where Q=capacity of plant in cft

14 The costs are tabulated as in Table A.

TABLE A: GENERATING COST OF BIO-GAS

(Rs)

		5,000 cft/day	100 cft/day	60 cft/day
1	Initial costs	41,00.00	2,500.00	1,500.00
2	Annual capital costs(C)	4,350.00	265.20	159.12
3	Annual maintenance costs(M)	2,381.00	47.62	28.62
4	Annual labour cost(L)	5,475.00	109.50	65.70

The Great Leap Forward in China

An Analysis of the Nature of Socialist Transformation

Prasenjit Duara

To investigate the rasion d'etre *of the Great Leap is to examine problems which are common to all post-revolutionary societies undergoing a process of socialist transformation. The primary problem faced in a post-revolutionary situation is the shortage of capital required for industrialisation, which is a basic pre-requisite for the construction of a socialist society.*

As the first workers' state in an underdeveloped country, the Soviet Union faced this problem most acutely. It had to generate the resources for industrialisation from an impoverished pre-industrial sector of the economy by pushing down the consumption levels of the masses and alienating powerful elements in the countryside. The use of force necessitated the creation of a powerful and pervasive bureaucratic structure which, in time, usurped the role historically, ascribed to the working class.

The Stalinist model of development was almostuniversally taken over by the post-war communist regimes and applied in their respective countries during the early years of their rule. But, within a few years, the counter-developmental tendencies inherent in the model began to make themselves felt, and the pressure to reform the system became irresistible.

Recognition of the various problems inherent in the Stalinist model of industrialisation is at least implied in Mao's essays titled "On the Ten Great Relationships" written in 1956 and "On the Correct Handling of Contradictions" written in 1957. The Maoist alternative implemented during the Great Leap Forward focuses on an alternative economic strategy.

The Great Leap Forward cannot, however, be reduced to a single economic motivation. The Great Leap was the product of a 'vision' rather than a plan. It sought to transform the entire social system.

THE Great Leap Forward in China spanned the period beginning from March 1958 till the end of 1960. Before beginning its analysis, I wish to delineate two parameters of the study.

The first deals with the question: Why the Great Leap Forward? When we investigate the *raison d'etre* of the Great Leap we shall actually be examining problems which are common to all post-revolutionary societies undergoing a process of socialist transformation. The primary problems faced by backward or semi-developed societies in a post-revolutionary situation is the shortage of capital required for industrialisation, which is a basic pre-requisite for the construction of a socialist society.

As the first workers' State in an underdeveloped country, the Soviet Union, naturally, faced this problem most acutely. Since the inflow of foreign capital was necessarily limited, the Soviet Union had to generate the resources for industrialisation from an impoverished pre-industrial sector of the economy — by trenching into the consumption level of the masses and alienating powerful elements in the countryside. The use of force necessitated the creation of a powerful and pervasive bureaucratic structure which, in time, usurped the role historically ascribed to the working class.

The Stalinist model of development was almost universally taken over by the post-war communist regimes and applied in their respective countries during the early years of their rule. But, within a few years, the counter-developmental tendencies inherent in the model began to make themselves felt, and the pressure to reform the system became irresistible. Beginning, formally, with the Twentieth Party Congress of the Soviet Communist Party, these regimes began to experiment with different models of capital accumulation and economic development.

Recognition of the various problems inherent in the Stalinist model of industrialisation, is at least implied in Mao's essays called, "On the Ten Great Relationships" written in 1956, and "On the Correct Handling of Contradictions" written in 1957. These essays sum up the problems that the Chinese Communists encountered in their experience with the Stalinist model during the First Five-Year Plan. The Maoist alternative, implemented during the Great Leap Forward, focuses on an alternative economic strategy, but the Great Leap Forward cannot be reduced to a simple economic motivation.

This is the second parameter: the Great Leap Forward, in the words of Franz Schurmann was the product of a 'vision' rather than a plan. A plan is a carefully worked out blueprint dealing with precise magnitudes; a "vision is a total insight into the essential inter-relationships of a situation" and encompasses all factors of societal dynamics: economic as well as social and political. The Great Leap Forward sought to transform the entire social system, and I have found it necessary to bear this in mind throught out the study.

Background of the Great Leap

While the Great Leap Forward was intended to be a comprehensive resolution programme of all the contradictions that characterised Chinese society, the bulk of its policies and campaigns were concentrated on resolving the economic contradictions that existed in China around the end of its Five-Year Plan. This, and the next section, therefore, deal with these economic problems.

Problems of Stalinist Model

The main principles of the First Plan (1952-1957) can be broadly summarised thus:[1] the development of the capital goods industries should be such as to promote the rapid growth of heavy industry; the rate of growth of the goods industries; should exceed that of the consumer goods industries; and finally, the development of agriculture should be directed to ensuring adequate supplies of grain and industrial raw materials, and to increase the agricultural surplus from which to finance industrialisation.

When we turn to assess the overall *performance* of the economy during this period, we encounter the problem of having to face a number of divergent estimates. The official Communist estimates for the average annual rate of growth of net domestic product during 1952 to 1957 was 9 per cent.[2] The biggest yearly increase (14.4 per cent) took place in 1956, and the smallest (4.2 per cent) in 1957. The only independent estimate, which is close to the official one, is William Hollister's. It shows an average annual rate of growth of 8.7 per cent.[3] The *official Chinese figures* have been challenged by Choh-ming Li[4] on the basis of the fact that the pricing of new products has increasingly inflated net domestic product. Among the others, T C Liu and K C Yeh[5] suggest a lower annual rate of growth averaging around 6 per cent. Yuan-li Wu, whose estimates are based on certain revisions and extensions of Liu's data, suggests an even lower estimate of 5.2 per cent.[6]

These estimates, moreover, manifest considerable variation in their respective annual rates from year to year. For instance, the mean deviation in percentage points of the annual rate of growth was 4.1 in the official estimate.[7] The annual fluctuation suggests that the pattern of economic development — especially the allocation of investment and the choice of its growth rate — may themselves have played a significant role in the instability of the growth rate.

On the question of the 'accumulation rate' or the rate of investment,° there exists a far greater unanimity of opinion. That there was an almost uninterrupted increase in the absolute value of investment, from 1952 to 1957, is undisputed. Hollister's[9] estimates of the percentage of gross fixed investment to gross national product is fairly representative (Table A).

However, the estimates of the sectoral distribution of the fixed capital investment are more controversial. Differences exist as to the percentage

° The word accumulation' or 'accumulation funds' used by the Chinese Communists refers to fixed investment. The distinction between 'consumption funds' and 'accumulation funds', a distinction we shall encounter quite often, is made clear in the following passage:

"We all understand that the material form of consumption funds is consumption goods and that of accumulation funds is the means of production".[8]

TABLE A: PERCENTAGE OF GROSS FIXED INVESTMENT TO GROSS NATIONAL

1952	1953	1954	1955	1956	1957
9.1	12.4	13.9	13.8	17.9	15.9

TABLE B: PERCENTAGE OF FIXED INVESTMENT IN HEAVY INDUSTRY TO TOTAL FIXED INVESTMENT[12]

	1952	1953	1954	1955	1956	1957
Hollister	23.4	24.5	27.6	31.9	33.9	36.9
Eckstein	29.5	29.2	34.9	40.5	39.7	44.4

TABLE C: PERCENTAGE OF FIXED INVESTMENT IN AGRICULTURE TO TOTAL FIXED INVESTMENT

	1952	1953	1954	1955	1956	1957
Hollister[13]	34.6	26.2	26.6	28.3	24.4	25.2
Eckstein[14]	13.8	9.7	4.6	6.7	8.0	8.6

of heavy industry to total fixed investment. We can compare Hollister's estimates with those of Alexander Eckstein.[11] (Table B).

These differences — which are not very significant — notwithstanding, what stands out clearly from both these estimates is the rapid increase in the percentage allocated to heavy industry during this period. This conforms to the Communist view of a socialist society, a necessary pre-requisite of which is a highly developed heavy-industrial base.

However, major differences arise in the estimates of the share of agriculture in fixed capital investment. Once again, we can compare the two estimates (Table C).

Hollister's figures for investment in agriculture are conspicuously at variance, not only with Eckstein's estimates, but also with all the other estimates including the official Communist one.[15] Making his point clear, he maintains that

> The trend does not justify the commonly held view that the industrialisation drive commanded such large amounts of resources that agriculture was starved for investment.

and that:

> The peasants paid as heavy price for the rapid build-up of heavy industry, but the price was not one of insufficient investment in agriculture ... the peasant bore a disproportionate burden in financing the high rate of industrial investment, and farm per capita consumption suffered as a result.[16]

Thus, Hollister seems to be saying that, in studying the problems of the Chinese economy during this period, the level of agricultural production is not the key question. In other words, even if we suppose that the growth rates of agriculture were high, the exploitation of the peasantry — defined in terms of a high proportion of agricultural produce being diverted for purposes of accumulation, and consequently a declining per capita consumption in the rural areas — continued during this period. We can infer, then, that, for Hollister, the central problem concerns the exploitation of the peasantry. Though, as we shall see, it is true that the Chinese Communists were not willing to reduce the proportion of accumulation in the national income, it is also true that the proportion of accumulation was not rising very much — in fact, it may even have declined somewhat. As we shall see, this is primarily because agricultural output, and especially the annual per capita availability of foodstuffs itself, was not growing at any noticeable rate. That farm consumption suffered is to be seen, therefore, in the context of the lagging agricultural production and the more or less constant growth rate of the proportion of accumulation in the national income.

The point is not so much that, had agriculture been able to generate large enough surpluses there would have been no consumption problems. Instead, the problem may be posed as: There was slow growth in the traditional sector of the economy, *viz*, agriculture; the need eventually to break this slow growth necessitated a high rate of growth in the producer goods industries, thereby making it almost impossible to reduce the rate of investment in this sector; but, unless a greater share of investible funds is channelled into agriculture, not only would there be problems of consumption but in the long run the rate of accumulation would also tend to fall. In the Maoist schema, these are the contradictions of functions: the relationship between production, accumulation and consumption.

Before we proceed to substantiate this hypothesis, it is necessary to underline the all-important and pervasive role that agriculture plays in a developing economy. As Choh-ming Li has shown, in China, the whole economy fluctuates cyclically according to the nature of the harvest. It stands on a peak one year after a good harvest, and then takes a downturn, until one year after the next good (or normal) harvest when it abruptly climbs to a new peak.

According to the provisions of the Five-Year Plan, agriculture was to play the important role of supplying food to the growing urban population and financing industrialisation. It was to perform this second function in several ways: first, through the supply of raw materials to the consumer goods industries; secondly, it was to serve as the principal bulwark of the country's exports to finance imports of industrial equipment; and finally it was to contribute to investment in industry through the agricultural tax and compulsory deliveries.[17] Thus, we see that the very nature of industrial development is dependent on the fortunes of agriculture.** During 1952 to 1957, industry developed rapidly, at an average rate of 14 per cent to 19 per cent annually;[18] and, within industry, the investment goods sector developed at a faster rate than the consumer goods sector. Nonetheless, the industrial production record is characterised by marked annual fluctuations in growth rates. In the early years, there was rapid expansion, but by 1954, the rate of increase had dropped to half that of the preceding year, followed by another marked drop in 1955. This was due to the mediocre harvests in 1953-54, which caused shortages of raw materials. In 1955 there was a good harvest, and consequently the rate of growth accelerated in 1956; but the bad harvest in 1956 caused a curtailment in the rate of investment in 1957 and a corresponding decrease in the rate of expansion.[19]

** Foreign aid was marginal to China's economic development. See Alexander Eckstein, 'Economic Trends in Communist China and Its Policy Implications for the US', in "Mainland China in the World Economy". Hearings before the Joint Economic Committee, Congress of the US, Washington DC, 1967. "It is important to realise that the Chinese have achieved this rate of economic advance essentially by their own efforts... It is estimated that the Chinese were net importers of capital to the extent of US $ 430 million: this amounts to 0.3-0.4 per cent of the GNP for these years (from 1950 to 1957) and to about 1 per cent of total savings. However, since 1958, the Chinese have been net exporters of capital."

Thus, in order to ensure steady industrial expansion, agricultural production had to increase — and at a regular pace. Official statistics of agricultural output estimate the annual, overall, growth rate at 4.8 per cent, and the annual growth rate of foodgrains at 4.3 per cent during 1952 to 1957.[20] Given the fact that population in this period increased by about 2.5 per cent annually the annual per capita availability of foodstuffs, should have grown at the rate of 1.5 per cent a year. Both Choh-ming Li and Eckstein reject this figure on the ground that, the statistics "seem to contain a strong upward bias as a result of the improvements in crop reporting and the broadening coverage of agricultural statistics between 1952 and 1957... per capita output of food was [growing at] significantly less than 8 per cent (or 1.5 per cent annually)".[21] Besides, reports of the ever-tightening food supply in the cities seem to indicate something other than what the government statistics suggest.

That there was relatively slow growth in agriculture is further confirmed by the well-publicised fact of a shortfall in the production of consumer goods, which was attributed to the shortage of raw materials from agriculture. But, the problem of shortage of consumer goods is a problem of some importance in its own right too. In August 1957, Po I-po[22] announced that the major contradiction in the economy at that time was that production of consumer goods was lagging behind development of the economy as a whole. In October 1957, Yang Po wrote: "It was due to the shortage of raw materials produced by agriculture that the utilisation of the equipment of several consumer goods industries reached only the following percentages — textile industry 85 per cent, sugar industry 66 per cent, oil extracting industry 75 per cent, cigarette industry 52 per cent, flour industry 68 per cent."[23]

The relatively slow rate of growth in agriculture and the consequent shortage of consumer goods had two important implications: First, there was the danger of the 'scissors crisis' being repeated in China. Although, the problem never approached the proportions it had reached in the Soviet Union, the shortage of consumer items was nevertheless likely to create disincentives among the peasantry. In November 1957, Huang K'o wrote in an issue of *Planned Economy* that, even though the volume of commodity supply for the year 1958 was to register an increase over the figure for 1957, it still could not "adequately meet the needs of the increased purchasing power, principally because the commodities suitable for the urban population are increased by a greater margin (the supply of subsidiary food, for instance, will be increased by 10.7 per cent), while the industrial goods needed by the peasants, such as cotton cloth, not only register no increase, but actually show a drop of 9.92 per cent... Cotton cloth in the rural areas constitutes about 14-18 per cent of the purchasing power of the rural population. Thus the decline in the supply of cotton cloth produces very great effects on the purchasing power of the rural population."[24] Moreover, towards the end of the First Plan many agricultural and other products subject to unified purchase entered the market before compulsory deliveries had been completed and commodities to be sold under planned purchase were sold in the market.[25]

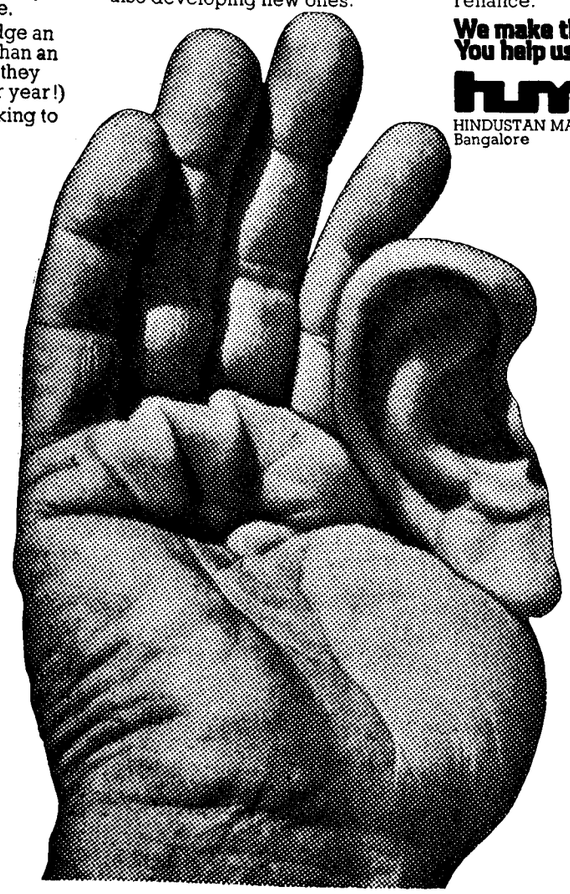
Secondly, since agriculture (and the traditional sector in general) was the major source for financing industrialisation, a lagging agricultural sector would reduce the rate of growth of funds available for accumulation. The available evidence suggests that, as far as State collections are concerned, this did happen in fact. The ratio of collection and purchase by the State to total agricultural output declined from 27.1 per cent in 1955-56 to 25.1 per cent in 1956-57.[26] Moreover, it is likely, that another important source of State funds — *viz*, the profits of the State trading and marketing organisations — was also affected as a consequence of the shortage of consumer goods and the fact many goods having begun to reach the free market.

But even though they recognised that agricultural stagnation was indeed the major problem, as late as in December 1957, the Chinese Communists were still not prepared to increase the funds for investment in this sector to any significant extent. In an important article on the distribution of the national income, Yang Po wrote about the "ratio between accu-

When it comes to talking to customers, HMT is all ears

HMT is constantly expanding, adapting, modifying and improving its range of machine tools.

In order to meet the changing production needs of its customers—both here and abroad.



But the most successful developments take place when the customers themselves actively participate and co-operate.

Because nobody can judge an HMT machine tool better than an HMT customer. (After all, they work together—year after year!)

So, HMT was all ears talking to the Railways, Lucas-TVS, Bajaj Auto, Ordnance Factories, Divgi Metalwares, Gajra Gears, ICF, Premier Automobiles, Escorts, BEML, American Tool Inc. and Wickman of U K.

And HMT was also all ears talking to a number of small-scale manufacturers and entrepreneurs.

The suggestions, advice and participation of both big and small-scale industries resulted in improving existing machines as also developing new ones.

This, in turn, resulted in HMT machine tools becoming more effective and versatile. And also more acceptable to potential customers.

Yes, it certainly takes two to match skills to needs.

You and HMT.

That's the HMT way to self-reliance.

We make the machine tools. You help us make them better.

TABLE D: DISTRIBUTION OF NATIONAL INCOME

(in percentage)

	1952	1953	1954	1955	1956
Consumption funds	81.8	78.6	77.7	79.1	77.5
Accumulation funds	18.2	21.4	22.3	20.9	22.5[27]

mulation (reserves) and consumption (expenditure) in the disbursement of the National Income". He felt that the ratio in the past, so far, was basically correct (Table D). Nonetheless, he also believed that the improvement in the standard of living of the masses had been basically restricted by the shortfall in the production of consumer goods (i e, 'the material form of consumption funds').

> In other words, if there can be an adequate supply of raw materials in the shape of agricultural products, the output of consumption goods can be greatly increased. Under such conditions, even if the accumulation rate in the disbursement of the national income is lowered and the percentage of consumption funds raised, the consumption level in the livelihood of the people can hardly be elevated.[28]

The implication is clear: the immediate needs of the people can be satisfied independently of affecting the rate of accumulation, i e, the rate of growth of heavy industry. This is one of the main assumptions underlying the Great Leap strategy.

There is yet another aspect in the interrelationship between the traditional sector and the modern industry sector which we have not considered earlier. The reallocation of labour, from agriculture to industry, is a significant aspect of agriculture's contribution to industrial growth. This also has the beneficial effect of easing the problem of unemployment and underemployment in the traditional sector in China. However, a situation may arise, where the flow of labour from the rural areas greatly exceeds the capacity of industry to absorb it. This situation can produce certain counter-developmental tendencies, while it does not in any way ease the problem of underemployment in agriculture. Moreover, overpopulation in the countryside could have the serious consequence of obstructing the mechanisation of agriculture thus permanently keeping down the level of labour productivity in agriculture. Thus, agriculture, in China is afflicted with yet another problem.

Throughout the First Plan period, the migration of the rural population to the cities had reached such alarming proportions that the authorities were beginning to feel genuinely concerned about it. During the entire period, 8,000,000 rural people had migrated to the cities,[29] and even in 1958 (though mainly in the earlier part) there was a phenomenal increase — estimated at 15.6 million — in the urban population, of which over 10 million is estimated to have resulted from migration.[30]

The factor primarily responsible for this massive influx is the income and general standard of living differential between the peasants and the industrial workers. And the event which contributed most to this influx was the wage reform (among industrial workers) in 1956, aimed at improving the general wage level by 14.5 per cent. The wage point system was abolished; a piece work system provided for 80 per cent of the worker's wages to be fixed and the remaining 20 per cent to be tied to norms — so that this part could rise or fall according to their performance. Bonuses were also introduced for innovation, overtime, and hardship.[31] The resultant improvement in the workers' situation attracted flocks of the poorer rural population — much beyond what urban industry could absorb.

The policy for dealing with the urban unemployed, from 1957 onwards, was to reverse the migration to the towns by the 'sending down' movement.[32] But, of course, this policy was not going to solve the problem of unemployment in agriculture. An alternative solution was required, and the Chinese Communists decided to utilise the surplus manpower as as a kind of investment for development of agriculture. This was aimed to kill three birds with one stone — lagging agriculture, surplus labour, and shortage of investible funds.

Strategy of the Great Leap

Thus, in all essential respects, the First Plan followed the Stalinist model of industrialisation: High rates of savings and investment institutionalised through agricultural collectivisation; heavy emphasis on the capital-goods industry; reliance on large-scale and capital-intensive technology in industry. This is a model which inevitably tends to produce rapid industrial expansion at the expense of agricultural productivity, and consequently, of rural standards of living. The weak link in the entire economy was the fact of agricultural stagnation; and, unless agricultural output could be raised, the rate of growth of industrial capacity would be limited.

The new strategy did not envisage any radical change in the direction of priorities. The "simultaneous development of industry and agriculture based on preferential development of heavy industry" was still the guiding principle.[33] However, the fundamental aim was to break the agricultural stagnation — but without diverting any resources from heavy industry to agriculture. A corollary to this principle was that all the other sectors of the economy would have to avoid competing for resources with the 'key' capital goods industries. Agricultural production was expected to rise without utilising the resources which were required by the 'key sector'. This is not to say that mechanisation of agriculture was not desired. On the contrary, Mao himself, argues for it:

> ... if we cannot advance from small-scale farming that uses farm tools drawn by animal power to large-scale farming that uses machinery ... our socialist industrialisation will run into immense difficulties and it will be impossible for us to complete socialist industrialisation.[34]

However, the need for mechanisation of agriculture in the context of the Great Leap strategy raises two problems: first, mechanisation of agriculture would involve diverting resources from industry to serve the immediate needs of agriculture. Clearly, this militates against the first principle of the strategy which we have outlined above. The Maoist solution to the problem is to be found in the development of small-scale industries that will be discussed later in this section. Secondly, in an economy where the rural sector is overpopulated and where the modern industrial sector cannot absorb any of the surplus labour, it seems axiomatic that mechanisation of agriculture will lead to further unemployment. The Maoists believe that the displaced labour can be absorbed by a diversification of rural economy and by converting labour into 'a kind of investment':

> ... the labour of the broad masses itself is a kind of investment ... During the socialist construction of the national economy, however, a tremendous portion of our wealth is not expressed in monetary terms, but is the invest-

ment made in terms of labour or the free labour consciously or voluntarily rendered by the hundreds of million people. What we should give particular attention to is the infinite ardour and creative force of the working people in new China. Such colossal material forces may be compared to the 'sea water which cannot be measured by quarts'.[35]

A novel aspect of the new strategy, therefore, involved the mass mobilisation of the unemployed or under-employed labour on an unprecedented scale. This labour was to be used at the local level for three purposes: to work on labour intensive investment projects, like irrigation, flood control, and land reclamation schemes; to raise unit yields in agriculture through closer planting, more careful weeding, etc; and to develop and expand small-scale industry rapidly.

It was hoped that, through the diversification of the rural economy and the investment of labour, increases in farm production could be achieved which would then be converted into rising industrial investment and provide adequate supplies of consumer items. Evidently, such a goal could not be accomplished unless rural consumption was kept in check, for increased consumption would dissipate the increase in farm output. Hence, there was a fundamental economic necessity to 'revolutionise' the attitudes of the peasantry towards the construction of socialism.†

As we have said earlier, one of the basis principles of the new strategy was that all the sectors of the economy would have to eschew competing for resources with the capital-goods industry. The development of local, small-scale industry†† can only be viewed in this context. The functions of local, small-scale industries were two-fold: they themselves must contribute to an increase in industrial production without utilising any of the resources required by the strategic sector; and secondly, they must serve agriculture so that agriculture need not draw on the scarce capital resources.

Our encapsulation of the dual function of local small-scale industry fits in with Carl Riskin's[36] analysis of the same: the principle that local industry should adopt small-scale, relatively labour-intensive, techniques (which utilise factors of production not required by the centrally controlled large scale sector), he classifies under the 'choice of technique' function; the principle that it concentrate upon production of rural producer and consumer goods, he calls its 'sectoral allocation' function.

With regard to this second principle, we can say that the primary task of local, small-scale industry was to carry out the industrialisation of agriculture — i e, the mechanisation and electrification of agriculture. It was held that "the appearance of innumerable local factories and mines will impel agriculture forward, providing it with tools and machines, chemical fertilisers, irrigation pumps, and electric power".[37] But apart from serving agriculture, the small industries were to perform two other subsidiary functions which too can be classified under the 'sectoral allocation' principle. First, these industries were expected to serve the nation's large industries also. "In raw materials areas simple factories may be set up to manufacture semi-finished products which can then be shipped to large factories for reprocessing".[38] But this role of theirs as ancillary industries, was clearly a secondary function. Secondly, they additionally constituted "an indispensable factor in increasing accumulation of funds in supporting and assisting construction of big priority projects".[39]

The 'choice of techniques' strategy during the Great Leap Forward, was essentially a part of the industrial policy of 'walking on two legs'. This policy emphasised small-scale, labour intensive (often using native and traditional), methods of production within the framework of long-term priority for large-scale and capital intensive techniques. The nature of the approach is summarised thus:

> It is the direction we follow in development to build large-scale enterprises using modern production methods; but at a time when our capital and technical conditions are not yet adequate, the development of small-scale enterprises using native production methods is the goal of our major efforts for a certain period of time and in given places.[40]

The advantages claimed for the small-scale, labour intensive, methods of production can thus be listed as follows:

(a) The ability to utilise dispersed deposits of material resources (thus also reducing transport bottlenecks).

(b) The development of 'backward' areas by bringing industry to them, and the creation of an 'industrial consciousness'.

(c) The reduction of the construction and 'gestation' period of investment, because of the small scale.

(d) The ability to undertake repairing, maintenance and processing activity, freeing large-scale capacity for jobs which the modern sector alone could do.

(e) And finally, use of available labour to achieve low capital intensity.

Consistent with the principle that local industry would not utilise the resources material inputs and equipment needed by the 'strategic sector', it was intended that local industry rely on waste, scrap, surplus, and other types of materials, without any opportunity cost. A similar policy held regarding labour inputs; for, as we have seen, a motivating principle behind the Great Leap Forward, was effective employment of the underemployed masses.

But, though local industry did not require large amounts of capital, they, obviously required some funds. Where were these funds expected from? Apparently, not very much attention was paid to this question at the time when the authorities were framing the policies. Chang Pei, writing in April 1958, dismissed the matter in a few sentences:

> Funds will come from local government revenue, capital accumulation (ploughed back profits from the industries), and the accumulation of agricultural and handicraftsmen's co-operatives. Local bonds may be issued when needed. As things look now capital will not be a snag. Once the signal was given to go ahead on local factories, many places managed to find large sums in short order.[41]

On this question, Riskin correctly points out that, the fact that local industries had their origins in previously existing activities reveals that redistribution or 'primitive socialist accumulation' was the principal capital resource base of local industries. But, because of the extremely low per capita income of the rural population, and the fact that:

> Industry was extracting decreasing, and possibly even negative, amounts of resources from agriculture... [these industries] found the only remaining source for redistribution in factors of production previously bypassed because their current employment was deemed too valuable to interrupt: resources employed in handicraft and petty industrial production of every consumer goods and utensils, agricultural tools and implements, special local arts and crafts with export significance, and in agricultural production itself.[42]

There is no doubt that these resources were an important source for financing local industry. But a low per capita income and declining state revenues from agriculture is not incompatible with the existence of surpluses in the hands of innumerable individuals, provided there exists a private sector in the economy. There is hardly any doubt that, even after collectivisation in 1956, a private sector did exist in the countryside which yielded fairly substantial incomes to some individuals. Income from this private sector as studied by Kenneth Walker,[43] includes income from the private plots, from horticulture, and from private livestock rearing. The percentage of the peasantry's income from this source (to its total income) ranged from 9 per cent in 1956 to 60 per cent in 1957. Comparing these figures with the needs of the peasantry, "it appears that the income from the private sector could very easily be the decisive factor in the standard of living."[45]

What is the relationship betwen the peasant class and income from the private sector? In 1955, Mao himself observed:

> Everyone has noticed in recent years that new rich peasants have sprung up everywhere.... On the other hand, many poor peasants lacking sufficient means of production, are still living in poverty.... If this tendency goes unchecked, the bipolar differentiation in the countryside will get worse day by day.[46]

Even after collectivisation in 1957, Walker, basing himself on a study of Fukien province, reveals that the poor peasants were heavily dependent on the collective for income, but "the higher peasant classes in Fukien, by owning most of those income earning assets still allowed to be privately owned, were so independent of the collective for income that the collective economy's existence was threatened by their non-co-operation."[47]

Therefore, it is likely that surpluses in the form of savings existed in the hands of rich and middle peasants, joint State-private traders, and so on, and these the central government had so far failed to mobilise. Together, these savings probably constituted a large and potentially investible sum. It was hoped, in 1958, that the communes would prove useful and compliant instruments in mobilising and extracting rural savings which would finance the industrialisation of the traditional sector.

Finally, I would like to comment very briefly on two more aspects of the Great Leap Forward, which are fundamentally linked to its economic strategy: decentralisation and communes. The decentralisation of economic authority actually preceded the Leap Forward; nevertheless, it had the effect of reinforcing the central ideas of the new strategy. For instance, local, small-scale industry could hardly function if it were subject to centralised economic authority for every decision. Greater freedom in decision-making at the local level therefore became an essential prerequisite of the new strategy. Economically, the introduction of the communes is to be seen as the beginning in a series of experiments aimed to discover the optimal size of unit for administering and controlling the numerous economic functions necessitated by the Great Leap strategy.

The Theoretical Sanction

In this section, we will try to examine the theoretical context in which the idea of the Great Leap was developed. The Great Leap Forward is to be seen as a 'package resolution programme' of the contradictions that existed in Chinese society. Their comprehensive resolution was sought to be effected in a *single* stroke — in the form of a leap from one phase to another. This is an idea which derives from Mao's theory of Permanent Revolution,[48] a theory which was formulated at the time of (or just before) the Leap Forward, and which in fact, constituted the philosophy underlying the 'leap'.

The central idea of this theory is that development consists of a series of uninterrupted revolutions, and that these revolutions continue even during the period of socialism.[49] A leap is no more than a break from quantitative changes to a qualitative one — the Marxist notion of revolutionary change.

> The struggle (not a class struggle, but between advanced and backward elements) during the transition from socialism to communism will also be a revolution. In the Communist era there will be many, many phases of development. The development from one phase to another must necessarily be a relationship between quantitative and qualitative changes. All mutations, all leaps forward are revolutions which must pass through struggles.[50]

By 1956, the Socialist revolution in the ownership of the means of production was basically completed, and then came the socialist revolution on the ideological and political fronts which, however, had not been completed at the time of the Great Leap and would "continue to be solved by annual bloom-contend-rectify-reform campaigns". "But now we must start a technological revolution so that we may overtake Britain in fifteen or more years".[51] The revolution was aimed at building socialism "more, faster, better and more economically". During the period of 15 years or so, it was maintained, Chinese steel production could be increased to 40 million from its 5 million tons. Electric power could be boosted more than ten-fold, while agricultural progress necessary to match these industrial advances could be attained in eight years.[52]

There is hardly any doubt that there was opposition at the top level to the Great Leap. But as Schram points out, it was "not simply the rapid pace of economic development set at the time of the Great Leap Forward which led to Mao's rupture with Liu and the others."[53] The crux of the matter was the underlying philosophy, which was to lend to the Great Leap Forward in the economic context its distinctive spirit and pattern of development.

For Mao, the course of a revolution cannot be laid down in all its details, beforehand. In January 1958, Mao said, "There is no pattern for straw sandals, they take shape as you work on them".[54] Broadly, the goals are known, but their real meaning and the path for reaching them can only be discovered in the field. It is in this sense that Franz Schurmann has called the Great Leap Forward the product of a 'vision', and not a plan as ordinarily understood. This view finds its justification in the idea that 'disequilibrium' or 'imbalance' in the economy is 'a universal objective law'.

> Things forever proceed from disequilibrium to equilibrium and from equilibrium to disequilibrium in endless cycles. It will be forever like this, but each cycle reaches a higher level. Disequilibrium is constant and absolute, equilibrium is temporary and relative.[55]

In concrete terms, this idea implied negation of balance in the relationships between local and national planning and recognised it as an effective principle governing economic development. Decentralisation (which was an essential part of the Great Leap Strategy) in the context of the Great Leap, was inversely correlated to co-ordination,

† The various mass campaigns and organisational changes that occurred during the Great Leap will be the subject of a later section. Here it will suffice to say that while there was a definite link between the campaigns and the economic strategy, it would be facile to reduce the attitudinal changes among the masses to a simple economic policy. The Cultural Revolution, for instance, witnessed similar politico-organisational changes, but it can hardly be said that these changes accompanied any major economic changes — change in economic strategy.

†† It is necessary to clarify what local, small-scale industry meant in China in 1958. It included heavy industries, but not industries requiring large capital outlays and defence industries which remained under central control and ownership even after the decentralisation of 1957-58. This group of centrally controlled industries we shall call the 'strategic' or 'key sector'.

Right now somewhere, a can of delicious fruits is fast disappearing.

You don't even realise it but our cans have been helping to bring you the things you use every day: fruits and vegetables, baby foods, cosmetics, fish, ghee and vanaspati, pharmaceuticals, paints, motor-oils. All with their quality intact.

Our way of doing it is with the most modern technology.

We are an associate of the world's largest can manufacturer, the American Can Company. Through us, the fruits of their over $ 20,000,000 annual research and development programme are available to canners and consumers in India.

Which means, better and more cans for you, naturally.

Things you can't do without, Poysha can

and the consequent lack of co-ordination was justified thus:

> Planned targets are constantly in a state of flux consequent on the boosting of the activism of the masses.... The overlapping of planning and reshuffling of targets often shatter the balanced relationships in the national economy and give rise to a new imbalance. If we realise that imbalance is normal, and moreover is a motive force to bolster the further development of the national economy, then we can dismiss the idea that the decentralisation of management would render it difficult to bring about a comprehensive balance.[56]

During the first few months of 1958, there was a large advance in production, which was unplanned and unexpected and was "the result of unleashing local initiative under decentralisation".[57] How was this 'great leap' achieved? Under the old system, Choh-ming Li explains, the central authority used to determine, according to the principle of balance, one single set of national targets which the provinces, together, were expected to reach or over-reach during that year. With the Great Leap and decentralisation, there was a change in the planning system. Under the new system, called the 'system of planning with two accounts', two sets of production targets were to be used instead of one — at every level of government. There were to be two with the centre, one of which was the public plan and had to be fulfilled, and the other was expected to be fulfilled but not made public. This second set represented what each province after internal discussion was reasonably sure to reach and had to guarantee. Again, like the second set of targets, each provincial government also had its own second set of targets which the cities and the 'hsiens' felt confident they could achieve; and so on until the village level. As a result, a national quota would become bigger and bigger in the successively lower levels of the local government. "And when the national quota itself continued to be revised upwards in time with the glowing reports from the field, local targets had to be raised, *pari passu*, which, in turn, would induce a further upward revision of the national goal. Thus, the nature of the planning mechanism inevitably generated a great leap — in targets."[58] Obviously, this could not go on for very long.

From the outset, the theory of disequilibrium was inextricably associated with the involvement of the masses. Their role was counterposed to that of the managers and planners (who had no role now); and it was only by unleashing their creativity and initiative that the 'leap' in production would be achieved. The role of the masses is constantly invoked in the writings of this period.

> Objective reality constantly shows us that the initiative and creativity of the masses, and the new-born forces, collide with the old things every minute and every hour, challenging the old quotas, the old targets, the old regulations and institutions... in this context, the old equilibrium will certainly be broken and disequilibrium is bound to appear.[59]

The Great Leap Forward in Operation

Decentralisation and the Communes

The Great Leap Forward was closely associated with the process of administrative reorganisation which began in the winter of 1957 and which culminated in the establishment of the people's communes in September 1958. The new regulations on industrial control published in November 1957 recommended greater decentralisation and more autonomy to the lower echelons of administrative authority.[60] Clearly, over-centralisation in the management of industrial and commercial enterprises had led to complications and inefficiencies. In the past, the various industrial ministries had kept a tight hold over the operation of the enterprises under them. For example, their permission had to be obtained by any concern which wished to acquire fixed property worth more than 200 Yuan, i e, £ 30.[61]

By the middle of 1958, the entire organisation of economic planning, taxation, industry and trade was overhauled and the powers of the local authorities — provinces, municipalities, *hsiens* and *hsiangs* — were strengthened. In mid-1958, it was announced that 80 per cent of the enterprises formerly handled by the central ministries had been handed over to the local authorities. These included virtually all the light industrial enterprises and a large proportion of those under the Ministry of Heavy Industry.

Together with a degree of flexibility in their levying, local authorities now received the proceeds of certain taxes which had previously gone to the central government. They also received a share in the revenue of certain industrial concerns which had previously been under the central government. In return, the local authorities were expected to meet their normal expenditures themselves.[62] Further, in June 1958, the power to issue bonds was transferred entirely to local authorities which were to use them to raise capital for their industrial development. Finally, in July 1958, further measures were taken authorising the local enterprises to retain without reference to the central government,[63] for development purposes, the surplus profits obtained from the sale of their products and to make other readjustments in programmes of capital development already authorised.

Decentralisation occurred in agricultural planning as well. Instead of drawing up a complete agricultural production plan according to which agriculture was to develop, the State planning authorities in the locality now had only a 'farm produce collection and purchase plan'. Local units now also had relatively greater autonomy than before in directing the course of agricultural development.[64]

It is important to remember that the devolution of authority strengthened the powers of the local administration and of the party units within whose jurisdiction the enterprises now came — rather than of the enterprise itself. This is very significant; the considerations influencing the decision in favour of the former type of effect were political and ideological rather than economic. As such, the full implications of this decision will be discussed in the subsequent section. Here, suffice it to say that, during the Great Leap Forward the party, with its recently increased powers, almost completely replaced the managers and experts in all spheres of economic activity. In fact, planning, management, and technical knowledge, were functions which were now considered highly dispensable, and were to be replaced by the "spontaneous initiative and the creativity of the masses" — the role of the party cadre was to release and guide this "spontaneous initiative". Their particular role, however, can only be appreciated in the context of the pressure on them to increase production as much as possible. As we have seen, this drive to increase production was sanctioned by the Maoist theory of 'disequilibrium', and made possible by the system of competitive target raising. The consequent loss of all real statistical knowledge contributed even more to the autonomy of the local cadre *vis-a-vis* the centre; the illusion of high output figures made the central authorities quite complacent about the direction in which the Great Leap Forward was moving. The substitution of expertise

and management by the politics of party leadership and the 'mass line' is seen to be a major underlying theme.

In retrospect, it seems that the decentralisation measures served merely as a preparatory stage for the final establishment of the communes; for, a strong multi-purpose local unit fitted in very well with the pattern of administrative decentralisation. The communes, however, combined their economic powers with political and administrative authority; they were to be "both basic economic units and basic units of State power".[65]

The people's communes were to be multi-purpose units for the management of agricultural, industrial, commercial and military affairs. They were to achieve this multi-purpose nature by absorbing or amalgamating the basic level organisations operating in the countryside: the agricultural producers' co-operatives, the co-operatives for supply and marketing, credit, and handicrafts, and the local branches of the People's Bank.[66]

The communes were also expected to represent a new phase in the progress towards communism. They were, in fact, the 'sprouts of communism'; for, the transformation from 'collective ownership' to 'ownership by the whole people' had begun. Partial introduction of the communist principle of distribution — from each according to his ability, to each according to his need — by which part of the income of the commune members was to be in the form of free supplies distributed on the basis of need rather than work, and drastic reduction in the private property among the peasantry, both reinforced this notion.

The organisational structure of the communes was based on the principle of "unified management and divided control". There was to be a congress of commune members which was to be a fully representative body, and this congress would elect an administrative committee under which various subsidiary committees would look after the various functions of the commune. Under the leadership of the administrative committee of each people's commune, there were various departments: agriculture, water conservation, industry, communications, and so on. Here again all responsible officials of the commune — the director, the deputy director, the departmental heads of the administrative committees — were generally party members.[67]

The commune was also divided vertically for purposes of management. Generally, a commune was divided into certain production areas, each one corresponding roughly to the size of the previous co-operative. These areas were entrusted to production brigades which were further subdivided into several production teams — each one corresponding roughly to a village. Though the brigade was responsible for the management of the production area entrusted to it, in fact, the central commune administration fixed the yearly and quarterly production targets and other tasks for each of the brigades. Although in the actual organisation of production and in the actual utilisation of labour and other means of production, the brigade was theoretically allowed a certain degree of flexibility, the commune administration maintained a strict supervision over its work. Reports of excessive centralisation within the commune revealed that it was because control over a few activities was centralised (as on large-scale labour projects) that it became difficult to prevent gravitation of all other decision-making powers to the centre.[68] Gradually, however, as it became increasingly evident that the methods of production in Chinese agriculture necessitated management by small units, the brigades and later the teams were given more and more autonomy.

What were the relations between the communes and the State? Apparently, the State seemed to have snapped all links with the commune. Apart from having to pay the required taxes, the commune maintained only ideological links with the State — through the institution of the party. However, the communes were not completely autarkic, and a good deal of trade went on both among the communes and between the commune and the State.[69] Prices of commodities exchanged played an important role in the economics of the period but here we shall study the nature of this financial relationship.

The State preserved the right to price all commodities exchanged between the State and the communes, all commodities exchanged among communes, and all products distributed and commodities supplied within the communes. On the question of what prices the State should charge for the manufactured goods which it supplied to the communes, it was decided that wholesale prices should be charged. The decision was somewhat inexplicable, for, in the same article it was observed that, "the production costs of manufactured goods of the people's communes will be higher than that of manufactured goods made by the State-owned factories."[70] In our study of the commune industries, we shall see how this policy decision sabotaged the very first principle of the sectoral allocation function of commune industry — the principle that it serve agriculture. Initially, the pricing of commodities exchanged among communes was left to the communes themselves. By December 1958, it had become apparent that the free fixing of prices by both the parties would lead to the revival of "the capitalist way of business which signifies blind production regardless of plans".[71] For this reason, it was decided that the prices of commodities exchanged among the communes would be subjected to the unified price policy of the State. Evidently, 'departmentalism' — that is, party cadres in a commune thinking only of the 'narrow interests' of their own commune[72] — could not be overcome only by ideological controls.

The chief source of investment for the commune[73] was the public accumulation, or reserve fund, of the commune; the welfare fund in the commune budget was used for welfare purposes. During the Great Leap Forward, targets for savings, like all other targets were raised to exaggerated levels. For example, in Hupeh it was recommended that accumulation should account for between 40-70 per cent of total income; this corresponded to marginal rates of saving of between 40-90 per cent of the expected rise in income in 1958 over the previous year. Such rates were clearly unreasonable, and the agricultural crisis of the following years soon forced a reappraisal.[74]

One of the innovations of the commune movement was the supply of free meals in the collective mess halls.[75] Though collective feeding was designed to promote the spirit of collective and communal living, it also played the important role of freeing women for collective work in the fields, even as the men were involved in the variegated activities of the diversified rural economy. Moreover, it now became easier to enforce rationing and save fuel, and harder for the peasants to hoard grain. Nurseries and creches were also established, in order to foster the habits of communal living and to free women for labour outside their homes.

One of the most widely publicised activities of the communes was the construction of irrigation and water conservation projects. The purpose of these constructions was to substitute capital equipment and technical expertise by the unskilled labour of the peasant masses. The new communes became the instrument for effecting this transfer of peasant labour to the water conservancy works. Even before the end of 1958, great claims were made regarding the construction of these projects. In October 1958, the Ministry of Agriculture issued its communique stating that,

> A total of 480 million *mou* was added to China's irrigated land area between October 1957 and the end of September 1958.[76]

The major objective of these efforts was to protect Chinese agriculture from abnormal weather conditions, to eliminate by this single stroke the root cause of economic instability. From this point of view, the campaign was a limited success. Lack of expertise coupled with overenthusiasm of the cadres had led to much waste. This was officially acknowledged by none other Chou En-lai in his report to the Second National People's Congress in August 1959, when he stated that only 33.3 million hectares of farm-land could be properly irrigated (as against the 1959 claim of 71.3 million hectares). Another 13.32 million hectares could benefit from irrigation, if adequate levelling of fields and digging of ditches were carried out.[77] Apparently, much of the reservoir construction work was destructive of the soil, the regular functioning of rivers, and of existing irrigation systems. The reason was that the upsurge in water conservation had not been based on geological surveying, technical back-up, and consistent planning. The hasty and uninformed building of dams, pools, ponds, reservoirs, and canals, resulted in alkalisation of the soil over a wide area. Nevertheless, at the end of the operations, there was an increase in the acreage of land brought under cultivation beyond the pre-1958 level.

According to official reports, 1958 witnessed a phenomenal increase in agricultural output:

> Total grain output is estimated to be about 750 billion catties, about 380 billion catties over 1957's billion catties. Total cotton output is estimated to be about 67 million piculs, about 34 million piculs over 1957's 32.8 million piculs.[78]

Moreover, it was claimed that these increases were more due to a boost in the output per unit area than an expansion in acreage. Although the claims were later revealed to be highly exaggerated,[79] favourable weather conditions combined with the tremendous effort at intensive cultivation — neatly summarised in the 'Eight-word Constitution': water conservancy, fertilisers, deep ploughing, superior seeds, close planting, crop protection and field management — did lead to an unprecedented increase in output. However, in 1958, for the first time, there was a marked difference between the biological yield and the barn yield. A portion of the yield could not be harvested because of the diversion of labour to work on rural industries and other non-agricultural operations. In March 1959, it was admitted that "the labour-power available for the increased agricultural production is estimated at only half the estimated requirements".[80] However, the solution envisaged did not as yet involve the redirection of labour into agriculture, but urged the cadres to increase the productivity of the existing labour in the fields. The target was to save labour-time through innovation of tools so as to make up for 50 per cent of the shortage of agricultural labour power.

Secondly, it was maintained that by strengthening labour management and improving labour organisation, "a successful way of developing labour initiative, tapping latent labour-power, and raising labour efficiency"[81] could be discovered. It was estimated that this method would "save labour-time sufficient to make up 30 per cent of the shortage of labour-power". It was not until late 1959 and 1960, when China was faced with an agricultural crisis, that labour was redirected into agricultural activities. However, the assumption in the two passages quoted above, that 30 per cent of the shortage of labour-power could be made up by increasing labour efficiency reveals a crucial fact about the Great Leap Forward. It is that labour-power was not fully utilised. Why this was so will involve a discussion of the incentive system of the Great Leap Forward.[82]

Incentive Policy

While it cannot be said with any certainty that there was a decline in the productivity of labour in agriculture and industry in 1958 (though this was almost certainly so in 1959 and 1960),[83] the fact that labour could not be fully utilised can be traced to the incentive policy of the Great Leap Forward. This policy was, in turn, tied up with the final object of the new strategy — which was to channel the increases in production for rapid capital formation into the modern sector rather than allow them to be dissipated by increases in consumption. To achieve these ends, the incentive system of the period combined a system of non-material incentives with a set of policies which kept incomes relatively low and had a tendency of level them off.

The system of remuneration in the communes was, basically, the time-wage system rather than the piece-rate system of the earlier period. Under the time-wage system, each worker was assessed for skill and 'attitude' to labour and then assigned to a particular grade. For each day's work there was a specific number of work points ranging from 4 to 10 points. "In other words, the lowest grade farmer receives 4 points and the highest grade 10 points for performing a ten-hour day's work, regardless of quantity of output".[84]

The dissociation of reward from effort was not bound to create disincentives by itself, for the 'attitude' of the worker (or peasant) was itself determined by his commitment to increase his effort. Moreover, whatever the method of payment, the crucial factor was the actual value of the unit of payment. This would depend on several factors determining the total amount of money (and supplies) available for distribution among commune members.

The total gross income of the commune was dispensed as follows: First, certain cost deductions were made, such as costs of production and management, seeds, reserves, etc. Then, taxes and compulsory deliveries which the communes made to the State were deducted. The net income left, after these deductions, was then available for distribution. One portion went to the 'accumulation fund' for the commune's own investment; another went to the welfare fund for members' social insurance, and other needs. Yet another portion, the supply part of wages, had already been used up throughout the period to meet the members' basic food requirements.[85] The residual income was what was paid out in cash or kind according to the differential claims of individual members.

Clearly then, one or more of the various claimants to a share in the commune's income were primarily responsible for keeping peasant motivation at a low key. Direct taxes imposed by the government on the communes were not very high during the Leap Forward: In fact, national agricultural taxes declined from a high of approximately 25 per cent of national total taxes to 16 per cent in 1959. For 1960,

Twenty seven years of Independence

Twenty years of significant service

Born in 1954, Hindustan Steel Limited was perhaps the largest and the boldest venture of Free India. We believe we have made some contribution to our coming of age as an industrial nation; we have helped to develop our material and human resources, our self-confidence and self-reliance.

GROWING INDUSTRIES

To India's growing industries, as on March 31 1974, the Bhilai, Rourkela and Durgapur Steel plants of Hindustan Steel have supplied over 12.8 million tonnes of pig iron, one million tonnes of ingots, 7.3 million tonnes of semis, and over 22 million tonnes of finished steel.

We have also supplied about 5.6 million tonnes of coke, a million tonnes of coal chemicals, and 5.3 million tonnes of miscellaneous by-products that include middlings, slags, dolomite, etc.

To the agricultural industry we have so far supplied over 1.8 million tonnes of calcium ammonium nitrate and 550,000 tonnes of ammonium sulphate—fertilizers, manufactured from by-products vital to improving India's agricultural yields. Besides, we have ensured a steady supply of steel for irrigation projects, construction of dams, deep tubewells, silos, farm equipment and other agricultural uses.

The total sales value of all these materials amounts to approximately Rs 3594 crores excluding exports.

The approximate break-up of finished steel despatches from the public sector plants as on March 31 1974 is as follows

	Quantity in million tonnes	Percentage of total despatches
A. Defence	0.88	3
Railways	4 50	20
Other Government departments	4.94	22.5
Total (A)	10.32	45.5
B Industries	6.97	32
C Stockists, including HSL stockyards	4.95	22.5
Total	22.24	100

The Alloy Steels Plant has supplied 20.6 thousand tonnes of ingots, and 188.2 thousand tonnes of finished tool, alloy and special steels valued at Rs 88 crores to the country's sophisticated industries such as automation, aviation, atomic energy, ordnance factories, machine tool industries, etc.

Between October 1970 and March, 1974 Hindustan Steel has imported a little over 2 million tonnes of steel to meet the urgent needs of priority industries.

To ensure a steady supply of vital inputs like coke, iron ore, limestone, etc for its plants, Hindustan Steel has developed its own captive mines, quarries and washeries, which have produced millions of tonnes of the materials required.

DISTRIBUTION

A Central Sales Organisation, backed by a network of 20 stockyards throughout the country, has been set up to ensure prompt delivery and equitable distribution at reasonable prices. The total sales turnover since inception, including exports, has been Rs 3886 crores.

Since the Bokaro Steel Plant went into operation in October 1972, over half a million tonnes of pig iron valued at Rs 31.5 crores, have also been supplied through our Central Sales Organisation to meet the country's demand.

FOREIGN EXCHANGE EARNINGS

Hindustan Steel entered the export market with pig iron and semis in 1959; subsequently stepped up its exports to cover a wide range of products particularly when there was a decline in the domestic demand for steel. So far over 6 million tonnes of pig iron, ingots, semis, finished steel products and coal chemicals have been exported to over 40 countries in six continents against international competition, earning nearly Rs 241 crores (FOB) worth of valuable foreign exchange for the country. Since commissioning of its first blast furnace, Bokaro Steel has exported through Hindustan Steel, pig iron valued at Rs 11 crores (FOB).

MANPOWER DEVELOPMENT

Hindustan Steel has directly employed and developed a new generation of over 130,000 industrial workers and managers and generated new skills and technological disciplines which are a basic necessity for the sustained growth of any modern steel industry.

CONSULTANCY SERVICES

The realisation that the development of an indigenous consultancy, design and engineering service was imperative to Indian Steel led Hindustan Steel to establish in 1959 its Central Engineering and Design Bureau. It is now an independent Company: "Metallurgical and Engineering Consultants (India) Limited" (MECON)

MODERN TECHNOLOGY

Our plants incorporate the latest developments in steel like the LD Process, sintering, etc. Other technological innovations to increase steel productivity and conserve scarce raw materials are being taken in hand. Some of these are: high top pressure, auxiliary fuel injection, oxygen lancing, slag granulation, pelletization, beneficiation of iron ore, etc. A nucleus of Research and Development has been formed.

In keeping with market demand, product diversification and rationalising of various sections have been initiated. We have introduced in the market cold rolled galvanized sheets, plain galvanized sheets in coils, electrolytic tinplates, heavy rails to Indian and international specifications, etc.

FINANCIAL POSITION

This is the financial position of Hindustan Steel Limited as of March 31, 1974:

	Rs.(in crores)
Total income	4284
Less: Excise duty and Freight outward	289 544
Net income	3451
Total expenses	2896
Leaving Cash surplus	555
Stock of finished and semi-finished products	151
Total surplus	706
Out of this, Government dues on interest	269
We are left with	437
But had to account for depreciation	683
	(—) 246

In the year 1973-74, we have made a profit of Rs 4.71 crores, thus reducing the previous under-provision of depreciation to Rs 246 crores. This represents our accumulated loss so far. From our cash surplus, we met our working capital needs as well as re-invested Rs 118 crores on additions and balancing facilities, and repaid long-term and short-term Government loans to the extent of Rs 170 crores. Our outstanding Government loans are Rs 374 crores.

Currently, our plants have to provide annually depreciation of about Rs 69 crores and interest charges of about Rs 24 crores, that is a total of Rs 93 crores. Cost escalation of inputs last year was estimated at Rs 38 crores. Excise duty paid in 1973-74 was Rs 101 crores, as against Rs 96 crores paid in the previous year, and yet, significantly, the per tonne steel price in India is way below world steel prices.

WHERE WE STAND TODAY

Today, Hindustan Steel Limited is 20. Young yet mature. To get where we are, we have had to struggle hard and overcome many obstacles including our own inexperience. Harder struggle lies ahead because as our production increases, the infrastructural imbalances—raw materials, transporation, power—come in the way. But we are confident of our progress.

It is the vitality of youth and the faith in our future that have helped us along, even as it has helped along our nation. As we take stock and look to the future, we steel ourselves for greater efforts. With the formation of the Steel Authority of India Limited, we feel confident of more efficient, more productive service to India.

HINDUSTAN STEEL

HSL 8069

it was planned that they would decline to 13.5 per cent.[86] However, Sidney Klein insists that the estimates for *real* taxes during the Leap Forward were much greater. The implicit taxes included: compulsory sales to the State of the commune's agricultural surpluses at low fixed prices; peasant repurchases of a substantial part of these agricultural surpluses at higher prices; and voluntary deposits by peasants in State-controlled banks which could be withdrawn only with difficulty.[87]

However, Klein's contention, that "the true tax bill of the peasants was at least twice the maximum rate estimated by the CCP, and most probably about three times — which is to say, at least 26 per cent and most probably 40 per cent of total agricultural output",[88] is unsupported by any evidence and remains an entirely impressionistic statement. An increase in the State revenues from the agricultural sector was, indeed, the intention of the Great Leap Forward. But it is unlikely that this was so abnormal as to constitute the most important factor in determining peasant motivation.[89] Government taxes were probably a contributory factor, but since no estimates of the real tax bill are available it is not possible to postulate it as a major one.

What seems more likely to have played this role are the targets for savings — or the accumulation funds within the communes — which, like the other targets, were raised to exaggerated levels. We have already noted the effects of this extraordinarily high rate of savings and the reappraisal which followed. With 40 per cent to 70 per cent of the total income being directed into the accumulation fund in 1958, the amount left for distribution was insubstantial; thus the wage technique did not provide a strong material impetus to the workers.

Also, the lower the value of a work unit, the more attractive will work on side-line activity be. But with the advent of the communes, private plots and private income-earning activities were no longer regarded as an important auxiliary to the socialist agricultural economy, but as a serious contradiction; and these were almost completely abolished — in any case, the the free market where these products were sold had already been closed earlier. It was maintained that "private agricultural activity had grown so much as to constitute a threat to collective agriculture".[90]

Apparently, the drive to communise 'private property' exceeded all limits and as early as in December 1958 the leadership found it necessary to exercise a restraining hand.[91] Overenthusiastic cadres, who had attempted to communise all the livestock and personal belongings of the peasants including clothes, quilts, household utensils and *savings*, were now severely criticised. Cadres were now instructed to define the boundaries between individual and collective agricultural activity. The severity of the injunction was hardly surprising, for the ban on subsidiary agricultural activities had caused considerable economic dislocation. No alternative arrangements had been made for the pursuit of these activities, which not only were a source of additional income but also provided some necessary items of everyday consumption. The shortages which developed, of pigs, poultry, vegetables, straw sandals, coir brooms, baskets, utensils, etc, caused considerable dissatisfaction among the peasantry.[92]

Consequently, the December 1958 resolution of the Central Committee laid down that in the communes all privately owned means of livelihood (i e, houses, clothes and furniture) together with bank and credit co-operative deposits should remain in private ownership in perpetuity. So long as it did not interfere with their collective work, peasants were also permitted to continue their small-scale, domestic side-occupations. But not until the reopening of the rural markets, were the peasants could sell their products, and till the introduction of flexible regulations regarding peasant work-attendance, did the private plots and sideline activities once again become important sources of supplementary income for the peasant or contribute to the recovery of Chinese agriculture.[93]

Non-material or ideological incentives are a distinctive characteristic of the Maoist approach, and their role as a political weapon which seeks to forestall the undermining of socialism will be discussed in the next section. However, they also have a vast potential of increasing output at very low costs, and as such they were indispensable to the ultimate objective of the Great Leap strategy. The efficacy of emulation drives and mass campaigns was obviously determined by the degree of politicisation of the masses. In this context, the role of the party, as the agency which made possible the implementation of these campaigns and 'drives', during the Great Leap assumed central importance. However, other social and political agencies, such as trade unions, youth organisations, and women's groups, were also involved in this effort.

In 1958 and 1959, individual workers were spurred on by a variety of formal and informal rewards, which aimed to raise the self-esteem of the honoured, and by inspiring innumerable others to improve their performance. These rewards included titular honours such as 'model' or 'labour hero', meetings with Chairman Mao and other celebrities, etc. Group competitive incentives were often like those employed to encourage individual output: the success of a unit in surpassing the others was rewarded by a similar variety of honorary awards.[94]

Moreover, mass meetings were held to discuss and review production experiences and concrete programmes for raising labour productivity; to exploit the 'wisdom of the masses' on how to increase output and stimulate innovations; to raise the level of backward units through disseminating the experiences of the advanced units; and to rectify individual work attitudes through criticism and self-criticism. Often, combined with the emulation drive, mass participation was used both on large-scale water conservation projects and on lesser activities.

Commune Industries

The *professional* and political leadership in the local small-scale industries, developed or taken over by the communes, was in the charge of the party leadership in the commune.[95] This leadership was given the responsibility to insure the completion of the tasks of industrial production assigned to them by the federation of the communes, and had to follow the *hsien* plan for distribution of products. It was claimed that, in this way, "the centralised and unified leadership of the *hsien* federation of communes will be insured, and the activism of the basic level communes in operating industrial undertakings will be adequately called into play".[96]

Under the leadership of party committees, commune factories set up factory administrative committees and workers' conferences, which met regularly to check the implementation of plans and to discuss important questions in the factory. The tendency was to eliminate, functionally, the gap between production workers and administrative personnel. Even while this may have been so, the activities of the commune industries were *directed* and *controlled* by the party authorities outside the factories and in the commune itself. Generally, there were two important means through which this control was maintained: the existence of a party unit within the factory — whose powers were immensely strengthened at the expense of the managers and experts during the Leap Forward — provided the ideological channel through which this control was extended and maintained; secondly, the control of commune industrial finances was entirely in the hands of the commune leadership. Commune finance departments allocated production funds to these factories, and the factories were bound to use these funds in accordance with the financial plans of income and expenditure. Except for a definite amount for reserve funds — about 20 per cent — the factories deposited all their funds in the commune credit departments. Also, all transactions between factories had to be done through the supply and marketing departments of the commune.[97]

The party being in power in the commune factories, it might be expected that the goals of the regime would be fulfilled, i e, that the local, small-scale industries would concentrate on serving agriculture — providing it with adequate producer and consumer goods. However, a variety of other factors combined to undermine the *raison d'etre* of commune industry.

In his study, Riskin concludes that only half of the gross production value of the commune industries came from components serving agriculture. "This observation points to an essential property of commune industry from the viewpoint of commune members — it was the major source of income at the commune level. In 1959, it was estimated that 70 per cent of the income from commune-level enterprises in the average commune came from industrial enterprises. Indeed, many of the hortatory articles appearing in the Press at that time strongly emphasised the ability of the communes to earn distributable income by developing industrial enterprises."[98]

Undoubtedly, it was the pressure on cadres to increase the profits of their collective enterprises, which determined the kind of goods to be produced. Commune authorities concentrated their efforts on operating a few industries that were highly profitable; tools and fertilisers needed for agricultural production were often neglected. In a sense, the methods of the Great Leap Forward had defeated the objective of its economic strategy: The pressure to increase profits, through the agency of competitive target raising, had made cadres blind to the direction of production. Loss of statistical control with the centre, moreover, prevented early governmental intervention in this process. At the same time, the financial autonomy of the communes gave them enough leeway to choose the most profitable line of investment. Such a choice would not have been contradictory to the policy of 'serving agriculture', had it not been for the fact that the non-commune industries undersold the commune industries in just those commodities which they were expected to provide to the rural sector.[99]

The tendency of the commune industries to concentrate on the production of the most profitable commodity — in violation of the general policy prescription — also led to neglect of consumer goods production. In 1959, Chao Hua-ling wrote that, even though light industry developed at a rapid rate during 1958, nevertheless, "because of the phenomenal increase in agricultural and raw material output, the existing capacity of light industry was not able to cope with the increased supply".[100] The increased supply was not, however, the only reason for the shortfall in the supply of consumer goods. 'Departmentalism' (the tendency to concentrate one's efforts only for the increased production of one's own industry) was under fire almost from the beginning of the commune movement:

> It is understood that during the last few months some enterprises exchanged goods between themselves using raw materials and equipment as means of exchange and stockpiling . . . Under the impact of goods exchange, transfer plans and supply contracts for some commodities were disturbed and production order was affected.[101]

But in 1958, it was still felt that the contradiction was to be resolved not by resorting to balanced and planned production but by "exploiting all kinds of favourable conditions and relying on the masses for pressing forward production, tapping latent power, and economising consumption."[102] Imbalance was still to be the order of the day.[103] Indeed, not till the middle of 1959, when the principle of 'imbalance' was silently revoked, was the problem given adequate consideration and funds were allocated to this sector.@

The technology and resources utilised by the commune industries led to some waste. Ch'en Yun himself testified to this when he talked about the need for developing industries discriminatingly:

> @ However, once greater co-ordination was reintroduced in the sphere of industrial production, the small-scale industries proved to be the most lasting achievement of the Great Leap Forward.

they were now to be developed only near the areas of raw material supply and were to be well linked with their markets.[104] Transportation bottlenecks also developed during 1958 and early 1959 with the prodigious and unplanned increases in output. However, the strain on transport facilities was at least partially overcome by the development of the native and traditional modes of transportation.[105]

Other observers have noted many successes as well of this experiment. Charles Bettelheim[106] refers to the invention of plants for extracting shale-oil which were built within three days and cost only 300 Yuan. Their annual capacity was only 100 tons of crude oil each, but since there were over 10,000 such plants, they produced 1.2 million tons of oil annually — about four-fifths of the total output in 1957. Wheelwright and McFarlane provide a number of instances where savings in construction and operation costs were effected without affecting the quality of the product.[107] But, significantly, the successful examples are of those low-cost factories which were supposed to *supplement* the output of the larger industries or act as auxiliaries — rather than of factories producing independently for agriculture.

Where the 'choice of techniques' principle floundered was in its intention to utilise labour resources. As we have noted, labour in the commune industries came from the agricultural and handicraft sector. Donnithorne has estimated the extent of labour diverted from handicraft activities.

> By May 1959, only 13.3 per cent of the five million handicrafts co-operative members of 1956 were reported to be still in co-operatives of the old types. Slightly more (13.6 per cent) were in units amalgamated to form co-operative factories, 37.8 per cent worked in what had now been designated locally-controlled industry, while 35.3 per cent were employed in commune factories.[108]

What is significant is that the labour *time* taken up in the commune industries was at the expense of the production of subsidiary goods and the necessary handicrafts. The situation in the consumer goods industries (both large- and small-scale) did not help, in any way, to compensate for the shortage of these products and, by late 1959, the leadership was forced to make a reappraisal. In the next few years, strong official encouragement was given to the return of handicraftsmen and others to their old occupations.

The Retreat

We have already referred to the retreat in the various aspects of the Great Leap Forward policy. The ret-

reat occurred at different points of time for the various activities because the loss of statistical control and the disruption of the planning system made it very difficult for the leadership to know the actual, or incipient, problems which the local organisations faced. Besides, the exaggerated output figures of 1958 confirmed their belief that the principle of imbalance was working out fine. The problems which were beginning to surface, even before the end of 1958, were thus seen as separate and specific aberrations and were, therefore, tackled individually — i e, whenever every manifestation of the principle of disequilibrium got out of hand.

In agriculture, the December 1958 resolution of the Central Committee attempted to rectify the general disincentive effects of communisation, by passing on control of production and incomes to the lower level units. The resolution reaffirmed that it was the brigade which was to organise agricultural production and the team which was to arrange labour allocation. But it was not until the beginning of 1961 that ownership and hence calculation of profit and loss and wages was passed down to the production brigades. The semblance of a rural free market was reintroduced in September 1959, and in the summer of 1960 private plots were restored and limits were imposed on the labour time required from commune members.[109]

By the autumn of 1959, disillusionment had set in about the efficiency of communal enterprise in constructing water conservation projects. Official opinion now swung toward control being vested in the hands of larger units — such as the *hsien* which might be better placed to muster mere skill and executive ability than was available to the communes.[110]

The realisation that the incentive policy should be made more realistic was also gradual. The disincentive effects of the free supply system was sought to be rectified by drastically contracting the scope of this system and emphasising the need to distribute according to the labour of the individual. It was now maintained that

> If we simply adopt the method of forcing equal distribution to eliminate such differences (as may exist under socialism) we shall commit the mistake of egalitarianism, which will only play a negative role that undermines social production and the movement for people's communes.[111]

Quite simply, the partial introduction of the principle, 'from each according to his ability to each according to his need' was being replaced by the principle 'to each according to his labour'. By 1961, the 'free supply' system came to an end, time wages were abolished, and the piece work form of remuneration was restored.[112] The real problem, which concerned the *amount* of funds available for distribution got the attention it deserved only towards the end of 1959. Donnithorne observes that by 1960, however, the proportion of accumulation and welfare funds together dropped to about 5 per cent of total income, from a high of approximately 50-60 per cent in 1958, thereby leaving a much larger share for consumption purposes.[113] Even as early as in 1959 considerable dissatisfaction was expressed about the common mess halls.[114] But they remained in operation till as late as 1961, chiefly because they performed certain indispensable functions like freeing labour power and effecting necessary savings. But during the hard years of 1959-60, when rations were cut, corruption among mess workers forced their closure, and peasant households re-established themselves as the basic units of consumption.[115]

The evidence we have reveals that, through the year 1959, considerable opposition to the policies of the Great Leap Forward was expressed, though this was never openly or explicitly directed against the Maoist leadership. The sporadic retreats we have observed, represented the beginnings of a piecemeal victory for the opposition. However, by the end of the year, the agricultural crisis resulting from a combination of disastrous weather conditions and mismanagement during the Great Leap Forward, forced the need for an urgent resolution of the problems. By 1961, there was barely any trace left of the original policies of the Great Leap Forward.

One factor predominantly responsible for the failure of the Great Leap Forward was cadre mismanagement and lack of expertise — whether in determining the rates of savings and consumption, in industrial production, in the sphere of subsidiary production, or in the allocation of labour. The removal of all constraints and the simultaneous exercise of pressure on them to increase production was sanctioned, as it were, by the theory of 'disequilibrium'. Moreover, by the decentralisation measures, their powers were greatly increased at the expense of the powers of the managers and the experts.

It is not as if this removal of constraints and increase of powers can be attributed solely to the need for rapid development. Rapid development is not necessarily incompatible with planning and expertise. The role of the party in unleashing the 'spontaneous initiative of the masses' is to be viewed also as an attack on the role to date of the managers and the technocrats. Thus, in order to comprehend the Great Leap Forward in its totality, especially the crucial idea, which ultimately sabotaged it, it is essential also to study the theory and practice of Maoist anti-bureaucratism.

Politics of the Great Leap Forward

The Great Leap Forward was a particular manifestation of a general trend. In order to study the Leap Forward meaningfully I have found it necessary to try to comprehend that trend itself Formally speaking, this trend towards de-Stalinisation can be said to have begun with the decisions taken in the Eighth Party Congress in September 1956. In this section, our study will begin from this date and end with the retreat from the Great Leap Forward strategy. It would be useful to bear in mind two phases in the political developments of this entire period: first, from the Eighth Party Congress till the end of the short-lived Hundred Flowers movement; second, the period beginning with the Anti-Rightist Campaign till the end of our period.

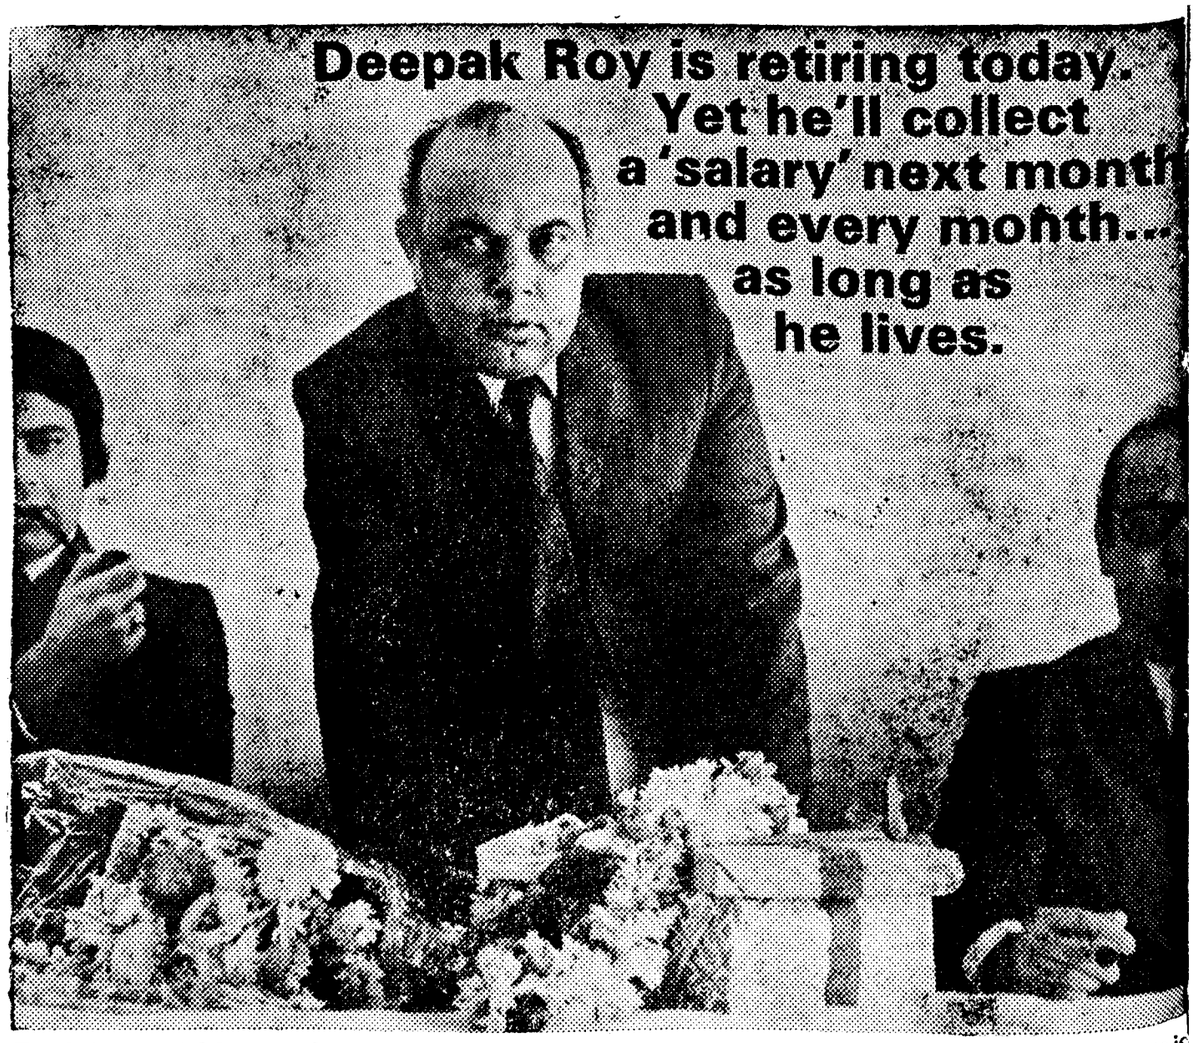
At the Eighth Party Congress it was unanimously felt that, in future, more emphasis would have to be put on 'democracy' in general.[116] During the earlier period, all organisations in China had used Stalinist techniques; they were a part of the model itself. Now, however, not only were these considered obsolete, but to some extent counter-developmental. The process of de-Stalinisation which had begun in China, even before 1956, was not peculiar to it. All over the socialist bloc significant reforms in the system were taking place; though the immediate events leading to these reforms varied from country to country, the techniques affected were in all cases the same, *viz*, extreme administrative centralisation, strict one-man management, control through parallel competing bureacracies, and rigid intellectual and professional *regimentation*.[117]

The major instrument of the Stalinist model of development was its administrative structure, and any reform of the system would necessarily have to effect this structure. In the People's Republic before the de-Stalinisation measures, the principle of administration was vertical rule.[118] This was a highly centralised system where one agency had full policy and operational control over all units of organisation within its jurisdiction. Commands flowed directly downwards and, conversely, lower level units were responsible only to the higher agency — the span of control and *responsibility* was, thus, direct and vertical. The central ministries ran a hierarchy of branch offices all over the country and these, in turn, directed the units of production under their jurisdiction. The principle of vertical rule was invariably accompanied by the system of one-man management to ensure unity of command.

These principles operated within the framework of a substantial rate of industrial growth on the one hand, and a steady tightening of labour discipline on the other. Strikes were prohibited; punishments were introduced for absenteeism, lateness, and negligence; and under the 'labour book' system, job changes were placed under the control of employers.[119] Moreover, managers were given sole power over piece work norms and over hiring and firing.[120] This kind of labour discipline, and the consequent absence of *independent* political institutions of the working class, was in the very nature of the Stalinist model which sought to find the sources of capital accumulation within the domestic economy. In China, where agriculture was incapable of generating adequate surpluses, the source of capital accumulation was increasingly sought in the modern industrial sector itself. In fact, the gap between wages, which remained static during the period before the wage reform of 1956, and increasing labour productivity, was sanctioned in the First Plan itself.[121]

However, the Stalinist model also engendered certain tendencies which were counter-developmental — not only for immediate objectives, but also for the long-term goals of the regime. Franz Schurmann observes that through the principle of vertical rule, not a few ministries created 'far-flung empires'. Notable among them were the Ministry of National Defence, the Ministry of Commerce, some ministries for the machine-building industry, and the Finance Ministry.[122] Within the enterprises, excessive centralisation manifested itself in the proliferation of instructions from above which were binding on the management of the enterprise. In his report to the Eighth Party Congress, Li Hsueh-feng attacked the principle of one-man management — and, implicitly, the system of binding instructions — for engendering bureaucratic tendencies. He maintained that managers lacked a sense of personal responsibility: they gave attention to the fulfilment of production tasks alone. Moreover, instead of encouraging 'persuasion, education, and administrative discipline' in mobilising the workers they often used punitive measures to maintain discipline. In no way did they inspire the workers and rouse their creativity.[123]

The counter-developmental tendencies inherent in a completely bureaucratised structure were buttressed by the system of incentives. For reasons mentioned earlier, the average real wage level of the Chinese workers did not rise substantially during the First Five Year Plan. In fact, real wages declined somewhat during 1954 and 1955, as the value of a 'wage point' rose less than most other prices — in spite of considerable advances in productivity.[124] Moreover, the workers possessed no institutional channel through which to voice their demands.



Besides, for the sake of economic development, it became necessary for the regime to secure the specialised services of the professional stratum of managers, technicians, and other economic administrators — people who had to be given privileges if they were expected to contribute their services, yet whose emergence as a privileged class would subvert the very goals of socialism. As early as in 1953, B Shastri of the Praja Socialist Party of India observed that workers were paid 50-60 wage units a month, while a factory manager received 2,750 wage units.[125] And even so, the technocrats resented the authoritarian methods of the system which they perceived as giving them little leeway.[126]

It seems likely that this professional stratum formed a major pressure group to demand reform of the system. An important group at the other extreme consisted of the militant ideologues whose policies were designed to eradicate the difference between mental and physical labour, to substitute moral for material incentives, and to subject the State machine to workers' control. From the outset it was evident that the kind of changes which the two groups sought were antagonistic and irreconcilable. Party secretaries who had made common cause with plant and factory directors in attacking administrative centralism learnt that their erstwhile allies were very reluctant to exchange the 'petty intelage' of ministers and planners for that of the local apparachitika. The cleavage was reflected at the top level as well, and as 1957 drew on, it became increasingly apparent. Nevertheless, a precarious balance was maintained between the interests of the two groups until the final rupture, which came with the decentralisation measures in November 1957.

If de-Stalinisation was essentially a response to domestic pressures it also received an impetus from events in the communist world — *viz*, the popular uprisings in Poland and Hungary. Significantly, the Chinese Government noted that the demands of the people of Hungary and Poland for freedom and democracy, equality and material well-being were 'completely proper'.[127]

It was against this backdrop that the Eighth Party Congress took place.[128] The Congress formally sanctioned the reform measures that had taken place earlier, notably the wage reforms of June 1956 (which we have discussed in Section I) and initiated a policy of general liberalisation. Even the constitution adopted at this Congress introduced greater inner-party freedom and greater elasticity[129] under collective leadership. Just as significant was the new policy towards the intellectuals and professionals. The admittance of ex-bourgeois intellectuals into the party was no longer barred. In fact, within a year, the number of intellectuals — of whom the managers, technicians and economic administrators formed an important part — in the Party rose by half.[130]

The 'Hundred Flowers' movement in the spring of 1957 marked the culmination of the liberalisation measures. Brief though it was, the reaction of the Maoists to the real opinions of the intellectual and professional groups undoubtedly shaped their notion of democracy and freedom, and, as we shall see, influenced the choice of the model of political and economic development — the Great Leap Forward. More immediately, the Hundred Flowers movement demonstrated the fragility of the alliance between the militant ideologues and the professional stratum mentioned earlier. In fact, the main target of the intellectuals was the Party, and they demanded fewer political controls, and greater independence and authority in professional matters. Critic-

Both he and his employer have gained through LIC's Superannuation Scheme.

LIC's Superannuation Scheme is the perfect incentive for your higher paid employees. Because it gets you a lot more in return. For one thing, it helps you attract and retain talented and experienced employees. And, when they are free from worries about the economic problems of Old Age, they will do better justice to their jobs. This means a big boost to your business efficiency, which will in turn mean higher profits.

The Superannuation Scheme enables an employee to retire, on the due date, with a guaranteed monthly income for life... or a guaranteed pay cheque for his dependents in case of his premature death while in your service.

Additional benefits to employees

- Income-tax concession in respect of employee's own contribution to the Scheme.
- The cash lump sum available in exchange of part of the pension is tax free upto limits specified by the Income-tax Act.
- The annuity or pension payable to dependents is exempt from Estate Duty to the extent of the equivalent of Rs. 15,000/- per annum.

Big gains for you

Your annual contributions to the Scheme are deductible as "Normal Business Expense"—so you save tax on your profits as well!

Moreover, the Superannuation Scheme is the kind of security your employees appreciate—so that their morale, efficiency and loyalty are maintained at a remarkably high level.

For further details, contact any of our Divisional Offices or Group an Superannuation Schemes Department, Central Office, LIC, Yogakshema, Bombay 400 020. Telephone · 296262.

ism focused on the exclusiveness of Party leadership, the methods of leadership, and the mistakes and excesses of the past.[131] This kind of opposition had a fundamental impact on the Chinese communists. They were now forced to confront the central problem in their conception of 'freedom' and 'necessity'. The dilemma, moreover, could not be disembodied from the question of political power and the nature of economic development.

At the leadership level, the differences that had emerged earlier, were transformed, after the 'Hundred Flowers' episode into two distinctly opposed sets of policies. The differences centred around the type of de-Stalinisation and the nature of the alternative model of development envisaged. For Mao and his group, the Hundred Flowers episode confirmed their instinctive antipathy towards bureaucrats and professionals. In their view, the imminent decentralisation plans should, at no cost, strengthen the position of this group; for, this would create the conditions for the emergence of new centres of power. During the Anti-Rightist Campaign that followed, the brief period of 'blooming and contending', the kind of freedom that the intellectuals had exercised was attacked as being petty-bourgeois and counter-revolutionary. For Mao, 'freedom' and 'democracy' now acquired a new meaning: it meant the 'unleashing of the spontaneous initiative of the masses', which meant the removal of all constraints on their creativity.[132] But since the Party was regarded as the conscious expression of the will of the masses, unleashing the creativity and initiative of the masses meant, in its most direct form, giving greater freedom to the Party at the lower levels. In the Maoist view, therefore, power to the people would necessarily involve concentrating the decentralised powers in the hands of local Party units.

Opposed to this was the view that power should be decentralised to the production unit itself, i e, to the experts and managers within the enterprise. This view was represented, in part at least, by Ch'en Yun.[133] The different types of decentralisation envisaged had profound implications for the kind of development that would occur. Putting decision-making powers into the hands of the producing units also involved the creation of external conditions for the autonomous exercise of such powers — *viz*, some form of market conditions. It has been an assumption among Chinese Communist economists that where production units are not subject to directive and regulatory controls, they will produce for self gain; they will increase output only if they can gain something in return. In other words, if the autonomy of production units, notably agricultural co-operatives and industrial enterprises is to be expanded material rewards must be given them as incentives.[134]

In fact, in his speech to the Eighth Party Congress, Ch'en Yun called for an expansion of the free market,[135] and it is not hard to see that the decentralisation measures proposed by him would have implied the creation of an economy not unlike the Yugoslav type. The decentralisation measures implemented in late 1957 and 1958, and the establishment of People's Communes represented decentralisation of the Maoist variety. The decision was rooted in the anti-bureaucratic climate of the times, and its logic entailed a shift away from material incentives and power to the manager-technocrat. As we have seen, the model of development, conceived by Mao, involved the mobilisation of mass initiative as the primary input for the construction of socialism. Moreover, they were to be spurred on purely by their ideological commitment — not only because material incentives tend to dissipate scarce resources, but also because the 'economic man' had no place in his world view.

The decentralisation measures replaced vertical rule by dual rule.[136] Dual rule meant that an agency was under the jurisdiction of two bodies on the same administrative level. It was a combination of vertical and horizontal control: one channel of command and information going up, and another going sideways. In other words, the powers of the local authorities — provinces, autonomous regions and municipalities under the direct jurisdiction of the central government, and below them, the lower authorities of the *hsien*, *hsiang* and later on, the commune — were to be increased.

Ideally, dual rule implied the effective division of authority between central and local governments; but during the Great Leap Forward, the local authorities — i e, the commune — dominated by the Party completely overshadowed the vertical chain. In fact, during the Great Leap Forward, all the affairs of government were managed by party committees. Branch agencies of the central ministries were greatly hampered in their operations by their inability to deal with the power of local party committees.[137]

In the field of management, the 'one-man management' system was replaced in 1956 by a system of collective responsibility — authority was shared by the party and the management.[138] In a sense, this was a practical manifestation of the alliance we have mentioned earlier. Policy-making powers were with the party committees, but the management still had the right to operate factories. With the termination of the Hundred Flowers movement the balance shifted in favour of the party cadres. The Anti-Rightist Campaign which followed marked the beginning of the tide against the professionals. It is to be noted that what started off as a movement against bureaucratism and 'subjectivism', was transformed at its peak during the Great Leap Forward into a movement directed against professionalism itself.

While the aims of the two movements may have differed — in that, whereas the Anti-Rightist Campaign sought to reform the ideas and rectify the work-style of the intellectuals, the Great Leap manifested a tendency to eliminate this stratum as a whole — the Anti-Rightist Campaign did not really end before the Great Leap; the two were part of one continuous process. The spirit of the Anti-Rightist Campaign and the techniques employed during it were carried on into the Great Leap Forward, and the Campaign submerged its identity in the larger movement.

The Anti-Rightist Campaign sought to reform the professionals by inspiring them with the politics of proletarian socialism. The technique employed to effect this was the *hsia-fang* ('sending down' or 'downward transfer').[139] Intellectuals and professionals were sent down, either to villages or to the production front of their enterprises, to participate in physical labour. As part of the Anti-Rightist Campaign *hsia-fang* was directed against the triple evils of bureaucratism, subjectivism, and sectarianism — all three being synonymous for any kind of activity "which departs from the masses and reality". Those in leading positions and separated from the masses were to devote their time to engaging in physical labour with the peasants and workers with a view to transforming their own work-styles and attitudes. As for the numbers of personnel actually sent down, one report indicates that, "during 1957, in the retrenchment movement, 100,000 cadres have been detailed to production posts, while 200,000 have been withdrawn to engage in ac-

tivities at basic levels."[140]

By the time of the Great Leap Forward, another report indicated that, in February 1958, the number of people sent down constituted the majority of the 1,300,000 total.[141] More important, between this date and September 1958, *hsia-fang* was transformed from a movement into a system. In other words, participation in physical labour by intellectuals, professionals, and technicians, was no longer to be a temporary affair, but a way of life — at least until the end of the Great Leap Forward. This move prepared the ground for the elimination of the professional group and their specialised services and for their replacement by the party. The process was best illustrated in the industrial enterprises. Prior to 1958, factories in communist China were three-tiered: The top layer consisted of those who directed the organisation — a party committee or a management council formulating policies. The policy was translated into operational commands by the technicians. And supervision of the implementation was done by the 'line-men'. These two groups constituted the middle tier — the professional group. Finally, the bottom tier of the organisation comprised workers.[142] During the Great Leap Forward, in Chekiang province alone,

> Cadres of 2,100 units in our province take part in labour and workers of 1,208 units take part in management; 3,861 cadres have been retrenched and sent down .... The proportion of administrative personnel to the total number of workers and office employees has, in general, dropped, from 15 per cent to 1-2 per cent. This is a new development of carrying out the mass line in industrial management.[143]

The *hsia-fang*, during the Great Leap Forward, sought to eliminate the middle tier of professionals and join the Party with the workers in the factories. The slogans of the period — 'politics takes command' and the virulent attacks against the 'fetishism of technology' — were a reflection of this trend. The middle management in industry were attacked, dismissed from their positions;[144] complex industrial designing and planning was reduced to simplicities which could be handed by the inexpert party cadres.

It is interesting to note that, in replacing the technical and professional intelligentsia with the party cadre, the Chinese Communists were doing more or less what Stalin did in the 1930s. But in China not enough 'red and expert' cadres were produced to match the technical staff that were trained in the Soviet Union. Consequently, the very notions of professionalism and expertise came under attack during the Great Leap Forward.

The Maoist vision also attempted to transform the 'organic solidarity' of the production organisations which had been engendered by the earlier system. The policies of individual responsibility, individual incentive, and division of labour, which existed during the period of the First Plan, produced a kind of worker who was merely an agent in the process of production, controlled by the system and without any inspiration to improve his efforts. During the Great Leap Forward, a new type of worker appeared on the scene: he was jack-of-all trades who could do a little of everything, in contrast to the specialist or master-of-one technique, who had only one narrowly defined skill.[145] At one level it was hoped, rather naively, that this could fill the expertise 'gap' created by the dismissal of the professional stratum. At another level, it was expected to produce a 'mechanical solidarity' among workers, who would now be held together — not by the division of labour constituting an aggregate of individuals but — by a knowledge of their role as the controllers of the process of production. The deeper meaning of this movement was indeed heroic. The Maoist vision held that the specialisation of skills produced a system which dominated man and distorted the human condition; hence the movement sought to attack the problem at its very roots. However, with the decline of the Great Leap Forward ideology, the movement, too, began to disappear; perhaps, it could only thrive in conditions where expertise was nominal.

In the State structures, as much as in the factory enterprises, there was a tendency to move away from regular procedure and formal management. Basic level congresses and State officials were by-passed like their counterparts in the factories; administrative tasks and professional management were now considered redundant. In fact, at the basic levels, the State apparatus was largely replaced by mass organisations, i e, by all organisations of workers and peasants, outside of the formal State structure, which gave political direction to their members.[146] Important among these were the trade unions and the rural production units. It need hardly be mentioned that these organisations were firmly controlled by the Party, through the placement of its members in leading positions.[147]

These mass organisations provided the effective location for mass political mobilisation and participation, which constituted the essence of the Great Leap Forward. An ideal illustration of how this worked is provided by the trade unions. In the trade unions, a primary organisation could be established in any enterprise or establishment with ten or more trade union members. In larger enterprises primary committees could set up subordinate committees at the workshop level and trade union groups on the basis of production or office units.[148] The creation of such small branches facilitated frequent meetings and direct personal contact between leaders and ordinary members. Since effective leadership in the union was in the hands of the Party, the small organisations provided the leadership with an ideal way of eliciting enthusiastic response for its policies. Under the guidance of the Party, workers would participate in discussions and come to conclusions as to what was the 'correct' line or decision — and why.

Moreover, the mass organisations were also used for political education. During the Great Leap Forward, there was an unprecedented effort to infuse the masses with a militant ideological spirit. There were two broad themes in this vigorous campaign: first, maintenance of constant vigil against bureaucratism and revisionism, and second, giving the call to achieve the high targets of the Great Leap Forward by going all out and making material sacrifices for an abundant and egalitarian future. The campaign utilised the methods of the earlier rectification campaign, and as Chou En-lai observed, made these methods a "permanent feature of our political life".[149] Mass meetings, constant discussion and debate, and Ta Tze Bao which were earlier used only for specific purposes now became during the Great Leap Forward the very heart of political activity.

More fundamental perhaps than any other changes, was the campaign to militarise the life of the peasantry, "to turn the whole nation into an army of soldiers". The aims of this campaign were clear: to maintain a vigil against 'revisionism' and to motivate the peasantry to increase production and make sacrifices. The aims conform to the themes in the campaigns analysed earlier. However, the militarisation campaign had a far-reaching impact on the

lives of the masses; for, actually, it attempted to change the very nature of their work organisation.

> The rapid development of agriculture simply demands that they (the peasantry) greatly emphasise their own organisational character, demands that in their work they act faster and in a more disciplined and efficient way, that they can better be shifted around within a broad framework like the workers in a factory or the soldiers in a military unit. Thus they have recognised that their organisation requires militarisation.[150]

This radical change in the organisation of the peasants' work meant a great change in their traditional working habits and attitudes. However, the unrealistic tempo and the pitch at which this transformation took place for over two years, foredetermined its collapse.

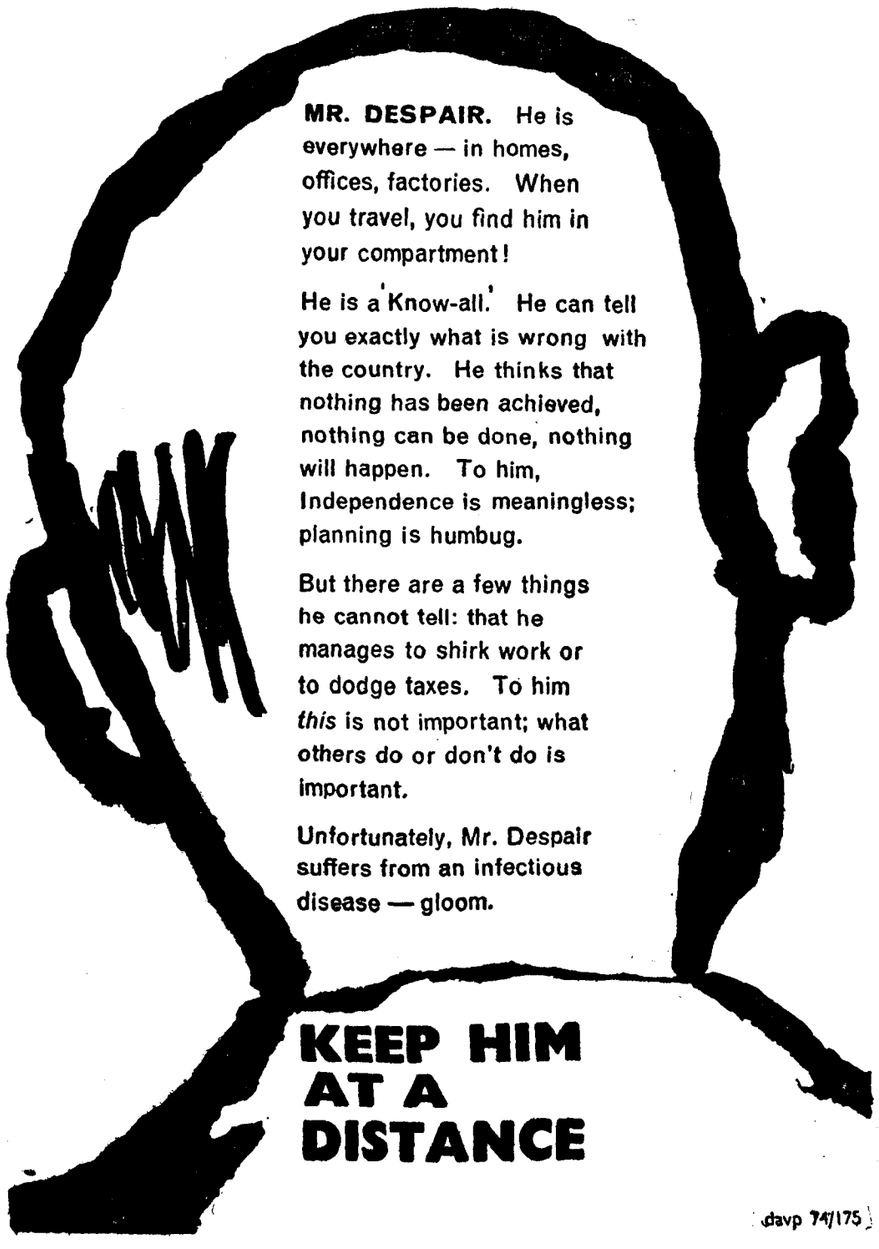
What can we say, in fact, happened? By the time of the Eighth Party Congress, there seemed to have been a unanimous agreement on the redundancy and undesirability of the Stalinist model. Between September 1956 and the decentralisation decision, there was alliance and compromise between the privileged professional stratum and the party radicals. But these were two groups contending for power, i e, for the economic decision-making authority which the central ministries were no longer to enjoy. However, the compromise was unlikely to last long, because the interests of the two groups were basically irreconcilable. Power to the one or to the other would mean completely different paths of development.

The Hundred Flowers movement gave the professional stratum freedom, but not power to convert this freedom into a reality. It now became apparent to the party radicals that, if power was transferred to this stratum, it would be used to undermine the authority of the party and to consolidate the stratum's own position as a class. Since decentralising of authority to the managerial level would entail a model of development based on material incentives and free market operation, the appraisal was not unrealistic. Consequently, the politics of the Great Leap Forward were directed precisely against this stratum. It should no longer be hard to perceive why the Great Leap Forward model of development cannot be understood independently of the question of political power.

However, in the tide of anti-professionalism, the slogan 'red and expert' lost its meaning. Indeed, essential expertise was reduced to meaningless simplicities. In its zeal to check the power and the inviduous influence of the professionals, the Great Leap Forward overreached itself — it undermined the very concept of expertise. Of course, one cannot discount here the role of the fantastic targets of the Great Leap Forward, the goal to overtake Britain in fifteen years. The management and the planners would have certainly opposed such an approach to economic development; for which reason the party radicals would necessarily have had to get them out of the way. In a very fundamental sense, the Great Leap Forward was indissolubly linked to the question of political power.

Conclusion

While the Great Leap Forward model of socialist transformation emerged as an alternative to the Stalinist model, the choice of its specific strategy was influenced also by other considerations. For, as the experiences of the other countries of the communist bloc testify, the Great Leap Forward was not the inevitable alternative to the Stalinist model. The determination of the Great Leap model was the outcome of the interaction of three necessary factors: first, the need to circumvent the problems inherent in the Stalinist model without reducing the flow of resources from the pre-industrial sector to the modern sector; secondly, the need to successfully accommodate, in a developmental model, the peculiar problem of the Chinese case, i e, overpopulation in the countryside; and thirdly, the need perceived by the Maoists to check the power of the professional stratum.



The Maoist conception of the Great Leap Forward's *economic* strategy — the strategy of primitive socialist accumulation — combining as it did the first two necessary categories outlined in the preceding paragraph, was suited to the Chinese situation. As we have observed in the first two sections of the first section, the strategy sought to resolve the problems of a stagnant agriculture — declining per capita availability of foodstuffs, declining supplies of agricultural raw materials for industry, underemployment, the problem of mechanisation, and most of all, the danger of reduced surpluses for industrialisation — without stepping up investment to any significant extent in this sector. At the centre of this strategy, was the unprecedented mobilisation of the surplus labour as the primary input in a diversified rural economy. Diversification of the rural economy basically meant the construction of water conservation and irrigation projects, and the development of local small-scale industry. Moreover, the idea was not only to undertake these projects with minimum capital investment, but also to ensure that surpluses from these projects were converted into rising investment and not dissipated by an increase in consumption.

However, in order to study the Great Leap Forward in its totality and to comprehend the real factors underlying its failure, it is necessary to study the third factor, i e, the need which the party militants felt to avoid reliance on, and check the power of, the professional stratum. It is necessary to understand the anti-professionalism of the Maoists with reference to the Stalinist model of which the professional stratum was an essential part.

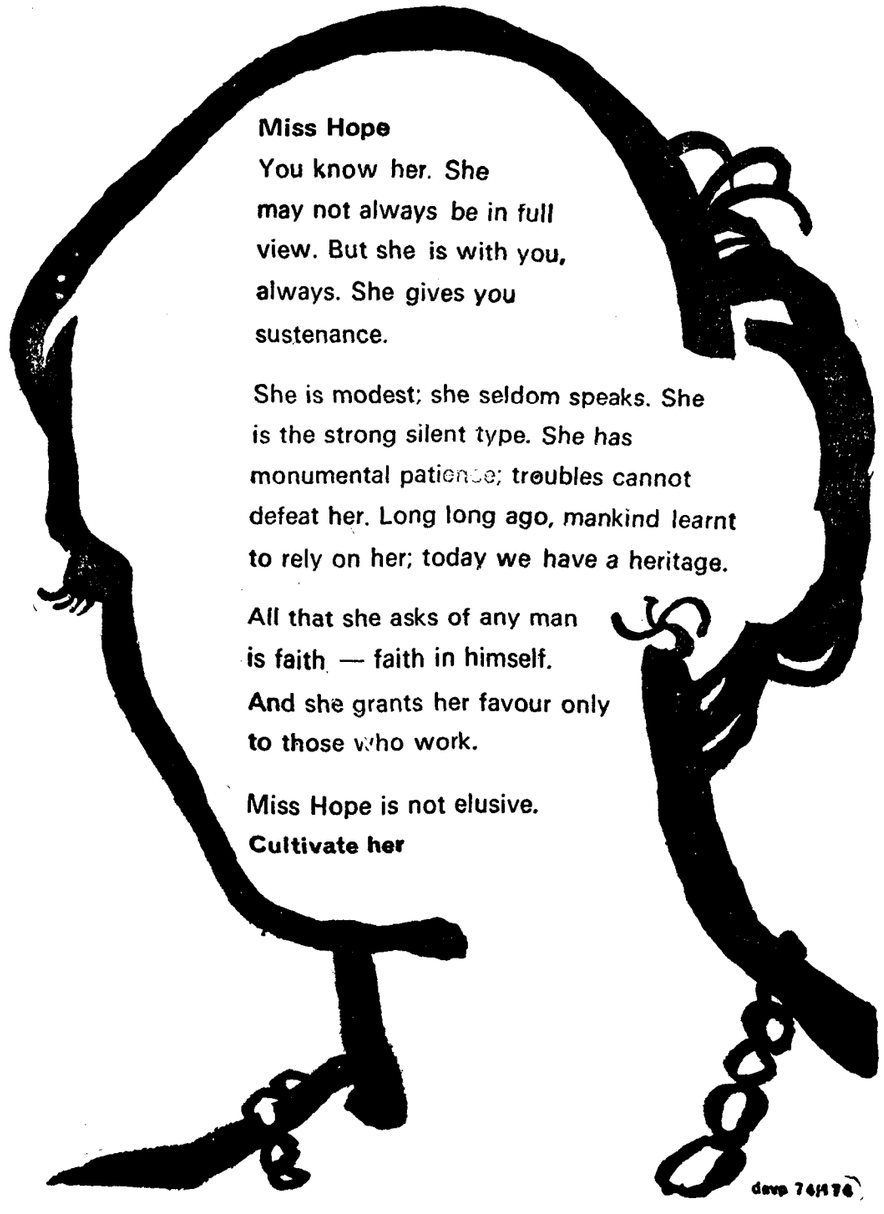
In the Soviet Union, the need to channel surpluses from the pre-modern sector of the economy for industrialisation, necessitated among other things, the creation of a pervasive and powerful bureaucratic structure. The organisational principles and complex operations of this bureaucratic apparatus were taken over by the Chinese Communists and applied in their country for the major part of the First Five-Year Plan period. While this bureaucratic model may have been suited for the efficient appropriation of surplus in the initial phases, in time, the disaffection it created among the various sections of the population, viz, the working class, the peasantry, the party radicals, and the professional stratum, created the conditions for its ultimate abandonment. The emergence of the last mentioned social stratum was a significant development of this period. During the First Plan, this group of professionals had acquired considerable privileges as an indispensable stratum; at the same time, they still resented the authoritarian system which gave them little power. After the de-Stalinisation decisions, it became increasingly clear that they wanted more freedom and authority in the decision-making processes. While, in most of the other countries of the communist bloc, considerable authority did devolve onto them as a consequence of the various paths of de-Stalinisation chosen (especially so in Yugoslavia), in China a covert struggle ensued between this professional stratum and the party militants.

The launching of the Great Leap Forward marked a temporary ascendancy of the party militants over the professionals. That the party would be

THIS PERSON IS TOO FAMILIAR; AVOID HIM

MR. DESPAIR. He is everywhere — in homes, offices, factories. When you travel, you find him in your compartment!

He is a 'Know-all.' He can tell you exactly what is wrong with the country. He thinks that nothing has been achieved, nothing can be done, nothing will happen. To him, Independence is meaningless; planning is humbug.



But there are a few things he cannot tell: that he manages to shirk work or to dodge taxes. To him *this* is not important; what others do or don't do is important.

Unfortunately, Mr. Despair suffers from an infectious disease — gloom.

KEEP HIM AT A DISTANCE

davp 74/175

THIS PERSON IS RATHER SHY; CULTIVATE HER

Miss Hope
You know her. She may not always be in full view. But she is with you, always. She gives you sustenance.

She is modest; she seldom speaks. She is the strong silent type. She has monumental patience; troubles cannot defeat her. Long long ago, mankind learnt to rely on her; today we have a heritage.

All that she asks of any man is faith — faith in himself. And she grants her favour only to those who work.

Miss Hope is not elusive.
Cultivate her

davp 74/176

in a dominant position was evident from the economic, strategy of the Leap Forward which focused on mass mobilisation and political control as central tasks. More fundamentally, the Great Leap Forward might not have existed if the decentralisation decisions had not strengthened the party units. What was significant, as a consequence, was the 'class war' which the party radicals conducted against the professional group. While this was implicit in the general tone of the Leap Forward, the most explicit manifestation of this was the mass dismissals of the professionals — the effective elimination of professionalism.

We have observed that it was this anti-professionalism, coupled with the feverish exhortations to step up production so that China could overtake Britain in fifteen years, which caused the failure of the Great Leap Forward. Nevertheless, the competitivenes *vis-a-vis* a country like Britain did play an important role in the Great Leap Forward strategy of primitive socialist accumulation. The ideologically compelling drive to increase production represented that aspect of the economic strategy for accumulation which sought to increase surpluses for investment without incurring corresponding increases in consumption. The failure of the Great Leap Forward revealed that, till the sixties at least, China was too backward (both, economically and in terms of the cultural level of the working class) : (a) to allow the accumulation process to occur smoothly, without it creating many disincentives among the producers (see the section on incentives), and (b) to stall the emergence and consolidation of bureaucratic and professional power centres. There is perhaps no more convincing proof of this than the developments of the immediate post-Leap period, a period which has been aptly characterised as the period of China's New Economic Policy.[151]

68 This tendency of gravitation towards centralisation occurred "partly because of the difficulty of coordinating decisions at different levels within the commune and partly as a result of the atmosphere within which the commune's party leadership operated. There was no hard and fast rule that would have allowed commune heads to plan for use of labour on large water conservation projects without in some way coming into conflict with demands on that same labour from the production bridgades heads (the heads of the old co-operatives) for use in farming. Since the commune leadership contained the more senior party personnel, they invariably won out — whatever the economic merits of their case".

99 See Meng, n 10. The fact the wholesale prices were charged for commodities produced in the State industries (which were mainly capital goods — the consumer goods industries had been transferred to the local authorities during the decentralisation) meant that the profit margin for commune industries producing the same goods would be relatively low. This was because the production costs in the commune industries were higher than those of state-owned industries. Consequently, the commune industries tended to concentrate on the production of those goods which were relatively more profitable to the neglect of production of agricultural tools and fertilisers.

Indian Peasant Uprisings

Kathleen Gough

Indian peasants have a long tradition of armed uprisings, reaching back at least to the initial British conquest and the last decades of Moghul government. For more than 200 years peasants in all the major regions have risen repeatedly against landlords, revenue agents and other bureaucrats, money-lenders, police and military forces. During this period there have been at least 77 revolts, the smallest of which probably engaged several thousand peasants in active support or in combat. About 30 of these revolts must have affected tens of thousands of peasants, and about 12, several hundreds of thousands. The uprisings were responses to deprivation of unusually severe character, always economic, and often also involving physical brutality or ethnic persecution.

The political independence of India has not brought surcease from these distresses. Major uprisings under communist leadership since British rule not unnaturally show a continuity of tactics with earlier peasant revolts. Of these, the more successful have involved mass insurrections, initially against specific grievances, and the less successful, social banditry and terrorist vengeance. Both in the case of communist revolts and in that of earlier peasant uprisings, social banditry and terrorist vengeance, when they occurred, appear to have happened in the wake of repression of other forms of revolt.

Although the revolts have been widespread, certain areas have an especially strong tradition of rebellion. Bengal has been a hotbed of revolt, both rural and urban, from the earliest days of British rule. Some districts in particular, such as Mymensingh, Dinajpur, Rangpur and Pabna in Bangladesh and the Santhal regions of Bihar and West Bengal, figured repeatedly in peasant struggles and continue to do so. The tribal areas of Andhra Pradesh and the state of Kerala also have long traditions of revolt. Hill regions where tribal or other minorities retain a certain independence, ethnic unity and tactical manoeuvrability, and where the terrain is suited to guerilla warfare, are of course especially favourable for peasant struggles, but these have also occurred in densely populated plain regions such as Thanjavur, where rack-renting, land hunger, landless labour and unemployment cause great suffering.

IN Kilvenmani village in eastern Thanjavur, Tamil Nadu, in 1969, a group of Harijan landless labourers, influenced by the CPI(M), struck for higher wages in view of the increased production and price inflation brought about by the 'green revolution'.[1] Goons hired by their landlords arrived on their street at night, imprisoned 42 men, women and children in a hut and burnt these people to ashes.[2] Again, in Chandwa-Rupaspur village, Bihar, in November 1971, a movement of Santhal tribespeople resisting encroachment of their land was met by landlords' thugs. For Santhals were roasted alive, 10 were shot dead or hacked to pieces, 33 were severely wounded and 45 huts burned down.[3] These incidents and many similar ones have illustrated a process of peasant resistance and landlord reprisals that has intensified in India during the past seven years. Since the Naxalbari uprising in West Bengal in 1967 and the emergence of rebel and revolutionary groups among both townsfolk and peasantry, several peasant struggles have erupted, hundreds of landlords, police and money-lenders have been assassinated, and thousands of peasants have died by violence.[4]

Social movements among the peasantry have been widely prevalent in India during and since British rule. We may define a social movement as "the attempt of a group to effect change in the face of resistance"[5] and peasants as people who engage in agricultural or related production with primitive (palaeotechnic) means and who surrender part of their produce or its equivalent to landlords or to agents of the state. This article is confined to social movements which (a) involved peasants as the sole or main force, (b) were class struggles against those who exacted surplus from peasants and (c) undertook or were provoked to armed struggle in the course of their careers.

Generally, the scope and significance of India's peasant uprisings have been understressed. Barrington Moore, Jr, for example, in spite of acknowledging at some length instances of peasant revolts described in recent Indian writings, concludes that China forms "a most instructive contrast with India, where peasant rebellions in the premodern period were relatively rare and completely ineffective and where modernisation impoverished the peasants at least as much as in China and over as long a period of time".[6] Moore attributes the alleged weakness of Indian peasant movements to the caste system with its hierarchical divisions among villagers and to the strength of bourgeois leadership against the landlords and the British and the pacifying influence of Gandhi on the peasantry.[7] I would argue that peasant revolts have in fact been common both during and since the British period, every state of present-day India having experienced several over the past two hundred years. Thus in a recent brief survey I discovered 77 revolts, the smallest of which probably engaged several thousand peasants in active support or in combat. About 30 revolts must have affected several tens of thousands, and about 12, several hundreds of thousands. Included in these revolts is the 'Indian Mutiny' of 1857-58, in which vast bodies of peasants fought or otherwise worked to destroy British rule over an area of more than 500,000 square miles.[8] The frequency of these revolts and the fact that at least 34 of those I considered were solely or partly by Hindus, cause me to doubt that the caste system has seriously impeded peasant rebellion in times of trouble.

There does seem no doubt that, apart from the Mutiny, peasant uprisings in China usually had a wider geographical scope than those in India. At least since late Moghul times the reasons for this may have included the political fragmentation as well as the diversity of language and culture among India's

people. During the later decades of Moghul rule the country had already disintegrated into a number of virtually autonomous, mutually warring kingdoms and principalities between whose peasants there was little contact. The British conquered India piecemeal over a hundred year period from the mid-eighteenth to the mid-nineteenth centuries. Early revolts against their rule therefore tended to occur at different dates in different regions, although there was inter-regional co-ordination among the largest — for example, those led by Raja Chait Singh in Oudh and other areas in 1778-81, by Vizier Ali in Gorakhpur in 1799, and by the military chiefs (*poligars*) of Madras and Andhra in 1801-5.[9]

Shortly after the British had subdued most of India a huge uprising, widely backed by the peasantry, did sweep over most of Northern and Central India in the shape of the Mutiny, but even in this case resistance tended to be strongest in the areas more recently conquered, while those which had earlier had revolts that had been crushed, played lesser roles.[10]

After the Mutiny, British rule and military preparedness became stronger than ever and the rural upper classes of landlords and princes were either crushed totally or co-opted by the British through concessions. At the same time, political disunity was perpetuated by the division of India into British provinces interspersed with 'native states' having separate judicial systems. Popular action was difficult to organise across these boundaries as well as across ethnic and linguistic lines. Between the Mutiny and Independence, the British government and army were also better co-ordinated than those of China and India was not disturbed by invasions. In these circumstances, politically disunited, under a despotic Central government and opposed by their landed aristocrats, after 1858 peasants engaged only in regional uprisings led by religious figures or by local peasant committees until political parties began to form peasant unions in the 1930s. Even so, some of these revolts were impressive and wrung concessions from the rulers. Since the mid-1930s peasant uprisings as well as non-violent resistance by peasants have usually been at least partly guided by political parties, especially by communists, or else by nationalist and separatist movements of the formerly primitive tribes. In brief, I would argue that the limitations of Indian peasant revolts have sprung more from broader political forces at the level of the province and the colonial and post-colonial state than from the caste system or from peculiarities of village structure. At least two Indian authors have, indeed, argued that the caste system provided a framework for the organisation of peasant rebellions, since in many cases peasants were able to assemble quickly through the medium of their caste assemblies.[11]

When peasant uprisings figure in the British literature, they are often obscured under such headings as "communal riots" between major religions, fanatical religious cults, or the activities of "criminal" castes and tribes. While the armed struggles of peasants *have* often had these characteristics, a large proportion of such movements has also, and primarily, been concerned with the struggles of tenants, agricultural labourers, plantation workers, or tribal cultivators, against the exactions of landlords, bureaucrats of the state, merchants, moneylenders, or their agents, the police and the military.

The Colonial Background

Information is limited about peasant uprisings and other forms of violence against the rich and powerful in remote pre-British times. Whatever the earlier record, revolts broke out in many areas during the seventeenth and eighteenth centuries, as the Moghul bureaucracy became more oppressive and exacted harsher taxes, as commercial relations penetrated the countryside, and as local rulers made increasing incursions into tribal hill territories.[12] Prominent among the peasant rebellions against the Moghuls were those of the Jats of the Ganges-Jamuna region from the 1660s to 1690s, and of the Satnami religious sect in Narnaul in 1672. In some, but not all, of the revolts against the Moghul power, peasants placed themselves under the leadership of local princes or land managers (zamindars) who rebelled because the imperial land revenue pressed so heavily on the peasants that there was little left for these local dignitaries. In the eighteenth century, the rapid expansions of Sikh and Maratha power and the growth of Thuggee bands in the heartland of the empire owed much to the fervent support of peasants suffering under Moghul revenue exactions.[13] Outside the empire, peasant opposition to encroaching royal authority in the eighteenth century was instanced in the revolts of the Maomoria movement against the kings of the Assam velley,[14] and in south India, in the resistance of the Kallar (literally, "Robber") tribespeople against the efforts of the rulers of Ramnad and Madura to extract taxes from them in traditionally independent hill regions.[15]

As it spread gradually throughout India, however, British rule brought a degree of disruption and suffering among the peasantry which was, it seems likely, more prolonged and widespread than had occurred in Moghul times.[16] The effects of British rule came, of course, unevenly and in stages, but once operative, they created a structure of underdevelopment in the Indian countryside which became endemic, and which has been modified but never eradicated since Independence. Although I cannot analyse this structure in detail here, the following seem to me to have been the major changes that have affected Indian peasants during the 200-odd years between the beginning of British rule and the present time.

1. The early decades of rule by the East India Company saw outright plunder of the country's wealth coupled with ruinous taxation of the peasantry, in some areas up to twice that imposed by the Moghuls. These no doubt contributed to the Bengal famine of 1770 in which a third of the people died. The collection of heavy revenues was subsequently regularised in the Permanent Settlement of Bengal, Bihar and Orissa in 1793 and in comparably harsh settlements in other regions. Revenues in the early decades were used chiefly for government expenses, wars, private fortunes, remittances to Britain and public works designed to increase imperial trade.[17]

2. In later decades, land revenue declined to a much smaller proportion of the crop than was exacted by the Moghuls, but by that time surplus was being removed from the peasants by other kinds of agents such as moneylenders, non-cultivating intermediary tenants, landlords, merchants, the new professional classes such as lawyers, and particularly, although less directly, by British firms engaged in export crop farming, banking, shipping, exports and imports, and internal trade.[18]

3. The British land settlements for the first time made land private property of a capitalist kind. The new landlords included zamindars who had previously been revenue collectors under the Moghuls, a variety of princes or subordinate rulers, village headmen, military tenants, religious or secular functionaries of former governments, in some cases peasant cultivators who had hitherto merely leased land under customary regulation, and in other cases merchants or moneylenders who bought land rights, along with the right to collect revenue, in government auctions when previous revenue collectors proved unable to bring in the tax. While such persons gained private landownership, the lower ranks of cultivating tenants, village servants, and serfs lost their hereditary rights to work and to share the produce of village lands, and could be evicted if their landlords found them unnecessary, recalcitrant or unable to pay their rents.

4. During and since British rule, there has been increasing encroachment on tribal hill territories and oppression of tribespeople by European and Indian planters, by government usurpation of forest areas, by landlords, merchants, and moneylenders from the plains, and by government agents. To the loss of large tribal areas was added exploitation in such forms as rack-renting, unequal terms of trade, usury, corvee and even slave labour, and the obligation to grow cash crops for little or no return.[19]

5. The British effected a reduction in the scale of at least some Indian handloom and handicraft industries, especially those for the production of luxury goods, through discriminatory internal and external tariffs. Such measures virtually destroyed India's export of manufactured goods and also obliged Indians to buy British industrial manufactures, notably cotton textiles.[20] Reports indicate that centres of manufacture such as Dacca and Agra, as large or larger than London in the mid-eighteenth century, shrank as a result of these and other British policies to a fraction of their former size.[21] Craftsmen deprived of their livelihood were driven back upon the land as tenants or landless labourers or joined the modern urban lumpen proletariat. Peasants had to sell their produce for cash, often to moneylenders in return for advance loans, in order to buy imported goods as well as to pay rents and revenues.

6. On balance, India was plundered through the export of capital to Britain by such methods as the repatriation of profits and salaries, debt services for colonial wars and public works, "home charges" and adverse terms of trade with respect to raw materials exported from India and to imported manufactured goods.

7. In many regions various means were used to encourage or compel cultivators to grow industrial crops, and even food crops, for export. In addition to highland plantations for tea, coffee, cinnamon, and later, rubber, large areas of the plains were at different periods turned over to indigo, opium, cotton, oilseeds, jute, pepper, coconuts, and other export crops.[22] Landlords and local merchants profited from their sales to British export firms, and brought pressure on peasants to grow them in their roles as wage labourers, serfs, tenants or indebted smallholders. Despite the expansion of the total cultivated area, the production of export crops reduced the area available for subsistence farming in at least some regions such as Kerala.

8. Speculation and investment in land by merchants, bureaucrats, landlords, and successful cash crop farmers made land sales increasingly common. The growth of absentee landlordism and of cultivation for private profit meant that traditional paternalistic relations of landlords and their tenants were disrupted in many villages, and that tenants were disrupted in many villages, and that tenants and labourers were exposed to new and more alienating forms of exploitation, resulting in greater resentment on their part.

9. Population increase occurred, especially after 1921, as modern medical supplies and services reduced epidemics and infant mortality. Thus, the population of former British India more than doubled between 1891 and 1951. At the same time, industry developed very slowly, so that there came to be too many villagers for a palaeotechnic agriculture to feed adequately and large-scale unemployment or underemployment in the villages. In India as a whole, per capita agricultural output declined between 1911 and 1947.[23] Some of the consequences of 'agricultural overpopulation' were fragmentation of landholdings leading to dwarf-tenancies; competition for land among share-croppers and other tenants, which encouraged rack-renting; moneylending and chronic rural indebtedness; and the growth of debt bondage in some areas and of poorly paid day labour in others. Although the data are imperfect, it seems probable that there has been, both during and since British rule, a decline in the proportions of landlords, rich peasants and middle peasants and an increase in the proportions of poor peasants and landless labourers.[24] Today, India has everywhere overburdened villages and underemployed and ill-nourished villagers.[25]

10. From the 1850s with the building of the railways, the increased movement of goods and people had profound effects. It further undermined the unity and self-sufficiency of villages. The modern transport of foodgrains reduced the danger of severe regional famines; at the same time, by permitting grain stocks to be removed from prosperous areas it appears to have allowed the growth of chronic malnutrition throughout the country. Concomitantly, however, modern transport fostered the movement of ideas between town and country and created links between urban and rural people. Such links strengthened the Indian nationalist movement led by the bourgeoisie; they also permitted a degree of unity between peasants and urban workers in the more recent revolts.

11. The most brutal feature of the British period was the famines.[26] There were serious regional famines before British rule, notably in the Deccan in 1630-32 and in 1702-4. It seems certain, however, that the famines of the British period were more frequent. Thus, 14 major famines are known to have occurred between the early eleventh and the late seventeenth centuries. During the period of government by the East India Company, by contrast, in addition to the catastrophic Bengal famine of 1770, there were twelve serious famines and four periods of acute scarcity before the Mutiny of 1857, while Indian peasants were being tormented by excessive revenue exactions. Still more devastating famines followed the Mutiny. The worst occurred between 1865 and 1899, and the most severe of all in 1896-97, when 97 million were seriously affected and at least 4.5 million died. Another 650,000 died in 1898, and a further 3.25 million in 1899. In the famines of the 1860s the principal victims were landless labourers and unemployed weavers, but by 1900 tenant cultivators formed the largest category employed in government relief works during famines in the Deccan and Gujarat, while landless labourers formed the next largest category, and weavers were still prominent. The data suggest that by the end of the century tenant cultivators had no reserves left and that in famines they suffered almost equally with landless labourers and with artisans thrown out of work by British industrial policies. Using figures collected by Bhatia, and selecting only those which record the deaths of more than 100,000 people in any single famine year and region, I have calculated a total of 20,687,000 famine deaths in India between 1866 and 1943. Because of the omission of smaller figures this is undoubtedly far too low.

Probably thanks to improved transportation, there was no very large famine between 1908 and 1943, when the stoppage of rice imports from

Burma by the Japanese invasion, coupled with hoarding and speculation, produced the Bengal famine in which 3.5 million died. Since 1947 no catastrophic major famine has occurred in India proper (as distinct from Bangladesh), but unknown millions annually die untimely deaths as a result of illness compounded with chronic malnutrition. A United Nations report of 1963 charged that five million Indian children still died of malnutrition each year.[27] Severe shortages occurred in 1964-66, and since 1971 the situation has become increasingly critical, with famine deaths, suicides by starving people, food riots and other forms of agitation in many parts of India.

Since Independence, and especially since 1954, foreign food loans have augmented India's food supply, but have also helped plunge the country hopelessly into debt.[28] India's own food production has roughly doubled since Independence. This is no mean achievement, but even when combined with foreign imports the increase is barely adequate to meet the needs of a population which grew from 356 million in 1951 to 556 million in 1971. When combined with hoarding, speculation and widening inequality in incomes, it is not at all adequate.

12. Since Independence, land reforms have removed some of the biggest landlords — the zamindars — and some of the non-cultivating intermediary tenants, but in general laws on land ceilings have been evaded.[29] Before and after each act, landlords have evicted numerous tenants on the grounds that they needed the land for "personal cultivation" and have created new paper owners' to conform with the acts while leaving the real control undisturbed. At least in some areas, therefore, land reforms have resulted in an increase in the proportions of poor peasants working part-time for wages, of landless labourers, and of both rural and urban casual workers and unemployed.[30]

13. During 1965-71 the 'green revolution' increased productivity in some regions. Reports indicate, however, that it tended still further to polarise agricultural incomes, for it enriched the larger owners while tenants and labourers gained little or none of the increase during a period in which they were also being affected by generalised inflation. As farms are consolidated and operate as industrial capitalist enterprises, the green revolution dispossesses some tenants, disemploys some landless labourers and drives out of business small farmers who cannot afford the new technology and cannot compete.[31] In 1972-74, moreover, the gains of the green revolution have for the most part been wiped out by seasonal drought and flooding or, most recently, by shortages of fertilisers.

The above conditions form the background of agrarian revolt from the late eighteenth century until the present. Directly or indirectly, all of them have been either created or severely exacerbated by British colonial policies or by the policies of the Indian government, under the influence of imperialism, in the post-colonial period.[32]

Types of Peasant Uprisings

Seventy-seven revolts, including the Mutiny, were considered in preparation for this article. Eight of them occurred in East Bengal (present-day Bangladesh); as it happened, none were selected from regions lying in present-day Pakistan. The East Bengal revolts help to illustrate general processes at work in British India. This paper does not cover agrarian unrest in what became East Pakistan and later, Bangladesh; it is evident, however, that there have been peasant uprisings there since the end of British rule, especially during the invasion by Yahya Khan's forces in 1971, and revolutionary movements based on peasants are continuing there.[33]

A rough classification of the revolts during British rule yields five types of action in terms of goals, ideology and methods of organisation: (1) Restorative rebellions to drive out the British and restore earlier rulers and social relations; (2) religious movements for the liberations of a region or an ethnic group under a new form of government; (3) social banditry (to use Hobsbawm's term);[34] (4) terrorist vengeance, with ideas of meting out collective justice; (5) mass insurrections for the redress of particular grievances.

The first and second of these types are transformative, in the sense that they sought from the beginning — and sometimes briefly achieved — a large-scale restructuring of society.[35] Restorative revolts were, however, backward looking, whereas India's religious peasant movements have been 'nativistic' in combining traditional cultural elements and values with new themes, sometimes derived from the oppressing groups, in a utopian vision of a Golden Age. The third, fourth and fifth types are initially reformative in the sense that they aim at only partial changes in society. Both the third and the fifth types have, however, sometimes become transformative and have led to the seizure of a liberated zone. The fourth type, terrorist vengeance, can take place sporadically and spontaneously with little or no organisation; it has probably occurred thousands of times in all parts of the country in the form of small outbursts of retaliation against landlords, moneylenders, etc. Occasionally, however, terrorist vengeance seems to develop into an organised movement, sometimes involving a religious cult; it is also usually present to some degree in all of the other four types. Religious movements (type 2) are thus not completely confined to attempts to liberate an ethnic group or a region: some bandit groups, indeed, have special religious cults, as well as some terrorist movements, and both restorative rebellions and insurrections have usually been regarded as sanctioned by 'normal' religion. The religious movements for liberation are, however, a sufficiently distinctive group, bearing messianic and millenarian messages, to be placed in a separate category. Finally, both messianic religious movements and agitations for the redress of special grievances have, of course, occurred very frequently in non-violent forms; but this paper deals only with armed revolts, or (in two or three cases) with armed movements which engaged in forceful action without actually resorting to fighting.

Since the mid-1930s peasant unions have been organised by a variety of socialist and social democratic groups and since the mid-1940s several armed peasant uprisings have occurred under communist influence. Some of these outbreaks took place in regions already shaken by peasant uprisings in the British period — notably, in Bengal, in various tribal hill regions and in Kerala. With modifications, the communist-inspired outbreaks have partaken of the character of types 3, 4 and 5, coupled with a consciously revolutionary and transformative ideology having some elements akin to type 2. There have thus been continuities as well as changes between the earlier revolts and the modern communist ones. The most significant changes have, of course, been the attempt at leadership by a vanguard political party, together with the possession of a view of world history, an analysis of India, a strategy of revolution and a plan for the nation state at large, derived from the theories of Marx and Lenin and, more recently, of Mao Tse-tung.

The goals and methods of those engaged in revolt varied with their circumstances. Although no neat correlations are evident I shall suggest some

connections between contexts and types of revolt. All of the revolts seem to have occurred under conditions of relative deprivation,[36] that is of deprivation considered outrageous by comparison with the past or with the condition of others in the present. All of them embodied ideas of freedom from undue economic exploitation or deprivation; of some form of collective independence from a domination conceived of as foreign and unjustified; and of a just social order sanctioned by some religious faith or all-embracing modern ideology, especially that of Marxism. It is true of course that Marxism differs from religious belief in its denial of the supernatural, and that the work of Marx and his successors points a way towards non-dogmatic, scientific analysis of social phenomena. As a political ideology, however, especially when translated into the language and concepts of peasants, Marxism has similarities to religious movements in that it purports to offer a complete explanation of society and especially of social evils, and in that parts of the explanation are accepted on faith. Marxist movements are also dedicated to a future state of ethical virtue, providing new relationships for a 'blessed community'. Finally, as in chiliastic religious movements, its followers are ideally willing to sacrifice their lives to bring this state about. Contrary to Cohn,[37] I do not regard these qualities as undesirable in times of oppression, nor as necessarily linked with lack of realism or with collective paranoia.

Restorative Movements

Between 1765 and 1857 a large proportion of revolts were led by Hindu or Muslim petty rulers, former revenue agents under the Moghuls, tribal chiefs in hill regions and local landed military officers (*poligars*) in south India. They were supported by masses of peasants and sometimes of former soldiers. The revolts were either against the conquest itself and the imposition of heavy revenues on existing nobles, or retaliatory attempts to drive out the British after they had dispossessed a zamindar or a raja for failing to pay the revenues and had replaced him with some other claimant to the estate, with a Company officer, or with a merchant, moneylender or adventurer who had bought the estate at auction. The goals of these revolts were complete annihilation or expulsion of the British and reversion to the previous government and agrarian relations. The peasants were not blind loyalists. Their own grievances were bitter, for in their efforts to squeeze out the revenue the Company's officers often completely pauperised the peasants or had them starved, flogged or jailed.[38]

Twenty-nine revolts involving peasants as the main force were counted for this period, 12 by tribal chiefs and 17 by Hindu or Muslim rulers or other former officials.[39] Six took place in Bengal, five in Bihar, three in Assam and 15 in central and south India. The enemies in these rebellions included all British officials and troops, British plantation owners, revenue agents, pro-British landlords, moneylenders, and police. Rebel armies of peasants and former soldiers holed up in forts, in the forests, or on hill tops with stocks of grain, and from there made forays in bands of a few hundred to several thousand, robbing and killing officials, looting and burning treasuries, plundering merchant boats or the homes of landlords and moneylenders, and ambushing or fighting off police and troops with matchlocks, knives, swords, or bows and arrows. All of the movements involved several thousand armed rebels and supporting populations of tens or hundreds of thousands. The largest rebellions produced alliances of nobles in several districts, peasant insurrections over wide areas, the capture of towns and the temporary expulsion of the British from one or more local government centres.

Among these major uprisings were the revolt of Raja Chait Singh and other Hindu and Muslim zamindars of Oudh in 1778-81; the subsequent revolt of Vizier Ali, the deposed Nawab of Oudh, in Banaras, Gorakhpur and surrounding areas in 1799; the massive uprisings of the *poligars* and their peasants in Tinnevelly, North Arcot, and the ceded districts of Andhra in 1801-5; the uprising of the Chuar tribesmen of Midnapore in 1799;[40] the revolt of the Pazhassi Raja, which commanded tens of thousands of guerilla fighters and affected most of the population of Malabar in 1796-1805; and almost immediately afterwards, an insurrection further south in Travancore and Cochin by Velu Thampi, the prime minister of Travancore state, with professional army of 30,000 and even larger numbers of cultivators. The last of these major rebellions before the Mutiny was the famous Santhal tribal revolt of 1855-56, involving a peasant army of between 30 and 50 thousand, village assemblies in groups of 10,000, and tens of thousands of government troops. All these revolts were, of course, eventually crushed by the British. Some rebel leaders fled into banditry or, very rarely, were reinstated with less exacting revenue settlements. More commonly they were wiped out with exemplary savagery; Velu Thampi was hanged publicly after his death. The Pazhassi Raja was executed and his lineage dispossessed; his palace was razed and a road built over the site. After a few of the revolts the revenue exactions on the peasants were reduced, but more often 'pacification' was brutally effected. Half the Santhal army was murdered and the victors randomly flogged or imprisoned peasants as examples to others. The Oudh revolt of 1778-81 ended with the zamindars' forts destroyed, their owners expelled into banditry and fierce plunderings and revenue exactions in the countryside which led to the famine of 1784.

The largest restorative rebellion was, of course, the 'Mutiny' of 1857-58. Begun by Hindu and Muslim soldiers in revolt against their conditions and against offences to their religions, it engaged millions of impoverished peasants, ruined artisans, dispossessed nobles, estate managers, tribal chiefs, landlords, religious leaders (Hindu, Muslim, tribal and Sikh), civil servants, boatmen, shopkeepers, mendicants, low caste labourers and workers in European plantations and factories. The leaders included rajas and nawabs with the emperor of Delhi as figurehead, native gentry, tribal chiefs and village headmen some of whom set themselves up as kings. The revolt was not centrally co-ordinated, but leaped from district to district throughout most of northern and central India and inspired scattered uprisings in the south.[41] The racism of the conquerors, their insults to religion, their eviction of rulers and managers, and above all their ruination of agriculture and manufactures, combined to provoke an anti-imperialist cataclysm. For the peasants, years of rack-renting, famines, high prices, tariffs, debts, land seizures and physical brutality were the main grievances; for the artisans, loss of livelihood; for the workers, low wages and sub-human conditions; and for the hill chiefdoms, incursions, taxes and loss of land. The prime enemies were of course the British government, military and planters, the big 'loyal' princes who allied with them, the revenue officers, the wealthier merchants and the moneylenders. The revolt raged most fiercely in areas which had been conquered after 1800, for example, Oudh (conquered in 1856), Chota Nagpur (1831-33), Jabalpur (1818), Nagpur (1854), Jhansi (1853) and Berar (1853-60). Bengal, Orissa, the ceded districts of Andhra and Madras, Kerala, Mysore and Bombay, which had been conquered earlier and had already undergone rebellions and repression, played lesser roles.

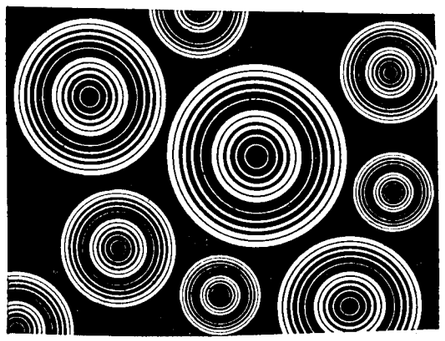
In the heart of the rebel area mass insurrections of armed peasants, in addition to the mutinying troops and the private armies of rulers, combined to massacre the British and to destroy government buildings, revenue and court records, coffee and indigo plantations and factories, telegraphs, railways and churches — in short, every organ of British rule. The war was a holy war, so announced repeatedly by rulers and religious leaders, but it was also most interestingly a war in which Hindu and Muslim, tribesman and Sikh, explicitly foreswore mutual enmity and combined in defence of their own and each others' customs and honour against infidel conquest and oppression. Contrary to standard British accounts, it seems to have come within an ace of ending the Company's rule.[42] It failed, apparently, because it did not spread to all of India and was not centrally co-ordinated (as was the British government and army), and because, spreading at different dates from region to region, the rebellion lost some strongholds, in particular Delhi, before it could properly take hold in others. Nevertheless, for several months it raged ever a 500,000-square-mile region in which the peasantry, including the lowest castes and the landless labourers, formed the backbone of resistance.

Religious Movements

After the failure of the Mutiny and the annexation of India by the Crown, rebel princes and chiefs were for the most part executed, driven into exile, or co-opted by the government. Tribal chiefs played a part in some of the later uprisings and also some religious leaders with claims to royal or noble descent. In general, however, peasant rebels from the Mutiny to the 1930s joined bandit troops, engaged in insurrections under their own committees or local popular leaders, or else took part in movements for local liberation under charismatic religious leaders. A number of such religious movements had already occurred before the Mutiny.

Hobsbawm,[43] Cohn,[44] and Worsley[45] have suggested that millenarian movements were rare or absent in India and the view is widespread that they stem usually from Judaeo-Christian origins or influences. In the strict sense of belief in a thousand year period in which the Evil One will be chained, this is probably true, but most writers give a wider meaning to millenarian. Cohn cites five characteristics: such movements are collective; they look forward to a reign of bliss on this earth; the transformation from the present evil age is to be total; it is imminent, its followers waiting in "tense expectation of the millennium"; and it will come about by supernatural means.[46]

In this sense, a number of millenarian movements have arisen among Hindus, Muslims and tribal peoples in India over the past two centuries and probably earlier, although their prevalence has until recently been overlooked by researchers. Stephen Fuchs' "Rebellious Prophets: A Study of Messianic Movements in Indian Religions"[47] describes more than 50 movements with messianic and millenarian overtones. All had divine or prophetic leaders who were believed to possess supernatural powers and looked forward to a terrestrial state of righteousness and justice in which their enemies would be removed or defeated. Most were transformative rather than reformative in their expectation of a sudden, total change, and most believed the Golden Age to be imminent and subject to some kind of supernatural intervention.



Fuchs records 19 such movements among peasants which resorted to armed struggle against the British and against those familiar foes, the landlords, merchants, moneylenders, revenue agents and other bureaucrats, troops, and police. The Moplah (or Mappilla) revolts of Malabar which took place between 1836 and 1896 — actually 22 in number and varying somewhat in ideology — are here counted as one further instance, for a total of twenty.[48]

Of these 20 revolts involving armed struggle, 10 occurred among tribal peoples and 10 among predominantly Muslim or Hindu populations. 10 arose before the Mutiny and 10 afterwards. Four of the non-tribal movements occurred in Bengal, one in Gujarat, one in Maharashtra, one in Malwa, one in Patiala, one in Kerala and one in Assam. Six of the 10 non-tribal movements were Muslim and only four predominantly Hindu, although most of the tribal peoples were affected by Hinduism as well as Christianity and a few by Islam. It is probable that other millenarian revolts may yet come to light among the Hindu peoples of various regions; certainly, there were some non-violent Hindu millenarian movements.[49] At present it seems, however, that tribal and Muslim minorities, especially in eastern India, were those most liable to violent uprisings of a millenarian kind.

If this is true, I suggest that fervent chiliastic movements may be most likely to arise among cultural minorities who have lost their customary security, occupations or statuses and have suffered unusual deprivation by comparison with their own past and with those around them.[50] This would apply particularly to the Muslim cultivators of Bengal and Kerala who suffered acutely, often under Hindu landlords, both as rack-rented or evicted peasants, and as religious groups who were hated by those in authority because their co-religionists had earlier wielded political power. I would also apply to the tribal peoples, who, more than most groups in India, suffered incursions, loss of land, swindling, bankruptcy, and the undermining of their culture by literate and technologically superior invaders, both British and Indian. It is noteworthy that the Hindus who have joined religious movements with an egalitarian and millenarian flavour, for example, the Vaishnavite Maomorias of Assam in 1769-1839 and the followers of the Bengal Sanyasis in the late eighteenth century, were also predominantly low caste or of tribal origin, suffering unusual deprivation from evictions, famine, and excessive rents or revenues.[51]

It seems likely that the more hopeless the real prospects of the religious movement and the fewer its means of practical rehabilitation or redress, the greater the tendency to seek an imminent millenarian outcome through non-empirical means, and to invest the leader with marvellous, indeed magical, powers. Thus five of the 19 movements studied were classically millenarian in character, waiting in tense expectation of imminent deliverance, chiefly by supernatural means. These movements included the early movement of Moplah tenants in the 1830s to 1850s led by the Mambram Tangal,[52] the Naikda tribal movement in Gujarat under the Hindu religious leader Joria Bhagat in 1867-70,[53] the Munda tribal movement under Birsa in the 1890s,[54] and the Bhil tribal movement under Govindgiri, a tribal convert to Hinduism, in 1900-1912, following a severe famine in 1900. The Bhil groups of the Panch Mahals and the Naikdas, both of whom probably number fewer than 10,000, came to believe that their leader was himself an incarnation of the supreme deity (Parameswar or Siva among the Naikdas and Vishnu among the Bhils). Both groups thought that their divine leader would deliver them from British

what have
CARBORUNDUM UNIVERSAL
got to do with
IAS?

Plenty!

'I' is for INTEGRATED

...the key word in systems engineering. What it means? Integrating all the factors, from choice of raw material to use of the right tools and techniques. What it achieves? Finished products of the highest quality at the lowest unit cost. This is the 'system' we promote —Carborundum Universal offer you abrasives, contact wheels and machines, all properly matched to your operation...to give you predictable and profitable results every time!

'A' is for ABRASIVE

...produced to meet your precise needs, equal in quality to the best manufactured anywhere in the world. What's more: we offer you the widest range. Remember, there's a Carborundum Universal abrasive to suit your every grinding operation ... always guaranteed to produce the exact results you want.

'S' is for SYSTEM

...and the comprehensive service Carborundum Universal is best qualified to offer you. Advice on latest tools and techniques. Methods to cut down costs and improve quality. This is service from us—backed by the vast experience of our world-famous associates: the Carborundum Company, U.S.A. No matter what your grinding problem is—call the man from Carborundum Universal. He is always ready—and qualified—to help you.

CARBORUNDUM UNIVERSAL LTD.
Manufacturers of Quality Bonded and Coated Abrasives,
Abrasive Grains, Calcined Bauxite and Super Refractories.
Madras . Calcutta . Bombay . New Delhi.
Service-conscious suppliers of basic tools for industry

OBM : 2371/2

rule and establish an independent, ethical tribal kingdom, which the Naikdas called *dharmraj* (kingdom of virtue), a Hindu term. The Muslim Moplah tenants, suffering from rack-renting, evictions and famine with the spread of cash crop farming and the disruption of their formerly stable tenancies,[56] were taught by the Tangal that if they would give up cultivating, pray diligently, and organise for battle, a ship bearing arms and modern equipment for 40,000 men would miraculously appear on the horizon and the British would be driven out of Malabar — a clear case of a millenarian cargo cult. Birsa received teaching from both Lutheran missionaries and Hindu ascetics but then reverted to his Munda religion, bringing with him beliefs and images from both major faiths. He taught the Mundas first that he was a divinely appointed messenger come to deliver them from foreign rule, and later that he was an incarnation of God (Bhagwan) himself. His mission was to save the faithful from destruction in imminent flood, fire and brimstone by leading them to the top of a mountain. Beneath them, all the British, Hindus and Muslims would perish, after which a Munda kingdom would be ushered in.

Although their religious predictions failed, all of these movements organised such numbers of fervent followers that they took instead to empirical means and made armed attacks on their oppressors. Birsa assembled a force of 6,000 Mundas armed with swords and bows and arrows, some of whom burned Hindu temples and Christian houses and churches, killed a constable and were finally defeated in battle by government troops. Joria's followers were organised for revolt by Rupsing Gobar, a rebel leader who actually founded a Naikda kingdom, collected revenues, and sacked two nearby police stations before his army was subdued by British forces. Govindgiri collected an army in the Mangarh hills in 1911 and plundered the surrounding Hindu and Muslim landowners, but was conquered by state troops and British artillery. Bands of Moplah devotees numbering from three hundred to several hundred, chiefly tenants facing eviction, carried out 22 uprisings over a period of 60 years in several talukas of Malabar, in which they assassinated numerous police, government officials, Hindu landlords and British and Indian troops. Faced with insuperable odds, but driven to frenzied action by continuing economic misery, the Moplah movement became sustained by a redemptive ideology. It was believed that the rebels, having first purified themselves by religious ceremonies, would gain instant salvation by assassinating their British and landlord oppressors until they themselves fell in martyrdom.

All of the religious movements believed in a coming realm of righteousness and invested their leaders with supernatural powers, but the more powerful ones seem from the beginning to have relied chiefly on their own efforts to usher in the new society. These movements were especially prominent during the famines and harsh exploitation of peasants in the early decades of Company rule in Bengal. They included the Muslim Maulvis under Titu Miyan, who spread over Barasat, Nadia, Faridpur, Jessore and Calcutta regions in 1827-31; the Muslim Pagal Panthis, converts from the Garo and Hajong tribes, under Tipu Shah in northern Mymensingh in 1824-33; and the Muslim Faraizis of Bogra and Faridpur in 1838-51. All of these movements attracted tens of thousands of rack-rented and evicted peasants, recruited armed bands of many thousands, and strove to drive out their Hindu landlords and British rulers and establish a reign of Islamic righteousness. Tipu Shah and Titu Miyan conquered large territories, set up administrations and levied tribute from the landlords. Dudu Miyan, the Faraizi leader, ran a parallel administration to that of the British from Bahadarpur in East Bengal, which he divided into circles of villages under deputies. Each deputy settled disputes among the tenants, forced Muslims to convert to the Maulvi sect, and protected cultivators from the zamindars' excesses through a mixture of litigation and armed intimidation. The British defeated Tipu Shah and Titu Miyan in battle and imprisoned Dudu Miyan in Alipore jail — a site of confinement and ill-treatment of revolutionary prisoners down to the present day.[57]

Social Bandits

Five of the revolts studied are best classified by Hobsbawm's term "social banditry". They are the Thuggee of north and central India of 1650-1850 or later,[58] the Sanyasis and Fakirs of Bengal in the late eighteenth century,[59] the dispossessed military chief Narasimha Reddi and his followers in Kurnool, Andhra Pradesh, in 1846-47,[60] the tribal Lodhas of Midnapore, who became a 'criminal caste' in the nineteenth century after being evicted from their homelands,[61] and the tribal Kallar of South India, some of whom operated as bandits from their hill country in Madura into lowland Madura, Pudukottai and Thanjavur in the late eighteenth to the twentieth centuries.[62] These groups form only a small proportion of the large numbers of peasants, tribesmen, disinherited landlords and disbanded soldiers who turned to part-time or full-time banditry in the eighteenth and nineteenth centuries when they were deprived of their livelihood, evicted from their homelands, or squeezed in their tribal territories.

The Thuggee were the most colourful and numerous of Indian bandits, the best of them combining a rather distant millenarian prospect with a certain Robin Hood gallantry and a genius for swift assassination. They arose about 1650 in the area between Delhi and Agra and multiplied in late Moghul times as revenue exactions became harsher. During British rule they spread throughout Bihar and into Oudh, Bengal, Orissa, Rajputana, the Punjab, Mysore and the Karnatak. Operating in bands of about a dozen, they left their home villages periodically and waylaid wealthy travellers many miles away, decoyed them by stealth and then strangled them with yellow scarves, robbed them and buried them. Precisely what was done with the booty is unclear, but in some cases at least the Thuggee must have shared it with their fellow villagers, for they had the peasants' loyalty in their own territories. Thuggee were recruited from outlaws of the state, peasants and disbanded soldiers — chiefly from the most oppressed classes of their regions. Each band customarily contained members of several Hindu castes, Muslims, and in the Punjab, Sikhs. Band members observed normal social distinctions in their own communities but ate, smoked and drank together on their outings. They were initiated into a movement devoted to the service of their goddess, seen as Kali by the Hindus and Fatima by the Muslims, by whom they believed their order to have been created so as to root out evil beings and save humanity from destruction. As in the case of the Moplahs and no doubt most of the other armed religious movements, rites of dedication and purification preceded each assassination. Thuggee were forbidden by their religion to kill women, children, youth, Hindu and Muslim holy men, carpenters, poor people, beggars, bards, water-carriers, oil-vendors, dancers, sweepers, laundry workers, musicians and cripples — in short almost every productive or defenceless category in the population. They confined their

assaults chiefly to merchants, soldiers, money-carriers and servants of the Company. They are reported to have assassinated more than a million people and plundered many millions of rupees.

The Thuggee, like the Kallar, the Lodhas and many other tribes who raided rich plainsmen when their lands were invaded, must be classed as reformative, since they sought not a liberated kingdom but only short-term relief for themselves and their fellows, and believed only vaguely in a Golden Age hereafter. The Sanyasis and Fakirs became, however, a transformative movement and for a short time a highly successful one. These religiosi were originally peasants, evicted and made homeless during the wars, depredations and revenue exactions of the East India Company and various rival Indian princes in the late eighteenth century. They first formed bands of Hindu and Muslim holy men and survived as mendicants. As their numbers swelled in the great famine of 1770, they gathered together with disbanded soldiers and dispossessed zamindars, formed bandit troops and scoured the countryside, raiding the grain stocks and treasuries of the wealthy and distributing them to the starving peasantry.[63] In trying to consolidate its rule the Company met with a large Sanyasi and Fakir rebellion in 1771 between Rangpur and Dacca which defeated a company of sepoys and killed the commander. Bands of five thousand to seven thousand bandits then spread over most of Bengal and eastern Bihar, set up an independent government in Bogra and Mymensingh and almost wiped out another British detachment in 1773. Further frequent encounters took place between the Sanyasis-Fakirs and British forces all over West Bengal and Bihar until the movement finally disintegrated about 1800; according to Stephen Fuchs, its survivors are believed to have migrated to join the Marathas in their wars against the British.

The militant religious movements discussed in type 2 strove for the liberation of an ethnic region — both from the British and from 'foreign' Indian predators and invaders — and for the establishment of a divinely ordained kingdom of righteousness and justice. They arose among severly exploited minorities most of whom, nevertheless, remained in their home territories and were numerically preponderant within a region. Many bandit movements resembled the ethnic religious movements in possessing special religious cults, charismatic leaders and a belief that their struggles would eventually release the world from pain. Bandits apparently differed from local religious movements for liberation, however, in being recruited from displaced or outcast groups and individuals — disbanded soldiers, unseated nobles, evicted peasants, unemployed artisans, outlaws of the state although not necessarily of the local community, and those who had lost all through war or famine. They were thus men who, although they might maintain a home or shelter in their villages, had no livelihood except plunder and were free to roam far afield. Alternatively, bandits arose part-time among tribal peoples squeezed by plains invaders and by the government, who could combine vengeance with predation by raising plains' landlords from their own base areas.

Being foot-loose, bandits had great adaptability and therefore an ambiguous status in the larger society. As Hobsbawm stresses, only some of them, probably a minority, were "social bandits", that is engaged essentially in class struggle and concerned with the interests of the poor from whom they sought protection and with whom they shared their loot.[64] Many bandit groups, including some Thuggee, served as mercenaries for established landlords and princes as well as for dispossessed rebel nobles or for adventurers seeking fortune and political power.[65] Others served religious messiahs bent on driving out the British.[66] The Kallar of Madura exemplify the diverse potentialities of bandits. Having fought unsuccessful wars to maintain their tribal lands tax-free from the Nayak rulers of Madura and the British in the mid-eighteenth century, some Kallar became bandits (perhaps "social") who robbed merchants and officials on the high roads out of Madura. Others hired themselves as mercenaries to the Maratha Raja of Thanjavur. After British rule became established around 1800, bandit troops from Kallar settlements of both Madura and Thanjavur became cattle thieves operating among high caste rich peasants and landlords of these districts. In their attempts to reduce cattle losses, the plains landlords even appointed single families of Kallar as watchmen (*kavalgar*) in their villages. These collected annual bribes from the villagers on behalf of bandit groups to ward off the bandits' predations, or when cattle did disappear, arranged their ransom.[67] The system persisted in western Thanjavur as late as 1953. The Kallar *kavalgar* of one village where I worked had earlier murdered his cousin in a family dispute and had served sentence in the Andaman Islands. On his return he came to live in his wife's village which belonged to Brahman landlords and obtained the post of 'watchman' there. At that date, small groups of youth of Kallar communities long resident as tenants in Thanjavur villages still engaged in plundering landlords and rich peasants through cattle thefts, highway robberies and thefts from grain carts far from home in the famine season and shared their loot with their kinsfolk. Their untouchable servants of the Palla (landless labourer) caste, specially trained in dacoity, sometimes assisted them. Two miles from my place of work lived a famous (but retired) Palla multi-murderer who told wonderous anecdotes. His neighbours protected him with amused pride as a kind of village marvel.

When whole regions were ravaged by famine or excessive revenue exactions, bandits sometimes led ordinary peasants in driving out the rulers and landlords, as in the Sanyasi and Fakir rebellion. The relationship of peasants to these liberators seems, however, to have been characteristically uneasy. During the Bengal famine of 1769-70 a third of the villages of Birbhum and Bishnupur districts were wiped out, yet the Company still further increased its revenue demands by twelve per cent between 1770 and 1776. Thousands of peasants ruined by famine or rack-renting scoured the countryside as bandits and in 1787 and 1788 sacked the Bishnupur treasury, carrying off more than three thousands sterling pounds' worth of silver.[68] In November 1789 the peasantry made common cause with the bandits and drove out the British from Rajnagar and Bishnupur. Very soon, however, the peasants came to be at odds with the bandits and fell upon them, slaughtering them unmercifully, and in 1790 peasants co-operated with the government to restore 'peace and order'. The reason for this clash is unclear: perhaps bandit rule proved less "social" than the peasants anticipated, or perhaps the peasants resisted bandit demands for division of their lands.

Terrorist Acts with Ideas of Vengeance and Justice

Banditry involves assassination, whether routine or occasional, but which is mainly far survival and predation, while restorative and religious movements for liberation kill or terrorise in pursuit of their aim to drive out the oppressor. The simplest, if least effective, form of revolt, however, is that in which peasants rise up and kill or

maim the oppressors without plans for the future — often, indeed, in the certain knowledge of being annihilated. In India every village has its legends of individual or small group acts of violence against landlords, revenue agents, moneylenders, bailiffs, or other authorities or wealthy persons. More rarely, when there is extreme suffering yet when it is impossible to drive out the enemy, patterns of violence may emerge in which members of a minority or even a whole region, engage in epidemic assassinations of key enemies, or burn buildings, stacks, or other property. The individual terrorist kills and risks his life for his community, in vengeance but also partly with a sense of group pride and natural justice; sometimes, with a religious belief that this is his unavoidable destiny and his road to salvation. Although the custom was ancient among them, some of the Lushai Kukis' headhunting raids into Sylhet and Cachar in the first half of the nineteenth century seem to have been in vengeance, "not [as some charged] to get heads to bury with [their dead chief] Laroo, but to avenge unfair dealing of Bengalis at the frontier marts".[69] And although they sprang originally from a millenarian ideology, most of the nineteenth century Moplah killings of British officials, landlords and revenue agents were carried out to avenge specific wrongs, to mete out rural justice and to afford desperate paupers escape to salvation through martyrdom.[70] The British correctly estimated the element of collective justice, for they levied heavy fines on the entire village of those who died fighting after they had assassinated some high ranking person.

Mass Insurrections

Fourteen of the revolts studied were mass insurrections in which peasants provided the leadership and were the sole or dominant force.[71] These revolts were sudden and dramatic. They lacked a religious movement ideology and a single charismatic religious leader. They aimed initially at the redress of particular grievances and thus were at first reformative. They started characteristically with peaceful mass boycotts or demands for the righting of wrongs, but fought when reprisals were taken against them. Seven of the revolts occurred in Bengal, two in the Punjab, three in the Deccan, one in Mysore and one in Kerala. Several became revolutionary in aim as they progressed and four actually achieved a temporarily liberated zone. These were the revolts of the peasants and bandits of Bishnupur and Birbhum in 1789,[72] of the Jat peasants of Haryana in 1809,[73] of the peasants of Khandesh in 1852,[74] and of the Moplahs of Kerala in 1921.[75] One revolt, that of the Santhals of Bengal in 1870, was predominantly tribal, although plains' peasants took part in it.[76] The rest involved Hindus, Muslims, or Sikhs, usually a combination of members of two religions. Six occurred before the Mutiny, and eight afterwards. The biggest revolts, those of Rangpur in 1783, of Bishnupur in 1789, of the Jats in 1809, of the Mysore peasants in 1830-31, of the indigo growers in Bengal in 1860, of the Deccan peasants in 1875, and of the Moplahs in 1921, probably affected populations of more than a million. The revolts characteristically lasted for several weeks, but the Moplah revolt continued for six months.

All the uprisings involved tenants or small owner-cultivators. All were against economic deprivations resulting from British policies and in most cases also from landlords' exactions. The revolt in Rangpur and Dinajpur of 1783 and the Deccan peasant uprising of 1875 provide earlier and later examples of features characteristic of all these uprisings. In Rangpur in the early years of Company rule, revenue exactions under the revenue contractor Debi Singh were outrageous — his agents chained and imprisoned selected peasants, then flogged and starved them until their villages paid the assessment. On January 18, 1783, peasants of many villages assembled in Tepah and elected a leader — the son of a peasant who had served as leader in a previous insurrection. The mob then stormed a prison and released the prisoners and marched with drumbeats to demand revenue concessions from the local agent. When his police fired and killed a peasant a fight ensued in which the agent Gaurmohan was captured and several peasants killed before the crowd could withdraw. Although the peasants made clear that they wanted justice, not bloodshed, and later presented a written petition to the government, they met only attempts to renew the revenue collections. The situation was so bad that, as they claimed, "we then sold our cattle and the trinkets belonging to our women. We have since sold our children ..." Failing to get relief, they killed two revenue agents[77] and raised a huge armed force which marched through the countryside. The revolt spread to Dinajpur, where peasants elected two more leaders and sacked and robbed a revenue office. After five weeks British troops put down the rebellion after killing many peasants, burning their homes and hanging a village headman. No relief seems to have been forthcoming from this uprising.

The Deccan revolt of 1875 was joined by water-carriers, barbers and even the house-servants of moneylenders in addition to cultivators. It covered Poona and Ahmednagar districts and spread into Gujarat. Excessive revenue exactions, low prices of grain and cotton crops and evictions and land mortgages to moneylenders drove the peasants to a three week insurrection. Tens of thousands met in public gatherings in market places and vowed to boycott the claims of moneylenders and to seize their documents. Some moneylenders fled the area. Those who resisted the armed bands who came for documents had their fodder stacks burned down, although the peasants carried on very little personal violence. After three weeks troops moved against the boycotters, hundreds were arrested in each centre, and the government levied collective fines throughout the area. The revolt produced some respite in the Deccan Agriculturalists' Relief Act of 1879.[78]

The famous Bengal indigo strike of 1860 was the first large strike in India and one of the most successful. It illustrates the initiative and discipline of which peasants are capable. It involved hundreds of thousands of tenants on British plantations. The tenants were forced to grow indigo at very low prices for the British textile industry, to the exclusion of most other crops. When they refused, slave drivers — some trained on United States southern plantations — kidnapped or flogged them, exposed them in stocks, or murdered them. Once decided upon, the strike spread rapidly. Tenants assembled with staffs, swords, bows and arrows and matchlocks to defend their settlements. In Pabna an army of 2,000 peasants appeared and wounded a magistrate's horse; otherwise, there was little violence. The strike stopped indigo planting in Bengal and forced the planters to move west to Bihar.

The Moplah rebellion of 1921 lasted longer than any other peasant insurrection I have examined. It bridged the period of 'pre-political-party, peasant uprisings and that of peasant actions sponsored by political parties. In its first large all-India struggle towards Independence, the Indian National Congress joined with Muslims of the Khilafat movement[79] to boycott British instituted councils, law courts, titles, educational institutions and the purchase of foreign goods. The boycott allied Hindu and Muslim middle class leaders, a few landlords, high ranking non-cultivating tenants and a large mass of poverty stricken cultivating tenants and landless labourers, especially Moplahs, who formed a majority of the population in the Ernad and Walluvanad taluks and who followed the Khilafat leaders. Both the Congress and the Khilafat parties had begun to organise a movement for tenancy reforms, which was strongly opposed by Malabar's big landlords with their memories of the nineteenth century Moplah revolts. The manager of a large Hindu princely estate persuaded the police to search the local Khilafat secretary's house for a gun that he alleged had been stolen from the palace. Thousands of armed Moplahs were summoned by drumbeats to prevent their leader's arrest. When police broke into a mosque in search of the fugitive, Moplahs throughout the two taluks rose in insurrection, sacking police stations, looting government treasuries and destroying records of debts and mortgages in courts and registries. For six months British rule became inoperative throughout the region. A leader emerged to govern it who was known as Raja by the Hindus, Amir by the Muslims, and Colonel of the Khilafat army. He administered the territory, supervised the execution of police, both Hindu and Muslim, who had committed atrocities, and of traitors who helped the British forces, put an end to the looting, and announced the suspension of land revenue and rents for one year. He commanded poor peasants to harvest their landlords' crops and used the surplus to feed his army. He issued passports to travellers entering and leaving his kingdom and edicts against the harming of Hindus by Muslims.

The Congress party under Gandhi withdrew its support from the movement as soon as it resorted to violence and tried ineffectively to mediate between the British and the revolutionaries, The resultant wavering among Hindu followers roused suspicion among the Moplahs and when British troops attacked and engaged in espionage among the Hindus the movement acquired a communal flavour. The rebels killed some 500 alleged traitors, chiefly Hindus, sacked about a hundred temples and forcibly converted 2,500 Hindus to Islam. A fierce struggle followed between British and Gurkha troops on one side and the rebel army on the other, in which according to A Sreedhara Menon about 10,000 were estimated to have died. There was prolonged guerilla warfare and two large battles were fought. On reconquering the region the British took savage reprisals. The rebel leaders were shot, hundreds of their followers were hanged or deported to the Andamans and 61 prisoners suffocated as a result of being enclosed in a railway goods-wagon on their way from Tirur to Coimbatore jail. Considering the violent enmity of the Hindu landlords, the wavering of the (largely Hindu) Indian National Congress and the terror instituted by the British, the rebel leaders' conduct must be considered moderate and the rebels' communal reprisals a minor part of the revolt, which was essentially a peasants' insurrection. The Moplah rebellion illustrates the fact that in India as elsewhere, agrarian classes usually have a partial isomorphism with major ethnic categories, whether these are Hindu and Muslim or culturally distinct blocks of Hindu castes, or even, in some areas, co-resident linguistic groups.[80] What is labelled inter-religious or inter-communal strife is often, perhaps usually, initially a class struggle, but unity in the class struggle is all too often broken by the upper classes' appeal to and manipulation of cultural differences, and under duress those most oppressed may turn on all the co-religionists of their oppressors.

Modern Peasant Uprisings

Except for the early revolts to drive out the British and re-establish traditional principalities, the uprisings so far discussed were 'pre-political' or 'primitive' in the special sense that they were not addressed to the future of the nation state and thus were doomed to failure when they aimed at revolution. These revolts were, however, politically progressive in that they sought a new state of peasant society which would combine freedom from alien rule together with some traditional virtues and modern technology and popular government, rather than merely reverting to pre-British social structures. The revolts also amply illustrated the remarkable organising abilities of the peasantry, their potential discipline and solidarity, their determined militancy in opposing imperialism and exploitative class relations, their inventiveness and potential military prowess and their aspirations for a more democratic and egalitarian society. The more impressive uprisings also show that even in India, where inter-ethnic strife has produced some of the most tragic modern holocausts, peasants are capable of co-operating in class struggles across caste, religious and even linguistic lines to redress their common grievances.

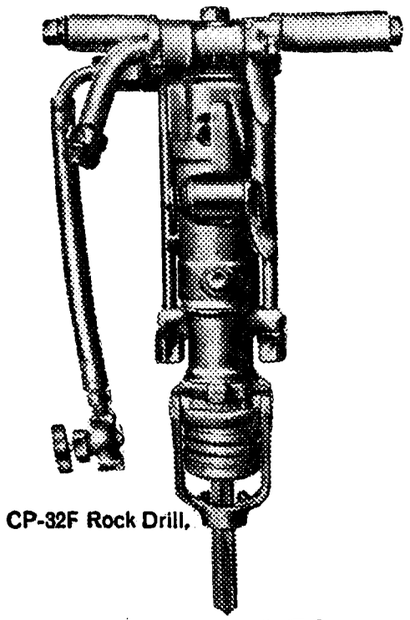
Peasant revolts since the 1920s have been co-ordinated within the policies of oppositional political parties. They have formed two major types. On the one hand, there have been political movements for independence or for national or regional autonomy among blocks of tribal peoples. The most notable of these have been the struggle for an independent state in Kashmir, the nationalist war of the Naga and Mizo tribal peoples, and the Jarkhand movement for the political autonomy of the Santhals, Oraons and other tribes. On the other hand, there have been peasant uprisings which were primarily class struggles and were guided by one or another of India's communist parties.

Seven major peasant uprisings or episodes of revolutionary struggle in the Indian countryside have occurred to my knowledge under communist guidance. The first four were conducted by the Communist party of India before it split into two wings in 1964. These were Tebhaga uprising in the north of Bengal in 1946, the Telengana peasant war in former Hyderabad state (now part of Andhra Pradesh) in 1946-48,[81] a strike of tenants and landless labourers in eastern Thanjavur for several weeks in 1948,[82] and a series of short strikes followed by attacks on granaries and grain trucks in Kerala in 1946-48.[83] The other three uprisings were led by Maoist groups which began to break away from the Communist Party of India (Marxist) in 1967. They included prolonged peasant struggles involving land claims and harvest shares in 1966-71 led by the Andhra Pradesh Revolutionary Communist Committee; the uprising in Naxalbari in West Bengal in 1967; and the "annihilation campaign" of the Communist Party of India (Marxist-Leninist) against landlords, moneylenders, police and a variety of political enemies of the party, especially in Srikakulam, Mushahari and Debra-Gopivallabpur in 1969-70.[84]

Communist sponsored uprisings differ in many respects from those of earlier periods. First, of course, they are led at least ostensibly by a vanguard party which recruits members from urban petty bourgeois, urban working class, or even landlord origins as well as from the peasants and which draws on the theories of Marx and Lenin as well as, more recently, Mao Tse-tung. In each uprising the party involved has had as its ultimate goal the revolutionary attainment of a People's Democracy as a prelude to the transition to socialism throughout India.[85] Peasant revolts have been co-ordinated, and sometimes

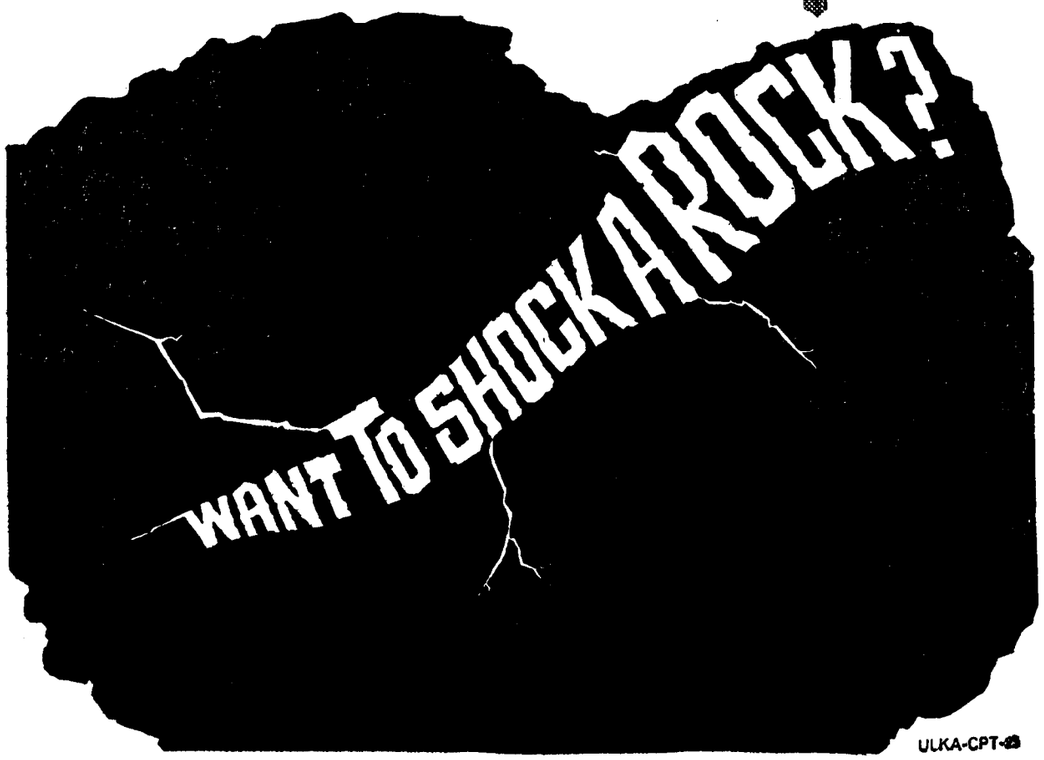
WANT TO SHOCK A ROCK?

CP Rock Drills are designed and built to do that and more, with the utmost efficiency. The CP-225 is an excellent general purpose tool for short hole drilling or demolition work and is widely used in mines and quarries. The CP-32F is recommended for shaft sinking, tunnel driving, quarry work, excavation and road work, where fast drilling speeds, strong rotation and efficient hole clearing are required.



Consolidated Pneumatic manufacture the widest range of construction and mining tools and air compressors—to standards of workmanship and quality that have earned them the reputation of leaders and pace-setters in air power.

(CP-225 and CP-32F are available as wet or dry machines, with a choice of 3¼"or 4½"x 7/8" chuck).



The Power of Air Harnessed for Industry

CP-32F Rock Drill.

started, in accordance with current party policy, and have sometimes been stopped by the party because of national or even international changes of party line.[86]

Nevertheless, just as modern tribal nationalist movements, in their goal of ethnic liberation, share common features with and may even draw experience and organisational strength from earlier tribal religious movements,[87] so various communist struggles among the peasants have had features in common with early peasant movements involving social banditry, terrorist vengeance with ideas of popular justice, or mass insurrections for the redress of grievances.

The most successful communist led peasant actions were those of Tebhaga in 1946, Telengana in 1946-48, Naxalbari in 1967, and Andhra Pradesh in 1969-71. All of them involved a large component of tribal people. All of these revolts began as strikes or other forms of popular action initiated by the peasants or with their willing consent for the redress of specific grievances. The Tebhaga revolt began with a demand for reduction of the occupying tenants' (jotedars')[88] rights in the crop from half to one-third and a corresponding increase in the rights of poor peasant sharecroppers (adhiars or bargadars). It had been preceded in the late 1930s by a campaign on behalf of middle peasants (the better-off tenants) to abolish 'feudal' levies over and above the legal rents. In Telengana, too, the initial demands were for abolition of illegal exactions by the deshmukhs and nawabs — the feudal lords — and later on for cancellation of peasants' debts.[89] In Thanjavur the demands were for halving the rents paid by cultivating tenants and doubling the wages of landless labourers. In Naxalbari the peasant unions began by taking over land which the communist-led West Bengal government had already decreed should be removed from the jotedars, the former occupancy tenants who by this time had become outright owners of the land with the abolition of zamindari rights. The land act provided for this land to be distributed to the landless, but the proprietors refused to surrender it. Having driven out the landlords, the peasant unions then went on to distribute all the land among the peasants.[90] Similarly, in Warangal, Khammam and Karimnagar districts of Andhra Pradesh in 1969, the communist peasant unions began their armed struggle by occupying land which had been taken from them by neighbouring landlords and redistributing it among the tribal peasants.[91]

In all these struggles, much as in more successful of the traditional peasant insurrections referred to earlier, the peasant unions were able to secure temporary liberated zones which they governed for several weeks or months through peasant committees supervised by the Communist Party. In Thanjavur landlords, police and bureaucrats remained in the area but obeyed the village committees; in the other regions the peasants killed or drove out these figures during the period of revolutionary government. The largest and longest revolt was that of Telengana, which is reported to have engulfed 2,000 villages in an area of 15,000 square miles, with a population of four million and a peasant army of 5,000. In the more recent Andhra Pradesh uprising of the late 1960s under the Andhra Pradesh Revolutionary Communist Committee, which took place partly in the same area, the revolutionaries claimed in mid-1970 a liberated area of 7,000 to 8,000 square miles with a population of 500,000 to 600,000.[92] Repression has since greatly increased and the movement appears to be temporarily crushed.

In contrast with these efforts, communist armed action has been less successful when it employed tactics suggestive of banditry or of terrorist vengeance, unaccompanied by mass insurrection or by demands for redress of specific grievances and popular control by peasant committees. These tactics predominated in the party's struggles among the peasants in 1948-49 in Kerala and in those of the CPI(ML) in eastern India and elsewhere in 1969-72.[93] In the former instance the communists had earlier, in 1946, conducted successful mass strikes for higher wages among landless labourers and mass cultivation of the forest lands of big landlords. (As in Bengal, they had also successfully organised strikes of middle peasants against illegal levies during the late 1930s.) When, however, police reprisals became heavy and several communists and peasants were killed, the party went partly underground and squads of party members and peasant leaders began to rob grain trucks and ransack the granaries of landlords and distribute food to the people. Although poor peasants admired these exploits — much as they admire those of dacoits who pillage the rich and powerful — the peasants did not become organised through these actions and had no control over them. In the course of these actions the police and the armed goons of (Congress-supporting) landlords killed several leading peasants and party members and arrested most of the others, and the Communist Party became temporarily isolated from the villagers.

In the second instance, the CPI(ML) moving away from its earlier policy of mass struggles in Naxalbari and to some extent in Srikakulam, developed the policy of "annihilation" of landlords, police, moneylenders, oppressive bureaucrats and enemies of other political parties by secret squads recruited from young party members and their associates in the cities, and, where possible, from the most oppressed groups of poor peasants and landless labourers in the countryside. Several dozens and probably hundreds of landlords in eastern India were assassinated in a three-year period. In their size, secrecy, primitive weaponry, utter devotion and in the fact that they tended to operate some distance from home, these revolutionary squads resembled those of the Moplah peasant insurgents who carried out acts of terrorist vengeance in Malabar in the nineteenth century — and no doubt also other Indian terrorist groups in urban uprisings of the early twentieth century. While commanding admiration in many villages, the squad tactic, unaccompanied by mass organisation around specific economic grievances, isolated the cadres and exposed a defenceless populace to police and later to military reprisals. The annihilation policy, along with other shortcomings, was criticised in a letter from the Chinese government in November 1970, and helped provoke a split in the party in 1971. Since the death of Charu Mazumdar, the party chairman and the main exponent of the annihilation tactic, in July 1972, it has been repudiated by most of the party's remaining leaders.[94] At present, most of the CPI(ML)'s cadres appear to have been arrested, or to have left the party, or to have been killed in action or in jails.[95]

Conclusions

Indian peasants have a long tradition of armed uprisings, reaching back at least to the initial British conquest and the last decades of Moghul government. For more than 200 years peasants in all the major regions have risen repeatedly against landlords, revenue agents and other bureaucrats, moneylenders, police and military forces. The uprisings were responses to relative deprivation of unsually severe character, always economic, and often also involving physical brutality or ethnic persecution. The political Independence of India has not brought

surcease from these distresses, for imperial extraction of wealth from India and oppression by local property owners continue to produce poverty, famine, agricultural sluggishness and agrarian unrest. Major uprisings under communist leadership since British rule not unnaturally show a continuity of tactics with earlier peasant revolts. Of these, the more successful have involved mass insurrections, initially against specific grievances, and the less successful, social banditry and terrorist vengeance. Both in the case of communist revolts and in that of earlier peasant uprisings, social banditry and terrorist vengeance, when they occurred, appear to have happened in the wake of repression of other forms of revolt.

Although revolts have been widespread, certain areas have an especially strong tradition of rebellion. Bengal has been a hotbed or revolt, both rural and urban, from the earliest days of British rule. Some districts in particular such as Mymensingh, Dinajpur, Rangpur and Pabna in Bangladesh, and the Santhal regions of Bihar and West Bengal, figured repeatedly in peasant struggles and continue to do so. The tribal areas of Andhra Pradesh, and the state of Kerala, also have long traditions of revolt. Hill regions where tribal or other minorities retain a certain independence, ethnic unity, and tactical manoeuvrability, and where the terrain is suited to guerilla warfare, are of course especially favourable for peasant struggles, but these have also occurred in densely populated plains regions such as Thanjavur, where rack-renting, land hunger, landless labour and unemployment cause great suffering.

The more successful revolts of the recent period occurred under irregular conditions which are unlikely to be repeated. The Tebhaga revolt took place three years after a famine had killed three and a half million Bengalis, leaving a labour shortage. The British government was nervous of offending the peasantry because of the Japanese invasion; it failed to move against the rebels until the Japanese had been defeated and the proportions of the rebellion had become alarming.[96] In Telengana in 1946-47 the change of government created an emergency, as the Nizam of Hyderabad refused to accede to the Indian Union, and it was some time before the Indian government decided to invade the state and mop up both the Nizam's forces and the communists. In Thanjavur in 1948 the government was occupied in invading Hyderabad and did not immediately institute repression.

Today the Indian government is more heavily militarised than it has ever been. It has the experience of crushing recent peasant struggles, of years of police repression in West Bengal and of the invasion of Bangladesh. It also has the example of US methods of repression in Indochina.[97] The increasing poverty, famine and unemployment make it seem certain that India's agrarian ills can be solved only by a peasant-backed revolution leading to socialism, but the struggle will be very long and hard.

Notes

1 An earlier version of this paper was presented at a Conference on Peasants of Asia and Latin America at the University of British Columbia in February, 1973, sponsored by the Canada Council. I am grateful to David F Aberle, Amiya Kumar Bagchi, Peter Harnetty, Gail Omvedt and Thomas Weisskopf for comments on the earlier version. None of them is responsible for my interpretations.

2 The hut and charred bodies were photographed and are reproduced in Lasse and Lisa Berg, "Face to Face: Fascism and Revolution in India", Ramparts Press, California, 1971, p 55. For more details and an account of recent class struggles in Thanjavur, see Mythily Shivaraman, "Rumblings of Class Struggle in Thanjavur", in Kathleen Gough and Hari P Sharma, eds, "Imperialism and Revolution in South Asia", Monthly Review Press, 1973.

6 Barrington Moore, Jr, "The Social Origins of Dictatorship and Democracy", Beacon Press, 1966, p 202.

7 *Op cit*, p 383. Moore is actually equivocal about the effects of caste on peasant unrest, for on page 382 he writes, "Any notion to the effect that caste or other distinctive traits of Indian peasant society constitutes an effective barrier to insurrection is obviously false", but on page 383, "Caste was also a way of organising a highly fragmented society . . . Though this fragmentation could at times be overcome in small ways and in specific localities, it must have been a barrier to widespread rebellion. Furthermore, the system of caste did enforce hierarchical submission. Make a man feel humble by a thousand daily acts and he will behave in a humble way. The traditional etiquette of caste was no mere excrescence; it had definite political consequences. Finally, as a safety valve, caste does provide a form of collective upward mobility through Sanskritization". My view is that an enforced etiquette of submission does not necessarily engender submissive feelings; if the subordinate comes to feel unjustly deprived, having to observe the etiquette may engender rebellious feelings which sometimes burst forth. In Thanjavur in 1952 I lived on a street of low ranking and poverty striken cowherds and sharecroppers, servants of Brahman landlords. The caste etiquette was the most subservient I have seen outside of Kerala. In private the sharecroppers often raged against their landlords as "evil". In spite of severe reprisals involving flogging and being forced to drink pints of cowdung and water, lower caste men in this village had frequently resorted to violence. One once smote his landlord across the face; another cut off his landlord's leg; two more bound their landlord to a cart-wheel, thrashed him and drove him out of the village for seducing a kinswoman. Sanskritisation permits upward mobility but only for a small minority. The conflicts of interest among castes which are respectively composed predominantly of smallholders, sharecroppers, and landless labourers, are a serious matter for revolutionary organisers, but such class conflicts among peasants are worldwide.

20 The century old dispute regarding the extent, or even the occurrence, of 'deindustrialisation' in nineteenth century India has not abated. Most writers acknowledge that there was certainly a decline in the proportion of Indian craftsmen relative to the total population in the first half of the nineteenth century, and some, that the decline continued throughout the century. The argument regarding the earlier period, in particular, seems unquestionable in view of the staggering decline in exports of Indian craft goods and the staggering increases in Indian exports of raw materials and in British imports to India of manufactured goods. For evidence and figures see Barratt Brown, *op cit;* A K Bagchi, *loc cit;* B B Misra, "The Indian Middle Classes", University Press, 1961; and Daniel Thorner, "Deindustrialisation in India", in "Land and Labour in India", Asia Publishing House, 1962, chapter VI. Romesh Chandra Dutt's classic study, "The Economic History of India under Early British Rule, 1757-1837, Routledge and Kegan Paul, 1963, first published in 1901, is still of great value, especially pp 176-200. Dharma Kumar, who is mainly concerned about stressing the existence of landless labour in India from pre-British times, nevertheless points out that the agriculturally dependent population increased from about 60 per cent to 69 per cent between 1800 and 1901. It had reached about 75 per cent by 1951 ("Land and Labour in South India", Cambridge University Press, 1965, p 181). In Kerala and Thanjavur in the 1950s I found many families in castes traditionally designated as Weavers, Goldsmiths, Traders, Tile-Makers, high class Potters, Oil-Mongers, Basket and Mat-Makers, or other craftsmen, who became unable to ply their crafts at some time during British rule and who became tenant farmers, landless labourers, or casual workers in towns. Saghir Ahmad found the same in West Punjab (see "Peasant Classes in Pakistan", in Gough and Sharma, eds, *op cit*, 1973, pp 203-221). Morris D Morris has argued more strongly than other recent writers against 'deindustrialisation', but I believe his arguments to have been ably answered by several Indian authors. See Morris D Morris, ed, "The Indian Economy in the Nineteenth Century: A Symposium", Indian Economic and Social History Association, Delhi School of Economics, Delhi 7, 1969.)

21 The population of Dacca is reported to have fallen from 150,000 in 1757 to between 30,000 and 40,000 in 1840. In 1787 the exports of Dacca muslins to England amounted to three million rupees, but in 1817 they had ceased altogether. Murshidabad, Surat, Agra and also southern cities such as Thanjavur suffered correspondingly (R Mukherjee, *op cit*, pp 337-339).

22 Opium, for example, was the chief agricultural crop in Malwa and lower Rajputana in 1817-18 (S B Chaudhuri, *op cit*, 1955, p 217), and this was still true in 1860-1880. Indigo in Bengal and Bihar, cotton in the north-west provinces, central India and the Karnatak, jute and sugarcane in Bengal, and tea, tobacco and coffee in north-east and south-east India, were among the export crops that were greatly expanded in the first half of the nineteenth century. In Bombay province in 1834-45 cotton occupied 43 per cent of cultivated land in Broach and 22 per cent in Surat but the cultivators were reported to receive little or no profit (R C Dutt, "The Economic History of India in the Victorian Age, 1837-1900", Routledge and Kegan Paul, 1960, p 98). Today about 40 per cent of the land in Kerala state is devoted to export crops and Assam is similarly dominated by a plantation economy; export crops occupy at least one-fifth of the cultivable land of India as a whole (A K Gopalan, "Kerala Past and Present", Lawrence and Wishart, 1959, pp 79-96). In addition to the expansion of industrial crops for export, India also exported increasing amounts of foodgrains during the nineteenth century, in spite of the growing population and the virtual stagnation of subsistence agriculture. Thus, India exported 1.25 million tons of foodgrains in 1879-80, whereas it had exported only 0.65 million pounds sterling worth in 1842, 3.58 million in 1860 and 27.26 million in 1880 (B M Bhatia, "Famines in India, 1860-1965", Asia Publishing House, 1967, p 38).

23 For a detailed treatment of trends in both commercial and subsistence agriculture during British rule, see George Blyn, "Agricultural Trends in India, 1891-1947", Philadelphia, 1966.

24 There is uncertainty about the exact proportions of the different classes of peasants and agricultural workers in various decades because of imperfect records and differences in modes of classification. Dharma Kumar rightly points out that there was a substantial class of agricultural labourers at the beginning of British rule, usually enslaved and mainly untouchable. She estimates its size at about 10 to 15 per cent of the total population. Although she emphasises continuities in the agrarian structure of India in the nineteenth century, Kumar notes that, agricultural labourers had increased to an estimated 15 to 20 per cent of the total population in the period between 1871 and 1901. Landless labourers were estimated at 28 per cent of the total workforce in 1951 and 26 per cent in 1971. It is also relevant to estimate the proportions of agricultural labourers in relation to the total population *dependent on agriculture* in the various periods, and the latter in relation to the total population of India. Rough estimates are as follows. Dharma Kumar estimates the agriculturally dependent population at 60 per cent of the total population in 1800 or even less. Agricultural labourers were probably about 17 to 25 per cent of the agricultural population. In 1901 the agricultural population was about 69 per cent of the total with agricultural labourers about 27 to 29 per cent of the agricultural population. In 1951 the agricultural population was about 75 per cent

of the total population and agricultural labourers about 38 per cent of the agricultural population. In 1971 the agricultural population had declined again to 69 per cent of the total; agricultural labourers still formed about 38 per cent of the agriculturally dependent population, but a larger proportion of them were probably totally landless than were in 1951. (See Dharma Kumar, "Land and Caste in South India", Cambridge University Press, 1965, especially pp 168-193; Charles Bettelheim, "India Independent", Monthly Review Press, 1969, p 25; and Government of India *Censuses* for the various decades.) In some states where the agricultural population's density is very high, the numbers of agricultural labourers have risen quite rapidly in recent decades. In Thanjavur district, for example, they increased by 60 per cent between 1951 and 1961. (See, e g, Mythily Shivaraman, "Rumblings of Class Struggle in Thanjavur", in Gough and Sharma, eds, *op cit*, p 252.) When middle and poor peasants lose their lands, moreover, not all of them show up in the category of landless labourers. Some, like some former landless labourers, are forced to migrate to cities, where they often join the lumpen proletariat of beggars, casual labourers and underemployed craftsmen or service workers. The urban population increased from about 25 per cent to 31 per cent of the total between 1951 and 1971.

25 See, e g, V M Dandekar and Nilakantha Rath, "Poverty in India: Dimensions and Trends", *Economic and Political Weekly*, Bombay January 2, 1971, pp 106-146. The authors estimate that in 1960-61, 38 to 40 per cent of India's rural population and about 54 per cent of its urban population received inadequate diet to maintain health by United Nations standards, even with respect to number of calories. By 1967-68, consumer expenditure among the poorest 5 per cent of villagers had declined slightly, while the poorest 20 per cent in the rural areas had stagnated. In towns, partly as a result of the migration of rural unemployed to the cities, consumer expenditure had declined among the bottom 40 per cent between 1960-61 and 1967-68. Using a different criterion of a minimum of Rs 15 per month per capita for consumer expenditure, Bardhan estimated that the rural population living below the poverty line was 38.03 per cent in 1960-61, 44.57 per cent in 1964-65 and 53.02 per cent in 1967-68 (P Bardhan, "Green Revolution and Agricultural Labourers: A Correction", *Economic and Political Weekly*, January 2, 1971, pp 25-48). Male agricultural labourers can find work for an average of only 190 days a year and females for only 120 days a year (Bettelheim, *op cit*, p 30).

26 See B M Bhatia, *op cit*, for the following information, especially pp 10-13, 239-242 and 308-339.

27 *Newsweek*, June 17, 1963, reporting on the World Food Congress held in Washington, DC, under the auspices of the United Nations.

28 P L Eldridge, "The Politics of Foreign Aid in India", Vikas Publications, Delhi, 1969, especially pp 112-116. India imported only 2.6 per cent of its foodgrains in the First Five Year Plan (1951-1955), but this was increased, chiefly under US Public Law 480 loans, to 4.9 per cent in the Second Plan and 7.5 per cent in the Third.

29 For the impact of land reforms, see, e g, Bhowani Sen, "Evolution of Agrarian Relations in India", People's Publishing House, Delhi, 1962; Grigory Kotovsky, "Agrarian Reforms in India", People's Publishing House, 1964; and Charles Bettelheim, *op cit*, pp 146-233.

30 See Hari P Sharma, "Green Revolution in India: Prelude to a Red One?" in Gough and Sharma, eds, *op cit*, pp 88 and 94. Observations in Kerala in 1964 convinced me that these processes were widely at work there, partly as a result of landlords' reactions to successive land reform acts. In one north Kerala village, for example, I found that whereas in 1948 poor peasants, landless labourers and casually employed non-agricultural day labourers, having no land or only one small garden, were 72.1 per cent of the population, by 1964 they were 88.2 per cent.

31 See, e g, Francine Frankel, "India's Green Revolution: Economic Gains and Political Costs", Princeton University Press, 1971, for the increasing gap in incomes brought about by the green revolution and the fact that it chiefly benefits the larger farmers. Mohan Ram, ("Maoism in India", Vikas, Delhi, 1971, pp 185-6) and Mythily Shivaraman, (*loc cit*) cite increases in landless labourers and unemployed.

32 See Hamza Alavi, "Imperialism, Old and New", *The Socialist Register*, 1964, Monthly Review Press, 1964, pp 104-126; and A K Bagchi, *loc cit*, for characteristics of neo-imperialism in India since Independence and for comparisons and contrasts with the period of British rule. Alavi's later essay, "The State in Postcolonial Societies: Pakistan and Bangladesh", in Gough and Sharma, eds, *op cit*, pp 145-173, is also in many respects highly relevant to India.

39 These revolts were those of (1) the Kallar of Madura 1710-1784; (2) the Rajas of Dhalbhum, 1769-74; (3) the Chuar tribe of Midnapore, 1799; (4) a chief in Sylhet, 1787; (5) a dispossessed zamindar in Sylhet 1799; (6) Vizier Ali in Banaras and Gorakhpur 1799; (7) the Raja Vizieram Rauze in Vizagapatam, 1794; (8) the Maratha Dhundia Wagh in Mysore, 1799-1800; (9) the Pazhassi or "Pyche" Raja in North Malabar, 1796-1805; (10) the *poligars* of Bellary, Anantapur, Cuddapah and Kurnool, 1803-5; (11) the *poligars* of Tinnevelly, 1901; (1) the *poligars* of North Arcot, 1803-5; (13) Velu Thampi, the Prime Minister of Travancore, 1808-9; (14) the heirs of the Desai of Kittur, 1824; (15) the Bhils of Khandesh, 1818 31; the Bhils of Malwa, 1846; (17) the Khonds of Orissa, 1846; (18) the Santhals of Bihar, 1855-56; (19) an ex-chief, Gopal Singh, of Bundelkhand, 1802-12; (20) the chiefs of forts in Aligarh, 1817; (21) the Paiks and Khonds of Cuttack, 1817-18; (22) the Gujars of Sindia, 1824; (23) the Kols, Hos, and Mundas of Chota Nagpur, 1831-32; (24) the Bhumij and Chuar of Manbhum, 1832; (25) the Khasis of Assam, 1829-58; (26) the Garos of Assam, 1852, 1857, and 1872; (27) the Syntengs of Assam, 1860 and 1862; (28) the Mers of Merwara, 1820; and (29) the 'Sepoy Mutiny' in north and central India, 1857-58. For the Kallar, see W Francis, *op cit*, pp 66, 88-91; for the Garos and Syntengs, Stephen Fuchs, *op cit*, pp 111, 115, 126; and for the Mutiny, Chaudhuri, *op cit*, 1957. The other rebellions are reported in Chaudhuri, *op cit*, 1955. L Natarajan includes further information on the Santal revolt of 1855-56 in *Peasant Uprisings in India*, 1850-1900, People's Publishing House, Bombay, 1953.

40 See Benoy Ghosh, "Prepolitical Rebellions in Bengal", *Frontier* Calcutta, Vol 5, Nos 27-29, October 14, 1972, pp 9-14, for a recent account of the Chuar and Santhal rebellions.

41 The Moplah revolt of 1857, for example, was influenced by the belief that the British would soon

The Profile of a Pioneer—
BHARAT ELECTRONICS LTD.

SET UP IN 1954 in Jalahalli, near Bangalore, with an authorised capital of Rs. 10 crores, paid-up capital Rs. 6.96 crores, BEL went into production in 1956 with two items—HF Medium Power Communication Transmitter and associated Receiver. Production in 1956 was only Rs 6 lakhs. Total labour strength was 1,000

TODAY, BEL HAS GROWN INTO A MAJOR ELECTRONIC EQUIPMENT AND COMPONENT MANUFACTURER, EMPLOYING OVER 13,000 PEOPLE AND CONSISTING OF SIX PRODUCTION DIVISIONS.

RADAR DIVISION : Manufactures Fire Control Radars, Field Artillery Radars, Surveillance Radars, Navigational Radars, Search & Weapon Control Radars, Secondary Surveillance Radars, Storm Warning Radars for the Army, Navy and Meteorological Department in 'L', 'S' and 'X' Bands; Gun Control Equipment for the Vijayanta tanks.

BEL looks to the future with confidence.

HIGH POWER COMMUNICATION & BROADCAST EQUIPMENT DIVISION : Manufactures 1 KW, 10 KW, 100 KW Medium Wave Broadcast Transmitters, TV Studio and Transmission Equipment, Professional Type Console Tape Recorders, Tape Decks, 100 W SSB Transreceivers, 400 W, 1 KW and 5 KW SSB Communication Transmitters, to cater to the Defence and Civilian needs for static and mobile roles.

LOW POWER COMMUNICATION EQUIPMENT DIVISION : Produces short distance communication equipment like Walkie Talkies, Ground-to-Air Communication sets, Ship-to-Ship and Ship-to-Shore Communication, Airborne Communication, and Multichannel Radio Relay equipment—in HF, VHF, UHF ranges.

ELECTRON TUBE DIVISION : Produces Receiving Valves for Radio sets, Television receivers, industrial applications; Indicator Tubes and TV Picture Tubes; Transmitting Tubes for communication, broadcast, industrial applications; Ceramic Tubes, Vapotrons, Thyratrons, Magnetrons and Vacuum Capacitors; X-ray Tubes for the medical profession; CRTs for instruments and radars.

SEMICONDUCTORS DIVISION : Produces Germanium Transistors and Diodes, Silicon Transistors and Diodes, Switching Transistors, Zener Diodes, Field Effect Transistors, Diode Gates, Darlington Pairs, Integrated Circuits and Hybrid Microcircuits.

PASSIVE COMPONENTS: Piezo Electric Crystals for Oscillators, Clocks, Filters, Quartz elements for ultrasonic work and other industrial uses. Mica and Ceramic Capacitors in plaquettes and miniature discs.

BEL also manufactures Computers and Digital equipment as a sub-contractor for ICL; data processing equipment for radars, data display consoles.

BEL's exports reached Rs. 1.9 crore during 1973-74. Besides sizeable exports to Asian Countries like Japan, Hong Kong, Thailand, Singapore, Nepal, Bhutan and Sikkim, BEL's goods have gone to customers in U.K., U.S.A., Canada, West Germany and several other countries.

With the know-how and the expertise garnered in the past 20 years, BEL has now reached the stage when it can go ahead on its own 'steam'. Its Development and Engineering Division now has over 200 highly qualified engineers who are contributing more and more to the independent production of many types of communication equipment and components.

Another unit at Ghaziabad in U.P. has also gone on stream. This unit will manufacture exclusively highly sophisticated air defence radar systems and microwave communication equipment.

Pioneers in '56... Leaders Today

46 Cohn, *loc cit*, p 32.

47 Fuchs notes 14 characteristics of the movements he calls messianic. They are: intense dissatisfaction with socio-economic conditions, emotional unrest with hysterical symptoms, a charismatic leader, the leader's demand for implicit faith and obedience, his demand for a radical change of life or for destruction of property, rejection of established authority and a call for rebellion, threat of severe punishment of traitors and opponents, the remembrance of a 'Golden Age' at the beginning of mankind's career, revivalism or renewed interest in traditional religion, nativism or the conscious attempt to restore selected aspects of traditional culture and to reject alien elements, vitalism or the desire for alien gifts from heaven, syncretism or indiscriminate adoption of various traits in the oppressors' culture, eschatologism or the expectation of world renewal after a worldwide catastrophe, and millenarianism or chiliasm, the hope or expectation of a paradise on earth. (See Fuchs, *op cit*, pp 1-15.)

48 The fullest account of the Moplah revolts up to the mid-1880s is contained in Logan, *op cit*, pp 554-594. See also C A Innes, *Gazetteer of the Malabar District*, Madras Government Press, 1908, pp 82-89. The movements recorded by Fuchs are: (1) the Hindu Maomaria movement in the Assam valley, 1769-1839; (2) the Mahdi movement of Aga Muhammad Reza with the Kuki Nagas in Cachar in 1799 (also described by Chaudhuri, *op cit*, 1955, p 73); (3) the Mahdi movement of Abdul Rahman and Bohra peasants in Gujarat, 1810; (4) the Muslim Pagal Panthi movement in Bengal in 1824-33; (5) the Muslim Maulvi or Wahabi movement in Bengal in 1827-31 under Titu Miyan; (6) the Muslim Faraizi movement of Dudu Miyan in Bengal in 1838-51; (7) an undated Hindu messianic movement in Sondwara, Malwa, in the early nineteenth century; (8) an undated Hindu messianic movement in Patiala state in the early nineteenth century; (9) revolts of the Gauda tribe of Mysore and some peasants of Coorg and south Canara under three successive Hindu religious leaders in 1837 and the following years; (10) the revolt of the Naikdas under Rupsingh in 1867-70 in the Panchmals; (11) the Munda revolt of the Sardari Lari in the 1870s in Chota Nagpur; (12) the Munda revolt under Birsa in Chota Nagpur in 1895-98; (13) the Oraon movement of Jotra Bhagat in Chota Nagpur in 1914; (14) the movement of Vasudeo Balvant Phadke among Maharashtrian peasants and others in 1879-80; (15) the Kacha Naga movement under Sambhudan in 1882; (16) the Kacha Naga movement under Jadonang and Gaidiliu in 1929-36 and again under Gaidiliu in 1961; (17) a revolt among the Garos of Assam in 1902; (18) the revolt of the Gonds of Adilabad under Bhimu against the Nizam of Hyderabad in 1940; and (19) the revolt of the Bhil Nath-panthis under Govindgiri in 1911-12.

49 Fuchs records a movement among the Pankas of Raipur an untouchable caste of weavers and village artisans; the messiah thought that a deity had entered him and preached that good men's crops would grow without sowing; when his following grew large and the revenue fell off he was arrested in 1860 (Fuchs, *op cit*, p 106).

50 Cf Aberle, *op cit*, 1962, pp 209-210.

51 Fuchs, *op cit*, pp 134 *et seq*.

52 Logan, *op cit*, p 567.

53 Fuchs, *op cit*, pp 218-221.

54 Fuchs, *op cit*, pp 28-34.

55 Fuchs, *op cit*, pp 240-243. The fifth classically millenarian movement was that of a Hindu messiah in Badawar, Patiala state, in the early nineteenth century who believed that he was Kalki, the last of the incarnations of Vishnu, the inaugurator of a happy and virtuous Hindu millennium. He announced that on an appointed day he would overturn the foreign government and set up his kingdom. He was arrested and his followers disappeared. Fuchs points out that Vaishnavism, Shaivism, Jainism and Buddhism, all contain millenarian mythologies — Vaishnavism that of Kalki, Shaivism of the 26 or 28 incarnations of Shiva each ushering in an age of liberation from evil, Jainism in the coming period of 63 saints whose saving qualities are similar to those to the Vishnu *avatars*, and Buddhism with its belief in the Buddha Maitreya, a future saviour of the world (Fuchs, *op cit*, pp x-xi, and for the Patiala movement, p 178).

56 Logan *op cit*, pp 558-59.

57 There have been at least three massacres of political prisoners, chiefly members of the Communist Party of India (Marxist-Leninist) since mid-1970. In particular on November 26, 1971, police admitted that six 'Naxalites' had been beaten to death with clubs and 237 wounded; according to some reports, however, up to 50 were murdered and many of the injured, at the time of reporting, hovered between life and death (*Frontier*, Calcutta, December 4, 1971; and *Le Monde*, Paris, November 30, 1971).

58 For a brief account and bibliography see "Thug", *Encyclopaedia Britannica*, 1958, Volume 21, p 1095.

59 Fuchs, *op cit*, pp 109-111.

64 E J Hobsbawm, "Social Bandits: Reply (to Blok)", *Comparative Studies in Society and History*, Volume 14, Number 4, September 1972, p 504.

65 Stewart N Gordon argues that Thuggee bands were employed by Maratha chiefs in the late eighteenthe century in Malwa in order to provide them with a non-local source of revenue from plundering far afield during a period of competition in small state formation and to pay for European-style artillery and infantry (Gordon, "Scarf and Sword: Thugs, Marauders and State-formation in 18th Century Malwa", *The Indian Economic and Social History Review*, Volume 6, Number 4, December 1969, pp 403-429).

66 Vasudeo Balvant Phadke, the Maratha Brahman religious leader who believed himself an incarnation of Shivaji Maharaj, recruited Ramoshi bandits in 1879 and with them carried out robberies and attacks on police stations to obtain supplies with which he hoped to build an army and drive out the British. He was disillusioned, however, by the fact that the Ramoshis looted for their own benefit, and so he turned instead to the Dhangar shepherd caste and to the Kolis, who joined him because they believed they had been unjustly deprived of a large part of their cultivated land (Fuchs, *op cit*, pp 228-33).

67 Francis, *op cit*, pp 91-92.

68 Chaudhuri, *op cit*, 1955, pp 66-67.

69 Chaudhuri, *op cit*, 1955, p 109.

70 Logan, *op cit*, p 584. Fuchs records another rebellion in which the motives seem to have been chiefly revenge on the part of Muslim cultivators and townsmen against unjust agrarian and municipal taxes. The revolt took place in Bareilly in 1816 under Mufti Muhammad Aiwaz and commanded an army variously estimated at five to fifteen thousand (Fuchs, *op cit*, pp 180-181).

71 Six of the revolts took place before the Mutiny, and are described by Chaudhuri, namely the revolt at Dinajpur and Rangpur in 1783, that at Bishnupur and Birbhum in 1789, that in Mysore in 1830-31, that in Kittur in 1824, that in Khandesh in 1852, and that of the Jats of Haryana in 1809 (Chaudhuri, *op cit*, 1955, sections 3, 4, 31, 43 and 45). The other eight revolts were those of the tenants of European indigo plantations in

Bengal in 1860, of the peasants in Pabna and Bogra, East Bengal, in 1872-73, of the Deccan cultivators in 1875, of peasants in the Punjab in the 1890s, of the Santhals and other peasants in Bengal in the 1870s, of converted Muslim tribal cultivators in East Bengal in the 1890s, of the Moplahs of Malabar in 1921, and of the Santhals during the Second World War and the national Independence struggle in 1942-43. L Natarajan describes the first three of these revolts in "Peasant Uprisings in India, 1850-1900", *op cit*. For the Bengal indigo revolt of 1860, see especially Blair Kling, "The Blue Mutiny", University of Pennsylvania Press, Philadelphia, 1966. For the Moplah revolt of 1921, see E M S Namboodiripad, "Kerala Yesterday, Today and Tomorrow", National Book Agency, Calcutta, 1967, pp 144-150; and A Sreedhara Menon, "Kerala District Gazetteers: Kozhikode", Government Press Trivandrum, 1962, pp 179-186. The other revolts are referred to by Fuchs, *op cit*, p 58; and A R Desai, "Social Background of Indian Nationalism", Popular Prakashan, Bombay, 1966, pp 188-189.

72 Chaudhuri *op cit*, 1955, pp 65-67.

73 Chaudhuri, *op cit*, 1955, pp 175-76.

74 Chaudhuri, *op cit* 1955, pp 171-172. The revolt began in mass opposition to the land survey and the placing of boundary stones on land — an indication of the peasants dread of the assessment that would follow the survey and demarcation of their plots.

75 Menon, *op cit*, p 179.

76 Chaudhuri, *op cit*, 1955, p 61.

77 The leader, Dirjinarain pleaded for the life of Gaurmohan the first agent, at some risk to his own, because Guarmohan was a Brahman and Brahmans were exempt from execution by traditional law. The peasants, however, insisted on killing him.

78 In "The Myth of the Deccan Riots", *Modern Asian Studies*, November 1972, Neil Charlesworth has argued that the extent of the uprising was much overestimated in current and subsequent reports. His argument does not seem convincing in the light of data cited by Natarajan and other writers.

79 The Khilafat movement was begun to protest against Britain's removing various Middle Eastern territories from the control of Turkey in violation of promises made by Lloyd George during the First World War.

80 See Kathleen Gough, "Indian Nationalism and Ethnic Freedom", in David Bidney, ed, "The Concept of Freedom in Anthropology", Mouton, 1963, pp 170-207, for further discussion.

85 For differences in ideology and strategy among the Communist Party of India, the Communist Party of India (Marxist), the Communist Party of India (Marxist-Leninist) and the Andhra Pradesh Revolutionary Communist Committee, see Mohan Ram, "The Communist Movement in India", *Bulletin of Concerned Asian Scholars*, Volume 4, Number 1, Winter 1972, pp 32-42.

86 The Cominform intervened in 1951 to induce the Communist Party of India to abandon armed struggle (Ram, *loc cit*, 1972, p 34).

87 The movement originally started by the Kacha Naga religious leader Jadonang in 1929 and carried on intermittently by his woman disciple Gaidiliu into the 1960s seems in particular to have been a forerunner of the Naga nationalist movement, although confined to one tribe, and much smaller in scale (see Fuchs, *op cit*, pp 147-56).

88 By the time of the Tebhaga rebellion the zamindar or landlord retained rights to only a small proportion of the produce and the jotedar or occupying tenant received most of the surplus. By the time of the Naxalbari revolt the zamindars had been removed and the jotedars were the landlords.

For the circumstances surrounding the Naxalbari rebellion and for the attitude taken towards it of the Communist Party of India (Marxist) which was then in power in a coalition government in West Bengal, see *People's Democracy*, weekly organ of the CPI(M), Volume 3, Numbers 23-30, 1967. See also Mohan Ram, *op cit*, 1971, pp 38-71.

91 Mohan Ram, *op cit*, 1971, pp 165-169.

92 Mohan Ram, *loc cit*, 1972, p 42.

93 Mohan Ram, *op cit*, 1971, pp 136-163; *loc cit*, 1972, p 41.

94 *Frontier*, Volume 5, Number 30, November 4, 1973, pp 15-16.

95 Several massacres of Naxalites and supposed Naxalite supporters have been conducted in the streets by police or gangs of hired hoodlums, notably one in Baranagar on August 12, 1971, when about 1,000 goons, under police protection, rampaged over an area of two square miles and killed 150 Naxalites and their sympathisers (*Frontier*, August 21, 1971, p 1, and September 18, 1971, p 10). Using police figures, which in some cases are known to be much too low, it has been estimated that 1,788 members of the CPI(ML) were killed outside the jails in West Bengal between March 1970 and August 1971, and 42 (unofficially, 172) inside the jails in Midnapore, Berhampore, Alipore, Dum Dum and Howrah (*Frontier*, Volume 5, Number 40, January 13, 1973, pp 3-4.) In the same period, 368 members of the Communist Party of India (Marxist) were reported to have been killed outside the jails, but some of these are alleged to have been people who had recently left the CPI(M) for the CPI(ML). Nine members of other political parties, including the ruling Congress party, were killed in this period and 66 police, businessmen, moneylenders, landlords and others. In November, 1973, a trial began at Parvathipuram in Andhra Pradesh involving 68 leaders of the Communist Party of India (Marxist-Leninist) and 38 of the Andhra Pradesh Revolutionary Communist Commitee, perhaps the largest trial of Communist revolutionaries in history. The trial continues at the time of writing (May 1974). About 45,000 other revolutionaries or alleged revolutionaries are still in jails in India, many of them under the legal classification of criminals rather than of political prisoners. Many have been held for four or more years without being brought to trial.

96 See Hamza Alavi, *loc cit*, 1965.

97 On March 1, 1971, the Government of India sent about 10,000 paramilitary personnel into the districts of Warangal, Khammam and Karimnagar in Andhra Pradesh and subdued the revolutionary struggle there. Something similar to the Vietnamese strategic hamlet plan has been attempted in Srikakulam district, people of scattered villages being herded together in camps at three mile intervals so that food supplies to the guerrillas are cut off. No civilians are allowed out after dusk. Some 50,000 tribespeople were still confined in these hamlets in April 1974. (See Mohan Ram, *loc cit*, 1972, p 42, *Frontier*, Volume 5, January 27, 1973, p 8; and *Economic and Political Weekly*, Volume 9, Number 17, April 27, 1974, p 666.)

The Telengana Armed Struggle

Barry Pavier

Without understanding the nature of the Hyderabad economy and the nature of the State, it is not possible to understand what went on in Telengana in 1946-1951. This brief article makes an initial, tentative attempt to suggest some possible lines of enquiry.

The Hyderabad economy, while it was of a combined nature, was coming to be dominated by a capitalist tendency. For the large 'feudals', their operations in the capitalist structure were becoming more important than their pre-capitalist exactions. Concurrently with this there was growing at the village level a layer of rich peasants and small landlords, tending to merge into each other.

To build a movement on the basis of a multi-class front against the 'feudals', as the CPI tried to do, meant adopting the programme of this last-mentioned layer, who found that the intermediaries — i e, the jagirdars, etc — were impeding their progress. The inability of the Hyderabad State to grant reforms which would have satisfied them was an indication of the weakness, first, of the indigenous bourgeoisie, and, second, of the colonial dependent State whose attempt at developing State capitalism had barely begun.

This situation meant that, at an early stage, demands began to be raised which were not simply 'anti-feudal' but were for land and increased wages. And the CPI was completely unprepared for these demands.

P SUNDARAYYA's book[1] is an improvement on most other memoirs-cum-polemics which have appeared on the Telengana armed struggle.[2] It contains a lot of 'facts'. Thus, if anyone wants to know which villages were involved during which period, and when a particular area came to be affected, then it is no longer necessary to plough through the files of *People's Age* to piece together the information. But if one is looking for a satisfactory analysis of the armed struggle — which deals with the nature of Hyderabad's economy, the social basis of the State, and the nature of the armed struggle itself —, in other words, if one is looking for an analysis which *explains*, and does not just put the CPM line yet again, then one is in for a disappointment.

There is absolutely nothing in the book on the origins, and hence the nature, of the dominant landlord layer — the *deshmukhs*. There is thus nothing on how they exerted their control over the countryside, on how their various methods of extracting the surplus combined to put them in a position where the CPI could — however briefly — unite against them all the other layers of the rural population into one of the CPI's famous 'multi-class fronts'. Consequently, and more importantly, there is no analysis of the positions of these other layers of the rural population, which led to the collapse of the front — especially after the Police Action of September 1948 — as something suspiciously similar to class warfare developed between the small-landlord-rich peasant layer on the one hand and the poor peasants and agricultural labourers on the other.[3] The roots of this lie in the rapid changes which had been occurring in certain sectors of the Hyderabad economy in the twentieth century, particularly the rapid spread of cultivation of commercial crops notably castor and groundnut. A considerable proportion of this production, it must be noted, was exported to the UK, the US, and Europe; Hyderabad was thus very much in the mainstream of pre-World War II imperialism, and was not simply the feudal backwater that Sundarayya and others are so fond of portraying. The precise relationship of Hyderabad to British imperialism has yet to be established, but simply to label the Nizam as a stooge of the British is nevertheless misleading. Sundarayya's analysis of 'feudalism'[4] is not very helpful either. It merely lists land concentrated in the hands of the Nizam and a few large jagirdars (but has nothing on the origins and role of the two), the number of kinds of intermediary landholders, the various forms in which forced labour (*begar* or *vetti*) were exacted, and just off-handedly mentions other items. Sundarayya states, for instance, that "In those days, excise (*akbari*) contract meant full control over the villages.[5] How? Sundarayya just leaves you up in the air. Yet, as we shall see, the importance of the excise contract lay in providing the cash for moneylending. This neglect by Sundarayya of a whole area of economic leverage is symptomatic of the fact that Sundarayya — in spite of writing a 650-page book — just like the rest is not interested in trying to find out what was really going on. It is almost as though he just wants to bash the CPI and the Naxals, just as they want to bash him and each other.

The point is that, without understanding the nature of the Hyderabad economy and the nature of the State, you cannot understand what went on in Telengana during 1946-51. What follows is an initial, tentative, attempt to suggest some fruitful lines of enquiry.

First the *deshmukhs*. These were, in the 1940s, the layer of the very large landowners in Telengana. They owned from 2,000-3,000 acres at the lower end to 160,000 acres at the upper as in the case of the Janareddy family of Nalgonda District. Their origin can be traced to the administrative reforms of Salar Jung I, prime minister of Hyderabad state in the 1860s and 1870s. The reforms abandoned the previous practice, of auctioning off the revenue-collection in the government-administered areas to farmers, in favour of direct revenue collection by the State. The 'revenue farmers' were given land in compensation. Most of them availed of the opportunity to seize as much of the best land as they could. They also received a pension. The *deshmukhs* were thus given a dominant position in the rural economy which they proceeded resolutely to strengthen during the succeeding decades. It was not possible to directly cultivate more than a few hundred acres, even with the use of *vetti*; consequently, most of their land tended to be let out on tenancy or was left fallow. The *deshmukhs* combined landlordism with moneylending — in contrast to the moneylenders in the Marathwada region of Hyderabad, who were mainly Marwaris taking no direct interest whatsoever in cultivation and being content to receive rents.

In this context, the introduction of

Chairman, Shri A. N. Haksar's statement at the Sixtythird Annual General Meeting on Thursday, 1st August, 1974.

Shri A. N. HAKSAR

INTRODUCTION

On behalf of the Board of Directors, I welcome you to this 63rd Annual General Meeting of your Company, and extend to you our most cordial thanks for your presence here today.

Shri A. K. Mitra and Shri J. B. Singh, both Directors of your Company, retired from the Board from 2nd April 1974, after many years of service. I would like to place on record our deep appreciation of their services, and wish them both all the very best for the future. Your Board has taken this opportunity to enlarge its membership in order to strengthen the management machinery at the highest level. Shri S. K. Banerjee, Shri A. Basu, Shri S. Ghosh, Shri R. Monani and Shri J. N. Sapru joined the Board on 2nd April 1974.

Your Company continued to receive awards and tributes from many directions in recognition of creditable performances in various sides of its business. To cite a few :

1. The Indian Merchants' Chamber Diamond Jubilee Endowment Trust selected your Company for their Award for "outstanding contribution for improvement of Industrial Relations". This Award was made in February this year and was in the nature of an unsolicited public recognition on the heels of the Federation of Indian Chambers of Commerce & Industry's Award to us in 1972 for similar outstanding performance in Industrial Relations.

2. At the World Selection for tobacco and tobacco-made products held in Paris this year, all six ITC brands of cigarettes entered received Awards. INDIA KINGS, with six gold medals to its credit now, is the only Indian cigarette to be so honoured.

3. As an Eligible Export House, your Company's exports of non-tobacco products earned it the Export Badge of the Chemicals & Allied Products Export Promotion Council.

4. Our Diversification & Export Press Advertising Campaign launched by one of our advertising agencies late last year, received the Air India trophy, which is the Commercial Artists' Guild's (CAG) highest Award.

5. Our Printing and Packaging Division at Tiruvottiyur —which, by the way, has always produced our Report and Accounts covers—has won the India Star Award for 1974 in March this year.

REVIEW—RESULTS

The Report of the Directors, which is already with you, will indicate that the Company has completed another successful year of operations. Corporate turnover, led by a demand revival of our cigarettes and tobacco products, has shown an impressive growth of over 20% compared to last year. Our exports of non-traditional items have continued to forge ahead, and this year have reached nearly Rs. 6 crores—a long way from a humble beginning made only three years ago. Our profits continue to be progressive and healthy, a result I am happy to report, when note is taken of two relevant factors : firstly, the economic crisis that surrounds the industrial environment and secondly, the inhibiting effects of an excise structure based on obsolete premises.

INFLATION IN THE ECONOMY

The nation has known inflation for almost two decades, and accepted a reasonable level of around 6% to 8% as an inescapable phenomenon which accompanies the conversion of an agricultural community to an industrial society. The origins of the present inflationary phase may be traced back to 1970/71 and 1971/72, when massive public outlays were made and staggering budgetary deficits resulted. Fortunately, these particular years witnessed buoyant agricultural outputs, which overcame the constraints of arrested growth of industrial production and thus the overall price escalation forces were temporarily held in leash. This volatile position could not be sustained indefinitely and with the1972 failure of the monsoon, the lid on runaway inflation was taken off. In 1972/73, prices of foodgrains and agricultural commodities registered a sharp increase, and with modest increases in other sectors, the wholesale price index of all commodities escalated over 20%.

Conditions during the year under review were even more depressing. Not only did the rate of inflation in the agricultural sector not reduce despite better harvests, but the cancerous growth of runaway inflation extended into other vital areas of power and fuel, transportation, intermediate

products and industrial goods among others. This all round character of inflation, which seems to gather momentum with every passing month since the middle of 1973/74, is the most disquieting feature of the current inflationary spiral, apart from the fact, of mere statistical importance now, that inflation was of the order of 25% by the end of the year. Growth in industrial production, which has almost come to a standstill, has been continuously impaired by shortages of raw materials and essential inputs, transport bottlenecks and widespread power crisis.

THE MANAGEMENT OF INFLATION

Your Company has firmly believed that its prosperity, current and future, is inexorably interwoven with the fund of consumer goodwill that your Company's products enjoy. This has been carefully nurtured and constantly reinforced over many years of genuine concern for, and service to, the consumer on numerous fronts, mainly centred around quality, variety, price and ready availability in the right quantity in the right place at the right time in prime condition. The second consecutive year of extraordinary inflation seriously threatened to undermine the basic foundations of consumer service, so assiduously developed over six decades.

The threats were quickly perceived early in the year and prompt action was taken to face up to the twin challenges of uninterrupted production and timely distribution on the one hand, and the management of inflationary costs on a priority basis on the other. The organisation was put into top gear to achieve closely-controlled physical targets in every sphere of its business and a series of measures were taken to beat inflation through innovation and productivity. The situation demanded quick reflexes to meet rapidly changing market conditions and it is to the credit of your Company's employees that they were unsparing in their efforts to keep the wheels of production in motion and responded to every need in the market place. Standby power generation arranged at our major production units, planned machine maintenance and overhauls, and efficient programming of manufacture resulted in more effective utilisation of productive capacity and higher machine efficiencies. Certain raw materials of indifferent quality did pose some problems, but none were too great that could not be resolved with adaptive technology and innovation designed to reduce waste and maintain product quality.

Prices of some major raw materials continued to escalate alarmingly throughout the year, but stricter financial discipline, better utilisation of plant and machinery, higher labour productivity and improved conversion efficiencies blunted their effect on unit product costs. I am pleased to state that unit product costs were not allowed to increase over 5% on average for 10 months of the year. This creditable productivity performance under such adverse circumstances provided your Company the necessary strength to refrain from making price adjustments over and above any that were absolutely essential, and in any case, to defer making them until the last possible moment in the consumer interest.

But here I would like to sound a note of caution. It must be recognised that while the concerted attempt at cost reduction has paid handsome dividends, it must also be realised that this has resulted in the fore-closure of a number of productivity options during the year. To expect an equally sterling performance in the future year in the wake of all round inflation showing no signs of abatement, despite our best efforts which continue, would be unrealistic. Invariably, unit product costs will mount more sharply than in the year under review, thereby exerting greater pressures to raise net prices to maintain present bedrock margins.

EXCISE

I have earlier said that your Company recorded an impressive growth of corporate turnover, out of which the traditional business has accounted for Rs. 43 crores. However over three-fourths of the incremental turnover has accrued to the Government in increased collection of excise duties—a total additional revenue of Rs. 37 crores in one year, a level of marginal collection it took your Company three years in the immediate past to achieve

This grinding pace of resource mobilisation from your Company and most others in the cigarette industry has some very serious implications, because the strategy of revenue maximisation by the Government invariably relies on frequent and stiff escalation of cigarette excise duty rates, without any apparent concern for the buoyancy of the taxable value base, which in turn is wholly dependent upon volume expansion. A simple illustration will highlight this point. During the last five years, cigarette excise collections have increased from Rs. 108 crores to an estimated Rs. 240 crores this year, a spectacular increase of 120%. During this period, industry volume on which these duties have been paid has only increased by 8%. This inordinate reliance on higher and higher duties is unquestionably a 'high-risk' course, because this policy has resulted in a growth of only 21% in the taxable value base during five years. An indirect taxes policy on cigarettes which only allows a 4% natural expansion annually in the taxable value, is prima facie in need of overhaul.

Per capita consumption in the country is about 9 cigarettes per head per month, and therefore the scope of volume expansion is unlimited. It only needs the adoption of a growth-oriented taxation policy to replace the existing excise structure to unleash the forces of demand followed by production, for which considerable unutilised capacity currently exists and more is in the process of being set up, and for which purpose virtually all inputs are indigenously available. I submit that a reassessment be made of the Indian cigarette consumer in order to determine the structure of demand, and a totally rational cigarette excise system be devised, which would also take into account current realities of the costs of production.

Two proposals automatically come to mind. Firstly, immediate steps should be taken to fix a more pragmatic ceiling of combined duties at say 200% ad valorem in place of the present 320%. The latter has the effect of extracting from the consumer a punitive premium of Rs. 4.20 in extra price, to enable the manufacturer to compensate Re. 1 of inflation. And secondly, the automatic buoyancy in revenues at current rates, afforded by significant increases in unit taxable values following the expected spurt in unit product costs in 1974/75, should be borne in mind by the authorities when next contemplating tariff revisions.

THE NEW LOOK

At an Extraordinary General Meeting of your Company held on 14th March 1974, you unanimously passed a resolution which changed the name of our Company from India Tobacco Company Limited to I.T.C. Limited. This heralds more than just a name change, for the change itself represents the culmination of several years of conscious identification of Company objectives with national aspirations, and the pledge to continue to reinforce this identification further in the months and years to come. With the continued development and accelerated progress of our diversified activities, your Board felt that the name of the Company should no longer be merely associated with tobacco. Although the cigarette and tobacco business will remain our primary interest in the foreseeable future, we are seeking to spearhead progress through growth from within, with the accent on vital new priorities. Hence, I.T.C. Limited from 1st April, 1974.

During the year, considerable progress was made in the execution of the Company's Hotels project. Construction of Hotel Chola in Madras is in full swing and it should be fully on stream by the end of 1974. Suitable sites have been

located at Agra and Delhi, where work is scheduled to commence later this year. Designed to attract foreign custom, this project, in the priority sector, is expected to generate foreign exchange earnings of about Rs. 3 crores annually when in full operation, and create direct employment for about 1,500 persons, apart from indirect employment generated in quite a few small scale industries, especially those employing artists and craftsmen.

Our Marine Products business has turned in another year of increased turnover, having exported a wider range of frozen and canned products, principally to the USA and Japan. This phase of our business has been the first step in the establishment of an integrated activity of trawling and procuring, processing at our processing plants and exporting our Marine Food products. The stage is now set for the commencement of the next phase—independent trawling operations and the setting up of shore establishments to process the catch. These establishments are proposed to be located in backward areas and when in full operation will create direct employment for about 1,000 people, and in addition indirect employment through ancillary industries and suppliers.

Exports of other non-traditional goods of a wider range and to diverse customers in international markets have been achieved. Products include wrapping and packing materials, myrobalan, chemical and allied products, engineering goods and leather products in addition to cigarettes. Emboldened by our success, we have opened an export office in New York.

With the transformation of the Company from a unified traditional tobacco business to a clearly identified multi-product, multi-activity operation, it has become essential to reorganise ourselves internally, in order to satisfactorily manage and control the associated stresses and strains. To this end, it has been decided by your Board to divisionalise the Company's operations, whereby each business is identified and is allowed to function as an independent division, complete with its own management team, under the overall ITC umbrella. And so there is the emergence of the Tobacco Division, Hotels Division, Marine Products Division, Printing and Packaging Division and General Exports Division. Management strength is being imparted to each division by blending the best entrepreneurial talent with professional management. It is my belief that ultimately the dynamics of any business are provided by the leadership of its top management and the quality of its decisions. In recognition of the challenges ahead, including the paramount need to harmonise and integrate divisionalised operations in the present industrial environment, it is befitting that your Board has been enlarged and strengthened.

Two years ago I had mentioned, on a similar occasion, the desire of your Board to Indianise the equity shareholding of your Company beyond the stage reached after the January 1970 issue of equity shares to Indian Nationals, and reported the approval in principle of the Government in this context. I am happy to state that necessary sanctions have been obtained by the non-resident shareholders to offer for sale a part of their equity shareholding to Indian Nationals, in such manner as prescribed by the Government, which upon completion, expected by the end of next month, would have the effect of increasing Indian participation to 40%. This offer, in which existing Indian shareholders, our employees, the general public and others are invited to subscribe, will be made at par, thereby conferring substantial benefits on the Indian investors. Other specific proposals are before the Government, which upon implementation will result in the foreign shareholding reducing to a minority in the near future, and to under 40% in the foreseeable future. Our foreign shareholders deserve our thanks for having appreciated the Government's policy in this regard long before it was widely publicised and having commenced the process entirely voluntarily some years ago. This carefully paced operation will provide the Company, as it has in the past, the opportunity to gradually adjust to the changing circumstances, without imposing any unnecessary burdens.

CONCLUSION

And finally, I shall attempt a look into the future of your Company. It is no secret that in recent months, the industrial picture and business conditions have been no better than towards the end of the year under review. The series of Ordinances just promulgated, it is hoped, will achieve the results for which they have been designed, for only then would there seem to be any purpose in the sacrifice you are temporarily required to make in terms of the Companies (Temporary Restriction on Dividends) Ordinance.

In I.T.C. its people are its greatest asset and we owe each and everyone of them our gratitude for their willing and spontaneous co-operation in these difficult times. In them resides our greatest strength, which we continually keep fortifying as a matter of deliberate policy. In any period of trial, such as we face in the immediate future, the mettle of all of us who work in the organisation is put to test. I am convinced that your Company is appropriately equipped to face the challenges with courage and determination, and we can look forward to the future with some measure of confidence.

This does not purport to be a report of the proceedings of the Annual General Meeting.

the requirement to pay revenue in *cash* in the late nineteenth century became important. Cash was very scarce in the villages, and the major source of it was the landlord. The landlord obtained most of his own cash from the proceeds of his excise contracts. Most other lending was in the form of grain; indeed most people who had a grain surplus used at least a part of it in this manner.

Thus many rich peasants and even some middle peasants would be moneylenders; and this would perhaps gain tenancy or even possession of land by resuming a debt. Any crisis which led to an inability to meet debts in fact led to a wave of land alienation, which was especially marked in Telengana during the Depression. It appears that, during that period, alienation in favour of the rich peasants was particularly marked; the rich peasants tended to have excess bullock-capacity which could be utilised by acquiring more land, which would result in an increase in production, which would help to offset the fall in prices. Unlike in Marathwada, alienation often meant that the victim was thrown off his land, instead of remaining as a tenant on the same land.

The effect of the fall in commodity prices in the early 1930s[6] shows the increasing importance of commercial crops in the economy. Hyderabad had 54.3 per cent of the total Indian acreage under castor, 90 per cent of which was sown in the Telengana region,[7] and 15.6 per cent of the total acreage under groundnut.[8] The introduction of these two crops had the effect of making large areas of previously almost useless land valuable. These crops grow well on the red, sandy, soil of Telengana which will support almost nothing else. Moreover, as they were the most profitable dry crops, they were cultivated by almost everybody — either to accumulate a surplus or to pay off debts. The proven viability of these crops in the region gave an impetus to land alienation, as people now tried to get hold of land which previously was not worth bothering about. The recovery in prices after 1933[9] assisted this; indeed, the wave of evictions during the War was at least partly due to the boom in prices — the price of castor had trebled between 1939 and 1944.[10] The other reason behind the evictions was the attempt to forestall a Tenancy Act which was to give a tenant security of tenure after six years of continuous occupation. Although it was highly unlikely that many tenants would have been able to produce documents certifying their tenure after even six years, many landlords evicted the existing tenants and put in fresh occupants just to doubly secure their possession of the land.

The issue of tenancy legislation raises the question of the nature of the State. Although that Act, and a number of others passed in the same period,[11] were uniformly feeble in content and inoperative in practice, they were nevertheless indicative of the anxiety of the government about the decline in the condition of most peasants. This is evident from the quite considerable volume of reports published by the state government after 1930.[12] There was a stream of documents on co-operation (which fared as badly in Hyderabad as in the rest of India), on the use of improved seeds, on better methods of cultivation and animal husbandry. Leaving aside the moralising about the peasants' 'ignorance', 'superstition', 'unproductive expenditure', what surfaces quite clearly is the desire to promote 'progressive' (i e, capitalist) agriculture, based on a rather idealised notion of a hard-working, progressive, yeoman farmer. It is never even hinted that, the real reason why all the supportive effort for farming had so little effect was the inability to 'solve' the problem of land alienation and indebtedness. Such explicitness would have entailed an attack on the landowners and moneylenders who were, after all, the social basis of the State. Therefore, the efforts to reform agriculture were essentially efforts to 'reform' landlords and moneylenders. It should have been clear to the State that while the landowners and moneylenders could dominate the countryside by exacting 'feudal' dues and exorbitant rates of interest, such supportive efforts were as effective as whistling up the wind.

Of course, legislation and propaganda were not the only means at the State's disposal for promoting capitalist agriculture. The establishment of large-scale irrigation works was a considerably more successful means than either legislation or propaganda. The most important project was the provision of irrigation canals from Nizamsagar Reservoir in Nizamabad District, in the north-west of Telengana. This was completed in 1934-35, and it led to the rapid spread of the cultivation of sugarcane and subsequently to the establishment of the Nizam Sugar Factory in 1937. Although the initial project had come in as a memorandum from a number of jagirdars, landlords, and government officials, the Hyderabad Government had a majority shareholding in the project. What developed was a little island of capitalist agriculture, with the cultivation of sugarcane by individuals and by the factory itself. At the same time, there was a large increase in the area under paddy — from 20,000 acres to 300,000 acres.[13] This meant that a certain section of the jagirdar and *deshmukh* layers were involved in several different sectors: in the pre-capitalist sector with regard to their tenants, in the 'progressive' capitalist agricultural sector, as well as in the industrial sector.

This 'combined' nature of the economy was reflected in the nature of the industrial development of Hyderabad, limited though this was. A few of the large landowners worked closely with the government, and the government by 1945 had a majority shareholding in almost all the major industrial enterprises through the Industrial Trust Fund which had been established in 1930 for the specific purpose of promoting industrial development. The private interests' role was to serve as the managing agents. Although the very orthodox budgetary policy of the government undoubtedly hampered industrial expansion in pre-War years, by 1945 the Post-War Planning Committee had produced a development plan which was much more ambitious than anything previously attempted.

The plan,[14] aimed to cover fifteen years, was an attempt to build a significant industrial base and to develop agriculture through a series of large-scale irrigation works and what might be termed 'green revolutionising' *via* large-scale introduction of pumpsets, improved seeds, etc. It was explicitly stated[15] that the State was the only agency that could accomplish this task, which was recognised as being essential for the survival of Hyderabad State. The plan had as its core a co-ordinated industrial, power, and irrigation scheme in the Godavari valley, and it pivoted around a new industrial town in Adilabad district — the most northerly and backward of Telengana. This project was consciously modelled on the Tennessee Valley Authority. The development plan envisaged a total expenditure of Rs 260 crores over the first 10 years — quite an advance on the era of the Nizamsagar Project (Rs 5 crores) and the Industrial Trust Fund (Rs 1 crore). The intention apparently was to build the industrial and the capitalist agricultural sectors without directly affecting the position of the ja-

girdars, who were neither to be brought into the state revenue system nor to be expected to mobilise any additional resources in the countryside. In fact, reading the plan, it is clear that the proposed sources of finance were inadequate as they stood, and that any substantial rise in costs would have meant, either a cut-back in the plan or resort to deficit financing or need to move against the 'feudal' sector. In any case, the fact that the plan envisaged that development could be undertaken alongside of the pre-capitalist sector, again illustrates the essentially combined nature of the economy.

So what were the conclusions that the CPI ought to have drawn, had they made an analysis of the actual situation, which, of course, they didn't? The key point is that the economy, while it was of a combined nature, was coming to be dominated by a capitalist tendency. The large feudals' operations in the capitalist sector were becoming more important for them than their pre-capitalist exactions. For instance, the Janareddy family, who as mentioned above owned 160,000 acres, was reportedly considering concluding a deal with the CPI at the height of the armed struggle whereby it would give up all its land *except* an 800-acre mango grove: An extreme example, perhaps, but one which serves to make the point. Concurrently with this process, there was growing at the village level a layer of rich peasants and small landlords, tending to merge into each other, who would generally alienate land in their own favour not to let it out on lease but to cultivate it directly. To build a movement on the basis of a multi-class front against the 'feudals' — as the CPI did — meant that they were in effect adopting the programme of this last-mentioned layer aiming at direct cultivation for profit, who found that the intermediaries, i e, the jagirdars, etc, were impeding their progress. The inability of the Hyderabad state to grant reforms which would have satisfied them was an indication of the weakness of, first, the indigenous bourgeoisie and, secondly, a colonial dependent State whose attempt at developing State capitalism had barely begun.

But, at an early juncture, demands began to be raised which were not simply 'anti-feudal' and which were raised largely by poor peasants and agricultural labourers. The demands were for land and increased wages. And the CPI was completely unprepared for either. These were taken up in anything approaching a systemised manner only by the Nalgonda District unit,[16] and even there most activity before 1947 was *ad hoc* action to meet particular situations which had arisen spontaneously, rather than part of any serious, regular, organising work among the peasants and labourers. In the rest of the state, the CPI lined up behind the Congress — and so, in effect behind the small landlords and rich peasants — and it campaigned for the accession of Hyderabad to the Indian Union. In Nalgonda, however, the CPI unit actually started to seize and distribute land — first, land which had been legally or illegally alienated over the previous two or three decades, and then as they discovered the demand for land to greatly exceed this, the entire land of pro-Nizam elements. Even this could not satisfy the demand for land from poor peasants and the landless; so they were obliged to implement a ceiling, starting at 500 acres, which was successively reduced to 200, and finally in August 1948 to 100 acres. The pressure which brought about this movement came very much from below. Even Sundarayya shows, although he does not explain how or why, that the party was being continuously driven to the Left by the poor peasants and agricultural labourers.[17]

This activity quite clearly raised the question of State power, as it involved at least the neutralisation of the local agencies of the State and the formation of defence squads against police raids. The CPI's initiative stopped with the setting up of village committees. These, locally called *gram rajyas* and sometimes ludicrously referred to as 'Soviets' (though not by Sundarayya), were in fact nominated by the CPI local cell in consultation with the village 'leaders'. In fact, however, 'village leaders' was a euphemism which covered landlords and rich peasants. The assembled village was presented with a list to accept or reject. Although village committees performed functions such as overseeing land distribution and controlling irrigation and drainage, and although in 1948 an attempt was made to strengthen the poor peasant element in them and to add an agricultural labour sub-committee in some places, they had little real substance to them.

There occurred, towards the end, a number of what Sundarayya terms 'mistakes' — i e, actions against rich peasants,[18] forcing them to return land which they had acquired through grain-lending. Now actions like these can be termed 'mistakes' only in the context of a multi-class front such as the one the CPI imagined it could build. Such actions would be rather less of a 'mistake' if it was aimed to have a movement which was becoming increasingly dominated by the agricultural labourers, poor and middle peasants, and artisans. It was in any case these layers, according to details given by Sundarayya himself,[19] who provided 80 per cent of the CPI activists throughout the period. Talk of the need to maintain the unity of the front in these circumstances is less tenable. The 'mistake' may then be seen to lie in the attempt to restrain the development of the struggle in the hope of retaining the support of the upper layer who were initially vacillating and latterly treacherous.

Following the Police Action, when the Congress very promptly gave the concessions which the small landlords and rich peasants wanted — jagirdari abolition (1949) and a tenancy act giving security of tenure and right to purchase if you could afford it (1950) — most of them promptly lined up behind the Congress. Sundarayya does in fact quote documents to show how that, immediately after the Police Action, rich peasants began to inform on CPI cadres.[20]

The offensive which the Indian army launched, barely a fortnight after the Police Action, effectively wiped out the CPI organisation in the plains areas and forced the survivors to take refuge in the forest regions along the Krishna and Godavari rivers. The CPI was thus yet again caught totally unprepared: They had believed that any military intervention by the Indian government would lead to a Kashmir-style stalemate. As a result, many of their cadres actually surrendered their weapons to the Indian army, while others buried them and went home. In any event, there was wholesale arrest of activists. Not even in Nalgonda where the party organisation was much tighter could they offer any serious resistance. The peasants were left to defend themselves as best they could.

Why? Was it because of inherent difficulties in working in such a situation, or was it because of the nature of the CPI itself which had no political organisation above the village level except the party itself. In mid-1948, when they had at least partial control over large areas of Nalgonda and Warangal districts, there was no attempt (apart from one 120-man squad) to establish

a military unit larger than a squad covering three or four villages. No large-scale military operations were in fact possible, because there was no political organisation above the village level which could have brought these formations into existence. There were no independent organisations of poor peasants or agricultural workers. Indeed no one ever thought of organising in this manner. The political expression of the kind of front the CPI believed it was trying to build was a Constituent Assembly — which was one of the CPI demands right from 1942.

With such a lack of political organisation and lack of self-activity by those whom they were supposed to represent, it is not surprising that the village committees collapsed so abjectly. The Army simply moved in, arrested the committee and anyone else who was known to be sympathetic to the CPI — often anyone else who just happened to be around — and there was no organisation left to carry on underground work. The cadres were exposed, and those who could had to get out never to return except as tiny touring groups constantly on the move and capable only of individual assassinations. Sundarayya's account of the spontaneous strikes by agricultural labourers in 1950[21] only serves to emphasise this, as the squads which were then operating in Nalgonda and Hyderabad districts could merely give ineffectual advice such as 'unite' (!), before having to move on quickly to avoid the army.

This incapacity to develop a coherent perspective, which would have eliminated the improvisations that the CPI was constantly driven to seek, prevented any co-ordination of the party's work in different sectors. The trade union organisation in Hyderabad, in smaller centres like Warangal town and Kothagudem coal mines in Telengana, and in Aurangabad in Marathwada, had the predictable qualities of being bureaucratically deformed and reformist. The defects of the CPI's working class organisations, which were a reflection of the party's politics as a whole, were most important in regard to their attitude towards a party called the Majlis-i-Ittehad-ul-Muslimin, which organised a fascist-style militia, the Razakars, to attack any sympathisers of the Congress or the CPI, and who were active in Telengana.

By 1947, reliance on the Ittehad had become the last strategy which the Hyderabad ruling class saw open to it in an attempt to stave off accession. But by 1947, the CPI trade unions (organised since March 1946 in the All-Hyderabad Trade Union Congress) had been broken up. In raids in October 1946, shortly before one of the CPI's general strikes, 43 out of 46 of the executive members of the AITUC had been arrested. Given the bureaucratic nature of the unions, all that remained was to pick up a few militant workers, and that was the finish of effective working-class action — the lack of which Sundarayya laments, again without explaining.[22] While admittedly small, the working class tended to be concentrated; in the case of the railway workers, it had a long history of organisation and struggle and held a key position in the Hyderabad economy. The industrial workers were the only organised section who could have given a lead in fighting the Ittehad's communalism, and thus drawn in the intermediate layers who comprised the bulk of the urban population. Instead, the ground was cut from under their feet by the Ittehad, principally because of the CPI's policy of declaring it a 'people's organisation' and offering it 50 per cent of the seats in a Constituent Assembly "to combat communalism, [and as it] protected the urban core of Hyderabad state"! By 1946, the Ittehad was well established; and once again there was a collapse as a result of the failure to build independent organisations based on the self-activity of the working class, at a time when the defeat of communalism would have put the complete overthrow of the Nizam's regime on the agenda.

The net result of the CPI's policy was that, by the beginning of 1949, they were reduced to small squads being chased around the hills by the Indian army. The land distribution programme taken as a whole was finished, and the 'defence' was almost entirely left to the peasants themselves. Only a few underground and passive cadres remained permanently in the plains areas. The struggle between 1949 and 1951 was of a distinctly different nature — in forest areas amongst a relatively undifferentiated tribal peasantry with a much lower cultural level, where the establishment of village committees was of comparatively little use. Once again, CPI cadres ran into previously unsuspected problems and were compelled to improvise, just as they had done in the beginning in the plains areas.

Which bring us around to the turgid debate as to when, if ever, the armed struggle should have been called off. The present-day CPI, of course, would have liked it to stop after the Police Action, once the 'anti-Nizam struggle' had been consummated. The CPM leadership, while not disavowing the struggle after September 1948 would say (and does, interminably) that it should have been conducted for the 'partial demands' of 'protecting the gains made', and that it was 'sectarian' in trying to capture State power from the Indian government.[23] As has just been pointed out, talking of trying to 'protect the gains' neglects the simple fact that the CPI was almost totally *incapable* of doing so. The participants in the debate as carried out thus far commit a basic mistake; because, to raise *any* demands which orginated from the poor peasantry and agricultural labourers would have *automatically* raised the question of State power, as at that particular conjuncture the ruling class, both in Hyderabad and in India, as a whole, were incapable of granting *any* concessions to those layers. Those few people who did raise the question of State power did so only in the context of 'the Chinese Path', which originated in the Andhra Letter of June 1948. This originated from the Andhra Provincial Committee of the CPI, and was a critique of the Political Thesis of the Second Congress of the CPI held in February 1948, which amongst other things had come out against an alliance with the rich peasants. Since this was based on a study of precisely two documents — Mao's "On New Democracy" and "On Guerilla Warfare" — one would feel justified in suggesting that they were perhaps a little hasty. To assert, as some of them do now, that bases should have been prepared in the forest areas in preparation for a retreat is correct if it means that contingency plans should have been made for a defeat. But if it is meant as a positive strategy, then it is objectively defeatist. Yenan was not built on the basis of a victory, but as the result of a defeat. The defeat of 1948 in the plains was not primarily the result of the inherent impossibility of working under difficult conditions, such as obtained after the advent of the Indian army which was much better equipped and organised than the Hyderabad forces, but the result essentially of the bureaucratically deformed nature of the CPI. The campaign, by the end of 1951, had degenerated into a collection of *focos*, almost completely isolated from the elements in the plains who had been their principal support.

The nature of the CPI cannot be

understood independently of its origins as the Indian section of the deformed post-Lenin Comintern. With every 180° switch in Comintern policy, as it leapt from one disastrous defeat to another, you would find the CPI padding obediently along behind. The gap between 'the theoreticians' and 'the rest' was never more nakedly exposed as in the discussions before the production of the 'Andhra Letter'. No one, apart from the five or six members of the Provincial Committee, participated in these discussions. In fact, no one else *knew* that they were taking place. How could they? it was none of their business; the party statutes expressly forbade it! So, even though some of the Provincial Committee members wanted to raise the discussion more widely, they had to wait for the Polit Bureau to 'organise an inner-party discussion' — which never took place, of course.

This bureaucratisation reached the absurd level that the Nalgonda District Committee could only give a leaflet on how to organise land distribution to cadres from an adjoining district *via*, and with the permission of, the Provincial Committee. Indeed, without the local initiative of the Nalgonda District Committee, it is perhaps unlikely that there would have been any 'armed struggle' at all — merely a generalised 'anti-Nizam struggle', ending in a total collapse of all activity after September 1948.

The CPI was incapable of fulfilling the role of the revolutionary party — to prepare the working class for power and to give the correct political leadership in a revolutionary situation. The latter situation never arose, partly because the CPI could not fulfil the primary role of building independent organisations of the working class and poor peasantry, as its perspective was firmly fixed on substituting the party for the self-activity of the working class.

Changing Pattern of Inter-Party Competition in Uttar Pradesh

An Analysis of the 1974 Election

V B Singh

Though many political parties suffered a decline in their share of votes in the Uttar Pradesh election earlier this year, they registered substantial increases in their share of seats in the Assembly. The one to benefit most from this electoral phenomenon was, of course, the ruling party. This has caused serious concern about the 'unrepresentativeness' of our electoral system. The widening gap between electoral wishes and poll results has visibly increased with this election.

Moerover, while the pre-poll assessments had shown the Congress party all set for a severe drubbing, the results belied such expectations. How did this happen? Why could not the opposition parties, particularly the BKD and Jan Sangh, do better? How could the parties polling less than their tally of votes in the previous elections muster more seats in the Assembly?

These are a few important questions, answers to which may throw some light on the working of our electoral system. We propose to examine these questions by focusing our discussion on the following:

First, we shall detail briefly the party position in terms of 'then and now', i e, the position brought about by the 1969 elections, the subsequent defections, and the situation obtaining after the 1974 poll.

Second, we shall discuss the changing matrix of inter-party competition, and its implications for the future party system in the state.

Third, we shall examine the regional support structure of the parties, in terms of their losses and gains between two elections.

And, finally, we shall highlight the relationship between the representational apparatus and the party system, as it has grown from one election to another.

AN outstanding feature of the Uttar Pradesh election is that though many political parties suffered a decline in their share of votes they registered substantial increases in their share of seats in the Assembly. The one to benefit most from this electoral phenomenon was, of course, the ruling party. This has caused serious concern among the psephologists and politicians as to the 'unrepresentativeness' of our electoral system. For, the everwidening gap between the electoral wishes and the poll results has visibly increased with this election.

This is evident in that 67.8 per cent of total electors actually exercising franchise in this election were opposed to the Congress party, yet they could not prevent it from assuming power. That is, the Congress captured a majority in the legislature with only 32.19 per cent of the total votes. Interestingly, it had failed to do so in the 1967 and 1969 elections, when it had polled a larger share of the votes than in this election. Moreover, while the pre-poll assessments by pollsters and journalists had shown the Congress party all set for a severe drubbing — and, in fact, the ruling party was never before placed so disadvantageously as in the 1974 election with the people having suffered acute economic hardships — the results belied such expectations. It was, indeed, one of those elections that could well be considered most opportune for the opposition parties. The opposition parties, too, were well prepared to exploit the situation. The Bharatiya Kranti Dal (BKD) and the Jan Sangh were especially hopeful of acquiring a majority. But the results were far removed from their expectations, as also those of the Congress party. How did this happen? Why could not the opposition parties, particularly the BKD and Jan Sangh, do better? How could the parties polling less than their tally of votes in the previous elections, muster more seats in the house?

These are a few important questions, answers to which may throw some light on the working of our electoral system.[1] We propose to examine these questions by focusing our discussion on the following: First, we shall detail briefly the party position in terms of 'then and now': i e, the position brought about by the 1969 elections, the subsequent stage of defections, and the situation obtaining after the 1974 poll. Second, we shall discuss the changing matrix of inter-party competition, and its implications for the future party system in the state. Third, we shall examine the regional support structure of the parties, in terms of their losses and gains between the consecutive elections. And finally, we shall highlight the relationship between the representational apparatus and the party system, as it has grown from one election to another. By applying the insights of political sociology to electoral statistics, we intend to examine how problems of electoral representation are essentially problems of the relationship between the party system and the prevailing social structure — particularly the socio-economic cleavages in the society — and how, only marginally, are they the consequences of certain electoral laws.

A discussion on the legislative party position 'then and now' is required simply because of the big reshuffle in the political scene at the national and state levels in 1969 and 1971. As for the party position in UP, the undivided Congress, which had 211 Assembly seats in the mid-term poll of 1969, found its strength after that year's split in the party distributed as follows: 112 legislators opting for Congress-R (Congress) and the rest for Congress(O). The strength of the Congress, increased to about 200, however, at the end of 1970, when a number of MLAs from other parties crossed over to it. The impressive performance of the Congress in the 1971 parliamentary elections

INDIANOIL SERVICE TO SERVICES

India's Defence Services, no doubt are our valued customers. But we do not look at it that way. As a leading public enterprise, we deem it our prime responsibility and our duty to rally round the Services and help keep round-the-clock vigil across the national frontiers.

Army, Navy or Air Force—Indianoil is there to meet all the requirements of petroleum products conforming to correct specifications wherever they are needed.

The recent Indo-Pakistan hostilities posed a challenge to provide the logistic support. Indianoilmen accepted the challenge and met it squarely, irrespective of the odds, risks and costs, thus earning the nation's gratitude for their efforts in war and no less in times of peace.

1974	215	10	1	61	106	—	5	16	2	3	5	424†

Notes: *These are the seats held by PSP.
**Six seats were vacant.
†Nathupur constituency in Azamgarh district was countermanded, subsequently by-election was held on May 30, 1974. The seat has gone to the Congress.

triggered off another spate of defections to it from other parties. The position before the 1974 elections was that the Congress had 271 legislators in its fold. Of the rest, the BKD had 42, the Jan Sangh 39, the Congress(O) 38, the Samyukta Socialist Party (SSP) 15, the Socialist Party (SP) 3, and the Communist Party of India (CPI) and the independents 4 each (see Table 1). The remaining three seats were shared, one each, by the Swatantra, the Communist Party of India-Marxist (CPM) and the Muslim Majlis. The Congress(O) and the BKD were the main losers; the former's strength declined to 38, as against 100 just after the split in October, 1969. The same fate overtook the BKD, its 56 members defecting from the party. The Jan Sangh was no exception to this phenomenon; although only 10 of its members defected, the jolt was too much for the Jan Sangh. The party position prior to 1974 was thus a reflection of the 1971 election results, when the Congress bagged with its 48.6 per cent votes 85.9 per cent of the total seats from the state in the Lok Sabha.

The 1974 election results, viewed against the background, depict that except for the Congress and the Congress(O) all the other parties in the election fray scored increases in their strength in the house (see Table 1). Significantly, of all the parties, major gains were made by the CPI which broke its own record of poll performance in the state: it won 16 seats in this election, as against its record win of 14 in the third general election of 1962. The second party with major gains was the BKD-led triple alliance. This was followed by the Jan Sangh record. The Congress too has improved its legislative strength in 1974, compared to its tally in 1969. Although Congress gains were not as conspicuous as those of the CPI and the Jan Sangh, its resounding success was significant, for, its legislative minority was turned into an absolute majority.

Here it is important to note the role of defectors in influencing the fortunes of the various parties on whose symbols they had in fact fought the election. In the pre-1974 legislature, one out of every four legislators was a defector. The Congress party's tally of 271 before going to polls in 1974 included about 90 defectors from other parties. This does not include members who defected from the Congress(O). It is interesting, therefore, to see how many of them got the Congress party ticket for contesting the 1974 elections — and to what end. We shall, therefore, restrict our discussion to only those defectors who were elected as nominees of one party in 1969 and contested as those of another in 1974. This we do simply because it is rather difficult to keep track of floor-crossings between 1969 and 1974. In all, there were 83 defectors, chosen in the manner mentioned above, to contest this election (Table 2). Of them, as many as 52 contested on the Congress ticket. Surprisingly, as many as 32 of them were defeated. That is, only 38 per cent of the total defectors to the Congress won in 1974. Against this, more than 56 per cent of the 'new' and 53 per cent of the party's sitting members were elected. Further, all the 6 defectors from the Jan Sangh and 2 of the 3 from Swatantra got elected on the Congress ticket, while only 4 of the 9 defectors from the SSP were returned. Chances of defectors from the BKD getting elected were bleak : and only 5 out of 22 of them won on the Congress ticket (Table 2).

As for the defectors to the opposition parties, there were 31 in all to contest this election. Of them, as many as 18 sitting legislators from the various parties contested as independents; and, surprisingly, all of them were rejected by their own constituents who had returned them to the Assembly in 1969. At the same time, except for the BKD, fielding 4 defectors on its ticket and getting 2 of them elected, no other party succeeded in getting even a single defector to win this election (Table 2). There was no defector contesting on a Jan Sangh ticket. From this we may conclude that the voters tend to reject defectors, though defectors stand a chance if they happen to be nominees of a major party. Secondly, independents seem to have lost their appeal for voters, and perhaps have no future in the state's politics. The number of independents in the Assembly has consistently declined since 1967. It is now 5, as against 18 in 1969 and 37 in 1967 elections. The dismal performance of defectors and the declining popularity of independents may reflect voter maturity and electoral development in the state.

Now the second point — that is, the multiplicity in contest and its impact on the electoral outcomes. We shall first distinguish between 'multiple competition' and 'multiplicity of candidates'. The latter seems to determine the former. But, technically, this is not always true. A constituency having three candidates polling almost an equal proportion of votes represents a three-cornered contest. However, another constituency with 15 candidates can easily be called a direct, bi-polar contest if the first two of them poll 46 and 45 per cent of the votes respectively, the remaining 9 per cent being thinly distributed among the 13 other candidates. We may argue, therefore, that the presence of numerous candidates in a constituency is not the sole factor which decides the complexion of the contest. In almost all constituencies with a large number of contestants, we find only a few candidates who really matter and from the core of competition. The rest are, in fact, passive or 'filler' participants. The 1974 election provides a very good example: despite the candidates being much

TABLE 2 : PARTY SEATS BY TYPE* OF CANDIDATES (1974)

(*) All the candidates are divided into three major groups : (i) those who were not sitting members in the last assembly, i e, 1969; we call them 'new candidates'; (ii) those who were sitting members in the last assembly and were contesting again on the same party's ticket; and (iii) those who were sitting members but were contesting on the ticket of a party other than their party in 1969. While doing so we are not treating those who were elected on Congress tickets in 1969 but were contesting on Congress(O) or those SSP members who were contesting on BKD tickets as defectors. We also do not take into account defections during the period after the 1969 election and before the poll in 1974.

more numerous this time than in 1969, their respective shares of votes polled by the Congress, BKD, and Jan Sangh, remained more or less unaffected. That is, if we exclude these three parties, we find that 1,648 candidates together polled 27.1 per cent of the votes in 1969, whereas 2,838 candidates polled only 29.6 per cent of the votes in 1974. In other words, despite an increase of nearly 1,200 candidates in the recent contest over the earlier one the increase in the votes polled by these was negligible. For instance, in 1974, the candidates of other parties and the independents were 72.2 per cent more than in 1969, but the corresponding increase in their share of votes was a mere 2.5 per cent. This indicates that the electoral contests were confined, in a way, to three major parties, i e, the Congress, the BKD, and Jan Sangh.

Let us examine this formulation in some detail. To do so, we select the first three parties (Congress, BKD, Jan Sangh) with the largest share of seats in the state legislature and evaluate their performance at the constituency level. What do we mean by electoral performance? First, the number of seats won by them; and second, the number of constituencies in which they stood second in the contest (for relevant data see Table 3). Irrespective of increase or decrease in the number of contestants, it is clearly seen that the number of seats held by the three parties has consistently gone up in every successive election. That is to say, although their number of candidates was much less in 1969 than in 1967 and 1974, yet the pattern of performance of the three parties (the first, second and third parties) remained unchanged. In fact, the number of seats held by these parties, put together, aggregated 78.2 per cent of the total in 1962, 80.3 per cent in 1967, 84.2 per cent in 1969, and 90.1 per cent in 1974 elections (see sub-total, Table 3). Similarly, by the 'second-placed party' in the constituencies' criterion, we find that the improvement in the performance of these three parties was even more pronounced — particularly between the 1967 and 1969 elections. For instance, the increase in the second-place share was 8 per cent against 4 per cent improvement in the share of seats won by the three parties together. Thus, as we saw earlier, Table 3 also suggests that in most of the constituencies the contest was mainly limited as among the three major parties (Congress, BKD and Jan Sangh).

If we look at Table 3 a little closer, we will find that, although in 1962 the Jan Sangh and PSP occupied second and third positions, respectively, even their joint share of seats was lower than that of the other parties and independents. Furthermore, the gap between the Congress and these two parties (Jan Sangh and PSP) was very large. However, in 1967, when the Jan Sangh considerably increased its strength in the legislature, the SSP which ranked third gained a few more seats than its counterpart in 1962. The poor performance of the Congress also contributed to the beginning of the three-party system in the state. We may say then that end of the hegemony of one party, or the end of the 'one party dominance', began in 1967 — the emergence of BKD in 1969 and the weakening of Congress helped to bring about the three party system in the state. Although the Jan Sangh was unseated from the second rank in 1969, its share of seats was higher than those of the second rank parties of the 1962 and 1967 elections (see Table 3). Moreover, the strength of the other parties and the independents in the Assembly went down to 67 seats, as against 94 and 84 in 1962 and 1967, respectively. Interestingly, in the 1974 election, while the first three parties — i e, the Congress, the BKD and Jan Sangh — showed an improvement in their tally of seats, the number of seats held by the other parties and independents slumped to a mere 42. We can, therefore, safely assume that for all practical purposes there are only three parties that matter in the politics of the state, and that they will be more or less equally poised in future elections.

Let us now examine how the presence of a large number of candidates in this election influenced its outcome. It has been seen that there was some disenchantment among voters with the Congress party.[2] It was reflected in the electoral statistics as well. Only 32.19 per cent of the voters in 1974 showed their preference for the party as against its impressive popularity in the 1971 parliamentary poll when it had netted 48.56 per cent of the total votes. In other words, roughly 17 per cent of its 1971 voters disowned the Congress in this election. The Congress's majority in the present Assembly, notwithstanding such a cut in its popularity, may be attributed to two factors: (i) the large number of new entrants in the contest, who attracted a substantial proportion of the floating votes, resulting in no cumulation of the opposition vote, and, (ii) the emergence of BKD and Jan Sangh as potent rivals, who nevertheless divided among themselves the anti-Congress vote.

TABLE 3 : CANDIDATE'S PERFORMANCE BY PARTY (1962-1974)

Notes : 1st Party—Congress is the first party in all the elections.
2nd Party—Jan Sangh enjoys the status of 2nd party in the state in 1962 and 1967 elections whereas it was replaced by the BKD in 1969 and 1974.
3rd Party—In the 1962 election the PSP is the 3rd party and in 1967 the SSP, but in 1969 and 1974 the Jan Sangh stood 3rd. Figures in brackets are percentages.

The first factor contributed to the Congress victory in two ways: (a) the peripheral voters, in being inclined to vote against the Congress, became victims of parochial interests and personal loyalties and opted for non-consequential candidates of the opposition, and (b) the politically actuated non-Congress votes were divided between the two major opposition parties (the BKD and Jan Sangh). Added to this was the loyalty of a small core of Congress supporters — especially from among the Harijans — and a substantial number of Brahmins as well as Muslims who sided with the party. This gave the Congress an edge over its rivals — the BKD and the Jan Sangh.[3] In a situation where a large number of candidates are in the field, even if the serious contest pivots around only three contenders, the party which stands one notch above the others in terms of committed and loyal supporters is quite certainly advantageously placed. The Congress having ensured the support of the Harijans did substantially benefit by it.

With regard to the second factor, we notice that despite solid support for the Congress from some social groups, the proportion of anti-Congress voters was very large. It was this block of disenchanted voters that the opposition could have meaningfully mobilised. But the opportunity was squandered, the BKD and the Jan Sangh being remiss in a major way. Where an understanding between the two could have blocked a Congress majority in the house the lack of it actually helped the Congress to gain a majority there on a minority vote. A study of the constituency-wise results in fact relates the Congress success to the electoral fight between the BKD and Jan Sangh. Let us select the constituencies in which the Congress won and add up the votes of the other two major parties to see in how many of them their votes outnumbered those of the Congress — and to what extent. For this purpose, we have evolved three combinations: the BKD and Jan Sangh, the BKD and Congress(O), and the Jan Sangh and Congress(O) (for the relevant data see Table 4). A glance at the Table will show that, *vis-a-vis* the three combinations, the Congress party had less votes in 88, 47, and 32 constituencies, respectively. As to the extent of the gap in votes, in the first combination (i e, the BKD and the Jan Sangh) the majority of constituencies show a difference of 5 per cent or more; in the latter two, it is less (see Table 4). This warrants the speculation that, had there been some understanding between any two of these three parties, it could easily have hamstrung the Congress in gaining an absolute majority in the Assembly.

One should, however, concede that the electoral understanding between parties is not always observed at the voter level. But even granting this, we could assume that a few seats at least could have been cornered by any of these three alliances. The chances for the success of such alliances are higher in the constituencies where the margin is wide enough. In view of this, if we concede success of 25 per cent, 50 per cent, 75 per cent, and 100 per cent, from the four categories, respectively (i e, less than 5 per cent, 5 to 10 per cent, 10 to 15 per cent and 15 per cent and above), the Congress would have lost nearly 48 seats in the event of Jan Sangh joining the BKD alliance. But would that have been feasible? While the BKD's aim was to bag the disgruntled Muslim support, by entering into an electoral adjustment with the Muslim Majlis, the Jan Sangh, allegedly anti-Muslim as a result of its RSS base, sought to exploit the sympathies of the traditional Hindus. Moreover, both represent diverse interest groups too. Keeping these diversities in mind one could rule out such an alignment between the BKD and the Jan Sangh which might have seriously attenuated the respective ranks of their supporters in the election. We are, therefore, left with the other two possibilities, *viz*, an alliance between the BKD and the Congress(O), or one between the Jangh and the Congress(O). The latter alliance having been put to trial in the 1971 parliamentary poll, of which the results were not very encouraging, the former combination might have been far more effective and plausible. It is not that they could snatch 21 seats (as shown in Table 4) from the Congress, but that the company of the Congress(O) could still enhance their image and raise the level of the contest. Without causing any serious repercussion among BKD

TABLE 4: DISTRIBUTION OF CONGRESS WON CONSTITUENCIES WHERE THE SHARE OF THE MAJOR OPPOSITION PARTIES IS GREATER THAN THE CONGRESS SHARE (1974)

Congress Share of Votes Is Less By	Probable Alliance		
	BKD and Jan Sangh	BKD and Congress(O)	Jan Sangh and Congress(O)
Less than 5 per cent	28	26	17
5 to 10 per cent	28	7	7
10 to 15 per cent	21	8	4
More than 15 per cent	11	6	4
Total	88	47	32

supporters, Congress(O) could claim a share of the supporters who formed the back-bone of the undivided Congress party. The voters who found Congress(O) comparatively the weaker party and hence stayed back with the Congress, could have been attracted easily by such an alliance. This would have been a serious challenge to the ruling party. But the leaders — C B Gupta and Charan Singh — failed to resolve their personal rivalries. Egotism and their personalised styles of politics prevented the alternative. In brief, in view of the razor-thin majority of the Congress party in the Assembly, any adjustment between the two major opposition parties might have dislodged it from power in UP (see Table 4).

This is an overall view of party configuration and competitiveness in the state's politics. But a region-wise analysis of their losses and gains would be still more instructive. For the purposes of this exercise, we may conveniently divide the whole state into four distinct zones — the northern zone comprising 8 districts of the hill areas; the western zone consisting of 18 districts converging on Delhi, Punjab and Haryana; the central zone which includes 9 districts adjacent to the state capital Lucknow and 4 districts of Bundelkhand division; and finally, the eastern zone consisting of 15 districts including the three Hindu religious centres of Kashi, Prayag and Ayodhya and the Tarai districts of Gorakhpur division.

These distinct regions, represent diverse political preferences at the elections as well; particularly so since 1962, when the opposition really emerged as a force in the state's politics. In this paper, however, we are concerned with the change in the regional support structure of the parties, between the 1969 and 1974 elections. Table 5 shows the region-wise performance of the major political parties — i e, the Congress, the BKD, the Jan Sangh — and the rest including the independents. A cursory glance shows that, of all the zones, the northern though the smallest, played a vital role in returning the ruling party to power. The second zone to contribute to the Congress majority in the state is the central zone. In fact, the Congress won 89.5 and 58.3 per cent of the total seats from the northern and central zones, respectively, as against 49.1 per cent from the eastern zone and 42.4 per cent from the western zone. Thus, even after failing to secure a majority from the two big zones (*viz*, the eastern and western zones), the Congress party's absolute majority in the Assembly was assured by the solid support it received from the northern and the central zones.

The northern zone, which has yielded two Chief Ministers (the first one and the present one) has all along been with the Congress party, but its contribution to the success of the Congress party was the greatest at this election. This, at a time when the party's overall image had suffered serious erosion. Such massive support may be attributed to two factors: First, Bahuguna's debut as Chief Minister was welcomed by the people of the hill districts who could, by and large, perceive him as one of them. This certainly turned out to be a plus factor for the party which was often blamed for its 'step-motherly' attitude towards the region. Second, the Bahuguna ministry, which was well aware of the conditions in the region, took no time to assure a regular supply of essential commodities to the region. This, together with the laying of foundation stones by the Prime Minister, gave people a ray of hope of improving their lot.[4] These factors, manipulated meaningfully, attracted the ordinary voter who, in turn, ensured the victory of the party. A review of earlier election results shows that the Congress has had complete supremacy in the region except in 1967 when it won only 12 seats (though it still maintained its majority in the region). In any case, the Congress enjoys predominance in the area.

In the western zone, notwithstanding that it has been a fortress of Chaudhury Charan Singh, the Congress may be said to have made a significant dent this time — gaining as many as 11 seats from the opposition, particularly from the BKD (see Table 5). Although, the party could not succeed in mustering a majority from this region, it still substantially increased its strength, from 53 seats in 1969 to 64 seats in 1974. A notable gain was made in Muzaffarnagar and Meerut districts, which were the strongholds of the BKD in 1969. As for the other districts, Congress gained remarkably in Bijnore, Moradabad, Etah, Agra, Aligarh, Saharanpur, Bulandshahr and Rampur. However, it lost in Mathura, Farrukhabad, Shahjahanpur, Bareilly, Etawah and Mainpuri. But the losses were marginal compared to its gains in the region. As against its loss of only 19 seats, the party gained 30 seats from others.

The other beneficiary in the region was the Jan Sangh. Its major gains came from Farrukhabad and Bareilly districts, where both the Congress and the BKD suffered a decline. This brings out another interesting point which explains the support-structure of the Jan Sangh. In constituencies where Muslims form a sizeable proportion of the population, voting on communal lines is fairly common.[5] In such a situation, the caste Hindus feel threatened and tend to band together to thwart the minority's assertion. In these circumstances, the presence of Jan Sangh was incentive enough for the Hindu supporters of BKD and Congress to vote for it. An excellent example is the result in the Moradabad constituency where Muslims form the majority.

The BKD, too, registered gains in some districts of this region. While it lost in most districts, its gains were remarkable in Mathura, a traditional stronghold of the Congress party.[6] This bespeaks the personalised style of rigorous campaigning undertaken by Gayatri Devi — wife of the BKD chairman — who took it up as a challenge. Her past record as social worker and her energetic canvassing in the district paid rich divdends to the party. In fact, its strength went up to 5 as against only 1 in 1969. Besides, it gained 2 seats in Badaun, and 1 each in Shahjahanpur and Mainpuri. The share of seats of other parties and independents has also gone down to 10.6 per cent in 1974, compared to 11 per cent in 1969.

These vicissitudes pose a few questions. Why could not the BKD retain its 1969 support? Perhaps for four reasons. First, the oppressed sections of

TABLE 5: PARTY POSITION IN UP ASSEMBLY BY REGION (1969-74)

Total	211 (49.6)	215 (50.7)	98 (23.1)	106 (25.0)	49 (11.5)	61 (14.4)	67 (15.8)	42 (9.9)	425 (100.0)	424 (100.0)

society, particularly the scheduled castes (the core of Congress strength) who were intimidated by strong-arm methods in the previous Assembly elections felt freer to exercise their franchise in the 1974 elections. Secondly, the voters in this region who are fairly politicised, apprehended the consequences in case Congress was not returned to power and decided to vote for it. Thirdly, the presence of the two Muslim parties — the Muslim Majlis and the Muslim League — and their bid to undermine each other disillusioned, and positively divided, the Muslim voters. The BKD could have attracted some of the Muslims, but its alliance with the Majlis perhaps left the Muslims with no alternative except to vote for the Congress. Fourthly, the Jat supporters, who were none too happy with their party's (BKD's) alliance with the Majlis, did not support it solidly. Thus, these being the probable motivations on the part of electors, the Congress staged quite understandably a notable recovery in this region.

Turning to the central zone, one would observe that except for the Jan Sangh no other party registered any gain at least at the zonal level. The loser, of course, is the Congress party, followed by other parties and independents. The BKD's position remained unaffected (see Table 5). The Congress maintained its position in 5 of the 13 districts of the region and lost heavily in Kheri, Banda, and Hardoi, but gained considerably in Lucknow and Fatehpur. More interestingly, a district-wise analysis indicates that the losses suffered by the Congress helped the Jan Sangh, whereas the Congress gained in Lucknow and Fatehpur exclusively at the cost of the BKD and its ally, the SSP.

Even though the Jan Sangh emerged as the potential winner from the region in this election, its strength is far below that in 1967. In fact, it won only 15 seats in this election against its 29 seats in 1967. Nevertheless, it was a major recovery for the party in the region.

The BKD's strength, though on the face of it the same in both elections, is rather deceptive — especially if we include the 6 seats won by its alliance-partner, the SSP, and the number it held in 1969 as well. The performance of the BKD-triple alliance, therefore, would seem to be poorer in the 1974 election. As for its losses and gains at the district levels, the BKD lost all the seats it held in Lucknow and Fatehpur in 1969. However, it was somewhat compensated for its losses by the gains it achieved in Barabanki. While tracing the reasons for its debacle in Lucknow, we should take note of the government employees' reaction to Charan Singh's hostile posture against them and the withdrawal of Muslim support for the reasons outlined above.[7] All this went in favour of the Congress party. As for the BKD's success in Barabanki, it has been benefited mainly by its alliance with the SSP.

Finally, the eastern zone. One can well see that the BKD's eminence in the state is due only to this region. But considering its alliance with the SSP, which held 23 seats in 1969, the BKD's score would not appear so impressive. It is, in fact, two seats short of the two parties' combined strength of 45 (22 of BKD and 23 of SSP) in 1969. But most of the SSP legislators of 1969 defected to the Congress and contested the 1974 election on its ticket. Therefore, however small the surplus of seats, it is no less significant as a gain. Its gains in Azamgarh, Varanasi, Ghazipur and Allahabad were remarkable. While its successes in Azamgarh and Varanasi were mainly due to the internal dissensions in the Congress, the case of Allahabad was different, in that, as a stronghold of the SSP it raised the party's stock.[8] Its success in Ghazipur, however, may be attributed to a dominant faction of the CPI which supported the BKD.

Moreover, the BKD-triple alliance's victory in this region may also be credited to the emergence of the middle caste groups who asserted their potential in the state's politics. The middle caste people, who had not occupied a prominent position during the nationalist movement, nor after the Congress was transformed from a platform to a party, were keen to make a bid for political power — particularly after Independence. It was only recently that they began to assert their potential importance in the state's politics.[9] The emergence of BKD in 1969 provided them with a platform. The Ahirs and Kurmis, the peasant proprietary castes in eastern UP, mostly sided with the BKD which, in their eyes, was the protector of their interests. This trend gave a shot in the arm of the alliance in 1974, when the SSP with its strong base among the poor peasantry joined the BKD alliance. Thus, a solid support from some middle castes on the one hand, and a widespread disenchantment with the Congress on the other, redounded to the benefit of the BKD-triple alliance in this region.

As far as the fortunes of the Congress and the Jan Sangh are concerned, this region does not reflect much change — except the losses of the Congress in some districts mentioned above. But its losses were more than neutralised by its gains in Pratapgarh, Sultanpur, Ballia and Jaunpur districts. Interestingly, the Rajputs — one of the 'elite' castes in UP — still hold prominent positions in the party organisation.[10] The Jan Sangh, which lost substantially in Jaunpur and Sultanpur, enabled the party to avoid a major loss by dint of Madhava Prasad Tripathi's influence in the Tarai districts of the region.

In conclusion, let us mark the salient points. First, although the Congress majority in the legislature came as a surprise to political academics and activists, its strength slid to less than that in the outgoing Assembly, and its performance was poor in view of its

grand victory in the 1971 Lok Sabha election. The slender majority of the Congress, examined closely, would seem to be nothing to rejoice about. Second, the electoral statistics suggest that the defectors are looked down upon by the voters. The Congress, with a large number of defectors in this election, paid a heavy price for it. The fate of independents is even worse. Third, the 1974 election was to-date the most competitive election ever fought in the state. It witnessed the emergence of two large opposition parties. And it was their internecine fight that helped the ruling party considerably. Moreover, the emergence of the BKD and Jan Sangh leads the state towards the three party system. Fourth, the use of caste — a familiar feature of Indian politics exploited by almost all the political parties in selecting a candidate from the numerically dominant caste in the constituency — surfaced in a little different manner in this election.[11] That is, the BKD surged forward as a political group to safeguard the interests of the upwardly mobile class of peasant proprietary in the state.[12] And finally, while the Jan Sangh made a recovery in its stronghold, the central zone, the BKD's debacle in the western zone may be traced to its alliance with a communal party — the Muslim Majlis. It owed its success in the eastern zone to its camaraderie with the SSP, which was further enhanced by the substantial support to it from the middle castes.

This outline of the inter-party competition based on electoral statistics perhaps ignores some qualitative changes influencing the growth of the party system in the state. This limitation of electoral statistics needs to be recognised before any generalisation is made about the nature of the political changes in the state. In the first place, the statistics side-step the dynamics of decision-making involved in the voters' preference among parties. This raises a question, as to how justified are we in aggregating the votes of the two opposition parties to match the Congress votes. This looks all the more problematic in a situation where the two opposition parties are more opposed to each other than to the Congress. A voter, for example, may decide to vote for the Jan Sangh because he does not like the Congress, but he may be equally opposed to the BKD.

Any proposition concerning an alliance between the parties, therefore, can be entertained only after examining their social bases and their images in the popular mind. Viewed thus, no party in India, except the Congress, would appear to be so broad-based — representing a vast heterogeneity of different social groups and unopposed to any major interest group in the society. In UP, the Congress would seem to have still retained this character. Of the other two major parties, the Jan Sangh is popularly known for its anti-Muslim pro-high-caste posture and an inclination towards the Right. The BKD is yet to acquire a clear ideological identity. However, it has acquired a reputation for being Kulak-oriented and Rightist. While the BKD could bank upon the solid support from the peasant proprietary castes, not especially opposed to any particular section of the society, the Jan Sangh has to depend for support on just the higher-caste Hindus. Moreover, its image among the depressed castes is not very favourable.[13] Given these socio-economic cleavages in the society, no understanding between the two — the BKD and the Jan Sangh — could be arrived at even to dislodge the Congress from power. For, an alliance at the organisational level, moreover, may not be endorsed at the voters' level. The parties representing diverse interest groups would fail to pull these groups together, just by rigging up an unnatural alliance. If an alliance is forged in disregard of such considerations, it might boomerang at the poll — as it did in the case of the BKD and Muslim Majlis this time, and in the case of the so-called 'grand alliance' in 1971.

Thus, until there is an opposition party or an alliance than can cumulatively attract voters from various sections of society, the Congress will go on enjoying the status of the largest party in the state. But will the opposition rise above sectarian interests? Or will it be able to do away with its personalised politics in the interest of a viable alliance? These are some important questions deserving better attention of the leaders of the opposition parties. If they continue to stall the forging of a broad-based, 'natural' alliance, the Congress, with its reduced share of votes, will continue to be the ruling party — as evidenced by the 1974 election. Or, it will give rise in the future to a fragmented multi-party situation, plunging UP politics into the dark unknown of political instability and worse.

Our analysis suggests that the outcome of this election was a function more of the nature of the competition among the political parties and their support structures rather than of the electoral laws. The gap between the electoral wishes and the electoral outcome, therefore, may be attributed mainly to the failure of the opposition parties to transcend their sectarian and personalised politics to create a broad-based support structure. This, they could do, by converting their present support, based on socio-economic cleavage, into a political support for them or for their alliance.

12 The Study Group, commissioned by the Jan Sangh to scrutinise the lapses of the party in Uttar Pradesh at the 1974 election observes: "the strong caste loyalties commanded by the Bharatiya Kranti Dal in this election". See *Hindustan Times*, June 12, 1974.

13 The group has also observed that the party's image in the eyes of the poorer section of the society was not favourable. *Ibid.*

The Upsurge in Gujarat

Ghanshyam Shah

The political upheaval which shook Gujarat for full two months early this year was unprecedented in the history of post-Independence India. No town remained untouched by the upsurge. Tensions also prevailed in some parts of the countryside. The agitation, spearheaded by the student community, took various forms. During the agitation about one hundred persons died and a large number were injured in police firings at different places.

The Chief Minister, Chimanbhai Patel, despite his claim of having a majority in the state Assembly, resigned on February 9, 1974. The Assembly was suspended and President's rule was imposed in the state. Later, 95 of the 168 MLAs resigned from the house. Consequently, the Central government was compelled to dissolve the Assembly on March 15, 1974. Corporators of Ahmedabad, Baroda and Surat resigned en bloc and the municipal corporations were superseded. Several Congressmen resigned from the party.

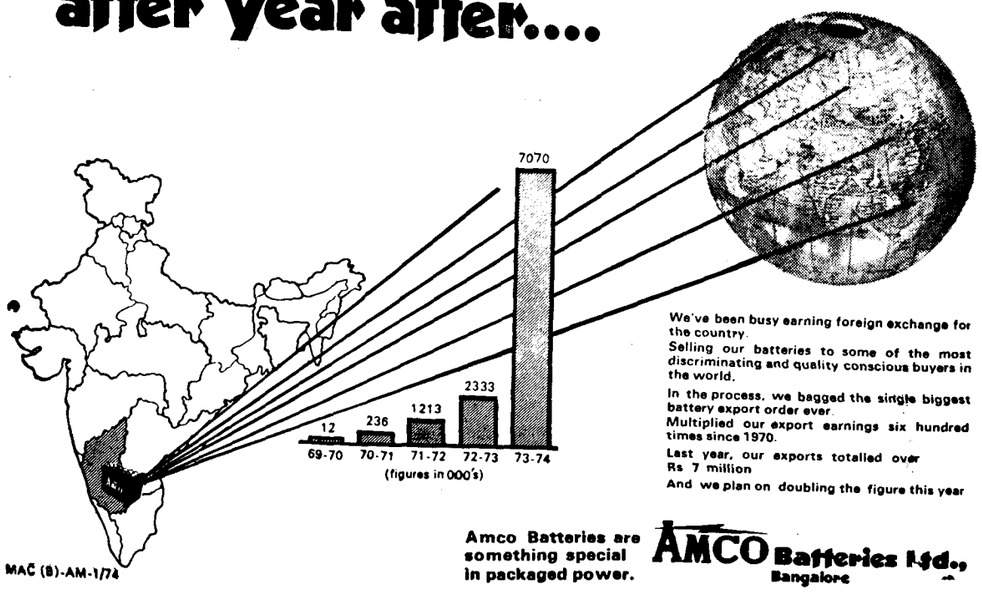
Different socio-economic and political groups participated in the agitation for different purposes, raising such diverse issues as corruption, blackmarketing, price rise, denationalisation, rationing, civil liberties, injustice to Gujaratis and Gujarat, etc. But finally all the issues converged on two common demands, resignation of the Chief Minister and later dissolution of the state Assembly.

The reasons for making these demands differed from group to group. To the majority of the agitators, it was a demand to overthrow 'corrupt' politicians. The opposition political parties were interested in dethroning the Congress party in the state. Some were interested in discrediting the 'progressive measures' of the ruling party, such as the wheat trade take-over, land legislation, etc. There was thus neither unity nor clarity regarding the steps to follow after the dissolution of the Assembly.

This paper is an attempt to observe the major events in the course of the agitation with a view to understanding the agitation as a social phenomenon. The paper seeks to examine the following questions: What role did the different groups play in smothering or accelerating the agitation? How and why did the agitation take different shapes at different stages? Which issues were highlighted by which groups and why?

This is an explanatory study based on interviews with those who participated in the agitation, survey data, newspaper reports as well as the writer's own observations. The paper is divided into two parts. The first part deals in detail with the prevailing tensions in Gujarat state. The nature of the agitation and the character of the participants are discussed in the second part.

THE political upheaval which shook Gujarat for full two months was unprecedented in the history of post-Independence India. No town had remained untouched by the upsurge. Tensions also prevailed in some parts of the countryside. The agitation was spearheaded by the student community.



The agitation took various forms such as processions, demonstrations, fasts, gheraoes, bandhs, stone-throwing, hijacking of buses and looting and arson of private and public property — including college and court buildings, municipal buildings, milk booths, provision shops, grain godowns, cloth shops, tea stalls and pan shops. Prohibitory orders, arrests, tear-gashing, lathi charges and even firings could not stem the tide of the people's wrath against the government. During the agitation about one hundred persons died and a large number were injured in police firings at different places. Some policemen and officers were also wounded in stone-throwing. Stray attempts were made to snatch away rifles from police personnel.

The Chief Minister, Chimanbhai Patel, despite his claim of having a majority in the state Assembly, resigned on February 9, 1974. The Assembly was suspended and President's rule was imposed in the state. Later, 95 of the 168 MLAs resigned from the house. Consequently, the Central government was compelled to dissolve the Assembly on March 15, 1974. Corporators of Ahmedabad, Baroda and Surat resigned *en bloc* and the municipal corporations were superseded. Several Congressmen resigned from the party.

Different socio-economic and political groups participated in the agitation for different purposes, raising issues like corruption, blackmarketing, price rise, denationalisation, rationing, civil liberties, injustice to Gujaratis and Gujarat, etc. But finally all the purposes converged on two common demands, resignation of the Chief Minister and later dissolution of the state Assembly. The reasons for making these demands differed from group to group. To the majority of the agitators, it was a demand to overthrow 'corrupt' politicians. The opposition political parties were interested in dethroning the Congress party in the state which they could not do by constitutional means. Some were interested in discrediting 'progressive measures', such as the wheat trade take-over, land legislations, etc, of the ruling party. Some groups considered the demands as marking the transition to socio-economic change. Some wanted to establish partyless democracy. While some others wanted to instil confidence in the public mind for future struggles against the state. Thus there was neither unity nor clarity regarding the steps to follow after the dissolution of the Assembly.

The upsurge has been viewed differently by different persons and groups. To some, it was a 'fascist' movement or a 'counter-revolution'. To others, it was a revolution or at least marked the pre-revolutionary stage. Some branded it as a 'Naxalite' movement. Some saw in the agitation the shape of things to come — chaos and turmoil in the country as a whole. It is not

we've been booming on the export front year after year after....

We've been busy earning foreign exchange for the country.
Selling our batteries to some of the most discriminating and quality conscious buyers in the world.
In the process, we bagged the single biggest battery export order ever.
Multiplied our export earnings six hundred times since 1970.
Last year, our exports totalled over Rs 7 million
And we plan on doubling the figure this year

HOPE

for the millions...

Bank Nationalisation!
Today, on its 5th Anniversary, Central Bank can give facts and figures to show what it has done to realise these hopes:

CENTRAL BANK'S ADVANCES TO PRIORITY SECTORS

(Provisional as on 31-12-73) (Rs. in crores)

* Agriculture	72.32
* Small Scale Industry	68.54
* Retail Trade & Small Business	7.80
* Miscellaneous	8.02
Total:	156.68

CENTRAL BANK'S BRANCHES

Total: 1175. Rural areas: 361 (of which 246 are in Lead Bank districts)

India's largest Nationalised Bank has taken the lead in revitalising the weaker sectors of the economy. It has given hope to the so far neglected sections of society, e.g., the Adivasis, small entrepreneurs, artisans, farmers, etc: Provided opportunities in every sphere for self-employment, for the generation of new industries. It has worked for the welfare of the country and its people and pledges itself anew to serve them to the best of its ability.

Central Bank of India

our intention to examine these views and the theories or lack of them behind these views. The present paper is an attempt to observe the major events or incidents with a view to understanding the agitation as a social phenomenon. The paper seeks to examine the following questions: What role did the different groups play in softening or accelerating the agitation? How and why did the agitation take different shapes at different stages? Which issues were highlighted by which groups and why?

The paper is an exploratory study based on interviews with those who participated in the agitation, survey data, newspaper reports as well as the writer's own observations. The paper is divided into two parts: In the first part, I have dealt in detail with the prevailing tensions in Gujarat state. In the second part, the nature of the agitation and the character of the participants have been described.

I

Discontent and Tensions

In order to understand the agitation, one needs to examine the socio-economic and political under-currents in the state. What follows is a broad outline of the prevailing tensions in general and those in urban areas in particular. We shall then proceed to examine the nature of the different sections of society and the political environment in the state.

According to the 1971 Census, 28 per cent of the population of Gujarat, as against 20 per cent of the all-India population, live in urban areas. In Gujarat the concentration of urban population is in the larger-sized towns. According to the 1961 census 52.97 per cent of the urban population lived in Class I (100,000 and over population) and Class II (50,000 to 99,999 population) towns. These were in all 7 and 18 such towns, respectively. This proportion had gone up to 60.76 per cent according to the 1971 Census. In the Class I and II towns the density of population is 8,216.20 and 4,402.24 per sq km respectively. The overcrowded towns do not have adequate primary amenities like water, drainage, health services, transport, etc.[1]

The Centre for Regional Development Studies, Surat, conducted a survey just before the agitation, between December 25, 1973 and January 10, 1974 in Surat to get an idea of prevailing tensions in urban areas. Surat is the second largest city in Gujarat. In this section, we shall make use of the data of the Surat survey to explain the prevailing tensions.[2]

In order to understand the problems of the city and the people's cognition of the civic problems, a question was asked "According to you, what are the major problems of the city?". Leaving out the one out of four persons who could not think of a problem either because he was too comfortable or because he lacked the cognitive capacity to articulate the problems of the city, a large number of persons (more than 50 per cent) interviewed indicated price rise and scarcity as the major problems of the city. This highlights the economic hardships of the people.

Next to price rise, people considered transport to be a major problem of the city. Besides irregular and overcrowded buses, people often had to wait for more than an hour to catch a bus. Consequently, frequent confrontations between members of the middle-class (particularly students and youth) and bus conductors took place during the last two years in several cities of Gujarat. It may be noted that only 48 per cent of the total transport buses of Ahmedabad run regularly on roads.[3]

The prices of essential commodities had sharply increased during 1973. Though the prices came down slightly after the July riots in Ahmedabad, they shot up again after August 1973, despite a bumper crop. The prices of foodgrains, edible oil, ghee, vegetables and meat rose from 30 to more than 100 per cent during the last one year.

Besides, milk cost Rs 2 per litre. A cup of tea in hotels cost 35 to 40 paise. A loaf of bread weighing 450 grams cost one rupee. Charges for a limited "thali" for lunch were Rs 2. One had to pay not less than Rs 110 per month for two meals a day. Ordinary snacks even in cheap eating places cost at least one rupee. One could not afford to eat even *chana* (gram) and *sing* (groundnut) which cost 80 paise for a hundred grammes.

Certain commodities did not only become costly but also disappeared from the market. For instance, oil, ghee, butter, baby-food, kerosene, etc, were not to be found in the open market. Foodgrains like wheat and rice were also scarce.

Gujarat is a deficit state in foodgrains. It depends on the Centre for feeding the people. The state faced a precarious food situation following a drastic cut in the supply of foodgrains by the Centre after June 1973. As against its monthly requirement of 1,00,000 tonnes of wheat, the state got only 15,000 tonnes a month in November and December. When we break down these figures at district level the gravity of the food situation becomes clearer. Take, for example, Surat city and district. There were 16,29,000 and 4,43,000 card-holders in the district and city, respectively. The total supply of foodgrains including wheat, jowar, milo and rice was of 10,000 tonnes in May. As months passed, the quota was reduced drastically, reaching 2,770 tonnes in the month of December (Table 1). Similarly, in the case of wheat it was 6,900 tonnes in May, in August it was reduced to 1,800 tonnes and in November it was reduced to 1,200 to 1,100 tonnes. The same was the position as regards jowar. In the case of rice it was even worse. In May the supply was 1,000 tonnes which declined to only 70 tonnes in December.

Consequently, a card-holder got only one kilogram of wheat per month per head in November and December from the ration shops. Rice was not distributed at all. A card-holder got two kilograms of jowar. The quality of foodgrains in the ration shop was also bad. The grains were full of dust and stones and one had to spend at least two to three hours to clean the grain. The poor quality and the meagre quantity of foodgrains forced poor persons to buy from the open market where prices of the commodities were twice as high.

The steep price rise and scarcity of essential commodities had, thus, broken the common man's back. In Surat, for instance, about 66 per cent of the families received less than Rs 300 per month. On a fairly conservative reckoning, the expenses of a family of four persons come to Rs 150 for foodgrains and other household items like soap, edible oil, sugar, etc, Rs 30 for milk (half a litre per day), Rs 10 for transport, Rs 30 for vegetables, Rs 30 for rent including electricity and water, and the remaining Rs 50 for tea and canteen, clothes, medicine, observing

TABLE 1: FOOD SUPPLY IN SURAT DISTICT 1973

(in tonnes)

Foodgrains.	May	June	July	August	Sept	Oct	Nov	Dec
Wheat	6900	6600	4500	1800	1500	2000	1200	1100
Jowar	100	—	—	—	1500	—	—	—
Milo	1500	700	2500	1200	—	3000	1800	1600
Rice	1000	894	450	—	—	100	155	70
Total	10000	8194	7450	3000	3000	5100	3155	2770

Source: *Gujarat Mitra*, December 30, 1973

social customs, and a minimum of entertainment like a visit to a cinema. One can imagine the strain on such families. And these are in fact the relatively better off families. The condition of persons like clerks, typists, Class IV employees, accountants and salesmen in private firms and shops and casual labourers earning Rs 200 or less per month is miserable. Their condition is more pathetic when they live alone in the cities, without their families (as about 10 per cent of the working population in the cities do). Because of the steep rise in the prices of all commodities, they cannot save anything and so cannot send anything to their dependants back home. Without family bonds and discipline on the one hand and faced with economic privations on the other, such people are susceptible to being drawn into any mob action.

There is a continuous conflict between consumers and traders in the urban areas, with the former becoming more vocal and conscious of their rights. The conflict has become sharper recently as a result of rising prices and scarcity of commodities, on the one hand, and incipient consumer movements on the other. There was a general impression among the people that shopkeepers were blackmarketeers and profiteers. Take the example of Surat city. It was found in our survey that every third person had a feeling that he was continuously being cheated by shopkeepers; another 40 per cent felt that they were being cheated sometimes. Thus three-fourths of the population did not trust traders. Further, 76 per cent of the respondents reported that they constantly felt that they got adulterated material from the market. They alleged that in order to make more profit the shopkeepers mixed all sorts of adulterants with commodities and thus played with the lives of the people.

The profiteering attitude and arrogance of the shopekeepers was obvious during the riots, too. In between the two curfew periods people rushed to do their shopping. Shopkeepers took advantage of this situation and charged higher prices. Sometimes this brought the conflict between the customers and the shopkeepers into the open and some customers looted some shops in sheer retaliation.

"The economic situation is worsening and we do not know what will happen tomorrow...We voted for Indira Gandhi in the hope that she would do something for the common man, but she has not done anything. Prices are rising everyday and it is difficult to live on our meagre means." This is what a white-collar worker, earning Rs 250 per month, had to say. His feelings were widely shared. An overwhelming number of persons (91 per cent) felt that the condition of the common man had not improved in the last two decades. On the contrary, many of them (70 per cent) felt that it had actually deteriorated. The picture of the future presented by these respondents was also very gloomy. As many as 84 per cent of the urban dwellers felt that their children would have to face greater hardships than they.

TABLE 2: ALIENATION AND POWERLESSNESS

	Items	Percentages
1	Cannot meet officials directly	74
2	Cannot do anything to make the city better	65
3	Find government and politics so complex that one cannot understand what is going on	88
4	Representatives do not pay attention to the problems of the people	88
5	Officials do not pay attention to what persons like me say	91

In addition to economic strains and frustration, a large number of people find themselves powerless in their relationship with the political system. This is evident from Table 2. Seven out of ten persons expressed their inability to meet officials directly. They also felt that they could not do anything in the development of the city. The number of persons feeling helpless increases when asked about their effectiveness with government officials and elected representatives. Nine out of ten persons felt that neither elected representatives nor officials paid attention to the problems of the common man. He was not being listened to by the government officials or politicians. He found himself powerless in his personal life as well as in the socio-political system.

People's frustration and helplessness need to be examined in the context of the present political system. This needs a separate and more elaborate study than is possible in the present inquiry. However, from our data we are able to present a few aspects which may indicate the trend. It is found that 40 per cent of our urban respondents, by no means an insignificant number, had lost faith in the elections. They felt that elections were deceptive. Only men of influence and money could fight the elections. After the elections, according to them, the leaders did not care for the electorate. Politicians only looked after their own interests and the interests of their groups.

Faith in the electoral system has been shaken and many persons pleaded the needs for direct action. Of the respondents of Surat, 67 per cent considered that strikes, gheraoes, dharnas, etc, were legitimate and necessary to secure their demands. And 22 per cent of the respondents accepted violence as either inevitable or as a last resort method to solve problems. This is not an insignificant number. After all, only few persons actually participate in violent activities (as seen in the recent riots).

The above evidence suggests that an overwhelming proportion of the people were frustrated, found themselves helpless and were loosing faith in the present political system. They opted for direct action to solve their problems. All this is relevant for understanding the widespread agitation that took place in Gujarat.

DIFFERENT SOCIAL GROUPS AND THEIR PROBLEMS

Though there was overall unrest among all sections of society, the areas of discontent differed from group to group. In order to understand the nature and process of the turmoil that took place in Gujarat, it is necessary to delineate the nature of the various groups and their problems.

Industrialists or big businessmen are not affected by the steep price rise or corrupt politics. They are highly organised and are in a position to assert their interests through organisations like the Millowners' Association, the Chambers of Commerce, Manufacturers' Associations, Wholesale Grain Merchants' Association, the Mahajans (Guilds), etc. And local associations are linked up with state and national level organisations. As a group they support the party and the faction which is in power. They give financial support to the Swatantra party as well as the ruling Congress. They oblige ministers, MLAs and officers and have no difficulty in "getting things done". What they cannot influence at the policy level, they manage to get at the implementation level. Their hold on the ruling party and on the administration is beyond doubt.

Groundnut oil dealers are well organised in Gujarat. In order to extract a higher profit, they are interested in exporting oil to other states. They smuggle out oil on a large scale to escape excise duty. The government has always succumbed to the oil dealers in one way or another. It was reported in the Press that the oil dealers gave large amounts to individual politicians of the ruling party and towards party funds for elections. These dealers were strong supporters of Chimanbhai Patel. At a meeting between oil dealers and the government in October 1973, the Chief Minister is reported to have said: "You know my interests and I know your interests. You protect my interests and I will protect your interests." Soon after this meeting, the prices of groundnut oil, which had shown a declining trend, shot up sharply. Moreover, in November the government gave up the practice of procuring oil through levy from groundnut oil mills. This also worked to the advantage of oil dealers. Nor was the government strict towards hoarders and blackmarketeers.

Individually, businessmen and industrialists are in competition with each other in business and public life. For status as well as patronage some of them sponsor educational institutions and several other voluntary associations. A few of them have also sponsored or supported students organisations. They support different political parties, Swatantra, Congress(O), Congress(R) and Jan Sangh. According to them, all the four political parties, though they differ in their postures, support their interests in one or another way. Individually, they also support different groups within the parties. And different industrialists spare no effort to bring men belonging to the groups they support to power and to keep them there in the face of opposition from their competitors. However, all of them are bitterly opposed to the 'radicals', the pro-poor politicians who are openly against business interests. For instance, during the recent events in Gujarat, the industrialists and the other rich persons were divided as supporters or opponents of Chiman Patel, Amul Desai, Ghiya, Adani, Oza or Thakorbhai Patel according to what at any moment suited their diverse personal interests. But they were all against Jhinabhai Darji, the president of the Gujarat Congress, who had refused to succumb to the demands of rich businessmen and industrialists. Suffice it to note here that they play a significant role in faction fights within the ruling party.

A section of the peasants has become prosperous during the last two decades. Thanks to irrigation facilities, fertilisers, new seeds and transport facilities and thanks to the enormous demand for cash crops in which the prosperous peasantry of central and south Gujarat specialises, the peasants have become very rich and very powerful politically. And they are no longer mere peasants; through their control of government and the co-operative credit institutions, they have become big entrepreneurs as well. They have thus been linked with urban businessmen and industrialists.

During the Independence movement, the peasants of central and south Gujarat launched agitations against the British government to oppose land revenue. And since Independence, they have been organised under different names. Bhailalbhai Patel, a leading Patidar leader of Kheda district and the founder of Vallabh Vidyanagar, organised a political party, Khedut Sangh, in 1952 to oppose land legislation. In 1968 the peasant interest in the Swatantra and Congress parties organised the Khedut Mandal, outside their parties. And in 1973, the Khedut Samaj, under the leadership of Dayaram Patel of south Gujarat, Vallabhbhai Patel of Saurashtra and Ambubhai Patel of north Gujarat, came into existence, to oppose 'progressive' land legislation. Besides such organisations, cotton growers, tobacco growers, sugarcane growers and others have set up their respective organisations and have worked as powerful lobbies within the Congress in Ahmedabad and New Delhi. Like the industrialists and rich businessmen, the rich peasants maintain good relations with the faction in power. Their hold on the administration too is strong. Land legislation has so far not been able to make much impact at the implementation level. And whatever surplus land has been acquired under the Acts largely has gone to the upper and middle castes. The condition of small farmers and landless labourers have remained more or less the same as before.

The Khedut Samaj had become active in the latter part of 1973 against the proposed land ceiling bill as well as the levy on paddy. In October the Samaj organised meetings, processions and demonstrations against the land ceiling bill. It organised a huge rally at Gandhinagar where a confrontation between police and demonstrators took place. A procession of teenage sons and daughters of the farmers was organised in New Delhi which submitted a memorandum to the Prime Minister, demanding protection of the minors' rights in land. The Kheduts also organised morchas and gheraoes against MLAs and tried to persuade them to resign from the state Assembly. In some villages, the organised peasants boycotted government works. These peasants demonstrated their strength in the Sabarkantha by-election in 1973 where they concentrated their efforts in favour of Sardar Patel's daughter Maniben Patel, the Congress(O) candidate.

The government could not scrap the land ceiling bill but at the same time it could not go against the peasants. It is interesting to note here that barring four or five members, all the Congress legislators favoured a raising of the ceiling. The government rejected a suggestion of a Congress MLA that agricultural land be taken over from so-called farmers whose non-agricultural annual income was more than Rs 15,000. The government also rejected even the simple suggestion of forming a watchdog committee to check on the implementation of the bill.[5] Nor did the government take any other steps to gear up its own administrative machinery to implement the bill. And the peasants took a pledge in public that surplus land would not be surrendered to the government for distribution among the landless under the land ceiling Act. A leader of the Samaj audaciously told a public meeting that the Act was not going to be implemented as "the Congress governments do exactly opposite of what they profess".[6]

The Samaj organised "patrol squads" in the 200 villages of Surat district "to keep a vigil". Each squad was headed by a "Commander" for a group of ten villages. It also organised "Sardar Senas" to protect the crops in the region. On November 24, 1973, a meeting of landless labourers was interrupted at Bardoli, south Gujarat, by the young sons of farmers. A Harijan youth was injured in the stone-throwing.[7] Similar incidents also took place in some villages of central Gujarat.[8]

During the first week of December the citizens of Rajkot city, Saurashtra, organised demonstrations demanding water for the city from the Bhadar Dam. At the same time, the farmers of Rajkot district threatened the government that they would launch a three-stage agitation, culminating in a satyagraha in the final stage, to forcibly release irrigation water from Bhadar Dam to the standing crop of sugarcane and cotton in an area of 7,000 acres in Rajkot district. The government released the water immediately.

Another major issue on which the peasants defied the government in December was that of levy. (The paddy levy is, in fact, not new. It was introduced by the erstwhile Baroda State.) The government has made several changes in the Levy Act over the years. The 1973 Levy Act is an improvement over the 1967 Act. According to the new Act, small far-

mers having one acre or less were exempted from the levy. Moreover, the rates had been fixed progressively whereby small farmers had to pay little and big farmers had to pay more. For instance, in Surat district, out of 70,000 farmers only 27,000 farmers (i e, 39 per cent) had to pay levy at different rates.[9] The idea was that only those farmers who were rich and had benefited from planning were to be affected by the levy. But as on previous occasions, to protect their interests the big farmers mobilised all peasants against the levy in the name of the common interests of the sons of the soil. We shall return to this point later when we discuss the agitation.

The poor — casual and unskilled labourers — are generally dumb. In the villages from where they migrate to urban areas, they are landless labourers. There they hardly used to get enough work to keep alive. As a rule they are illiterate. In urban areas they live in slums and their belongings are meagre. Though they live in the city, they are not acquainted with city life. They live at a sub-human level. The present political system is completely alien to them. They feel strongly the pinch of rising prices and scarcity. But this is not new to them. This has been a fact of life for them for long. Even during normal times, the prices have been always beyond their reach and they could not afford to meet even their essential needs which are any way very few.

Factory labourers are of two types. One comprises those who work on a daily wage basis. The factory rules of the government do not apply to them. If they work for more hours and produce more, they get more money. They do not get wages for Sundays and other holidays when they do not work. They are unorganised.

The other type of factory labourers are those organised in trade unions. Most of these trade unions in Gujarat are dominated by the Majoor Mahajan which is wedded to the philosophy of class collaboration and not class conflict. The Mahajan avoids direct action such as strikes or gheraoes. Even during the large-scale retrenchment of workers in the textile mills in 1972, the Mahajan did not launch any agitation. However, a few trade unions are controlled by socialist and communist parties. Barring a few exceptions, all the trade unions, by and large, work as brokers between the management and the workers. Or they work as clearing agencies for taking the problems to the labour officers and other authorities. Once in a while, they negotiate with the management on issues such as bonus or rise in wages on behalf of the workers. But they do not aim at developing a working class consciousness among the factory workers. Consequently, the factory workers look upon their problems in terms of economic demands and are not concerned with the larger issues relating to the societal structure. As a result, fraternity among the workers as a class has not developed in Gujarat. In fact, they have remained quite divided — among Hindus, Muslims, Baniyas, Harijans and so on. During the 1969 communal riots some of these workers killed each other.[10]

The number of the agricultural labourers has risen in Gujarat at an alarming rate during the last decade from 14.77 per cent of the working population in 1961 to 22.48 per cent in 1971. A few of them are attached labourers who are employed either on annual contracts, i e, from Holi to Holi (April to March) or on seasonal contracts for four months. As attached labourers they live with the employer and perform all sorts of chores from cleaning utensils to agricultural work. They are not organised and in social and political matters they follow the instructions of their masters. A large number of agricultural labourers are casual workers. They get employment for about 7 months in a year. For the remaining period, they either do not have anything to do or migrate to urban areas in search of unskilled jobs or work on their own land, if they have any. It is estimated that on an average a labourer is totally unemployed for a period of 100 days in a year. He gets roughly from Re 1 to Rs 3 per day for agricultural work. Seasonal employment and meagre income make the agricultural labourers' life extremely difficult. Except in south Gujarat, they are unorganised; therefore, their participation in any protest activity is negligible.

In south Gujarat, Sarvodaya workers have organised agricultural labourers, particularly the Dublas or Halpatis. The Halpati Seva Sangh, an organisation of agricultural labourers, works on the philosophy of class collaboration. The workers of the Sangh preach harmony between landlords and labourers. It mainly conducts welfare activities such as constructing huts, conducting night schools and propagating prohibition to uplift the labourers. The landlords, however, do not approve of these reformist activities of the Gandhians. Because they fear that education and consciousness among the Halpatis would endanger their interests, they try to curb the activities of the Sangh. This obviously creates conflicts between the landlords and Halpatis. In such situations, interestingly enough, the Gandhian workers pacify and control the labourers. During 1973, Halpatis of some villages launched a strike against landlords demanding a daily wage of Rs 3. In such cases, as Jan Breman observes, "the social workers intervene in order to prevent rising tensions and to reach a compromise. Self-respect and class consciousness are not taught. On the contrary, the organisation does not aim at making the Halpatis able to stand up for themselves, aware of their exploitation and oppression, but envisages their adjustment to the social system without a fundamental change in their dependence."[11]

The middle class consists of higher and upward mobile sections of intermediary castes engaged in white-collar jobs or small business. Like the working class, there is no common interest or ideology that inspires this class. It is divided into several groups of interests. Income-wise, the lower middle class — clerks, typists, accountants, shop assistants, teachers, petty shopkeepers, etc — is not better off than the industrial workers. Yet a great social gap divides the two who live in different residential areas in the cities. Industrial workers live in slums and chawls where the economic condition of the people is by and large same. Persons of lower middle class live in *poles*, i e, streets or recently constructed housing societies outside the old residential towns where the upper middle class and the rich also live. Thus their aspirations, norms and values are those of the rich. For instance, a clerk desires to have a refrigerator, a fan, a sofa-set, etc, because his neighbour or his relative possesses these things. For him, these are symbols of status. But he does not have the means to have all these 'luxury' items (looked upon by now by his class as necessities) which the neighbour who is either a government officer or small factory-owner has as a matter of course. Consequently, the present economic hardship hits him hard. The sense of "relative deprivation" is very strong in him.

By and large a middle class person is vocal and sensitive. He gets angry when he does not get a bus in time. He quarrels with the bus conductor, the rickshaw-driver, the station master, the postmaster, even the policeman and the government officer. He fights with shopkeepers and hawkers when they raise prices or indulge in fraudulent measurements or adulteration. He feels that it is his right to fight against injustice. And he finds injustice everywhere. "All are corrupt" he exclaims. But he finds himself helpless against government servants, organised bus conductors, rickshaw drivers, traders, police, etc. He sees immorality all around him. But he does not organise as a class against other organised interests. Therefore, consumer movements of the middle class have not succeeded against traders and farmers.

He feels that in the present social structure, he shuffers the most. He complains against the government, against its schemes for the development of backward classes and welfare programmes for the labourers. He also complains against industrialists and big businessmen. He feels somewhat like this: "Poor persons do not have many needs and they do not have to observe a certain etiquette...Rich persons have no problems. But we, the middle class, have short means, yet we have to live in a certain way. We have to maintain our status. A poor person can beg, but we cannot. We are, therefore, sandwiched between the affluent rich and the frugal labourers." The middle class is full of such agonies. The most organised and articulate sections of the middle class are the teachers and the students. They are large in terms of numbers and they are highly sensitive and vocal.

College teachers who come mainly from the upper and middle castes are a force to reckon with in Gujarat. During the last decade they have organised and developed a powerful teachers organisation for protecting and advancing their interests against university and college managements. The college management is largely dominated by big businessmen, industrialists and rich peasants.

Further, college teachers of Gujarat in general and of Ahmedabad in particular are more politicised than many other sections of the middle class. Some of the college teachers write regularly in the vernacular newspapers on all major issues facing society. College teachers in general, and their organisational leaders in particular, were against Chimanbhai Patel who had been a teacher, a principal of a college and manager of a string of colleges. Chimanbhai Patel had used his control of the colleges for political ends. He was responsible for bringing back Ishverbhai Patel as Vice-Chancellor of Gujarat University. Ishverbhai Patel had earlier been bitterly opposed by college teachers and made to resign. It may be noted that despite strength and organisation, college teachers could not succeed in the elections to the University Executive (Syndicate) and in the Vice-Chancellor's election in which Chiman Patel, using his power and patronage as Chief Minister, had personally and openly canvassed for his own candidates. The teachers' leaders had launched an agitation for preventing Chiman Patel from becoming the Chief Minister of Gujarat in July 1973.[12] Both the political success of Chiman Patel and his success in imposing his will in the affairs of the University produced a sharp sense of frustration among teachers.

As elsewhere, more than 75 per cent of undergraduate students come from middle-income or high-income groups and belong to high or middle castes. The composition of the students, by their fathers' occupations, varies from city colleges to taluka town colleges. In the cities, according to a survey of college students, the fathers of 36 per cent of the students are engaged in white-collar jobs, either in the government or in private service. The fathers of about 27 per cent of the students are either businessmen or factory owners. And 16 per cent of the students are sons of farmers. Barely 2 per cent of the students come from the working class.[13] In taluka town colleges a majority of the students are the sons and daughters of farmers. Among the hostel students of Baroda, Ahmedabad, Surat, Morvi, Bhavnagar and Rajkot, many belong to the landed class.

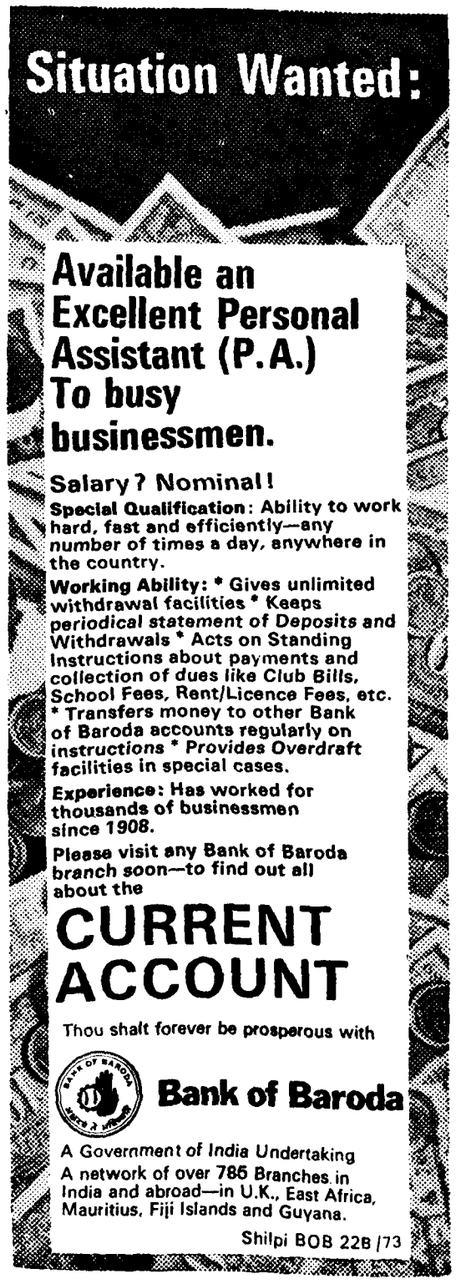
On the whole, a large number of students are not interested in their studies. They find their studies tiresome, boring, bearing little relationship to their lives. The students, particularly those belonging to the lower middle class, complain that the present education does not enable them to earn a stable livelihood. They constantly worry about their future economic security. But they do not know the way out. They therefore imitate the rich students. On the other hand, students belonging to families of rich peasants, factory owners and big businessmen do not care for their studies either — though for quite different reasons. For them college is a pastime. They say "we do not care for studies. We do not want degrees. We have enough land ... We have joined college just to have experience of college life. This is a time to enjoy life." On the whole, except for their dress and permissiveness in sex relationships, available studies suggest that students do not hold values different from their parents or the ruling class.[14]

However, a small but significant section of students in all cities is more sensitive towards social problems such as poverty, inequality and injustice. For instance a group of students in Ahmedabad formed a group, named *Hun*, i e, "I", in 1971. In 1972, the group brought out a mimeographed booklet, 'Donkey', in which it satirically compared politicians with donkeys. On January, 26 1973, the group published a booklet *'Bhukh'*, i e, hunger. On the front page, it says "What are *'ladus'*? Where are the *'ladus'*? Are those *'ladus'* meant to be thrown away? Are they to be worn? Or are they to be eaten?" The point that the group was making was that poor people do not know what *'ladus'* are. Significantly, the booklet was inaugurated by a shoe-shine boy. In Baroda and Surat some students organised study circles in 1973 to discuss economic and political problems. A few students also sometimes visit slum areas with a view to helping poor persons.

The more affluent section of the student community is not serious about its studies. They either read during the last month before the examination or get marks through illegitimate means. Many of them are more interested in films than in sports, debates, drama, dance or discussion. They roam about on the college campus, tease girls, use vituperative language, sit in restaurants, go to film shows, take LSD or liquor and thus simply "kill" time. When in a crowd, they harass the older men, bus drivers, conductors, hotel boys, hawkers and, above all, girls. They have a nuisance value in urban areas. Their mischief and supposedly carefree life attract many other students to their fold. And with money, they are able to collect groups around them. They are always in favour of a strike, if not for any other reason then at least for fun.

There is no powerful city or state level students' organisation except the Vidyarthi Parishad which is associated with the Jan Sangh. During the last five years, about one dozen student organisations have come into existence in Ahmedabad. But none of them has a stable organisational net work, programme or regular membership. They are largely *ad hoc* creations of some temporary events. They launch agitations and issue press statements but

there is no follow-up. Most of these organisations are supported by different political leaders belonging to the ruling as well as opposition parties. In order to make their appeal citywide, the various organisations get united under some common banner. For instance, the Vidyarthi Madhyastha Samiti was formed in 1971 for launching agitation against the fee rise in Ahmedabad.



On the whole, students' agitations have increased in India since 1966-67. During the period 1967-68 to 1969-70, the incidence of agitation among university students on a rough count was around 45 agitations per 10,000 students per year; and of these around 14 per 10,000 were violent. Large-scale students agitations had become a regular feature after 1965.[15] We do not have data on students agitations for the whole of Gujarat. However, the data on protest and violent incidents in Surat and Ahmedabad suggest that Gujarat was relatively peaceful till 1963 on the student front and the number of students' protests has increased in the last five years.

Our own survey data on the students of Surat city suggest that most students participated in school or college strikes. About 49 per cent of the undergraduate (Arts and Commerce) students approved of strikes in colleges on students' problems. They believed that teachers and college authorities did not listen to their complaints. Thirty four per cent of the students, however, disapproved of strikes. They felt that only rowdy students organised strikes. Some of them reported that most of the strikes were organised on flimsy grounds.

During 1973, the students of Gujarat launched several agitations. In March-April, B Com students walked out of their examination centres in Ahmedabad in protest against "tough" questions papers. The authorities gave in to their demands for a re-examination in all papers. In June-July, students of the Ayurvedic College of Ahmedabad damaged the college building in support of their demands. In July students launched an agitation protesting against the in-fight in Congress between the Chiman Patel and the Oza factions. They also gave a call for bandh in support of their demands. In October, students of the H L Commerce College, Ahmedabad, demanded postponement of first term tests as they wanted to participate in flood relief work. The college authorities and teachers did not listen to the students' demand and the principal and the professors resigned *en bloc* in protest against the demands. The students had to withdraw the demand but the tension continued.

In November 1973, students of Petlad College of Kheda district organised a procession against the University authorities for reinstating the principal of the college. All colleges of the district supported the demand.

In Baroda, the conflict between students and the State Transport authority has remained a permanent feature throughout last year. In south Gujarat, students launched an agitation against a fee rise and for the removal of the "internal evaluation" system. In Surat,

Navsari and Chikhli several instances of student unrest were reported. In Saurashtra, particularly in Bhavnagar, Morvi, Rajkot and Jamnagar, students agitations on some issue or the other had been reported almost every other month in the newspapers.

Besides, as a result of the new University Act the students of Gujarat University were given representation and 11 out of 145 seats in the University Court (Senate) were allotted to them. In October 1973, in the elections to the Court students were mobilised by teachers, political parties and managements. Because of their resources, the managements could win over the students and get their support for their nominees in the elections. Some popular teachers and students were defeated. This produced frustration among the student leaders.

Changes in Style of Politics

With the formation of Gujarat state in 1960 and the introduction of Panchayati Raj in 1963, the public life of Gujarat entered a new phase in its political style — a gradual progression from elitist to mass politics. Till the mid-1960s the Baniya-Brahman styles of politics with its vague Gandhian concepts of propriety in public life dominated. This style was largely acceptable to the urban educated middle class, particularly the upper castes engaged in white-collar jobs or business. According to this style, an individual's personal and public life are so divided that while any means that led to success was acceptable in private life, 'purity' in public life was to be insisted upon. The latter implies two things. One, there should not be coercion and corruption in public life either to win over or to defeat one's opponents. Accommodation in distributing positions or favours among both one's followers and one's opponents with a view to maintaining oneself in power was acceptable. But the use of either money or intimidation or recourse to coercive methods was not acceptable and was considered both undemocratic and bad. Second, the finances of public institutions should always be above suspicion. One can cite several examples of Baniya businessmen accumulating money through illegitimate means but in their association with public institutions they are found to be straightforward and meticulous in maintaining accounts, etc.

There has been another style of politics alongside this, with feudal remnants and with the accent on success by any means. In this style, the end is more important than the means and one should follow any means to attain and maintain political power. There is no inhibition against distribution of money, use of coercion, kidnapping and intimidation. These are accepted as an inevitable part of politics.

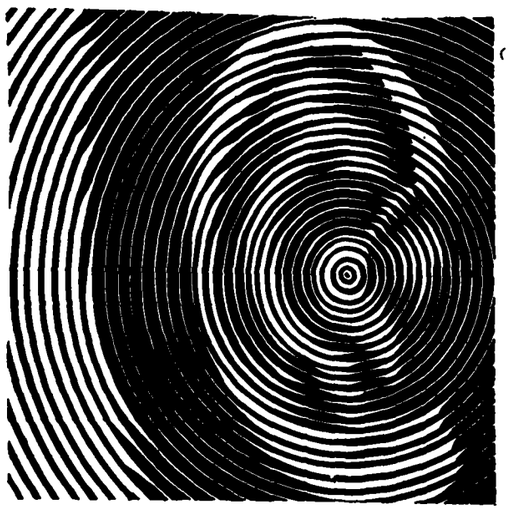
The Gujarat Congress was dominated by the Baniya-Brahmin style of politics till the formation of Gujarat in 1960. It was one of the most disciplined, well-knit and organised political parties in the country. Though there were differences and groups within the party, these were not as sharp as in many of the northern states. The state party did not fall in the scheme of the factional structure that was conceived as an integral part of the "Congress system". Most of the decisions of the party were taken by consensus, usually dominated by one leader. The leader was expected to be above all groups. Congressmen believed that the party was like a 'family' and party difference should not be discussed outside the party. Almost till 1967 the Gujarat Congress by and large did not submit its internal problems to the Congress High Command for resolution. The working of this style was evident even during the Jivaraj Mehta episode in 1963.

At the same time the Jivaraj Mehta episode was also the beginning of the decline of the Baniya-Brahmin style of politics. A signature campaign against Mehta was organised on the ground that he did not accept the directives of the *movadi*, i e, the elderly leader (Morarji Desai).[16] And at the same time, Chimanbhai Patel, Kantilal Ghiya and Thakorbhai Desai ignored the *movadi*, i e, the elderly leader Morarji believed that a signature campaign against an elected leader was not a healthy practice. Yet, he took the responsibility for this action on his shoulder, befitting a *movadi*. This was a part of the Baniya-Brahman style. However, the point should be underlined that the urban middle class did not approve of the way in which Jivaraj Mehta was ousted.

By the biginning of the 1960s, Patidar and Kshatriya groups in the Swatantra party joined hands to break the monolithic structure of the Congress. Both of them have a feudal past and they had little tolerance for the Gandhian style of politics. They followed the manipulative style of politics within and outside the Swatantra party. In 1967-68, the Swatantra party, having failed to capture power, adopted this style in an even more naked form. Its leaders followed different means, including coercion, bribery and kidnapping of MLAs to win over the members of the Congress.[17] In fact, this style of politics was all along prevalent in the villages. But it was for the first time that it was practised openly and on a large scale in Ahmedabad, the state capital. Reacting to this and in order to preserve power, the Congress party followed the same style. But because of its well-knit organisation, it did not have to adopt that style as openly as the Swatantra party.

The hold of the Swatantra party declined with the split in the Congress in 1969. The new Congress followed the manipulative style of politics, and emerged as a strong party in the state after the 1972 state Assembly elections. Ghanshyam Oza became Chief Minister of Gujarat in March 1972. Faction fights began within the party, between the Oza-Adani-Darji group and the Chimanbhai-Chiya group. Both the groups followed the manipulative style of politics. But Patel proved more skilful than the others and managed to edge them out. By now the Baniya-Brahmin style of politics had become obsolete. And during the last three years, popular vernacular newspapers have reported in detail the day-to-day manipulations in politics. With this the conscious and vocal sections of society, particularly the urban middle classes, became disgusted with politics. They branded it as "corrupt politics" and revolted against it.

The politicians began to rely so much on manipulative politics that they lost their contact with the masses. In the cities as well as in the villages, the party leaders increasingly depended on brokers, smugglers, goondas and those who gave finance to the party rather than on committed party cadres. The old guard who were respected and who were always ready to help the people have slowly disappeared from the scene. Professional politicians who are not respected and loved have taken their place. People go to them for getting certain concessions from government offices and, in turn, politicians approach them for votes during the elections. These politicians do not enjoy any moral influence over the people.



The character of the ruling Congress, except for increased exhortations in favour of socialism, has remained the same as that of the undivided Cong-

ress. It is a hotchpotch of various divergent interests. In order to win the 1971 and 1972 elections, the party obtained the support of smugglers, bootleggers, as well as rich peasants, factory-owners and businessmen. It got men, money and material from these groups. On the other hand, it gave high promises to the middle class, the poor and the labourers. All shades of opinion and opinion-holders, from Swatantra to Communist, were accomodated in the Congress.

The party has certain disadvantages as compared to the undivided Congress. First, the new Congress in Gujarat was born out of manipulative politics. Some joined the party because certain opportunities were offered to them. Some joined it because they had no opportunities in the undivided Congress. And some others joined it because they saw this party rising to power surely and suddenly after the 1971 elections. Only a few joined the new Congress on ideological grounds. Consequently, there was more opportunism than party commitment among Congressmen. They were more interested in attaining personal power than building up the party. Secondly, though there were conflicts and factions in the undivided Congress, the present factions were very sharp and open. During the last two years, many of the state-level leaders had undermined the party's prestige and discipline.

Most of the state-level party leaders were deeply involved in internal power struggles and they had no interest in building the party. The Central High Command of the party entrusted the responsibility for party building to Jinabhai Darji. He was made convenor of the state party in April 1972 after the state Assembly elections. Darji, an artisan by caste, rural bred, who had worked among the tribals for many years, had sympathy for the poor. He did not have the sophistication of the middle classes or the rich. While he was the president of the district panchayat for more than five years, he dealt firmly with officials. He has a harsh tongue. Because of his pro-poor policies and harsh tongue he was rather unpopular among the urban middle class. Particularly, the upper middle class, kulaks and businessmen were bitterly against him. Most of the vernacular Press started a campaign against Darji after he became the president of the Gujarat Congress. However, the youths who had joined the party with the hope of bringing about socialism and the backward classes enthusiastically supported Darji. They found hope in him.

After becoming the convenor, Darji travelled all over the state to organise the party. He also tried to mobilise young persons. At the same time, he firmly dealt with opportunistic elements and also tried to keep businessmen and black marketeers out of the party. He won the election to the Gujarat Congress presidentship against Vakharia, an ex-PSP member and a nominee of Chiman Patel. Ex-communists like Himmatsinh and others joined hands

communication
the vital link

Whether it is to produce a daily newspaper, or to keep trains running on time, or conduct business through far-flung offices, or defend the country against aggression, instant communication is an absolute necessity.

Hindustan Teleprinters manufacture teleprinters, teleprinter switching equipment and a wide variety of other electronic communication equipment that help the P & T, Railways, Defence Services, Daily Newspapers and a number of business enterprises to do their jobs quickly and efficiently. Hindustan Teleprinters help build better communication systems to build a better India.

with Patel against Darji. Despite his victory, it was not smooth sailing for Darji. His opponents were bitterly against him and missed no opportunity to embarrass him. At the same time, many of his supporters who, though they backed him against Chiman Patel for different reasons, did not support his pro-poor politics and his party building activity. Consequently, Darji had willy-nilly to compromise and struggle both within and outside his group. Most of his time was spent in solving disputes among different groups. Consequently, taluka offices of the party could not be organised at several places. And there is evidence to show that even some district offices were not functioning and remained closed for weeks. Taluka and district leaders were busy pulling each other down. As a result, Darji did not get co-operation of state and district party bosses and he did not have funds even to run the state party office. He frequently expressed his desire to the High Command to resign from the post.

On the government front, the party's record was poor. Soon after the Congress came to power, the state faced a serious drought. Despite this, the government under Oza managed to perform rather well initially. But slowly, the government was losing its grip over economic problems which worsened after the change of chief ministers and the preoccupation of the opposing factions with day-to-day political wrangling. The prices of some of the essential commodities rose very high in July 1973. The government was helpless. The rich peasants and the big businessmen who had financed the party began to assert their claims.

In July 1973 Oza was ousted by Patel through manipulative politics. Patel got the support of the communists as well as of industrialists in his bid to capture power. Consequently, he was obliged to pass certain legislation which looked socialist. But when it came to implementing these measures he and the administration succumbed to the rich peasants and the big businessmen. Such actions displeased both the rich peasants and the poor people in the cities and in the countryside.

Chiman Patel became Chief Minister at a time when food riots had started in Ahmedabad. In order to calm the riot situation and to win popularity, Patel announced several measures aimed at controlling prices. Narendrasinh Jhala, the Minister for Civic Supply, once a Swatantra party leader, announced in August that several businessmen had agreed to reduce price of commodities used by the urban middle class. However, Jhala's agreement with the businessmen did not work for even a fortnight. On the contrary, prices increased further after August. Both Jhala and Patel repeatedly announced that the government would take action against hoarders and blackmarketeers. In December, the Chief Minister announced a series of measures, including invocation of the DIR, to deal with hoarders in the state. Export of foodgrains like wheat, rice, paddy and bajra outside the state was banned. But all these were mere announcements. They were not followed up by any action. Jhala publicly accepted that their threats had no impact on rich farmers or traders.

The moral authority of the government had by now been seriously jeopardised. People felt that the government was helpless and was not capable of controlling prices. The Patel government, according to them, did not mean business. Such feelings were reflected in news items, editorials, articles and letters in the newspapers. Further, rumours spread in the cities that Chimanbhai and Jhala had got several lakhs of rupees from businessmen and oil dealers and that in turn they had allowed the prices of edible oil to rise steeply despite a bumper crop. Some ministers were known to maintain open contacts with known smugglers and black-marketeers. All this raised doubts in the minds of the people about the sincerity of the ministry. There were also strong rumours that Patel and Chhabil Mehta, the Public Works Minister in Patel's cabinet, took money even from government servants for withdrawing corruption cases. Several other similar rumours kept spreading. What is important to note here is that such rumours, none of which was effectively countered, created hostility against the Chief Minister. For the first time, corruption charges had been levelled against the Chief Minister in public. And Chiman Patel lost credibility in the public eye rather quickly.

Thus, both on the organisational and governmental fronts, the Congress party's record of performance was poor. The gap between the people — particularly the disorganised middle class — and the party increased. Within the party, some of the so-called radicals felt that the Chief Minister was siding with the rich peasants and the blackmarketeers. They also felt that he was depending solely on corrupt tactics. But they were in a minority in the party and therefore helpless. Consequently, directly or indirectly, some of the top leaders supported the students' agitation. We shall return to this point again. Suffice it to note here that the Congress was a divided house. And factions were based on personal considerations and not on ideology.

The Congress (O) in Gujarat had been reduced in strength after the 1972 Assembly elections. Many left the party and those who remained were frustrated. The party became almost dormant for a year. However, thanks to the strong party loyalty among members, the party slowly recovered from its shock and launched certain programmes in 1973. A team of party workers worked in the drought-affected areas and organised campaigns against price rise in mid-1973. The party organised a torch march throughout the state for rousing public opinion on the Narmada issue. It also organised a training camp for the proposed satyagrahies who were to launch a satyagraha for securing a height of 560 feet for the proposed Narmada dam. Moreover, the party also supported the anti-levy movement launched by the peasants and thus tried to get rehabilitated among them. People began to compare the Patel ministry with Hitendra Desai's ministry under the undivided Congress and felt that the latter had been at least not corrupt.

The Jan Sangh too slowly gained ground in the urban areas. Its nationalist posture and militancy attracted young boys. The party took up local issues and launched agitations. For instance, during the first week of December 1973, the party organised a large-scale agitation on the water problem in Rajkot. The demonstration was followed by looting and arson. Like Congress(O), Jan Sangh supported the anti-levy movement of the peasants and also launched a campaign against rising prices.

However, though the Congress(O) and the Jan Sangh could rouse opinion among the urban people against the price rise, they could not attract large masses to their party activities. Their meetings and processions consisted of not more than a few hundred persons in Ahmedabad, Baroda or Surat. The Leftist parties, CPI and CPM, have very little influence in Gujarat.

Since the beginning of the seventies, hopes among the urban and rural poor in Gujarat had been aroused. On the

other hand, big businessmen and kulaks became alarmed by the 'garibi hatao' slogan of the Congress. They organised themselves and pressurised the government to look after their interests. The party in power, being dominated by the rich, succumbed to their pressures, both at the policy and the implementation levels. Artificial scarcity, black-marketing and rising prices were the result.

The Congress party remained a crowd of opportunists. A few young idealists found themselves misfits in the party; they therefore left it in disgust. Party bosses at all levels were involved in cutting each other's throats. People, particularly the educated urban middle class, were put off by the manipulative politics of the Congress. But they did not find any alternative party to support. The average urban dweller found himself powerless and alienated. His faith in the present political system had sharply weakened during the last two years. An increasing number of people found violence and direct action to be the inevitable ways to solve their problems. With this background, we shall now turn to the recent agitation.

II

Unorganised Masses and Organised Groups

We have provided above the background for understanding the events that rocked Gujarat from January to March 1974. We shall now give an account of the agitation.

In July 1973, on the eve of the change of Chief Minister, from Ghanshyam Oza to Chiman Patel, the teachers and students of Ahmedabad launched an agitation against corrupt politics. The agitation turned into food and then communal riots. The police, however, controlled the situation within three days.[18] The law and order situation returned to normal quickly. But tension continued and in fact was continuously mounting, expressing itself in sporadic riots at several places in the state. The January-March agitation was a continuation of the prevailing tension in the state. The riots and agitations were all directed against the government. Some of these events took place simultaneously and it is therefore difficult to give a precise chronological account. At the same time, there seems to have been a certain sequence of developments. The objectives of the agitation seem to have changed in a certain order.

As discussed earlier, the food problem became acute in December 1973. People found it difficult to live in the face of constantly rising prices. Several voluntary organisations such as locality organisations, youth clubs, women's organisations and other non-political organisations, as well as political parties, raised their voices against the price rise and the scarcity of foodgrains. Newspapers were replete with headlines on the food problem.

Some organisations urged that a statewide agitation be launched against high prices. The Civil Supplies Minister admitted in public that the food position was not satisfactory in Gujarat. He alleged that the Centre was not supplying an adequate quota of food to the state. The Chief Minister also said that the state would face a crisis on the food front in the following few months. Contradictory statements by different ministers appeared in the Press on food supply and distribution. One of the top ranking leaders of the Congress party asked for the resignation of the Civil Supplies Minister for his failure to meet the needs of the people. One MLA from south Gujarat offered to resign if the government failed to control the prices and provide food to the masses. Some dissident Congress leaders called a meeting of Congressmen on January 5, 1974 to discuss the launching of an agitation against scarcity and price rice. A Congress MLA said in public that the Chief Minister was protecting vested interests. He alleged that ministers were indulging in corrupt practices in broad daylight. He, along with 23 other MLAs, demanded President's rule in the state for six months. However, the people did not put much trust in their radical speeches. They believed that such speeches were only a part of the power struggle in the Congress. They asserted that they wanted foodgrains and not speeches.

Congress(O) declared in the last week of December that the party would organise public meetings in various areas to mobilise public opinion against the price rise. A conference of the Gujarat Chamber of Commerce, held in Ahmedabad on January 5, demanded denationalisation of wholesale wheat trade. It alleged that the food crisis in the country was due to the nationalisation of wheat trade.

The Jan Sangh was very active in Ahmedabad and Saurashtra in exploiting the grievances of the masses. It gave a call to observe an anti-price rise week in Ahmedabad and elsewhere. On January 1, 1974 it gave a call for a Jetpur (Saurashtra) bandh. The party organised a procession and attempted to lock the Mamlatdar's office. The police foiled its programme. The agitators retaliated against the police action by throwing stones. Later, the crowd looted two shops and set fire to the purchase and sale shop from where foodgrains were distributed. Lathi-charge and tear-gas followed, 175 men and women courted arrest and police arrested another 80 persons on charges of looting. The Jan Sangh again gave a call for a Jetpur bandh on the following day in protest against alleged police atrocities in the town.

In Ahmedabad, the Jan Sangh organised public meetings every day from January 1 against the price rise. Stone-throwing incidents invariably followed the end of every meeting. On January 6, stone-throwing took place in as many as seven places in Ahmedabad. The places were middle class localities, *viz*, Khadia, Dariapur, Relief Road, Gandhi Road, Delhi Chakla, Saraspur and Kalupur. These localities were to become the storm centres in the subsequent agitation. Lathi-charge, tear-gas and at one place firing also took place.

Anti-Levy Satyagraha

While the anti-price rise agitation was spreading in urban Gujarat, a different kind of agitation developed in the rural areas of south Gujarat. This was the anti-levy satyagraha. In order to show the importance and strength of the farmers the Khedut Samaj stopped the supply of milk and vegetables to the cities for two days. The government, having a soft corner for the peasants, did not take firm action against the agitators. In fact, landless labourers declared that they would assist the government in procuring the levy. They also said that they would show the godowns of the farmers to the officers for procurement. In retaliation against this offer and following the arrest of khedut leaders, disturbances took place in Bardoli on January 3. The young sons of farmers were active in the anti-levy satyagraha. They were overtly more militant than their fathers. They organised a procession in protest against the arrest of two Khedut Samaj leaders. A crowd of students attacked Arvind Desai, a prominent leader of landless labourers and at that time a close associate of Jhinabhai Darji, the GPCC President. He was severely beaten and his house and furniture were set on fire. After this, several confrontations between landless labourers and farmers took place in the villages of Surat district.

On the following day, January 4, a procession of three to four hundred persons, mainly diamond cutters who were migrants from Saurashtra and were known for their rough ways, was organised in Surat. It became an unruly crowd which went on a rampage and forced the traders of the city to close their shops. Stones were thrown at public and private property. Incidents of looting and arson also took place. "Khedut Samaj Zindabad" and "Indira Murdabad" were the two slogans shouted by the crowd. Significantly, there were no slogans against Chiman Patel or the Gujarat government. On inquiry, we came across several people who were more concerned with price rise then with the cause of the Khedut Samaj. They joined the agitation because it was against the government. It was not a spontaneous crowd. The procession was organised and supported by some political leaders of Surat city.

On the 7th a bandh was observed in several towns of south Gujarat (Valsad, Bardoli, Valod, Buhari, Navsari, etc) which are the strongholds of the peasants — again, in protest against the arrest of the Khedut Samaj leaders.

The price rise had affected hostel students. In December the mess bill rose from Rs 85 to Rs 120. According to the manager of the mess of L D Engineering College in Ahmadabad about 45 to 50 per cent of the students found it difficult to pay the mess bill regularly.[19] The hostel students were also dissatisfied with the quality of food, as one of them (a final year student from Morvi) said, "This is not a new problem for us. Ever since I joined the college, we have been complaining against the quality of food and sometimes we boycott our lunch or dinner." Besides food and bad management of the mess, their anger was aroused by the internal evaluation system, the semester system, the authoritarian attitude of teachers, etc.

On the issue of the mess bill, the students of L D Engineering College became violent, setting fire to the furniture and other belongings of the rector on December 20, 1973. The rector resigned and a committee was formed to look into the demands of the students. Similarly, on December 28, 1973 after returing from a party given by a Jan Sangh leader who got elected to the municipality, about 150 students of Morvi Engineering College destroyed the furniture of the college and the mess. They beat up one of the two rectors and his son. His furniture and scooter were set ablaze. The agitation continued for four days. The college was closed.

The agitated students of L D Engineering College of Ahmedabad again launched a strike on January 3, 1974 on the same issue. The students destroyed college and hostel furniture. Police entered the campus and the confrontation between students and police continued for several hours on the 3rd and the 4th. Some students were severely beaten up by the police, some were arrested, and it is alleged by several students that policemen stole their wrist watches and money. The behaviour of the police added fuel to the fire.

The Engineering College being situated in the vicinity of the university campus, the incident there affected the students of other colleges and hostels. On the 5th, about 1,000 students went to Navrangpura police station in a procession, demanding the release of the arrested students of the hostel. The Police Constable in charge of the police station expressed his inability to comply with the demand as it was beyond his power to take the decision. The infuriated mob went to Congress House. There they asked the Congress Secretary to convey their feelings to the Chief Minister and the Congress President. The President was out of station and the Chief Minister said that he did not have time to meet the students. The students discovered that the Chief Minister had time to attend the premiere show of a film. They felt that the government did not care for the people. Consequently, for the first time anti-Chimanbhai slogans began to be shouted. However, the Police Commissioner later met the students and released the arrested students who numbered more than three hundred.

Following the agitation of the students of the engineering colleges of Ahmedabad and Morvi, some students of Ahmedabad formed a committee called the Yuvak Lagni Samiti. The Samiti gave a call for an indefinite strike in schools and colleges from January 7 in protest against the closure of the L D Engineering College and the high mess bills of the hostels. Most of the schools and colleges responded to the call. Sporadic incidents of stone-throwing took place on Relief Road and Gandhi Road.

A meeting of more than a hundred student representatives of different colleges was held at Sardarbag on January 7. The meeting gave its approval to the call for a strike and directed that the strike should continue. The major demands of the Yuvak Lagni Samiti were reduction of mess bills and redressal of certain educational grievances. They were:

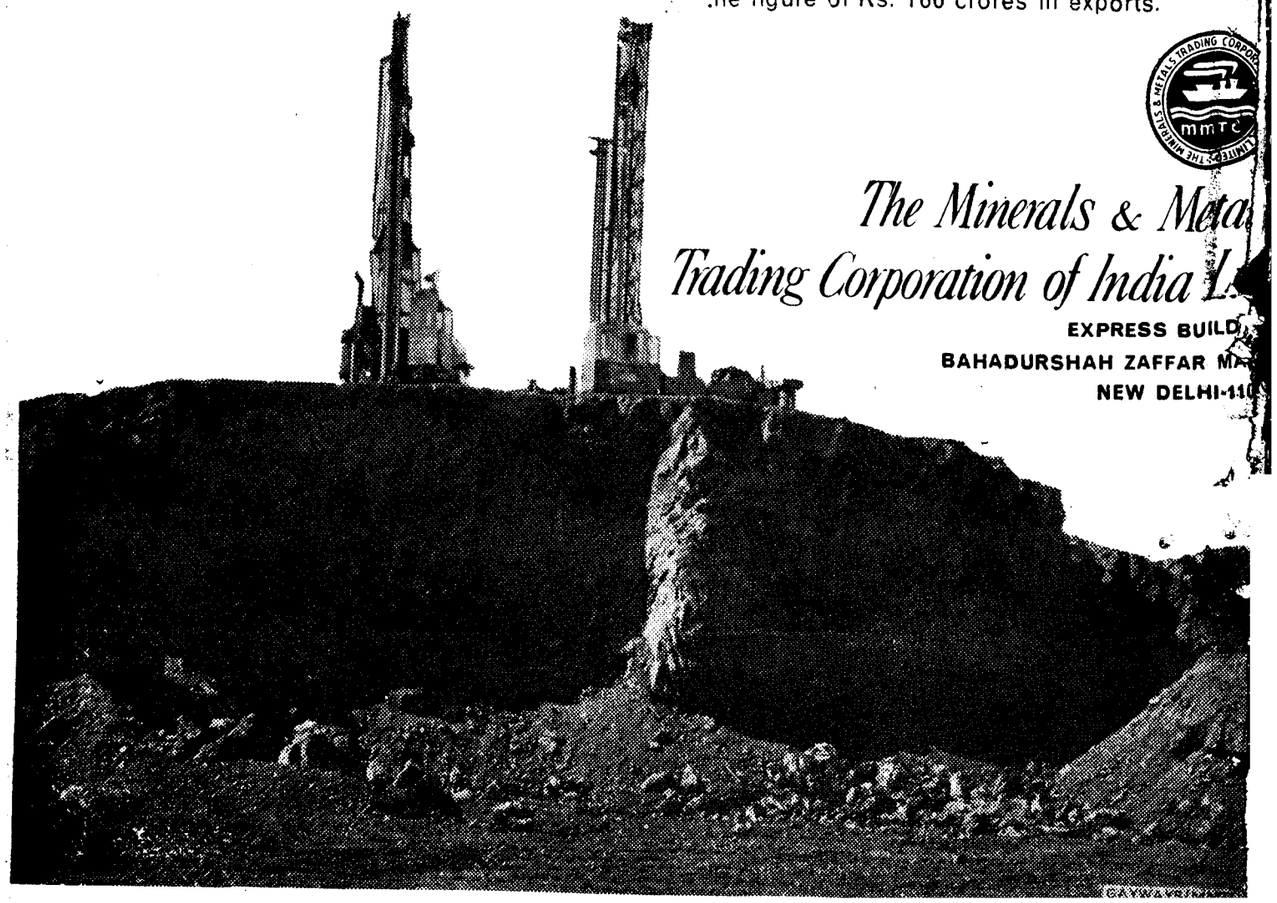
(1) Mess bills of hostels should not exceed Rs 70 per month, per student;
(2) police atrocity should end;
(3) the University should reduce term fees by Rs 10;
(4) the conveners of the Youth Festival must resign because they invited hoarders, businessmen and black-marketeers instead of artists and educationists at the valedictory session;
(5) the Education Minister should resign as she did not carry out her duties;
(6) police should not enter the university campus;
(7) the university should stop compulsory collection of Rs 2 for mark-sheets; and
(8) hoarders and profiteers should be arrested and good foodgrains should be distributed to the masses.

Besides several college-based student organisations, the Akhil Bharatiya Vidyarthi Parishad, the student front of the Jan Sangh, supported the demands of the Lagni Samiti. And the students of the Vidyarthi Parishad observed a fast on the pavement near Apana Bazar, a co-operative store. Thus, it was an attempt to link the students' problems with the anti-price rise agitation of the Jan Sangh. However, soon after the Sardarbag meeting, a student mob damaged the car of the Finance Minister, Amul Desai.

During the night a number of shops selling foodgrains, provisions, oil and ghee were looted by the mob. The worst affected areas were Khadiya, Saraspur, Dhana Sutharni Pole, Vadigam, Dariapur, Panch Bhai Pole and Chhaga Bari. In a conflict between students and police, six policemen and several students were injured. The police arrested 188 persons.

In Saurashtra several towns, Dhrangadhra, Gondal, Jasadan, Jamnagar, etc, also observed bandh on the 7th in response to the Jan Sangh's call. In Dhrangadhra a clash between police and the crowd continued for three hours. The police carried out a lathi-charge and also burst tear-gas shells.

On the 8th some student organisations such as the Gujarat Students' Circle, Gujarat Students' Federation, Nav Javan Sangh, etc, organised a pro-



Ore Deposits are Nature's Endowment

Resource creation is MMTC's Ingenuity

Nature takes millions of years to create deposits like this. Converting reserves resources also takes time, expertise, experienc massive investment and many people ..... like the people at MMTC.

11 YEARS OF HARD LABOUR

In 11 eventful years of existence, MMTC's expo drive has accelerated the pace of developme of mines all over India. Today our exports minerals exceed Rs. 124 crores. Future promising for export of mineral ores from Indi By the end of the year 1974-75, we hope to cro the figure of Rs. 166 crores in exports.

cession of students against rising prices. Their plan was to set on fire a demon representing the price rise. However, the leaders of the procession were arrested before they could carry out the programme. Some other student leaders were also arrested on the eve of their evening meeting at Sardarbag. Except for destruction of a milk booth and some sporadic stone-throwing incidents, Ahmedabad had a peaceful day.

In Saurashtra, Wankaner observed a bandh in protest against the police atrocities in Jetpur. The call was given by the Jan Sangh. Some stone-throwing incidents took place. Police used tear-gas and lathi; 10 policemen and 15 other persons were injured. Savali, a small taluka town of Baroda district, also observed a bandh. There the call was given by the Congress(O).

On the 9th morning students assembled in the University Senate Hall. There they pledged that they would sacrifice their studies to procure essential commodities for the people. For the first time, they openly linked students' problems with the problems of the masses. And after a few hours the general meeting of the Gujarat University Area Teachers Association (GUATA) took place in the same University Senate Hall. The teachers decided to launch an agitation against the Vice-Chancellor for his pro-management policy. The secretary of GUATA opposed police atrocities to curb the students' agitation.

On the 9th, the students observed a "Vidyarthi Curfew" for three hours from 9 am to 12 noon. Accordingly, students did not allow vehicles, whether private or public, to ply on the roads. Some students lay down on the roads to prevent the movement of vehicles. Some student leaders were arrested. In order to demand the release of the students, a large procession of students went to the police station.

Several stone-throwing incidents took place in the city. Foodgrains shops of the Dariapur and Lunsawad areas were looted. Seven milk booths were set ablaze. Besides tear-gas shells and lathi charges, police opened fire on the crowd. Several persons were injured in the confrontation. Night curfew was imposed in some parts of the city.

On the same day, the Jan Sangh and the Congress (O) organised a bandh in several towns: Ankleshwar, Dharampur, Vicchia, Mahuva, Bagsara, Vagodia. In Himatnagar of Sabarkantha district, students went on strike in support of the Ahmedabad students. They organised a procession and threw stones on shops and the police. The police lathi-charged the crowd.

The 14th August Shramjivi Samiti, dominated by leftists, an organisation of several trade unions of white-collar employees, including of the Jan Sangh and the Congress (O), gave a call for Ahmedabad bandh on January 10, against the price rise and scarcity. It declared that the price rise and scarcity were man-made. The Gujarat government had failed to jail the people who were really responsible for the price rise and scarcity. This had led to food riots in Gujarat. The Samiti also added that instead of providing essential commodities to the people, the government had used force to curb the demands of the masses. The bandh call of the Samiti was supported by 80 trade unions of the city (mainly of the white-collar employees), various political parties including the Jan Sangh, School Teachers Association, Gujarat University Area Teachers Association, Yuvak Lagni Samiti and various other students organisations. Purshottam Mavalankar, an independent MP, also supported the bandh. And three senior ministers of Chiman Patel's cabinet hailed the students' struggle against the price rise. They appealed to the students to leave their classes and lead the people.

The city observed almost total bandh on the 10th. Newspaper offices also did not work. However, the textile mills were working as the Majoor Mahajan did not support the bandh. From the morning crowds gathered at various places and sporadic stone-throwing incidents started. As the day passed, tension mounted and looting of provision and oil shops began: 30 shops were looted and 20 shops and milk booths were set ablaze. The police fired 57 rounds at 20 places; 52 tear-gas shells were burst at 16 places. Yet the confrontation between the police and the crowd continued for the whole day. And in spite of the imposition of curfew the riots continued for the next two days. The situation was under some control on the 13th.

Students of the Baroda University left the classes on the 10th. They threw stones and damaged college and private buildings. While stone-throwing continued, Jan Sangh workers organised a procession, a mile-and-a-half away from the college. It was followed by stone-throwing incidents. During the afternoon two foodgrain shops in Raopura were looted. Riots then spread to several other parts of the city. Foodgrain, oil and kerosene shops were looted. Bus-stands and milk cabins were set on fire. The police opened fire, burst tear-gas shells and lathi charged violent crowds. The confrontation between police and crowd continued for two days despite the "shoot-at-sight" order. The mood of defiance had caught on.

The battle between the State Reserve Police (SRP) and the people continued in the *poles* (intertwining narrow streets with lanes within lanes) of Ahmedabad on January 10 and 11 and thereafter for two months. The residents of the poles retaliated against police atrocity in groups. From balconies and terraces, they threw stones at the police. A strong "we" feeling grew among the members of poles and united the residents against the police. The residents of the poles act together to defend any person of the pole. Each pole has its own organisation which undertakes social and medical services for the inhabitants. Moreover, the physical structure of the poles is defence-oriented. There is only one entrance. And the main street of the pole is divided into small lanes, each of which is further subdivided until all that remains is just a narrow passage to walk through.[20] Both social homogeneity and a physical structure oriented to defence helped the residents in giving a stubborn fight to the police.

The situation was aggravated by the indiscriminate use of police force in the middle class areas of Ahmedabad. It was reported in the newspapers that the police cruelly beat up 90-year old persons, a three-year old child, pregnant women, etc. Consequently several neutral groups such as pleaders, teachers, sarvodaya workers, etc, joined the agitation. They condemned police atrocities.

The riots soon spread to other parts of Gujarat. Modasa, Palanpur, Visnagar, and Mehsana in north Gujarat, Bhavnagar and Savarkundla in Saurashtra and Dohad, Jhalod and Khambhat in central Gujarat were engulfed by violence on the 11th and the 12th. Some other cities and towns such as Surat, Bharuch, Prantij, Palitana, Shihore, Salaya, etc, observed bandhs on the 10th or the 11th in response to the call of either the Jan Sangh or the Congress(O). On the 12th more than 16 towns of Gujarat observed a bandh. By January 12, most of the urban areas of the state were affected by the food riots of Ahmedabad and

Baroda. Thus, the anti-government agitation of the students, political parties and pole organisations of the urban middle class continued simultaneously, and it is difficult to say who led whom. The common thread among them was the deep-rooted discontent of the masses against the government. It may, however, be added that the anti-government agitation of the peasants came to a halt when urban students and the middle class revolted against the price rise.

New Turn: Chiman Hatao

The agitation of the students took a new turn after January 10, in which the masses took an active part. And from education and mess-bill problems, the agitation turned to political problems, demanding the resignation of Chiman Patel. The problem of political corruption was taken up and became a major issue in the agitation.

Purushottam Mavalankar was elected from Ahmedabad to Parliament early in 1973. He was an Independent candidate, supported by the Jan Sangh and the Congress(O), against the ruling Congress. Mavalankar, a professor of political science, was principal of a college. He had many supporters among the students and teachers. After quarrelling with the college management, dominated by the local industrialists, Mavalankar resigned from principalship in 1972. He had also certain grievances against Chiman Patel. It should be added that Mavalankar organised a procession of students and teachers in July 1973 in protest against *brasta rajkaran*, corrupt and rotten politics. At the time when Chiman Patel was trying to become the Chief Minister by ousting Ghanshyam Oza, Mavalankar submitted a memorandum to the Governor, asking him for the imposition of President's rule in Gujarat.

Mavalankar believes that various political parties look after their interests only and neglect the problems of the masses. The people should, he pleaded, elect only Independents who could look after the interests of the people.

Some of the leaders of the Vidyarthi Lagni Samiti were close to Mavalankar. They had worked for him in the elections. Mavalankar, through his son who was also a student leader, was closely watching the developments. He supported the Ahmedabad bandth call on the 10th, and came to Ahmedabad from Madras.

Soon after his return he addressed a meeting of students. The next day, i e, January 11, he again addressed a student meeting. He congratulated the students on their having launched the agitation. He revived his demand of last July, i e, the dissolution of the state Assembly and imposition of President's rule. He said that the government of Gujarat, headed by Chiman Patel, was *brasta* and the Congress party had also lost the confidence of the people. He appealed to the students and teachers to realise that it was their responsibility to see that honest persons got elected in the elections. Students were not responsible only for expressing the feelings and emotions of the people; they were responsible also for reconstruction of society. Therefore, on Mavalankar's advice and at the suggestion of a journalist, the Vidyarthi Lagni Samiti was dissolved, and the Navnirman Yuvak Samiti (NYS) was organised in which, besides student representatives of all colleges, some non-student youths were included. Mavalankar became the President of its advisory committee.

However, Mavalankar's association with the Samiti continued only for four days. On the 15th he resigned as its president, alleging that before deciding their programmes, the students did not consult him.

On the 14th and the 15th, during the Sankranth, a major festival, Gujarat remained more or less calm and people were busy with kite-flying. On the 16th, Jamnagar, Surendranagar, Maliya and Vadhavan in Saurashtra and Bhuj and Anjar in Kutch, and on the 17th Petlad, Nadiad and other towns of central Gujarat responded to the Jan Sangh's call for a bandh. Except for a few stone-throwing incidents, the state remained peaceful. On the 18th, following the Saurashtra bandh call of the Jan Sangh, large-scale looting of shops and stone-throwing incidents took place in Rajkot, Junagadh, Gondal and Veraval. Thus, by January 18 more than a hundred cities and towns of Gujarat observed bandh, responding to the Jan Sangh's call. The Jan Sangh protested against price rise but it did not demand Chimanbhai's resignation. It took a lukewarm attitude after January 20 towards the agitation of the students till the end of the month. Jan Sangh students published handbills, criticising the leaders of the NYS. The party also opposed the call for Gujarat bandh given by the 14th August Samiti and the NYS. And the party alleged that the dissident Congress leaders were responsible for the turmoil in Gujarat.

Meanwhile, the Khedut Samaj which was leading the anti-levy agitation became alarmed by the urban riots, which were demanding Chiman Patel's resignation. Though the rich farmers opposed land legislations, they were not against Chimanbhai Patel. They, therefore, went to the rescue of *khedut putra* (son of a peasant) Chiman Patel. Opposing the demand for the Chief Minister's resignation, Vallabhbhai Patel, a leader of the Khedut Samaj said that the Central government was responsible for corruption and the price rise. The Khedut Samaj withdrew its agitation and declared that farmers would give more paddy in levy than what the government had demanded. In fact, some of its leaders from Saurashtra and south Gujarat moved in villages for the collection of the levy.

There was a lull in the situation between January 14 and 16 in Ahmedabad. Many students attended schools and colleges on the 16th. The leaders of the NYS and teachers feared that the agitation would fizzle out if the students attended classes. In order to revive the agitation, the Samiti gheraoed the Vice-Chancellor, Iswarbhai Patel, and also set ablaze the furniture and the records of the University. The Samiti demanded closure of the University and colleges till the resignation of the government. The police arrested the President and the Secretary of the Samiti. Stone-throwing incidents followed in the city. The GUATA supported the students' agitation against price rise and condemned police atrocities. It also expressed its willingness to join the agitation against hoarders and corrupt politicians.

On the following day, the Chief Minister called a joint meeting of the Vice-Chancellor, college principals and general secretaries of the college unions. The government put forward a proposal for the formation of a committee of general secretaries of the students' union which would negotiate with the government to solve the problems of the students. On the acceptance of the proposal, the government agreed to release the President and Secretary of the NYS. The student leaders agreed to attend schools and colleges from the 19th.

The students, however, rejected the agreement the next day. They said that the agreement was imposed upon them by the government. The Secretary of the Samiti tore off the agreement papers. The leaders announced that there was no question of attending schools and colleges. The agitation would continue till the resignation of the government. Two leaders of the Samiti and some teachers were arrested

by the police under MISA and other important student leaders went underground. Further, the Chief Minister and some of his colleagues also tried, without much success, to win over some student leaders of Ahmedabad and elsewhere. The government also accepted the pending demands of the college teachers. But the teachers and students did not succumb to the government. They declared that they were fighting for the masses and not for themselves.

The agitation accelerated after the police beating of the girls of the H K College on the 21st. School and college girls came out in different cities and towns against the police action. School and college teachers became more active. Leading college professors resigned from the Congress. The GUATA demanded the resignation of the government and of the MLAs and release of arrested leaders. Several teachers said that they would make Chimanbhai a teacher again. Objecting to the statement some teachers said that they would not allow him even to become a teacher because he would corrupt education. Such was the hatred among teachers against Chimanbhai. The teachers' association provided an important organisational channel for spreading the agitation as it had branches in most of the towns in Gujarat. Banners of student-teacher unity were afloat in many places. The GUATA organised fasts, processions, demonstrations, etc, to mobilise the masses against the Chimanbhai government. It also supported a Gujarat bandh call on January 25, given by the 14th August Sramjivi Samiti and the NYS. It may be added that the business community opposed the call for bandh. The business organisations asked the traders to keep their shops open. The Majoor Mahajan also opposed the bandh. However, the government imposed curfew for 24 to 36 hours in as many as 44 cities of Gujarat. That did not calm the agitation. On the contrary, the riots became widespread.

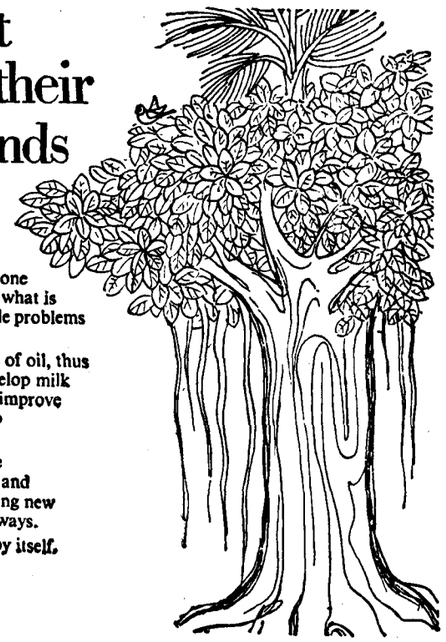
During this period, some incidents were reported of pole-dwellers of Ahmedabad forcing shop-keepers to open shops and sell commodities at the price declared in *Tanakha*, a leaflet published by the NYS and the 14th August Sramjivi Samiti. The business community was alarmed by the incidents. A leading industrialist, Amarital Sheth, appealed to the government to provide protection to the traders. It was reported that Chief Minister Chimanbhai Patel assured Sheth that the government would provide protection to the traders. Soon after that the military took charge of Ahmedabad on January 28. The city remained peaceful for three days. Then began another round of processions, violation of prohibitory orders, large-scale fasting, stone-throwing incidents, looting and arson of public and private property.

By the end of January, besides teachers, authors, poets, doctors, lawyers, sarvodaya workers, women's organisations also joined the agitation. And each of them put forward some programme or other to keep the agitation alive. Members of the middle class supported the actions of the students and others. They thanked the students for voicing their grievances. They did not object to the participation of their children in the agitation. Several parents encouraged their sons and daughters to join fasts or processions. In fact, several thousands of them even during the curfew and despite considerable intimidation and often severe repression by the police, participated in the funeral processions of "martyrs" who had died in police firings. Several of the citizens — mostly young but some older ones too — queued up in the hospitals to donate blood for the injured boys. In Baroda and Ahmedabad, more than 200 middle-aged women of middle class families took out processions to police stations where, demanding the release of the arrested boys of their localities, they told the police in high pitched excitement: "You can kill our boys in as many numbers as you want. Each of us will produce one hundred sons in their places." The mood of defiance was very strong and widespread and generally the people's morale was maintained for some time at a high level.

By the first week of February, the agitation had acquired a highly popular base and could not be ignored by anyone. Hatred of Chiman Patel, who became the symbol of an anti-people government and of corruption, spread like wild-fire. The President of the state Congress and the dissident leaders had already come out against the Chief Minister. Then followed the dramatic resignation of a few ministers, and on the advice of the Centre, Chiman Patel himself resigned as Chief Minister on February 9. The Governor suspended the state Assembly and President's rule was imposed on the same day.

Demand for Dissolution of Assembly

The news of Chiman Patel's resignation set off a wave of jubilation in all cities of the state. While the student leaders and teachers were busy celebrating the victory and trying to restore normalcy, the opposition political parties — the Congress(O) and Jan Sangh — declared that the dissolution of the Assembly was the ultimate goal of the agitation. The Secretary of the GPCC(O) declared that the suspension of the Assembly was a "fraud" on the Constitution to deprive the people of their right to elect new representatives. On February 10, the Executive Committee of the GPCC(O) demanded a fresh poll in the state. It declared that people of Gujarat should observe "dissolution day" on February 17. Sarvodaya workers, Rayishankar Maharaj and Jayaprakash Narayan, gave strong support to the students, and demanded the dissolution of the Assembly. Maharaj appealed to all MLAs to resign from the Assembly, to facilitate its dissolution. In the new elections. he said that he would see that no corrupt person would get elected.



The leftist parties, the CPI and the CPM, though they demanded the dissolution of the Assembly, emphasised the implementation of curbs on price rise and of inquiry into corruption charges. The dissident Congress leaders and the GPCC Chief appealed to all sections of society to restore normalcy.

After a brief period of normalcy, the demand for the dissolution of the Assembly got added momentum with the *en bloc* resignation of 16 Congress(O) MLAs from the state Assembly on February 16. Later, the Congress(O) municipal corporators of Ahmedabad, Surat and Baroda also resigned from the Corporation to support the demand. The Jan Sangh MLAs and corporators followed suit.

The NYS demanded the dissolution of the state Assembly within "ten days". It launched a fresh agitation. The Samiti prepared a charter of demands which included, besides dissolution, judicial inquiry into police firings in the state during the disturances, withdrawal of the cases against the agitators and "universalisation" of higher education. It should be noted that the charter did not include any economic demands for which the Samiti had initially launched the agitation. The teachers, though they re-joined the colleges, supported the demand for the dissolution of the Assembly.

The agitation which was so far confined to urban areas, spread to the countryside soon after Chiman Patel's resignation. The farmers of Saurashtra, central Gujarat and south Gujarat

They saved the ancient banyan tree and now their daring knows no bounds

'Let it stand,' someone said of the banyan tree as the site was being cleared for the Hindustan Lever Research Centre, at Andheri.

So the tree still stands — and it stands for quite a lot. For one thing, the tree signifies that we can't easily get away from what is home-grown. Appropriately, therefore, the Centre will tackle problems rooted in India — the kind that can only be solved here:

Can we discover and exploit hitherto unused *local* sources of oil, thus cutting imports and saving foreign exchange? Can we develop milk foods that are ideally suited to *Indian* needs? How can we improve the nutritive value of protein-poor foods? Can we develop processes for the preservation of Indian type food dishes?

Research on all this can only begin at home. It has, at the Hindustan Lever Research Centre in Andheri. The sweep and thrust of the studies are daring. The scientists are producing new devices for old, making traditional things happen in new ways.

They have, of course, left the banyan tree alone to grow by itself.

Hindustan Lever

Lintas-HLL. PR. 9A-537

so that they may grow

ITI is giving a helping hand to small scale industries in the country to build up the necessary infra-structure in the vital telecommunications field.

ITI, purchasing materials and components annually worth more than Rs. 5 crores, is nurturing over 200 small industries spread all over the country. A number of items made by these small entrepreneurs are import substitution items made to international standards. Some of the units which started primarily to meet ITI's requirements have today diversified the production and entered foreign markets—an example of how small industries can produce quality sophisticated goods, given the support by a major industry like ITI.

A more vigorous role played by ITI is the setting up of an Ancillary Industrial Estate with over 40 small industrial units. ITI gave them free know-how, raw material support and guaranteed sales. All these industries are now playing an important part in increasing the production of telecommunication equipment. More ancillary units are also being set up at Bangalore, Naini and Rae Bareli.

ITI is the foremost in public sector—nurturing small industries, so that they may grow and one day help others to grow.

THE HELPING HAND OF ITI FOR DEVELOPMENT OF SMALL SCALE INDUSTRIES

Communication is our business

INDIAN TELEPHONE INDUSTRIES LIMITED,
BANGALORE-560016.

Dharam-ITI-1-C

supported the demand for the dissolution of the Assembly. Bardoli, Navsari, Morvi, Anand, etc, became active in the agitation. The Gujarat University Syndicate which was known for its pro-Chimanbhai stand, declared an indefinite closure of the University and demanded dissolution of the Assembly. College principals of Saurashtra also jumped into the fray.

Businessmen and factory-owners also supported the agitation. They also observed bandh to support their demand. In consultation with the mill-owners, the Majoor Mahajan asked workers to abtain from work on March 7, in support of the demand for the dissolution of the state Assembly. It is needless to add here that the Majoor Mahajan opposed the call for Gujarat bandh on January 25, in protest against price rise.

Barring this, the factory workers of Gujarat, as a class, by and large, remained indifferent to the agitation either before or after Chiman Patel's resignation. Similarly, the backward classes, except their students, did not support the agitation. In fact, in Ahmedabad sharp clashes took place between them and the students. In some rural areas, it also took the form of conflict between the landed peasantry and landless who supported the MLAs belonging to the Congress. The urban factory workers and landless labourers soon after the agitation was launched felt that it was not really for curbing the price rise but was politically motivated and directed against the Congress which was sympathetic to the poor.

However, teachers, pleaders, doctors, Sarvodaya workers and other sections of the middle class continued their support to the agitation. Several pole organisations came into existence. They intensified the agitation. At a later stage, the pleaders boycotted the courts. White-collar employees of banks and the LIC also joined the upsurge; 3.5 lakh employees of the state, central and panchayat administrations went on a day's casual leave in demand for the dissolution of the Assembly. The students and non-student youth directed their energies at persuading the MLAs to resign. By the second week of March, 95 MLAs had resigned from the Assembly. On March 3, more than 500 students from various parts of the state went to Delhi. There they gheraoed the Congress MPs, met Union ministers, organised processions and demonstrations and launched fasts.

Chiman Patel and his supporters demanded the dissolution of the state Assembly. And Morarji Desai, the leader of Congress(O), went on an indefinite fast on March 12 in support of this demand.

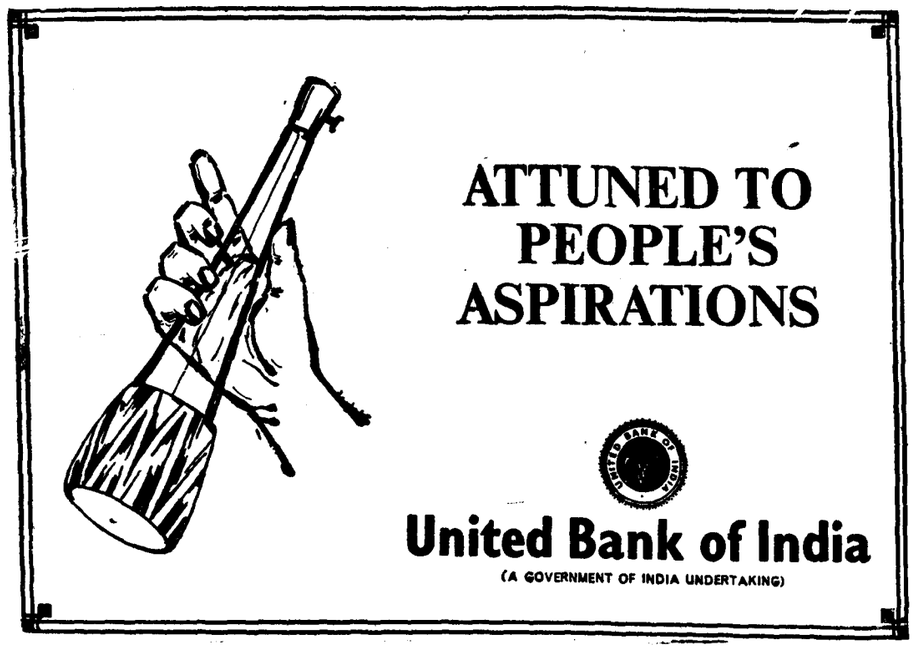
In the meantime, the riots continued in many cities and towns. Attempts were made to loot banks and co-operative societies. Stone-throwing incidents and looting and arson of public and private property continued on a large scale. Attempts were also made to close the borders of the state, so that products of the state did not go out. Violence became widespread. Terror of the agitators prevailed in the state and nobody could oppose them.

At last, on March 16 the state Assembly was dissolved. All-India Radio, in its last news bulletin, announced the Governor's decision. Thousands of people came out on the streets — even in areas under curfew. The night turned into a festival. The joyous crowd threw stones on police and also damaged public property. All political parties, Sarvodaya workers, voluntary associations and students appealed to the people to restore normalcy. Later, schools and colleges reopened and students became busy with their examinations.

Organisation and Leadership

As has been seen, the agitation in Ahmedabad began with the formation of the Vidyarthi Lagni Samiti which later was transformed into the Navnirman Yuvak Samiti (NYS). In Baroda, the Students Action Committee; in Surat, the Yuvak Sangram Samiti; in Rajkot and Bhavnagar the Navnirman Samities came into existence. In other cities, towns and villages Navnirman Samities or Sangram Samities were set up. As the agitation gained momentum, particularly after Chimanbhai Patel's resignation, such samities were set up at pole and even sub-pole levels by local school and college students and youth, in the beginning at the instance of political leaders. In Ahmedabad city alone more than two hundred such samities came into existence during February and March. Further, in some cities rival organisations were also formed by students at the city level. For instance, in Rajkot there were two Navnirman Samities; in Baroda a Yuvak Sangarsha Samiti and in Surat a Navnirman Samiti were also organised. Several other organisations such as the Gujarat Students Circle, Ahmedabad; Study and Struggle Alliance, Baroda; Akhil Bharatiya Vidyarathi Parishad of Jan Sangh and Tarun Santi Sena of Sarvodaya Mandal also took an active part in the agitation. Each of the samities and organisations was independent of the city level Navnirman Yuvak Samiti or Yuvak Sangram Samiti and there was no co-ordination among them. Each samiti or organisation used to announce some programme which kept up the tempo of the agitation.

Space and time do not permit us to examine in detail the composition and character of all these samities. It requires a separate study. We shall deal here with only the major city-level samities of Ahmedabad, Baroda, Surat and Rajkot.

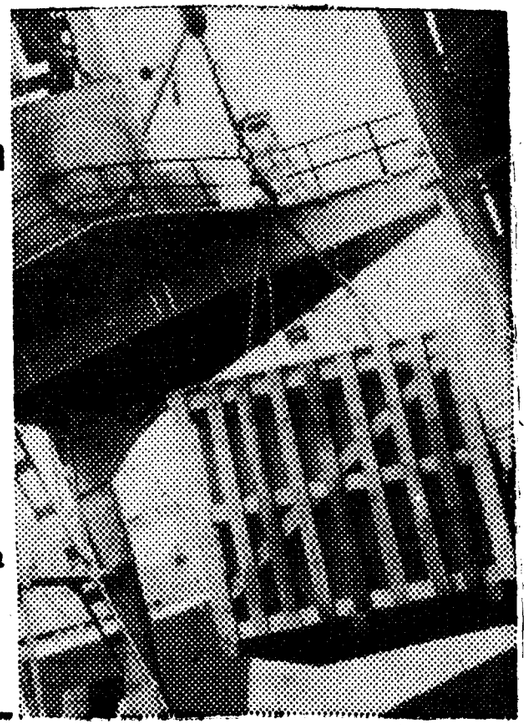


The leaders of the main city-level samities largely came from the upper middle income group. They were the sons of white-collar employees (particularly managers and officials), businessmen or industrialists and of upper castes. In the taluka towns such as Morvi, Padra, Bardoli, Anand, etc, the student leadership was dominated by the sons of the rich farmers and were Patidar by caste. Most of the office-bearers of these organisations were elected representatives of college or university unions.

Broadly, the student leaders can be divided into two categories: the radicals and the rebels. The former was consicously pro-poor and against injustice in society. The latter enjoyed defiance of authority, no matter whether it helped or harmed the rich, poor or anyone, including students themselves. They were inconsistent in their ideas. They used words and phrases borrowed from others without understanding their meaning. They were weak in argument and lacked confidence in across-the-table discussions. Therefore, they were prone to lose their temper quickly and took to direct action.

Like the politicians against whom they revolted, they gave promises which could never be fulfilled. They were demagogues. They often emphasised not only traditional symbols but also traditional values. For instance, a member of the NYS said in a public meeting of two thousand students in Bardoli:

> Indira is not Mataji (mother). She is worse than a witch. In olden days people did not allow even the shadow of a widow to follow on them as this was considered inauspicious. There must be some meaning in that belief. Today, because of this widow there is corruption and rising prices (applause).



Such leaders had many fans and followers. Their lead was followed by many students. And they were boosted

by newspapers and politicians.

The radical student leaders, on the other hand, were few in number and did not have many fans and followers. But they were respected by the general student community and others. They had to depend upon popular, rebellious leaders for collecting large crowd and for carring out the programmes. The rebellious leaders also depended on the radicals during negotiations with university authorities and government officials. They drafted memoranda, appeals and press notes. In general, the radical student leaders were against businessmen and industrialists and they emphasised the need for social change and eradication of poverty. Manishi Jani, President of the NYS, highlighted poverty in his verses and speeches. He believed in a classless society which would be brought about with a more equitable distribution of wealth and a better deal for the working class.[21] Another student leader, Bhagirath Shah of the Yuvak Sangram Samiti, Surat, also believed in a classless society. He said that the dissolution of the Assembly marked only an "initial victory" for the student movement against "rising prices and corruption". According to him, for "final victory" students must seek an "alliance with the industrial working class and the rural poor."[22]

Some of these student leaders were attracted by Indira Gandhi's call for Garibi Hatao. Once they were close to the Ruling Congress. Because of their faith in pro-poor policies of Indira Gandhi, as opposed to the Jan Sangh and the Congress(O), these leaders made all attempts during the agitation to encounter the "Indira Hatao" call given by the opposition parties and and the farmers' lobby. They also did not respond to parochial demands like redressal of alleged injustices done to Gujarat.

Barring a few, most of the radical student leaders did not, however, have any concrete programmes to direct the agitation. They wanted to eradicate poverty and control price rise, but they did not know how to do it. They talked about "reconstruction" of society but they could not spell out their vision of the new society for which they were fighting. Kanu Bhavsar, a member of the NYS, said, "we wanted to touch the basic issues of society like poverty and inequality but we do not know what to do for that. We are in confusion and darkness".[23] Many others shared Bhavsari's perplexed situation.

There was no inhibition as regards violence. In fact, the radical as well as the rebellious leaders advocated violence in public. They believed that non-violence was out of date. "Even Gandhi would not have advised non-violence in the present conditions" a member of the Surat Yuvak Sangram Samiti said in a public meeting. During the early period of the agitation, another member of the NYS asked the students to take to "guerilla warfare". One of the top-ranking leaders of the NYS said in a public meeting at Bardoli:

> We do not believe in non-violence or violence; but we should reply to the police in its own language. Our students are revolutionaries, stone in one hand, and iron drainage covers in the other ... Gandhi was talking about non-violence because he was wearing a *'langoti'* while we have terelyne clothes and therefore we cannot follow Gandhi's advice ... There are many government buildings which are still untouched by us. We want to bring them down ...

Apparently, the student leaders were not members of any political party. In Ahmedabad, the main leaders of the NYS were not members of any political party and they made this quite clear from the beginning. They abused not only the Congress but also other political parties as well, from the Jan Sangh to the Communists. But many of the leaders had personal loyalty to some political leader or another. In Baroda, Surat and Rajkot, the student leaders had close links with the Jan Sangh, Congress(O), or one of the factions of the Congress party. Student leaders got help in cash or kind — vehicles, telephones, hotels, etc — from rich political leaders. They also sought advice and guidance from the latter.

The Executive Committee of the NYS, Ahmedabad, and other city level samities in other cities hardly met during the agitation. The main seven or eight leaders used to meet informally at someone's place, sometimes an hour after the scheduled time. They hardly transacted any serious business. They would chit-chat about several things, from sex to politics. Meanwhile, someone would suggest some programme for the next day which others accepted with little or no discussion. Someone, mostly a non-student, a teacher, a journalist, or a political leader would prepare a press note about the programme. More often than not, many other members of the samities came to know about the programmes through press notes. Sometimes, different student leaders gave different programmes and the press found it diffcult to know which of the programmes were genuine.

Needless to say, the programmes were not planned out in any detail. The student leaders were not sure why they preferred a particular programme to others. Most of the programmes had only stunt or symbolic value. Whenever any serious programme, which involved planning and time, such as picketing or distribution of handbills or undertaking signature campaigns, etc, was suggested, the leaders showed little interest in it. It would appear that they were interested in press notes or in seeing their names and photographs in print. If, for some reason, a newspaper failed to publish their press notes with their names, the leaders got annoyed with the press and quarrelled with the reporters. Before their release from jail, these leaders often called photographers and their friends to receive them. Sometimes, in order to enable receptions, to be organised, they would stay longer in jail or spend a few hours outside the city.

During the early phase of the agitation, the student leaders were relatively united. In Ahmedabad, some leaders were in jail and others were underground; so they did not meet each other. But slowly their unity declined and differences developed among them. Often they quarrelled on petty issues, largely the result of misunderstanding, gossip or temperamental behaviour. Besides, in Rajkot, Surat and Baroda, the rivalry between the Congress (O) and Jan Sangh student leaders increased. At the same time, they got united against radical students. After the Gujarat bandh of 25 January, radical students who were few in number were isolated and were also beaten up by the Jan Sangh sympathisers.

Serious differences among the leaders of the NYS came to the surface in the last phase of the agitation. A section of the Samiti accepted the invitation of Gokhale, the Union Law Minister, to visit New Delhi. But some others, mainly supporters of the Jan Sangh, the Congress (O) and Chiman Patel (who, ironically, had after his expulsion from the Congress thrown his support behind the agitation) opposed the Samiti's move. They were interested in continuing the agitation. They therefore tried to prevent the students from going to New Delhi and, after they had managed to go, denounced them openly.

Besides youth and student samities and organisations, school and college teachers' associations, Bar associations, sarvodaya mandals, mahila parishads, journalists' associations, etc, different

India's biggest undertaking in the field of fertilizer industry the Fertilizer Corporation of India Limited, is one of the largest producers of plant nutrients in the world.

HOW BIG IS FCI? FCI's five functioning units at Sindri (Bihar), Nangal (Punjab), Trombay (Maharashtra), Gorakhpur (U.P.) and Namrup (Assam) have the installed capacity of half a million tonnes of plant nutrients. This will rise to 3.5 million tonnes when additional plants, now under construction and advanced stages of planning, go on stream.

CATALYST KNOW-HOW — FCI is one of the few organisations in the world to develop and produce a complete range of fertilizer catalysts so vital to the industry.

TOTAL FERTILIZER TECHNOLOGY — Backed by its intensive Research & Development efforts, FCI has now developed its own know-hows, design and engineering capability and can execute six to eight modern fertilizer plants at a time from the blue-print to the final commissioning stage.

MARKETING SET-UP — With a vast network of sales outlets and promotional activities, FCI now serves about 80 per cent of the country.

THE FERTILIZER CORPORATION OF INDIA LIMITED

political parties also actively participated in the agitations. They announced their own programmes and tried to boost the morale of the students. Particularly, some teachers and journalists worked as constant friends, guides and philosophers to the students at many places. For instance, when the main student leaders of the NYS were either in jail or underground, they used to issue press notes and appeals in the name of some student leaders and encouraged the second rank leadership of the NYS to sustain the tempo of the agitation. Ravishankar Maharaj and Jayaprakash Narayan, the Sarvodaya leaders, also raised the students' morale by their open support.

Issues and Programmes

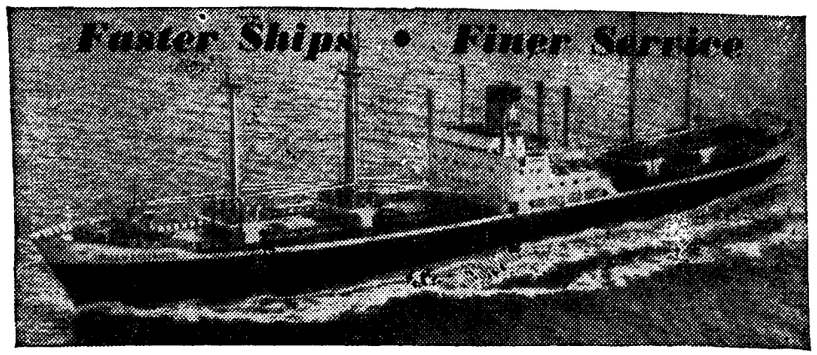
The agitation was not carried out by a single organisation or political party. Several hundred groups participated in it. Therefore, it had diffused objectives varying from group to group. As has been observed, the agitation began with the protest against price rise and scarcity of food. Slowly, as the agitation continued, other issues such as resignation of Chimanbhai Patel, dissolution of the state Assembly, misuse of MISA, police atrocities, injustice to Gujarat and Gujaratis, construction of Narmada dam, etc, entered the picture. Certain issues got currency and others did not.

The radical student leaders and teachers of Ahmedabad who started the agitation wanted to highlight and direct the agitation against the economic hardships of masses. They were against hoarders, blackmarketeers and capitalists. They therefore supported the 14th August Sramajivi Samiti. In the handbill, *Tankha* ('Spark'), jointly issued by the 14th August Sramajivi and the Navnirman Yuvak Samiti, they declared:

> People want cheap and good quality foodgrains. People do not want the charity of the *shethiyas* [capitalists] people also do not want dramatic announcements of the ministers; nor do they want a farce in the name of levy ... Price rise can only be fought by strong implementation of the levy, by nationalising the business of edible oil, by jailing blackmarketeers and hoarders.

They demanded eight kgs of good quality foodgrains per individual. They appealed to people to form Roji Roti Samitis in every pole, which should start picketing shops and watching prices and quality of articles. They also appealed for the formation of an alliance of students and workers.

For the time being, in Ahmedabad, Bhavnagar and many other cities, the traders were forced to sell certain commodities at fixed reduced prices. In Surat, radical student leaders made organised attempts to maintain the price line of certain commodities and control traders. The Yuvak Sangram Samiti formed corps of volunteers to supervise the maintenance of price line, prevent adulteration and other irregularities of the traders. With the help of the Collector and District Supply Officer (DSO), the supply of vegetable oil and sugar was entrusted to co-operative societies and fair price shops instead of the traders. A fixed quota of both commodities at reduced prices was supplied to all families of the city on ration cards. They also detected hoarders and wholesalers and forced the police and DSO to raid their godowns. A women's organisation of Surat, Stri Shakti mainly composed of students, mobilised slum dwellers and organised processions demanding construction of latrines, drainage and provision of water facilities instead of the construction of a town-hall. It denounced bureaucratisation. In Baroda, the Study and Struggle Alliance, a student organisation moved in working class areas and tried to establish links with them. The Alliance formed mohalla (area) committees and also organised processions demanding a ration of 12 kg of foodgrains per individual per month. In Vedchhi, Adivasi college students moved in villages, gheraoed landlords and forced them to pay at least Rs 3 per day to their agricultural labourers. However, no permanent organisation or machinery was set up by the radical students to lessen the economic hardship of the masses. Barring these few isolated instances where the local radical students sought the help of the people, the NYS did nothing significant to fulfil its economic demands. It did not even organise symbolic programmes to highlight the economic issues. No Roji Roti Samiti was set up either in Ahmedabad or elsewhere. The call for an alliance of students and workers remained only on paper. In fact, the working class conspicuously remained out of the agitation. The NYS did not have any machinery even to distribute handbills.



Except for expressing support for the agitation by press notes, the leftist parties the CPI and the CPM, played almost no significant part in the agitation. They did not organise public meetings or processions. They were virtual onlookers. At the most they used to discuss 'kranti', i e, revolution, in the abstract for several hours a day. Or they branded the agitation as 'counter-revolution'. The Sarvodaya workers were concerned with such issues as violence and non-violence, corruption, etc. They organised processions and satyagrahas for establishing peace. But they were more concerned with ousting Chiman Patel and bringing about the dissolution of the Assembly than with economic problems.

The radical teachers of Ahmedabad gave importance to economic problems but were obsessed with removing Chiman Patel from power. They therefore highlighted corruption and put forward programmes which were taken up by rebellious student leaders, Congress (O), Jan Sangh, Vidyarthi Parishad and middle class pole-dwellers. And during the latter part of the agitation, these organisations, political parties and pole samities imposed several stunt programmes on the NYS.

Besides strikes and bandhs, several processions were organised in all cities and towns by the Navnirman or Sangram samities, mainly demanding Chiman Patel's resignation and dissolution of the state Assembly. These included silent processions; processions with empty tins of oil and empty bags, expressing the scarcity of essential commodities; processions depicting Congress leaders and MLAs as animals or stones; and mock funeral processions of Chiman Patel and other Congress leaders (at places, also of Indira Gandhi). Sometimes as many as a hundred effigies were burnt in a day in Ahmedabad. Children and young school boys were very active in these programmes which sometimes led to stone-throwing incidents and rioting.

The medical students of Ahmedabad, Baroda and Surat performed mock surgery on Chiman Patel and other Congress leaders. They declared that they found edible oil, grains, currency notes, etc, from the body of the operated leaders. Girl students of Ahmedabad held a mock court. The "court" charged Chiman Patel and others with acts of corruption and mismanagement.

Gheraoes and dharnas directed at the Congress leaders and MLAs were common. Demonstrators demanded their resignation from the Assembly, the Corporation and the party. The houses of the leaders were stoned. They were presented with bangles, sarees and brassiers, implying that they were effeminate, incapable of raising their voice in support of the masses. They were also given bread prepared from bajra available from the ration shops, to show them what kind of food people were being forced to eat. Bottles of blood to show that the students were ready to shed the last drop of their blood if the government wanted it as price for its resignation were handed over to the Congress leaders. Vehicles of the Congressmen were damaged or burnt. Their houses were set on fire Water-

electricity and telephone connections were cut. Some Congress leaders were beaten up and ridiculed by the mobs. One Congress leader was not only stripped nacked, but was forced to walk several miles from village to village. Student mobs painted the face of an MLA black and forced him to ride a donkey. The Speaker of the state Assembly was beaten up in a hospital. Slogan shouting and loud demonstrations lasting several hours took p'ace every day in front of the residences of Congressmen. At appointed times in the evening the now well known "thali-beating" demonstrations took place in the major towns — signifying the death-knell of the Chiman Patel government.

State Transport buses and trucks were hijacked. In Ahmedabad as many as 37 buses were hijacked by the students on a single day. Similar incidents took place in other cities and taluka towns.

Various forms of fasts in public places opposite government offices, houses of MLAs, Corporators' offices and almost in every pole were observed. Signature campaigns demanding dissolution of the Assembly were undertaken. Public opinion polls for MLAs' resignations and dissolution of the Assembly were conducted in some towns.

Most significantly radical students, teachers, political parties, including the Jan Sangh, Congress(O) and Communists, Sarvodaya mandals and some other voluntary organisations put all their efforts to see that the agitation did not turn into communal riots. Wherever a communal colour was sought to be given to the agitation, this was condemned. And, in order to avoid clashes between Hindus and Muslims, the NYS and other organisations did not put forward any programme on Moharrum and Holi. They repeatedly appealed to the people to maintain communal harmony. Collective prayers of Hindus and Muslims were also arranged in which the leaders of the NYS recited Kuran and Gita.

Conclusion

Spiralling prices and scarcity of essential commodities and inadequacy of basic amenities in urban areas provided the breeding ground for the unprecedented upsurge in Gujarat. Discontent against the government was deep and widespread. People in general and the middle class in particular had increasingly felt that they were powerless and were being alienated from the political system. Their fury was against excessive manipulation and corruption in politics, where the common man had no place. Recently acceptance of direct action and violence to solve problems had become widespread among all sections of society. Tensions gradually mounted which turned into rioting and violence.

It was essentially an urban middle class agitation. Being unorganised and diffused in its interests, the middle class could not direct the agitation. It supported and participated in all anti-government protests, whether it helped or harmed the middle class itself. On the one hand it followed the organised interest groups and political parties, and on the other it also sometimes initiated *ad hoc* and impulsive programmes to ventilate their grievances against hawkers, milkmen, bus-drivers, bus conductors, traders, industrialists and politicians. The programmes were locality-based and unorganised. Such programmes, however, kept up the tempo of the agitation. When Khadiya was calm, disturbances started in Maninagar. Similarly, when Ahmedabad was about to return to normalcy, riots started in Baroda, then in Rajkot and so forth. This is the strength and weakness of the agitation led by unorganised groups.

Students, one of the relatively more organised sections of the middle class, spearheaded the agitation. Most of the students who participated in the agitation were rebellious, and enjoyed the thrill of revolt and defiance of authority. During the agitation, they felt a sense of power and self-importance. But they lacked direction, commitment and sense of purpose. Significantly, except perhaps in dress-style and relations with the opposite sex, their values did not differ much from those of their parents and the ruling class. Needless to say, there were a few radical students who worked as the brains of the agitation. In the course of the agitation, they were, however, isolated by the political parties and the rebellious students. Though they had a sense of purpose and direction, they lacked organisation and cadres. And they were also confused about their immediate and future programmes. Under the direction of the radical leaders, the Navnirman and other samities tried in the beginning to link up their problems with those of the larger society. But because of their *ad hoc* approach, lack of organisation and direction they merely became instruments of organised groups. They lost track of their own objectives. The student agitation in Gujarat suggests that students can overthrow a government and yet be unable to become an independent force for political change.

College teachers in Gujarat, who were well organised through their association, had deep-rooted grievances against Chimanbhai Patel. They were determined to oust him as soon as he came in power. They, along with certain intellectuals and political leaders of the opposition parties, directed the students revolt against the Chief Minister. In doing so, despite the fact that some of the leaders of teachers' association were radicals, they undermined the economic programmes of the NYS. They were hardly able to rise above their trade union (GUATA) activities. Later on, after Chiman Patel's resignation the Congress (O), Jan Sangh, Sarvodaya Mandal, businessmen and kulaks undermined the economic programmes of the agitation such as lowering prices and directed the agitation for the political ends — mainly the dissolution of the state Assembly. The radical students and teachers were helpless against the powerful and organised forces on the one hand and the unorganised rebellious students on the other. The latter were led by the organised political parties and interest groups.

The faction-ridden Congress party also did not stand united against the agitation. Some Congress leaders worked as catalysts in accelerating the agitation. The ordinary members of the party were confused.

The middle class agitation in Gujarat began on the issues of price rise and scarcity, but succeeded under the shrewd guidance of organised interest groups and parties in ousting Chimanbhai Patel and then dissolving the state Assembly. As the dust settles down, people are feeling that the basic issues for which they had revolted for two months have remained unsolved. In fact, the price rise and scarcity have worsened. It is anybody's guess when the tensions, which persist, will again erupt into violence.

NEED-BASED FINANCIAL ASSISTANCE FROM ...

TIIC — THE PREMIER STATE LEVEL DEVELOPMENT BANK OF THE COUNTRY

TIIC
THE FINANCIAL INSTITUTION WITH A HEART

We grant term loan assistance upto Rs. 30 lakhs to industries engaged in the manufacture, processing, preserving etc. as also to shipping, transport, hotel industries etc. Amount in excess thereof would be arranged in collaboration with State Institutions like SIPCOT and TIDCO and/or with All-India institutions like IFCI, ICICI etc. Also Assistance by way of issue of guarantees for deferred payments and underwriting of shares.

Our new scheme finances import of machinery under IDA Credit—an affiliate of the World Bank, from any country of the World Bank Group and Switzerland.

For technically qualified people with no means to start their own shall scale industry and willing to go into rural areas we grant loans from Rs. 10,000/- to Rs. 2 lakhs. Interest 7.5% p.a.

For all qualified and registered physicians, Surgeons, dentists or veterinary practitioners, willing to work in rural Tamil Nadu—loans from Rs. 10,000 to Rs. 1 lakh. Interest 7.5% p.a.

FIXED DEPOSITS

We are the foremost amongst the Development Banks in the country in mobilising Fixed Deposits as a resource of Finance. The deposits with us, and the interest thereon, are unconditionally guaranteed by the Government of Tamil Nadu and hence fall under the Category of "Trustee Security" and "Approved Security".

OUR CURRENT RATES OF INTEREST ARE AS UNDER:

12 months and over but less than 24 months	6¾% p.a.
24 months and over but not exceeding 36 months	7½% p.a.
Over 36 months but not exceeding 60 months	7¾% p.a.
Over 60 months	8 % p.a.

THE TAMIL NADU INDUSTRIAL INVESTMENT CORPORATION LTD.

"ARUL MANAI", 26, Whites Road, Madras-600 014.
Branches: Thanjavur, Madurai, Coimbatore, Salem and Vellore.
Managing Director: S. N. PAI.

TIIC Celebrates its Silver Jubilee (1949-74)

6 Per Cent State Government Loans, 1974

	State	Amount of Loan (In crores of Rs.)
1.	**Andhra Pradesh**	**16.25**
2.	**Assam**	**7.75**
3.	**Bihar**	**14.00**
4.	**Gujarat**	**16.25**
5.	**Haryana**	**11.25**
6.	**Jammu & Kashmir**	**2.25**
7.	**Karnataka**	**16.25**
8.	**Kerala**	**8.25**
9.	**Madhya Pradesh**	**9.50**
10.	**Maharashtra**	**16.25**
11.	**Orissa**	**13.00**
12.	**Punjab**	**12.00**
13.	**Rajasthan**	**16.25**
14.	**Tamil Nadu**	**16.25**
15.	**Uttar Pradesh**	**16.25**
16.	**West Bengal**	**13.50**

All the above loans will be issued at Rs. 99.00 per cent and will open for subscriptions on Tuesday, 27th August 1974 and close on Saturday, 31st August 1974 or earlier without notice as soon as subscriptions approximate to the amount of each issue. All the State Governments reserve their right to retain subscriptions upto ten per cent in excess of the notified amounts.

The loans will be redeemable at par after 10 years i.e. on 27th August 1984 and interest will be paid half-yearly on 27th February and 27th August each year. Interest in respect of all loans will be liable to tax under the Income-tax Act 1961. Interest on Government securities along with income in the form of interest or dividends on other approved investments will be exempt from Income-tax subject to a limit of Rs. 3,000/- per annum and subject to other provisions of Section 80L of the Income-tax Act, 1961.

The value of investments in the Loans now issued together with the value of other previous investments in Government securities and the other investments specified in Section 5 of the Wealth Tax Act, 1957 will also be exempt from the Wealth Tax upto Rs. 1,50,000/-.

Subscriptions may be in the form of CASH/CHEQUE.

Securities of the following loans will also be accepted AT PAR for conversion into the new loans of the respective State Governments:—

Name of the loan tendered for conversion	*Name of the new loan issuable*
1. 4½% Andhra Pradesh State Development Loan 1974	6% Andhra Pradesh State Development Loan 1984
2. 4½% Assam Loan 1974	6% Assam Loan 1984
3. 4½% Bihar State Development Loan 1974	6% Bihar State Development Loan 1984
4. 4½% Gujarat State Development Loan 1974	6% Gujarat State Development Loan 1984
5. 4½% Kerala State Development Loan 1974	6% Kerala State Development Loan 1984
6. 4½% Madhya Pradesh State Development Loan 1974	6% Madhya Pradesh State Development Loan 1984
7. 4½% Madras Loan 1974	6% Tamil Nadu Loan 1984
8. 4½% Maharashtra State Development Loan 1974	6% Maharashtra State Development Loan 1984
9. 4½% Mysore State Development Loan 1974	6% Karnataka State Development Loan 1984
10. 4½% Orissa Government Loan 1974	6% Orissa Government Loan 1984
11. 4½% Punjab Loan 1974	6% Punjab Loan 1984
12. 4½% Rajasthan State Development Loan 1974	6% Rajasthan State Development Loan 1984
13. 4½% Uttar Pradesh State Development Loan 1974	6% Uttar Pradesh State Development Loan 1984
14. 4½% West Bengal Loan 1974	6% West Bengal Loan 1984

If the cash value of the securities tendered for conversion is not an exact multiple of the issue price per cent of the new loan the tenderer will receive in cash at the time of issue of the new securities the amount by which the value of the securities tendered exceeds the nearest lower multiple of the issue price. Interest on the securities accepted for conversion will be paid at the rate of 4½% per annum upto and inclusive of 26th August 1974.

Applications *for all the loans* will be received at the offices of the Reserve Bank of India at Ahmedabad, Bangalore, Bombay (Fort and Byculla), Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi and Patna and the State Bank of Bikaner and Jaipur at Jaipur.

Continued Overleaf

Applications will also be received *at other places within the* respective States as follows:

i) Branches of the Subsidiary Banks of the State Bank of India conducting Government treasury work except at Hyderabad;

ii) Branches of the State Bank of India at places where there is no branch of its Subsidiary Banks conducting Government treasury work; and

iii) In the case of Jammu & Kashmir loan, applications will be received at branches of the Jammu & Kashmir Bank within the State of Jammu and Kashmir and branches of the State Bank of India where there is no branch of Jammu & Kashmir Bank.

Application for Kerala State Development Loan will also be received at Treasuries and Sub-treasuries in the State of Kerala at places where there is no branch of the State Bank of India or its subsidiaries conducting Government treasury work. Applications for Uttar Pradesh State Loan will also be received at the District Treasury, Chamoli.

Applications for Punjab and Haryana State Government Loans will also be received at the State Bank of India, Chandigarh.

Copies of the Notifications and Application Forms may be obtained from any of the Receiving Offices mentioned above.

In the event of over-subscription to the loan applied for, applicants tendering applications at the offices of the Reserve Bank of India at Ahmedabad, Bangalore, Bombay (Fort and Byculla), Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi and Patna will be given the option of transferring their cash re- funds to any other State Government loan which may still be open for subscription. To avail themselves of this facility, applicants should complete the "Special Option Form", copies of which can be obtained at any of the offices of the Reserve Bank of India mentioned above and tender the form along with their applications.

ATTENTION : DISTRIBUTION ENGINEERS

If you are looking for a clean and easy-to-joint cable, the answer is:

ALIND SOLIDAL

The solid conductors make soldering and compression joints far, far easier and trouble-free.

CLEAN AND COMPACT
EASY TO LAY
EASY TO INSTALL

Fully annealed solid aluminium conductor, PVC insulated & sheathed LT (660/1100 V) underground cable with aluminium armouring—conforming to Indian Standards Spec. IS-4288

Mukand Iron and Steel Works Limited

Statement of the Chairman, Shri Viren J Shah

THE following are excerpts from the Statement of Shri Viren J Shah, Chairman of Mukand Iron and Steel Works Ltd, to the Shareholders while presenting the Balance Sheet for the year 1973-74:

Power — A Basic Index of Development

One of the basic indices of the economic development of a country is the quantum of power that is available to industry and agriculture. Production depends on power. A shortfall in the supply of power is, therefore, certain to lead to all round shortfalls in production — in agriculture as well as in every field of industry. The country has been in the grip of an acute power shortage and the economy has been reeling under the impact of the shortage. Our plans had estimated the likely growth of our requirements of electricity and fixed targets for every Plan. But, we have fallen short of targets in every Plan. The percentage of the shortfalls has increased from 15.4 in the First Plan to 50 in the Fourth Plan. We have achieved a capacity of 18.87 MKW as against a target of 28.83 MKW. The Fifth Plan itself has identified the reasons for this shortfall in installation as lack of adequate project management and monitoring; shortages of key materials, like steel, cement, electrodes and explosives; delays in civil works and the ordering and supplying of plant and equipment; and disturbed industrial relations. None of these are unforeseen natural calamities. They are all factors that man could have and should have controlled, and the shortfall is, therefore, primarily the result of failures in management.

Poor Record of SEBs

The State Electricity Boards that bear the primary responsibility for generation and supply of electricity have functioned as Government departments and not as autonomous commercial enterprises that are accountable to consumers and responsive to their needs. Ideological predilections, hostility to private licensees, delays in decision making — in approving projects and applications for import licences for plant and equipment, have riddled the functioning of the Boards. Operational efficiency has been at an inordinately low ebb. The Thermal Stations of the State Electricity Boards generate only 3000 KWH for every KW of installed capacity, whereas the comparable figure is 4700 KWH in the US, 5600 KWH in Japan and even in India 6700 KWH in the Tata Power House at Trombay.

Losses in Transmission and Distribution

The story is the same when we look at the losses in transmission and distribution. While the average in industrially advanced countries is between 5.7 and 12.5 per cent, in India the average is 17 per cent, and in some States the loss is as high as 29.3 per cent. The loss of 1 per cent in distribution and transmission is equivalent to the loss of Rs 50 million per annum.

Erratic Supply

Another continuing source of worry has been the erratic and unreliable quality of power supply and the damage that fluctuations in frequencies cause to machinery. Even the Power Mission from the UK had to point out to "inadequate teaming of operational and maintenance staff" and "manning levels which were 10 times higher than in equivalent plants in Europe."

Blend of Sources

Though power is generated from Thermal, Hydel and Nuclear sources in our country, Thermal Power accounts for more than 50 per cent of the power we generate. 63 million tonnes of the non-coking coal we have is concentrated in a few locations. The Railways are not able to cope with the task of transporting them to long distances. This leads to shortfalls and breakdowns.

Under Utilisation of Hydel Resources

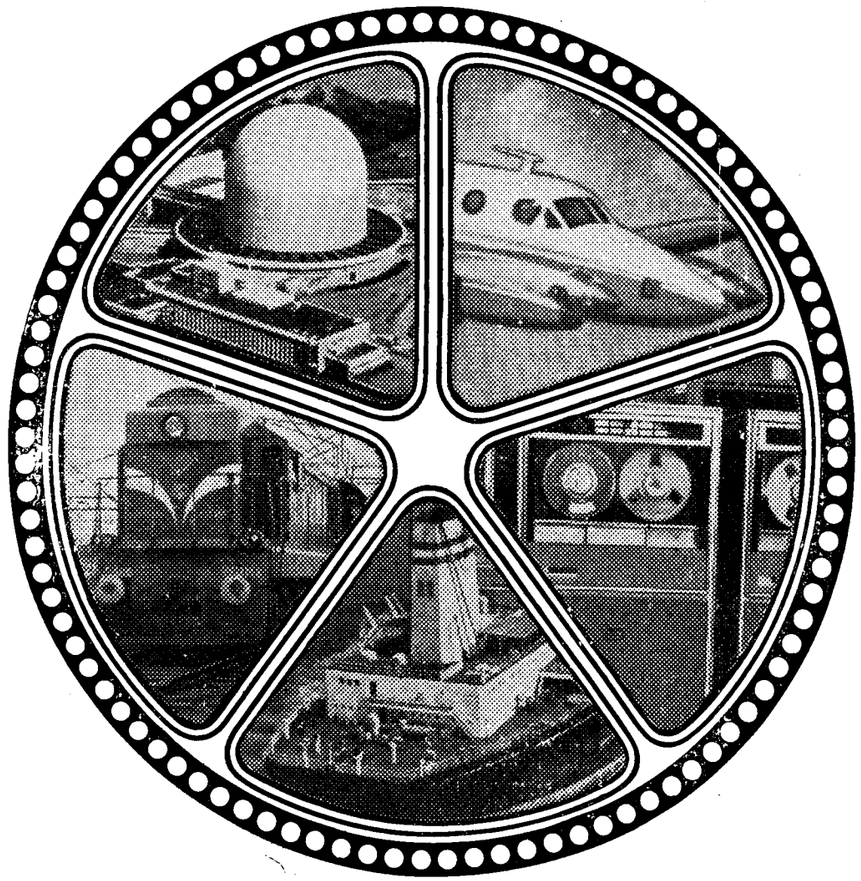
The abundance of hydro sources in India, their wide distribution in the States and low cost of generation indicate that in any judicious blend of sources that can sustain a sound power system, hydro power will have to carry the base load, leaving it to Thermal and Nuclear power to carry the peak loads. But we have harnessed only 17 per cent of these sources. Many river valley projects like the Narmada project have become the victims of indecision and political wranglings, resulting in colossal loss to the nation. The delay on the Narmada alone has been estimated to have cost the nation nearly Rs 9,500 million in the last 26 years. Even States which have abundant hydro sources have been the victims of acute shortage of power. How could they have found themselves in this predicament but for inadequate attention to hydro sources, and an injudicious blend of sources and administrative mismanagement and inefficiency?

Need for Tapping Nuclear Energy

An estimate made in 1960 points out that 35 per cent of the country and 30 per cent of the population are outside the economic range of thermal sources. Some of these areas have not been blessed with adequate hydro resources either. It will obviously be more economic and efficient to go in for nuclear power in such areas like Kutch, Saurashtra, Rajasthan, Haryana, Western UP, Eastern Maharashtra and Tamil Nadu. There is no doubt that a rational and balanced energy programme for the country will, therefore, have to assign an increasing load to our nuclear sources.

Effect of Power Shortage — Losses

I would have liked to present a quantified estimate of the losses that the power shortage has caused in every sector in every industry and consequently on every other industry that is a feeder or a dependent. But many of the enterprises and even the Government have found it difficult to obtain statistics on the separate effect of each of the causes of the current crisis in production. Yet, the Finance Ministry's economic survey acknowledges that "the most important cause of slow growth has been the widespread shortage of power."



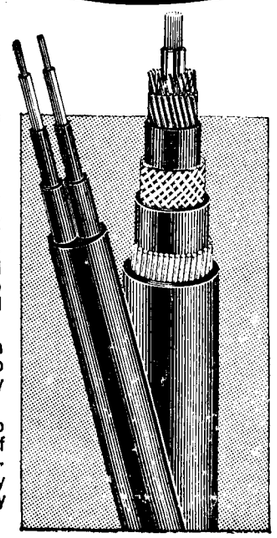
The survey and statistics cited in the Reports of the different concerned Ministries and industrial associations reveal the extent and intensity of the loss in many key industries.

Steel

Official sources have estimated that India lost 414,000 tonnes of saleable steel in 1973-74 as a direct result of power shortage, excluding the loss due to non-operation of electric arc furnaces; that the power supply to the Durgapur Plant fluctuated between 28 and 38 MVA as against a minimum requirement of 52 MVA, to the Alloy Steel Plant between 29 and 38 MVA as

Creating a prosperous tomorrow

100% dependable INCAB cables transmitting power wherever it is needed



Whatever the purpose—wiring a computer or connecting a temporary electric line, Incab has a cable for the job.

Ranging from light load twin flexibles to heavy-duty multicore cables, every Incab cable is of superior quality, manufactured after extensive research, subjected to rigid checks, and specially conditioned to specific climatic and environmental requirements.

Little wonder then, that decision makers at all levels insist on Incab cables when it comes to efficiency and ultimate economy.

They know that with every Incab cable comes over fifty years of pioneering experience and expertise in cable manufacture. Specify Incab for dependability, efficiency and economy.

Contract Department—another Incab plus

For over 50 years Incab's Contract Department has successfully implemented the electrification of major projects all over India. Whatever installation job you want done —Incab's Contract Department does it better.

INCAB
THE INDIAN CABLE COMPANY LIMITED
quality cablemakers—first and foremost

BRANCHES : Ahmedabad, Bangalore, Bombay, Calcutta, Coimbatore, Jamshedpur, Kanpur, Madras, New Delhi, Poona and Secunderabad.

FACTORIES : Jamshedpur and Poona.

INC 7690R

against a requirement of 45 MVA, to TISCO about 55 MVA as against a requirement of 90 MVA; that the actual performance of steel arc furnace industry was only 38.2 per cent of its potential performance since the industry received only about 35 per cent of the power it required.

Coal

Frequent interruptions and breakdown of power supply, affected the production of coal. Short supply of coal not only led to shortfalls in the generation of power but also, in turn, affected production in agriculture, industry and mining including the mining of coal itself.

Engineering Industry

The Association of Indian Engineering Industry has estimated that the loss of production in the engineering industry in West Bengal alone amounted to Rs 570 million in the first quarter of 1973.

Fertilisers

Fertilisers are crucial for our attempts to increase agricultural production and fight the chronic food shortage. Yet the total loss in the production of nitrogenous fertilisers for which the "power shortage was largely responsible" has been estimated as the equivalent of 90 million dollars worth of imports.

Aluminium

Aluminium is a key industry. Aluminium cables and conductors are needed in the generation and supply of power. They are also among our export earners. But as against the installed capacity of 195,000 tonnes per annum on account of power cuts imposed by the different State Governments production was around 150,000 tonnes. The power cuts to the largest manufacturer of aluminium in the country, *viz*, Hindalco, started at 25 per cent, was increased to 40 per cent, then to 50 per cent and since January 1974 the supply was completely cut off in spite of an agreement which binds the UPSEB. The Madras Aluminium Plant had to close down completely for 5 months and it is subject to a 30 per cent power cut now. The Indian Aluminium Plant at Belgaum is reported to be under a 60 per cent power cut since June this year. Thus, all plants are being forced to shut down or reconcile themselves to the progressive conversion of most of their installed capacity into idle capacity. Yet one hears talk of importing aluminium to meet the shortfalls in indigenous production.

Cement

Cement has fared no better. It has suffered cuts ranging from 20 to 75 per cent and the Cement Manufacturers Association has estimated the loss of production due to power shortage as 1.8 million tonnes for the first two quarters of 1973.

Cotton

Cotton and jute are the highest and second highest export earners, accounting respectively for 13.1 per cent and 12.6 per cent of our total export earnings. According to the Indian Cotton Mills Federation, the drop in the production caused by power cuts during February to June 1973 was 37 million kilograms of yarn and 72 million metres of cloth.

Jute

In the case of jute, the loss in production for the single month of April 1974 is estimated at Rs 150 million. The total estimated loss was Rs 252 million in June 1973 and Rs 181 million in January to March 1974. At a time when the oil crisis has compelled many countries that had taken to synthetic packing materials to turn back to jute, we find that the power shortage in the country has robbed both the grower and the manufacturer of the opportunity to benefit from this favourable swing in the international market.

Social Impact

The shortage of power has even affected hospitals, particularly the surgical wards and the cardiac units. The number of workers who have either been retrenched or laid off as a result of power shortage will run into many lakhs in the country.

Remedial Measures — Short Term

The Government does not hold out any promise of an early improvement in the position. In fact, all estimates warn of sizeable shortfalls and recurring shortages. It has, therefore, become imperative to draw attention to the paramount need for immediate remedial measures, as well as the long term plans and administrative re-organisation necessary to see that industry and agriculture are not paralysed or hobbled by the shortage of power.

(1) The operational efficiency of the existing plants and transmission and distribution systems must be improved. If all power plants in the country are run as efficiently as the Hindalco and Trombay power plants, at around 90 per cent capacity, and transmission losses are brought down from 17 per cent to around 5.7 per cent, we would have nearly neutralised the current power shortage. Adequate in-plant training must be provided to staff and the services of qualified consulting engineers should be used to locate defects and improve operational efficiency.

(2) Construction of intra-state and inter-state transmission lines and load dispatch facilities should be hastened to enable each system to benefit from the surpluses that may originate in neighbouring systems.

(3) Each Thermal Station should be linked with its sources of coal, both to ensure that the kind of coal suitable to it is available and that boilers are designed on the basis of the quality of coal. The Government should examine the suggestion that captive mines should be attached to Thermal Stations.

(4) All captive power plants and generating equipment available in the private sector should be immediately pressed into service.

(5) Power projects and plants that generate and transmit power should be considered crucial to the economy and strikes should be banned in them.

(6) The SEBs should strictly adhere to the guidelines that the Ministry of Irrigation and Power has formulated on priorities to be accorded during periods of shortage.

Long Term Measures

(1) Projects should be made more realistic. The recent experience of several hydel projects makes one wonder whether we have been unrealistic or slipshod in assessing the potentials of some of the reservoirs or have allowed political pressures to prevail over the estimates of engineers. We need a thorough and systematic reappraisal of the real problem of all our hydel projects.

(2) Our enthusiasm for instant self-sufficiency in heavy plant and equipment should not be allowed to delay projects or affect maintenance and the quality of equipment. Will it not be wiser to permit the import of limited quantities of crucial goods that are in short supply, including spares, even if we have to earmark imports against the requirements of specific projects?

(3) Increasing the line capacity of railways especially on "bottleneck stretches" will do more to reduce difficulties in the transport of coal than transport through sea.

(4) All industries or services that require power in bulk like aluminium, iron and steel, coal mines, railways, fertilisers, etc, should be encouraged to generate their own power through captive power plants.

(5) The possibility and economy of pumped storage with reversible pump turbines should be examined to increase the installed capacity of hydro stations.

(6) High capacity turbo sets must either be manufactured by the BHEL Plant at Hardwar or we must decide to import them.

(7) An extensive programme of standardisation of the design of equipment should be undertaken to speed up installation, facilitate maintenance and reduce inventories.

(8) The rural electrification programme should be revised. Nobody will grudge the spread of electricity or modern amenities to villages or the use of electricity for energising pumps. But our villages are far flung, and the cost of long transmission and distribution lines and diverting scarce power from revenue yielding higher production and quicker economic growth such as fertilisers, steel, etc, should be commensurate with the economic and social benefits that it is expected to yield.

Restructuring Power Administration

The Government's proposals to restructure the administrative machinery for power have not come a day too soon. The revision of the 1948 Electricity Act is long overdue and it should be expedited. The Fifth Plan aims at the installation of an additional capacity of about 16.55 MKW. One has to describe this as a herculean task when one recalls that it took five years of the Fourth Plan to create an additional capacity of 4.58 MKW! It is too much to expect the SEBs to carry this administrative, technical and financial burden without radical reorganisation.

Responsibilities of Ministries

Today the responsibility for the decision making at the policy level is almost fragmented among different Ministries — Irrigation and Power, Industrial Development, Finance and Commerce and the Planning Commission. At the executive level it is divided among the SEBs, Ministries of Steel and Mines, Heavy Industries, Petroleum, Transport and Railways.

Locate and Remove Constraints

The Ministers and the Government repeatedly declare that "we would have to live with power shortage for some time to come." But it will not allow private industry to set up its own plants. How long should the economy of the country then continue to suffer for the doctrinairism of the Government? The least that can be done if we are serious about attaining our target is to activate dormant captive power plants, and to identify every constraint that has obstructed or delayed the installation of new capacity, and take immediate steps to remove them.

Power: Largest Single State Investment

At the end of the Fourth Plan, our total investment in power plants reached Rs 49,600 million. The Fifth Plan proposes to invest an additional Rs 61,900 million, thus making a total of Rs 111,500 million. Power thus has become the largest industry in India far *outstripping* even the Railways. It is then imperative that governments, both at the Centre and in the States, ensure that the administrative and technical personnel that manage this concentration of national investment in one single industry is of the highest calibre available in the country.

By now we have had about a quarter century of closely directed planning. The least that one should expect from it is a stable infrastructure on which we can build the edifice of our economic strength and raise the levels of living of the masses of our people. However, every adverse blast that has blown across the country has found our infrastructure quaking and creaking. Where then, I would like to ask, is the "basic strength of the economy" which our Ministers boast about day in and day out?

Viren J Shah

File your information down to size

with microfilm

Microfilm will record your information permanently and store it safely in 2% of the space it takes on paper. Reference to information is faster and surer too. For example the Kodak Instamatic Microfilm system can record 30,000 letter-size documents on a single roll of Recordak Datapak film at 200 documents a minute. With a high-speed retrieval terminal you can find the information you need in 30 seconds.

There are many forms of microfilm and one of them will be just right for you.

Talk to Kodak soon; they probably have more experience than anyone in designing microfilm systems.

Kodak, Datapak, Instamatic and Recordak are trademarks.

WHAT ATUL MAKES

AND OFFER FOR EXPORT

DYESTUFFS
For Textiles, Paper, Viscose, Silk, Wool and Man Made Fibres.
Acid Dyes, Direct Dyes, Tulathols.
Tulabases, Sulphur Black (Grains & Powder), Tulagenes (Rapid Fast), Tula Disperse Liquids, Oil Dyes, Food Dyes.

FLUORESCENT WHITENING AGENTS
Swetak CT (for Paper)
Swetak MNA (For Textiles)
Swetak NR (for Polyamides)

INORGANIC CHEMICALS
Sulphuric Acid, Oleum 25%
Chlorosulphonic Acid, Oleum 60%
Hydrochloric Acid 30%
Caustic Soda Lye (Rayon Grade)
Caustic Soda Flakes (Rayon Grade)
Potassium Hydroxide Flakes
Liquid Chlorine, Phosgene Gas,
Dicalcium Phosphate (Dentifrice Grade)
Dicalcium Phosphate (I.P.)
Phosphorous Oxychloride
Phosphorous Trichloride
Sodium Thiosulphate (Crystal and Powder)

WEEDICIDES
4-D. Sodium (Technical), 4 Dichlorophenol

PHARMACEUTICALS
Quiniodochlor, Nikethamide I.P.
Saccharine USP
Saccharine Sodium I.P., Sulfadiazine I.P.,
Halazone N.F., Sulphathiazole BPC
Menadione I.P., Acetomenadione I.P.
Menadione Sodium Bisulphite I.P.

INTERMEDIATES
Methyl Dichloro Acetate
Tolyl-p-Sulfonyl Ethyl Carbamate
Para Chlorobenzene Sulfonamide
Orthotoluene Sulfonamide
Paratoluene Sulfonamide
Paratoluene Sulfonyl Chloride

DYES INTERMEDIATES
B.O.N. Acid, Chicago Acid,
G. Salt, Gamma Acid, H. Acid,
J. Acid, J. Acid Urea, Metanilic Acid, Peri Acid, Phenyl J. Acid,
Phenyl Peri Acid, Rhodoline Acid,
Schaeffers Acid, Sodium Napthionate,
Sulfanilic Acid, Tobias Acid.

FOOD: UNKNOWN CALCULUS

Ask Taylor.

We'll tell you. The chips Taylor deals with are a lot different from the ones you eat. They are wood chips. And they have to be 'cooked' and 'digested' before they can be pulped for making paper. And Taylor instruments control and measure temperature, pressure and liquid levels in the Digester. Taylor instruments control and measure other process variables too. Like humidity, specific gravity, force, load, etc.

That's how you find Taylor in sugar and milk plants, in rubber, textile and medicine plants, in fertilizer, petroleum and cement complexes.

But what is so special about Taylor, you might ask? Can't others do the same job? They can, but they don't have the experience and expertise that Taylor does. Taylor instruments incorporate the most sophisticated technology with continuous research to change and modify. Taylor provides customers with the most comprehensive design, installation and commissioning services. And on the national front there is Taylor's active participation in industrial progress, the generation of employment, the complete stress on indigenisation. And the pride in knowing that there will continue to be a lot of Taylor in the nation's life.

Notice on India

IN terms of Bangladesh's domestic politics, Tajuddin Ahmed had quite some months ago already become a nonentity. His dismissal by itself is most unlikely to release any new forces there. The National Awami Party led by Muzaffar Ahmed and the Communist Party of Bangladesh might, of course, now feel very much more exposed and vulnerable; the pro-American lobby may be happy to have been presented with this post-Ramzan gift; and the Soviet Union may begin to worry, much more than in the recent past, about the recent drift of events in a country where its investments in the past three years are second only to those of India. But all these would be only overt manifestations of a trend which has been there for at least a year. Tajuddin Ahmed, shorn of effective power ever since Sheikh Mujibur Rahman's triumphal return to Dacca in January 1972, had continued to exist in the Bangladesh cabinet more as a symbol of the political reality that the regime was not quite prepared yet to demolish the precarious bridges which were built in the uncertain days of 1971-72.

His removal now is thus in the nature of a notice being served; the world at large is being told that the Bangladesh authorities are not terribly interested in the bridges established in 1971-72; that, in fact, those bridges have become so major a liability for the regime that it would be most unwise to postpone the task of their demolition. Through dismissing Tajuddin Ahmed, the Sheikh is therefore speaking to India. In the climate currently prevailing in Bangladesh, there is great need for sacrificial goats. In a minor key, this point was emphasised on the occasion of the abrupt transfer of Abdus Samad from the Foreign Ministry to a relatively minor portfolio in 1972; Tajuddin Ahmed's dismissal underscores the point.

At this stage, it is altogether futile to speculate whether this worsening of Indo-Bangladesh relations could have been avoided, or whether the developing rupture between that country and India is a historical inevitability. It may well be that, if, in the initial period, instead of a swashbuckler like D P Dhar being principal emissary from this side, a quieter man had been assigned the task, the fouling up of relations might have been a slower process. D P Dhar's style, it is now well known, irritated Dacca no end. Tajuddin Ahmed is in a sense paying the price for the fact that he got along so famously with the Deputy Chairman of the Indian Planning Commission.

Obviously, the situation had arrived at a point where Sheikh Mujibur Rahman could no longer ignore the development of anti-Indian sentiment. He could have ignored the demand for Tajuddin Ahmed's head only at his own peril. The latter was obliging enough by talking out of turn about the need of an all-party committee to tackle the problems of food and famine, and by referring, howsoever obliquely, to the plight of political prisoners. After such seeming insubordination, it became all quite simple to arrange his excommunication.

In its existing mood, the Soviet Union could not perhaps care less as to the nature of the internal regime in Bangladesh — so long as China is kept out of the arena. If the American presence becomes overt, that too may not perturb Moscow unduly. For, in the current diplomacy in favour with the two super powers, spheres of influence are henceforth to be matched by spheres of counter-influence, and which weak nation came under which super power's sphere of operation could become a minutiae.

India, however, has greater reason to worry. One major consequence likely to follow Tajuddin Ahmed's exit is a revival of interest in Bangladesh for having a Pan-Asian Islamic concordat, consisting of Indonesia, Malaysia and Bangladesh. This would also be something which the Americans would find easy to handle. India's isolation would then be once more nakedly revealed. Having acted as the major instrumentality in destroying the regime in Pakistan, we need not have acted in a manner as would prevent the simultaneous emergence of two hostile regimes along the border. But this is precisely what has been precipitated.

The other danger to guard against is the temptation to use Bangladesh as an alibi for all kinds of domestic failures. Indira Gandhi has now gone to the length of claiming that the erosion of 9 million tonnes of buffer stocks, which the country had around 1971, was entirely because of the war over Bangladesh! This is gross terminological inexactitude. No doubt, it will now be extensively used by India-baiters in Bangladesh to establish the fact of Indian cupidity.

Food

The Unknown Calculus

THE Government continues to maintain its taciturnity in the matter of food imports. The Managing Director of the International Monetary Fund came and went, Henry Kissinger too arrived and departed. What specific issues were discussed with the IMF chief remain unknown. Whether there was enough co-ordination between the Prime Minister's secretariat, the Ministry of External Affairs, and the Ministry of Finance is equally unclear. India has just been permitted, by the Fund, a special oil facility of 200 million dollars. But this country, in the course of the past nine or ten months, has also already drawn on the so-called 'gold-tranche' of the Fund in addition to the first 'normal' tranches. Drawal from the subsequent tranches will involve much more minute scrutiny by the Fund which may not be averse to making implementation of reforms recommended by it in the domestic sphere a pre-condition to further accommodation. This, in its turn, will raise ticklish issues, with far-reaching political implications. How far New Delhi would be prepared to humour the IMF will thus depend on the kind of options which are open to the authorities. As things are developing, there may not be very many left in the field very soon.

Partly, what the Fund's Managing Director has been told will have depended upon the arrangements which Henry Kissinger has proposed for operating the new Indo-American economic commission — which will depend essentially upon the sustenance received from the Americans. Unlike in Bangladesh and Pakistan, where Kissinger straightaway referred to the American decision to transfer an extra 100,000 tonnes of foodgrains to each country, the joint communique issued in New Delhi following his visit there contains no specific reference to the question of food supplies. This could be because the US administration is not in a position to hand over at short notice supplies that can match the magnitude of India's demands.

But the fact is that the public is no wiser today about the calculus of food supply and distribution in the coming year, or about the more unsavoury details of the country's balance of payments. True, the drive against smugglers, if seriously pursued, could conceivably improve the balance of payments by at least Rs 100 crores in a twelve-month period. If the artificial boom in sugar prices continues in the world market, it is indeed possible that, in the ensuing calendar year, the country might make as much as Rs 300 crores from the export of sugar. But these snippets by themselves are hardly enlightening about the overall position of the balance of payments. The total import requirements on account of oil and fertilisers can again be roughly put together. But a failure to tot up the food bill leaves a glaring gap in the balance of payments calculations.

Jagjivan Ram is making radical-sounding speeches, warning hoarders and traders of dire consequences in case they do not disgorge the stocks in adequate quantities, but the big question mark continues to hang over the magnitudes of market availability, procurement, and import of foodgrains during the next one year. The current uncertainty, largely brought about by governmental reluctance to share with the public the details of the food distribution programme, is therefore of little help. Till as long as the uncertainty continues, the speculators, who go by market sentiments, will continue to bid up prices — and hence create even more difficult conditions for the poor. The talk of additional imports will by itself have a disinflationary influence here; and the larger the quantum mentioned, the greater ought to be the impact against inflation. So the effect of such talk of massive imports on the American grain market is not to be discouraged. But, irrespective of whether the imports are finally arranged under some sort of 'aid' programme or through the payment of hard cash, it should be possible to persuade the American government to agree to the concept of a 'ceiling price', above which the contracted price would not be permitted to rise for the purpose of official transactions. In any event, there ought to be an end to the present process of running the government so utterly out of public view.

Political Prisoners

India's Vote on Chile

IN one of its more blatantly cynical acts, India abstained in the vote on a resolution in the UN General Assembly on this Wednesday directing the military junta in Chile to release political prisoners and to grant safe conduct to all those who wanted to leave the country. The resolution, which was adopted by 90 votes to 8, also requested to President of the General Assembly and the UN Secretary-General to take appropriate action to re-establish human rights in Chile.

Even conservative opinion the world over has been appalled by the brutality of the repression practised by the military regime in Chile. A fact-finding mission sent to Chile by the International Commission of Jurists had found that the methods of torture of political prisoners included "electric shocks, blows, beatings, burning with acid or cigarettes, prolonged standing, prolonged hooding and isolation in solitary confinement, extraction of nails, crushing of testicles, sexual assaults, immersion in water, hanging, simulated executions, insults, threats and compelling attendance at the torture of others". In another report, Amnesty International has disclosed that even little children have been tortured to extract confessions out of their parents. In one case, a nine-year old girl and a four-year old boy were tortured to death in front of their parents.

There was a time, not so long ago, when the Prime Minister of India publicly shed crocodile tears over the murder of President Allende and the brutal overthrow of his government. She was not above even suggesting that her supposedly socialist policies had exposed her government to the similar danger of falling a victim to unnamed "vested interests", national and international. All this led the American ambassador in India to send his now-famous confidential cable to his Secretary of State in which he warned that the recent revelations about the CIA's role in Chile had confirmed the Indian Prime Minister's "worst suspicions and genuine fears" about Washington's policies towards her government. Said ambassador Moynihan: "Her concern is whether the United States accepts the Indian regime. She is not sure but that we would be content to see others like her overthrown."

It is difficult to say whether ambassador Moynihan really believed what he was telling his boss in Washington or whether he was simply doing a hard-sell job for the government of India. In any case, after Henry Kissinger's recent visit there can be no doubt that Indira Gandhi's "worst suspicions and genuine fears" have been completely dispelled. Simultaneously, the tragedy of Allende has apparently been erased post-haste from the Prime Minister's memory and so far as the Indian government is concerned, the obscenities of the military junta in Chile have ceased to exist. How else can one explain India's abstention in the vote on the General Assembly resolution?

Of course, there is another explanation for the vote, and one which cuts even closer to the bone. As it happens, Amnesty International has produced a report on political prisoners in India itself, with carefully documented evidence on torture, indefinite detention without trial and sundry other enormities which are supposed to be the preserve of fascist regimes such as the present one in Chile. Indeed, it is not at all far-fetched that in the not-too-distant future the UN General Assembly might have before it a resolution calling upon the Government of India to release political prisoners and requesting the UN Secretary-General to take appropriate action to re-establish human rights in India. Faced with such a prospect, how could the government of India have voted differently on the resolution on Chile?

Oil Revenues

Behind the Recycling Debate

THE discussion on recycling of surplus oil funds of the oil-exporting countries has generated more heat than light so far. The oil-exporting countries themselves appear to be content to sit tight over the huge sums that are flowing to them. During the current year so far these countries are said to have accumulated surplus funds to the tune of nearly $ 30-35 billion. The actual surpluses are likely to be even larger, because of the lags in payments by the oil firms. Between end-1973 and end-September 1974, the official reserves of the major oil-exporting countries increased by $ 24 billion. Sizeable sums of money have already moved into purchase of real estate and shares of companies in the developed Western countries though some of the Arab oil-producers are hesitantly beginning to pump a part of the surpluses they are accumulating back to the UK and the US, in particular, in the form of loans, investments in government securities and bank deposits.

The oil-exporters do not appear to be particularly worried by the warnings that there is bound to be a major global recession if the oil-exporters do not cooperate with the oil-consuming nations in recycling their surplus funds. This is not altogether surprising since these warnings have come mainly from politicians and economists from the West. Many Arab policy-makers are not only suspicious of the various recycling plans but some of them have shown concealed hostility to them. The oil-exporters' revenues have increased phenomenally only in the last few months and they are yet to mentally adjust themselves to the situation of surfeit of funds. It is natural, therefore, that they should take some time to prepare their own plans for employing them gainfully. Besides, for most of the oil-exporters their oil reserves are not inexhaustible. So they cannot afford to squander away their oil revenues or employ them in such a way as to jeopardise their safety. Their distrust of the grandiose plans of recycling their surplus funds for the benefit of those who require these funds for bridging their balance of payments deficits is, therefore, understandable. Besides, many Arab policy-makers believe that the West's economic troubles began long before the rise in oil prices and that the West is looking for a scapegoat in the higher oil prices.
