The Vanishing Plan

THE government has set up two committees to consider ways of pruning Plan and non-Plan expenditures so as to ensure that the Centre's budgetary deficit this year does not exceed the level of Rs 125 crores indicated in the Budget. Earlier there were reports that, as an anti-inflationary measure, the Planning Commission had already decided to slice Rs 150 to Rs 200 crores off the public sector Plan outlay of Rs 4,844 crores envisaged in the Annual Plan. All this would suggest that the Budget estimates for the current year have gone so wide of the mark that unless government expenditure is drastically cut or additional resources raised the deficit would be far larger than Rs 125 crores. Indeed, reports indicate that on present trends the deficit may turn out to be in the region of Rs 800 crores.

The estimates of budgetary income and expenditure were presented to Parliament only three months back; the Annual Plan for 1974-75, which was based on the Budget's estimate of deficit financing of only Rs 125 crores, was released even more recently, on May 3. What has happened in the last two or three months to have so completely upset the estimates of the Budget and the Plan? Or is it that these estimates had no basis to begin with and the government knew this to be so even when it presented the Budget and the Plan to Parliament? It had been claimed that the Budget Statements and Demands for Grants for 1974-75 had followed a revised accounting classification, introduced by the Comptroller and Auditor General, which "besides providing management with purposeful accounting information for monitoring programmes will also help Parliament and the public in a meaningful appreciation of allocation of resources and purposes of government expenditures". That the budgetary calculations should have gone so awry within such a short time appears particularly ironic against the above claim.

However, to return to the question: what has happened since the preparation of the Budget to require the pruning of expenditures? On the side of receipts, revenue and capital, the budgetary estimates should, if anything, be expected to be exceeded. First, a very high proportion of tax revenue comes from indirect taxes, the rates of which in almost all cases are *ad valorem*. The continuing inflation should result in higher sale values of commodities even if real output of some of the industries is adversely affected. This is true even of industries directly affected by the oil crisis, such as a number of chemical and petro-chemical industries; most of the major companies in these industries have reported increases in sales ranging from one-fourth to one-third. Import values of petroleum and petroleum products have of course gone up sharply. In any case, the Finance Minister had "assumed some deceleration in growth of revenues from excise and customs" to allow for "the likely adverse impact of the energy crisis". There is, of course, the very real factor of evasion of excise and customs duties. But is it the suggestion that a sharp increase in such evasion is one of the factors behind the current revision of the budgetary estimates?

As for revenue from direct taxes, the one assumption of the Budget which was quite obviously baseless was that the reduction in the rates of income-tax on personal incomes "will lead to better tax compliance, and full disclosures of incomes by all tax-payers" so that there would be no loss of revenue on this account. If the government has now come to realise that this assumption was unwarranted — something which was obvious all along —, this would seem to call for a reversal of the reduction in income-tax rates but would not entail any significant changes in the Budget estimates since, according to the Finance Minister's calculation, the amount involved is only Rs 36 crores in 1974-75 and Rs 60 crores in a full year.

Among capital receipts, market loans in net terms were placed at Rs 498 crores against the revised estimate of Rs 472 crores in 1973-74. In the first instalment of its borrowing the government has already floated loans to fetch a net amount of Rs 238 crores and the balance will no doubt be raised later. As for external loans, the Budget provided for net receipts of Rs 552 crores or Rs 82 crores higher than the revised estimate of Rs 470 crores for 1973-74. Now, according to the government's own assessment, aid prospects have become much brighter after the recent Aid-India Consortium meeting; it has been confidently predicted that the overall availability of aid this year would be about one-third higher than it was last year and that disbursements by the Consortium countries would also be faster. The Budget's estimate of resources from this source should, therefore, be expected to be substantially exceeded.

The sources of finance for the Annual Plan are the budgets of the Central and state governments and the negotiated loans of semi-government bodies.

The resources of the Central government are, as indicated above, unlikely to be lower than estimated in the Budget. The state governments were expected to raise additional resources for the Annual Plan to the extent of Rs 227 crores. Against this, they have already raised Rs 224 crores, even though almost all of them have shied away from fresh imposts on the agricultural sector and have relied mostly on indirect taxes. There is no reason why the negotiated loans of semi-government bodies should be lower than the Budget estimate since they are subscribed to by financial institutions like LIC and banks and the Reserve Bank. There remains the impact of the railway strike on the Central Budget to be considered. However, even if the Railways' negative contribution to the Annual Plan resources turns out to be higher than Rs 50 crores, as estimated in the Plan, the difference will almost certainly be made good by larger receipts on other counts.

On the expenditure side too there have been no developments since the presentation of the Budget calling for any substantial revision of the Budget estimates. It is certainly not the intention of the government to expand the scale of developmental activities and the expenditures on them during the year. In fact the Cabinet Secretary, who heads the committee which is considering ways of economising on Plan expenditure, has admitted that there would be some cut in the aggregate Plan outlay. On the side of non-developmental expenditure, the government is said to be thinking of ways of avoiding payment of additional dearness allowance which has become due twice during the year on April 1 and June 1 in terms of the Third Pay Commission's recommendations. The Budget has provided an amount of Rs 120 crores for the payment of additional dearness allowance and the government should be able to keep expenditure on this score within Rs 30-40 crores of this limit. Likewise, the government has already curtailed subsidies on foodgrains and abolished those on fertilisers.

It would thus appear that the need to prune Plan and non-Plan expenditures has arisen, not on account of any unforeseen developments which have upset the Budget estimates of revenue or expenditure, but because, as has happened every year in the recent past, the government's non-developmental expenditure is threatening to exceed the estimates presented in the Budget. Though, for form's sake, the government is talking in terms of 'economies' in both Plan and non-Plan expenditure, the current exercises will in the end result in a disproportionate cut in Plan or developmental expenditure. The experience of 1973-74 is a clear pointer to what is in the offing. Last year the government had sought to make out that the cut of Rs 400 crores proposed in total government expenditure would mostly fall on non-Plan expenditure; ultimately, however, it turned out that the Plan outlay for 1973-74 had been slashed from Rs 4,364 crores to Rs 3,960 crores or by Rs 404 crores.

The Plan outlay proposed for 1974-75, the first year of the Fifth Plan, is definitely small in relation to the physical and financial targets set for the five-year period. While comparing the Plan outlay of Rs 4,844 crores for 1974-75 with that for 1973-74, allowance has to be made for the following factors: (i) it is based on gross capital formation and therefore includes provision for replacement of equipment and machinery; (ii) it includes cost of construction of residential and administrative buildings, as well as loans to government servants for housing; and (iii) it also includes market borrowings and negotiated loans by semi-government bodies. As against these, the Plan outlay for 1974-75 does not include two items which had earlier formed part of the Plan outlay: (i) inventories of public enterprises and other additions to stocks in the public sector to be financed by bank credit; and (ii) committed expenditure "on account of the maintenance of Fourth Plan schemes completed at the end of 1973-74". As for the first, the addition to inventories of foodgrains is likely to be considerably lower this year. As for the second item, though there is no way of arriving at the committed expenditure on the maintenance of completed past Plan schemes, the Annual Plan's estimate of Rs 500 crores as the expenditure on this count in 1974-75 seems to be grossly exaggerated. It is unlikely that the figure will be anything more than Rs 200 to 250 crores. However, even on its own estimates, the Annual Plan document concedes that, on a comparable basis, the Plan outlay for 1974-75 is only about 13 per cent higher than the revised outlay for 1973-74. And now this is proposed to be further cut.

Despite the cut of over Rs 400 crores in Plan outlay, the budgetary deficit in 1973-74 remained as high as Rs 650 crores, according to the revised estimates. (How this was subsequently reduced is still not very clear.) The government now proposes to restrict deficit financing in 1974-75 to the budgeted figure of Rs 125 crores. The Annual Plan for the year may, therefore, end up with an expenditure no higher than in the previous year — at current prices. What these figures connote in real terms may be judged from the fact that the past two years have seen an increase of about 30 per cent in investment cost, according to the official index of wholesale prices; on the basis of the actual market prices of some key investment goods like cement, steel, non-ferrous metals, etc, the rise in investment cost is much more. Given the rise in the cost of investment, in real terms the Plan outlay in 1973-74 or the likely outlay in the current year is no higher than that in 1965-66. Even if we restrict ourselves to the period since the beginning of the Fourth Plan, the current Plan outlay of around Rs 3,950 crores at current prices gets reduced, with an appropriate investment deflator using the official index of wholesale prices, to an amount of Rs 2,595 crores. Four years ago, in 1970-71, the Plan outlay was broadly of the same order (Rs 2,523 crores). Thus the decade-long stagnation of Plan investment will continue into the first year of the Fifth Plan.

The decline in Plan and developmental expenditures as a proportion of total government expenditure has been frequently referred to in these columns. In respect of the Central government, for which the data are available, the proportion of developmental expenditure to total expenditure was 59.4 per cent in 1965-66 but would be just 46.7 per cent in 1974-75, according to the Budget estimates, or barely equal to that in 1973-74. In fact, the Budget for 1973-74 had envisaged developmental expenditure at 53.1 per cent of total expenditure, but the revised estimates now put the figure at 46.3 per cent. Similarly, the current pruning of the Plan, in the name of fighting inflation, is likely to reduce the proportion of developmental expenditure in 1974-75 to even below last year's level. In terms of capital formation expenditure, the deterioration is even more striking. The proportion of capital formation to total expenditure was 48.3 per cent in 1964-65 but steadily declined to 32.2 per cent by 1971-72 and has continued at that level thereafter. The Budget for 1974-75 puts the figure at 35 per cent, but it is likely to get reduced to around 32 per cent finally.

The prospect of a further cut in the Plan outlay in the current year, below the already unappetising level at which it had been pegged to begin with, has been sought to be sugar-coated with the promise that there would be no reduction in the outlay on projects in the core sector including coal, power, steel, cement and fertilisers; in fact it has been suggested that the outlay on these projects might even be raised above the levels indicated in the Annual Plan. This is, however, another instance of the kind of manipulations which appear to have marked the formulation of the Annual Plan. The fact seems to be that, even without allowing for the price rise during the year, the cost of core sector projects in coal, steel, non-ferrous metals, railways, power and fertilisers included in the Annual Plan have been underestimated to the tune of Rs 250 to Rs 300 crores. The promised increase in outlay on these projects — which will naturally be at the cost of other Plan programmes, especially those in the area of social services — will at best partially make up for the initial underestimation of costs and will not mean any expansion of the physical programmes. Eventually, after the further rise in prices during the year has also taken its toll, the achievements in physical terms in the core sector will lag far behind the aspirations of the Annual Plan, even after the relevant financial outlays are raised.

The petty manipulations of Plan outlays need to be set against the Planning Commission's purple prose about the perspective of development in the Fifth Plan period and ahead which, it had urged readers of the Draft Fifth Plan, "requires both vision and determination and an unshaken faith in the capacity of the country and the people to think and act big. Cynicism, inertia and fear of everything new and bold are alien to it... We must discover ourselves fully ... The nation is surely capable of achieving much more than the modest goals set out above ... The temporary difficulties must not be allowed to cloud our vision and shake our will. We have all the opportunity to create an India of our dreams. Let us seize it with both hands. A great socialist future beckons us irresistibly." Amen.

Sikkim

Of Courtiers and Colonists

THE imposition of Section 144 of the Indian Penal Code was one of the first actions taken by B S Das, the Indian bureaucrat who took over as chief administrator of Sikkim in April 1973. In 1949 too, the last time there had been political unrest in Sikkim, Indian armed forces had moved in to establish law and order. That time it was to maintain the authority of the Maharajah in the face of 'popular' elements. This time the function of the Central Reserve Police has been different — the authority of the 'popular' forces is to be enhanced and that of the Chogyal (formerly the Maharajah) reduced and, if necessary, extinguished.

The leadership of the Sikkim Congress which is said to represent the popular and democratic aspirations of the people of Sikkim is of dubious background. With leaders like the self-styled Kazi Lhendup Dorji of Chakhung — who not too long ago were fawning courtiers at the palace of the Chogyal — at the helm of the Sikkim Congress, it is difficult to discern even any populist ethos in the party. There are some younger and non-feudal elements in the party but they are nowhere in command. The Prime Minister and her advisers are, however, convinced of the need to retain tight control of a 'strategic' frontier area like Sikkim. A coterie of courtiers with the trappings of popular support are now more useful than a lone prince to maintain the facade behind which Indian bureaucrats and brasshats can continue to call the shots.

The question whether the condominium jointly established by Indian officers and the Sikkim Congress coterie will be qualitatively any different from the previous Chogyal-cum Indian civil servant duet can be left to those who can always find fine differences. In substance, the lot of the people of Sikkim is unlikely to be bettered by the 'new' condominium. But the expectations aroused over the last year among the Nepali ethnic majority in Sikkim could quite conceivably lead to the growth of an irredentist movement covering not only Sikkim but also Bhutan (about 25 per cent of whose population is Nepali) and the district of Darjeeling, two of whose five legislators in the West Bengal Assembly are from the Gorkha League which has been demanding special privileges for the Nepalis in India and for the setting up of an autonomous hill district centred on Darjeeling. One of the leaders of the well orchestrated unrest in Sikkim last year was Roop Narayan Dahal, a lawyer from Kalimpong, who is the All-India General Secretary of a faction of the Gorkha League.

The Gorkha League is not known to be close to Nepal's royal regime or to the Nepali Congress emigres in Bihar. Its leadership is more self-assured and purposeful than that of the Nepali Congress and the Sikkim Congress as presently constituted. Therefore, with the establishment of the Sikkim Congress in Gangtok, there are bound to be influences at work with in and on that party from the Gorkha League and from the downtrodden Nepali minority in Bhutan. This may pave the way for a 'Greater Nepal' movement based in Gangtok, especially if the royalists in Kathmandu show no signs of liberalising their regime. Kathmandu's complete silence about the aspirations of the Nepali majority in Sikkim is notable in this context.

Obsessed with the strategic-defence significance of Sikkim, the Ministry of External Affairs which still deals with that territory, is likely to ignore the fact that the colonial short-cut of integrating Sikkim with India could become the short path to creating serious trouble for New Delhi all along the Himalayan frontier. The vote for the Sikkim Congress in April was not necessarily a vote for the integration of Sikkim with India. The Bhotia and Lepcha minorities in Sikkim are already anti-Indian and with integration it will not be long before the Nepali majority also turns anti-Indian, especially because the standard of living of the local population — at present the per capita income is double that of India — is bound to go down with the unrestricted entry of Indian nationals into the territory. The courtiers in the Sikkim Assembly who have passed resolutions for the "participation and representation of the people of Sikkim in the political institutions of India and its parliamentary system" will not be of much use then.

India-Bangladesh Relations

Yet the Only Option

THE Indian Press has not played up — and, for once, wisely — the behind-the-scene drama which marked the descent of Zulfiqar Ali Bhutto upon Dacca. Barely twenty hours prior to Bhutto's arrival, the Indian High Commissioner, who also happened to be the doyen of the diplomatic corps, quietly left the Bangladesh capital after relinquishing charge. He was scheduled to retire, but the general impression was that he would stay on till at least the second week of July. It may or may not be true that the Bangladesh authorities expressed some unhappiness at the particular date he chose to leave. But not even half-a-dozen diplomats were present to see off the doyen of the diplomatic corps. The chief of Protocol of the Government of Bangladesh did put in a perfunctory appearance; however, according to reports, he reached the airport even as the High Commissioner's plane was about to

take off. This, too, might not have been a deliberate slight; nevertheless, the episode does seem to be symptomatic of the climate which at the moment is typical of Dacca.

At the political level, India is still considered worth cultivating, if not as dispenser of assorted bounties, at least as a useful bargaining counter. However, within the bureaucracy and among the population at large, considerable prejudice, rational as well as irrational, has welled up against this country. Much of this may be traced to the failure of the Bangladesh economy to take off, and the consequential urge to spot a scapegoat. Part of the prejudice certainly is traceable to reports of wide-scale smuggling of jute across the border. Bangladesh politicians have exhibited hard-headed commonsense in managing their country's external relations: The prospects of cheap yarn, textiles, sugar, edible oil, rice, wheat, and other consumer goods from Pakistan have been a major factor in the remoulding of popular emotions. The pampered middle class, with vivid memories of their cushy existence during the Ayub and Yahya regimes, has other private hopes too. It has been easy, therefore, for motivated groups to emphasise the 'positive aspects' of a possible rapprochement with Pakistan, particularly amidst the developing disenchantment with India and the near-morbid anxiety about infiltration of Marwari finance capital.

As the date of Bhutto's arrival neared, Sheikh Mujibur Rahman was thus faced with an acute embarrassment. He simply could not afford the reception to the Pakistan Prime Minister to be so gushing as would wash away his own bargaining positions. Hence the re-exhibition on television of old films about Pakistani atrocities, as well as the editorial-mongering in Dacca newspapers on the same theme. Probably, the promulgation of Section 144 was also primarily to keep the pro-Bhutto crowds away. Even so, the reception which the Pakistan Prime Minister and his entourage received was of a kind that would have been unimaginable some months ago; slogans proclaiming goodwill and *bonhomie* towards Pakistan rented the Dacca sky as Bhutto's plane landed.

The Pakistan delegation could not perceive this groundswell of latent sympathy. They decided to play hard; and discussions on issues, such as the division of assets and liabilities between the two nations and the repatriation of the so-called Biharis to Pakistan, have for the present ended infructuously. It is going to be a ding-dong battle from now on, and the Sheikh would have his work cut out: There was never any danger of the Bangladesh population turning pronouncedly pro-Indian — history and economic circumstances would ensure against that — ; on the other hand a gradual softening of attitudes towards Pakistan is altogether more credible because — once Bangladesh's separate sovereign entity has been duly recognised and a seat in the United Nations has been secured — the people may be persuaded that the other outstanding issues between the two nations are easily negotiable. The unusual step which the Sheikh took, namely, to talk of substantive matters at the formal banquet in honour of Bhutto, was therefore more to safeguard his own position and to warn the Pakistan Prime Minister that he will not be taken for granted.

The talks in Dacca have, on this round, ended 'unsatisfactorily'. But the Pakistan Prime Minister knows that the advantage lies with him and that the Sheikh's predicament is altogether genuine. This could provide Indian diplomacy with a lifeline. The Bangladesh leader has no constituency in Pakistan; Zulfiqar Ali Bhutto has one in Bangladesh. To neutralise this asymmetrical situation, the Sheikh, in the short period, has nowhere else to look except toward India. It would thus be prudent for South Block not to give excessive vent to its felt pique over the inadequate send-off to the retiring High Commissioner. The appropriate thing at the hour is to continue the low stance. It may be a heavy cross to bear, but politicians must not forget either the domestic pay-off they have received because of it or the heavy external consequences of any abrupt, impetuous action.

Vanaspati

Cooked Up?

WHEN the government allowed a whopping rise of Rs 180 to Rs 220 per quintal in the controlled price of vanaspati around the middle of last month, it was made out that the production of vanaspati would go up as a result. Vanaspati production had come down from a monthly average of 50,000 tonnes in 1972 to 38,800 tonnes in 1973 and to 35,000 tonnes in January-May 1974. In May 1974, the month prior to the announcement of the price rise, production had allegedly dropped to a mere 25,000 tonnes. It was this continuous decline in production which the price rise was supposed to reverse.

Nothing of the sort seems to have happened. Production of vanaspati in June has reportedly fallen further to 16,000 tonnes, according to industry sources. That the production figure for June should be available so promptly, within a few days of the end of the month, is itself interesting. The industry is apparently anxious to show that the price increase has not been able to arrest the declining trend in production and would like this to be taken as proving its contention that the price rise allowed by the government is grossly inadequate and that the controlled price of vanaspati still does not cover the manufacturers' costs.

Even if there were some truth in this argument, the steep fall in production of vanaspati in June still calls for some explanation. Even the industry cannot deny that the increase in the price of vanaspati allowed by the government, however inadequate, has very considerably narrowed the gap between the controlled price and the manufacturers' costs. The supposed loss that vanaspati manufacturers had been incurring has thus been sharply reduced even if, as claimed by the industry, it has not been eliminated altogether. Yet the industry has cut its production to half compared to the times when it was allegedly making far heavier losses.

The situation is intriguing enough for a question or two to be raised about the veracity of the production figure for June. The market price of vanaspati is much higher than even the revised controlled price. In Bombay, for instance, against the controlled price of Rs 9.62, a one kg tin of vanaspati is not to be had for less than Rs 15. No one will believe that the vanaspati manufacturers do not get a part of this large premium over the controlled price. The customary *modus operandi* is for the manufacturer to sell at the controlled price to a few trusted distributors who then sell at the going market rate and split the difference with the manufacturer. This procedure is followed in other industries such as cement, paper, aluminium and fertiliser. Another way of circumventing price control would be for the manufacturer to understate his production. Only a part of the actual output is disclosed and shown to have been sold at the controlled price; the rest is then available to be sold at the going price. Of course, the latter sale proceeds cannot be shown in the books of the company concerned, but for the majority of vanaspati manufacturers this should present no problems!

It may be pointed out that given the checks on production that exist it is simply not possible for any vanaspati manufacturer to conceal a part of his output. Only the very innocent will be overly impressed by this argument. Is it not well known, for instance, that a large number of industrial units which use raw materials in short supply, such as non-ferrous metals, are able to get their production figures accepted by the concerned government agencies when in fact all that they do is to sell their raw material quotas at high premiums? Similarly, the figures of recent excise duty collections from quite a few industrial products — soap is only one of them — appear to call for a closer scrutiny of the relevant statistics of output. And let no one suggest that in the vanaspati industry itself government regulations, such as the officially fixed price, are not circumvented with the connivance of the government. According to newspaper reports many vanaspati units in Punjab and Haryana have come to an understanding with the authorities whereby in return for making a part of their production available to the government for fair-price distribution, they are "allowed" to sell the rest at the going market prices!

All told, therefore, it is unnecessary to be too impressed by the vanaspati industry's arguments about declining production on account of uneconomic controlled prices. That is not to say, however, that the government has many options before it. The industry is presenting the government with a choice between a further rise in the controlled price and decontrol. Whether the government chooses the one or the other or pretends to get tough by holding the controlled price at the present level, it will make little difference to the price at which the consumer gets his vanaspati.

Small Savings

For the Non-Small Saver

A Correspondent writes:

THE Ministry of Finance is said to be considering steps to make small savings more attractive in the face of the steady erosion of the value of the rupee with a view to ensuring that the Fifth Plan target of small savings of Rs 1,850 crores is reached. The Ministry is, at the same time, concerned about artificial inflation of small savings collections through diversion of savings with financial institutions like co-operative and commercial banks. One of the northern states, for instance, is supposed to have shown a sizeable increase in small savings in 1973-74 by transferring funds from its co-operative banks.

The Fifth Plan target for small savings, as for everything else, was fixed in 1972-73 prices. One should have expected it to be revised to allow for the price rise. However, the Finance Ministry is evidently concerned that even the target of Rs 1,850 crores in current prices may not be fulfilled.

How does the Finance Ministry hope to cope with the problem? Most financial assets, be they post office and bank deposits or provident fund and life insurance accumulations, are earning negative interest rates at present. A straightforward way of countering the impact of inflation on financial savings would be to introduce some sort of indexing. But any suggestion in favour of indexing usually meets with opposition on the ground, firstly, of the alleged insensitivity of household savings to the rate of interest and, secondly, of the serious danger of indexing itself adding on to the inflationary pressures.

Neither of these arguments is difficult to meet, however. The first argument ignores that even though household savings may not be very sensitive to interest rates in the sense that households decide on the amount to be saved regardless of the rate of interest, they may still not be insensitive to the opportunity to earn higher rates of interest (including capital appreciation) on whatever they decide to save. Higher interest rates may, therefore, induce them to hold a relatively higher proportion of their savings in the form of financial assets. As for the second argument, that higher interest payments will add to the inflationary pressures already operating, it can be met by some device whereby payment of the higher interest rates is deferred by, say, about a year — though too long a deferment itself will have to be compensated.

The pundits of the Finance Ministry, however, appear to have already made up their minds on the 'right' step to make small savings more attractive. It is apparently proposed to offer still higher tax exemptions to small savings. Though the justification advanced for this step will be the erosion in the value of the rupee, the real reason, one suspects, is that with the reduction in the marginal rates of income tax the differential in the taxable rate of interest for those subject to the highest marginal rate of tax has been slashed from the unbelievable figure of 220 per cent to only 22 per cent.

This decline in the tax advantage from small savings to those in the higher income levels has, of course, nothing to do with the inflation. To compensate for it by raising the tax concession on small savings amounts to making it possible for the tax-payers to eat the cake and have it too — to pay tax at lower rates and yet retain the tax advantage on small savings intact. To the genuine small saver who gets very little, if any thing at all, out of the tax concessions on small savings the proposed enhancement of these concessions will not increase the attractiveness of small savings. To him the larger tax concession will be no compensation at all for the loss in the real value of his saving because of the inflation.

As for preventing diversion of funds from financial institutions to small savings, is not the Centre itself to blame for what is happening? The whole business of linking a part of loan assistance to the states with small savings collections was wrong. However, the Centre went even further and allowed a part of provident fund accumulations to be put into small savings, thus putting certain states at a clear advantage *vis-a-vis* others. Is it surprising, then, if the latter resort to the type of practices referred to at the beginning to boost their small saving collections?

TDA

Inflation by Duplication

IN its fourth year, the activities of the Trade Development Authority (TDA) appear to have gathered some momentum. Exports of its clients not only nearly doubled, from Rs 23 crores during 1972-73 to Rs 45 crores during 1973-74, but the share of the type of exports it is encouraging to its chosen markets, *viz*, Western Europe, the US, Japan and Canada, has risen considerably. The target of exports of Rs 75 crores which the TDA has set for 1974-75 would in all probability be overreached. However, this would happen not only because of the efforts that the TDA is putting in for its clients but also because of certain other factors.

As the chairman of the TDA, who also happens to be Secretary in the Ministry of Commerce, has reiterated, the TDA was started by the government in an attempt to promote exports through commercial development programmes mainly in the markets of certain selected developed countries. In addition to the work done by the export promotion councils for their clients, the TDA was asked also to offer package assistance to individual exporters which would carry them from the stage of intention to export, through the collec-

tion and collation of information, product development, market research, export finance and assistance, to securing and executing export orders. The primary objective was to induce and organise the medium and small-scale entrepreneurs to develop their individual export capability. But as is wont to happen with organisations that get obsessed with statistical targets, the TDA has forgotten some of its basic objectives.

The clients of the TDA can also concurrently be members of other export promotion councils (EPCs); consequently, what are claimed as export achievements by the EPCs would also figure as export achievements of the TDA. Since the EPCs are generally preoccupied with the big few among their members, the TDA could have played a role in promoting the small and medium-scale units. However, even a cursory examination confirms the impression that almost all the prominent producers of the items of particular interest to the TDA feature in the TDA's list of its clients. Among such big clients are also organisations like the Projects Equipments Corporation (PEC), State Trading Corporation (STC), and Rajasthan Financial Corporation. The PEC and the STC are themselves public sector bodies deeply involved in export marketing activities. Why, then, are they enumerated as 'clients' of TDA?

Such duplication and overstatement of real achievements in terms of basic objectives has become an almost regular feature of the Commerce Ministry's activities. Thus the Ministry announced with a lot of fanfare this year that to remove the supply constraint on exports it had created a new Department of Export Promotion headed by a full secretary. In consultation with the other economic and industrial ministries, the department was to ensure expansion of the production base to increase the availability of the items of export. It was expected to do much of the lobbying required to obtain the production licences, secure priority allocation of raw materials, domestic and imported, and also ensure the availability of imported machinery and capital goods required for export production. But the TDA too is supposed to be doing a number of these tasks, some of which also fall within the purview of the various EPCs.

The idea of TDA as conceived was unexceptionable, except for the fact that it evidently failed to take into account the other institutions already in the field and to ensure that the TDA's focus was on just a few producers. A TDA-type organisation each for different export products so that export promotion for the smaller producers would get underwritten may better meet the requirements of the situation. The present structure and working of the EPCs leaves much to be desired. If the government is really serious about export promotion, it needs to take a comprehensive view of the export effort required for the more important export products.

Two Tehsils in Maharashtra

Part of the Pattern

A Correspondent writes :

SITUATED near the Madhya Pradesh border, Melghat and Achalpur tehsils of Amravati district are yet to come out of their feudal past, in spite of flourishing cotton cultivation and orange orchards and improved food production. Land distribution in both tehsils is highly skewed, particularly in Achalpur.

Achalpur has a sizeable landholding population of about 34,000 and Melghat of about 9,000. More than 60 per cent of the arable land in Melghat is devoted to food production, though in recent years there has been some shift of land from food to cash crops. Achalpur, on the other hand, has a growing cotton cultivation and orange orchards, which make the region relatively prosperous. According to the 1971 Census, Melghat has the highest proportion of tribal people in the population among all the tehsils in Amravati — 73.6 per cent. In Achalpur, however, the tribal population is hardly 11,000 in a population of 2.60 lakhs.

Despite these differences in the nature of productive activities and the composition of the population, the plight of the landless workers and poor peasants in the two tehsils is broadly similar. For the landless labourers farm work is the only available source of employment, and that too from July to December with occasional breaks. During the slack season, the rural poor survive on marginal activities like wood-picking or they starve.

Lack of organisation of the peasants and the existence of a vast reserve of army labour enable the rich farmers to force the labourers to work at subsistence wages. A male labourer cannot earn more than Rs 2.50 per day and for women the maximum wage is Rs 1.50. Children get still less. The following is the general range of wages:

	Maximum Rs	Minimum Rs
Men	2.50	1.50
Women	1.50	0.75
Children	1.25	0.75

In Melghat there is a class of contract labourers, known as 'saldar majdoor'. The saldar commits himself to working for a particular farmer for a yearly sum of Rs 150 to Rs 200.

Given their meagre wages and long spells of underemployment and unemployment, the rural poor are forced to borrow in order to survive. These loans are taken at exorbitant rates of interest. In Achalpur and Melghat interest rates between 50 and 150 per cent are quite common. Lands, livestock and even utensils are forcibly confiscated by the moneylenders from defaulting peasants. In fact, moneylending has been a major source of transfer of land in this region — so much so that in places like Melghat 'sahukars', meaning moneylenders, are often synonymous with 'big landholders'. Some years ago, after a famine in one of the villages of Melghat, the government auctioned lands of peasants whose rents were in arrears. In auction 50 acres were sold for Rs 25 — and the buyer was none other than the village Patel!

The pattern is the familiar one: low wages as a result of backwardness and unemployment drive the impoverished peasantry into the hands of the moneylenders; the loans they take at usurious rates of interest keep them in permanent bondage and keep wages at starvation level.

The government has recently introduced some schemes supposedly for improving the peasants' condition. In Achalpur a cotton scheme has been mooted with the blessings of the World Bank to increase cotton production. Poor farmers and landless farm workers are expected to benefit from the fallout of this project. For Melghat also, some such projects are being planned. However, the poor peasants and the vast mass of landless are sceptical about these schemes. Their reservations are more than justified because of the hold of the landholders and moneylenders over the social, political and economic system which is such that they will skew the distribution of benefits of any scheme, however successful, in their own favour.

Calcutta Diary

A M

SOMETIMES one does not feel like writing about a fact, because by the very act of writing one confirms that fact. Daniel Thorner said a quiet goodbye, a couple of weeks ago, in Paris — one quarter the world away from his native United States, one quarter the world away also from his other home, India. This should not have been allowed to happen. One wishes he could be persuaded to return to those noble United States of America, of whose great liberalism he was such a flaming heritage. Something had however snapped. The wonderfully generous man was also an intensely bitter man within. Joe McCarthy's wayward America had shoved him out in those hazy early 1950s. Daniel Thorner lived just long enough to see the ordinary decencies gradually return to the American establishment. One would have understood his impish pleasure at the re-awakening of the American commonsense. He, no doubt, was having great fun now that the impostors had begun to receive their just deserts. But he was a proud man. He would not go back.

Stories which are not written are, more often than not, the stories of private courage. Heroes are not the ones on whom newspapers expend their column-inches. They are a different genre. They embrace a principle, cling to it, live by it. Daniel Thorner was a man of principle, a man of enormous character: Joe McCarthy and his clime could not cow him down. To him, the bully was a bully, be he an honourable member of the United States Senate, or the Vice-President of the nation. If he had, for example, once upon a time known Owen Lattimore, broken bread with him, Daniel saw no reason for not owning up to that fact. At both Columbia and Philadelphia, he had, in his time, come across several other 'security risks'. He could not care less for the consequences: a man of character does not rat upon his friends. He would rather chuck his job, walk out, if need be, go to prison. The Dashiel Hammetts and the Daniel Thorners made up that other part of America's political and social history of the post-World War II decades: a history which is no less true simply because few talk about it.

You can interpret it either way: that Daniel Thorner was pushed out, or that he himself took the initiative to say boo to the hysteria at home and sail away. Whichever way it was, the grit of the man came through. Why did he come to India? Because his graduate research was on a theme concerning India? Because he had spent the major part of the war years here? Because he took Tagore at face value and was thus assured that this was the land where the mind could be without fear and the head could be held high? Because it was where most of his friends were? At this distance, it is idle to speculate on the factors underlying his decision. He came, bereft of funds, but loaded with integrity.

It would now be a trivial thing to state that he loved India and Indians. He *adopted* India: history will be incapable of recording a more remarkable empathy. There he was, Daniel Thorner, the scholar who was also an activist, up and down, jumping, shouting, arguing, calling a fool a fool to his face in case the fool also happened to be a crook; Daniel Thorner unravelling the sociology of the economics, the capitalism in the socialism, separating the grain of candour from the chaff of verbosity; Daniel Thorner with his zest and intensity, his bewitching smile and eyes constantly rolling in mock wonder, his magnanimity and a hundred kind gestures, his rudeness and plain speaking which could demolish, at one stroke, stodgy, hitherto-secure reputations. It was a total identification with the Indian milieu. He gave as much as he took. He took because nobody, he assumed, would question his prerogative to give back. He, after all, was an Indian, as much as, if not more than, that charlatan next door, who expiated on poverty while unabashedly making his millions. He took it for granted that, having made that difficult, lonely migration from the now-no-longer liberal United States to the pristinely liberal India, he would be taken for granted, and there would be no characters around to question his credentials.

He was wrong, as he was on many other occasions in life. Meanmindedness has no particular nationality. Daniel Thorner arrived in India in the early fifties, somewhat short of funds, accompanied by a family each of whose constituents was as brave and full of compassion. But it was not a tranquil existence. He loved, lived and battled for India. A few over here thought his expressions of exuberance as belonging to the species of the presumptuous. A few others took it that this man, financially so much out on a limb, was available for exploitation. Some were condescending, some were suspicious of his headlong rush to radical prescriptions. It would have been futile to point out to them that the fault did not lie in the shape of Daniel Thorner's mind, but in the structure of the polity they themselves were directly responsible for.

Daniel Thorner could be forgiving. Perhaps he had exhausted most of his bitterness on the knaves back home in America. About the Indians who would not want him around, would not want him to poke his nose into the the distribution of water from the Sarda Canal or the hocus-pocus of the co-operative societies fattening themselves at the expense of the hapless rural poor, he preferred most times to keep quiet. For, by then, he had developed a fiercely protective form of patriotism, something which was never evident in his attitude toward the United States. In case there was company, *foreign* company, he would refuse to run down India, his native land; on the contrary, he would have a ready explanation for every folly indulged in, and every sin committed. The biting words would come out when only compatriots were around: comrades, we call this self-criticism.

Despite all that, he could not arrange for his victuals in India. Hence Paris. It was an awkward equilibration, an expatriate in Europe, but it was as an Indian, not as an American, that, one suspects, he felt the pangs of his state of exile. Which would be why he would, all the while, be looking for pretexts to return to India, even if it be *en route* to altogether far-fetched destinations. For Daniel Thorner, all roads led to India — and through India.

He had strong likes and dislikes. One dares say he too evoked equally strong likes and dislikes. He could not forsake Indians, for they mattered to him. And just as there was no dearth of men, in Bombay, in Delhi, or in Calcutta, who would give continual expression to their deeply felt malice toward him, there were many others who could never forsake him. Daniel Thorner grew on you. At least to a few, he was good expiation for their often irrational, nearly rabid anti-Americanism. Such people who used Daniel Thorner to salvage their own conscience hardly deserved any sympa-

thy. For much larger numbers, Daniel Thorner was what he was: the quintessence of integrity and basic human virtues. His nationality was irrelevant: whether he was hounded out of America during the mad days of McCarthy or was the victim of some pretty abominable manners in New Delhi or Bombay became, after some time, so much minutiae — as Daniel would transcend each of these.

These are difficult lines to write. In the final analysis, the passing of a friend is always an intensely personal loss. One's ideologies and predilections are relevant, but they are relevant only insofar as they are instrumental for ushering in, howsoever partially, a climate of circumstances. These circumstances enable people to draw close and get to know each other. The rest is severely personal. Bonds of loyalty and affection are phenomena which defy analysis. Despite William Butler Yeats, it is impossible to remember all those renowned generations, it is impossible to remember all that have sunk in their blood, all that have died on the scaffold, or, for that matter, all that have fled, or stood and standing took death like a beat on an old tambourine. It is however equally difficult to assert that all that is finished will, and ought to be allowed to, fade. The memory of Daniel Thorner, whose body gave up its last resistance in Paris last month, will not fade. For it is an intensely personal memory. To allow it to fade is to permit a part of oneself to die. One had rarely met a greater Indian than Daniel Thorner. One should have the civility to add, or a greater American either. A nation is made up not just of the Joe McCarthys; the Norman Browns and the Daniel Thorners are as much a part of it. The part is never greater than the whole, but it is the parts you choose to own which matter most of all. Many Indians came to own Daniel Thorner, and he them. This is not a tribute, but a confession. And Daniel hated long goodbyes.

CAPITAL VIEW

Diplomatissimo

Romesh Thapar

THE way this Kachchativu business was settled with Sri Lanka was such a delight. No speculation. No leaks. No wrangling. Just wake up one morning and read about it. The rantings of the Jan Sangh, against this background, deserve the contemptuous reaction they receive. Obviously, this matter was handled at higher levels than the Foreign Office — probably at the Prime Minister's level.

If Kachchativu is a bright spot in our handling of affairs, the Sikkim crisis is not. To the moment of writing this, when everyone appears to be in disarray, sought to be covered up with exaggerated posturings, no coherent explanation has been given of what actually happened to persuade the Chogyal to turn obstructionist to the necessary democratic transition in this Himalayan outpost. Or, maybe, it is just a question of 'second thoughts' sparked off by foreign adventurers. Whatever the scenario, it needs telling.

These two contrasting comments are necessary if only to highlight the sad and tattered state of our foreign service and our representation abroad. Whatever the merits of a Swaran Singh, he cannot possibly make up for the lags in official functioning that damage our credibility abroad and encourage snide comments about 'those Indians'. Nor can we indulge in the usual and commonplace rationalisation that the foreign service does a remarkable job "considering the prevailing conditions of work and pay". The time has come to carry out a major reorganisation — and a purge, if need be — of the service inherited from the days of Jawaharlal Nehru. Here, again, no short-cuts will yield results.

Even within the foreign service, one can discern the beginnings of an introspection. A small corps of officers, equipped with diplomatic small-talk and the sophistication that goes with it, and a vast army of clerks, variously trained but with an eye on making as much as they can, constitute this pseudo elite corps. If the *status quo* persists, we should soon be appointing the clerks to represent us. A brilliant, outstanding clerk has his uses, but diplomacy requires other dimensions. Promotion by seniority alone is the death sentence for any service, particularly one dealing with international problems. Decorated promotion for real talent and fresh blood, are vital.

Something of the blurring of perspectives can be seen in the preparations for building economic expertise in the foreign service — a vital element in our diplomacy these days. Short courses at the Commerce Ministry, a course or two at some institute of economics and, behold, we have an Economic Counsellor. Those businessmen who have had to deal with our diplomatic outposts tell a traumatic tale of incompetence, delays, and incomprehension. Occasionally, a bright fellow pops up and cuts his way through the bureaucratic bally-hoo, but he is a 'specimen' not to be advertised as a model — and the 'confidential report' on him probably says as much.

One could sympathise with the officer cadre of the foreign service who groan about the favourites from outside — the defeated politicians and the boot-lickers who wend their ways to top diplomatic assignments. But, then, where are the men from within the service? So few, indeed, that you can count them on your fingers. Actually, the speculation in South Block these days is about an 'outsider' for Foreign Secretary. When that happens, the time will have come to move the Foreign Office cadre to patriotic tasks within the country!

Not a few have tried to discover positive points in the functioning and the precedents by which the Foreign Service fulfils its role, both as representative of its country and as an efficient service for visiting Indians who need specific assistance that only an embassy can provide. The story, somewhat unkind, suggests that Air India does a better job of looking after visitors. The lazy attitudes which pervade the Foreign Service are best seen in the archaic rules and regulations by which the embassies function. Admittedly the 'babu culture' is not an exclusive preserve of any single arm of government; it gets deeply etched into areas where local babuism has not triumphed as in India.

There's little point in getting over the impending crisis by extending the terms of a variety of functionaries at the Capital and in various world Capitals. This is precisely what is being done, and on the flimsiest of excuses. The time has come to let the crisis build so that solid thinking on restructuring can be done, or else we will never think. Alternatively, we will drift along until we find ourselves in a morass from which we cannot extricate ourselves. Then, we will start screaming.

Yes, here is a tidy little operation which can be undertaken. It is not like attempting a reorganisation of the system atop which the Government of India festers. Will someone stir, or are we all happy to rot slowly, diplomatissimo?

GOODYEAR INDIA, which paid a dividend of 20 per cent and also issued bonus shares on a one-for-one basis last year, is skipping dividend for 1973. The year's results have been extremely poor, with net profit plumetting from Rs 203 lakhs to a mere Rs 17 lakhs. This outcome occurred following only a 12 per cent shortfall in net sales. The profit erosion was mainly due to inflation which brought substantial increases in manufacturing costs with no corresponding increases in selling prices. Although the factory at Ballabgarh in Haryana operated under the constraints of power cuts, irregularities in supplies of coal, shortages of several raw materials and labour problems which entailed closure of the plant for a period in July 1973, production could be maintained at the 1972 levels. However, sales were lower because of the reduced availability of industrial rubber products and accessories from outside sources. The redeeming feature of the report is that the company achieved record production in last December and the output trend has continued to be encouraging since then. Profitability suffered in the first quarter of the current year owing to "unprecedented" rise in the cost of raw materials, but the picture has vastly changed since the decontrol of prices of automotive tyres and tubes from April. The directors foresee improved prospects for the current year, if raw material and power supplies are not greatly restricted. The company's foreign exchange earnings amounted to only Rs 39 lakhs while the c i f value of imports of raw materials, components and spare parts and capital goods and expenditure in foreign currency on account of technical fees, commission on exports and interest aggregated about Rs 95 lakhs. Besides, the amount remitted in foreign currency on account of dividends for 1971 and 1972 was Rs 45 lakhs. It may also be noted that the interest expenditure does not include about Rs 24 lakhs paid in local currency on loans obtained in foreign currencies from ICICI.

HOECHST DYES AND CHEMICALS' production of polyvinyl acetate dispersions declined to 1,736 tons in 1973 from the previous year's level of 2,277 tons owing to non-availability of the principal raw material, vinyl acetate monomer. The price of this raw material also increased considerably as a result of the oil crisis and the company promptly jacked up selling prices. Sales of dyestuffs and textile auxiliaries, refrigerant gases and high density polyethylene were higher compared to

° 11 months † 12 months

the previous year. Orders booked for polyester fibre too showed a sizeable increase. Total exports rose from Rs 7 lakhs to Rs 27 lakhs. Margins looked up and net profit was a third better compared to the previous year. Dividend, reduced from 25 per cent to 12 per cent on the capital enlarged by a bonus issue, claimed slightly less than in 1972 and found a better earnings-cover. The shares offered to the public were allotted in January last and are not eligible for any dividend for 1973.

BAYER (INDIA) has received an industrial licence for expansion of capacity for manufacture of chloroquine phosphate, from 4 to 12 tonnes, on the condition that manufacture of the expanded capacity will be from a more basic stage and based on indigenous raw materials. The enhanced production is expected to start during the second half of this year. Government has also approved the capital goods to be imported for the expansion projects of rubber chemicals and pesticides. The rubber chemicals project will cost about Rs 3.5 crores and the pesticides project Rs 2.5 crores. The company is well placed in respect of its requirements of raw materials. Sales in the current year have been some 35 per cent higher than in the same period last year. The price of the company's share had been rising consistently on expectations of the announcement of an issue of bonus shares at the annual general meeting; but the price fell sharply on the eve of the meeting. The chairman, B M Ghia, assured shareholders that the board would consider the question of issue of bonus and 'rights' shares and decide in three or four months. The company has fared very well during 1973, with higher sales and better margins compared to the previous year. Net profit, however, turned out to be lower owing to increased tax liability. The tax provision of Rs 198 lakhs includes Rs 155 lakhs towards the surtax liability. No provision had been made for surtax in the previous year. Dividend is maintained at 20 per cent. Ninety per cent of the distribution will be exempt from tax. The company has not been given extension for continuing its indent business beyond July 1973.

WARNER-HINDUSTAN has submitted a revised proposal for issue of bonus shares on a three-for-ten basis, as its earlier proposal to issue these shares in the proportion 1:2 was turned down by government because the residual reserves after the proposed capitalisation did not meet the 33-1/3 per cent test laid down in the revised gudelines for bonus issues. The company's latest accounts relate to a period of 11 months ended November, and therefore are not strictly comparable with the previous year's figures. Even though, on a 12-month comparative basis, the company's sales and profits showed a moderate growth, margins have been slightly depressed. Inflationary pressure and power shortage apart, what restricted the company's growth was a 59-day strike at Hyderabad. Dividend has been repeated at 18 per cent and is covered twice. The ratio of inventories to sales increased considerably over the previous year. The company increased exports from Rs 10 lakhs to Rs 12 lakhs. A large quantity of 'chiclets' was exported for the first time from India.

WG FORGE AND ALLIED INDUSTRIES' public issue of 13.80 lakh equity shares of Rs 10 each at a premium of Rs 2.50 per share has evoked a good deal of interest among investors. The issue is being made to raise part of the funds required for the Rs 284-lakh project to expand capacity for forgings by 4,000 tonnes by the 'pour forge' process and to undertake manufacture of 12,000 finished crankshafts per annum. The public issue will bring down the shareholding of Wyman-Gordon of USA to 39.4 per cent. The crankshaft project is expected to be completed by mid-1975 and the 'pour forge' project by the end of that year. The 14-year-old company, formerly known as 'Wyman-Gordon India', has an impressive past record of sales, assets growth, profitability and dividends. Over the last five years ended December 1973, turnover expanded from Rs 3.63 crores to Rs 9.14 crores, gross block from Rs 2.78 crores to Rs 6.99 crores, gross profit from Rs 89 lakhs to Rs 202 lakhs and profit after tax from Rs 49 lakhs to Rs 77 lakhs. Dividend, paid at 10 per cent for the first four of these five years, was stepped up to 15 per cent for 1973 on capital enhanced by issue of bonus shares on a three-for-four basis. Reserves as at the end of 1973, after the bonus issue, stood at around Rs 158 lakhs against the paid-up capital of Rs 175 lakhs. The present installed capacity is 11,000 tonnes of forgings per annum. The company expects to produce 12,000 tonnes of forgings in 1974 and to achieve sales of about Rs 15 crores and a gross profit of Rs 2.84 crores. At full capacity, after implementation of the two projects, sales and gross profit are expected to be around Rs 26 crores and Rs 5.60 crores, respectively. Out of the present issue, 1,60,000 shares have been reserved for allotment to LIC, 80,000 shares to UTI and 3,00,000 shares to directors and employees of the company. The public is being offered 8,40,000 shares. The subscription list will open on July 24 and close on August 2 or earlier, but not earlier than July 27. An unusual and welcome feature of the issue, managed by FNCB, is that it has not been offered for underwriting.

JAYANT VITAMINS, which recently commissioned its vitamin C plant at Ratlam in MP, has planned a programme of expansion and diversification which, when implemented, will considerably enhance its profit-earning capacity. The present licensed capacity of 143 tonnes of vitamin C per annum is being sought to be doubled to help bridge the gap between the country's total requirements and production. The company also intends to set up an edible protein plant with an annual capacity of 300 tonnes at a cost of about Rs 70 lakhs. Meanwhile, manufacture of sorbitol is expected to commence by October next. Of the total annual production of 1,200 tonnes, nearly half would be supplied to outside parties and the balance would be retained for captive consumption. It is also intended to undertake, in course of time, manufacture of glucose for the company's own requirements. The quality of vitamin C produced by the company has been found to be very good, and the company is seeking an upward revision of the selling price.

UNIVERSAL CANS AND CONTAINERS is offering 1,35,000 equity shares of Rs 10 each at par, through a prospectus, to raise part of the finance required for its Rs 49-lakh project for manufacture of 18 million aluminium collapsible tubes per annum. The project is being located at Taloja, lying in a 'backward' area of Maharashtra, where the company will be entitled to a special incentive from government. Part of the machinery is being imported from West Germany. The project is expected to go on stream by October or November next. The management expects the company to pay a maiden dividend for the year ending September 1976. The subscription list will close on July 22 or earlier, but not earlier than July 15. The public issue is managed by FICOM. The board is headed by S M Dahanukar.

FROM OUR CORRESPONDENTS

MAHARASHTRA

Vindictive Turn

THE Maharashtra government and its employees, numbering over two lakhs, are once again locked in a confrontation. In a symbolic protest against the vindictive attitude of the government and its attempt to divide the employees, the state government employees staged a 48-hour 'dharna' from the evening of June 21 in front of government offices all over the state. In Bombay the 'dharna' was staged at Chowpatty, not far from the Chief Minister's residence.

The 'dharna' expressed the strong resentment among the state government staff against two recent decisions of the government. The government has decided to treat participation by its employees in the nation-wide one-day token bandh on May 15 in support of the railwaymen's strike as constituting a break in service. This decision has serious consequences for the employees; at one stroke, it wipes out their entire past record of service. Second, the government has revived its decision, taken in November 1970 but held in abeyance, to grant two additional increments to those who did not participate in the 12-day strike of state government employees in November 1970. The non-strikers, who number about 15,000, are to get advance increments with retrospective effect from November 1970. The amount of the two increments is proposed to be credited to the provident fund accounts of the employees. The arrears on this account are also to be credited to the provident fund accounts.

Apart from the withdrawal of the vindictive decision of the state government, the other main demands of the state government employees are security of service for 80 per cent of class III and class IV employees who, despite long years of service, are still regarded as 'temporary' workers. Their temporary status means that they can be discharged without notice and without any reasons being assigned. They are also not eligible for pension, gratuity or retrenchment compensation. The Confederation of State Government Employees has also demanded that those government employees, numbering over 60 per cent of the total, who do not today get any house rent allowance should be paid this allowance. It has also been demanded that the minimum wages of class IV employees, which are now Rs 189 per month, should be raised to Rs 250. It is pointed out that the counterparts of class IV employees receive Rs 220 per month in the State Transport, Rs 250 in the State Electricity Board and Rs 240 in the Bombay Municipal Corporation. Similarly, it has been demanded that the class III employees' minimum salary, now fixed at Rs 250 per month, should be raised to Rs 400

It is significant that the state government's decision to give two advance increments, taken as far back as in November 1970, should have been revived after the railway strike. In the last four years the government had postponed the implementation of the decision more than ten times, following agitations by the employees' organisations. Even Rajni Patel had, soon after his appointment as president of the Bombay Pradesh Congress Committee, warned the state government against reviving the decision to grant two supplementary increments to the non-strikers. The revival of the decision is clearly a part of the government's new policy of toughness towards labour. This time there have been no protests, from the BPCC president or any of the other 'Leftists' in the Congress.

The vindictive attitude of the government is brought out even more clearly by the decision to treat participation in the bandh on May 15 in support of the railway strike as constituting a break in service. This was by no means the first instance of such action by government employees. In April 1970 almost all non-gazetted employees of the state government had resorted to a one-day mass casual leave in support of their demands. This was followed by a three-day mass casual leave in August 1970. Then followed the 12-day strike in November 1970. More recently, on April 9, this year the employees observed a one-day mass casual leave to press their demand for dearness allowance at the Central government rates and other benefits like house rent allowance. In all these cases the employees' absence was treated as leave without pay and condoned as part of legitimate trade

union activity. The question then is : what happened between April 9 — the date of the mass casual leave — and May 15 — when the government employees participated in the nation-wide one-day bandh — to explain the government's decision to treat the latter action as constituting a break in service?

The various associations of state government employees formed themselves into a Confederation in 1962. Although the organisations of state government employees as well as the Confederation have deliberately remained aloof from the trade union politics of the political parties in Bombay and in the rest of the state, their strength and unity have grown. The decision to treat participation in the May 15 bandh as a break in service and to give two additional increments to non-participants in the November 1970 strike is an attempt to warn the employees that their association with the organisations of government employees and with their Confederation is being taken seriously and is fraught with serious consequences for them in terms of their prospects of promotions, etc. It is also an attempt to divide the employees, by rewarding those who will not take part in trade union activities and punishing the others.

ASSAM

Students Fill the Vacuum

B K Bhattacharyya

THE vacuum created by the inaction of the established political parties in Assam has been sought to be filled by students who have been carrying on an agitation based on a 21-point charter of demands. The demands are divided into long-term and short-term ones, but have little to do with specifically student or educational problems. The usual demands for job-oriented education and overhauling of the education system have been voiced as part of more general demands. This has expected attracted the charge that the students' agitation is 'politically-motivated'. The students have not shied away from the charge, but have quite openly emphasised their social and political role.

The long-term demands of the students include the establishment of a socialist economy, nationalisation of all foreign capital and state trading in all food articles. The students have also demanded an end to eviction of peasants — the so-called 'squatters' — from the lands on which they have been living and the rehabilitation of those already evicted. In particular, the students have taken up the issue of the eviction of peasants from the Doyang Valley Reserve on the Assam-Nagaland border. During the eviction operation there, many excesses were committed by the police. The students have demanded an inquiry into the circumstances of the death of a girl, Nilima Bora, who had been ill and who died following the eviction operation. Another demand of the students is that measures be taken to stop the unchecked immigration into the state. The people of Assam have for long regarded this immigration as the cause of their being deprived of land, jobs and business opportunities. It has even been suggested that, like the Bhotiya-Lepchas in Sikkim, the numerically weak Assamese might be politically overwhelmed and deprived of economic opportunities by the immigrants. Other demands of the students include industrialisation, flood control and the setting up of a large oil refinery near the source of oil in Upper Assam.

But it is really over the demand for public procurement and distribution of foodgrains that the movement has really gathered momentum. A weekly ration of 3 kgs of rice at the rate of Rs 1.20 per kg and 2 kgs of atta at the rate of 75 paise per kg to every adult, to be distributed through the co-operatives and fair-price shops, is the students' main demand. The price stipulated by the students is 40 paise per kg lower than even the controlled price; the current blackmarket price is over 250 per cent higher. Similarly, the ration quota demanded by the students is 4 times the present quota. Other related demands include distribution of essential items like salt, oil, dal, potato, onion, kerosene and paper at subsidised prices.

These demands have made such a great impact because of the government's failure on the food front. The rice trade take-over launched in November 1973 was aimed at replacing the 600 or so wholesale traders by an equal number of co-operatives. The responsibility for procurement had been entrusted to the FCI and the State Apex Marketing Co-operative. The procurement for kharif cereals was fairly successful, falling short of the target of 20 lakh quintals by only 3 lakh quintals. Yet there was acute rice shortage by May. While the co-operatives were unable to maintain normal supplies to the rationed areas, rice disappeared from the free market following a government-backed public dehoarding campaign in which the students also participated. Even the good rabi crop did not save the situation and the state had to seek special quotas of atta from the Centre to ease the rice scarcity. The population in the rationed areas is now living on a rice-atta diet, which is not at all popular.

What has angered the people most of all is the impotence of the established political parties and political institutions. The Assembly meets and passes resolutions. These have become non-events. Ministers talk of tomorrow, not today. The newspapers, while they try to curry favour with the public, resort to cliches to obscure the truth. It is now widely accepted that democracy is often better served by movements outside the established political institutions. The student movement has given expression to the people's dissatisfaction with and anger against the government more effectively than anything done by the political parties.

The state Chief Minister, S C Sinha, had taken a liberal attitude to the students' movement till May. Two subsequent developments, however, changed the government's attitude to the movement. The railway strike convinced the government about the effectiveness of strong-arm methods. Secondly, the Chief Minister began to suspect that his opponents in the Congress and some opposition parties like the SP and the CPM were behind the student movement. He entrusted some of the colleagues with responsibility of weaning away backward class students from the All-Assam Students' Union (AASU). He also cautioned the Opposition and Congress MLAs against the potential danger of the wrath of the students being directed against them, as had happened in Gujarat and Bihar. Two Congress MLAs, Rebati Das and Birenram Phookan, were suspended for signing a declaration supporting the students' charter of demands, even though they claimed that they had done so under duress. In the meantime, Congress dissidents began to surface under the leadership of Biswadev Sarma, a ex-Minister and a Congress high-up. They held an open convention at Nowgong a month ago and for this they were able to obtain messages from Fakhruddin Ali Ahmed, Union Food Minister, and Moinul Haque Chaudhury, former Central Minister. The situation faced by S C Sinha is similar to that faced in 1970 and 1971 by the-then chief minister, M M Chaudhury, now Governor of Punjab. Sinha has the support of the Assembly Congress party but cracks have appeared in the party organisation. Many of his old comrades are dissatisfied with the way the government is functioning. There are many failures to which they can point. Food is one. The 'garibi hatao' programme is another. And, above all, there is the students' agitation.

All this apparently convinced the Chief Minister that unless the agitation was dealt with firmly, his regime might be threatened and his opponents in the Congress party might stage a coup. The five-day student satyagraha from June 7 to 12 was marked by two instances police firing in one of which two school boys, belonging to the backward classes, lost their lives. A large part of the state was put under curfew and police resorted to lathi-charges on flimsy pretexts. The show of force was repeated on June 25 when the students observed a bandh in protest against police repression. The bandh was only partially successful because of the tardy response to the call given by the AASU leadership from some sections of students. But the day was marked by a grave incident in the University campus. The government used the police force to keep road transport buses running and to put pressure on shopkeepers to keep their shops open. The students protested against this and obstructed some buses from plying. Later these buses were released and at that stage the police should have withdrawn. This did not happen. Instead there was a raid on the students' hostels. Residents of one of the hostels were mercilessly beaten. One student received serious injuries. This happened right in the presence of the Vice-Chancellor, who was a helpless witness to the tragedy.

Many student leaders are now under arrest. Most of them were arrested without warrants. The government is apparently determined to continue its policy of repression. However, the food and price situation remains precarious and so the students' agitation will continue to attract popular support. Secondly, dissidents in the Congress party are waiting for the opportunity to use the agitation for their own purposes. They have already despatched a delegation to New Delhi to present their grievances to the Congress High Command.

It may be too early to say whether the Assam agitation will assume the proportions of the movement in Bihar. It may, if the police repression continues unchecked.

Nagaland Chief Minister's Quest for Peace

Brahmanand Mishra

FOR many years, Vizol, who became Nagaland's Chief Minister last February, has been unceasingly trying to bring about peace in his strife-torn state. As a first stage towards reconciliation with the underground Nagas, he has suggested that New Delhi stop all military operations.

In a recent interview, I asked the Chief Minister to comment on the Government of India's reaction to his unique proposal. He replied that the proposal had been received with appreciation but hastened to add that there was a difference between appreciation and implementation. He felt that the solution to the Nagaland problem lay in "reconciliation through persuasion". There was no other way out. He strongly felt that the period of confrontation stretching through more than 25 long years "had led us nowhere". Though there had been some sort of relative peace recently, the tension had continued. It was to bring this tension to an end that he was proposing the stoppage of army activities in Nagaland so that the sober elements among those in rebellion could get some time to think coolly about what was in their best interests. During the past two and half decades practically all methods — conflict, ceasefire, negotiation — had been tried and all had failed.

Vizol further stated that although the underground Nagas did not wield as much power as before, they were still a force which could not be ignored if there was a genuine intention of solving the problem. Persuasion could only work when there was "proper contact" with them. For this peace was essential. Peace was also essential to allow the ordinary people of Nagaland to carry on their day-to-day activities and so contribute their share to nation-building like the people of any other state of the country.

Asked about the Indian army's role in Nagaland, he said it had been the role of an army. Nowhere did any army love the people. But the army had to stay in Nagaland as long as the situation demanded it. He was conscious of security requirements. He did not share the view that the threat from Chinese-trained underground Nagas was imaginary. This threat was real and serious. Though the security forces, along the 900 km Nagaland-Burma border running through thick jungle and hilly terrain, were constantly on the alert, the underground traffic to and from China continued. The danger or threat from this traffic was not in the small quantity of arms brought in but in the ideas that came with the arms. He was all for putting an end to these links across the international border.

The Chief Minister then came back to the question of peace and said that Nagaland's Baptist Church leaders had recently formed a peace council and were trying to establish contact with the underground. This effort was welcome and the Nagaland government would give it all help. But the effort of the peace council was not enough in itself. If military operations continued, the atmosphere of fear, uncertainty and suspicion would also continue. No proper contacts or discussions could take place in such an atmosphere.

When asked if there was any move either from New Delhi or London for a meeting between the Prime Minister and Phizo, the exiled underground leader who was in London, Vizol said he was not aware of such a move. He, however, believed that after proper contacts with the underground had been made and discussions started, a stage would come when Phizo's participation or involvement would be necessary. Though Phizo had been away from Nagaland for a very long period, he still enjoyed some popularity among the Nagas. Therefore, without bringing him into the picture no permanent solution to the underground problem was possible.

ISLAMIC CONFERENCE

Participants in Common Struggle

Harish Chandola

THE fifth Islamic Conference of Foreign Ministers, attended by 36 states of Africa and Asia, which concluded its five-day session in Kuala Lumpur on June 25, made it absolutely clear that the Islamic world was an inalienable part of the third world of developing countries. The main theme of the conference was that it must strengthen its solidarity with other organisations of third world countries and unite all those struggling against domination and exploitation. The representatives of the Islamic world made it clear in their communique that the struggle against colonialism and imperialism was not over and that the "machinations of imperialism to sow seeds of disunity amongst the ranks of the developing countries" had to be fought.

There were some elements in the Conference who would have wished to devote more attention to religious matters and to quarrels with non-Muslim countries. These elements would have liked to avoid getting involved in problems of the common struggle of the third world. But such elements were overtaken by the tide of enlightened opinion of most of the leaders who did not want the Islamic world to stay aloof from other struggling peoples.

But what did the Conference actually achieve? Meetings or conferences do not formulate a set of orders which they then issue out to member countries to implement. They discuss common problems and recommend methods of solving them. These conferences provide guidelines and recommendations for concerted action. They also set in motion trends which become the common policy of countries. It is in this light that the decisions of the Islamic Conference have to be viewed.

West Asia, which continues to remain one of the major theatres where the people are locked in struggle with imperialism, is part of the Islamic world. The Conference therefore devoted a considerable amount of its attention to it. It began by stating that the West Asian problem was one that not only concerned the Islamic world but "all nations which were opposed to aggression". It stated that "the recovery by the Palestinian people of their national rights was the main condition for the establishment of a just and durable peace in the region and that the Palestinian people's struggle to recover their usurped land was an integral part of the peoples' struggles everywhere against colonialism and racial discrimination". The Conference called upon all countries to stop supplying Israel with arms and political, economic, financial and human support, which helped it to pursue its aggressive and expansionist policy. It asked all states to impose economic sanctions against Israel, in accordance with Chapter Seven of the UN Charter. About the current efforts being made for peace in West Asia and the disengagement of forces on the Egyptian and Syrian fronts, the Conference said peace there could only be established by complete Israeli withdrawal from occupied Arab territory and the recovery of all Palestinian national rights. It also expressed full solidarity with the Lebanese Government and people for the protection of the security and independence of Lebanon.

The other major theatre of struggle against imperialism is Africa. The Conference reaffirmed its full support for all national liberation movements in that continent and called upon countries not to establish relations with the Portuguese regime unless it started serious negotiations with national liberation movements in its colonies. The Conference expressed its full solidarity with the struggles of the peoples of the Sahara under Spanish domination and of French-controlled Somaliland, and Comoros and the British-controlled Seychelles.

The Conference, however, did not offer support to major Asian struggles, except that of the Philippine Muslims. It called upon the Philippine government to seek a political and peaceful settlement of its problems with the Muslims in its southern provinces. It decided to establish a Filipino Muslim Welfare and Relief Agency with contributions from Islamic countries to provide help to Muslims affected by the fighting in the southern provinces.

The Conference also stressed the need for joint action, along with other developing countries, to regulate the role and activities of multi-national corporations.

A jarring note was struck by Pakistan which insisted that India must be named for exploding a nuclear device in its resolution on "Strengthening the Security of Non-nuclear States". In pressing for naming India for allegedly enlarging the nuclear threat, both the Pakistan Minister of State for Defence and Foreign Affairs, Aziz Ahmed, and its Foreign Secretary, Agha Shahi, used the language of anger and bitterness, which created a great deal of unpleasantness in the Conference. Pakistan kept on trying to bracket India with Israel and South Africa for nuclear ambitions. This was not liked by most Islamic countries. Pakistan, however, won its point because its prestige at the Conference was high due to its successful holding of the Islamic Summit in Lahore four months ago. And the kingdoms of Saudi Arabia and Morocco, Pakistan's treaty partner, Turkey, the Secretary-General of the Islamic Secretariat in Jeddah, Hassan al-Tohamy, an Egyptian, and for unknown reasons, faraway Gambia, unreservedly backed Pakistan in whatever it said. Al-Tohamy began vilifying India by saying that it was collaborating with Israel in the development of nuclear devices and the Pakistanis supported him on this. But they did not succeed in prejudicing the others.

Through all this Bangladesh behaved in a calm manner. It stood by its principles of non-alignment and during the long debate on the Pakistan resolution, its delegates said they supported the operative part of it which sought to strengthen the security of non-nuclear states. But Bangladesh felt that either all the nuclear powers be named in the resolution or none. It wanted the resolution to note that the world was now divided among nuclear and non-nuclear powers, instead of merely "noting that on May 18, 1974, India exploded a nuclear device, thus increasing the number of nuclear powers..."

It should, however, be noted that the more meaningful decisions had already been taken prior to this Conference. An Islamic Solidarity Fund of US $ 20 million was set up. This Fund is to be used for the establishment of two universities in Africa, to provide relief to Muslims in the Philippines and to recruit experts for the Islamic Secretariat. With fresh contributions this Fund is expected to grow from year to year. An Islamic news agency has already been set up in Jeddah. There are plans to make it international in scope and to allocate $ 2.5 to 3 million for its expansion.

Since all the Islamic countries belong to the developing world, economic advancement remains their primary need. The Arab countries have agreed to use their oil wealth to promote such advancement. It is mainly with the help of their contributions that an Islamic Development Bank with a capital of $ 2 billion will be functioning by the end of this year.

Population and Poverty

Bharat Jhunjhunwala

The Myth of Population Control by Mahmood Mamdani; Monthly Review Press, New York, 1972.

CENTRAL to Mamdani's analysis is the understanding that motivations originate in social experience, not in "education" which often negates the reality of social experience. People will be motivated to limit the size of their family only when the social conditions become conducive to such an activity (p 20). Therefore, the roots of the problem, and the reasons for the failure of the current family planning programmes have to be found in the reason why many men and women, particularly amongst the poorest half of the population, feel no compelling motivation to limit their fertility.

We, therefore, need to understand the nature of the social experience which determines the number of children families would want to have, namely, the costs and returns of having children. No doubt, there are many psychic and social factors which affect motivations. For our purposes, however, costs and returns would suffice.

It would be useful to separate the rural population into three occupational classes: the agricultural landed, the agricultural landless, and the non-agricultural service class.

The agricultural landed class have a very distinct incentive to have a large number of children. In the childhood years, along with going to school, the children take care of the cattle and help with housework. Later, the male children help to substitute for hired labour. The average marriage age for girls having increased, they can earn a greater part of their dowry and also help with the housework and harvesting for a longer period of time. As a Khanna farmer explained, "if he had more sons, his labour costs would be significantly reduced and his household maintenance costs only marginally increased... Every farmer knows that the cost of having each child declines the more children he has. The benefits on the other hand, increase" (p 85). There may be some disincentives in the danger of land fragmentation, but as one farmer contended, "Of course, I am worried about the fragmentation of land. But even before I worry about my land being divided up tomorrow, I must worry about making a living on it today. Just look around: no one without sons or brothers to help him farms his land. He rents it out to others with large families. Without sons, there is no living off the land. The more sons you have, the less labour you need to hire and the more savings you can have. If I have enough, maybe we will buy some more land, and the fragmentation will not matter" (p 78).

The agricultural landless suffer from the increasing family size of the agricultural landed because they may be displaced. But agricultural employment is highly seasonal in nature. Thus, although the landless may be displaced from their year-round employment, their demand in the critical harvest and sowing periods continues. It is also in precisely these periods that wages rise considerably and the bulk of their incomes are obtained. The possibility of having a large number of daughters has also ceased to be a disincentive. Mamdani reports a drastic change "in the composition of the labour force and in the attitudes towards girl children. Women and girls now work side by side with their husbands and brothers..." (p 94). Smaller children, in addition to going to school if possible, assisting with housework and tending the family animals, can often tend others' animals and work as domestic servants. They may in this manner earn two meals a day plus some clothes and money as well (p 100). Larger families thus allow contracting for larger area of land for harvesting. This is important, for the landless family's income depends "upon the amount of work his family can contract during the busy season. A larger family means a greater income during the busy season and higher savings for the slow season" (p 95).

Thus larger families continue to be profitable for both the agricultural classes, although they may result in further maldistribution of income against the landless and in favour of the landed.

The rural non-agricultural service classes present a different picture. The breakdown of the traditional *jajmani* system has often reduced them to wage earners without any security. Of these, those who are willing to take jobs as agricultural labourers also desire large families for aforementioned reasons. On the other hand those who have some "skills", e g, tailors and cobblers often emigrate to towns. Only a third residual group mainly belonging to the erstwhile Brahmin aristocracy face unemployment, hence may have an incentive to limit the size of their family (pp 105-127).

The rural people who emigrate to towns and urbanites in general are crucially different from the rural populace in one thing — their children have little in the way of employment opportunities, hence the entire cost of their upbringing upto adulthood, including education and entertainment, has to be borne by the parents. Their desired size of the family will essentially depend upon their perception of the employment situation and the cost of bringing up children. If they percieve considerable job problems for their children, the expenses towards their upbringing plus continued expenditure in their adulthood may suffice as a disincentive for having more children. This holds equally for the educated and the uneducated, white collar and blue collar urbanites. Herein lies the explanation of the relative success of family planning programmes in the urban areas and their near total failure in the rural areas.

Researchers have consistently reported a positive correlation between education and low fertility. This has been misread to imply that education *leads* to smaller families. "Obviously" then the problem is reduced to that of providing the people with right information so that their currently "irrational" behaviour of having large families is changed to a "rational" behaviour of having small families. A long run population policy must, therefore, have a strong emphasis on the education of girls (p 40). That a correlation does *not* imply causality is yet to be understood. What is neglected is that education enhances very little in the way of people's capability of making cost and return calculation; nor does it do much in terms of educating them about "techniques" of contraception. What it does primarily is to change the class affiliation of the subject. He now "belongs" to the urban white collar class where unemployment is far more severe and the costs of upbringing much greater. What serves as a disincentive is *not* "information" but the social experience of the educated unemployed. As it turns out most of our social scientists belong to this class

Imagine National Health...

...without Petrochemicals

The average life expectancy of Indians has risen from 40 years to 52 years since Independence. This would not have been achieved without the 40-fold increase in pharmaceutical production over the past 27 years.

The proposed outlay on health during the Fifth Plan period is over Rs. 800 crores. This means that more medicines will be produced and used to improve the health of our people.

Expansion in pharmaceutical production will require increasing supplies of the essential solvents and intermediates provided by the petrochemical industry.

Growth of the petrochemical industry will not only help increase pharmaceutical production, but will also contribute to growth of many other key sectors of our economy.

Petrochemicals—essential to many crucial sectors of our economy.

NATIONAL ORGANIC CHEMICAL INDUSTRIES LIMITED — NOCIL — Mafatlal Centre, Nariman Point, Bombay 400 021.

AIYARL NOC.317 REV.

where the social experience is conducive to small families. They smoothly generalise their experience to all classes under an implicit belief that what is true for their class is true for the country!

The basic fallacy, then, in all attempts at family planning is the misconception that amongst the poorer half of the Indian populace poverty cannot be much alleviated until they begin having fewer children. The reality, however, remains that "people are not poor because they have large families. On the contrary: they have large families because they are poor" (p 14). Consequently the solution to the problem of poverty lies *not* in population control but elsewhere.

So far we have considered the problem from the micro standpoint. What is wrong with the macro arguments in favour of population control? The conventional argument runs as follows: if there is a smaller population there will be more resources available per capita and higher education for each child; this will result in greater productivity of labour, greater income and improved standard of living for all. This argument fails to internalise the fact that greater resources per capita, or greater level of education in themselves do *not* lead to greater productivity, more income or economic development. The utilisation of these resources is crucially contingent upon the capital accumulation that the economy can undertake. The example of many (relatively) sparsely populated African countries is a case in point. The resources (natural, human, educational) have to be combined with complementary capital before they become productive. The educated face severe unemployment and consequently are often unproductive only because they require large amounts of capital. In contrast the rural agricultural workers suffer only from *seasonal* unemployment and continue to be highly productive for the economy in the crucial agricultural operations. So the very policy of education designed to increase the productivity of labour actually serves to reduce the productivity — it shifts the seasonally unemployed into the category of annually unemployed. It is only the educated and urban unemployed who constitute a burden on the economy. The rural populace, as large as it may be, is not a burden on the economy. In the few busy months that they harvest the crop their productivity is very high and results in a net income over the year. A reduction in rural agricultural population without the availability of additional capital to substitute for it would result in reduction of GNP as well as NNP.

It is not to be denied, however, that a smaller population will result in some savings of social resources in form of the subsidy that is provided towards their educational and medical expenses. I would suspect that such a saving would be negligible compared with the magnitude of capital accumulation that needs to be carried out. What is more interesting is that precisely this subsidy which is supposed to "educate" the people into having smaller families serves quite the opposite. By reducing the cost of upbringing children it makes it profitable to have more children and actually becomes conducive to larger families. If the people had to pay for the actual cost of their education and medicine it might serve as a disincentive.

Three other points need to be mentioned. First is the policy of the government to offer cash incentives for undergoing sterilisation. The magnitude of the incentive would have to be substantially higher than Rs 50 to effectively alter the cost and returns calculations in favour of smaller families, and unless they can affect that they are unlikely to be effective. Second, many of the studies dealing with family planning programmes, particularly the Khanna study severely suffer from response error from their respondents who are in favour of contraception "in principle", with those who accept contraceptives, those who say they use contraceptives, and those who actually use contraceptives (pp 32-35). The statistical results are, therefore, often invalid and meaningless, as in the case of the Khanna study. Third, the results of these studies are often misinterpreted. "If an area has a birth control programme and if the birth rate in the area declines, it is concluded that the programme is responsible for the decline . . . the conclusion doesn't follow from the evidence. One must show that the decline in the birth rate is a result of the work programme, and not merely coincident with it" (p 14).

In conclusion, it is not the purpose of Mamdani's study to show what the solution to the problem of Indian economic development is. That would require a much more extensive, holistic and historical analysis. The purpose is only to point out what a solution is *not*, namely, population control.

Mamdani, in his re-study of the Khanna study, by having shown that large families are not a cause of rural poverty but a remedy to it, has made an important contribution. Unfortunately, it may be a long time before the lesson is learnt by the "enlightened".

A Cold Look at Indian Managers

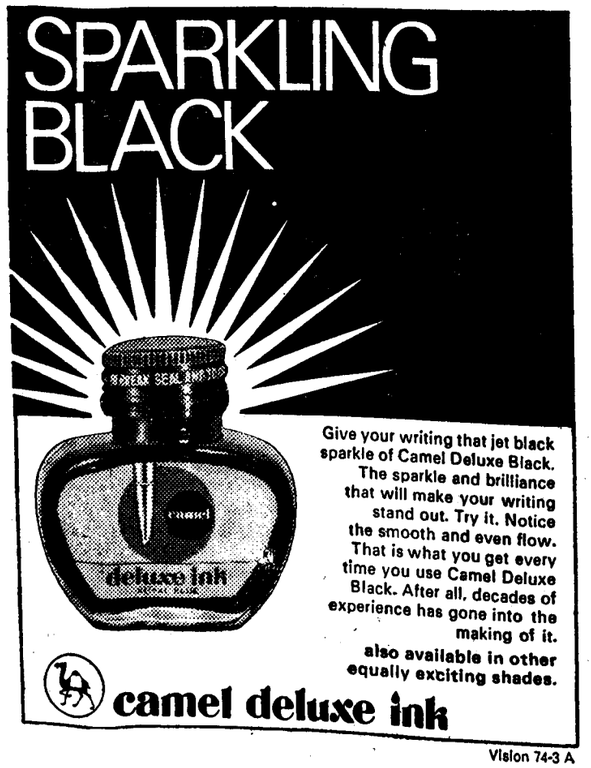
S L Rao

In the Wonderland of Indian Managers by Sharu Rangnekar; published by Associated Personnel Services; illustrated by R K Laxman; pp 134; Rs 30.

IN the tradition of Parkinson, Lawrence Peter and Raymond Hull ("The Peter Principle"), Townsend ("Up the Organisation") and Antony Jay ("Management and Machiavelli"), Sharu Rangnekar has written a highly entertaining book which cloaks its deadly seriousness. The book comprises a collection of Rangnekar's talks and articles, delivered over many years, which nevertheless hold together to make a very relevant book. Some of the chapters are applicable to management practices in other parts of the world as well, while some are familiarly Indian.

The 'committee approach' to decision-making is a wellknown device, of Parkinsonian repute and a long list of methods — such as proposing a survey, appointing a consultant, asking for more details, and even asking the subordinate to decide for himself — are many times used to delay decisions. It must be recognised that each of these could have a valid role to play, provided the user is consciously using it to help in better decision-making and not merely for procrastination.

Rangnekar's description of recruitment practices, concluding that in the final analysis, 'connections' are what counts, is very amusing. There is no doubt that advertisements which are clear, jobs that are well defined, simple forms that ask for only relevant information, interviewing levels not exceeding two to three, and early communication of the selection decision, are good rules to remember. It is clear that the same rationality



as in selecting applicants for a new job, should apply for promotion practices. The needs of the job should be clearly defined, the candidate's past record of performance charted out, his other qualities related to the needs of the job, and promotion based on an impartial selection system rather than on the whims of one individual.

Training in India is rapidly becoming a huge 'industry'. Everyone seems to run training courses and at increasing prices. The surprising thing is that even so they are always sold out. Evidently, companies are in mystical awe of training programmes and have a touching faith that they will pay off in improved personnel. However, no effort is made to define training needs, to establish that the programme, faculty and participation can meet the needs, and finally to assess what in fact has been achieved. Training programmes have also become a mutual back-scratching device among the 'executive preachers'. An executive of one company lecturing at a programme sends his subordinates to it and persuades his friends in other companies to send people to participate; and then reciprocates the favour! Perhaps one way to bring more rationality into the design and use of such programmes might be to make the expense on outside training ineligible to deduction for tax calculations.

The chapter on "The Problem of Indian Managers" should be required readings for all managers in the private and public sectors. The conclusion is that training should be aimed at nstituting accountability, trust and ystem. 'Defensive Management' as lefined by Rangnekar to tackle uperiors, competition, and subordinates, calls essentially for style without content. But one can think of nany successful practitioners in India! The practice started by P L Tandon, as Chairman of Lever, of using his annual speeches to shareholders to 'educate', appears to have acquired epidemic proportions, and today most chairmen of companies are eager to bare their souls, casting many words but little light.

The problem of Indian management is really that it is still slowly making a transition from feudal family-controlled businesses to the joint stock company run by professional managers; and from an amateur style, with managers drawn from an 'old-boys' network of selected public schools and colleges, to a professional method of work, practised by men of competence, ability and drive, whose socio-economic background is quite different. The early Indian professional manager was the inheritor of the foreign mantle, and as the foreigners departed, he automatically moved into high positions. This, of course, happened in other services too. It is only in recent years that recruitment, training and career development are beginning to be aimed at fitting the right people into particular jobs. Companies are still groping for the right ways and Rangnekar's book, by giving them a cold look at themselves, should assist in the making of the transition.

The major lacuna in this book is the absence of comment on the relevance of the Indian business school graduate and his proposed role. With business schools and departments of business management mushrooming around the country, and considering the enormous social investment in these graduates, it is time to review whether they have acted as catalysts for change or merely afforded an alternative to the old public-school elite. How relevant is the education, that they receive, to the kinds of jobs that they enter; is any of it applied, and when? Are they creating a new elitist wonderland or are they succeeding in moving Indian industry more rapidly into more professional ways?

Alternatives in Energy Development

B V Rangarao

The energy crisis has resulted from the prodigal use of fossil fuels. Utilisation of renewable resources — solar radiation and subsequent forms — is the only long-term solution.

The advanced countries have certain disadvantages for a change-over to the renewable energy sources — unfavourable geographical positions and an industrial structure geared to highly concentrated energy consumption pockets. India is not burdened with the same energy tradition. Therefore disposition of technical manpower and material resources to large-scale utilisation of replenishable energy resources should be the long-term objective, which would provide the necessary energy and employment distribution, helping also to eliminate some of the ills of urbanisation.

AS the energy crisis now faced by the fuel consumers of the world is unlikely to ease, the need for an independent and comprehensive assessment is urgent. In India, policies and programmes for fuel and energy are handled by several agencies, commodity-wise and region-wise. The Atomic Energy Commission, Central Water and Power Commission, Ministry of Mines, Ministry of Petroleum and Chemicals, and the State Electricity Boards are some of them. At the same time, vast energy resources are utilised today outside of the organised sectors.

The assessment would have to have a very definite indigenous outlook, since the policies and programmes of the the advanced countries are highly irrelevant to this country. To take one example: Consumption of electric power in the US is approaching 10,000 kwh per capita annually, whereas in India it is less than 100).[1] The disparity, by a factor of 100, should be sufficient to warrant the search for basically different kinds of solutions. The US, with less than 6 per cent of the world's population, has 35 per cent of the world fuel consumption.[2] Moreover, it is impossible for India, even after 100 years, to reach the present fuel consumption level of the US. One could have optimistic plans, but the few advanced countries have already exhausted 50 per cent of the world oil resources and the remaining oil resources are not likely to last more than 30 or 40 years if present consumption trends continue. Besides the depleting oil resources, enhanced prices and increasing demands due to the developing technology will seriously aggravate the situation. It would be folly to wait for the advanced countries to change their habits, before we evolve a suitable policy for ourselves. Our problems are quite distinct. While the cost for the rich nations is in modifying their present mode of fuel consumption, the poor nations have yet to build an industrial structure. This 'clean slate' on the fuel front could be a consolation for the poor countries if they in fact avail it.

Energy Resources and Uses

The energy policy to be evolved cannot be the same for the immediate future and for the years ahead. There are several fuels which are already at our disposal and some might yet be discovered. Agricultural waste, wood, solar radiation, geothermal energy, tides, winds, coal, oil, natural gas, and nuclear energy, are already available and utilised to varying degrees. Each of the fuels is likely to have its best use in some specific area. Each fuel has a suitable application. Some energy forms, like electricity, have wider applicability but are not always economical — either in terms of the fuel or the social cost of conversion of other fuels into that form of energy. While it is unavoidable to use electric power to produce controlled high temperatures for manufacturing certain alloys, it is sheer wantonness to use the same to heat or cool residences.

A national policy for fuels has to be based on the natural fuel resources which can be broadly divided into two categories: replenishable and non-replenishable. While the former category including solar energy, wind, tidal power, agricultural wastes, and biochemical sources, are diurnal or seasonal and natural reservoirs, coal, oil natural gas, and fission fuels, belong to the non-replenishable type.

While it may not be possible to switch over to the renewable energy sources immediately, the strategy should be directed towards them. It should be accompanied by a serious policy to reduce the consumption of less abundant fossil fuels. In the near future, only those societies which can adapt their energy consumption methods to anti-entropic processes are likely to be prosperous. The prosperity of today's advanced countries has resulted from their monopolistic exploitation of world energy resources as well as world markets. The industrial pattern and energy utilisation were, moreover, decided by the profit-seeking owners. This process is too fallacious by democratic norms and should not be emulated by developing nations.

Aspects that require immediate survey and study are:

(1) The magnitude of renewable energy resources in India: (a) solar energy, locational and seasonal variations; (b) hydropower resources; (c) wind sources with suitable mapping; (d) ocean energy resources, preparation of survey maps of tides, thermal differentials, ocean flora, etc; (e) survey of flora; (f) microbiological activity; (g) agricultural and biological wastes; (h) animal and human power.

(2) Non-renewable resources: (a) coal; (b) oil; (c) natural gas; (d) fissile and fertile nuclear energy resources; (e) geothermal resources.

(3) How the resources are utilised at present: (a) type of fuels under use; (b) purposes for which energy is used; (c) conversion techniques, their economy and side effects.

(4) Present day knowledge on energy conversion processes.

(5) Feasible techniques of conversions.

(6) Research programmes on conversion, conservation and utilisation of energy and energy resources.

SYNDICATE BANK

Condensed balance sheet as at 31st December, 1973

(Rounded off to the nearest Rupee)

CAPITAL AND LIABILITIES	Rs.	PROPERTY AND ASSETS	Rs.
1. Capital (Wholly owned by the Central Government)	1,41,97,104	1. Cash (in hand with Reserve Bank of India and State Bank of India)	30,19,00,423
2. Reserve Fund and other Reserves	2,42,24,700	2. Balance with other Banks	1,52,12,442
3. Deposits and other Accounts	343,77,99,232	3. Money at Call and Short Notice	Nil
4. Borrowings from other Banking Companies, Agents, etc.	15,77,88,501	4. Investments	109,91,50,955
5. Bills Payable	4,68,84,979	5. Advances (including Bills purchased & discounted)	230,40,79,695
6. Bills for collection being Bills receivable as per contra	22,74,81,579	6. Bills receivable being Bills for collection per contra	22,74,81,579
7. Other Liabilities	23,02,88,054	7. Constituents' Liabilities for acceptances, endorsements & other obligations per contra	15,99,77,808
8. Acceptances, Endorsements and other obligations per contra	15,99,77,808	8. Premises less depreciation	89,85,104
9. Balance to be transferred to Central Government	23,40,930	9. Furniture, Fittings etc. less depreciaton	2,03,76,498
		10. Other Assets	16,29,46,966
		11. Non-Banking Assets acquired in satisfaction of claims less depreciation	8,71,417
TOTAL Rs.	430,09,82,887	Rs.	430,09,82,887

As on December 31st 1973

- **Deposits Rs. 343.78 Crores**
- **Advances Rs. 230.41 Crores**
- **Advances to priority Sectors Rs. 106.54 Crores which account for nearly 47% of the Bank's total advances.**
- **Deposit Accounts 33.71 lakhs**
- **Borrowing Accounts 6.58 lakhs**
- **Branches 638**

Head Office: Manipal (Karnataka State) • **K. K. PAI Chairman & Managing Director**

SB-177

Though several aspects have been studied by different agencies, these studies are partial and incomplete and thus, could not give rise to any comprehensive technological breakthrough.

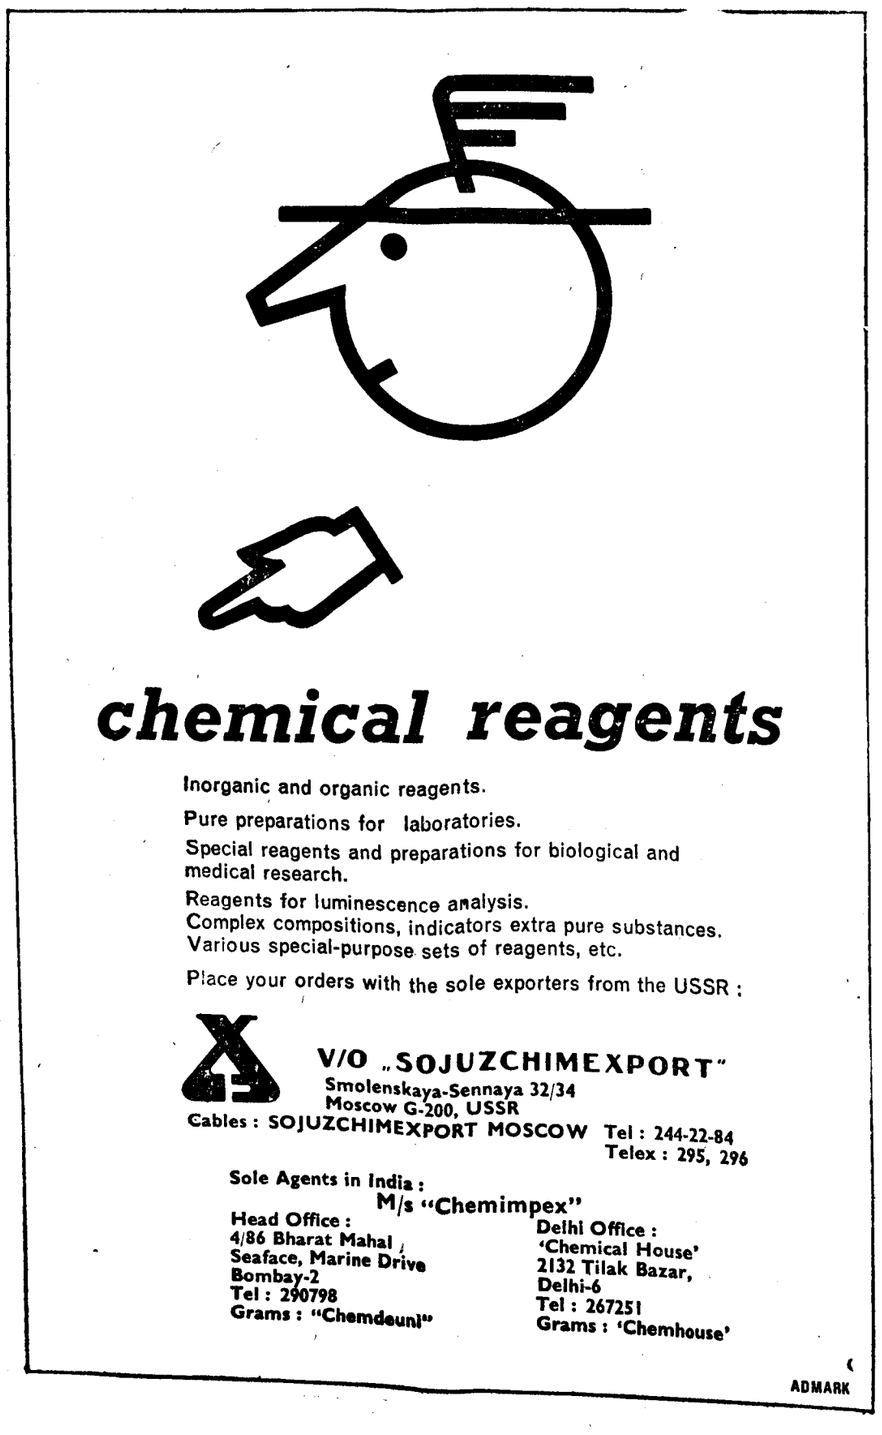
Fuel statistics in India are sporadic. It is often only the commercialised items that figure with any reliability. In recent years, even the estimation of non-commercial fuels has been given up. While the misuse of fuels is a common feature for both commercialised and non-commercialised items, highly inefficient conversion is common for non-commercial fuels whereas indiscriminancy is common for the commercial fuels.

Solar Radiation

Solar radiation is, in fact, the source of all fuels, fossil or other otherwise — excepting the nuclear fuels and the gravitational sources. Part of it is converted into winds, occean currents, and water cycle. A small fraction is used by plants to convert atmospheric carbon-dioxide into carbohydrates. The intensity of solar radiation on the ground is of the order of 1.2 kw per square metre when the sun is overhead. In the tropical regions, the average over 8 hours is 0.90 kw, and it is abundant throughout the year. It is considered uneconomical to convert it into other forms of energy beyond 40 degrees latitude. The industrially advanced societies are highly urbanised and they no more envisage electric power plants of less than 1,000 megawatts of electricity capacity. The fad for large generating units has its origin in the use of fossil fuels, where efficiency of conversion is the only criterion in view of the fuel costs. In case of solar radiation, where the cost of fuel is nil, efficiency becomes important only for capital investment — i e, collection of radiation from extra area — but not the recurring cost as in conventional generation. In fact, conversion of any fuel into electric energy is a fanciful engineering practice in view of the losses at the various stages. Of course, once it is converted into electricity, it is convenient, but not for transporting over long distances or for scattered consumption. Use of electricity for space heating or cooking, a reversal of generating process, is a technological extravagance. Even for lighting purpose an incandescent bulb is many times costlier, energy-wise, than a florescent lamp.

Two decades ago, some attempts were made in India to produce solar cookers, but unsuccessfully. No attempts were made to improve the collectors and transport the energy into shaded regions. Later, Israel took up the same problem. The Israelis collect with small devices solar radiation from more than 20,000 square metres which provides several megawatts of thermal energy, and they put it to several uses.

New devices to collect solar radiation — Fresnel's lenses — cost only Rs 15 per square metre. Adam Baker Meinel, along with his wife, prepared a project for 1,000 Mw generating station with solar energy at about 40° latitude.[3] In this, solar radiation, collected over nearly 20 sq miles area, generates steam at 560 degree centigrade; the heat is stored in a liquid metal reservoir. Through a second loop, energy is transferred to turbines to generate electricity.



In the national science and technology programmes of Australia, solar energy is included as one of the only four major areas of research to be undertaken in that country. Though Australia has coal and uranium already being mined and exported, it recognises that solar radiation is a superior source of energy.

Even in the regions close to the North Pole like Sweden and Norway, where forest resources are major elements in the economy, solar radiation is the source of wealth and prosperity through a patient natural process. These processes have very high efficiency in terms of negligible investments.

Indian technological organisations should turn their attention to such programmes, instead of being carried away by the glitter of the prodigal ways of some advanced countries. In the advanced countries, with the glamour of the recent achievements in space and electronics as the guiding forces, it is envisaged to collect solar radiation more than 22,000 miles away from the surface of the earth, convert it there into electrical power and transmit it to the receiving stations on earth through microwaves. Technologists in India may watch such projects with admiration but cannot expect this country to invest similar resources in them. Even in the US massive investments in research and development are made only in the areas considered 'ripe'; the degree of ripeness for India should depend upon its own available technological and financial capabilities. Until a heat storage system with insulated liquid metals is developed, it is necessary to supplement the solar energy with other sources. Conversion by solar batteries using thermo-electric effects are already in use; but they are too expensive and inefficient for uses on earth. In space research they are used unmindful of the cost. Thermal dissociation of water into hydrogen and oxgen is also feasible, with a view to using hydrogen as a clean fuel. But the practical use of such techniques on a large scale is yet remote.

There are other indirect ways of converting the solar radiation into fuels. Photo-synthesis, in which plants utilise solar energy to reduce carbon-dioxide in the atmosphere to carbohydrates, such as starch and cellulose ought to be exploited effectively. This will, of course, necessitate water conservation and utilisation. In the same agricultural areas, microbiological conversion of non-edible starches can yield liquid fuels, like methyl and ethyl alcohols. Even now the production cost of ethyl alcohol is of the order of 25 paise per litre. Alcohol can supplement petrol in the operation of the internal combustion engines already working. To increase the production of alcohol to several million tonnes per year, it may be necessary to improve the fermentation technology and cultivate plants like tapioca which can produce abundant quantities of starch.

Water and soil nutrition are prerequisites of effective utilisation of solar radiation for growing plants and crops of different types; firewood and starches for fermentation, and so on. Fertiliser production, as now undertaken, is highly power and fuel intensive — another legacy of Western technology. With the advances achieved in biological sciences, it is possible to utilise the natural biological processes to maintain the soil fertility. It is well known that certain bacteria can fix nitrogen in leguminous plants. Agriculture can be revolutionised if bacteria, which could do the same in rice and wheat plants, could be identified. Such discoveries, of course, are not in the pipeline. It is necessary to organise research effort in these lines which have higher feasibility in this country. If the fusion reactor is a possible challenge for the science in the advanced countries, microbiological solutions for the energy crisis should be sought in countries like India which are favourably situated for the purpose. If ever scientists in India are to make revolutionary contributions to world science, they will have to make massive efforts in sectors associated with our special natural conditions and productive interests. The public sector unit, the Fertiliser and

Chemicals, Travancore (FACT), used cheap quality wood as the basic raw material to start with; later it switched over to oil products!

Biological Wastes

While in India agricultural wastes are used in one form or the other, the same cannot be said of organic wastes. It is estimated that organic wastes alone can produce in the US 30 million million (10^{12}) cu ft of methane per annum which is 1½ times the current natural gas consumption, i e, more than 35 per cent of all the commercial fuels consumed in that country.[4] In India, obviously, this source can yield several times more energy than all the commercial fuels consumed at present. It is reported that 20,000 domestic gas units are to be set up by the Khadi Village Industries Commission (KVIC). Under the scheme 10 gobar gas plants are to be set up in each community development block. There is also need to improve operational performance and reduce costs of materials used.

Instead of offering cost subsidy, development of designs suitable to each locality depending upon available raw materials and cooking habits, training artisans who would remain in rural areas, etc, are likely to be more effective methods of assistance. Further, supply of metal components at reasonable rates has a better chance of spreading the programme than any temporary monetary incentives would do.

Wind Power

Heat energy is required to be converted into mechanical form for several applications. Parts of solar radiation are converted into water cycle (hydropower), wind and ocean currents. These sources have been traditionally utilised for electric power generation and transport. A study of wind regions and patterns is necessary for such purposes. In some of the European countries electricity generated from wind power is fed into national power grids. Coastal and hilly regions are better endowed with wind power.

Even in the plains, wind power is considerable. A survey[5] has indicated that the annual mean wind velocity at Lucknow is 9 km/hr. A machine having a cut-in speed of 8 km/hr and swept area of 30 sq metres, and an overall power efficiency of 12 per cent, can annually produce 1,320 kwh. For pumping water, the efficiency is higher. The National Aeronautical Laboratory (NAL), Bangalore, is reported to be engaged in setting up some wind mills in Karnataka state. The NAL design costs less than Rs 1,000 per kw generation, for small units of 4 or 5 kw. The operational cost is negligible. Use of wind power is common in many regions of the country for water transport. Water transport is often the cheapest, but our waterways are not designed for this, though the additional cost would be negligible. Water current and wind power alone would be sufficient in several regions and seasons to transport the goods to and from rail junctions or ports.

Geothermal forms are a combination of renewable and non-renewable sources. Some geothermal sources have their origin in the hot core of the earth, and the energy released in radioactive decay by the constituents of the earth. Gravitational phenomena, in the form of relative motion of moon and earth and spinning of the earth also create motions of fluids on the surface of the earth, and become energy sources.

Renewable geothermal power sources, such as thermal gradients in oceans and tidal waves, though they appear to have potentialities, are yet to be investigated from scratch. However, in India, the magnitude of such resources is limited. Underground geothermal energy is already exploited in a number of countries, such as Iceland, Italy, New Zealand, Japan, and the US. At Geysers of California, where 82 Mw is generated from the superheated steam generated underground, power generation is being expanded by another 110 Mw and the potentiality is expected to be 1,000 to 4,000 Mw. In all, more than 1,000 Mw is generated from underground heat sources in the world.

Fossil Fuels — Coal and Oil

In several countries, coal, oil and natural gas constitute 90 to 60 per cent of the total commercial fuel consumption. These fuels have similar orgin — in the decay of biological products by geo-biological processes. It took several hundred million years for natural biogeological processes to accumulate the present deposits of these fuels and their exploitation is a permanent drain on the national and world reservoirs of these fuels. While the presently known coal formations took 500 million years to form, after partial exploitation over the last 200 years, this fuel would last for only a little over 200 years if present trends continue. For oil and natural gas, the situation is worse; at the present rate of utilisation, oil would last for less than 40 years and natural gas for less than 20 years. Fossil fuels, created millions of years before the emergence of man on earth, are to be exploited only sparingly, because they not only are limited in quantity, but also disturb the ecological balance of the globe. Rapid burning of fossil fuels has been increasing the carbon-dioxide in the atmosphere and raising its temperature. Besides, several poisonous oxides are released. In the immediate future, until an energy technology for better living is evolved, it may be necessary to continue to use fossil fuels, but it has to be done more discriminatingly than at present.

Use of petrol as a fuel for transportation of individuals or small groups is a typical example of indiscriminate use. In the first instance, the efficiency of the internal combustion engine of a car is less than 15 per cent, while for finally converting to motion it reduces to about 4 per cent. Again, the fraction of this mechanical energy finally available to the passengers is negligible in view of the mass of the vehicle itself. Except for the aeroplane, the private automobile is the most inefficient mode of using energy for travel. In view of the consumption of a non-renewable fuel, and the associated pollution, this mode of oil use is even more foolish than burning cow-dung for cooking.

The present mode of fossil fuel consumption is an outcome of exploitation of scientific knowledge and earth's resources for private profit. The advanced countries have been anxious to exploit the oil from outside their territories as quickly as possible in competition with others. Some of them preserve their own resources and buy from the underdeveloped areas. A global or a long-term welfare of the population is never an important calculation in private enterprise. Pollution and ecological damages are intentionally overlooked by these sections.

As coal and oil are the products from the same basic materials — biological wastes — and oil is a more modified form of carbohydrates than coal, it is possible to derive from coal almost all the materials produced from crude oil. But in India, research and development effort in this direction has been negligible.

Nuclear Fuels

There are other potential fossil fuels such as uranium and thorium. But their technologies have yet to be developed and fission reactors are full of risks for present as well as for future

generations. The highly toxic plutonium of which a fraction of microgram is sufficient to seriously damage a human being is an intolerable nuisance in any society — and particularly in the strife-ridden ones.

Though fusion energy is not such a nuisance, its feasibility is not in sight, though in the USSR, a temperature of 8 million degree centigrade has been attained in the laboratory, the ion flux is too low and the life of the pulses too short to be optimistic. Even if extreme safety precautions are taken, the large quantities of radioactive materials constitute a permanent danger. For example, in a period of political or social unrest, sabotage against reactors may cause catastrophes. Further, in a full-scale fission programme, the radioactive waste will soon become so enormous, that a total poisoning of our planet is possible. Under such conditions safety margins, which are acceptable in other fields, are inadequate. It is not evident whether the waste problem can be solved in a satisfactory way. Solar energy or fusion energy are free of such risks. Scientists in Europe and North America want their governments to concentrate efforts on fusion reaction but do not consider solar energy sufficient to exploit with the technology feasible in the immediate years. The situation in India is different, due to the magnitude of the radiation and scattered rural needs.

Immediate Requirements

The above resources require development of suitable technologies and are bound to take considerable time. The policies to exploit the new resources are to be initiated with research and development efforts. The existing structure cannot be replaced suddenly. In the mean time increase in energy consumption will continue. While the coal resources are comfortable for several decades, liquid fuels are the present day anxiety.

There are areas in which liquid fuel cannot be substituted such as in the airforce. Civilian airlines and road transport also may require considerable increase even with the revival of inland water transport. Fertiliser and other chemical industries can reduce petrochemical bases but cannot avoid completely for several years.

As already stated, hydro-electric power sources should be exploited as early as possible, and always with the prime consideration of using water for irrigation, and industrial needs. Technology in this field is highly advanced and the Indian engineers are well equipped to design and implement these projects.

Though off-shore drilling for oil is anxiously carried out, methods to produce power alcohol on a large scale has still not been taken up seriously. India is one of the exporters of molasses which can be immediately used to produce alcohol. The industry so generated should provide incentives for higher research effort in fermentation technology.

Though large investments (relative to other sectors) are made in nuclear power, their economics, operational efficiency, safety precautions, radioactive waste disposal, etc, are so serious that the Indian research effort is unlikely to provide any key solutions. Breeder reactors are more complex and dangerous than the other nuclear reactors. Two decades back a prominent Indian scientist declared at the First UN Conference on Peaceful Uses of Nuclear Energy that the fusion process would be a practical reality within a decade from then. Instead, in this period, more and more scientists have turned sceptical about the fission energy itself.

Like MHD (magneto hydro dynamic) power generation, breeder reactors, in spite of the radiation hazards, are investigated at a considerable cost in technological manpower and financial support. In these areas massive investments are made in some of the advanced countries and poor countries like India can await the results of that research because the returns for the massive investments are doubtful. Even if success is achieved in these areas, it will not be in India; and adoption by India from a later stage should be less expensive. There are more relevant areas in which the potentialities are higher, feasibility is established, the research costs are low; and these areas are not of interest in any of the already advanced countries.

Social Tasks

Though energy utilisation has been the basis of the prosperity of the advanced countries and general liberation of the human beings from the drudgery, the effort to design entropy conserving mode of life has been negligible. Only mechanical energy, as in case of hydro-power, can be converted into electrical form, with reasonable efficiency. In a country like India, it is necessary to choose an optimal mix of several energy resources for different uses.

Scientific and technological research in this country requires to take a comprehensive view of the energy resources and social goals to select a few areas for intense research, and acquire the capacity to adopt any successful achievements in the other fields. The technological research effort should be closely linked up with productive techniques to be followed. Though thermal and hydro-power have been the only sources of electricity in India, till recently, for the last two decades the research inputs in this area have been almost non-existent. During these years, the efficiency of thermal energy conversion to electricity increased by more than 15 per cent (from a little above 30 to nearly 50 per cent), but at each stage we have had to borrow outside technology.

While it would take several years before there can be massive conversion of solar radiation and other renewable resources into mechanical and electrical forms, as fossil fuels are depleting, it would be useful to build up in India, an infrastructure which will be compatible with the new sources of energy and forms of utilisation.

Economy in the use of electricity cannot be achieved by preaching to the users or by enhancing prices. Town planning and house designs should be geared to economise electricity consumption.

Similarly, in transport and rural electrification, the outlook required would be radically different. Fossil fuel economy necessitates setting up large capacity electric power stations, high voltage transmission, and intense electric energy consuming centres. High voltage transmission is not feasible in the rural areas of India. Already, our transmission losses are among the world's highest. If the fuel costs are nil as for solar radiation and wind power, the norms of economy are radically different. This may further help to reduce urbanisation, and take technical skills and technology to wider sections of the population.

Though it is necessary, drastic changes in fuel consumption cannot be introduced overnight, without altering several social activities. Even to retain the already substandard position, the present system requires oil imports which may require as much as 60 to 80 per cent of all the export earnings. Such desperate need to export, puts this country in a highly unfavourable position and subjects it to easy exploitation by not only the oil suppliers but also all importers of the Indian goods.

Notes

1 The estimations of energy consumption and comparisons are based on certain parameters. The per capita energy consumption ratio between the USA and India is 100 for electricity, it is 40 for oil and 10 for coal, non-commercial fuels are completely neglected. The ratio falls rapidly from the commercially advanced forms to the others.

2 The world average consumption of electricity is about 1000 kwh per capita, in the underdeveloped countries it is about 100 kwh, in the Western Europe a little over 2,000 units and in the USA it is more than 9000 units. The industrialised regions in 1963, constituting 29 per cent of world population consumed 77 per cent of all coal produced, 81 per cent of all oil, and 95 per cent of all natural gas; while the 71 per cent of the underdeveloped world used 77 per cent of human energy; 87 per cent of animal energy, and 73 per cent of fuel wood and waste.

World Crisis and Latin America's International Options

A Note

Andre Gunder Frank

THE international options of the countries of Latin America to 1980 will depend in the future as in the past on the course of capitalist development in the remainder of the world, including the kind of internal political development and the direction of foreign policy elsewhere, and on the internal political development in the Latin American countries themselves, which in turn will depend largely on the nature and course of capitalist development in the world as a whole, as well as on the stage and kind of the process of capital accumulation in the Latin American country in question itself. With respect to these economic and political developments during the 1970s, we may hazard the following working hypotheses to summarise, however schematically, some of the contradictory tendencies of uneven capitalist development, which for the foreseeable future are likely to be largely determinant for the question at hand: the international options and relations of Latin America in the 1970s.

Uneven capitalist development, temporal (cyclical), spatial ("development and underdevelopment"), and sectoral. World capitalist development appears to be entering upon another major crisis of capital accumulation analogous to, albeit not repetitive of, the period between 1873 and 1895, which witnessed the birth of monopoly capitalism and imperialism, and the period which included the First and Second World Wars and the intervening "Great Depression". Whether or not such periods of more frequent and deeper cyclical crisis of accumulation correspond to the quarter-century-long downswings of so-called "long cycles" sometimes associated with the name of Kondratieff and others, the end of the long post-World War II upswing and the beginning of the contemporary apparent downswing may tentatively be dated from 1967, after which rates of profitability and of growth of investment in the major capitalist countries of North America, Europe and Japan seem to have initiated a period of decline. The contemporary "stagflation", currency crises, and breathtaking changes in international political relations may be seen as symptoms of this growing crisis of accumulation. The same crisis forebodes increased temporal, spatial, and factoral disadjustments as well as a sharpening of the class struggle, for the foreseeable future which, however, at the same time, generate the opportunity and the necessity for major readjustments in world capitalist development, readjustments which will be necessary if capitalism is to overcome its present crisis instead of being destroyed by it, to be replaced by another social system. The international relations of the countries of Latin America, like those of the remainder of the world, will be largely determined by this process of disadjustment and readjustment in the coming years.

The international division of labour. The increased exhaustion of major investment opportunities with the, in the past, leading technologies and the reduced rates of profit are likely to restrain the quantitative extension of the inter-sectoral and international division of labour in certain past or present directions (such as the runaway shops in textile and electronics parts industries to areas of cheap labour, if only because of political resistance by unions and others in the metropolitan economies). At the same time, the present and future crisis of world capital accumulation, like those of the past, is likely to generate deeper and faster qualitative changes in the process of technological invention and in the inter-sectoral and international division of labour. The development of new major sources of energy (nuclear fusion, solar, etc), exploitation of the oceans and the ocean floor for minerals and "agricultural" products, and developments in bio-chemistry and genetics are likely to be among these major new directions. If and when profitability can again be enhanced through technological progress, reduction of the wage rate and increase in the rate of exploitation, the degree of capital intensity of capitalist production is likely, again, to increase. In these periods of accelerated disadjustment and readjustment of capitalist development, the development and exploitation of sources of raw materials appears to be more important relative to that of the production and trade of industrial commodities than it is during the decades of rapid capitalist economic growth, such as those preceding World War I and following World War II. Additionally, the coming period may witness a certain transfer of the production of energy and certain minerals to the industrialised countries and "their" oceans, while they will transfer some production, not only of textiles and electronics parts, but also of steel production and the automotive industry, etc, to certain underdeveloped and socialist countries. These latter will be drawn increasingly intensively into the international and inter-sectoral division of labour, with far-reaching consequences and implications for their international economic and political relations, foreign and domestic policies. (For further discussions, see below).

Capitalist competition for monopoly and exploitation. The capitalists' attempt to stem and turn the tide of declining profits and profitable investment opportunities during this crisis of accumulation enhances competition for markets among them (a partial reflection of which is the currency crisis and the inability to solve it satisfactorily), promises a revival of the "beggar thy neighbour" policy of the previous major crisis, and — with particular relevance for Latin America's options — induces them especially to intensify

and accelerate the exploitation of some socialist and Third World economies through primitive (non-capitalist) accumulation and unequal exchange while acceding to the greater participation in this same process by some intermediary economies and regimes, and, to assure the greatest possible share of the pie for each of the major powers, augurs at the same time for the strengthening of economic blocs and monopolistic relations within them. This tendency will be increasingly strengthened by any further breakdown of the present dollar-based international currency system and the renewed formation of a dollar area, Euro-currency or Deutsche Mark and French franc areas, sterling area, yen area, not to mention a rouble area. Increased multi-polarity leads to "detente" and shifting alliances, but also threatens major political conflict, including military confrontation, between some of the "allies", such as the USSR and China on the one hand and Japan and its American and/or European partners on the other hand, if not directly then, to begin with, in Third (World) countries.

Class struggle in the industrialised capitalist countries. The profit squeeze (after Wyn and Sutcliffe, "British Workers, Capitalism, Capitalism and the Profit Squeeze") in the major capitalist countries implies not only an attempt to shift the burden of the costs to "beggar thy neighbour", socialist, and Third World countries; but, especially insofar as the increased costs the workers in these countries will have to bear will be insufficient to stem and reverse the tide of the crisis of capital accumulation in the major capitalist countries, the workers in these countries themselves will be asked or obliged to bear a substantial part of the sacrifices themselves. The sharpening of the class struggle, particularly in Western Europe, has been in increasing evidence during the years immediately past and promises to become still more extensive and intensive in the decade to come. A first response to this intensification of the class struggle is recourse to neo-social-democratic, labour, "popular union" revivals of popular frontism, attempts to share the burden of the crisis and persuade labour to "sacrifice its selfish interests to the national interest in this time of crisis". The threatened failure of these social-democratic "resolutions" of the crisis, especially as it deepens internationally and nationally, also enhances and accelerates the threat of, and indeed paves the way for, recourse to neo-fascist corporative and even militarist solutions leading to 1984. The outcome of this class struggle in the major capitalist countries will, of course, also determine the economic, political and ideological position of their governments and their foreign policies with respect to each other, the socialist countries, and the Third World countries, including those of Latin America, thus partially defining also the latter's international options. All the more so, of course, will this be the case if the bourgeoisie fails to find the resources to save capitalism in its next period of crisis and the working class finds the political means to overthrow that ruling class and replace capitalism by socialism.

The Third World and Latin America in this crisis of capitalism. The accelerated qualitative transformation of the international division of labour during the present crisis of capitalist development offers increased opportunities for the development of intermediary "sub-imperialist" economies and regimes along the "Brazilian model", and, at the same time, generates further pressures for the formation of increasingly dependent "client states" along the post-September 11, 1973, "Chilean model". Economies which achieved a certain level of the development of their productive forces during and since the last major crisis of world capitalism, like India, South Africa, and Brazil, and, to a lesser extent, Mexico and Argentina, but, albeit under socialism, the Soviet Union as well, will find accelerated and increased opportunities to advance their insertion in the international division of labour in new directions. Some other countries, particularly Iran, but perhaps including also some other petroleum-producing countries, and, to a lesser degree, economies like Egypt, Algeria, will find the opportunity to accede to sub-imperialist status. This implies further capitalist development for these economies which permit a political alliance of their bourgeoisies with the imperialist ones on the one hand, and some sectors of their own middle classes on the other. However, especially for the former countries, unlike the import-substituting development of consumer goods industries based on the extension of the internal market, the more progressive distribution of income, and the relatively politically progressive populist regimes during the last world crisis of accumulation, the coming capitalist development in these economies is likely to turn increasingly on accumulation through the capital goods and export industries, whose output must be bought by the external market, industry itself, high income receivers, and particularly the state, including its military apparatus. This implies further regression in the distribution of income, increased unemployment beyond the 25 per cent "effective unemployment equivalent" estimated by the United Nations for Latin America for 1970, low wage policies such as those which have reduced the wage rate in Brazil by 40 per cent during the "economic miracle", strengthened marginalisation of large portions of the population, and reactionary political regimes that pursue internal policies of repression, external policies of expansionism, militarism, and international political alliances with other reactionary regimes, while seeking to maintain a delicate and shifting balance of dependent autonomy in their international economic and political relations.

The largest number of countries in the Third World, including Latin America, however much some of their political leaders may, like the Chilean junta, express such vain hopes, cannot realistically aspire to such sub-imperialist development and, in this crisis of capitalism as in others past, is likely to have the large masses of its people suffer from vastly intensified super-exploitation and political repression along the lines of the post-September 1973 "Chilean model", which may be the latter-day version of the regimes of Ubico, Batista, Trujillo and the like of earlier years. Here, as in the case of the Philippines, for instance, and large parts of South Asia, the degree of super-exploitation, unemployment, marginalisation, and, of course, repression, threaten to go much farther — as they already have in Chile in a mere half year — than in the case of the sub-imperialist regimes, whose victims they are likely to become increasingly as well. For the corporativisation, if not also militarisation, of the state appears as the order of the day, and the degree of brutal repression to replace institutional repression is a measure of the degree to which such corporativisation has not yet been achieved. In their international relations with the imperialist powers, and, indeed, some sub-imperialist ones, these repressive, neo-fascist, corporativist states seem condemned to still greater economic and political dependence than in the past. As to the international relations among countries of the Third World and Latin America themselves, forbode the threat of growing cut-throat economic competition among themselves and political, including military, confrontation and wars among neighbouring Third World and Latin American countries. In the next deep crisis of capitalist capital accumulation, only the successful popular revolutionary overthrow of capitalism can avoid such human costs of capitalist readjustment and survival.

Credit Policy, Interest Rates, Central Banking and All That

A Comment

Suraj B Gupta

H T PAREKH ("Credit Policy, Interest Rates, Central Banking and All That", May 25, 1974, pp 839-41) has come down heavily on the monetary and credit policy prescriptions of academic economists. His critique suggests that he has not invested enough effort to understand the economist's case for his policy recommendations. It is, therefore, appropriate to spell out the case briefly, and then to provide the economist's counter to Parekh's arguments for an easy and cheap credit policy in the present inflationary situation.

Parekh has advocated that the credit policy should be so conducted as to meet "the legitimate credit needs of production and export" (p 839). This kind of argument is nothing new to a monetary economist. It has been advanced in various countries from time to time. And one comes against it time and again in this country, too. I wish it were possible for banks to do so in a non-inflationary way. Unfortunately, this is not always possible. Moreover, individual banks are not in a position to see (or are not directly concerned with) the macro consequences — on the aggregate money demand for output — of their own lending policies. Therefore, the central bank of the country is entrusted with the task of planning the growth of money supply and the concomitant growth of credit in the economy.

Policy Criterion

In the present-day inflationary context, the first and foremost question which must be asked about Parekh's policy criterion is : at what price level should the real credit needs of production and export (or trade) be valued in money terms while planning the nominal amount of credit and its expansion? Should it be some initial price level which the monetary authority wants to stabilise, if it is genuinely interested in price stability? Or should it be at current prices? The economist's answer is the former, Parekh's answer is the latter when he says, "one has only to see the recent increases in foodgrain prices, steel prices, coal prices, transport costs, prices of imported items such as metals and chemicals, and wage costs to realise that the volume of bank credit could not but have reflected these steep increases" (p 841).

According to Parekh's way of thinking, if prices over a period have increased by 50 per cent, then neglecting real growth and any speculative inventory build-up, the nominal credit needs of industry and trade would also have gone up by 50 per cent and the monetary authority should so conduct its monetary and credit policies as to fully meet this increased nominal credit need. Following this logic, if, alternatively, over the same period, prices had increased by 500 per cent, the nominal credit needs of industry and trade would have also gone up by 500 per cent, real credit needs remaining the same, then banks must increase credit by 500 per cent. And so on. It can be easily seen where "meeting the needs-of-trade credit" argument and policy will lead us. Theoretically, this would make the price level indeterminate. Practically, this would open the flood gates of hyper-inflation. Instances are not lacking of countries having succumbed to hyper-inflation, when they have followed a policy of 'validating' increases in the supply of money and credit to meet the increased demand for credit at higher and higher price levels.

This leaves unanswered the question: what starts the inflationary process in the first instance. And it is not very fruitful to pose this question thus either, because it is very difficult to isolate a single 'cause'. Our immediate problem is to face inflation as an ongoing and accelerating process. There is no denying that, among other things, excessive increases in the supply of money and credit, shortfalls in output on all fronts, and increases in the prices of our crucial imports, have all contributed to this process. And, a multi-pronged drive alone will halt it. Immediately, we are concerned with the role which the monetary-credit policy can play in halting the continuing process of inflation. And it is in this context that nearly all academic economists in the country have advocated that excessive increases in money supply must be stopped forthwith. This would help contain the excessive increases in the money demand for output. The process of money creation being what it is, it follows from this policy requirement that deficit spending by the central and state governments must be brought under control, because such deficit spending by increasing currency (high-powered money) through Reserve Bank credit to the government, has been the major source of excessive increases in the supply of money — both directly, and indirectly through the secondary creation of demand deposits by banks. Another corollary to the control on money supply is that the credit-creating capacity of banks will be automatically checked, as the reserves in their hands will not be increasing at an excessive rate.

Legitimate Needs

Let us come back to the question of banks meeting the legitimate needs of production and trade. Suppose there is a regime of stable prices. Even in such a regime, are banks always able to meet all the legitimate needs of production and trade? What is the criterion of legitimate needs? What about the pools of black money in the hands of large firms which they could easily draw upon to meet their need for funds? What about the limitation arising from the side of deposit mobilisation of the banks, given the asset preferences of the public? Even if the 'legitimate' needs (howsoever defined) of large firms engaged in manufacture and trade are fully met by banks, what about meeting similar needs of agriculture and allied activities and small industrial and trading firms? By Parekh's own admission, the latter have to depend largely on non-institutional credit. This is because they are generally rationed out of the bank credit market. Commercial banks in India still continue to provide a major share of their total credit to the relatively larger and well-established firms. If banks are supposed to meet the 'legitimate needs' of the larger firms in industry and trade, why can they not be expected to meet the legitimate needs of all firms engaged in production and trade?

One answer may be that some of the smaller firms do not have adequate and acceptable security to offer to the banks. But this is not the whole answer. A more important answer is that banks, after all, have limited funds to lend, and a major share of such funds continues to be fed to their well-

established customers — in the main, the larger firms. The limitation of funds, it is well known, arises from the total deposits that banks are able to mobilise from the public. If the banking system does not honour this limitation, and the central bank (the RBI) permits banks to create any amount of credit and deposits by providing them with the required amount of reserves either through its discount window or through some other channel, then, it is widely recognised that this excessive expansion of credit can unleash the forces of inflation in the economy by creating a situation of excess money demand for a given output. Alternatively, this means an excess of deficit spending over the surpluses generated in the economy. It is against this kind of danger that academic economists have been arguing, and it is up this primrose path of inflation that Parekh unwittingly wants to lead the economy.

Reasons for Rejection

Parekh has asserted that "so long as it cannot be established that there has been any speculative inventory build-up in any sector of industry, any large increase in bank credit need not cause the kind of alarm it has caused among academicians" (p 841). This kind of argument must be rejected outright, and for the following reasons. First, as pointed out earlier, it prescribes a credit policy which is openly inflationary, by ensuring that the banking system will provide whatever amount of credit is demanded to support the same level of *real* economic activity at higher and higher prices; this is the very anti-thesis of *any* anti-inflationary monetary-credit policy. Secondly, Parekh implies by his assertion that there has been no speculative inventory build-up in any sector of industry; if it is counter-asserted that there has been such a build-up, how is Parekh going to deny this; has he looked into the relevant data; are reliable data on the question available; how does he distinguish between speculative and non-speculative inventory build-up; these are questions that arise, and it must be said that in an inflationary climate when producers and traders and even households come to develop inflationary expectations, there is a sense in which all inventory holding is characterised by an element of speculation — speculation of higher future prices.

It is hard to believe that industry and trade do not have the necessary economic motivation to make easy and quick capital gains from mere inventory-holding, when the climate is so very ripe for it. They would, of course, defend it by arguing that in this period of growing shortages and uncertainty, they must have an extra margin of safety by holding extra stocks of essential raw materials and other inputs. What they cannot surely defend is the extra build-up of stocks of *finished goods*, which also is reported to be widely on the increase. But whatever the defensibility of the extra-margin-of-safety argument at the level of an individual firm, it is not at all defensible from the social point of view, when the system as a whole is suffering from acute real shortages. Then the short supply of real goods should be properly distributed in the system. As the households, so the firms, too, must learn to live and operate on rations of fewer days than normal so long as the real shortages last. And the authorities, as guardians and promoters of the social interest, must adopt and implement policies to enforce such a behaviour on the public — despite the latter's unwillingness to submit to such a discipline. This is another way of rationalising the policy of monetary and credit restraint, recommended by academic economists. They see that there is no way whereby the system as a whole can successfully rid itself of the real constraints in the short run. All that the internal working of the system can do is to redistribute shortages to the benefit of some sections of the community and to the loss of others. The function of policy, then, is to redistribute shortages in a rational, equitable manner.

The traders in India, big and small, know very well that they have never had it so good as in the periods of high inflation. The hefty capital gains on mere inventory holdings have fattened them out of all proportions and to the acute suffering and loss of the fixed-income groups in the society. Such large-scale transfers of income and wealth cannot be completely avoided. But intelligent, honest, and timely policy measures by the authorities can lessen substantially the inequities of the inflationary process. And any monetary authority, worth its name, should know how this corrective process always operates. When the credit screws are tightened, they are surely going to hurt someone. Both the producer and the trader, who individually see that they can make a 'kill' by mere hoarding of goods and that the larger the hoarding the bigger the kill, will demand more and more credit, so long as the expected net gains from inventory holdings exceed the cost of credit to them after allowance has been made for various kinds of risks involved. When credit is either tightened or made costlier, they see some of their expected profits disappearing into thin air. Naturally, they would make a hue and cry and advance all sorts of arguments in favour of keeping bank credit both easy and cheap. No wonder, well-intentioned persons fall easy prey to this kind of propaganda.

Inflation Hurts

But it is essential to understand that any kind of anti-inflationary measure, whether monetary or fiscal, is going to hurt the gainers from inflation during the process of adjustment. And, looking to their immediate and narrow self-interest, these people are going to resist such a corrective process of adjustment. Also, the more strongly entrenched they are, the greater and stiffer their resistance. The authorities must be fully prepared to face this kind of resistance. This is as true of the tighter monetary and credit policy and higher interest rates as of cuts in deficit spending. But no inflation can be brought under control without a proper management of the aggregate money demand for output. Production must, of course, be increased. But no one can honestly assert that, in recent years, production and investment by large firms in India has suffered on account of either inadequate or costly credit facilities to them, whatever be the plight of the small producer and investor. On the contrary, the problem of 'excess liquidity' with which commercial banks suffered during 1971 and 1972 is testimony to the deficient demand for 'productive' bank credit from these very large firms — the established customers of banks. Since the beginning of 1973 we do not find any spurt in their production and investment activities either, which is now going to suffer from credit restriction. Thus, the causes of economic stagnation have to be seen elsewhere — not in the inadequate and costly bank credit to large firms. Further, to say that "inflation can *only* be contained by increased production" (p 841, italics added) is not true. For, even with increased output prices will rise, if the aggregate money demand for output outstrips the increased real output (supply). To repeat, this statement should not be misconstrued to mean that increased production is not an important anti-inflation policy measure. It is, and must be given high priority along with controlling the money demand for output.

It is well known how inflation and inflationary psychology harm the true interests of society. It is not for me to go into any detailed discussion of them at this juncture. But it must be repeatedly emphasised that, in addition to large-scale transfers of income and wealth from the economically weaker sections to the richer sections, continued inflation tends to discourage saving and real capital formation, encourages socially unproductive asset holding by the public in the form of real estate, jewellery, and inventories of goods which promise quick and high rates of return in the form of capital gains, discourages socially productive enterprise, distorts allocation of resources, encourages wasteful and conspicuous consumption, creates balance-of payment difficulties, breeds large-scale social and labour discontent and unrest, encourages corruption among fixed-income groups and demoralises the population, thus reeking havoc on the entire social structure.

But to enforce an anti-inflationary process the government must adopt measures in a steadfast manner and not give in to pressure from the gainers from inflation. For reversing inflationary expectations, the public must be convinced beyond doubt that the government means business and that the anti-inflationary policy is not a short-term popular slogan to mislead the common man. In this context, it is a matter of serious social concern that the Reserve Bank after announcing with so much of fanfare a policy of credit restraint for the busy season of 1973-74 succumbed so easily to the false alarms raised by the business community. All along in the past it had been blaming the Central and state governments for excessive deficit spending as the chief source of excessive expansion of money supply. And now it more than gave away through the discount window whatever extra reserves and deposits it had mopped up through upward revisions of the cash reserve ratio and the statutory liquidity ratio of banks. This makes mockery of the policy of monetary-credit control to contain inflation. No doubt, Parekh can take pride in the drubbing the business interests, in collusion with the banks, have given to the RBI's short-lived policy of credit control. The question of appropriate anti-inflationary monetary-credit policy calls for immediate attention and rethinking on the part of the government and the RBI. The latter owes it to the discerning public to come forward with its side of the explanation for its patently weak-kneed credit policy.

On high or low interest rate policy, Parekh asserts that "there is no accepted theoretical basis for working out a rate structure" (p 840). The question at issue, however, was not so much the structure of interest rates — i e, the relation among the several rates of interest which prevail in the money and capital markets — as the level of (the *entire* structure of) interest rates. On this issue, contrary to Parekh's assertion, there is a well-accepted theory in Economics. According to this theory, in equilibrium, the pure (i e, net of risk premium) money (market) rate of interest will be equal to the pure real rate of interest plus the average expected rate of change of prices. In actual practice, the adjustment of the market rate of interest to changing inflationary expectations is very slow. In the government bond market and the commercial bank loan market, the interference by the central bank has also to be reckoned with. But the anti-inflationary policy implication of the above-mentioned theory is clear-cut. In the commercial loan market, the central bank should so conduct its monetary-credit policy that the market rate of interest is fully adjusted to the average expected rate of change of prices — so that, in periods of inflation, the borrower does not derive any special benefit from the expected inflation and so does not boost his demand for credit on that count alone, and the ultimate lender (surplus units) do not suffer real capital losses on account of inflation simply because they are holding monetary assets.

Interest Rates and Inflation

What Parekh has stated about the historical level of interest rates in India and the norm of 6-9 per cent per annum may hold good for only real rates of interest and not money or market rates of interest, or for both only in a climate of price stability when the two will coincide with each other, because the expected rate of inflation will be zero. But this traditional level has no relevance whatsoever, for money or market rates of interest in the current inflationary situation. If the expected rate of inflation is 30 per cent, a money rate of interest of 10 per cent means a ***negative*** real rate of interest of 20 per cent. No wonder, such a situation on the one hand, discourages savings and their holdings in the form of monetary assets, and on the other hand encourages borrowing for mere speculative hoarding of goods.

Thus, in highly inflationary situations, we cannot speak of any particular level of rates of interest being absolutely high or low *without reference to the expected rate of inflation.* In a country characterised by a *steady* rate of inflation of (say) 100 per cent per annum, even a rate of (say) 100 per cent per annum would be considered as low, for it would mean a real rate of interest of only zero per cent per annum. Countries which have passed through hyper-inflation or are currently experiencing hyper-inflation, market rates of interest of 24-60 per cent or even higher, depending upon the expected rate of inflation, are neither unknown nor unusual. It is in this sense that the experience of other countries regarding the behaviour of their rates of interest is relevant to us.

To assure Parekh, economists are not enamoured of high interest rates *per se.* When they recommend that the current controlled rates of interest should be revised upward to neutralise the effect of expected inflation. They do so only as an anti-inflation measure, as a temporary therapy. Once inflation is brought under control and its rate gradually reduced to zero, the market rates of interest should also be brought down to their real levels.

Parekh has shown his concern for the credit needs of the small borrower. But the concern is more apparent than real, because essentially he is concerned about the cost and availability of credit to the large borrower and not to the small borrower, and he refers to the latter only to buttress his case for cheap and easy credit to the former. For, he refuses to envisage a situation in which banks will meet a substantial part of the credit needs of the small borrower even at competitive rates of interest. Instead, he predicts their continued dependence on the unorganised non-institutional segment of India's credit market. In his prediction, he may well be right. But, then, the question arises: For what earthly purpose were the 14 major commercial banks nationalised five years ago with so much fanfare and breast-beating, if not to meet an ever-increasing proportion of credit needs of small borrowers in the near future?

In view of our above arguments in this section, Parekh's characterisation of the high rates of interest as usurious, unsocialistic or exploitative, is a piece of misplaced rhetoric.

SEVEN SEAS TRANSPORTATION LIMITED

Speech of the Chairman, Shri Gopalkrishna Singhania

THE following is the Speech of Shri Gopalkrishna Singhania, Chairman, Seven Seas Transportation Limited, delivered at the Second Annual General Meeting of the Company held on June 27, 1974:

LADIES AND GENTLEMEN,

It is my privilege to welcome you all here at the Second Annual General Meeting of the Company.

You will have observed that the Company's accounting year has now been changed to 31st December from 30th September, to reflect a truer picture of the Company's operations, in view of the fact that the first ship was acquired in January 1973 and the third ship in June 1973.

I am sure that the members will commend the performance of the Company during the very first year of actual operations, that too only for a part of the year, which has resulted in a net profit of Rs 40.22 lakhs before providing for development rebate reserve.

OIL AND COMMODITY BOOM

The oil and commodity boom has brought about a bonanza for countries which are large exporters of these commodities. As a result thereof the share of developing countries in world's exports is likely to increase from 17 per cent in 1970 to 27 per cent in 1974. However, this unprecedented prosperity has not and will not come in the way of countries like India, which do not have commodities like oil, copper, zinc, rubber, tin, etc, where prices have literally gone through the ceiling. This has, therefore, created dismay in the minds of countries without such big commodity earnings as their development plans have been thrown entirely out of gear. Unless, therefore, substantial income transfers *inter se* between the new rich developing world and the rest is brought about, through differential pricing of commodities and long term aid on soft terms, the economies of the affected countries are bound to receive a severe jolt.

BALANCE OF PAYMENTS

The very sharp increase in prices of imported commodities referred to earlier has made the chapter on balance of payments in the Draft Fifth Five-Year Plan obsolete.

It is estimated that India's oil import bill in 1974-75 will be about Rs 1,300 crores, 70 per cent of the total imports in 1972-73. As food imports have become inevitable the total imports in 1974-75 may well exceed Rs 4,000 crores which is 50 per cent more than in 1973-74 and 125 per cent more than in 1972-73. The favourable balance of trade of Rs 164 crores attained in 1972-73 is likely to be converted into an adverse balance of the magnitude of about Rs 1,300 crores this year assuming food imports of 3 million tonnes, imports of crude oil, petroleum products, steel, fertilisers and maintenance items at current levels and growth in exports of 18 per cent.

India is today faced with a basic structural change in her foreign trade. The position will remain extremely difficult during the best part of the Fifth Plan unless some radical steps are taken right now. The first and foremost is giving all possible importance to oil exploration and restructuring of the energy base. Coal development must receive the requisite thrust so that the Fifth Plan target of 135 million tonnes is not only achieved but exceeded. Utilisation of installed capacity will have to be improved speedly through revamping of management so that the draft on foreign exchange can be drastically reduced particularly imports of steel and fertilisers which in the current year may amount to Rs 700 crores. To achieve near equilibrium in our balance of trade by 1973-74 exports will have to grow at a minimum rate of 18 per cent per annum, i e, twice the rate of growth attained during the Fourth Plan, despite domestic shortages. We are today faced with the problem of continuing to preserve our credit worthiness abroad and in which respect we have so far had a first class record.

Our own efforts apart we must use all our diplomatic skills and in which we have not been found wanting during crucial moments, to prevail upon the oil producing countries to adopt a dual pricing structure. Since the oil consumed by the developing countries is hardly 10 per cent of the total world oil exports, the oil producing countries must be made to see the economic and social rationale of such a policy in view of the enormous hardship faced by the non-oil producing developing world as a result of the incredible hike in oil prices. A way out could be to prevail upon the oil producing countries to supply oil to developing countries at pre-October 1973 price levels. Further at least one-third of the oil import bill could be in the form of long term soft loans.

Foodgrains imports of at least 8 to 10 million tonnes seem inevitable during the Fifth Plan. In view of the serious foreign exchange constraints, we will have to increasingly look to large grain producing countries abroad such as USA, USSR, Australia and Canada to supply grains in the form of product loans on the lines of the arrangement arrived at with the USSR last year.

OPENING OF SUEZ CANAL

Surveys conducted some time ago indicated that the reopening of the Canal will not have any major influence on the supply and demand of tramp ships. The importance of this waterway has considerably diminished as a result of the increase in the size of ships and the emergence of oil tankers of over 2,50,000 DWT since the closure of the Canal in 1967. It is estimated that the opening of the Canal may mean a fall in the demand for tramps anywhere between 2 to 3 million DWT and for tankers 8 to 10 million DWT. The current world tonnage is around 500 million DWT out of which the non-tanker tonnage is about 50 per cent, roughly half being employed in tramping. The additional availability of about 2 per cent of dry cargo and 4 per cent of tanker tonnage is likely to have only a marginal impact, but psychologically this could be important.

On the wider plane of India's foreign trade this may have two implications. The time and freight advantage in terms of exports to the Arabian Gulf area may be somewhat reduced. On the other hand as far as India's exports to Europe and North America are concerned, which constitute 70 to 75 per cent of the total, we would be at an advantage, particularly in respect of exports of iron ore. Lack of adequate shipping space, infrequent sailings, and the considerably longer voyage time going round the Cape have been serious deterrents to growth in our exports in the last few years. On balance, therefore, the opening of Suez may be to India's advantage.

SHIPPING PERSPECTIVE

Fifth Plan Target :

The rapid growth of Indian shipping in the last few years has put India on the maritime map of the world. Though the Indian tonnage in operation, currently 3 million GRT, is just a little over 1 per cent of the world tonnage Indian shipping companies have established a good track record with many of the world's leading banks about their capacity to operate fleets of increasing size and diversity in an efficient and profitable manner.

The net accretion of under 0.9 million GRT to India's tonnage during the Fourth Plan does not by itself appear very impressive. However, the tonnage on order at the end of the Fourth Plan was over 2 million GRT. Consequently the Indian tonnage in operation by the end of 1976 will be close to 5 million GRT. This is a commendable achievement indeed.

The Draft Fifth Five-Year Plan target of 8.6 million GRT, with 1 million GRT on order, is indeed challenging. This would involve a gross addition to Indian tonnage of 6 million GRT during the Plan period, after allowing for scrappage.

Ship-Building :

Despite several inherent advantages the progress in ship-building in India has been slow and tardy. Even today the total annual production in the country of ocean going vessels is hardly 50,000 GRT. On the basis of the schemes already approved, the total capacity in the country by the end of the Fifth Plan would be a little under 200,000 GRT per annum. Consequently over 90 per cent of the additional tonnage required during the Fifth Plan will have to be procured from abroad.

If indigenous yards are to cater to India's growing needs of shipping not only the existing shipyards will have to be expanded to their ultimate potential of 475,000 GRT, but a very early decision would have to be taken on establishing at least two new yards so that by the end of the decade the country would have shipbuilding capacity of 1 million GRT and possibly over 1.5 million GRT by the end of the Sixth Plan. Private initiative in setting up such yards should also be encouraged. This would not only help cater to our growing needs but also develop an export potential.

Ship-building and ship repairs capacity must constitute an integral part of overall shipping policy of any maritime nation. Rapid growth of ship-building could also help bring about an enormous saving in foreign exchange. Currently the foreign exchange component in Indian built ships is about 35 per cent of the total cost or 50 per cent of the material cost. With fuller development of the marine ancillary industry this could be reduced substantially to around 20 per cent of the total cost.

The allocation for ship-building made in the Draft Fifth Five-Year Plan is Rs 160 crores. This is inadequate and needs to be increased to at least Rs 400 crores as at current prices a well equipped yard would cost anywhere upto Rs 100 crores.

Financing Acquisition :

At current prices and assuming that 20 per cent of the additional tonnage acquired will be second hand, the foreign exchange outlay required could be of the magnitude of US $ 3 billion, i e, about Rs 2,300 crores at the current rate of exchange. While this may appear to be a staggering sum, around 80 per cent of it could be raised by way of term loans from commercial banks/financial institutions abroad and by way of yard credit. In the last three years increasing resort has been made to acquisition of tonnage by borrowing in the Eurodollar market. India has a relatively high credit rating and has been able to obtain such credits on terms which in some cases have been comparable with those at which the developed countries have been borrowing. However, there has been very heavy demand for these loans lately from even public authorities in the UK, France, Italy and other countries which has tended to keep interest rates at very high levels.

The arranging of foreign exchange finance is indeed an essential part of the ship acquisition programme. However, it is only the first step. Shipping is a highly capital intensive industry and hence servicing and amortisation of loans raised over a period of eight years, which is normally the maximum for such loans whether commercial or yard credit, from freight/charter earnings alone, is not possible except in the case of fairly old ships. Hence suitable Rupee back up on soft terms has been a pre-requisite, particularly in respect of new and relatively modern second hardships, especially for companies which have been in operation for a short period and consequently have not been able to build up substantial reserves and liquidity. The loans advanced by the Shipping Development Fund Committee have, therefore, made a

significant contribution to the progress Indian shipping has made so far.

In the Draft Fifth Five-Year Plan a provision of Rs 243 crores has been made to be advanced to Shipping Development Fund Committee for giving loan assistance for acquisition of ships. This appears woefully inadequate in terms of the financial dimensions of the acquisition programme set out earlier and will have to be at least doubled. Further the current debt equity guidelines for SDFC loans, *viz*, 6:1 with a minimum margin of relaxed considerably. The debt equity ratio, therefore, needs to be relaxed to at least 10:1 and the margin requirements to 110 per cent. What is really of the essence is viability of the operations and earning potentialities. The pre-eminent maritime position of Japan, Norway and Greece has been in a large measure due to the very high leverage used by the shipping companies in those countries. The suggestion that the SDFC will consider more favourably the request for guarantees to enable the shipping companies to raise loans elsewhere is no substitute for direct loan assistance under existing terms for two reasons. Firstly, while the SDFC guarantees could be a substitute for bank guarantees given as collateral against foreign exchange loans raised abroad, it would certainly not provide the liquidity cushion which SDFC loans do for amortisation of foreign exchange loans. Secondly, raising of Rupee loans against such guarantees would pose problems in view of the considerable interest differential and the resource constraint which commercial banks and financial institutions in India are presently facing.

Fiscal Incentives :

Shipping is an internationally competitive industry and its fortunes are subject to cyclical fluctuations, sometimes violent. The rate of return on capital employed has been well below that for other industries. This will be borne out from the figures reproduced below, from the study made by the Reserve Bank of India of 1650 selected public limited companies:—

	Shipping		All Industries	
	1970-71	1971-72	1970-71	1971-72
Gross profit as per cent of total capital employed	6.9 per cent		10.2 per cent	
	6.1 percent		10.2 per cent	

Attractive fiscal incentives and/or operational subsidies to shipping companies are a normal feature in most maritime countries. In India the development rebate, ranging from 20 per cent to 40 per cent depending on the age of the ship, has provided considerable thrust to the growth of the Industry. According to the Finance Act 1974 the availability of development rebate has been extended to 31st May 1975 in respect of ships ordered before 31st December, 1973. In view of the special problems of the shipping industry the extension of this rebate at least during the entire Fifth Plan period would undoubtedly give it considerable fillip.

The proposed initial depreciation of 20 per cent for specific industries or accelerated depreciation now under consideration for shipping, is indeed a very inadequate substitute for development rebate as has been pointed out by so many eminent fiscal authorities. This apart, unless it is specifically laid down in the rules that the actual provision in the accounts need not be more than say 50 per cent of the initial/accelerated depreciation claimable for tax purposes, approximating to the tax saving thereon, it would make it extremely difficult for shipping companies to declare dividends especially during the phase of rapid expansion in the next few years, which in turn will not attract additional capital to the industry.

Administration :

I may also refer to certain administrative problems which are likely to prove as constraints. The attainment of the Plan target would involve acquisition of about 60 ships per annum (average 20,000 GRT). The approval procedures involved will, therefore, have to be considerably streamlined by setting up a coordinating committee comprising of all the government agencies concerned. This is imperative if attractive proposals are not to be lost in view of the fact that offers for sale are normally not kept open beyond 8 to 10 days.

Steps will also have to be taken to ensure the availability of sufficient and competent manpower as more and more sophisticated ships are acquired. The cost per tonne will continue to increase not only because of inflation, but owing to the ships being better units. As it is today, junior officers are conspicuous by their absence and the burden on senior officers has been continuously increasing. This has led to reduced efficiency on the ships which, if not checked now, would lead to lower output as also increase in casualities.

All leading shipping companies in India presently come within the purview of the Monopolies and Restrictive Trade Practices Act as the value of their assets exceed Rs 20 crores. It is quite possible several more companies will come within the purview of this Act within the next two to three years. In an industry like shipping, where the unit value of large bulk carriers and tankers exceeds Rs 20 crores, it is suggested that the applicability of the Act should be substantially relaxed by giving block clearances for the acquisition programme planned by the companies concerned during the Fifth Plan in due consultation with the Ministry of Shipping and Transport. Shipping is truly international in character and the question of "concentration of economic power to the common detriment" is most unlikely especially as the Shipping Corporation of India and its subsidiaries will own around two-thirds of the total Indian tonnage at the end of the Fifth Plan.

Development of Ports :

Modern ships, which are getting larger and larger in size require greater depth of water in the ports. They also require larger land areas behind the berths and modern and faster equipment for loading and unloading. Those ports which have not been able to cater to modern ships have been left behind and the cargo handled by these ports has witnessed a fall due to diversion of traffic to other more developed ports.

The development of ports at Mormugao, Visakhapatnam and Haldia are already in hand which will enable them to handle bulk carriers and oil tankers in the range of 60,000 to 100,000 DWT. Madras and Paradeep ports have also been developed recently to accommodate large sized vessels in the range of 60,000 DWT to 80,000 DWT. However, the development of ports on the west coast—Bombay, Kandla and Cochin have not kept pace. These ports presently can handle dry cargo ships of upto 20,000/22,000 DWT, and oil tankers upto 55,000 DWT at Bombay only. The pattern of cargo handled at Indian ports has undergone marked structural change in the last 20 years. Bulk cargo which formed 25 per cent of the total in the 1950s today constitute almost 75 per cent and is likely to increase to over 80 per cent by the end of the decade. It is, therefore, imperative that our ports are adequately equipped to handle bulk cargoes which calls for specialised equipment and very large land area adjacent to the berths.

The port of Bombay has berth occupancy rate of 98 to 99 per cent the highest in the world. Consequently there is very little time and scope for undertaking dredging operations. Extensive development of the ports at the present locations has serious limitations. Hence a scheme was prepared for a new port at Nhava/Sheva of development of three deep water berths to accommodate ships upto 80,000 DWT. These berths would profitably cater for such vital commodities such as sulphur, rock phosphate, potash, sugar, oil-cake and containerised general cargo. The scheme has been under the active consideration of the Government of India for some years and its development should be included in the Fifth Plan.

The lack of development of ports in keeping with India's growing foreign trade has resulted in enormous congestion at almost all ports. For instance for unloading a 20,000 DWT ship carrying foodgrains takes on an average 2 to 3 days in a port in any of the developed countries as against a minimum of 15 to 20 days in India and even longer on the east coast. This is despite the fact that the productivity of manual labour is fairly high. In Bombay Ports alone 3,000 shipdays have been lost per year on an average involving waiting cost of Rs 4 crores per annum and which well exceeded Rs 6 crores last year, bulk of which is paid in foreign exchange by way of demurrage to foreign flag vessels. Immediate steps must therefore be taken to develop ports on the lines indicated.

Future Prospects

The fluctuations in the freight market are so frequent and marked that it is extremely hazardous to guess the likely freight rates in the foreseeable future. There has been undoubtedly softening in time charter rates consequent to the slowdown in the level of industrial growth in the developed countries. There has, however, been a very sharp rise in ship-building costs. The prices of second hand ships have also gone up enormously being 50 to 60 per cent higher than those obtaining at this time last year and no downturn is yet visible despite softening in freight rates as there are few sellers.

Shareholders will be happy to learn that the Company acquired on 6th May, 1974 at a cost of about Rs 13.5 crores, its fourth ship, a bulk carrier of 75,350 DWT which has been named "SATYA KAILASH". This brings the Company's total tonnage to 142,095 DWT, more than double what it had planned in the first phase of its development. The proposal for this acquisition was processed most expeditiously by all concerned.

I wish to express the Board's appreciation to Shri Raj Bahadurji, the out-going Minister of Shipping and Transport, and also to Shri Kamlapati Tripathi for their stewardship of the ministry. We welcome the new Deputy Minister, Shri Pranab Kumar Mukherjee to our industry. The dynamic leadership provided by the Secretary, Shri M G Pimputkar, has added a new dimension to India's Fifth Five-Year Plan targets and your Board will do its utmost to help achieve them. We would like to thank the Director General of Shipping, Shri S V Bhave, Chief Controller of Chartering, Shri N R Reddi, and the Principal Officers of the Mercantile Marine Department and various other Senior Officers of the Ministry of Shipping and Transport for their guidance, advice and co-operation but for which the progress made by this Company would not have been possible. We also thank the various firms of ship brokers, who have assisted us in buying and finding employment for these ships as also the Food Corporation of India and its staff. We have also been gratified at the very valuable co-operation and support which we have received from all our bankers especially the State Bank of India.

The Company's working to date certainly lends hope for a bright future. Your Company's affairs are in very able hands. The Committee of Directors which has been entrusted with the direction and control of its affairs, subject to the overall superintendence of the Board, has been closely guiding and reviewing its operations. The Company has an excellent team of managerial and technical personnel, both ashore and afloat, headed by Mr B D Kataria, the whole-time Director. The fine performance of the Company has been substantially due to their initiative, diligence and endeavours which deserve our hearty commendation.

I would also like to express my thanks to all my colleagues on the Board for their counsel and continuing interest.

GOPALKRISHNA SINGHANIA

Chairman

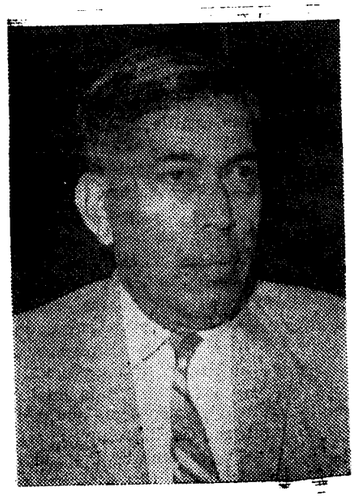
Bombay,
17 June, 1974.

Note : This does not purport to be a record of the proceedings of the Annual General Meeting.

Agricultural Finance Corporation Limited

Statement of the Chairman, Shri V M Bhide

THE following is the Statement of Shri V M Bhide, Chairman, Agricultural Finance Corporation Limited, at the Sixth Annual General Meeting of the Corporation on Friday, June 28, 1974:



GENTLEMEN:

I have great pleasure in extending to you a hearty welcome to the Sixth Annual General Meeting of your Company. The Directors' Report and the audited accounts for the year ended 31 December 1973 have been in your hands for some time now and with your permission I may take them as read.

The year 1973, as you all know, has been a year of acute economic stresses and strains. The year was preceded by a severe drought which brought in its wake inflation, rising prices and scarcity of important commodities required both for industrial production as well as consumer needs. This situation was further aggravated by the oil crisis which has magnified our problems on the economic front to proportions which posed a challenge to the intrinsic tenacity of our people. It is evident that nothing short of a very bold and imaginative policy dedicated to accelerating production in the entire economic field would enable us to cross the hurdles that we are faced with. It is in this context that I would request you to view the policies adopted by your Corporation and consider the plans it has for its working in the future.

In a vast country like ours even though we have substantial areas endowed with assured water supply, it would be idle to expect that this bounty of nature will be available to us uniformly throughout the country year after year. Droughts due to failure of rain and devastations caused by floods appear to go in cycles from State to State. Efforts at arresting havoc caused by these natural calamities through the successive Five Year Plans have, no doubt, produced laudable results but they are inadequate to meet the requirements.

Unfortunately within a span of just one decade we have witnessed two very severe droughts which extended over large fertile areas. The peculiarity of this calamity has been its extended duration to as many as six cropping seasons in many cases. Our people, particularly the cultivators, who were hit the hardest, faced the situation admirably. The first severe drought of mid-60s had gripped vast areas of Bihar, Uttar Pradesh and Rajasthan while the recent drought of 1970-72 has adversely affected the vast population of Maharashtra and Gujarat. The challenges posed these cycles of drought have brought in their wake some welcome changes also. The first drought of North India brought in a wider adoption of High-Yielding Varieties of food crops throughout Uttar Pradesh and Bihar while the recent drought in Gujarat and Deccan Plateau has directed energies to conservation of water resources through the renovation of percolation tanks, dug-wells and water harvesting techniques. You will be happy to know that your Corporation has associated itself with the efforts at stabilising and increasing agricultural production in the affected areas by taking advantage of the changes in techniques that have emerged. We cannot, however, overlook the fact that efforts to ameliorate the conditions created by these calamities or to prevent their recurrence in areas prone to be affected by them have been piecemeal and ad-hoc in nature. In the face of such calamities the State and the Central Government Organisations as also private philanthropic organisations rush to help the victims and, indeed, make valuable contributions to save the situation. But as soon as normalcy returns, all the agencies seem to turn back and leave the people again to their fate. What we have to consider is whether some stable long term strategy, as was tried out in our earlier schemes for Bihar or the recent schemes of sinking of artesian wells in Tripura to solve the problems of such areas can be found. It is here that I think your Corporation can play a vital role.

Shri V M Bhide

My predecessor, Prof M L Dantwala, in his address in June 1972 as Chairman had remarked, "I would like to submit that AFC is somewhat like a research and development wing serving the commercial banks rather than an independent financial institution". Your Directors' Report will give abundant evidence that he has steered the activities of the Corporation in this direction. I now wish to go a step further and add that the time now appears to have come when the findings of the studies undertaken by this Corporation have to be applied in actual practice by all development agencies in formulating and fruitfully implementing the projects with the help and co-ordination of all other agencies operating in the field, specially the developmental and extension functionaries.

While the recurrence and duration of natural calamities or other handicaps in the way of increased agricultural production, will continue to get our attention and we will endeavour to make a study of these problems, a vital part of our activities will be to divert greater attention to some of the current problems which have assumed greater urgency, taking advantage of the expertise at the disposal of other agencies such as the Planning Commission, Reserve Bank of India, ICAR and other Agricultural Institutions.

The international oil situation has had direct repercussions on fertiliser production both within the country and outside. The immediate effect has been that fertiliser prices have gone up by almost 100 per cent and its availability reduced considerably. This is bound to offer insurmountable problems in terms of our efforts to increase production. Your Corporation has been conscious of the problems raised by this

situation and has tried to minimise the impact of this shortage by recommending to the State Governments a judicious case of the available water resources created through bank finance so that production is sustained, if not increased, as has been done in the schemes formulated by your Corporation in Jalna in Maharashtra, Vaishali in Bihar, Dhenkanal in Orissa, Tuticorin in Tamil Nadu, Murshidabad in West Bengal, etc. Just as it has been scientifically established that the high-yielding varieties do require high dosages of fertiliser, it has also been established that reduction in the dosage of fertiliser could, to a certain extent, be offset by adoption of proper water management techniques, combined with the application of other packages of technology available, including better methods of fertiliser placement and application, use of high-yielding variety of seeds, proper spacing etc. These would no doubt require intensified extension support, whereby farmers having assured water supply are provided with guidance as also other inputs in needed quantities at appropriate time. With this in view, your Corporation had advised State Governments to intensify extension activities in the command areas of wells energised through commercial bank finance. I am happy to report to you that some of the State Governments have responded favourably to our suggestion and have already initiated action.

The Corporation has been active in recommending to the State Governments the use of supplementary manurial resources in the form of urban compost to offset the shortages of chemical fertilisers. Our discussion with the Government of India and some State Governments has resulted in getting favourable response from Agro Industries Corporations and we hope that action will be initiated for the the conversion of urban waste through mechanical means into compost for use in rural areas.

I may, however, add that the increasing role played by the commercial banks in financing agriculture is not yet adequately backed by the extension agencies in the State. There appears to be an impression that once the commercial banks sanction funds for some kind of schemes mentioned in the plans, results will follow automatically. In practice this does not happen. As a matter of fact, entry of the commercial banks in financing individual cultivators or groups of cultivators has increased the burden on the extension agencies which is still to be fully realised. In many cases the cultivators need greater guidance from the agencies in utilising the funds that can be provided by the commercial banks. In fact, the extension agencies will be required to play a vital role in advising the farmers first to formulate projects and continue to guide them until they have harvested their crops. If such a backing from the extension agencies becomes available, the total performance of all the institutions will improve. It will improve the utilisation of the funds as also the productivity of individual cultivators and lastly it will also facilitate recovery of the loans given by commercial banks in time.

Your Corporation has also been in in close touch with the State Governments for the formation of "Core Groups" of their officials in charge of Development Departments to review intensification of agricultural production by an integrated approach and providing extension support to the farmers in those areas where energisation programmes have been financed by our member banks. The State Governments have also responded to this suggestion favourably and have already set up informal groups of Senior Government officials to co-ordinate these activities.

The National Commission on Agriculture had recommended the organisation of Farmers' Service Societies as an institution which would convert credit into agro-services. The Corporation had helped the Banks and the State Governments in the organisation of these Societies and training of their staff. It is, however, too early to make an evaluation of these institutions, but progress reports from some States indicate that Farmers' Service Societies have helped the small farmers in getting institutional finance for agricultural development and that disbursements, utilisation and recovery of loans were being effectively supervised. In this connection, I would, however, like to caution both the commercial banks and the State Governments that it would be wise to organise these Societies only after a proper survey, study of the farmers' response, as also detailing the key personnel including the Managing Director right from the start. It is lot more beneficial to proceed slowly and consolidate the position as we go along rather than build up haphazardly and dilute the standards.

The small farmers have always been given priority in projects designed by the AFC. A quick study was undertaken in six SFDA areas in different regions of the country to identify the constraints on banks' credit to small farmers. As a result of this study, a set of recommendations were sent out to Banks to facilitate dispensation of credit. It will be our continuing effort to make the potentially viable small farmer attain a state of self-sufficiency, if not one of surplus. In this effort, I hope the Farmers' Service Societies will play an effective role.

Effective coverage of borrowing farmers could be vastly increased if co-ordination, between the co-operatives and commercial banks is ensured at the grass root level. I must confess that despite the various Co-ordination Committees that have been set up by the Government of India, State Governments and the Banking Industry starting from the national level to the district level, they are still not in a position to bring about "operational co-ordination", with a view to achieving a greater level of productivity by avoiding areas of overlap, dual financing or effective supervision. As a step forward, the commercial banks were induced to adopt co-operatives where the central tier, *viz*, Central co-operative bank was weak and was not in a position to service the requirements of farmers who were good paymasters and happen to be members of the Society affiliated to such Central Co-operative Bank. However, there appears to be a lurking fear in the co-operative organisations in some States that the commercial banks intend to replace the co-operative institutions by taking up their role. There needs to be greater understanding between the co-operatives and the commercial banks in this regard, when specially it is a known fact that even both of them together will not be in a position no meet the entire requirements of agricultural sector. The co-ordination between the co-operatives and the commercial banks is crucial in the organisation and operational success of Farmers' Service Societies and hence I wish to emphasise this point for the attention of commercial banks as well as co-operatives.

The Agricultural Finance Corporation works in close harmony with the State Governments as also the commercial banks in helping them identify projects, formulate and appraise them, especially innovative projects like, Drought Prone Development Projects, Command Area Development, Tribal Development, Forest Development Corporation, Water Resources and Land Development Corporations. The State Governments have

been increasingly drawing upon the services of the AFC in these areas and I foresee that in the next few years assignments from State Governments would become a major component of the project formulation portfolio of your Corporation. The Co-operation that the commercial banks have been giving to the AFC would be very evident from the Directors' Report. I am happy to inform you that our consultancy portfolio in general has increased nearly four fold compared to last year's level, i e, from Rs 21.61 crores it has gone upto Rs 81.59 crores.

AFC is now focusing its attention to giving personalised service to the commercial banks. Your Corporation will accordingly be initiating discussions with the commercial banks to identifying areas in which services of your Corporation could be better utilised. Many of our non-nationalised member banks have asked for a greater share of our attention and services, especially the smaller regional banks which have a rural base. We would also like to bring them more into the field of agricultural financing and I hope that our efforts in this direction would bear discernible results in the near future.

As I have already pointed out, the prosperity of our agriculture will depend upon, apart from the blessings of weather Gods, the active co-operation between the Agriculture, Co-operative and other Development Departments of the State Governments, the Agricultural Universities, specialised agencies like AFC, ARC and commercial banking institutions. While, as you will have seen from the Directors' Report, we have achieved some degree of success in this direction, we have still to go a long way in securing a fully integrated approach on area development, centred round potential for agricultural production of the area. Our efforts will therefore be to continue serving the commercial banks to reach higher levels of productive lending in the field of agriculture, with a slant towards helping small farmers, oral lessees and dry land farmers and developing backward and neglected areas.

In conclusion, I would like to take the opportunity of thanking my colleagues on the Board for their support and advice to me. On behalf of you all, I place on record our gratitude to Prof M L Dantwala who served as the Chairman with distinction and steered the activities of the Corporation in the right direction with dignity and purposiveness. Our grateful thanks are also due to the Reserve Bank of India, the Banking Department of the Ministry of Finance, Government of India and the Agricultural Refinance Corporation, for their support which has been responsible for what we have been able to achieve. I am grateful to Mr Ghulam Ghouse, Managing Director, for the very keen interest he has evinced in the affairs of the Company. I thank all the Executives, Officers and Staff for their excellent team work and devotion to duty. Thank you.

Fresh alternatives for industrial enterprise:

AN OPEN OFFER TO INVEST IN ORISSA.

If you are planning to set up a large or medium scale industry, you would do well to establish it in Orissa. The facts prove that Orissa has all the essential pre-requisites for healthy, profitable enterprise :

Abundant natural resources : a vast concentration of mineral ores, a large agricultural area, valuable forest land, a long coast line and numerous rivers. Factors ideal for a broad spectrum of industries.

Responsive labour : technically qualified personnel from the engineering colleges, polytechnics and industrial training institutes augment a large, responsible work force.

Ideal infrastructure : abundant electric power, easily available water, ready-and-waiting industrial estates and developed land; a developed communication network, plus the economic advantages of the country's deepest port, Paradip.

Attractive incentives : Orissa's industrial and financial corporations - IDCOL*, OSFC*, OSIC* and IPICOL* - offer attractive credit facilities and competent services to set up and run large or medium scale industries profitably.

This advertisement can only serve to highlight the advantages of investing in Orissa. For details of investment opportunities, contact the Corporations mentioned below. You'll find these professionals speak the same language as you - profitability.

The Absurdity of It All

THE poor and the relatively poor who have been pushed to the wall by the inflation must, it appears, also get the worst of the government's measures to control the inflation. The details of the Ordinance impounding all wage increases and one-half of increases in dearness allowance — as well as of the other one which limits dividend distribution by companies — are discussed elsewhere in this issue. The inequity of reducing further the real earnings of workers, which is what the Ordinance on wages and dearness allowance seeks to do, is patent, but the measure is in keeping with the government's entire approach to the management of the economy in recent years. The last vestiges of planning having disappeared during this period, the economy has been left to manage itself as a free enterprise market system. In such a system the accepted way of tackling inflation is through deflation. And this, it has been clear for quite a while, is the path the government has chosen.

Even before last week-end's Ordinance curbing the growth of wage and salary incomes, there had operated, through the low and declining levels of investment, particularly in the public sector, a virtual moratorium on the growth of employment and the creation of new incomes. This has now been extended to the incomes of the existing employed. True, incomes of certain sections — rich farmers, traders, those who control companies, high-salaried executives in the public and private sectors; self-employed professionals — had not only not been bridled in but had expanded disproportionately. However, that only meant that the curb on the unborn incomes of those at present unemployed, in the form of cuts in investment and check on expansion of employment, had to be that much more ruthless. How the impounding of wages and dearness allowance will effect the working class is clear; but the consequences for the poor of the cut of over Rs 400 crores in the Plan outlay last year were equally serious, though more camouflaged. Having found that it was not enough to keep the unemployed without jobs and income-less, the government has now launched an attack on the incomes of the existing employed. It is all part of the same approach; to deflate the economy.

It is a grotesque situation. Here is an economy where investment levels have been stagnant for the last ten years; growth of employment has lagged far behind the growth of the labour force; industrial and agricultural production has fallen short of the altogether modest expectations of the government; idle capacity has been rampant in a wide range of industries and, above all, nearly one-half of the population continue to live below the most-austerely defined subsistence level. This is the economy that the government has been *trying so hard* to deflate. There can be no better illustration of the incongruity of it all than the government's decision, at a time when some of the most essential development programmes, whether in power or in public health, are being held back for want of investment funds, not to use for investment the Rs 500 crores or so which are expected to become available as a result of the Ordinance on wages and allowances. Instead these resources are to be kept idle in the Reserve Bank's vaults. *The interest payment on them, amounting to about* Rs 300 crores, would come out of government revenues and so reduce investible resources further. Distrust of investment in a country so desperately short on investment and growth could scarcely go further!

There is no doubt that the impounding of wages and allowances, as well as *cuts in investment*, will reduce the consumption of certain identifiable sections of the population. To the extent that they reduce consumption it can be argued that, other things remaining the same, they would make for a better balance between supply and demand. But that is the same as saying that the demand for food, for instance, can always be adjusted to any given level of supply, provided enough people can be made to starve. In an economy where there already are such a large number of starving people, measures which add to this number can hardly be elevated to the status of policies. In these conditions, it is not enough that a balance is achieved between demand and supply; what is more important is how this is achieved. This applies with equal force to the government's latest anti-inflation measures.

Not that a great deal can be said for their ability to control the inflation. It is well known that for a number of essential consumption goods — whether foodgrains or vegetable oils — the rise in prices has been out of all proportion to the trends in supply and demand. The explanation, of course, is to be found in large-scale withholding of supplies from the market. The last wheat crop is an excellent case in point; with the marketing season drawing to a close, if official figures are to be believed, less than 5 mn tonnes out of an output of between 26 and 30 mn tonnes has reached the market. Those who are

July 1[illegible] the pcks held back from the duction programmeso in the confident exaggerated ot high and rising prices. present ave the economic and polistock muscle to ensure that nothing upto these expectations. In the case of industrial products like cement or paper, their soaring prices have been the result both of long-term lack of investment and growth of capacity as well as deliberate restriction of output. Here, again, the government has proved to be totally helpless. No wonder, therefore, that in sharp contrast to the stock markets which were in jitters over the Ordinance about dividends, the Ordinance on wages and allowances left the commodity markets absolutely cold.

The government is now said to be preparing a compulsory deposit scheme to cover the higher salary earners, the professionals and so on. It is as if it were all a public relations exercise. Since some measure affects the ordinary salary and wage earners, another has to be thought of to curb dividends and a third has to be devised which will seem to affect other well-off sections. But those whose handiwork the inflation really is know the shadow from the substance. Thus the rich farmer or the trader figuring out how to maximise his profits from the stocks of foodgrains he has built up knows that what is material is that releases through the public distribution system are now down to 5 lakh tonnes a month, or less than one-half of the level about a year ago; similarly, the textile mill magnate can count on the fact that the government's scheme for production of mass consumption cloth has died a most unnatural death. With the government having virtually no control over the availability and distribution of the necessities of life, many more will be pushed much nearer starvation, and many over the brink, before the government's deflationary policies begin to have any impact on the inflation.

Food

Along Predictable Lines

B M writes:

FAKHRUDDIN ALI AHMED is unlikely to be missed in the Food and Agriculture Ministry. While Fakhruddin's successor has yet to be appointed, a high-powered Cabinet Committee has been set up under the chairmanship of the Prime Minister herself to tone up the working of the Ministry. How exactly the new committee proposes to go about its business has not been spelt out, but there are few indications of new initiatives or lines of approach. On the contrary, there is already strong evidence that, under the stress of the gathering crisis on the food front — following the complete failure of the new wheat trade policy to secure the minimum stocks required for the public distribution system —, there will be moves to further appease those that are profiting from the crisis.

The government's policies for foodgrain distribution as well as for raising foodgrains production will thus move along entirely predictable lines. While stocks with the government for public distribution are to be augmented by importing about 3 mn tonnes, there will still not be enough to keep the public distribution system going even at the present reduced levels of offtake. From about 1.1 mn tonnes of releases per month — the peak level reached last year — the releases had come down to about 7 lakh tonnes per month for the last several months; they have now dwindled further to barely 5 lakh tonnes. The official argument is that with private wholesalers back in the trade this year, open market supplies are more than last year — no matter at what prices! — and that it is therefore no longer necessary to maintain an extensive public distribution system. The much-advertised ordinance to make the penalties for hoarding and profiteering under the Essential Commodities Act more stringent and the fixation of a ceiling price of Rs 150 per quintal for transactions in wheat by wholesalers are no more than attempts to cover up the government's abdication of responsibility.

There has also followed the inevitable 'crash programme' to boost agricultural production. As in the past this will amount to pumping in additional funds into the kitties of the richer peasantry — all in the name of providing fertilisers and high-yielding varieties of seeds and digging wells and installing pumpsets. Past experience is that, in terms of making available greater marketable surpluses at lower prices, the impact of all this expenditure is imperceptible. On the other hand, the outlays on such crash programmes are known to have bolstered the hoarding capacity of the rich peasants.

Similar contradictions can be traced also in the field of fertilisers. Great anxiety is being routinely expressed about the fertiliser shortage. The states have as usual pitched their demands as high as possible. Their estimate of requirement is 4.4 mn tonnes of NPK for this kharif season alone, although consumption for both the kharif and the rabi seasons in the current agricultural year was only 3.2 mn tonnes. Even the Indian Council of Agricultural Research always a votary of high fertiliser use, has mildly warned that the role of high cost inputs should not be exaggerated. Yet the states' exaggerated estimates of requirements have been considered enough justification to build up pressures for larger imports for which ever more aid will be sought.

At the same time, there has been further back-sliding on the fertiliser production programme. In the wake of the oil crisis, the realisation had at last dawned on the government that reliance on imported feedstocks for fertiliser manufacture was inadvisable. There was talk of coal-based fertiliser plants though the enthusiasm for such plants never went beyond the verbal stage. Now, however, even the verbal enthusiasm for coal-based fertilisers has been abandoned — again, predictably, in the name of achieving quick results in fertiliser production. An important part of the brief that has been prepared for the Cabinet Committee on Food is that the decision in favour of coal-based fertiliser plants should be modified and naptha-based plants should be encouraged. The specious plea is that the expenditure on import of naptha will be offset by the corresponding 'saving' on lower imports of fertilisers.

Calculators

Farce of Exports

THE licensed capacity for manufacture of desk calculators now exceeds 80,000; however, production last year was a dismal 4,000 or so. Yet the government is said to be considering licensing further expansion of capacity for calculator manufacture.

Indigenous development of desk calculators has been in progress for at least six years. Early models, such as the one at BARC, used transistors and were therefore relatively large and unwieldy. NELCO was the first to go into production with such a model, but soon gave up due to the high cost (about Rs 13,500) and also because in the meantime the government permitted manufacture of calculators using imported integrated circuits. The Department of Electronics set up a panel in 1971 to report on the prospects of manufacture of desk calculators on a large scale. The major issue to be decided was between manufacture using local components (i e, transistors) and manufacture with imported integrated circuits.

Predictably, the decision went in favour of use of imported technology and components. Equally predictably, little attention was paid to the development of the technology and of the components within the country.

Integrated circuits with their inherent miniaturisation and higher reliability offer prospects of lower cost and smaller size. Small-scale integration (the equivalent of about 5-10 transistor circuits) can be used for desk calculator manufacture but with higher assembly costs since about 100 such 'chips' would be required for the larger models. On the other hand, medium and large-scale integration (the equivalent of 200-2,000 transistor circuits) reduces the number of 'chips' required for a desk calculator to around 5 to 7. With this development, making a desk calculator now involves simply designing a plastic moulded case, assembling the chips on a small printed circuit board and putting together the keys and the display panel. Integrated circuit manufacturers abroad supply the minimal circuit layout, so that the development required locally is trivial.

When those licensed to make calculators were permitted to import integrated circuits, all of them naturally chose to get large-scale integrated 'chips' to cash in on the advantages of low assembly cost and high retail price (Rs 3,000-7,000 for calculators made from a kit of imported components costing $ 50-75). In fact, some 'manufacturers' have even imported whole calculators in knocked-down condition and marketed them after no more than a change of brand labels!

Examination of the list of desk calculator manufacturers shows that large business houses have found this a highly profitable avenue of diversification with low capital investment and a false facade of participation in high technology manufacture. The same manufacturers are now awaiting the government's decision on grant of licences for manufacture of mini-computers. Large-scale integrated circuits are now available that will, at one level of operation, allow mini-computer manufacture also to be a semi-assembly operation.

What, it may be asked, are the considerations which have influenced the pattern of development of the desk calculator industry? Certainly, the product is not so essential as to have justified its manufacture in the country at any cost. Equally certainly, there have been no technological spin-offs of any kind from the manufacture of calculators which have simply become yet another semi-luxury item, with those favoured with licences making easy money by charging scarcity prices for a product assembled from imported components.

To assuage their conscience — or to pull wool over the eyes of potential critics —, the licensing authorities have slapped on seemingly impressive export commitments, ranging from 25 to 50 per cent of output, on calculator manufacturers. And it has been reported that the export obligation would be fixed even higher for new units or for expansion of capacity. However, it is a laughable idea that Indian manufacturers with production capacities of 3,000 and 4,000 calculators a year can successfully enter the international market in calculators which is dominated by large American, Japanese and European manufacturers with well established brand names. Not surprisingly, therefore, the government has to offer all sorts of incentives and subsidies on export of calculators which today attracts a cash subsidy of 20 per cent, import replenishment equal to 30 per cent of the value of exports and duty drawback at the flat rate of Rs 175 per calculator. A little calculation will show that with these incentives, it will pay any calculator manufacturer to export dummy calculators and remit the 'export proceeds' by purchasing foreign exchange in the black market so as to claim the cash subsidy, the import replenishment and the duty drawback. In fact, this is precisely what some manufacturers are known to be doing. The less unscrupulous ones simply dump their calculators at throwaway prices so as to fulfil their export obligation. Some manufacturers are said to be exploring the possibility of exporting calculators to the East European market and one at least has claimed bagging a substantial export order. Such exports would be simply to spend about $ 50-75 foreign exchange per calculator for earning a roughly equal amount in non-convertible rupees.

If the government's objective was only to earn some foreign exchange by encouraging assembly of calculators in the country for export, there might have been a case for getting one or the other of the established international manufacturers of calculators to take advantage of our low labour cost and set up assembly facilities in this country on condition that all or most of the output was exported. Of course, in that case there should been no illusions about development of indigenous technology. If, however, as the Department of Electronics, like the Department of Electronics likes AFC's claim, the objective is to build up when own capabilities in the field of electro-as nics, manufacture of calculators, or for that matter of so-called mini-computers, should not have taken the form of assembly of imported components, but should have been based on manufacture of the essential components in the country, preferably at one or the other of the public sector electronics units. It is amazing that despite the paraphernalia of a separate Department of Electronics and the Electronics Commission, a supposedly high-powered expert body, which has the last word on all matters connected with the development of electronics industries, the establishment and growth of calculator 'manufacture' in the country has been so thoroughly misguided and aimless.

Scheduled Castes

A High Price

RANMALPUR village in Surendranagar district of Gujarat was the scene of a particularly vicious attack on scheduled castes by caste Hindus on June 22. Two scheduled caste men, Devji Dahya and Bijal Govind, were brutally murdered with spears, dharias and lathis by a 300-strong mob of Kanbi Patels. Seven scheduled castes were injured in the attack. The rampaging mob ransacked and looted every one of the 19 harijan houses in the village.

Ranmalpur is a small village with a population of only about 1,500 of whom the majority, around 1,000, are landowning Kanbi Patels. The scheduled castes, numbering only about 100, live in a cluster of huts just outside the village. There had been open tension between the Kanbi Patels and the scheduled castes for quite some time before the attack on the scheduled castes on June 22. This was known to the district authorities. Yet the only precautionary step they took was to post two policemen in the village. So ineffective was this protection given to the scheduled castes that during the attack by the Kanbi Patels the wife of the village sarpanch was able to disarm one of the policemen by taking away his rifle!

The cause of the tension between the scheduled castes and the Kanbi Patels in Ranmalpur was the Patels' refusal to allow the scheduled castes to use the village well to draw water. The village has two wells, one of which was traditionally used by the scheduled

castes. This well dried up two months ago, forcing the scheduled castes to turn to the other well for water. The Kanbi Patels resented this though, unlike the scheduled castes who are entirely dependent on the village well, they have available to them a number of farm wells to draw water from. The Kanbi Patels have no special rights over the village well and, in fact, it is illegal to prevent use of village wells by anyone. Yet this is precisely what the Kanbi Patels tried to do. Early attempts by the scheduled castes to use the well resulted in scuffles with the Patels and it is very likely that had the scheduled castes not organised themselves to resist the Patels they would not have been able to use the well. Significantly, Devji Dahya, one of the two victims of the attack by the Patels on June 22, played the leading role in organising the scheduled castes. Faced with the Patels' refusal to let the scheduled castes use the well, Dahya had lodged complaints with the police. Some Kanbi Patels were arrested as a result, though only to be released on bail immediately.

The organised fight put up by the scheduled castes finally forced the Kanbi Patels to agree to a compromise, which still reflected their caste bigotry and their contempt for the scheduled castes. Thus it was stipulated that the scheduled castes would be allowed to use the well only during fixed hours, very early in the morning and late in the evening. Further, the scheduled castes were not to be allowed to use the well directly; instead, water from the well was to be filled into troughs near the well and the scheduled castes were to be allowed to use only water from these troughs.

However, the Kanbi Patels did not reconcile themselves to even this compromise, with its humiliating conditions for the scheduled castes. Though they resented the very idea of the scheduled castes being allowed to use the same well as they, what enraged them even more was the fact that the scheduled castes had organised themselves to a point when they were able to force the Kanbi Patels to agree to a compromise. The main object of their hostility was Devji Dahya who had taken the lead in organising the scheduled castes. The attack of June 22 was evidenlty intended to teach the scheduled castes a lesson and to once again put them in their place.

The known details of the attack indicate careful pre-planning and also testify to the Kanbi Patels' bitter hatred of the scheduled castes. Thus the time of the attack was so chosen that most of the scheduled caste young men were then away from the village. Similarly, it was clear that Devji Dahya had been picked out as the main target by the attackers. The venomousness of the Kanbi Patels is brought out by the fact that both Devji Dahya and Bijal Govind were mercilessly pursued and literally hacked to death. Bijlal Govind was murdered right inside the village temple where he had sought shelter. His body reportedly bore 40 wounds. Devji Dahya had tried to hide himself inside a large earthen jar. He was forced out of it with dharias and spears and killed right in front of his wife and daughter. Those who have talked to the Kanbi Patels, some of whom were among the attacking mob, after the attack have found their attitude to be that whatever had been done had to be done to save the honour and prestige of the Kanbi Patels which the scheduled castes, under the leadership of Devji Dahya, had sought to threaten.

Some 120 persons, including the sarpanch of the village and the police patel, have been arrested in connection with the attack. As usual, the police investigations will take long to complete and it will be many months before the accused Kanbi Patels are brought to trial. It is a common experience that, even when the police investigations are pursued seriously and efficiently, guilt is not easy to establish in cases involving mob attacks of this type. This is all the more so because prosecution witnesses, who will almost all be scheduled castes, can be terrorised and mob made to keep quiet. Right now, despite the stationing of an SRP platoon in Ranmalpur, the scheduled castes are terror-striken. They have been subjected to an economic boycott by the caste Hindus. They cannot buy grain and other provisions from the village shops and have to depend on supplies from scheduled castes of neighbouring villages.

The government is taking a strait-jacket law and order attitude. In a quaint gesture, reminiscent of colonial administrations, it has imposed a collective fine on the Kanbi Patel population of Ranmalpur — supposedly to meet the cost of the SRP platoon posted in the village. There has been no gesture of positive sympathy and help for the ravaged scheduled castes from the government. Nor has any of the political parties been drawn by the scheduled castes' plight.

The scheduled castes of Ranmalpur have been thus left very much to themselves to lick their wounds — and perhaps to rue the day when they decided to cross the path of the Kanbi Patels.

Soviet Aid

Hard Counter

AFTER the success of his officials, at Paris, in soliciting aid from the Western Consortium, the Finance Minister took it upon himself to visit the Soviet Union and Czechoslovakia on a similar mission. The main purpose of his mission, however, was not to seek more credit but to try to secure better terms of aid from the eastern bloc of countries. Chavan thus attempted to persuade the Soviet authorities that they should give non-project aid and further ease the terms of debt servicing from the present standard of a 2 per cent rate of interest and a 12-year repayment period.

He does not appear to have met with much success, however — the usual expressions of friendship and goodwill on both sides notwithstanding. The Russians, we should know by now, are hard bargainers. And the latest affirmation of their no-nonsense dealings in bilateral arrangements is seen in their response to the pipe-dreams in Indian official quarters that the Soviet Union could be persuaded to allow us to participate along with it in some of the projects it is undertaking in third countries. This arrangement was seen as holding potential for greater exports of engineering goods from some of the plants in India aided by the Soviet Union.

The Soviets have put it that Indians may participate in this business if they too are willing to match the credit terms the Soviets themselves offer to their clients in the third countries. Obviously, this is not an attractive proposition for India which made the counter proposal that the Soviet Union could be the customer for these supplies destined for the third countries and that the payments for such supplies could be adjusted in the trade account between India and Soviet Union which is negative for India. The Soviet Union has bluntly turned down the suggestion.

Agricultural Finance

Jack of All Trades

THE Agricultural Finance Corporation (AFC) has completed six years and its Sixth Annual Report for 1973 underlines its anxiety to justify its existence. A good deal of work is being done and yet all is not well with AFC. Why is this so?

When banks were brought under social control, the major banks (now nationalised) decided to establish the AFC with an authorised share capital of Rs 100 crores (which, incidentally, is four times the authorised capital of the Agricultural Refinance Corporation, set up by the Reserve Bank in 1963) to act as the consortium leader for banks in the field of agricultural lending. The banks wanted some agency to handle agricultural finance on their behalf and in association with them. They put up a total share capital of Rs 5 crores and AFC made an ambitious beginning. Its outstandings (inclusive of interest) as the end of 1973 were Rs 3.33 crores to State Electricity Boards, Rs 13.39 lakhs (after excluding Rs 6.64 lakhs written off as bad debt) to others as secured advances and Rs 3.42 lakhs as unsecured advances. The figure of advances has not changed much between 1972 and 1973, indicating that shortage of funds has forced the AFC to practically stop lending.

It goes to the credit of the AFC that, faced with this situation, it has diversified its activities. The AFC has been unable to expand its lending business because, after the nationalisation of the 14 banks in 1969, banks have not increased their share capital to augment AFC's resources. Agriculture having been designated a priority sector, banks have been anxious to show increases in their own agricultural advances. They have raised their advances (direct and indirect) to agriculture from Rs 162 crores in 1969 to Rs 429 crores by March 1973. The AFC and banks have thus become competitors in financing agriculture. This has posed a challenge to the AFC's survival.

The AFC has attempted to meet this challenge dynamically. It is now providing consultancy infrastructure and personalised services for agricultural lending by banks. As its former Chairman, M L Dantwala, said in 1972, "AFC is somewhat like a research and development wing serving the commercial banks rather than an independent financial institution". The AFC is now busy helping state governments and banks to identify projects and to formulate and appraise them, especially innovative projects like Drought Prone Area and Tribal Area Development schemes and forestry schemes. Just in one year — between 1972 and 1973 — its consultancy portfolio increased nearly fourfold from Rs 21.61 crores to Rs 81.59 crores. Out of schemes worth Rs 105 crores formulated/appraised by AFC between 1968 and 1973, the bulk of the work appears to have been accomplished in 1973.

The question, however, is how many of the 110 schemes which the AFC had formulated/appraised till the end of 1973 have been accepted and sanctioned by the concerned banks. If many of them have not been implemented by the banks (AFC's Annual Report is silent on this point), is that because the banks are not keen or that the AFC schemes have lacked flesh and blood to enable the banks to go ahead, without much further work, with their implementation? It would be in the AFC's interest to give the actual progress of the schemes formulated by it so as to set at rest doubts about the quality of its project formulation and appraisal.

One can, however, legitimately ask why AFC should try to become a multipurpose all-India consultancy agency when the real need is to have separate consultancy agencies specialised in the field of minor irrigation, rural electrification, processing of agricultural products, fisheries, etc? Will not the AFC's technical competence be diluted when it attempts so many varied activities as agro-aviation, market yards, energisation of irrigation wells and even crop loans? Will there also not be overlap between the AFC's work and that of the ARC, the Rural Electrification Corporation (REC) and other similar bodies. Would it not be better if the AFC concentrated its efforts in certain areas or lines of business? Certainly, it is questionable that the AFC should try to become a training agency for other developing countries in the techniques of project formulation and appraisal. The AFC should not fall prey to the temptation of image-building at the cost of thorough professionalism. These issues have so far been swept under the carpet. But the sooner the government, the Reserve Bank and the concerned banks tackle this problem, if necessary through the appointment of a special expert committee, and define the role of AFC vis-a-vis the ARC, the REC, the banks, etc, the better it would be for all these bodies.

LETTER TO EDITOR

Shah's Writ Here Too?

THE expulsion from this country of the Iranian students was a mockery of all legal norms (April 13, 1974, p 574). Some of us Bhopal pressmen had met Nosrat Temoorzaddeh — one of the Iranian students who was later expelled — on April 5 when a Bombay police party had brought him here. According to Inspector Pawar of the Bombay police there were "no charges" against Temoorzaddeh. He was brought to Bhopal to pack up his belongings and to complete certain formalities at the local Maulana Azad College of Technology where he was a third year student.

Despite the police officials' reluctance we succeeded in talking to Temoorzaddeh. He told us that he had been given the option of going back to Iran or any other country of his choice. He had decided to go to West Germany which was the headquarters of the International Iranian Students Confederation. This makes it obvious that the decision to expel him was taken much before the formal expulsion order was served on April 11.

It is possible, as indicated in your comment, that the order came from New Delhi to please the Shah on the eve of Indira Gandhi's visit to Iran. However, it is more likely that there was some sort of arrangement between the Iranian Consul-General in Bombay and the Maharashtra police and administration. There have been accusations that money might have played a role. These apprehensions gather strength from the fact that the Special Branch had got the expelled students booked on a flight passing through Teheran.

Temoorzaddeh told us that he feared harassment of his family members in Iran, including his 90-year old father, but he seemed undaunted. He told pressmen: "No matter how much an individual suffers we will continue our struggle". One may try to trace the political aspect of the episode from another statement he made: "All the progressive people, especially those believing in Asian Collective Security, should understand that all their slogans will remain hollow until the fascist regime of Shah continues".

Calcutta Diary

A M

HE who escapes, lives: so goes that adage in Sanskrit. Young people from middle-class homes evidently are sold on it. The travel regulations are pretty rigorous; to arrange a passport can take months; foreign countries — even those who were generally hospitable in the past — have gradually clammed up; most of the time an uncertain future awaits the young men and women who migrate. Still they are not deterred. It is not so much the pull of distant lands: the reason for their eagerness to take the plunge is more humiliating. They want to escape from their native place, from its hopelessness and claustrophobia. These youngsters are a near desperate lot, bonds of emotion do not detain them, they want to forsake their heritage. Every day, you can see them crowding at the foreign consulates, swallowing the insults, and ignoring the brush-offs, from lowly-placed officials.

Hazardous Occupation

One can rail against them. One can berate their lack of dignity, castigate them for their selfishness, be aghast at the poverty of their ideals. To sit in judgment over the conduct of others is however a hazardous occupation in all seasons. Moral issues are hardly ever resolved through polemics or through a show of hands. More often than not, patriotism merely provides instances of of I-have-loved-thee-Seneca-in-my-fashion. Some of the young people would even argue that, by leaving the country, they are lessening the burden of problems for the rest of the nation: the authorities will now be saved the bother of worrying about *them*. Pitted against this, is the by-now-stylised argument: the nation has invested so much of its scarce resources over so many years to feed and train these young men and women, they therefore have no business to depart, along with the capital embodied in them, to foreign shores. An opportunity cost is involved in rearing and educating them: to allow them to leave is akin to a total write-off of a certain volume of invested funds, which this poor country can ill afford. A would-be emigrant, slightly disturbed by the moral aspects of his decision to get away, will perhaps commit himself to remitting from abroad the equivalent of the estimated sum till now spent on him by this society. Or perhaps he will turn round and counter-attack: the accident of birth is an accident of birth, his commitment is *not* to his native land, but to science and technology, and he will be in a better position to contribute to both if he is permitted to work, under immensely more congenial conditions, in a foreign laboratory or plant than at a dreary place at home. He might even decide to be viciously belligerent: if the nation were interested in him, well, it should have provided him with wages and facilities commensurate with his talent, and in accordance with international standards. The majority of would-be emigrants will however stay away from controversies. They will not even try to rationalise their decision, or to provide it with a moral cloak. They escape for bread-and-butter reasons: because, with all its uncertainties, life is still much easier in a foreign country, corruption is less rampant, bureaucracy is a shade less hidebound, and jobs are still comparatively a-plenty. It could be that the existence over there will be drab and anonymous, maybe one will miss the challenges and excitements one faces at home; but maybe one will also avoid the tensions and frustrations, the pettinesses, and the lack of opportunities. There is, after all, only one life to live: make the most of it while you can, if necessary even at the cost of alienating the large, large numbers of your own people who are not as lucky as you are, who cannot escape.

There is, no doubt, a certain heartlessness in the phenomenon. Given the structure of distribution of assets and incomes in the country, some people suffer more than others do from the social and economic stagnation. Those with the advantages of an appropriate education and a disproportionately large share of the capital stock are able to get something out of even the decaying system. And, as they succeed in extracting more despite the lack of growth, the availability of goods and services and hence the standard of living are *pari passu* reduced for the others. If you want to stay alive, escape: says the adage. But those who are impoverished do not, cannot, escape to foreign lands. Even to escape, you need assets. It is only those who have assets — and 'connections' — who manage to fly away.

Should one roar against them? Lack of idealism is however hardly a culpable offence. And making the most of the opportunity of free mobility is, after all, one of the proclaimed virtues of the system of *laissez faire*. Before firing an ideological salvo at them, one must also be sure of one's own moral foundations. Patriotism cannot be forced into an individual's metabolism: either he has it, or he has not. There can be no cram course where you pay the fee and pick up lessons on how to love the country. One comes to patriotism through one's sense of pride in one's native land. That pride is a gradually disappearing category for a not-altogether-insignificant number in this country. Recent events have ushered in a kind of non-philosophical anarchism. There is a loss of pride in the nation's achievements, perhaps because these have been so few and far between. From loss of pride follows the loss of a sense of involvement. The young people try to escape: they suffer from no ethical bind. Life is not worth living here, escape, join the rush to Canada, try hard for an immigration visa for the United States, wangle a work-permit-cum-entry certificate from the British High Commission. Arrange something and go, go, go. Let the nation be left to its own devices. To stay on in India is to condemn oneself to the daily grind of despair; escape while there is still time, while the visas and the entry permits are still relatively easily grabbable.

Valid Datum

Stop the world, we want to get off: say these youngsters from middle class homes. Another lot of them, also from middle-class homes, equally sick with the state of affairs in the country, choose another course. Those of them who do not get killed are locked away. Does one venture to sit on judgment on either — or both? Must not those who stay behind and continue to fight for principles to be preferred to those whose thoughts turn towards escape — most of the time, comfortable escape? But that too would be an exercise in preferring between systems of values. And this is a hazy world, ruled by indeterminacy. But that the rate of economic development has been brought down to near-zero is a statement which does not involve any moral dictum: it is a fact. The opportunities for gainful work have almost totally dried up is another fact. That corruption has proliferated, both inside the citadel of power and outside is an equally valid piece of datum. That the credibility of the government has been so eroded that many will not thrust it even over the time of the day cannot be denied either. But, beyond such assurances, what else can one cling to? Gloom and loss of faith, a feeling that nothing matters any more; the blurring of distinction between idealism and the lack of it: these are the staples of the day. There was, perhaps, at one point of time, an excess of identification between the processes of the government and the nation's aspirations. This, the cynic would say, was the left-over gift of *socialist pretension*. Now that the government has been seen plain, the crumbling of faith has dragged each and every thing down. The nation is infested by hypocrites: the proposition passes by a unanimous show of hands. The nation has been captured, and is being led, by a claque of crooks: motion approved again. The nation is altogether lacking in moral principles, for this is what the leaders have reduced it to: again, the proposition wins, hands down. The nation does not any longer grip you, it cannot therefore command your allegiance. The amorality at the aggregative level is matched by a frightening array of individual amoralities. Call it brain drain, call it the apotheosis of talent, the rush to forsake the native soil therefore continues, and you are admonished to withhold your moral judgment. The stringency in 'P' form regulations cannot stem the tide. People find devious ways to give the nation the slip. They manage to get away from it all.

Those who make the get-away do not stop to consider the plight of the millions who cannot escape, who will have to remain behind, grist in the mill of the ruling class. Now is for now, and each is for himself or herself. Those who can, escape, for they have learned that those who escape, live. Whether those that are left behind deserve an equal opportunity to live is a thought which does not detain them: this callousness they have picked up from the environment which currently defines the nation. This cynicism, in a manner of speaking, synthesises within itself the saga of the Indian tragedy. Shut your heart against the past and the future, now is for now. What is even worse, right is wrong and wrong is right, and none could tell it all by sight. Crass authoritarianism can now pass for humanism; fascist behaviour can parade as socialism; putting the squeeze on the poor can be trumpeted as another milestone on the road to egalitarianism. Crooks are rewarded with national honours; opportunism is elevated to the status of a national code; debauching the modalities of justice so as to serve a sectarian cause, is applauded from official forums; bending the administrative process for furthering a narrow, partisan objective is asserted as a fundamental right; the country's economic future is bartered away through heavy borrowings abroad and the operation is described as a decisive step towards self-reliance. The pride is gone; not because this nation is poor, nor because the nation has little to show by way of achievement in any sphere, but because it — rather, its self-styled leaders — have promoted lack of integrity as the centrepiece of the new morality. The listlessness one senses is the listlessness which follows from an abdication of faith. One particular code of faith, on which one was wont to lean, has been sabotaged, and no surrogate seems to be around. Nobody knows for certain how long the interregnum is going to be, or whether this tunnel, where one waits, itself constitutes the remainder of one's existence. Since no specific co-ordinates of social behaviour are any longer considered viable, people make their own rules. Some of the stragglers, the old-fashioned ones, still join processions, dream dreams, and crowd into prisons. Others, who have liberated themselves, either make their pile in the black market, bribe ministers and buy governments — or quit the land. In the absence of a community preference map, who is to judge who are the saints and who are the sinners? The climacteric of the Indian drama is at hand: right is wrong and wrong is right, and who can tell it all by sight?

CAPITAL VIEW

The Trouble about Ordinances

Romesh Thapar

GOVERNMENT by Ordinance is the pattern these days. Apart from the fact that the speculators have to be curbed, there's no time to go through the tedious procedures in Parliament which permit disruptive lobbies to build, lobbies that paralyse action. And action is urgently demanded because political survival is directly dependent on it. The Government of Indira Gandhi is gathering all its courage to force compulsory saving at the point where it has deflationary meaning — at the level of the working force. This is a categoric decision and may mean a confrontation with the trade unions.

Yes, this is quite contrary to what has been the general style these last twenty-five years. The curb on dividends from shares is an attempt to be fair, but anyone with a modicum of statistical knowledge knows that the inflationary pressure in India is not building from a tiny minority of rich families. Some more measures are also promised to compel saving in these affluent areas. However, we still wait for the attack on the parallel black money economy, euphemistically called "the unorganised sector". Until it is cracked, hoarding and conspicuous spending will continue.

A great deal of speculation has already begun on whether these measures (neutralising some Rs 500 crores) will curb the runaway inflation. If the debate does not underline it, at least government is aware that Ordinances of the kind that have been announced cannot hide the fundamental truth: that productivity through full utilisation of existing capacities and further expansion of productive capacity in critical areas are the real answers to inflation. It is in this shadowy area of bureaucratic delays, corruption, incompetence and indiscipline that correction is slow, terribly slow.

If we continue to study at the feet of Heath and Wilson when it comes to designing Ordinances, the wonder is why we do not also adopt some of the reforms which the rather easy, free-wheeling British have inserted into their system of administration and accountability. Maybe, we could start by using the telephone — crossbars notwithstanding! — more frequently to get prompt decisions. Why should we forever be writing chits and counter-chits in these days of grave paper shortage?

The trouble with so many enthusiasts of economic regeneration is that they do not understand 'the system' and how it operates to prevent anything from happening. In the Capital, one is forever bumping into the power-

ful cadres who constitute "the system". Pleasant, honourable fellows who live rather simple lives. Socially attractive. But mean, unthinking dastards when they are sitting in their offices. That's what the system does. And its a system that needs a brutal surgical operation. The sooner the better — or else the people might turn butchers.

Occasionally, one comes across an extraordinary fellow who *is* performing, despite all the weight of tradition and inertia. This great Government of India has no way of picking him up and giving him more and more challenging tasks. Routine promotions, the emphasis on amenability, the perpetual frown for the experimenter, the impatient soul, and the total lack of reward heighten the palsy of the administration. I could write a whole issue of this weekly on the extraordinarily criminal usage of personnel.

At this juncture, when the Government of Indira Gandhi is beginning to stir — yes, even against its corrupt friends — it is necessary to warn that the crisis will not be resolved through Ordinances alone. Leadership will have to be intelligently re-established at every level before we can even hope for greater productivity and performance. The location of talent and expertise in a continental situation is in itself a massive undertaking. So far the power hierarchy has relied exclusively on its very inadequate list of friends — and they've been a crashing failure.

Have we ever thought of investing in a compact computer? We could keep programming it with relevant information on qualified personnel drawn from all over the country. Want someone for a job, just press a button — and out pop the relevant cards. A computer could be a vital aid to "the system". But, then, what would happen to the joys of patronage, of having friends wherever one needs them? What would happen to communal quotas, regional quotas, caste quotas? Bright young men would start pushing from underneath. Certainly the ferment would become productive.

Terrible thought. Let's keep them loyal — lazy, inefficient, corrupt, but loyal. Let's hope the Ordinances will do the trick. After all, Fakhruddin Ali Ahmed is all set to be President. A new age begins. For Fakhruddin Ali Ahmed or for Indian agriculture? God alone knows. . .

Meanwhile, Siddhartha Ray is getting into hot water over his corruption inquiry. L N Misra, famed far and wide, has lost his grip over Bihar. Bansi Lal in Haryana has a son to cope with. And Malhotra, that extraordinary Chief Cashier of the State Bank who gave Nagarwala Rs 60 lakhs in a trunk on a telephone call or some such thing, has surfaced as a Congress Party stalwart in Delhi!

July 8

COMPANIES

Good Results despite Dim Prospects

Hansavivek

METAL BOX COMPANY OF INDIA's chairman, Bhaskar Mitter, says that the growth of the market for consumer packages has been restricted by a stagnant economy, output constraints at the packers' end, and rising packaging material prices, and that these factors have led to steady shift from consumer packaging to bulk packaging and loose retail sales. He sees little hope of any substantial improvement in the output of tinplate, board, paper, plastics and aluminium, although their production capacities are much underutilised. In addition, new excise levies have been regularly imposed on both packages and packaging materials. All these factors, he says, have clouded the long-term prospects in packaging. The company has, therefore, been examining possibilities for diversification, both related to and outside packaging. A beginning has already been made with a small equity investment in a new glass bottle-making company and a joint-sector printing machinery unit. Agreements have also been finalised for the manufacture in India of a wider range of sophisticated machinery. Besides, some other proposals are being discussed with government. Meanwhile, the chairman views the immediate prospects with some optimism, since demand for the company's own products remains strong. However, he feels that inflation, materials shortages, lack of adequate power, and growing foreign exchange problems, may have a recessionary effect on the company in the second half of the year.

Last year, MB had to contend with power crisis in West Bengal, Tamil Nadu and Haryana, where five of its 10 units are located. Even so, net sales were 14.3 per cent higher than in the previous year, but this was chiefly due to increased selling prices. With trading margins widened, gross profit jumped by nearly 80 per cent. It is explained that package prices stood 36 to 60 per cent higher in April 1974 than the January 1973 levels, while basic packaging materials were 52 to 196 per cent dearer over the same period. Much of the increase in the company's selling prices came during the latter half of the year and as such is not fully reflected in the 1973-74 sales. Equity dividend has been stepped up three points to nine per cent, but still finds better cover than in the previous year. The company spent Rs 46 lakhs on research and technical development against Rs 30 lakhs a year ago. Export earnings increased from Rs 62 lakhs to Rs 71 lakhs.

SHREE RAM MILLS has turned out good results for 1973 in line with the performance of the textile industry as a whole, although the overall profits were restrained as a result of the yarn control order and inability of the engineering division to achieve the expected results on account of 'steep increase' in prices of major raw materials which could not be passed on to customers. These handicaps notwithstanding, margins widened impressively, as reflected in the sharp advance in profit in spite of a small increase in total sales. The directors are of the view that if costs and supply of raw materials are not very adversely affected and if the power situation does not worsen, both the foundry and machine tool accessories divisions would show reasonable profits this year. Machinery and equipment worth about Rs 29 lakhs, chiefly for the textile division, were purchased last year. The styrene monomer project of Hindustan Polymers, in which the company has invested Rs 88 lakhs, went into production in April 1973, but it has been facing considerable difficulties. Some of these have been overcome and production of styrene has been raised from 30 per cent to around 50 to 55 per cent. Certain additional equipment, available indigenously, has to be installed to bring the project to full production. The company had filed two writ petitions against the collector of Central excise regarding excise duty on Lappet and Butta cloth. The High Court delivered judgments in favour of the company, but the orders have been stayed to enable the opponent to consider what further proceedings they should take in the matter. The amount of excise duty involved in the dispute is Rs 8 lakhs.

BLUE STAR lifted its sales by 30 per cent to Rs 17.12 crores last year, but its gross profit was up by less than 9 per cent at Rs 76 lakhs, owing to inflationary pressures and spiralling costs of raw materials and labour. These results followed a 5 per cent increase in the net value of production at the Thana factory. The manufacturing operations were affected by shortage of raw materials, particularly copper tubing. Contingent liability in respect of gratuity to employees for the period upto the end of 1971, amounting to Rs 11 lakhs, has not been provided for. One of the notes appended to accounts discloses that certain defalcations by an accounts officer and some staff members came to light towards the end of

the year. The amount of Rs 2,27,470 due by these persons has been shown under 'other advances' and has not been provided for. It is stated that severe steps have been taken and that an amount of Rs 52,481 has since been realised. The company has launched a new model of water cooler which will be useful for small industries and commercial establishments. Also, new models of deep freezers have been developed. The company is now producing its own airhandling units and has developed instrument desks and trolleys for a wide range of sophisticated electronic equipment — till recently imported. The company stepped up exports of its standard products by about 20 per cent and also secured three orders for air conditioning of new textile mills in Indonesia and Thailand.

According to B T Advani, the new chairman who took over after the demise of the founder chairman Mohan T Advani, the company may have to consider later this year a 'rights' issue to meet the requirements of working capital, if inflationary conditions are not brought under control. Meanwhile, total income in the first five months of the year has been well ahead at Rs 7.21 crores compared to Rs 5.88 crores in the same period last year, although it is doubtful if, with all-round rise in costs, the increase in profit will match the growth in income. The 3,500 preference shares of Rs 100 each, issued pursuant to the prospectus dated June 24, 1969, are convertible into equity shares on the expiry of five years from the date of issue at the option of the shareholders. The company will fix a period of 30 days during which the preference shares will be converted at 20 per cent below the market rate of equity shares prevailing on the date of the notice or at par, whichever is higher. The shares will remain non-convertible thereafter.

KILLICK NIXON's all the three manufacturing divisions, namely, machinery, pre-stressing and furnace, experienced disturbed industrial relations during the latter part of the past year and complete stoppage of work from October till about mid-February last. All the divisions carried a large backlog of orders, several of which were cancelled and cancellation of some more was threatened by customers. Normalcy was restored following an interim settlement and, since then, the company has been concentrating on expeditiously executing the orders on hand. The furnace division, however, continues to face a difficult import licence position and problems in securing necessary raw materials. Among the other operating divisions, the drilling division fared better owing to heavy demand for drilling equipment, following severe drought conditions in several parts of the country. A few larger-sized drilling machines were airlifted from UK and, after assembling, were despatched to drought-affected areas of AP, Gujarat and Maharashtra. The steel sales division had another record year with order bookings well exceeding the previous year's figure. Sales of aircraft spares were also satisfactory. Sales of Snowcem products continued to show improvement, but those of Caribonum and Dexion products registered declines. The performance of the domestic appliances division improved. In spite of adverse factors affecting cargo movement in the India/UK conference trade, the shipping department performed well. Commission earnings from diamond exports also continued to be satisfactory. KN's accounts show that margins were slightly shaded. The unchanged dividend of 9 per cent is adequately covered by earnings.

INFLATION—I

Facade of Action

THE government has introduced, effective from July 6, what it has described as anti-inflationary measures in the form of two Ordinances and a subsequent administrative notification. Under the Additional Emoluments (Compulsory Deposit) Ordinance, 1974, all additional wages and allowances payable to an employee for one year in pursuance of any wage revision would be impounded in a compulsory deposit account, known as the Additional Wages Deposit Account. The Ordinance also provides for compulsory deposit of one-half of the additional dearness allowances payable hereafter for a period of two years in an account known as the Additional Dearness Allowances Deposit Account. These compulsory deposits will carry simple interest at 2.5 per cent above the maximum bank deposit rate (which is now 8.5 per cent). The amounts so deposited will be repaid in five equal annual instalments after one or two years, as the case may be, together with interest. Earlier repayment is to be permitted only in cases of extreme hardship. The amounts of wages and dearness allowance transferred to these compulsory deposit accounts will not be taxable but the instalments repaid will be treated as arrears of salary and taxed accordingly. Interest income earned on these deposits will be exempt from tax upto the prescribed ceiling along with other earnings from financial assets like dividends, interest on bank deposits, etc.

The government apparently felt that it would not be able to sell this obnoxious Ordinance, which amounts to a partial wage freeze, to government employees as well as the organised working class in the public and private sectors without taking some measure seemingly directed against the richer sections. Hence, the Companies (Temporary Restrictions on Dividends) Ordinance, which imposes, for a period of two years, a ceiling on the quantum of distributable profits at one-third of net profits or an amount required to pay 12 per cent dividend on the face value of equity shares, whichever is less. Reflecting its casual approach to this particular measure, the government is still not clear about the definition of net profits. The official press release on the two Ordinances clearly stated that "the first Ordinance provides for a scheme for limiting after-tax profits distribution by companies". The next day, the Cabinet Secretary, who explained the rationale of the two Ordinances to the Press, quoted a study (possibly that of the Reserve Bank) to show that companies were paying 45 to 49 per cent of their net profits as dividend. If it is the Reserve Bank study that he had in mind, the percentages relate to profits net of tax provision; on profits before tax, the relevant ratios would be 29 to 32 per cent. Curiously, the Ordinance makes use of a concept of net profit as defined in some unrelated sections on the Companies Act, 1956, which now have only historical significance. These are sections 349 and 350 which define net profits for the purpose of fixing the share in company profits of erstwhile managing agents — as profit after providing for depreciation but before taxation and development rebate. Again, the deduction of depreciation permitted under these sections is on the written-down value basis and not on the straight line basis which is adopted for company taxation purposes and hence used in the published accounts of companies. Whether the one definition of net profits is accepted or the other will make considerable difference to the implications of the dividend curb.

Confused Approach

The same confused approach is reflected in the government's failure to envisage the possibility of bonus issues by companies consequent upon the dividend restraint. It was only two days later that the government tightened the restrictions on the frequency of bonus issues. The time-lag between two successive announcements of bonus issues has now been increased from 18 months to 40 months. Similarly, the minimum gap for making an application for issue of bonus share, after the scrip in respect of the last bonus issue has been listed on the stock exchange or after the completion of despatch of the relevant share certificates, has been increased from 12 months to 36 months.

A third confusion, though a minor one, is with regard to the assertion by the Cabinet Secretary that "the present permitted rate of return on preference shares is 9.5 per cent and the new scheme would enable it to be raised to 12 per cent". Apart from his failure to realise the implications of a uniform dividend rate on equity (risk) capital and preference shares, it is obvious that it is not at all the intention of the Ordinance to encourage the dividend rates on preference shares to be raised to 12 per cent. The existing rates of dividend on preference shares are to continue; the ceiling of 12 per cent is on equity capital. And the two together are not to exceed one-third of net profits.

The rationale for the two Ordinances has been explained in a variety of ways. The Ordinances themselves state, in their preamble, that their promulgation is "in the interest of national economic development". The Cabinet Secretary described them as anti-inflationary and claimed that their net effect would be that about Rs 500 crores of purchasing power would be held back in the first year of their operation and that money supply would be reduced by 5 per cent. The Rs 500 crores comprise Rs 50 crores of dividends withheld by the companies and Rs 450 crores as a result of the impounding of dearness allowance in the next one year (but not necessarily in the current financial year) in respect of about 18 mn employees: 6.1 mn in the private sector and 11.9 in the public sector consisting of 3 mn Central government employees, 4.6 mn state government employees, 2.5 mn employees of public sector undertakings and 1.6 mn employees of local bodies. The Central and state governments and public sector undertakings, it has been estimated, would be required to pay their employees Rs 575 crores by way of additional DA and the private sector Rs 325 crores, together making Rs 900 crores. Wages impounded would be in addition to this.

Government spokesmen are apparently unaware of the distinction between impounding of purchasing power so that it is not available for current consumption and reduction in money supply. Assuming that the ratio of income velocity of money supply for the entire national income is also applicable to wage income, the arresting of money supply expansion on account of the wage restraint would be one-fifth, considering the current income velocity of money supply of 5. Even this prob-

able arresting of money supply expansion has been wrongly interpreted by the government spokesmen as contraction of money supply to the extent of 5 per cent of the existing money stock of about Rs 11,000 crores.

More important, the relationship between expansion in money supply and additional wage disbursements is very remote. Expansion of money supply takes place essentially through the borrowing capacities of the government and the commercial sector from the banking system. There could be wage and salary increases without any increase in money supply or conversely vast increases in money supply could take place without any significant increase in wage and salary payments. To cite recent experience, the years 1969-70 to 1972-73 saw hardly any increase in the dearness allowances of employees in major industries in the private and public sectors. For instance, the average dearness allowance of a Bombay Textile worker in money terms increased by less than 5 per cent per annum during this period when the rate of increase in money supply accelerated from 11.8 per cent in 1970-71 to 15.7 per cent in 1972-73. Additional wages are paid out of profits and particularly in a period of high financial liquidity in the economy and high profits, the question of expanding money supply for additional wage and salary payments should not arise.

As for the withholding of dividend payments by companies, the estimate of Rs 50 crores seems to be based on the assumption that the limit would apply to net profits before taxation. The companies in the private sector, it is estimated, would have distributed about Rs 160 crores as dividends during 1974-75 in the normal course and about one-third of this is likely to be saved as a result of the restrictions on dividend payment, if net profits prior to taxation is taken as the basis. If, on the other hand, profit after tax is considered, the dividends withheld may amount to about Rs 75 crores.

These fine points of arithmetic apart, the main criticism of the Ordinances is that they expose the perversity of the government's approach to controlling the inflation. As it is, the real earnings of the working class has been considerably eroded — even for those groups of workers who are paid dearness allowance linked to the cost of living index. The cost of living index for Bombay (base 1960=100) has increased by 20 per cent from 225 in May 1973 to 269 in May 1974. During the same period, the monthly money wage of a cotton textile worker has gone up by 6 per cent from Rs 283 to Rs 300! At the All-India level, the consumer price index for industrial workers (base: 1960=100) had reached 294 in May, showing a rise of 50 per cent over the index two years ago.

Incidentally, it is ironical that government spokesmen should, while expounding measures for curbing inflation, assume that there would be five additional DA increases before the end of the fiscal year 1974-75 even if the Consumer Price Index for Industrial Workers remains constant at the April 1974 level of 283. It has already galloped to 294. The Finance Minister who presided over his Ministry's Parliamentary Consultative Committee, admitted that an effective price policy needed action on many fronts and that the government intended "doing all that is in its power to discourage hoarding, increase the supply of essential commodities and ensure their equitable distribution". If the government were serious about these other measures, the impounding of workers' earnings would have been redundant. The fact that the government has assumed continued prevalence of high cost of living in its calculations of the impact of the Ordinance on wages and dearness allowances shows that it has acknowledged its powerlessness against hoarders and blackmarketeers.

The differential treatment given to the funds arising out of the impounding of additional wages and dearness allowances on the one hand and the curbs on dividends also calls for comment. The former would be impounded in special funds with the Reserve Bank of India and "would not be used as a resource for government expenditure". On the other hand, the savings out of dividends are to be left with the companies as retained earnings. This raises a fundamental issue about the government's own misgivings regarding its ability to employ the funds mobilised by it productively. Even the government has apparently been converted to the view that private sector companies use their funds to better purpose than the government. If the argument is that the funds so immobilised should not be put into circulation again, it should hold equally for the funds arising from the dividend curb.

The curb on dividend would involve a substantial income-tax loss to the government. According to the Income Tax Revenue Statistics for 1969-70, a dividend amount of Rs 83.19 crores assessed involved a tax assessment of Rs 36.78 crores, i e, a tax burden of 44.2 per cent. Thus, if dividend payments are reduced by Rs 50 crores, the loss to the government would amount to about Rs 22 crores. If the reduction in dividend is Rs 75 crores, the loss would be about Rs 33 crores. Instead, the government could have immobilised the funds and taken them as capital receipts for a nominal interest payment. Likewise, it has committed itself to the payment of as much as Rs 300 crores as interest on the wages and dearness allowances immobilised even though the funds so immobilised will be kept in the Reserve Bank's vaults. These funds too could have been taken by the government as capital receipts and used for improving investment in the public sector. Or, even if it were insistent on completely immobilising the funds, it still had the option of retiring its market debt raised through treasury bills and of showing a surplus budget.

It has been argued that the Rs 50 crores (or Rs 75 crores) saved through the restriction on dividend payment will be available to be used for investment, expansion and diversification. In the same breath, it is also suggested that the companies' dependence on bank funds would get reduced to a corresponding extent. In the first place, banks do not generally grant large loans for long-term investment purposes. Secondly, the companies can easily inflate their working capital requirements and get away with not reducing their borrowings from the banks.

Two implications of the restriction on dividend the government has clearly failed to appreciate. First, the higher retained earnings on account of the dividend curb will accrue on the whole to the larger companies. Out of the total estimated retained earnings of about Rs 170 crores of the entire corporate sector, as much as Rs 126 crores or about 74 per cent was with 293 large companies. Among them about 200 companies have been paying considerably higher than 12 per cent dividend. These are the companies which will get the largest chunk of the increase in retained funds. Genuine medium companies will continue to be starved of funds for expansion.

Secondly, and more importantly, a vast proportion of the additional funds with companies will be concentrated in the non-priority, non-core industries. On the other hand, industries like cement, paper and fertilisers will continue to be short of funds for expansion.

INFLATION—II

Inequitous and Irrelevant

THE government can at last claim that it has taken some specific measures to curb inflationary pressures in the economy. However, even a cursory examination of the measures in question shows that they will hurt some sections without containing the inflation.

The first measure requires the deposit with the Reserve Bank of half the increases in salaries and dearness allowance; the former for a period of one year and the latter for a period of two years. The funds so impounded will earn interest at 11 per cent per annum and will be returned in instalments over the subsequent five years. The second measure restricts dividend payments for two years to the lower of (a) one-third of profit before tax or (b) 12 per cent of the face value of equity shares.

Evidently, the main objective of the limit on dividend distribution is to make the impounding of additional wages and dearness allowance palatable to workers and salary-earners by creating the impression that the government is treating capital on par with labour. This appearance of even-handedness is entirely spurious, however.

Payment of dearness allowance compensates workers, in most cases only partly, for increases in the cost of living that have already occurred. To the extent that half the dearness allowance is now sought to be impounded for two years and made returnable over five years, the real income of the wage-earners will be reduced for the duration of this period. By contrast, the restriction on dividend payment involves only a temporary redistribution of available profits between companies and and their shareholders. To the extent dividend distribution is reduced, the companies' finances will be strengthened, and, once shareholders get over their immediate disappointment, they will find their equity improving. There is no suggestion that the saving in dividend payment as a result of the imposition of the ceiling is to be transferred to a government authority or is to be immobilised.

There is some confusion about whether the limit of one-third relates to pre-tax or post-tax profits. If it relates to pre-tax profits, as the ordinance clearly says, then the one-third limit is broadly in line with the dividend distribution practices of most companies. The bite, therefore, lies in the limit of 12 per cent on the face value of equity shares. It will affect particularly companies which have not distributed bonus shares in the recent past.

The interest payable on the impounded wages and dearness allowances has been fixed at 2.5 per cent above the highest rate on bank deposits which is 8.5 per cent at present. An interest rate of 11 per cent may appear generous at first sight, but two factors have to be borne in mind. First, the impounded wages will be returned over a period of six years from the date of impounding and the impounded dearness allowance over seven years. Second, the calculations underlying the official estimate of the additional dearness allowance which is likely to become payable show that the government is expecting a further price rise of 15-20 per cent. The 11 per cent rate of interest will not, therefore, compensate workers for the decline in the real value of their impounded wages and dearness allowance.

There is another element of inequity in the measures — that between the organised and the unorganised sectors. The measures extend only to the former. The vast sector of traders, the self-employed and the like remains untouched.

The limit placed on dividend can have little deflationary impact — except to the extent the stock exchanges work themselves into a bearish frenzy. Companies have been left free to use the additional liquidity resulting from the curb on dividends to build up assets, fixed or current.

The impounding of wage and dearness allowance increases will, of course, reduce purchasing power in the economy. But taking the government's own estimates, the impounded purchasing power will come to less than 1 per cent of national income and less than 3 per cent of income in the organised sector. When the rate of rise in prices is around 2.25 per cent per month, action in this scale will be hardly effective.

The policy options before the government are narrowing with the passage of time. This is happening not only because the price situation is becoming progressively more difficult but also because the area subject to the influence of government policy — the organised sector — is becoming relatively small. And should this year's harvest turn out to be poor, the government's ability to take corrective measures against inflation will be practically extinguished. Even now, the range of anti-inflationary measures has to be wide enough to touch all the upper sections of society. They have to cover not only monetary and fiscal policies, but also industry directly. A straightforward reduction of inventories and trade credit and a reduction in the stock of purchasing power with the public have to be the main elements of an anti-inflationary policy. By contrast, the measures taken so far are of a petty-fogging nature.

Incidentally, what the government has succeeded in doing is to add vastly to the administrative burden all round. In the process of immobilising Rs 1,050 crores over two years and returning Rs 1,350 crores (including interest) over five years, the government would be involved in 105 million transactions (15 million in each of the 7 years) of which 30 million in the first two years will have to be executed monthly!

A STRONGER BASE FOR THE FUTURE

NATIONAL AND GRINDLAYS BANK GROUP

Profits for 1973 were lower than in 1972 principally because of the effect on our London profits of the high level of interest rates. At the end of 1973 the Bank Group was able to add to its reserves £3.7 million from the Group Profit and Loss Account. The high level of interest rates has continued to affect adversely our 1974 operations in London, but elsewhere the Bank and its Group are making steady progress.

We have in 1973 built a stronger base for the future than we have had before. Taking the whole management team together, they are stronger and better organised to carry on business internationally both at home and overseas.

We now operate directly or by active participation with associates in 33 different countries overseas, having added to our network during 1973 Germany, Greece, Indonesia, Malaysia, Philippines and Zaire.

AFRICA

Our business in Africa, with the exception of Uganda, has shown useful progress. Our new subsidiary in Zaire—Banque Grindlay Internationale au Zaire—started its operations in November.

ASIA

In the Bank's traditional overseas territories in Asia the results were up to expectations, despite some restrictions on credit and other effects of inflation. Enquiries for foreign currency loans from these territories for general purposes and for special projects have been more numerous in 1973. Negotiations for the loans that follow these enquiries involve a great deal of research and other work on the part of the Bank, and very often nothing tangible results. But there have been some useful successes and the Bank has been able to show that we are not just 'fair weather friends' of countries which we know well.

In Cyprus, Jordan, the Gulf and Oman results were definitely good. In the Far East, Dao Heng Bank continues to live up to our expectations. We are extending our activities in Hong Kong to include a wider range of banking services, partly through Grindlays Dao Heng Finance Company Limited which started business in August 1973, and partly through Brandts. In Japan we expect to start a full branch in Tokyo in June. In Malaysia, the Asian International Merchant Bankers Berhad, in which we are joined by Malaysian partners and the Fuji Bank, opened for business in October 1973. In Indonesia we have established a joint Representative Office with the Bankhaus Ludwig in Jakarta. In the Philippines we have acquired a 20% shareholding in Genbancor Development Corporation which produces for us a partnership with Filipino interests and two Japanese banks.

EUROPE

In Europe existing activities were strengthened in France and Switzerland, and new ventures were begun in Germany and Greece. In London results were dominated by the interest rate. Gillespies had a satisfactory year. This fulfills the hopes which we had of combining a sound confirming house business with National and Grindlays widely spread experience and contacts. Gillespies are planning to expand their base of operations into the Far East in the near future.

On the travel side, Cox & Kings are now the official tour operator for Air India for tours to India from the United Kingdom, and other new travel facilities are being developed.

OIL

The explosion in oil prices has produced wholly new problems for the economies of the less developed world. It is in that less developed world that we have much of our traditional business. It is our expectation, and certainly our hope, that the world Bank and governments of the developed world with the help of oil producing countries will, in the months ahead, produce satisfactory plans to fulfill the essential needs of these countries so that economic conditions can be stabilised and development continue.

The preceding are extracts from the annual statement of the Bank's Chairman, Lord Aldington. He also said:

STAFF

I extend on behalf of all my colleagues a sincere word of thanks to all members of the Group's management and staff wherever they may work, for the strenuous efforts which they have contributed to the success of the Bank.

GRINDLAYS

This is the last time I shall be writing an annual statement of National and Grindlays Bank Limited. The name will change on the 1st January, 1975 to Grindlays Bank Limited. Historically, Grindlays is our oldest name—146 years. May the new Grindlays Bank and all who work with us enjoy happiness and prosperity.

GROUP HIGHLIGHTS

	1973 £	1972 £
Capital & reserves (including loan capital & minority interests)	79.0 m	70.4 m
Deposits	1,330.3 m	1,021.7 m
Advances	728.7 m	557.4 m
Profit after tax before extraordinary items	3.95 m	5.07 m
Total addition to revenue reserves including extraordinary items	3.7 m	3.4 m

GRINDLAYS IN INDIA

ORIENTATION TO SOCIAL AND CUSTOMER NEEDS

The National and Grindlays network in India looks back on 1973 as a year of rapid and far reaching changes in the organisation, and in the business undertaken.

MARKETING

In 1973, we created a new marketing structure. Account Managers, trained in marketing and in modern methods of credit analysis, were posted in the larger cities. These officers are our front-line marketing management, charged with identifying the needs of customers and potential customers in specified market segments, and arranging to supply finance and allied services to satisfy those needs.

OPERATIONS

Other changes were put in train for improving the processing and delivery of our customer services. In this vital area, which we designate Operations, emphasis is being laid on providing special training for our officers and clerical staff, systems are being changed and modernised and office layouts and premises redesigned. By these means we are confident that we shall improve the quality and speed with which we serve our customers.

MbO

In pursuance of our management development policy, we have adopted the participative mode of Management by Objectives (MbO). Officers specially trained in Britain installed. MbO in our Western Region (Bombay) in 1973, and this life-style will soon be in operation throughout our entire Indian network.

SMALL-SCALE INDUSTRY

April 1973 saw the inauguration of our Small Scale Consultancy Services Division in Calcutta. This received a heartening response from the public in Calcutta, and led to our extending this service to Bombay. The Division offers a variety of specialist management services in the fields of systems design, marketing and financial control. The services of this Division are available to our customers and non-customers alike as it is our aim to provide a service which will add a new dimension of profitable growth to units in this vital sector of the Indian economy.

EXPORTS

Exports have been a priority in this Bank for over a hundred years. In 1973 our customers did particularly well in exports and we plan to give increasing and innovative attention to this sector.

STAFF DEVELOPMENT

We are conscious that further progress in the directions planned is possible only with systematic development of our human resources at all levels. Manpower planning, training and development are therefore receiving our closest attention. Our credit analysis training establishment—'ASIACAD' in Calcutta—provides advanced credit skills to our marketing personnel. We have also established in Bombay basic training in executive skills. This, and training in the techniques of modern banking, will soon be available to our staff from Regional Training Centres in Bombay, Calcutta and New Delhi. Our training facilities, including those for credit analysis training, have been made available to a limited extent to other banks and this will continue.

SOUTH

Behind the 'Normalcy'

Mohit Sen

ANDHRA has been quiet for many months now. The storm of the separatist movement seems like a memory of a distant and faded past. In official quarters it is called a return to normalcy, but this normalcy is itself left undefined.

There is the normalcy, of course, of the Congress practice of accommodating the most outspoken opponents of official policy. The separatist chieftains who had sworn to finish with the Congress unless Andhra was bifurcated have not only forgotten their pledges but are today among the chief pillars of the Vengal Rao Ministry. It has to be said to the credit of the present Chief Minister that he was and remains a staunch integrationist. But it has also to be said that it is he who has taken the initiative to bring in the separatists into strategic posts in his Ministry.

It should not be thought that this is a sign of strength, although Vengal Rao certainly does strike this pose. His claim is that it is his unchallenged position that acts as a powerful pole of attraction drawing everybody into its field. There is an element of truth in this assertion. And it is thus that any Congress Chief Minister is able to fairly quickly extend his factional frontiers. But these frontiers have an equally inherent tendency to contract no sooner does the incumbent change. But, paradoxically, the strengthening of the Chief Minister through the policy of cajoling the separatists is a manifestation of the crisis of Centrism.

The essence of the crisis of Centrism is the attempt to substitute a policy drive against the Right by concessions to them in the field of policy combined with a series of organisational adjustments. The idea of Vengal Rao appears to be to defuse the separatists by inducting them into the power system of integrated Andhra Pradesh. This is a remarkable example of class-blindness since it was precisely from this power system that the separatists emerged in the first place. And there need be no doubt that in the most unlikely eventuality of a recrudesence of the separatist sentiment, among the vast intermediate strata the government and the ruling party would fragment quite as much as in the past.

But it is not really to win a broad consensus for integration that Vengal Rao has acted in the way he has. There is a deeper class reason behind it. And that is the attempt that he is making to unify the landlords, particularly of the capitalist variety, behind his government. The induction of all the former separatist bigwigs into the Ministry is precisely meant to secure the support of the delta landlords who undoubtedly had serious reservations about him on account of his unflinching stand in favour of integration. And it is not only by this means that he seeks to reassure the most powerful section of the landlord class in Andhra. He has done so by means of his food policy — the state being turned into a single zone — and the extraordinary announcement that lands "donated" by the landlords would not be treated as *benami* transfers and hence would not be included as being in the landlord's ownership for purposes of the implementation of the ceiling law. True, the latter statement was later explained away and brave declarations made that the Ceiling Act would be implemented as soon as parliament put it under the protection of the Ninth Schedule of the Constitution. True, also, that checkposts have been re-established as a partial repair of the damage done by the single-zone state scheme. But, nevertheless, the landlords have been granted a declaration of intent by the Chief Minister.

The recent by-election results showed that there has been a measure of response by the landlords to these overtures by the Chief Minister. At the same time, it would be quite premature to come to the conclusion that the landlords have all rallied to a man behind Vengal Rao. The divisions among the landlords along caste and regional lines have by no means been overcome. And they have by no means all come to the conclusion that the best bet for them is to stake everything on Vengal Rao.

It is interesting to note that at the same time the Chief Minister has persisted with his attempt to speed up the industrialisation process in the state. There are also indications that a certain shift in assets-preference is beginning to manifest itself in the ranks of the rural rich. The feeling is growing that while the Ceiling Act may not effectively erode their wealth, land ownership and speculation therewith may no longer be as lucrative as in the past. It might be more profitable, therefore, to invest in industries. Not so much in hotels and cinemas as in the past put industry proper. And here the state government is going out of its way to help through the development of the joint sector. The present trend is neither for the state public sector to be expanded nor to invite the All-India monopoly concerns as partners in joint sector ventures. The trend is for the state government to provide funds, infrastructure and the indispensable guarantee against risks — all in favour of turning the agrarian capitalists into agrarian industrial capitalists. It is yet too early to come to any conclusion as to how far all this would succeed in changing the capital contour of the state. But it is by no means too early to identify this trend.

Note should also be taken of another development which would be of even greater importance. And that is the stirrings among the agricultural proletariat of the state. The Tenali meeting of the Bhartiya Khet Mazdur Sangh was remarkable not only for the large-scale mass attendance but also for the composition of that mass. Agricultural labourers belonging to organisations led by the CP(M) and the Congress turned up in large numbers along with, naturally enough, much larger numbers of those whose loyalties were to the CPI-led organisation. Not only were women present in very large numbers but also the youth. And among the youth a fair number who were educated and whose sense of rebelliousness was far greater than that of the older generation. This rebelliousness if properly developed into class consciousness would be an invaluable asset. And if not properly developed, it could erupt into anarchist adventurist acts which would, in the end, be far more self-destructive than damaging to the class enemy. There is every indication that a powerful movement on the issue of wages would sooner rather than later unfold throughout the state. An impetus to this movement has been provided by the news that in Kerala their class brothers have won such a magnificent victory through the legislation concerning conditions of service in the rural areas. Gone are the days, in Andhra at any rate, when the hamlet of the Harijans was a dark, impenetrable fortress. News does break in and politics as well. Outside help is still required but rendering of it, though still extraordinarily difficult, would not be any more as arduous and hazardous as in the past.

If the capitalist landlords are tending to close their ranks, their grave diggers are also readying their battalions. Given unity of the leadership at least as far as action on mass issues is concerned, it is the latter who can well set the pace and the pattern for an invigorating change of course in Andhra.

BANKS

Bargadars Are Bankable

THE myth that sharecroppers and the poor peasantry do not make viable banking propositions has been exposed by a recent study of bargadars and institutional finance. The study, conducted by a team under an officer of the Directorate of Land Records and Survey, Government of West Bengal, shows that in spite of various hurdles put in the way of their getting bank loans — with even government officials saying that they could not be trusted to repay the loans — a group of bargadars who received loans from the State Bank of India have made full use of the funds and increased paddy production by 77 per cent in one year. They repaid over 70 per cent of the bank loans with interest immediately after the harvest, even before the bank raised formal demands. The balance "has been agreed to by them to be repaid before they take a bank loan for the second time". The repayment picture, even according to the bank officers, is "very encouraging and certainly better than that concerning owner-cultivators". By contrast, the study says, loans were disbursed to a group of owner cultivators in October 1970. These owner-cultivators "have repaid 40 per cent of the loan over more than two years". At the end of last year overdues were 60 per cent.

The study brings out the miserable condition of the share-croppers. Before approaching banks for loans the group of share-croppers studied had borrowed an amount, the repayable value of which was Rs 12,300 at the time of starting cultivation. Out of this amount, they could repay only Rs 10,025 from their gross income and the balance of Rs 2,275 remained outstanding along with an old unpaid loan of Rs 25,600. Thus at the end of the year they were burdened with unpaid loans of Rs 27,875. Even if the rate of interest payable on the loan is put at a modest 12 per cent, the bargadars' liability at the beginning of the next cultivation year would have come to Rs 31,220. This was the position before they received loans from banks.

The bargadars received bank loans for 135 bighas of land for raising an additional high-yielding crop. By using this loan, they raised 2,025 maunds of additional paddy. Their share of the additional produce was 1,618 maunds. The gross income from this crop was Rs 64,720 and the net income Rs 38,720. The gross surplus was Rs 27,725. The total loan outstanding, including the earlier loans with interest, was Rs 55,701. If the entire gross surplus was used for repayment of outstanding loans, the study estimates, the bargadars "would be able to reduce the old loan liability by 10 per cent". Thus if this system of granting bank loans was maintained in subsequent years, they would be able to repay the entire amount of the private loans within ten years. At the end of the eleventh year, they would have a surplus of Rs 6,990 after repayment of the bank loans with interest. According to the study, at the end of the 15th year, they would be completely self-supporting and would no more need bank loans. "If bank loans are extended to all the poor cultivators of the state", the study observes, "it will not only revolutionise the standard of their living and boost the rural economy on an unprecedented scale, but will also greatly accelerate the state's endeavour to attain self-sufficiency in a short period."

The study team found that the sharecroppers used to take loans from the village mahajans at an interest of 'one anna' (six paise) per rupee per month and that too by mortgaging articles like gold, utensils and even the small parcels of land that they possessed. To illustrate the hold that the mahajans have over the sharecroppers, the study team says, "The whole operation of selecting and granting loans to the bargadars was over in a couple of days. Seventeen bargadars were granted loans at the first instance and eight others at a later date. The fact that some bargadars received loans from the banks upset these mahajans, so much so that they built up pressure on the remaining nine bargadars during the intervening period to such an extent that they [the bargadars] refused to receive bank loans. They were convinced that there was no point in changing their masters as the banks would not give them loans for all times to come."

The study also throws light on the role of the Block Development Officers who "discouraged the bargadars from contracting bank loans, telling them that they would thereby come under the perpetual financial domination of the banks. It was with very great difficulty that the bargadars could be freed from this pious advice of the Block Officers". Nor did the bargadars get much technical advice from the Block staff. As for the banks themselves, though they have elaborate staff with knowledge of agricultural operations, "their financing pattern has a grow-more-produce bias under which only big owner-cultivators, called euphemistically 'progressive farmers', are always the beneficiaries. The bank staff can never locate the right bargadars' records". The study team points out that while the State Bank of India and other commercial banks after nationalisation claim to be anxious to finance small farmers in selected areas, on what they call an area development basis, "the most progressive steps the banks have hitherto launched for financing are restricted to only owner-cultivators for purposes approved by them". In the above context, according to the study, it is an uphill task to convince the bank that share-croppers are bankable propositions and that "no improvement of the agricultural community in the state can be dreamt of leaving the vast number of bargadars outside its purview".

Before they finance a bargadar, banks raise all sorts of questions: What is his relation to the land? What will be the security for the realisation of the loan? What guarantees will there be that the bargadar, who lives from hand to mouth, will actually use the loan for agricultural purposes? What will happen to the money advanced to the bargadar if there is a crop failure? The staff of the bank is asked to satisfy itself on all these points.

It was only through "constant coaxing and cajoling that the State Bank of India ultimately agreed to launch a pilot scheme on a very limited scale", the study points out. Some of the criteria used by the State Bank for selecting the area and the bargadars for financing were: the bargadars must be recorded and must own some land of their own; they must be close to and easily accessible from the State Bank's head office, in Calcutta, to enable close supervision by the bank; they must also be close to a Block office so that extension facilities are available to them; they must be reliable about repaying the bank loan; they must grow an assured high-yielding crop; they must be capable of resisting the pressure of landowners who are also mahajans.

The study points out that the banks insist that since a sharecropper can legally hypothecate nothing but his share of the produce (that is, 75 per cent of the crop), only such bargadars should be selected for financing as possess some land of their own which can be hypothecated to the bank. The banks also insist that someone else possessing land, preferably the owner

of the land whose plot the bargadar cultivates, should be persuaded to stand as a guarantor for the bargadar's loan. But where does one find an owner who will stand as the guarantor for the bargadar? "Even satisfied that the selected share-croppers are progressive farmers and not defaulters on any loan, the bank officers", the study says, "are reputed for their conservative attitudes especially when advancing money." The question of security and legal formalities loom large whenever any such transactions are considered by the Banks.

The bargadars covered by the study have, however, dispelled most of the misconceptions about them. As a group they have increased their paddy production by 77 per cent, reduced the burden of their long-outstanding private loans by 10 per cent and increased their subsistence expenditure by more than 7 per cent. They will be able to repay the entire amount of their private loans within 10 years if they are favoured with bank loans in the coming years also and be in a position to do away with bank loans by the 15th year.

Booming Economy

Vinod Mehta

THE Central Statistical Board of the USSR has published the results of the third year of the Ninth Five-Year Plan under the title "Fruits of Shock Labour". A glance at the figures given in Table 1 would show that whereas 1972 had been an exceptionally bad year for the Soviet economy, 1973 has been an exceptionally good one. The Soviet economy has done well in all sectors but more so in the agricultural sector.

The national income increased by 6.8 per cent in 1973 as compared to 4 per cent in 1972. In absolute terms, the national income of the Soviet Union increased from 310,000 million roubles in 1972 to 333,000 mn in 1973 — an addition of 23,000 mn roubles. The most spectacular progress was in agriculture. In 1971 agricultural production was stable at the 1970 level. But due to extremely unfavourable weather conditions (snowless winter and summer drought) grain production fell from 174.6 mn tonnes in 1971 to 168 mn tonnes in 1972, i e, by 5 per cent. In 1973 agricultural production went up by 14 per cent. Grain production in 1973 was 222.5 mn tonnes — an increase of 54.5 mn tonnes over the 1972 figure. Of the 1973 total, wheat production amounted to 109.7 mn tonnes, maize — 13.4 mn tonnes and rice — 1.8 mn tonnes. The statistical report singles out three republics for their major contribution to the grain harvest. The RSFSR made the largest contribution of 128.9 mn tonnes. The Ukraine contributed 48.5 mn tonnes and Kazakhstan 27.7 mn tonnes.

In 1972 due to the shortfall in grain production, the Soviet Union had to import large quantities of wheat and other foodgrains from the United States and other countries. These massive purchases by the Soviet Union sent food prices spiralling up in the United States by 3.5 per cent. This year, the Soviet Union is reported to have indicated to the US Agricultural Department that it is willing to defer delivery of 30 mn bushels of wheat involved in the 1972 transaction. The Soviet Union is also reported to have offered to sell one mn tonnes of wheat to the US.

On the industrial front also, the 1973 performance has been quite good. Industrial output increased by 7.4 per cent as compared to the target figure of 5.8 per cent. The most remarkable progress was made in the power engineering, chemical, petro-chemical, engineering and building materials industries. However, outputs of light industry and the food processing industry increased only by 4 per cent and 5 per cent, respectively. Production figures of some of the major industrial items are given in Table 2.

Here it may be recalled that one of the cardinal features of the Ninth Plan was that the consumer goods sector would grow at a faster rate than the producer goods sector. But as can be seen from Table 1, this happened only in the first year of the Plan — 1971. In 1973 the growth of the producer goods sector outstripped the growth of the consumer goods sector by about 3 per cent. Another feature of 1973 was that the increase in the sale of certain consumer goods was less than that in 1972. In certain cases the sales even went down as compared to 1972. For example, though the production of TV sets and washing machines was the same in 1973 as in 1972, their sales went down by 10 per cent and one per cent, respectively. This has led to stocks of these goods piling up.

1973 also saw an increase in the incomes of the Soviet people. The real per capita income increased by 5.9 per cent. This increase was partly due to the increase in money incomes and partly because of the 12 to 30 per cent reduction in the retail prices of some consumer goods like textiles.

TABLE 1: BASIC INDICES OF SOVIET ECONOMIC DEVELOPMENT

	1971 as per cent of 1970	1972 as per cent of 1971	1973 as per cent of 1972
National Income	106.0	104.0	106.8
Industrial Output	107.8	106.5	107.4
Output of Producer Goods	107.7	106.8	108.2
Output of Consumer Goods	107.9	106.0	105.9
Agricultural Output	100.0	95.4	114.0
Commissioning of Fixed Assets	105.0	104.0	108.0

Notes forming part of the Balance Sheet:

(1) The Bank's building at 33, Netaji Subhash Road, Calcutta in which the Calcutta Branch of the Bank was situated, was destroyed by a fire on the night of 3rd/4th January, 1974. In the said fire most of the books and records of the branch were destroyed. The returns for the half year ended 31st December, 1973 of this Branch are, therefore, compiled on the basis of available information and on certain assumptions and estimates.

(2) As returns in respect of Pakistan (including areas now comprised in Bangladesh) Branches have not been received for the period after 30th June, 1965, unaudited returns as at that date only have been incorporated in the Bank's Balance Sheet as at 31st December, 1973. As no further information is available, the assets and liabilities in Pakistan have not been shown in the Balance Sheet under the individual heads but only the net book value thereof has been incorporated.

(3) The actual amount of liability arising from future gratuities payable to staff has not been ascertained but is greater than the amount provided.

(4) For the year 1972, provision for bonus to staff was charged to the Profit and Loss Account. For the current year, provision for bonus to staff is disclosed as an appropriation of profit.

(5) There is a demand from the employees for payment of bonus for the year 1973 in excess of the amount provided. The provision made in the accounts is on the basis of the offer made by the management to the employees.

(6) Certain old items in the branch reconciliations remain to be cleared. The balancing of general ledger with subsidiary ledgers/schedules remains to be completed at a few branches. The schedules supporting general ledger balances and reconciliation statements for accounts with other banks were not ready at a few branches. Necessary steps are being taken in this regard.

(7) The figures for the previous year have been regrouped where necessary and possible.

In terms of our report of even date attached.

AUDITORS' REPORT TO THE PRESIDENT OF INDIA

1. We have audited the attached Balance Sheet of Central Bank of India as at 31st December, 1973 and also the Profit and Loss Account of the Bank for the year ended on that date annexed thereto, in which are incorporated the returns of 129 Branches audited by us, 347 Branches audited by other auditors and the unaudited returns in respect of 690 Branches including the Calcutta Branch at 33 Netaji Subhash Road and also the unaudited returns as at 30th June, 1965 in respect of 5 Branches in Pakistan (including areas now comprised in Bangladesh).
2. The Balance Sheet and the Profit and Loss Account have been drawn up in Forms 'A' and 'B' respectively of the Third Schedule of the Banking Regulation Act, 1949. Accordingly, they disclose such matters as were required to be disclosed in the case of banking companies prior to nationalisation by virtue of the provisions of the said Act as read with the related provisions of the Companies Act, 1956.
3. As stated in Note 1 to the Balance Sheet, most of the books and records of the Calcutta Branch at 33 Netaji Subhash Road were destroyed by a fire which took place there on the night of 3rd/4th January, 1974. The returns for the half year ended 31st December, 1973 of the said Branch were therefore, not prepared from the books of account but were compiled by the Bank on the basis of available information and on certain assumptions and estimates. The returns so compiled, reflected total assets Rs. 50.77 crores and total liabilities Rs. 27.60 crores as at 31st December, 1973 and gross income Rs. 2.10 crores and total expenditure Rs. 1.39 crores for the half year ended on that date, which have been incorporated in the accounts of the Bank. In the absence of books of account and other supporting records, we are unable to express an opinion on the figures relating to the Calcutta Branch incorporated in the accounts of the Bank.
4. In relation to the Calcutta Branch, we have not obtained all the information necessary for the purposes of our audit as the books of account were not available.
5. On the basis of the audit indicated in the first paragraph and subject to the limitation of disclosure indicated in the second paragraph and the reservations contained in paragraphs three and four, we report that:
   (a) In our opinion and to the best of our information and the explanations given to us and as shown by the books of the Bank:
      (i) the Balance Sheet read with the notes thereon is a full and fair Balance Sheet containing the necessary particulars and it is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December, 1973 and
      (ii) the Profit and Loss Account read with the notes thereon shows a true balance of profit for the period covered by the Accounts;
   (b) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;
   (c) The transactions of the Bank which have come to our notice have been within the powers of the Bank, and
   (d) The returns received from the Branches of the Bank, except for the Calcutta Branch and the five Pakistan Branches (see Notes 1 and 2 to the Balance Sheet) have been found adequate for the purposes of our audit.

Economics and World Order (ed) Jagadish Bhagwati; Orient Longmans, 1972; pp xii+365.

A COLLECTION of essays is normally difficult to review, particularly when they are written by different authors. In the present case, however, the task of the reviewer has been made relatively easy by two things: First, the essays have a unity of purpose; sponsored by an educational foundation, the World Law Fund, they address themselves to a chosen set of questions. Secondly, the editor, Jagadish Bhagwati, provides us with an excellent summary view of the issues with which the essays are concerned.

The issues centre on the pattern of international economic relations as it should be and as it is likely to be by the end of the present century. First the concept of an optimum world order is formulated, and then an attempt is made, on the basis of past trends of economic growth in different regions, to make a projection up to the decade of the century. The method is one of forecasting and the purpose is to assess how far what is conceived to be an optimum order is realisable within the century.

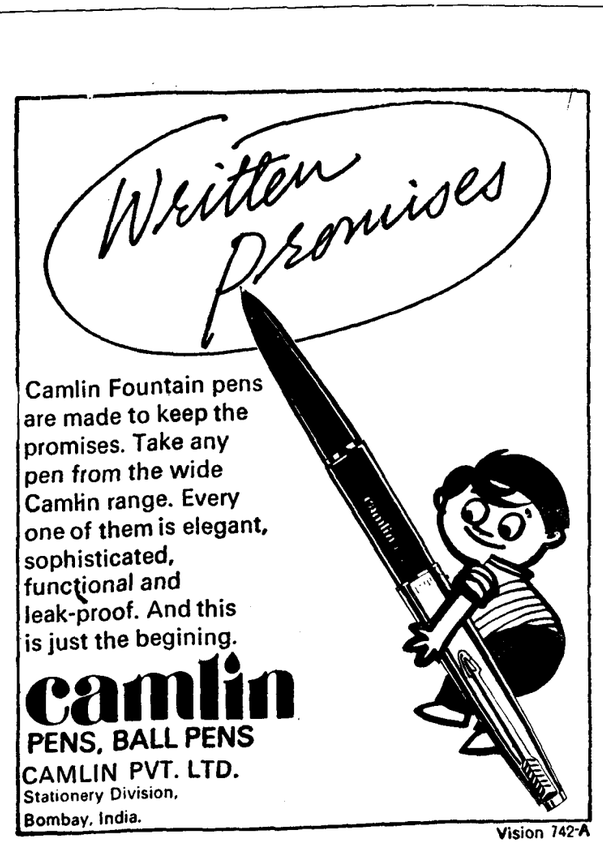
The levels of economic development in the various regions of the world have been widely disparate over the years. The regions where poverty prevails constitute more than two-thirds of the world population. Will these disparities tend to persist? If they do, what countervailing measures should be taken in advance to bring the regions into line with one another? Is international economic integration a feasible proposition? Is it attainable within a measureable distance of time, say, by 2000 AD? These are the sorts of questions that the authors ask themselves — difficult questions whose answers depend, partly at any rate, upon one's way of looking at things. No wonder traces of wishful thinking are discernible in the answers provided in the essays. Yet, in spite of the fact that the authors represent different regions and have different backgrounds, there is a certain commonness in their approach and understanding of world problems which is impressive.

The central point round which the studies revolve is redistribution of income through transfer from rich nations to poor nations. An optimum world order, sketched by Jan Tinbergen, demands such transfer. The gap in the levels of economic development of different regions has to be narrowed. This can happen if the rates of growth of poor nations are raised beyond what they have been experiencing and if rich nations help this process by measures of transfer, thus reducing their own rates of growth. The idea is commonplace and has been with us during the greater part of the post-war period. There is, however, one bold feature in the general outline chalked out, namely free migration of labour. Tinbergen acknowledges its importance as one of the requirements of a world order, and Bhagwati draws attention to a feature of international migration which is adding to international imbalance — transfer of talent from the poorer countries. He therefore urges that the immigration policies of sparsely populated countries should be reversed in favour of unskilled labour if migration has to contribute to international balance.

On the central problem, namely the "gap" between the rich and the poor nations, Paul Rosenstein-Rodan seems to be optimistic. He hopes that there will be a narrowing of the gap by 2000 AD. His prediction is based on an interesting speculation, namely that workers in the more developed countries of the world will in future demand more leisure than real income. Working hours in these countries will be reduced and, other things remaining the same, the rate of growth will come down. On the other hand, there will be faster growth in the underdeveloped countries, because of their low base and because superior knowledge and technology are already there which only need adaptation for use in these countries. Rosentein-Rodan's anticipations are reasonable, and his prediction concerning the more developed countries may hopefully be realised also; with the standard of living that they have already attained, and given that they do not have a perverse preference system, it is surely reasonable to expect that these countries will in future opt more for leisure than for real income. However, when it comes to underdeveloped countries, Rosenstein-Rodan's thinking seems to be only wishful. The experience of India, with which Rodan has enough acquaintance, should have warned him that a mere knowledge of technology and of economic policy cannot do the trick if the will to use it purposefully is lacking. Among the less developed countries of the world, India is supposed to possess the largest supply of skill and expertise (alas, comparing the quality of the essay on India in the present volume with that of the essays on Africa and Latin America, one would begin to doubt the validity of this supposition), and it was among the earliest to have adopted the principle of planning for economic development. Yet its record of growth is about the lowest among these countries. In fact the performance of the last Plan in its later phases makes nonsense of the projection in Pant's paper on Indian Perspectives: 1990-2000 — the only paper on South Asia that the volume carries.

A more realistic projection seems to be that suggested by Jozef Pajestka. According to Pajestka, the gap will tend to grow wider between the developed countries and those among the developing countries which have adopted the capitalist way, while the socialist countries will have a substantially faster rate of growth, so as to be able to bridge the gap between them and developed countries. Pajestka's projection is amply supported by the actual growth trends in the three different groups of countries. It is significant that over the period 1950-67, the annual rate of growth in per capita product in the socialist countries of Europe was as high as 6.7 per cent as against 3.0 per cent in the developed countries, while the figure for the non-socialist poor countries of South Asia and Latin America was a meagre 2.2 per cent.

The finding is on the face of it somewhat of a paradox. Is it not through capitalist enterprise that the richer countries of the West achieved their present level of economic development? Why, then, should the system fail when it comes to the development of the hitherto underdeveloped countries? The answer to the paradox is provided by Weisskopf. There are obstacles in the capitalist path for late starters such as the underdeveloped countries of today. First, there is the demonstration effect. Integration with countries which are already developed affects the consumption pattern of the poorer countries in a way which dissipates productive resources; those who have surplus income imitate their counterparts in the richer countries and indulge in luxury consumption. Secondly, the economies tend to be dominated by foreign enterprise in one form or the other. Technology and knowhow are thus imported into the poorer countries to which these economies are ill-suited. And thirdly, much of the local expertise trained in Western science and technology is drawn away from the poorer countries where remunerations are relatively low — the so-called brain-drain effect. These obstacles are real; those of the poorer countries of the world who have adopted the capitalist path are showing up by their behaviour how real they are. The case of India can be cited as a conspicuous example of wasteful consumption slowing down growth.



Now, if integration with the rich capitalist countries is an obstacle to rapid economic development of poorer countries, then it remains a pertinent question as to whether foreign aid, as it is conceived by Rosenstein-Rodan, Tinbergen and others, is at all an answer to the problem of the international gap. It is true that, other things remaining equal, foreign aid does help; it enables the receiving countries to cross the normal foreign exchange barrier. Where exports are inelastic and where external and internal resources are complementarily related, foreign aid can indeed be shown to produce a multiplier effect upon domestic investment. But the trouble is that other things do not remain equal. The institution of foreign aid is not as simple as it appears to be on the face of it. It is an institution whose effect is not a straightforward addition. There are leakages accompanying it by way of distortion in the structure of production and the pattern of consumption which need to be taken into account. The net effect is not unambiguous. It is not an accident that countries which have pursued a policy of isolation in their economic planning in the post-war period have shown a higher rate of growth than those which have sought integration with the West.

Tinbergen has a vision of a world government. As a precondition of an optimum world order he envisages an international decision-making body on "aid" and trade whose decisions must be binding on all peoples represented on the body — poor as well as rich. "For the vital decisions on 'aid' and trade, this means a world government."

The concept of a world government is not new. Many high-minded men have backed it before. If it is still supposed to be an utopia, it is because the nations of the world — big or small, rich or poor — are not prepared to accept the loss of autonomy which the concept involves. Moreover, the viability of an international order presupposes a degree of national economic integration which the countries of the world are yet to achieve — a point made out strongly by Stapanov, the only contributor to the volume representing the Socialist bloc. Tinbergen does not seem to be disturbed by such considerations, and he asks why, when "we have the multinational firms already for quite some time", should there not be multinational governments to take decisions on commercial relations between nations? A well-meaning proposition, and yet how naive! If the multinational corporation is to be the standard for the constitution of a world government, then the problem is simple enough — you have only to leave decision-making to the US State Department, supported by its own chosen representatives in the other countries! If anyone doubts it, he should read Stephen Hymer's critique of the Multinational Corporation in the present volume. Poor Tinbergen — political economy is not his forte.

There are two papers on the future of the international monetary and trading system by Harry Johnson and Robert Triffin. Their views on these matters are well known — reduction of trade barriers and a rationalisation of the international liquidity system. The papers contributed to the present volume provide a succinct account of the problems involved and the prospects of their solution.

On the whole it is a rich collection worthy of the subject and, one hopes, will be widely read and discussed.

Foxed by Wealth of Facts

K K Taimni

Co-operatives in Asia by Mohinder Singh; Praeger Publishers, New York, 1970; pp 489; $ 10.

PLANNERS in all developing countries have recognised the importance of creating an institutional framework and evolving a technology that would hasten the process of development and make an impact on the life and work of the community. It is in this context that co-operatives have been selected by governments in the Asian countries with varying degrees of emphasis — including in Japan and Taiwan at one end and Pakistan and the Philippines at the other — as an institution for developing and modernising more particularly agriculture. Some of these countries have witnessed phenomenal expansion of co-operatives also in such diverse fields as consumer business, housing, insurance, industries, agricultural marketing and credit, and urban banking.

Development of agriculture, on which the prosperity of many of these countries depends, calls for rapid institutional changes, and co-operatives have seemed the appropriate institutions for bringing about social and economic change in a peaceful manner. At any rate, it is such calculations that have encouraged governments of various hues to foster co-operatives.

The book under review traces the history and growth of various types of co-operatives in Asia, among them agricultural credit co-operatives, industrial co-operatives, housing co-operatives, etc. It also contains selected 'country' studies of the functioning of co-operatives in Sri Lanka, the Philippines, India, Iran, Japan, Malaysia, Pakistan and South Korea.

However, the pronounced variations in the development of co-operatives in these countries and certain angularities in the co-operative movement in each of the above countries — which are traced largely to historical factors — seems to have made it well-nigh impossible for the author to identify the factors responsible for their success or otherwise. Thus, agricultural credit co-operatives in Japan are not analysed except in the most general terms. This, therefore, is a major limitation of this otherwise pioneering effort in the study of co-operatives.

In Part I, 'Agricultural Co-operatives', the author rightly points out that agricultural credit co-operatives have flourished in Japan and Taiwan largely because of the higher yields per hectare in these countries, the small size of their average holdings notwithstanding. Thus the success of the co-operatives is linked with the success of agriculture itself: If Japan and Taiwan today have exceedingly successful co-operatives, it is largely because of the long and sustained efforts at modernising of agriculture — encompassing intensive research work, efficient arrangements for extension, and appropriate arrangements for the supply of institutional credit (especially credit for production) and other agricultural prerequisites and marketing. If, however, co-operatives are promoted as institutions that will act as catalysts of development, there is something circular about the above analysis, unless it is followed by further analysis of the other external factors that make a success of the co-operatives themselves.

There is a comprehensive treatment of all aspects of agricultural co-operatives. Here again, the importance of the structural relationship among the different tiers is underlined, so also the role of apex organisations, the marketing and supplies of various inputs, etc. The author notes that, because of the limited supply of trained personnel and the non-viable size of the base-level society, it "will appear logical to promote multi-purpose co-operatives in the Asian countries". He also seems to favour the channelling of all types of agricultural credit — short, medium, and long-term — through the same secondary and primary level co-operatives, as is done in Japan.

The author also emphasises the other unexceptionable — *viz*, the need for closer co-operation between the co-operatives and the government extension activities — and he suggests that the office of both should be housed preferably in the same building.

In Part II, 'Non-Agricultural Co-operatives', the pride of place is given to the consumer co-operatives, apparently because of the role that these co-operatives can play in the distribution of essential articles to the community at reasonable prices. "Since many of the factors contributing to the imbalance between growth of demand and supplies are likely to persist [in developing countries], some governments are promoting consumer co-operatives as a supplementary (or alternative) channel of distribution that could, in addition to its direct benefits, exercise a healthy influence on individual distributors."

While tracing the history and growth of the consumer co-operatives in Asia, the author points out that, in many countries (among them the Philippines and Taiwan), separate legislative and administrative arrangements exist for the non-agricultural societies. A historical perspective of their growth and development is presented, but no serious attempt is made to explain their rapid deterioration, once government controls on essential articles are lifted, and the official support is withdrawn. Looking to the Western experience, one would have appreciated a more intensive treatment of the role of federal organisations in this respect.

Chapters on urban and credit co-operatives, industrial co-operatives and housing co-operatives follow.

Part III contains selected country studies of Sri Lanka, India, Iran, Japan, West Malaysia, Pakistan, the Philippines, South Korea, Taiwan and Thailand.

This is, overall, a compilation which describes in very readable style the various facets of the development and growth of co-operatives in Asian countries.

Mahindra Ugine

MAHINDRA UGINE Steel Company expects to commence commercial operations at the expanded plant by the beginning of the second quarter of 1977. The expansion envisages increase in capacity for tool, alloy and special steels from 24,000 tonnes to 60,000 tonnes per annum and diversification of production into stainless steel, high speed steel, die, tool and drill steel, alloy and carbon constructional steel, etc. Meanwhile, with the implementation of the balancing scheme, the company has already ensured a fuller utilisation of the rated capacity in most of the key production departments of the integrated plant. MUSCO's sales in the first 5 months of the current year have been a third higher compared to the same period last year. This increase, however, reflects inflation in prices of several essential inputs such as ferrous scrap, fuel oil and graphite electrodes, according to the chairman Harish Mahindra.

Share of Labour in Manufacturing Industries

Sreelekha Basu

During the period 1960-1971, in real terms total emoluments per employee went by only 23 per cent compared to a 53 per cent increase in value added peremployee.

At constant prices, the share of employees inthe total domestic product in the registered factories sector recorded only a slight increase over the period.

[The views expressed here are those of the author and not of the organisation in which she is employed.]

AN attempt has been made in this note to study the fluctuations in the share of salaries and wages in the "income originating" in the organised manufacturing industries sector as well as to examine the increase (if any), in the per worker wages earned in real terms in this sector. Some of the results arrived at appear to be of topical interest and have been further analysed to arrive at important indicators in this field.

The main source of data on employment, wages, etc, has been the Annual Survey of Industries which covers the total factory sector in India. Both large and small factory units are covered by this Survey. Factory units include "manufacturing" as well as some "servicing" units, such as water supply, sanitary services, motion picture production, laundry, etc, but exclude units under the control of the Ministry of Defence, oil storage depots and technical training institutes. All units employing 50 or more workers with the aid of power and 100 or more workers without the aid of power (in any preceding three years) are completely covered, while all electrical undertakings are completely enumerated. The remaining units, i e, units employing 10 to 49 workers with power and 20 to 99 workers without power are covered on a probability sampling basis.

ASI data, however, are available only upto the year 1969. Basic data relating to 1970 and 1971 have been arrived at with the help of figures on the average daily employment and the corresponding per capita annual earnings of "workers in manufacturing industries coming under the Payment of Wages Act, 1936", as collected by various states and Union Territories and published in the Indian Labour Statistics. All the indicators relating to these two years are provisional and will be revised as soon as more upto-date data on ASI are received.

° Provisional, based on indicators prepared from Labour Bureau data.

The basic data are presented in Table 1 "workers" refer to all persons defined as workers under the Factories Act (1948), but excludes all other employees in supervisory, managerial and administrative work. "Total" includes all workers, and other employees engaged in administrative, technical and clerical work in the factories, but excludes employees engaged in distributive activities. "Wages" refer to all remuneration in terms of money paid to workers, more or less regularly, while "total emoluments" consist of salaries, wages and bonus to all employees and imputed value of all benefits given in kind, as well as employers' contribution to Provident Fund, Pension, Gratuity, etc. However, for 1967 to 1969, ASI data on "total emoluments" are exclusive of the employers' contribution. Necessary adjustments have been made in the "total emoluments" figures for these years, on the basis of separate data on employers' contribution available for 1965 and 1966.

Statistics on per capita annual wages/total emoluments/value added as obtained from ASI and Labour Bureau data are furnished in Table 2. At current prices per capita average wages went up by 113 per cent during 1959 and 1969, while the increase had been 149 and 156 per cent respectively in total earnings and value added per capita, over 1959 and 1971. However, it would be interesting to find out how much of these increases in wages, etc, were due to price rise and what had been the real increase in these growth indicators. The "wages" and "total earnings" have been deflated with the help of the all-India working class consumer price index numbers, with 1960 as base, and the value added deflated

by the implicit income deflator for the registered manufacturing sector, as obtained from the official national income statistics. In real terms, wages had gone up by only 11 per cent during 1960-69, while the corresponding growth in total emoluments had been 23 per cent and in value added as much as 53 per cent, over 1960-71. Though total emoluments per employee at current prices had gone up by more than 133 per cent during 1960-71 (from Rs 1,483 to Rs 3,463), in real terms they have gained by 23 per cent only as compared to a 53 per cent increase in value added per employee at constant prices. The total net domestic product in India registered an increase of 43 per cent during 1960-71 (in real terms) and the per capita income by 13 per cent only. Though at current prices, the total earnings per employee in the factory sector registered a rising trend over the period under study, when deflated by the increase in their cost of living the trend had been quite erratic — registering sharp falls during 1964 and 1967. Similar trends are noticed in the average wage per worker as well, but the value added per worker

had recorded continuously rising trends both at current and at constant prices. Indices of average wages, total emoluments and value added at current and constant prices are presented in Table 3. At current prices, the index of average earnings had been consistently above those of value added, since 1964. But at constant prices the picture is completely reversed.

The share of total emoluments (which in other words is known as compensation to employees) in the total income originating in the registered manufacturing industries sector over the years under consideration, at current and constant prices, would furnish an interesting study (Table 4). Data on net domestic product, at current and constant prices are official estimates, which are mainly based on ASI and on index of industrial production data, with necessary adjustments for non-responding units and for imputed bank charges (the latter is deducted from the net value added as it forms a part of the income originating in the banking and insurance sector). Necessary adjustments in the total emolument figures noted above, have been made for Defence manufacturing establishments and for the non-responding units to make these comparable with the estimates of net domestic product in this sector. At current prices, the share of employees registered a sharp rise from 53.4 per cent in 1960-61 to 69.2 per cent during 1971-72, though the highest share was obtained during 1970-71. But the picture has been rather disappointing when we look at the constant prices series. Employees' share in the total domestic product in the registered factories sector had recorded only a slight increase during the years under study, with erratic trends, registering fluctuations all over the period, the lowest recorded at 49.7 per cent during 1964-65 and highest at 55 per cent in 1971-72. The increase in the proportion of the net domestic product, in the registered factories sector, going to the employees was mostly wiped off by the sharp price rise. Though the total compensation to employees did shoot up from Rs 540 crores in 1960 to Rs 1,985 crores in 1971, the lot of the people working in this sector had only marginally improved. The picture would have been darker if relevant data relating to 1972 and 1973 were available for processing, as the price spiral has eroded whatever the factory workers (including the white-collars) managed to get by way of wage/salary increase and other benefits in the form of free or subsidised food, fuel, accommodation, electricity, water, sanitary services, transport, medical attention, education, welfare projects, etc, as well as of employers' contribution to PF, Pension, Gratuity and other social welfare measures. As the factory workers mostly spend all their earnings on bare necessities (food, clothing, house rent and education), their real wages must go up not only to provide them with a better level of living, but also to give them more incentives for better productivity and saving. A more meaningful analysis would have been to study the change over time in the distribution of total earnings amongst factory employees to check which section of workers has benefited by the 23 per cent rise in the total emoluments during 1960-71. With the marginal rise in the per capita earnings during the sixties and early seventies, it would have been interesting to examine if it was shared more by the lower paid workers than by the comparatively well-off section of the employees. However, the existing statistical information is deficient to throw any light on the distributional aspect of the earnings of the factory employees, though the basic data can be collected by the ASI, once in every five years, to examine how the additional income generated by the employees is distributed amongst them.

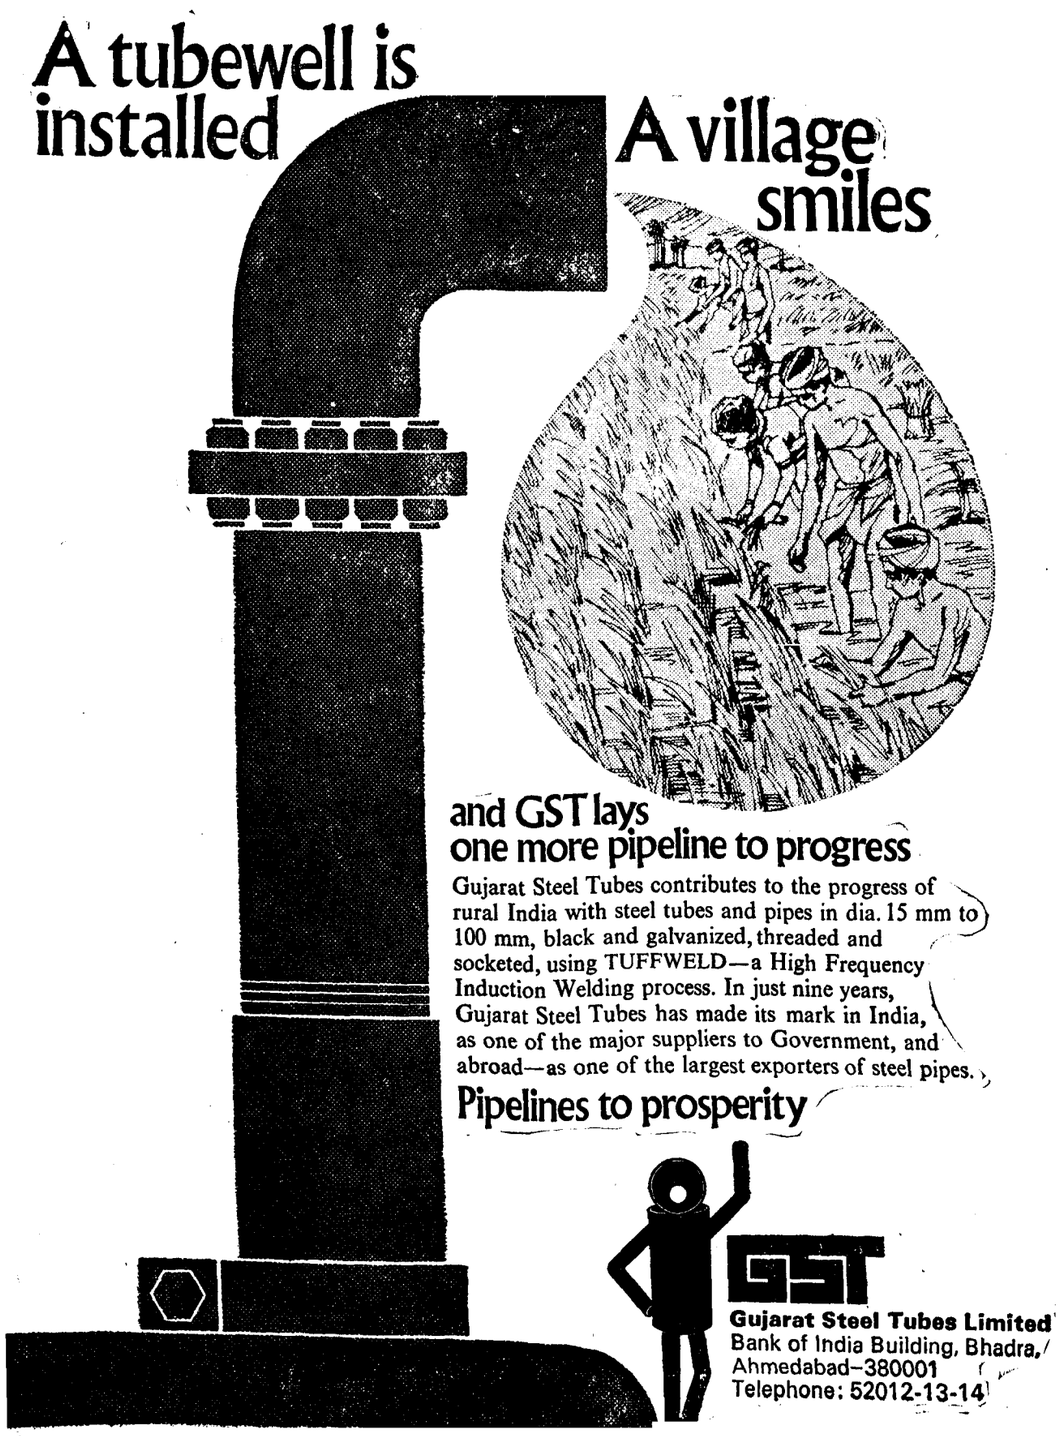
India and the World Tea Economy

K B K Rao

Augus Hone

This article describes the policy failures in the tea sector during the 1960s and 1970s and suggests measures that would enable the industry to continue to expand its output for domestic and international markets while pursuing the possibility of an international tea agreement to regulate export availability of tea and to raise the market price.

Obviously, such an agreement would have to cover policies relating to expansion of acreage, replanting, replacement and domestic consumption, on the one hand, and to market sharing and quotas, on the other.



Any tea agreement would, at the same time, have to make provision for a well-planned and heavily financed promotion plan designed to expand tea usages.

The revival of India's tea in world markets from 1975 to 1985 will require an integrated promotion to expand the exportable surplus even as domestic consumption expands, a working agreement to raise price and export earnings, and a promotional strategy to expand tea's market in competition with coffee and other beverages.

"Though tea consumption will doubtless continue to increase, prospects for producers in the short and medium term do not appear particularly favourable unless a satisfactory international tea agreement can be concluded and implemented, and unless substantially larger funds can be made available to promote tea and thus raise the rate of increase of demand, particularly in developed market economy countries."
— "Plantation Crops", Commonwealth Secretariat, London, 1974, p 95.

INDIAN tea exports have fluctuated between Rs 160 crores and Rs 180 crores since the middle of the Third Plan; and government conceded, albeit implicitly, that tea export earnings are likely to stay stagnant. The Fourth Five-Year Plan while estimating an increase from Rs 180 crores in 1967-68 to Rs 205 crores by 1973-74 cautiously commented that:[1]

"The growth of our major traditional exports, and in particular tea, jute and cotton textiles is likely to

be slow."

In the event, policy failures, a gradual erosion of the competitiveness of Indian tea in world markets, and a very low level of spending on marketing and promotion have confirmed the correctness of the Planning Commission's outlook if not the accuracy of their forecast. Actual 1973-74 offtake of tea is likely to be between Rs 160-170 crores, and the Fifth Plan's projected figure for 1978-79 is as low as Rs 174 crores — which is significantly lower than the Rs 228 crores projected in the Fourth Plan for 1978-79 and the Rs 240 crores for 1980-81.[3]

It will be the purpose of this article to describe the policy failures in the tea sector during the 1960s and 1970s, and to suggest measures that would enable the industry to continue to expand its output for domestic and international markets while pursuing the possibility of an international tea agreement to regulate export availability of tea and to raise the market price. Obviously, such an agreement should cover policies by the tea-exporting countries relating to expansion of acreage, replanting, replacement, and domestic consumption, on the one hand, and to market sharing and quotas, on the other. Any tea agreement would, at the same time, have to make provision for a well-planned and heavily financed promotion plan designed to expand tea usages.[3] The revival of India's tea sector in world markets from 1975-1985 will require an integrated promotion to expand the exportable surplus even as domestic consumption expands, a working agreement to raise prices and export earnings, and a promotional strategy to expand tea's market in competition with coffee and other beverages: beer, wine and soft drinks.

Production Background

The Indian tea industry, in common with that of Sri Lanka, has not expanded its acreage very significantly. In contrast, the East African producers have been expanding acreage under tea rapidly (see Table 1).

The pattern of India's expansion of acreage and yield has been by extension. Replanting has been extremely limited, and since 1967 India's total replanting particularly with the high-yielding teas prepared by 'Vegetative Propagation' methods fell behind that of Sri Lanka in spite of an acreage 50 per cent larger in total.[4] Sri Lanka has pushed ahead a major replanting with high-yielding VP teas.[5] Plans for Kenya, too, suggest a continuing rapid expansion of smallholding tea (see Table 2).

The economics of such acreage expansion, given the high yields from VP teas with irrigation and fertiliser application, may be doubted but total replantings from 1962-63/1971-72 did not exceed 50,000 acres.[6] Indian production, however, has expanded more rapidly than was thought likely in the earlier years of the Fourth Plan, and the target of 460 million kg was exceeded in 1973 (see Table 3).

However, there are many difficulties in the 1974 season, particularly as far as diesel oil, nitrogenous fertiliser, herbicide and pesticide supplies are concerned. Tea output, after a promising recovery from unfavourable weather and the Dooars area strike in West Bengal in 1969, has failed to reach the limits set under the International Arrangements for the Stabilisation of Tea Prices, which produced the Mauritius agreement and the system of internationally agreed exports.[7]

India's exports in 1973-74 were around 207 million kg against a quota of 217.8 million kg. The likelihood of 224 million kg target being achieved in 1974-75 — given the problem of inputs — must be considered remote. The additional difficulties of shipping and warehouse space will not be solved immediately, and the pull of a strong and growing domestic consumption is unlikely to be dampened sufficiently by the recent rapid inflation (of over 25 per cent in 1973-74) to allow the exportable surplus to be expanded (see Table 4).

A close study of Table 4 reveals that, if the domestic consumption of tea continues to rise in 1974 instead of falling marginally along with the fall in real income, it will be virtually impossible to hold exports at their present physical level. Export earnings, however, may rise as a result of higher prices from the international auctions at Calcutta, Cochin and London, where the January-May prices have been marked up by 25-30 per cent as the shortage produced by the weather and fertiliser shortages began to be felt.[8] The years ahead will be particularly difficult if agricultural output and real incomes begin to rise again in 1975 and 1976. All studies point to tea having a high income-elasticity of demand in India. Per capita consumption increased from 0.25 kg to 0.37 kg from 1955-57 to 1967-69. Total consumption increased at the same time by 5.8 per cent annually, or by a cumulative total of 95,000 tonnes. Total consumption has been expected to increase by 5 per cent yearly between 1967-69 and 1980 (reaching 350,000 tonnes in that year).[9]

However, it must be expected that 1973 and 1974 reverses in the economy will affect the pattern of tea consumption, and it is extremely unlikely that domestic consumption will continue to rise at its previous pace. The previous rate of increase was due to three factors: population increase (2.2/2.5 per cent per annum), fall in real retail prices of tea (1.5-2 per cent), and finally elastic demand for tea with reference to real income changes (2/2.5 per cent annually).[10] It is nevertheless possible that, as consumers become used to tea, they are highly resistant to reducing their purchases even when real incomes fall, as in 1966-68 and 1972-74. During these periods, domestic tea consumption has held up well and made it very difficult to expand exports to reach agreed quota levels.

A number of commentators have become increasingly concerned that overall production growth rates are not adequate to increase exports by even 1.2 per cent per annum. K M Mandava-

*Note**: 1973 and 1974 are based on an estimated 1973-74 export figure of 207,000 tonnes and a deterioration from April 1974 as a result of fertiliser shortages.

walla estimated that:[11]

> "On this basis, tea exports from India would rise to around 220 million kg in 1973-74."

As a result of rising domestic consumption, with an inadequate rate of production expansion, 1973-74 exports have been under 210 million kg, with a further fall to 200-205 million kg in 1974-75 appearing almost inevitable.

PRODUCTION AND PROFITABILITY

The trend increase in tea production from 1961-70 was as low as 1.9 per cent. A committee of the India Tea Association suggested that this be raised to 3 per cent to allow for holding of exports in the range of 200-210 million kg and increase of domestic consumption at 5 per cent annually. In the event, tea production grew by over 3 per cent from 1970 to 1973, but domestic consumption rose by over 6 per cent. The likely production falls in 1974 will thus make it almost impossible for tea exports to be above 200 million kg in 1975 and 1976 unless domestic demand ceases to rise.

India has suffered from the age-pattern of its tea bushes:[12]

> "... around a third of Indian tea bushes are over 50 years old, and a further two-fifths are between 30 and 50 years; replanting, replacements or extension is obviously of importance and will become increasingly so as the years pass."

However, extension of area — rather than replanting with high-yielding cloves produced through vegetative propagation — has been responsible for the bulk of newly expanded production. A major USAID study on the tea industry in 1971 suggested that at present it was uneconomic to replant many of the North Indian and the bulk of South Indian gardens. Replanting costs rose steadily in the 1960s, and rising costs and falling export prices in the late 1960s combined to reduce returns to the tea companies to very low levels. Table 5 shows the 1964-72 London auction prices.

Subsequently, in 1973, and in the early months of 1974, export prices have again risen, and domestic prices have followed export prices since the poor realisations in export markets during 1966-70. That the recovery of the price from 1969-70 to early 1974 meant a significant change in the profitability, was brought out by the 1967 study of the Reserve Bank. The study showed a rate of return only slightly more than half the average for all industries.

The government has, however, offered various forms of assistance to the industry: the Tea Machinery Hire Purchase Scheme from 1960, which can loan up to Rs 6 lakhs per garden; a Tea Plantation finance scheme with loans of up to Rs 13,750 per hectare; and a Replanting Subsidy Scheme from October 1968 which from 1972 allows Rs 5,000 for plains gardens and Rs 6,000 for hill gardens for each hectare of average bushes replanted. In the second half of 1972, moreover, the Reserve Bank of India instructed the commercial banks to lend on easy terms to the industry.

COMPETITIVENESS OF INDIAN TEA: 1961-74

The declining competitiveness of Indian tea in the major non-communist consuming countries has been matched by a growing volume of exports to the bilateral markets. Table 6 shows the change in the pattern of destination of Indian tea exports during 1961-72.

The increase in bilateral shipments, from under 40,000 tonnes in 1961 to over 90,000 tonnes in 1972, largely confirms the pattern noted by K M Mandavawalla in Table 4 of this article[13] where he observes an increase in bilateral exports as a percentage of total exports, from 19.9 in 1960-62 to 44.6 in 1968-69.

It is sometimes argued that India's bilateral exports represent a displacement, or shift, and not a net addition to total tea exports.[14] India's losses in the UK market were replaced by a massive surge in East African exports, which rose by 114 per cent from 1957-60 to 1969-70. Since East African prices were consistently below North Indian prices it might well have been very difficult for India to compete for the UK market without driving prices sharply lower.

In the fifties, Indian export prices were undoubtedly up because of excise and export duties accounting for 10-15 per cent of the export price of tea.[15] And it is possible that:[16]

> "... rather than engage in a price war India accepted a loss of her market share."

India has in fact suffered more throughout the period in question from a de-

cline in the international price of tea, particularly at the London auctions, although this has been reversed from 1972 to 1974.

Table 7 shows the improvement of tea prices in 1972, which further accelerated in the last quarter of 1973 and the first quarter of 1974. At the same time, India's share in world markets continued to fall upto 1971, with slow replanting and the low profitability in the industry. However, the production performance from 1970-73 has been extremely impressive and suggests that the initially higher yields of the Indian tea industry were capable of being raised even further by improved husbandry, weeding, and increased fertiliser applications. However, the very high cost of fertilisers and their shortage as a direct result of the oil crisis from October 1973, may lead to a very serious production crisis in 1974 and 1975 as the older Indian gardens with their average bushes and their low proportion of recently planted or replanted VP teas may suffer much sharper falls in yields per acre than would the gardens in Sri Lanka or East Africa.

The tea industry had only begun to recover in 1970-71 from the very poor years of 1968-69 and 1969-70 and the heavy tax provisions which depleted the resources available to the industry.

Reinvestment by the major groups was postponed, or in some cases took place in East Africa instead, where groups such as Brooke Bond, Liptons, and Williamson Mager, had built up substantial interests.

Tea Agreements and Quota Restrictions

The long-term outlook for tea prices has been recognised as a major problem for producers. The FAO in its "Agricultural Commodity Projections 1970-80", projected consumption growth at 2.8 per cent and output at 3.8 per cent, and estimated that the commodity would be in surplus.[17] These projections were prepared in 1969, before the dramatic fall in the UK consumption since 1970.

Already, the search for an agreement among the producers had been under way for several years. *Ad hoc* consultations took place in Sri Lanka in 1965, in Britain in 1967, and in Kampala in January 1969. Further discussions in Rome and Mauritius led to the establishment of a Working Party on Long-Term Measures. The Working Party met in April 1970 and decided on an export quota agreement. The 1970 quotas were revised in September 1970 to take account of shortfalls and overful quotas. The export quota system has continued to be in force (see Table 9).

The weakness of the export quota agreement has been its failure at the same time to examine ways of significantly raising prices and its failure to ensure positive action to begin properly financed advertising and promotional campaigns for tea.[18]

The history of previous tea agreements and their weaknesses was carefully reviewed by Liaqat Ali,[19] who was particularly emphatic in documenting the stagnation of world exports during 1961-68 — a position seriously worsened by the devaluation of the pound sterling in November 1967, which led to a sharp fall in receipts *in dollar terms*.

The downward trend in prices (Table 7) and in total receipts has been partially reversed since 1970, though the upward trend was again reversed in 1971 and did not move sharply ahead till 1973-74; even now it is hardly sufficient to cover cost increases forced on the tea companies by the oil crisis. Happily, the earlier pessimism of the 1969 UNCTAD study[20] — which estimated a price decline of almost 4 per cent a year against a 2 per cent annual volume increase and saw a fall in export value to $ 400-425 million in 1975 — has proved totally unfounded. Exports in 1975 are likely to exceed $ 600 million. The quota system can undoubtedly claim considerable credit for this achievement, although the present situation is still unstable because of the absence of agreement on production control. The continuing expansion of East African production also makes it most unlikely that production controls can be agreed to in the immediate future. Liaqat Ali was correct to concentrate on the problem of reduction in tea planting programmes:[21]

> "The major exporters might still find it advantageous to reduce their exports in order to support a higher price (for instance, the 1968 level) provided, as *quid pro quo*, future planting of small producers could be so restricted that the rate of growth of export availabilities does not exceed the growth of world import demand at the agreement price level."

Clearly India and Sri Lanka would have to offer the smaller East African producers as well as Indonesia and Bangladesh a growing share of world quotas *and* a higher price in order to get any agreement on acreage limitation. Such a policy will involve withdrawal of up to 10 per cent of their joint exports *either via* additional bilateral sales in Eastern Europe and the Soviet Union *or* by lowering of tea excise duties in India to increase offtake in 1974-75 and 1975-76 from 230,000-200,000 tonnes to 250-000-260,000 tonnes. Without a radical upward shift in prices, it is unlikely that the export quotas can be made watertight, as India and Sri Lanka fail to fill their agreed quotas and the East African plantings and yields continue to expand.

The system of export quotas agreed to in Mauritius has worked to prevent falling prices of tea exports from

1970 to 1974. Tea was particularly suited for the introduction of an agreement. It was almost entirely exported by developing countries and its market characteristics make limitation of exports feasible. At present there is no competition from synthetics or substitutes, though in the absence of promotion other beverages such as coffee, soft drinks, beer, and wine, have eroded the demand for tea in its traditional markets such as the United Kingdom. The price-elasticity of demand is low. Finally, imports and exports are concentrated in a few countries and there is no significant protected production outside Japan. However, between 1975 and 1980, it is unlikely that the export quotas, by themselves, will have satisfactory results, without a major attempt to secure acreage limitations and mount a major promotional campaign to hold the levels of tea consumption in traditional markets and expansion in new or changing markets. India should take the initiative within the Standing Exporters' group.

Promotion and Advertising

Promotion of tea has been sadly neglected since the Tea Council's earlier campaign from 1961-64, which held tea consumption in the United Kingdom between 1961-1965 at 230,000 tonnes.[22] However, since 1965, UK consumption has fallen alarmingly: from 218,590 tonnes (4.01 kg per head) in 1966 to 197,201 tonnes (3.52 kg per head) in 1973.

The UK position highlights the dual strategy necessary on the part of the producers: promotion to maintain per capita consumption in countries where tea drinking is established, and carefully planned advertising to raise per capita consumption elsewhere but particularly in economies with high or rapidly expanding per capita incomes.

Delays in planning from 1969 have been followed by delays in agreeing to spend on the detailed promotional campaigns.[23] Initially, India and Sri Lanka wished to spend 2 per cent of the tea export earnings and Kenya 1 per cent; but delays and difficulties led to Sri Lanka's withdrawal from the UK generic campaign in 1971, and this has only been resumed at £ 225,000 for 1973.

Brand advertising by tea companies has partially filled the gap. But low sales promotion expenditures and very limited generic promotion has meant that expenditure on tea promotion as a proportion of turnover is only half that for coffee in the United Kingdom.[24] In West Germany, tea promotion expenditures are equal to only 10 per cent of coffee and 1 per cent of all drinks.

Tea has also lost because of the small proportion of instant tea sold outside the United States, where it accounts for over 30 per cent. Very little has been spent also on promotion of iced tea and iced tea mixes in markets such as Australia, South Africa, Japan, Italy and France. Tea has lost in institutional markets sold through vending machines — tea in the UK has less than 22 per cent of this market and coffee over 60 per cent. Finally, tea bags were introduced in all markets and have contributed to the reduction in tea consumption in the UK,[25] although they may have assisted tea in the small Scandinavian EEC markets.

Promotional Strategy

A promotional strategy for Indian tea exports, in collaboration with other producers, should be based on five separate promotional and advertising strategies — costing a minimum of 2 per cent : $ 12 million out of total tea exports at $ 600 million :

(1) A campaign to prevent further erosion of the United Kingdom, Ireland, Canada, South Africa and Australia market, with very high per capita consumption figures. In 1972, the UK absorbed 192,000 tonnes and the others 12,700 tonnes, 21,000 tonnes, 19,000 tonnes and 26,000 tonnes, respectively. However, with the exception of South Africa, consumption has been stagnant or falling. A major expenditure of $ 3 million, out of the $ 12 million allocation, should be spent in these markets concentrating on the 13-24 age group and young housewives as well as on promoting iced tea drings for summer use. A large portion of this budget, perhaps up to $ 500,000 per year, would have to be spent on improving the convenience of tea brewing and

the share of tea in automatic vending outlets.

(2) The second major effort should be spent in the United States market where tea consumption has climbed from a 1961-1963 average of 54,000 tonnes to over 70,000 tonnes in 1970-1972. To make an impact in the United States market, an allocation of at least $ 3 million would be required with a concentration on iced tea drinks for summer use and luxury quality teas, which are particularly produced in India.

(3) The third major market would be Europe — Germany and Scandinavia. But the coffee habit is strongly engrained here and total consumption is still very small, at 15,000 tonnes in 1971, though strongly up from 10,000 tonnes in 1961. The allocation should be limited to $ 1.5 million and spent largely in Sweden and Germany.

(4) The next major market is critically important. The oil States of North Africa and West Asia, excluding Afghanistan which is a traditional market, will continue to grow in importance. Saudi Arabia and the Gulf (20,000 tonnes +), Iran (7,000-8,000 tonnes), Iraq (20,000 tonnes), Syria (2,500 tonnes) have expanded since 1961. In North Africa, Libya now has the highest per capita consumption of tea, at over 4.5 kg (12,000 tonnes). Egypt (30,000 tonnes), Morocco (12,000 tonnes), Sudan (15,000 tonnes) and Tunisia (4,000 tonnes) are all important consumers, and India is an important supplier only if a bilateral agreement has been signed. The same position is repeated in West Asia. India sells in Egypt, Sudan, Iraq, Tunisia and Jordan; but loses markets to Sri Lanka where there is no bilateral trade that supports prices and offtake. In any case, a joint strategy is needed, costing perhaps $ 2 million, to expand consumption in line with rising oil or oil-based incomes.

(5) Finally, there is the Japanese market. Japan has traditionally been a green tea market, but is gradually shifting to black tea and is importing a larger proportion. Tea production there has remained stationary at 85,000-90,000 tonnes from 1965, while imports have climbed from 3,500 tonnes in 1965 to nearly 19,000 tonnes in 1972 — the tariff has been cut from 35 per cent to 5 per cent; black tea imports have risen from 2,613 tonnes in that year to 7,167 tonnes in 1972. The Japanese market, particularly if domestic production is cut back till 1980, could justify the spending of $ 1.5 million annually to promote branded and packeted teas.

This joint promotional strategy will leave $ 1 million for administration and reserves on an annual basis. This expenditure of $ 12 million *might* well raise the annual offtake in the market by between 1-2 per cent annually, or $ 6-12 million dollars at current prices, and would certainly slow down the erosion of certain saturated markets and build up consumption in the low per capita consumption countries. While promotion cannot by itself guarantee increased market offtake, without promotion demand growth will be slow and prices will be weaker.

Conclusions

This article has stressed the need for an integrated strategy to rebuild India's tea sector. Higher profitability will be required, along with specific measures aimed at encouraging these, to allow major replanting and re-equipment in the plantations. India must work to link the export quotas in the present tea agreements to higher prices and to withdrawal of a part of the India/Sri Lanka production from the auction rooms — but only after the East African producers have agreed to control new plantings and to cutback on production and export. The present agreemeants are unlikely to survive till 1980 if East Africa continues its policy of indiscriminate expansion. Finally, whatever is done to expand domestic production and raise prices internationally, it is absolutely vital that tea is advertised and promoted as effectively as coffee and other drinks are in the key markets. The world market for tea over the next 10 years can provide India with a profitable and growing market for its teas. But India will have to produce and market her primary products much more effectively than in the past.

Notes

[The authors wish to gratefully acknowledge the helpful suggestions made by Keith Griffin and are especially grateful to Deepak Nayyar for making a chapter on tea in his forthcoming book available. The opinions expressed in this article are the authors' own and do not represent the viewpoint of the organisations for which they work.]

Kachchativu Settlement

Befriending Neighbouring Regimes

S D Muni

India's leadership has a clear stake in stabilising and consolidating the existing distribution of power, political patterns and strategies for socio-economic development in the South Asian region. Towards this goal, the Indian leadership is endeavouring to evolve a consensus, together with its counterparts in South Asia, on the issues of peace, security and stability that are vital to itself and also to the neighbouring regimes.

As a natural corollary, India's leadership is keen to strengthen such governments in South Asia which would be amenable to its perception of the subcontinent and willing to work towards the evolution of the desired consensus. The removal of minor irritants like the Kachchativu territorial dispute is part of the movement towards achieving this consensus.

THE recent boundary demarcation agreement between India and Sri Lanka is based on a notional median line drawn through the Palk Strait between the two countries. This median line now marks the boundary between them. It places the disputed Kachchativu island within Sri Lanka's bounds. Under the agreement, details about fishing, navigation and pilgrimage rights of the two sides have been worked out to their satisfaction. The two countries have also agreed to explore and divide whatever mineral wealth is available in the area. Thus India's immediate and long-term interests have been duly safeguarded. Further, the detailed provisions of the agreement will facilitate the finalisation and execution of a very important Indian project in the area — the Sethu Samudram Canal. This project will facilitate the transport by sea of goods between India's east and west coasts.

India's recognition of Sri Lanka's sovereignty over Kachchativu island constitutes the main point of public interest in the agreement. The dispute over the ownership of this island was one of the many unsettled issues handed over to India and Sri Lanka by the British. It was first in 1949 and then in early 1956 that the attention of the two governments was drawn to this unresolved issue. This was in the form of permission sought by India in 1949 and Sri Lanka in 1956 from each other to use the island for air exercises. Since then the issue has figured quite regularly at the various high level meetings between the two countries. In 1968-69 some newspaper reports saying "Ceylon takes over Kachchativu" sparked off serious public controversies in India and Sri Lanka. And in the absence of any settlement, this dispute continued to disturb relations between the two countries. It was in January this year that the basic understanding for settling the dispute was arrived at between the Prime Ministers of India and Sri Lanka when Sirimavo Bandaranaike paid an official visit to India. The present agreement is based upon that understanding.

The dispute had magnified the importance of Kachchativu which is, in fact, a barren, uninhabited, tiny rock-island. It is situated in the Palk Strait at a distance of 10 and 8 miles from the nearest points of India and Sri Lanka, respectively. Its importance lies in St Anthony's Church where pilgrims from both countries gather every year in March-April for a week-long religious festival. Fishermen from both sides also visit the island occasionally. No mineral wealth is so far known to be located on the island. But, of late, some hopes of oil being found in and around the island have been expressed.

The myth of Kachchativu's strategic importance in the Indian Ocean area was created and played up by the two sides during the period of intense public controversy. The island had been occasionally used by the British since the 1920s as a naval gunnery practice range, but nothing more. The island is hardly vital for that purpose as there are many other islands in the area which could be used by India with greater ease and advantage for gunnery practice.

The Kachhativu settlement, however, has much wider implications. Viewed in the broader South Asian context, the settlement reflects some degree of freshness and initiative in India's diplomacy towards its immediate neighbours. From Independence to the mid-1950s, India's leaders appeared to be fully preoccupied with the self-assumed task of preserving peace, order and stability in the world. India's immediate neighbours were taken almost for granted, perhaps with the exception of Pakistan. India's approach towards the small but vital bilateral issues concerning its neighbours was a sorry tale of indifference, self-righteousness and complacency. In the subsequent period, India's foreign policy was overshadowed by its confrontation with Pakistan and growing antagonism with China.

India's poliitcal and military humiliation at the hands of China in 1962 proved to be a blessing in disguise in several respects. For one, it corrected some of the imbalances in India's approach towards its neighbours, who then onwards received due attention and respect. The change in India's approach became evident in the case of Nepal with the withdrawal of moral support to the Nepali Congress and the recognition of King Mahendra's Panchayat System immediately after the outbreak of the armed conflict with China in 1962. In the case of Sri Lanka, the spirit of understanding and accommodation led to the conclusion of an agreement in October 1964 on the problem of stateless persons. Several other examples may be cited in support of this contention.

Notwithstanding this change, India remained rigid, stingy and irritatingly legalistic regarding its territorial disputes with its neighbours. It appears that the loss of territory to China had something to do with this aspect of India's behaviour. However, as a result of this behaviour, the disputes concerning the Susta area with Nepal and Kachchativu island with Sri Lanka were allowed to drift and become complicated. This gave rise to major public controversies on these minor territorial disputes which in turn vitiated the whole gamut of India's relations with these two neighbours. Some official circles in the neighbouring countries (in Nepal and Sri Lanka particularly) viewed India's rigid and legal stand as a conscious and calculated posture aimed at browbeating them in order to wrest other concessions as a price for settling these disputes. This may partly be true. But, by and large, this ap-

proach reflected India's lack of self-confidence and diplomatic maturity — partly an outcome of the 1962 debacle. On the other hand, India's neighbours, being conscious of India's loss of credibility as a stabilising force in South Asia after 1962 and its internal weaknesses, were also asserting themselves. It was not just a coincidence that the Susta and Kachchativu issues reached the peak of public controversy in 1968 and 1969, respectively, at a time when India's economy and politics were particularly chaotic.

India Regains Confidence

The emergence of Bangladesh in 1971 was a watermark in the history and politics of the subcontinent. Besides other things, this development helped India a great deal in regaining its lost prestige, self-confidence and diplomatic initiative. It also restored its credibility as a source of decisive influence in South Asia. The Indian leadership at present seems to be fully conscious of this. It has a clear stake in stabilising and consolidating the *existing* distribution of power, political patterns and strategies for socio-economic development in the region. Towards this goal, the Indian leadership is endeavouring to evolve a consensus, together with its counterparts in South Asia, on the issues of peace, security and stability that are vital to itself and also to the neighbouring regimes. As a natural corollary, India's leadership is keen to strengthen such governments in South Asia which would be amenable to its perception of the subcontinent and willing to work towards the evolution of the desired consensus.

India's denunciation of the concept of balance of power in the subcontinent; its emphasis on democracy, secularism and socialism in intra-subcontinental relations; its nuclear blast followed by its assertion that it will use nuclear energy only for peaceful purposes and its expression of willingness to share nuclear technology with its neighbours; its moral and material support to the present governments in Bangladesh, Sri Lanka, Nepal and even in Pakistan; its keen and close watch on the 'international ambitions' of Bhutan; its determined attempts to restructure political forces in Sikkim — all these are moves in the direction of trying to achieve the desired consensus in South Asia.

The removal of minor irritants, including territorial disputes, and the improvement of relations with its neighbours occupy a crucial place in the above mentioned larger frame of India's present diplomatic strategy in the subcontinent. The Indo-Sri Lanka agreement on boundary demarcation constitutes an important achievement in this context. This trend had already been set in May 1974 when India finalised the border pact with Bangladesh. It appears certain that India's gesture of accommodation and understanding reflected in its agreements with Sri Lanka and Bangladesh is already at work in relation to Nepal. It is reliably known that Indira Gandhi informally assured King Birendra during his visit to India last October that India was willing to concede that the Susta area belonged to Nepal. A formal agreement between the two countries to that effect may thus be in the offing.

Variance over Indian Ocean

With Sri Lanka, India needs a very close understanding on the questions of peace and security in the Indian Ocean — an area which is increasingly becoming a focus of tension and rivalry between the super powers. On this question, the views of India and Sri Lanka are at variance on two important points. First, Sri Lanka's declared objective is to see that the Indian Ocean becomes a "nuclear free peace zone". India on the other hand has talked only about a "peace zone" in the Indian Ocean. The difference over the nuclear aspect of the peace zone in the stands of India and Sri Lanka has become all the more significant since May 18, when India exploded its first nuclear device.

The second point relates to the presence of non-Indian Ocean powers in the Indian Ocean. Soon after Independence, India and Sri Lanka were neither capable nor willing to undertake the defence of the Indian Ocean on their own. Therefore, they agreed to a continued British presence which was considered 'friendly' by both India and Sri Lanka. There is much evidence in support of tacit but clear Indian connivance in the continuation of the British naval and air bases in Sri Lanka at that time.

Today also, India and Sri Lanka are incapable of guarding the Indian Ocean by themselves and will continue to remain so for a very long time. Therefore, they will have to depend upon some 'friendly power' to assert its influence in the region. However, unlike in the late 1940s, the two countries now differ on the power which should be considered friendly. Sri Lanka is quite averse to the Soviet presence which India, at least at the moment, does not consider unfriendly. Global and regional equations are of course always open to realignment but there would be serious implications for peace and security in the Indian Ocean if India and Sri Lanka were to work at cross-purposes.

Variations in the viewpoints of India and Sri Lanka on the Indian Ocean situation have to be sorted out mutually and amicably for the sake of the needed consensus on matters pertaining to the subcontinent. The recent Indo-Sri Lanka agreement which clearly defines the fishing and navigation rights of the two countries in the Palk Strait and the Gulf of Mannar is a concrete step in the direction of achieving a basic understanding between the two countries. The fact that while this agreement was being given its final touches Sri Lanka accepted India's stand of using its newly acquired nuclear capability only for peaceful purposes, needs to be underlined in this context. Not only this, Sri Lanka, in its capacity as chairman of a 15-member *ad hoc* UN Committee on the Indian Ocean, disallowed Pakistan on June 7 from using that forum to attack India over the nuclear blast. Further, since the announcement of the boundary agreement comes on the eve of Sirimavo Bandaranaike's visit to Pakistan, it is likely to thwart any possible Pakistani attempts to play upon India's alleged "highhandedness" and "hegemonistic tendencies" in its dealings with its smaller neighbours.

Boosting Sirimavo

In Sri Lanka's domestic context, the Kachchativu settlement may go a long way in boosting the sagging morale of the Bandaranaike government. The popularity and credibility of the government are under strong economic and political strain. Economically, like most of its South Asian neighbours, Sri Lanka is confronted with an unprecedented crisis. Inflation is reaching dangerous proportions. The prices of essential commodities are skyrocketing. The import bill is growing fast in contrast with declining export earnings from tea and rubber. The unemployment rate is increasing every day. Production on all fronts has fallen down. The gap between rich and poor is widening. The food situation till recently was precarious, though now there are signs of marginal improvement. The discontent resulting from these economic pressures has been so widespread and intense that the government had to take stringent measures and deploy troops to deal

with the threatened opposition-led civil disobedience movement on April 21.

Politically, the ruling united front of the Communist Party (CP), Lanka Sama Samaj Party (LSSP) and the Sri Lanka Freedom Party (SLFP) is in great disarray. Along with the dissensions in the united front, each one of its constituent parties is ridden with deep internal divisions. Even Sirimavo Bandaranaike's SLFP is heading towards an open 'left-right' division. The entry of Sirimavo Bandaranaike's daughter and son-in-law, Sunethra and Kumara Rupasinghe, into the thick of Sri Lanka's politics in 1972 initiated and activised such a division in the SLEP. They are alleged to have mobilised the 'left' and the 'young' within the party under their leadership. Furthermore, early this year, the opposition, led by the United National Party chief, J R Jayewardena, warned the nation through a calling attention motion in parliament, that a military coup was in the offing. He alleged that the aim of the coup was to demolish Sri Lanka's democratic structure and establish a dictatorship under Sirimavo Bandaranaike's nominal leadership. Indirect accusations were made about Sunethra and Kumara Rupasinghe being the authors of the coup plan. It is not without significance that some of the 'rightist' SLFP MPs quietly sympathised with the opposition's attack on the government in general and Sirimavo Bandaranaike in particular.

The acceptance of Sri Lanka's sovereignty over Kachchativu island by India after a dispute lasting nearly two decades will be seen in Sri Lanka as a significant achievement of Sirimavo Bandaranaike's foreign policy as she also holds the Defence and Foreign Affairs portfolios. Thus the agreement is being publicised in Sri Lanka as a personal triumph for Sirimavo Bandaranaike. This is being done to enhance both the credibility of the government in the country and the personal image of Sirimavo Bandaranaike among the factions of the ruling united front and the SLFP.

The agreement has also blunted the edges of anti-Indian propaganda indulged in by a section of chauvinist Sinhalese elements. As against these elements it has slightly strengthened the Federal Party and the Tamil Congress which are sympathetically disposed towards India. The Federal Party veteran, Chelvanayakam, was rather quick to underline this aspect in his recent statement on the agreement. Indira Gandhi and her associates in India would naturally have assessed all these implications of the agreement for Sri Lanka's domestic politics. The week-long relatively unpublicised visit of Sunethra and Kumara Rupasinghe to India and their extensive quiet talks with Indira Gandhi immediately after the conclusion of the agreement confirm that the agreement has already helped to cement relations further between the governments of Indira Gandhi and Sirimavo Bandaranaike.

FROM THE CHAIR

Tata Engineering and Locomotive Co Ltd

Statement of the Chairman, Mr S Moolgaokar

THE following is the Statement of Mr S Moolgaokar, Chairman, the Tata Engineering and Locomotive Company Limited, for 1973-74:

The financial year ending March 1974 was a year with an abundant share of problems for the Automobile Industry. In challenging conditions, your Company produced 780 vehicles more than in the previous year, maintained its profitability, and vigorously forged ahead with its expansion plans.

Operating Problems

2 The challenges arose out of a host of problems faced by the Company during the period under review. Most of these stemmed from weaknesses in the country's economic infrastructure. Every industry was confronted with shortages of power and materials, the impact of the oil crisis, transport dislocations, mounting inflation and the credit squeeze. Industries like ours, which obtain their inputs from various industries, had to bear the cumulative effect of all this.

3 Power shortage was a major problem which interfered with our production and disrupted the flow of materials from suppliers. Shortages of alloy, carbon and spring steels, tyres, wheel rims, clutch and brake parts, bimetal bearings, shock absorbers, pistons and many other items threatened to bring the assembly line to a standstill on more than one occasion.

4 Disruptions elsewhere in the world also affected our operations. For example, when the UK went on a three-day week, the availability of special rolled steel sections required by the indigenous wheel rim suppliers was so drastically reduced that we had to roll out almost half the production during the past four months with only four wheels per vehicle. Many of our ancillary suppliers faced stock-outs of imported materials and parts when the oil shortage adversely affected the availability of shipping facilities.

5 During the year, prices of all commodities soared, and we were forced to accept substantial price increases by most suppliers. The availability of working capital was restricted following the credit squeeze suddenly imposed by the banks, and this necessitated a major exercise in financial re-planning. To make matters worse, our own prices could not be increased to compensate for rising costs, and we had to work literally in a strait-jacket.

The Challenge

6 But problems constitute a challenge — to be overcome by action, not to be explained away. Considering the difficulties which the Company had to face in the past year, the performance was satisfactory. I would venture to say that this was made possible largely by our efforts at developing in Telco a team that never looks for excuses — a team capable of meeting every situation dynamically, a team at all times capable of directing its energy to solving problems. It is our belief that such a team is essential if an organisation is to grow within the constraints of a developing economy.

7 Your Management has confronted the challenge of growth in a developing economy by building up the Company's infrastructure, particularly in areas where facilities have been inadequate within the country. Through the Training Divisions set up at Jamshedpur and Poona, the Company has assured itself of an ever growing reservoir

of high-grade technical skills, so necessary for the manufacture of a quality product. Enormous efforts and large sums have been invested to achieve self-reliance in the design and manufacture of the Company's products. In the Automobile Industry, Telco is by for the biggest investor in research and development, and the expertise that we have now built up provides us with the capability to design sophisticated engineering products which is enabling us to undertake our current major expansion entirely on our own. Each year, our Research and Development Sections help us to make vehicles of better quality — vehicles that perform better, take longer to depreciate, and give our customers higher re-sale value. These qualitative improvements above all help us to sustain our position in the export markets. Today, we are the largest exporters of commercial vehicles in the country: during the year under review, we exported 86 per cent of the country's total vehicle exports.

8 In a major attempt at import substitution, we have painstakingly fostered the varied design skills required for the production of complicated press tools and special purpose machines. Progressively more and more of our requirements for sophisticated special purpose machines, intricate press tools, metal patterns, dies and fixtures will be met from within the Company. Early next year, we shall be introducing a new semi-forward truck model which we have already tooled up fully at Poona. This model will have a number of important advantages over our present model: a more durable engine and gear box, additional loading space, more comfort and better visibility for the driver.

Price Control

9 You will appreciate that it would not be possible for any company to direct its managerial and financial resources towards such pioneering activities unless its financial strength is sustained. Recent decisions of Government affecting pricing can have a direct bearing on the Company's performance and rate of growth, and I would like to dwell on this subject at some length.

10 In April 1973, government controlled our selling prices, and the Company had perforce to work under severe constraints throughout the past year. I have already mentioned how we were sandwiched between production interruptions due to power and other shortages on the hand and increasing costs due to soaring prices on the other. We furnished exhaustive facts and figures to government to justify a price increase, a decision on which was deferred pending completion of a detailed investigation into our cost structure. After a prolonged study by the Bureau of Industrial Costs and Prices and the Ministry of Heavy Industry lasting over a year, government came to the conclusion that our prices had been fair and reasonable, and that our request for a price increase was fully justified. While permitting a 7½ per cent increase in vehicle prices as from the 15th of May 1974, government stipulated, however, that future increases more than once a year or exceeding 7½ per cent of the existing price would require their prior approval. In an inflationary economy like ours, such controls can have disastrous effects and, naturally, we are disappointed that these constraints on pricing have been imposed.

11 Last year, the improvement in our profitability, despite the price control, was due to the increase in production and the reduction in interest charges brought about by better financial and materials management. While we are constantly striving towards higher productivity, it will not be possible for us to continue to absorb the inexorable cost increases taking place.

12 Our contention has consistently been that industry must have the freedom to determine its own prices. Freedom is not licence, and therefore we agreed to limit our return on capital employed through self-discipline. We also agreed that pricing could be based on 90 per cent plant utilisation — in itself an ambitious target in today's conditions, with shortages of power and raw materials aggravated by factors such as inadequate railway facilities and unrest in different parts of the country. Even without these handicaps, efficient foreign manufacturers find it difficult to operate their plants at this level! The guidelines for pricing suggested by us would have offered the vehicle manufacturers a worthwhile managerial challenge to secure maximum productivity, reduction in cost and some plough back of earnings for sustaining research activities and maintaining the health of ageing plant; at the same time, the customer would be assured of a fair deal. As manufacturers of commercial vehicles, we are at the end of a chain; it is finally our product that must bear the full impact of all preceding increases in the costs of raw materials and ancillary parts. When prices of all our inputs are increasing at a much higher rate, there can hardly be a case for imposition of an arbitrary limit of 7½ per cent on our annual price increases. There is no restriction whatsoever on the prices of goods we have to purchase from outside sources, whether they be raw materials from public sector steel plants or components from ancillary suppliers. Unless these factors, totally beyond our control, are checked at a national level, it is hardly fair to control the prices of our vehicles.

13 The ravages of inflation provide joy to none of us and we all yearn for the time when greater stability will be introduced in our economy. No price increase that we make can benefit us under today's conditions; we are not even recovering fully the cost increases over which we can have no control whatsoever. As an example, since April 1973, the price of our representative model has gone up by Rs 10,958. Out of this, Rs 4,299 covers increases in the cost of raw materials and ancillary components, Rs 1,894 covers increase in the price of tyres (since the decontrol of tyres, the price increase on this account alone has been as high as 40 per cent), Rs 3,548 is accounted for by increase in excise duty, and Rs 1,217 represents increase in sales tax. Telco did not benefit by a single rupee; on the contrary, we are left with the problem of absorbing labour and other cost increases which confront us continuously.

14 The rapid growth of the Automobile Division of the Company, despite the poor industrial and ancillary base that existed at the time of its inception twenty years ago, has benefited not only the Company but the country as a whole. It has led to the development of a network of ancillaries, substantial direct and indirect employment, large contributions to the Exchequer and export earnings of a high order. Above all, it has helped to meet the acute need in our country for quality commercial vehicles. I do feel that the fairest treatment to accord to this important and complex industry is to adopt the guideline that there should be a fair and equitable return on capital employed, linked to high capacity utilisation. Our record on price discipline surely merits this limited freedom of action. It is essential that the stipulation that our price increases cannot be made more than once a year and cannot exceed 7½ per cent, without government's prior approval, be removed. Otherwise, our profitability is bound to decline as costs are escalating at

far greater rates. Government have been quite pragmatic while dealing with our industry in the past; this has helped the industry to progress and grow. In view of the vital role the industry plays in national development, I am hopeful that government will reconsider their decision in this important matter.

Plan Targets

15 The importance of our industry has been appreciated by the Draft Fifth Five Year Plan which views the rapid development of road transport as an essential component of the "Minimum Needs Programme" to be implemented during the Plan Period. The schemes of development of the backward and under-developed regions, and indeed of increased agricultural production, can have no meaning till road transport is developed as an infrastructural facility. We welcome the proposal that allocations to road transport, in money terms, will be 2½ times higher than in the Fourth Plan.

16 The Plan also visualises that the annual production by 1978-79 will be 110,000 commercial vehicles — the industry is expected to more than double its present output. However, with ad hoc decisions such as the 7½ per cent per annum constraint on pricing in a hyper-inflationary situation, there is no hope of this target being achieved. Such arbitrary decisions, by depriving the industry of the minimum resources it needs, will impair its ability to grow even marginally, let alone reach the target of 110,000. The resultant loss to the nation will be staggering, while the cost of accepting the industry's plea for freedom with self-discipline through a ceiling on the return on capital employed is negligible. Unless government stop taking decisions contradictory to the long-term goals sought to be reached, national planning will only be an empty exercise.

Expansion

17 Our own major expansion, which is a source of excitement to all of us, is proceeding according to schedule. The new fully automated foundry at Poona is expected to be ready early next year. Construction work at our Poona Complex is in full swing and a major portion of our requirements of indigenous and imported machine tools have been ordered. Precautions have been taken to ensure adequate capacity for the production of spare parts which at the moment are in extremely short supply. Prototypes of the various aggregates and the new vehicles to be produced at Poona will be ready for evaluation trials early next year.

18 You will be anxious to know whether the oil shortage is likely to affect the demand for our products and whether it has any implications on our expansion. Our own projections clearly reveal that increasing dependence on road transport for the movement of goods and passenger traffic is inescapable in our country. It needs to be more widely known that even when our Railways are functioning normally, over 40 per cent of the goods traffic and over 50 per cent of the passenger traffic moves by road. Trucks are essential for the economic growth of our country, and for Defence. Government have therefore ensured maximum production of middle distillates like high speed diesel required in the operation of commercial vehicles and the price of diesel has been kept as low as possible. The demand for our vehicles continues unabated and there are waiting-lists of thousands of customers. The ever increasing demand for our vehicles can only be met by completing our expansion programme as rapidly as possible and at the same time maintaining our existing capacity in good health.

Energy Crisis

19 As commercial vehicles account for about 75 per cent of the consumption of high speed diesel in the country, your Company has always considered it a duty, as a corporate citizen, to ensure optimum utilisation of this scarce and valuable commodity. As you know, a direct injection engine which provides upto 15 per cent reduction in fuel consumption was introduced on our vehicles about two years ago. There are now on the road 40,000 Tata vehicles powered by this engine and more are being added every month. We estimate that these 40,000 vehicles have brought about lower diesel consumption of the order of 100,000 kilolitres each year. Intensive efforts continue at our Engineering Research Centre to improve further the fuel consumption of this engine.

20 In view of the oil crisis, a campaign was launched in April 1974 to provide free service check-ups to Tata vehicles all over the country. Apart from checking all defects, tuning the engine and even arranging with MICO, our suppliers, to re-calibrate the fuel injection equipment, if necessary, we manifested to each operator how adherence to the stipulated maintenance instructions and correct driving ensures 5 per cent fuel savings and longer vehicle life. As our customers' response has been most satisfying, we intend to repeat the campaign periodically.

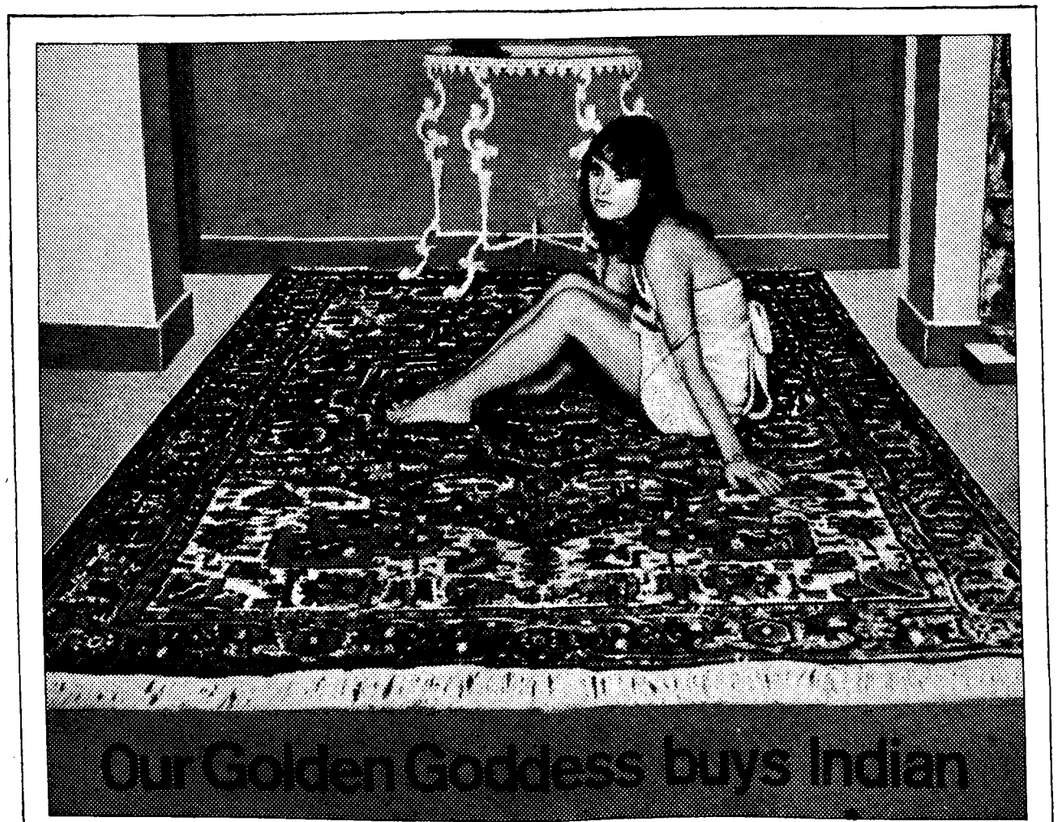
The Future

21 Despite all the vicissitudes of the past year and gloomy projections made by many for the future, we are determined to maintain our progress, to implement our expansion in good time, and to continue to find avenues of growth. Given the limited freedom of action for which I have pleaded earlier, and with some improvement in the country's infrastructure, our contribution to the nation could be much greater. Your Company has a well-defined growth plan and a strong organisation capable of implementing it aggressively.

22 Whilst 1973-74 was a difficult year, the dedicated work of our loyal employees, the co-operation of our dealers, the understanding of our suppliers, and the confidence of our customers as well as shareholders were continuing sources of inspiration to Management. It is a very real pleasure for me to take this annual opportunity of saying *Thank You* to all those who with their ideas, energy and hard work have overcome difficulties and obstacles to contribute to the year's results.

Chairman

Bombay, 28th June 1974.



Note : This does not purport to be a record of the proceedings of the annual general meeting.

Anglo French Textiles

ANGLO FRENCH Textiles has undertaken a programme of installation of additional 12,400 spindles and 72 heavy duty looms at a cost of about Rs 401 lakhs. Construction of the new factory buildings is in progress and about 6,000 spindles are expected to go into production before the end of 1974. Apart from this programme, the company also intends to take up replacement of a sizeable part of the old machinery. Bearing in mind the need for cash resources for programmes of expansion and rehabilitation, the board has recommended only maintenance of a 15 per cent distribution, although the 1973 results were the best achieved so far in the company's entire career with higher production, sales and profitability. Commenting on the current year's prospects, T S Krishna, chairman, points out that cost of manufacture has gone up owing to unrelenting inflation. Moreover, labour relations have deteriorated since the beginning of the new year owing to 'inter-union rivalry'.

She is our Golden Goddess because she buys our Indian handmade carpets —worth millions in dollars, pounds and marks each year.

According to legend, carpet weaving was introduced in the district of Mirzapur by Persians in Emperor Akbar's time. Ancient skills have since passed from father to son...our artisans once more are pleasing customers in many lands while earning foreign exchange for the nation.

This is a Heris carpet made in Badhoi, U.P., and known for its warm, glowing colours. Last year Dodsal, India's leading exporter of handicrafts, sold Indian carpets worth Rs. 94 lakhs. Dodsal's world-wide export network is proud to be serving the craftsmen of India to successfully enter the most sophisticated markets of the world.

Mr. Ali Ahmed Khan
leading manufacturer.
whose carpets we export.

Method in Its Madness

THE Planning Commission wants no part of the onus for creating a 'revolutionary situation'. The country's economic prospects being what they are, children sent to school would, at the end of their schooling, find no jobs; as a consequence, they might be up to all kinds of mischief, including, for all one can surmise, the creation of 'revolutionary situations'. The Commission as a responsible body, must put its foot down against schemes and proposals which have such dangerous possibilities. It is not given to it to plan and implement the generation of additional employment opportunities; it can, however, certainly recommend drastic reduction in the financial outlay for school-level education, so that the problem of the unemployed educated turning revolutionaries can be nipped in the bud.

The Planning Commission has applied itself to this task with great zest. The Approach to the Fifth Plan had talked of 75 per cent enrolment in the age-group of 11 to 14 during the Plan. The draft Plan pruned this target to 47 per cent. But as awareness about the functional relationship between education with no jobs at the end of it and germination of revolutionary situations has further sunk in, the target has been even more severely slashed: in the age-group of 11-14, only 31 per cent, it has now been decided, need be enrolled in schools during the Fifth Plan — in case there is to be such a thing. This need not be the end of the narration: wait for the subsequent bulletins and it is possible that some more cuts are in the offing.

The story is repeated in regard to primary education. The Approach paper had set a breathtaking target of 100 per cent enrolment in the age-group of 6 to 11. The Draft Plan scaled it down to 97 per cent. The target has now been further reduced to 90 per cent. Going by the drift of things, very soon one might expect a tacit admission that no expansion of primary education beyond what obtains at present is feasible in the Fifth Plan!

Even as it is, official claims about the realisation of targets under the various educational programmes are marked by wide exaggerations. The statement that enrolment in primary schools is currently about 82 per cent of all children in the age-group of 6 to 11 may be quoted as an example. It is rarely ever mentioned that the percentage cited is a gross figure, that it does not take into account the dropouts — which, in many regions, are as much as 50 per cent or more —, and that it is often subject to manipulation by parties and agencies interested in exercising control over disbursements of official funds earmarked for elementary education. A relatively high target might still convey the government's keenness to intensify its educational efforts. Viewed in this light, the hasty scaling down of targets for enrolment in primary and secondary schools can only signify the lukewarmness of official attitudes towards large-scale basic education among the masses.

At the same time, the educational plans for the elite have been left undisturbed. Despite 'financial exigencies', the Planning Commission has left the target of enrolment at the college and professional levels at what it was in the draft Plan. Universities and colleges are excellent pork barrels for politicians; these, therefore, will be permitted to be opened galore. The children of the privileged demand sophisticated education. What they demand they will get during the Fifth Plan — may be a few more institutes of management, a few more courses on public relations, and such like. In the draft Plan, Rs 500 crores have been allocated for university and technical education. Reportedly, not one crore out of this is proposed to be cut. What will be guillotined is the allocation of Rs 743 crores for primary education, the allocation of Rs 113 crores for the ancillary programme of school feeding, and the allocation of Rs 241 crores for secondary education.

A residual issue remains. Perhaps there is a method in this Planning Commission madness. The children of the poor millions, once they attain maturity, are in any event bound to discover that, with the country's social and economic progress at a dead halt, the prospect of joblessness and meagre earnings continues to stare them in the face. They might begin to think on their own, read on their own, and appreciate the relevance of class analysis for explaining the nature of the crisis confronting the nation. This must seem a most perilous thing, affecting the stability of the system, to those handful who receive the special bounties of it. On the other hand, if the overwhelming majority of the children of the nation's poor are denied all education, while they would still remain discontented, it could be easier to channel their discontent along 'desirable' lines: the wrath of the uneducated unemployed, for instance, could be mobilised not against the system and those few who enormously profit from it, but against the organised working

class. The Planning Commission, one almost begins to suspect, knows what is what; it has a charter to create *lumpen* elements in society, and it is going about the job with considerable gusto and acumen.

Cyprus

Towards Division ?

NIXON is bound to use one of his choice expletives when he hears of Turkish paratroopers tumbling out of the skies over Nicosia and Turkish marines storming ashore at Kyrenia. Brezhnev and his cohorts are likely to receive the news with quiet joy. This is the first time since the formation of NATO in March 1949 that the soldiers of NATO partners are fighting each other. The entire south-eastern flank of NATO has been disrupted and Washington's recently built-up prestige in West Asia, especially in Syria, is likely to be somewhat diminished on seeing that the Americans are unable to prevent a key Atlantic Treaty partner from taking unilateral action against the expansionist activities of another.

Clearly, this time, the US State Department has muffed it. Even while Joseph Sisco, the US Under-Secretary of State, was trying to pacify the Turkish Prime Minister, Bulent Ecevit, Turkish warships were approaching Cyprus. Ecevit had asked for firm assurances from the United States for the withdrawal from Cyprus of the Greek officers who had led last Monday's bloody coup against Makarios, for the protection of the Turkish minority in Cyprus and for the restoration of the Makarios government. The Americans baulked at giving these assurances, particularly that of restoring Makarios to power. They had been quite happy to see him overthrown as he was the only 'non-aligned' leader in that particular area. They seem to have overestimated their influence in Turkey and misjudged the susceptibilities of the relatively new civilian government in Ankara which could not afford to be seen acquiescing weakly in the *de-facto* takeover of Cyprus by the Greek military regime. Any show of weakness on its part would not only have angered its civilian supporters but also provided an excuse for the Turkish armed forces to interfere once again in the running of the country. Not that there had been no warning signs for the Americans. On July 1, the Turkish government lifted its American-backed ban on the cultivation of the opium poppy which had been the main source of illegal heroin for the US narcotics market. The ban was lifted, despite strong American protests, to placate the large rural electorate of eastern Turkey which was losing sizeable cash inflows due to the ban. And despite last month's Greek protest the Turkish government had gone ahead in exploring prospective oil-bearing sites on the disputed continental shelf of the Aegean Sea.

It was most impolitic of the State Department to have made Sisco concentrate on Ankara rather than on Athens where General Phaedon Gizikis and his junta are very dependent on direct US monetary assistance and on diplomatic backing in the councils of NATO where Washington has for some time been the junta's sole supporter. The regime is also totally unpopular within Greece and retains power only through physical coercion. Such a regime cannot allow itself to retreat on the battlefield. It is therefore most likely to hit back at the Turks at the narrow land frontier on the European side of the Bosphorus Strait since it can do little to counter the full-scale Turkish invasion of Cyprus which is only 50 miles from Turkish coast but 500 miles from the Greek mainland. The Greek forces could initially gain some ground in European Turkey but even a few days prolongation of the fighting would lead to serious military reverses for them. The Turkish forces are about four times the size of the Greek forces and better trained. The equipment of both sides is generally the same — supplied by the Americans. But before there are further military developments, the Americans will now — belatedly — be doing their best to arrange a cease-fire or failing that, will try to confine the fighting to Cyprus. If there is a cease-fire fairly soon it will probably lead to the partition of Cyprus between the Greeks and the Turks which is what Ankara had wanted years ago and would be quite happy with even today. In this new situation Makarios will have little standing because even if he returns to Cyprus he will be regarded as a Turkish stooge whatever the origins of this ouster may have been. The only certainty is that the Greek military regime has dug its own grave by precipitating events which it cannot possibly control.

Meanwhile, America's Europen allies will be exerting strong pressures on Washington to dilute its support for the regime in Athens. But whatever the effect of these pressures on Washington, there is going to be another flaming row between the Americans and its major European allies on the former's mishandling of the Turks and the Greeks. The bickering within NATO during and after last year's October War had estranged relations across the Atlantic. This time the estrangement might be much more serious. In these circumstances the Russians need do nothing more than chuckle to themselves and make some deliberately pointless noises in the Security Council.

West Bengal

Sick Politics, Sick Justice

THERE is an apocrypha concerning the tabulator for a Calcutta University examination. The tabulator's nephew was a candidate at the examination. According to the University's rules, a candidate may sit at a supplementary — 'compartmental' — examination, if he or she fails in two subjects while obtaining pass marks on the whole. The nephew did not secure the minimum pass marks; the tabulator took care of *that* detail. A further problem arose however: the nephew must be shown to have failed in not more than *two* subjects, whereas he had actually failed in three — mathematics, history, and geography. The tabulator, confronted by the challenge rose to the occasion. His bright nephew, the tabulator surmised, would never be able to pass in mathematics. The thing to do, therefore, was to ensure that he sat for the 'compartmental' examination in only history and geography, and so to manipulate the tabulations that he could be shown to have already passed in mathematics. This was done, after due consultations with the nephew.

A surreal story? But the goings-on in West Bengal over the constitution of Justice Wanchoo's Commission for enquiring into the alleged corruption indulged in by ministers suggest an almost parallel script. Out of the 130 complaints against the ministers originally submitted to him, the learned justice, after some sifting, recommended that 10 deserved to be probed more thoroughly. At this stage, the West Bengal Cabinet got into the act. The Cabinet — or at least some of the Cabinet members — decided that five out of these 10 allegations lodged against important ministers were altogether frivolous, and must not be taken up by the Wanchoo Commission. The Chief Minister has concurred, and the Commission's terms of reference have been modulated accordingly. A unique innovation has thus been introduced in the field of jurisprudence. The accused on their own have determined whether any *prima facie* case exists against them: they have decided that no such

case exists and have vetoed the recommendations of the former Chief Justice of the country who has thus been instructed to enquire into only the residual allegations against the residual ministers. Since the latter wield little political clout, the leaders of the various factions of the state Congress are no longer unduly perturbed. If, for brightening up the 'image' of the party, some ministers have to be found to be corrupt, or at least have to stand investigation, let the relatively unimportant be offered as sacrificial goats. The big ones must, of course, go scot-free; the judge must not dare investigate their conduct, howsoever serious the allegations.

That such low-order comedy can be staged for days on end without raising widespread ire, underscores the malaise in the country's polity. I-the-accused, I-the-jury, I-the-judge, is the general theme. Prices soar, economic administration deteriorates every day, corruption and thuggery proliferate. No sense of outrage rents the air. The masses are in general tired and listless. The opposition parties are in disarray. Ministers operate in the manner of the liberal leaders of the 1920s, *via* asinine statements to the Press and closed-door parleys in upstairs rooms.

In this climate, ministers who are literally in the dock can find it possible to decide what charges are to be even permitted against them and what charges are to be thrown out. Amorality has coalesced with a certain lack of shame and politicians stop at nothing. But what about the former Chief Justice of India? Must he put up with this charade? Justice Wanchoo had recommended that 10 specific allegations should be investigated by his Commission. He has been overruled by the very ministers whom he is supposed to investigate. A judge, with the much vaunted regard for the sanctity of the judicial processes, should have refused to be party to any of this. Justice Wanchoo has not done so.

Food Supplies

A Ruse, Not a Policy

A Correspondent writes :

AS kharif sowings gradually get into swing, the predictable pressures are once more on for raising the support prices for these crops. A particular technique would seem to have been refined over the past few years by the pressure groups involved. On the eve of the kharif sowings they hustle government into raising the support prices. Since such support prices are at the time of sowings of little practical significance, the substantive effect is simply to create a psychological climate for higher and higher prices. This climate is useful as the crop ripens and is ready for harvesting. A searing campaign is then launched, ponderously pointing out that support prices, howsoever high, are of no help for procurement operations: what is relevant is the level of procurement prices, which must approximate to the level of market prices if one wants government purchases to be of a satisfactory order. Though, initially, the rise in support prices is demanded on the implicit ground that these are crucial for production and procurement, as the marketing season approaches, it is the procurement price which is claimed to be the determinant of procurement.

By now, this cycle of repetitive demands for higher support and procurement prices has been stripped of nearly all its economic content. It has been reduced to a process of blackmailing, and one in which the pressure groups discover in the government a complaisant respondent — so much so that even the facade of maintaining a national system of procurement and support-cum-procurement prices has been discarded. Autarkic trends have come to the fore; how much of which grain will be procured and at what level of price is being increasingly left to the whims of the politically influential in each state.

A reversal of the trend could be attempted this year by abandoning the ritual of fixing support prices for the kharif cereals. This act has no direct significance since farmers, traders and consumers know that the prices at which the government would purchase grains would be considerably higher than the support prices that might be fixed. By not fixing support prices at this time of the season, the government would be avoiding the induction of further inflationary forces into the economy.

In fact, in the absence of any coordinated national economic policy, one might even question the efficacy of fixation of prices — whether support or procurement — by the Union Government. At the centralised congregations usually convened by the Union Ministry of Agriculture to settle these prices, the state governments gang up with one another to press successfully for interminable price increases. Thus if the system of national price-fixation is formally given up, the opportunity to apply collective pressure on the Union Government would also diminish. Instead, once the harvesting season arrives, New Delhi could negotiate, on a bilateral basis, procurement prices with the representatives of individual state governments. The important states for purposes of exports of kharif cereals to other states are Punjab, Haryana, and Andhra Pradesh. The other states are by and large deficit in kharif cereals. They are by now fully aware of the precarious position that the Union Government is in for organising the supply of foodgrains as well as the subsidies required in the distribution of the procured grains. The absence of a centralised system might force a number of the deficit states to take on more direct responsibilities: many of the deficit states are, after all, major producers of kharif cereals; they have, within their respective territories, sizeable surplus pockets from where substantial procurement should be possible.

What is being proposed here is not a purposive dismantling of a national policy; such dismantling has already been effected by the Union Government itself. But since pretence of a policy does more harm than good, it may be better to give the policy an open burial. In the present political climate, negotiations for the fixation of prices and procurement targets on a bilateral basis would perhaps be somewhat more effective in keeping prices in order.

Asian Development Bank

Borrowed Sensitivities

JUDGED by the scale of its lending operations, the performance of the Asian Development Bank (ADB) in the last six years, and particularly in the last year, may be considered satisfactory. Loans sanctioned increased from $ 42 mn in 1968 to $ 316 mn in 1972 and to 421 mn in 1973. Special Funds Loans, which are extended on highly concessional terms, increased from $ 22 mn (over one-fifth of all loans) in 1969 to $ 118 mn (over one-fourth of all loans) in 1973. Loans sanctioned by the ADB rose by 33 per cent in 1973 compared to an increase of about 24 per cent in 1972. Loans were made to 16 countries in 1973, with Bangladesh, Burma and Tonga receiving their first loans. By the end of 1973 the ADB had made 171 loans totalling $ 1,376 mn for 150 projects. This may be considered a good record for an institution which started operations less than

seven years ago.

But in assessing the performance of an international development finance institution, financial statistics alone cannot be the guide. The ADB started with some laudable objectives, among them rendering assistance particularly to the less developed and smaller countries of the region. ADB's annual report for 1969 stated that the ADB "will not be guided by an *a priori* emphasis on one or the other sectors of economic activity but by considerations relevant to a rational choice between different investment opportunities". However, during the last six years ADB appears to have developed its own preferences, influenced by traditional development banking concepts.

Most of ADB's funds have been channelled into what may be termed heavy development areas — nearly three-fourths into industry, electric power, transportation and communications. Most of ADB's lending to agriculture has been for mechanisation or irrigation dams. ADB is, surprisingly, rather less concerned than the American-dominated World Bank with the indirect social effects of its lending in these areas. During 1968-72 electric power absorbed 29 per cent of ADB's lending, but the figure came down to 22 per cent in 1973. The share of industry, however, rose from 24.7 per cent during 1968-72 to 25.3 per cent in 1973 and that of transport and communications from 21 per cent during 1968-72 to 30 per cent in 1973. The proportion of ADB's funds channelled to the three sectors, *viz*, power, industry and transport and communications, was higher in 1973 at 77 per cent than during 1968-72 when it was 75 per cent. This seems to reflect a tendency to view economic development purely in terms of formation of physical capital goods, to the neglect of a more overall view of the development process.

The geographical distribution of loans also reflects the conservative approach of the ADB. Over three-fifths of all loans upto the end of 1972 went to the six strongest developing countries of the region, *viz*, Taiwan, Hong Kong, Korea, Singapore, Thailand and Malaysia. This is in sharp contrast to the ADB's charter which states that the ADB would give "special regard to the needs of the smaller and less developed member countries in the region". The ADB, however, tried to correct these trends in 1973 by giving relatively fewer loans to some of these countries. Taiwan and Hong Kong did not receive any loans in 1973 while the share of South Korea was brought down from 21 per cent during 1968-72 to 11 per cent in 1973 and that of Singapore from 9.9 per cent to 2.4 per cent. Malaysia and Thailand however continued to receive favourable treatment in 1973, Malaysia's share in ADB's loans going up from 8.7 per cent during 1968-72 to 13.3 per cent in 1973 and that of Thailand from 7.9 per cent to 11 per cent. Of the cumulative total of ADB's loans upto the end of 1973, these six favoured countries received 53.4 per cent. The South Asian region, comprising Afghanistan, Bangladesh, Pakistan and Sri Lanka, has received relatively less attention from the ADB than it deserves. It has been suggested that the disproportionate attention paid by the ADB to South-East Asia is indicative of the ADB's sensitiveness to the priorities of its two largest developed country members, Japan and the United States.

The President

Convergence of Power

FAKHRUDDIN Ali Ahmed had been Finance Minister of Assam for a number of years, and was continuously involved in the political goings-on in that state. His roots are, however, anywhere but in Assam. To palm him off as the first President to be elected from the eastern region is much too transparent a subterfuge. The eastern region is not so deficient in manpower — not even in manpower of the supernumerary class — as would call for the requisitioning of such a marginal personality as Fakhruddin Ali Ahmed.

The reasons for his choice must be different, and of an altogether bread-and-butter variety. Ahmed has been and is expected to remain, completely loyal to the Prime Minister. In fact, whatever little is known of his attitudes and demeanour, underscores that he would be incapable of organising any initiative of his own on any matter. Considered in this light, his assumption of the office of the President of this Republic will represent a watershed.

It is not, of course, to be held against him that he is a colourless person. But it is to be held against those who, despite knowing that he is colourless and without an independent base of his own, have decided to make him President. For this, he will remain for ever beholden to the Prime Minister. True, Giri too owed his election to the Prime Minister, but, as the episode during the recent railwaymen's strike indicated, he had on occasions the inner strength to cut athwart that particular bond of inhibition. Delving through the record of Fakhruddin Ali Ahmed's long political career, one is unable to discover even the hint of a suggestion that he would dare to strike out on his own. He promises to be a commonplace President all through.

The choice must have been purposive. The Prime Minister must have made up her mind to rub out, once and for all, notions of the existence of dual centres of power within the Government of India. The trend in the country in recent years has been increasingly towards transforming a British-type of parliamentary democracy to a US-kind of presidential democracy, with a gradual convergence of power, however, not in Rashtrapati Bhavan, but in the Prime Minister's secretariat. Fakhruddin Ali Ahmed's elevation as President will help hasten this process.

LETTER TO EDITOR

Rape and Order

WHILE any conscientious person would denounce and condemn unprovoked atrocities if committed by our security forces or police in any part of the country under the cover of maintaining law and order (April 20, 1974, p 614), how much credence should one give to a report on Nagas prepared by a London-based agency and quoted by you, that describes the army in Nagaland as "the Indian Army of Occupation", refers to the jawans as "Indians" (as if the Nagas are not Indians) and to an army post as an "occupation post"! Doesn't the report smack of a hate-India campaign undertaken by certain groups, perhaps with ulterior motives? These elements depict India as a barbarian country perpetrating genocide against an ethnic and religious minority. A pro-Phizo group seems to be active once again in London!

While you have shed tears over the alleged atrocities in Nagaland by the security forces, will you kindly spare one or two tears for those thousands of jawans and administrative officers who have been killed, not by peaceful demonstrators fighting against rising prices or injustices in Nagaland, but by a minority of armed underground Nagas who have risen against India and its unity? In this encounter, if a few of these traitors and their relatives are punished, is it worthwhile to uphold their cause?

RAJANIKANT

Bombay

Calcutta Diary

A M

A TALE of two years. Crop-wise, 1967 was a thoroughly bad year, but the rate of price increase was only half of what it has been in the current year. In 1967, the production of foodgrains in the country was at least 30 million tonnes lower, but procurement was more than twice what it will be this year. In 1967, 14 million tonnes of foodgrains were supplied through the public distribution system, but in 1974, it will be a surprise if even 6 million tonnes get distributed. In 1967, traders and big farmers were still somewhat in awe of the government, but now in 1974, they control it and ordain its policies.

Since it is the traders and big farmers who ordain official policies, the officially organised onslaught against the working class continues. The alibi, of course, is the control of inflation. The central aim in the control of inflation should be the rolling back of prices. But the government will not, dare not, take one direct measure to restrain prices. How could it, for has it not, in the course of the past few months, on its own, raised prices across-the-board for all foodgrains, textiles, coal, steel, cement, paper, kerosene, milk and milk products, vegetable oils, and name whatever other commodity you want to name? Has it not also stripped to the bare bones the public distribution system, thus ensuring that food prices in the market soar and soar?

It now steps in and hands down the further ukase: lower income-groups in the organised sector must draw Rs 450 crores less in wages and allowances in the current year. The bulk of these earnings, which are being frozen, would have been spent on food. Once wage-earners spend less on food, inflation will be over — so seems to be the prescription. Nothing is wrong with the proposition that, if prices of foodgrains could be restrained other prices too would begin to behave. But will a denial of their wages to the workers help lower food prices? What about phenomena on the supply side? Food prices stay high mainly because farmers and traders have ample means to hold back stocks from the market. These means have been created by the government through its budgetary operations (for example, the various so-called crash programmes for agricultural development), through its permissive attitude toward procurement prices, and through its credit and monetary policies whose first preamble is that traders could do no wrong. While high-falutin ordinances are issued, there is hardly any declaration on whether the liberal flow of funds to the farmers and traders is to be cut back. On the other hand, the Rs 450 crores now to be frozen for the salary and wage earners might well be additionally available — in the name of emergency production programmes — to the government's particular friends. And yet, the more you spend on schemes for raising production, the less of output and market availability there is likely to be. This is not a conundrum, but sound economic law, confirmed by what has happened in the country over the past few years: Because restrictive output maximises the profits of surplus farmers and traders, the money pumped out by the government has been used, not to raise output, but to improve the organisational underpinning for speculative operations.

Those who go hungry are fairly desperate people. They are also incapable of grasping the unique dialectics of a set of official measures which, at one end, raises food prices, and, at the other, confiscates from them purchasing power with which food could be bought. They will try hard to obtain the food anyhow. They will sell off their wares, they will hock their property, they will dispose of the family trinkets, they will dismantle whatever assets they possess, for they must have food. Since the authorities have abdicated the responsibility to supply food through the public distribution system, they will buy the food from the market and at stiff prices. Thus, if the inflationary impulse in the economy had originated in the foodgrains sector, it will continue to be there — the pretensions of the ordinances notwithstanding. The latter will merely have denuded the poorer sections of the community of some more of their meagre resources.

Come, come, it might be said, this government could not be as blatantly class-biased as is being made out, has it not frozen dividends too to the extent of around Rs 50 crores? granted; but should one not also note how justice is scaled? Rs 450 crores to be lifted from the pockets of the relatively poor, only Rs 50 crores from the pockets of the affluent. There is, besides, that other asymmetry: while the amount drawn away from the wage-earners will not immediately find its way back to the market, the dividends held back will still be spent, and *in the current period* — ostensibly these are supposed to be ploughed back for 'productive' purposes. The big fellows might, in fact, welcome the arrangement: to the extent dividends are reduced, at the tax-brackets to which they belong, the burden of the wealth and income taxes will be substantially less. Moreover, some funds — which would otherwise have gone out to shareholders in the middle income groups — will now be available to the companies to be spent in whatever manner they think best. Your guess is as good as mine, much of these funds could be spent, directly or otherwise, to stash away extra raw materials and foodgrains, and thus raise their prices even further. The government may dole out assurances that this will not be allowed to happen: such assurances go the way of all flesh. Additional liquidity is additional liquidity, and it will continue to be spent on speculation and not on production so long as speculation gives a higher rate of return.

In this particular matter, the authorities have really wrapped themselves up in knots. In case these Rs 50 crores worth of dividends were distributed, they would get expended on consumption and not serve any productive purpose. It is the same government which, barely four months ago, decided to present the affluent citizenry with Rs 60 crores of extra money in the name of relief from income-tax; for this the argument had been that the sum made available to the rich would be used for productive investment. It obviously depends on the time of the day what the comfortably placed do with their money.

It is necessary, the wise ones say, to shed *a priori* prejudices: whether the government means well or is merely going through the motions of doing something should be judged in terms of its acts. So here it goes. Considering the economy as a whole, Rs 450 crores denied to the wage-earners is not such a large sum. Simply by raising foodgrain prices by 5 paise per kilo across-the-board, farmers and traders create additional income for themselves of Rs 450 crores or more. In the course of the past 12 months, they, with the co-operation and connivance of the government have added to their income — and taken away from the consumers, the vast majority of whom are indescribably poor — at least Rs 4,000 crores. Those in authority could have resisted, if they had so wanted, this transfer of purchasing

power from the poor to the rich by coming down hard on the price-fixers. Instead, they have come down hard on only those who have been forced to buy at the high prices, not on those who have been charging these prices!

If the very poor are denied the minimum command over purchasing power, some of them will die; this inflation will not be stopped thereby. In 1943, roughly three million died in Bengal, but the spiralling of prices was not checked. The authorities might keep freezing the income of the poor, but inflation would continue to march inexorably forward — for, the poor did not create it in the first place. It is by now altogether impossible, however, to put this simple truth across to the decision-makers in New Delhi. Once an administration loses its bearings, and is obsessed by narrow class interests, a certain frenzy seizes it. Perhaps it needs an Alfred Hitchcock, no less, to depict the pathological state the government has induced itself into; its economic policy has come to feature the same combination of lurid murder and black humour which is the staple of the Hitchcock creations.

As specimens of black humour, every now and then hints are planted across newspaper columns about the drastic steps soon to be taken to ration credit and otherwise to discipline the propensities of the predatory rich. But some tomorrows never come, and some philippics are never delivered. Even when they are — as in Bangalore last week —, everybody knows that they are for the birds.

CAPITAL VIEW

No Escape from the Economic Tangle

Romesh Thapar

IT is unfortunate that, in order to curb speculative activities, fundamental economic adjustments have to be evolved, in secret, by cabals of bureaucrats. True, the secrecy is often penetrated; but that doesn't change the logic behind the secrecy. Even repeated errors, which could have been corrected through wider consultation, fail to change the frightening style.

Some such thoughts are passing through the economic ministries of the Government of India as they tinker with the criticism of the recent Ordinances and prepare for further anti-inflationary measures. The bureaucracy, no matter how extensive its specialisation, backed by a sprinkling of newly-imported experts, cannot ever provide the experienced touch of those who work at ground level in the complex productive and distributive system. Hence the wobbling whenever economic decisions are taken.

The wobbling is caused by the intense activity of lobbies hoping to move tens of crores into their coffers. The wobbling is caused by genuine mistakes which theoretical people, out of touch with the practice of economic compulsions, inevitably make. And the wobbling is caused by the confusion in ideas and concepts which the bureaucrats and experts, *underpinning* the Council of Ministers, seldom admit to.

Of course, following the Ordinances and the implied will to act, the Capital is again buzzing with rumours. In fact, they have little basis. Indeed, if I were to put all the reports together, all the lockers are to be frozen, bank accounts are to be made into compulsory deposits, and severe restrictions are to be put on spending. This projected 'economic implosion' is talked about in the most irresponsible manner. Significantly there is not a word about the parallel black money economy. Public opinion in the towns is convinced that the ruling party and the parties of the Opposition are determined to preserve their very special black money funds.

I should imagine that the anti-inflationary measures or the so-called 'packet of measures', will be fully revealed by the end of this month. After that, the Government of India will be too busy with the formalistic elections of the President and Vice-President — and all the ramifications of another session of Parliament, including the long-projected Cabinet and Ministerial reshuffle and the recently-threatened agitations around the new 'tilt' in the GOI's policies which, it is alleged, have significant political repercussions.

At Least a Developing Confrontation

At this moment of economic manoeuvre and tension, the political situation is certainly as confusing. The Bihar situation, aided and abetted by Congress factions, has placed in the hands of those who oppose Indira Gandhi's political dominance — 'dictatorship', it is called — a powerful weapon of embarrassment. Increasingly, the cutting edge of Jayaprakash Narayan's speeches reveals an anti-Indira slant. This suggests a sharp and developing confrontation, particularly if the agitation spreads or spills over into other regions.

Several views prevail in the Capital about the prospects of a political stir. Some underline the depth of the anger in Bihar, particularly over corruption in the Congress. Others suggest that JP is 'out on a limb' and desperately needs a few more sympathetic agitations. A minority believes that the anti-inflationary measures will spark many upheavals, in which situations like the one in Bihar will gather new dimensions. Many of our aimless radicals, busy stoking whichever fire is nearest, are speaking in the same breath of the possibility of 'fascistic' trends if the present drift continues.

Of course, the confusion among the opponents of Indira Gandhi is best seen in their inability to produce a presidential candidate. The truth is that several persons — even V V Giri (*sic*!) — have been contacted, but no one is prepared to offer his head. Of course, if there was a raw passion in the suffering of India's people, a reluctant JP would have had to enter the fray. Then, maybe, some excitement might have returned to the dreary scene of politics.

Broadly, however, the rural area is untouched by the tensions in the urban centres. Indeed, in most parts, there is more money roaming the countryside than ever before. After all, the towns are no longer living off cheap food — and whatever the notorious role of the traders and *kulaks*, there is certainly more money in the pockets of the farming community. Probably, the present confidence of the ruling party is based on the hope that this is a meaty fact and fairly general.

So, the task which has priority is that of salvaging the towns from the depredations of the inflationary spiral. At last, we are wrapped up in a tangle of economic problems — and there can be no running away because the monsoon has arrived. That's all to the good. But we must keep our eyes open just in case the rigidities of the bureaucrats and the theorising of the experts push us into an 'economic implosion'. There will be no joy for anyone in that . . .

July 15

Expanding Profitably

Hansavivek

TATA ENGINEERING AND LOCOMOTIVE COMPANY's major expansion is proceeding on schedule. The new foundry at Poona is expected to be ready early next year. By then the prototypes of the various aggregates and the new vehicles to be produced at Poona will also be ready for trials. The company has approached financial institutions led by IDBI for a rupee loan of Rs 17 crores; to finance the expansion programmes at Poona and Jamshedpur. The foreign exchange requirements for the expansion (excluding the foundry) is to be met out of a project loan to be granted by KFW to the Government of India. Last year, ICICI agreed to grant a foreign currency loan equivalent to Rs 108 lakhs to the company for the foundry project, in addition to the loans of Rs 573 lakhs already given by it. The company's cash credit limits were reduced from Rs 38.5 crores to Rs 20 crores as a result of the credit squeeze by banks last December. TELCO has requested bankers to restore the original limits in view of the increasing financial requirements due to the expansion programme and increases in costs. TELCO was allowed to increase vehicle prices by 7.5 per cent from mid-May last, and Government stipulated that future increases, more than once a year or exceeding 7.5 per cent, would require its prior approval. S Moolgaokar, chairman, observes that, since there is no restriction on the prices of goods which the company has to purchase from outside sources — whether they be raw materials from public sector steel plants or components from ancillary suppliers — there can hardly be a case for the arbitrary limit of 7.5 per cent on the annual price increases.

TELCO produced 22,559 commercial vehicles during 1973-74, compared with 21,779 in the previous year. Value of spare parts sold increased marginally, to Rs 15.16 crores. But production of excavators was lower at 72 numbers against 91 owing to shortages of bought-out components and power. The press tools division at Poona manufactured a variety of intricate dies and tools, required for replacement and expansion projects. The machine tools division manufactured a range of special machine tools. All-round rise in costs notwithstanding the company's gross profit advanced by 15.5 per cent — and this despite a less than 4 per cent increase in net sales. Equity dividend, originally recommended at 15 per cent, was pruned to 12 per cent, following the Ordinance restricting distribution of dividends. With the amendment of the Ordinance clarifying that the restriction on dividends would be on profit-after-tax and not on pre-tax profit, the board is expected to once again review the dividend recommendation. Although total borrowings increased over

the year, expenditure on interest was lower by Rs 77 lakhs. The ratio of inventories/sales was considerably higher. The company's exports increased from Rs 6.88 crores to Rs 7.29 crores and would have been still higher but for the shipping difficulties. The chairman is confident about the future.

COLOUR-CHEM's output of some of the dyes and intermediates was lower in 1973-74 than in the previous year, owing to "the acute shortage and steeply rising costs of essential raw materials, both indigenous as well as imported". It is stated that these factors 'enforced' upward revision of selling prices. The accounts show, however, that while net sales were 21 per cent higher, gross profit jumped ahead by 50 per cent. Equity dividend, maintained at 12 per cent on the capital enlarged by a one-for-two bonus issue, was covered over 2.8 times, against 2.6 times on the old capital last year. Both the ratios of gross profit/sales and net profit/sales were conspicuously higher over the year. Ramniwas R Ruia, chairman, observes that to many manufacturing units for basic chemicals and intermediates, each of a size which would deny to it the substantial benefits of 'the economies of scale', are not likely to subserve the long-term national interest. He adds that the company contines to encounter 'strong competition' from a growing number of large as well as medium and small indigenous producers of organic pigments and synthetic binders — which products together account for well over three-fourths of the company's turnover. He states that, considering the "growing trend towards the needless proliferation of the number of manufacturing units these old and well-worn areas to the neglect of many new, more up-to-date and challenging ones", the company has based its long-term plans on a programme of ever-widening and even more up-to-date development and diversification covering intermediates as well as auxiliaries. Colour-Chem last year paid to auditors Rs 15,000 for management services, Rs 7,000 for taxation matters, Rs 6,900 for other services, and Rs 396 for out-of-pocket expenses — besides audit fees of Rs 20,000 against Rs 15,000 paid in the previous year. The value of dyestuffs exported by the company was Rs 113 lakhs. As it formed more than 10 per cent of the aggregate value of the dyestuffs produced by the company, this will once again enable the company to receive import licences for essential raw materials and intermediates from preferred sources of supply. Demand for the comapny's products has been growing rapidly in overseas markets, including the sophisticated markets of West Germany, the US, the UK as well as in the Far East. The company envisages a substantial further growth of export business during the current year. Erection of new buildings and plant for the licensed expansion and diversification projects is in progress. As a result of the research and development effort, nine additional items were added last year to the range of licensed products. Also, three new products are being manufactured for captive consumption.

SHALIMAR PAINTS, more than 52 per cent of whose capital is held by Courtaulds — one of the international corporate giants — is awaiting industrial licence to establish a new factory in South India. The company had represented to government to modify the conditions stipulated in the 'letter of intent', to which the latter has partially agreed. Meanwhile, the company could produce last year only 8,526 KL of paint at the Calcutta factory against the installed capacity of 11,273 KL. The shortfall is attributed to the shortages of essential imported raw materials and also of indigenous ones, based on the former, and severe power shortage. Although sales were about 12 per cent higher than in the previous year, gross profit remained unchanged. The directors say that rising inflationary pressures eroded profitability. The earnings-cover for the distribution has thinned down. The ratio of inventories/sales was conspicuously up compared to last year, while that of wages/sales was slightly down. The 72-year-old company continued to direct research and development efforts towards finding suitable substitutes for scarce raw materials, both imported and indigenous. Even so, over 21 per cent of the raw materials consumed, amounting to Rs 95 lakhs, were imported. Besides, about Rs 4 lakhs were remitted in foreign currency by way of dividend for 1972. As against this, exports of goods (including those to Nepal, Sikkim and Bhutan) were less than Rs 17 lakhs compared with Rs 26 lakhs the year before. The fall in exports, according to the management, occurred because the international paint prices were "much lower than our minimum prices" — on account of the non-availability and the high prices of imported raw materials "the content of which in exports is higher than in domestic sales".

PHALTAN SUGAR started sugar production early during the 1972-73 season, and crushed 2,33,487 tonnes of cane and manufactured 2,57,630 bags of sugar. But the average recovery of sugar was lower at 10.90 per cent against 11.43 per cent in the preceding season when 1,63,433 tonnes of cane was crushed and 1,87,562 bags of sugar were produced. However, the excise duty rebate of Rs 25 lakhs under sugar incentive scheme, against Rs 7 lakhs earned in the previous year, compensated for the loss in sugar recovery, and the company was able to pay a competitive cane price to growers. But the financial results turned out to be poor, with gross profit down from Rs 40 lakhs to Rs 34 lakhs, in spite of rise in sales from Rs 323 lakhs to Rs 432 lakhs. Nearly one-third of the unchanged dividend of 14 per cent was short-earned. The Government of India has approved Phaltan's investment in equity shares of Syarikat Gulla NS of Malaysia of the equivalent value of Rs 120 lakhs. The progress of the joint venture project has been satisfactory. Phaltan's subsidiary, Havero Industries, showed a loss of Rs 25 lakhs during the year ended March 1973 owing to dull transistor market, drought conditions and increases in costs. The machinery required for expansion arrived late in the third quarter of 1973. The plant is expected to operate at the expanded capacity in 1974-75.

WELCAST STEELS has been behind schedule in implementing its project owning to delays in deliveries of plant and equipment. Melting capacity has been established and trial runs are being carried out. Integrated operations of the plant, originally scheduled for October 1973, are now expected to commence shortly. Harish Mahindra, chairman, expects the company to turn out 2,500 tonnes of finished product by the end of this year. The licensed capacity of the plant is 4,500 tonnes of alloy steel grinding media balls. The company has built sufficient inventories of essential inputs like melting grade scrap, graphite electrodes, etc, and also made adequate arrangements for their regular supply. No difficulty is envisaged in marketing the entire output of the plant. Bearing in mind the shareholders' expectations of a reasonable financial return on their investment in the company, the chairman assures them of "encouraging results" next year.

Not By Ordinances

FOR sheer hypocrisy, it would be difficult to excel some of the recent statements by government spokesmen on the economic situation. There have been, for example, the Prime Minister's speech at Bangalore (July 12), the Finance Minister's address to the Youth Congress conference at Poona (July 14), the Planning Minister's speech to a meeting of the Consultative Committee of his Ministry (June 5), and the draft AICC resolution on economic policy, which claims to have been inspired by the Prime Minister's speech at Bangalore, approved by the Congress Working Committee and released on July 15. The tone of all these statements would suggest that the government was not at all responsible for the mismanagement of the economy in the last few years.

Some obvious changes in the official view of the economic situation, as revealed in these statements, need to be noted first. For one thing, the Prime Minister and her colleagues seem to have realised that their reading of the economic situation hitherto has been wrong. Till very recently, inflation was being underplayed by the government as being not so serious. Now the Prime Minister acknowledges that "the rise in prices is the gravest of our problems . . . Inflation of this order will subvert our hopes for the future". Earlier, in more than one public speech, the Prime Minister had attributed the inflation to international factors. Now she admits that "our inability to accelerate production and prevent distortions has contributed to [the inflation]".

The Planning Minister was even more specific: "the inflation we are witnessing today is not the product of a decline in agricultural production or industrial production, specially of mass consumption goods, in the last one or two years. Nor can it be explained exclusively in terms of the addition to money supply. What has been happening for some time is that we have invested, relatively speaking, less and less in things that would strengthen the growth potential of the economy, and more and more in things that cater to the needs of a very small section of the population".

Secondly, there appears to be some recognition of the fact that the poor are the worst hit by inflation. To quote the Prime Minister: "The increase in prices has caused particular hardship to fixed income groups, labour and the landless".

Lastly, all the official statements have spoken of the need to undertake radical and many-sided measures. According to the Prime Minister, "An important — almost decisive — anti-inflationary force would be to dispel the feeling that nothing will happen and nothing can be done. This is the frame of mind which prompts the grower to keep back stocks, the consumer to make panic purchases, the trader to hoard, and the administrator to slacken". The draft AICC resolution lists procurement, a well-organised public distribution system for essential commodities, decisive action to punish "smugglers, hoarders, speculators and tax evaders" and measures to combat black money as being among the measures called for. The AICC resolution refers to some more fundamental issues as well. "The time has come to terminate the deplorable co-existence of mass poverty and the privileged wealth and economic power of a conspicuous minority in our society." The Prime Minister has particularly emphasised the need to mobilise resources from rich farmers "who have benefited most from our schemes of rural development".

In sum, there seems general agreement on what needs to be done. But does this means that action on all, or any, of these lines will follow? Here the prospect is distinctly improvising. First, the problems facing the economy have resulted almost entirely out of the gross mismanagement of the economy by the government during the past decade or so. Poor procurement of foodgrains, failure to build up an extensive public distribution system for commodities of mass consumption, frittering away of vast resources in non-developmental expenditure, low levels of public sector saving and investment, neglect of growth of employment, failure to evolve devices to protect the real incomes of the employed poor — all these have been of the government's making. The result is that the economy has not only not moved even an inch forward, measured by the proportion of people living below the poverty line — defined very austerely as an income of Rs 20 per capita per month at 1960-61 prices — it has moved many steps backward. The proportion of such people has increased from 40 per cent in 1967-68 to about 66 per cent in 1973.

The sabotage of the wheat trade take-over and the subsequent surrender to rich farmers and traders, the sharp rise in the price of wheat and failure to procure even a modest 5 mn tonnes for public distribution are all developments the responsibility for which is that of the government. For the government to now talk of a well organised public distribution system for essential commodities lacks credibility. Similarly, the state governments have ignored the recommendations of the Raj Committee — but again with the connivance of the Central government. Where, then, is the hope for larger mobilisation of resources from the farm sector? In fact, only a month or so ago the Prime Minister herself is reported to have opposed proposals to tax rich farmers put forward by the Planning Commission as politically impracticable and unrealistic. What credence is to be given to her recent declarations about taxing rich farmers and abolishing the subsidies involved in the losses of the government's irrigation and power projects? Again, only four months ago, the Finance Minister had, in the name of reducing tax evasion, quite sharply slashed income-tax rates. Now the AICC resolution declares: "Fiscal measures for levelling down incomes and legislative and executive action for redistribution of wealth should go hand in hand with our programmes for levelling up living standards from below." As for what the AICC resolution has to say about the removal of mass poverty, it is well to remember that the outlay on the Minimum Needs Programme, for instance, has been drastically cut in the Annual Plan for 1974-75 and is being reduced further in the name of fighting inflation. It had been made out that Garibi Hatao would involve a basic change in the social and economic power relations in society. In fact the existing power structure has been not only fostered but strengthened in the name of higher production. Land reforms, socialisation of urban land, control over monopoly houses, dispensation of commercial bank credit to persons of small means, ending of the control of large industrialists over banking and other credit institutions — all these were to be a part of the many-sided attack on poverty. Actually in none of these areas has the *status quo* been really disturbed.

Thus what the government has been doing is quite contrary to its proclaimed multiple objectives of growth, social justice and self-reliance. But what

about the measures announced recently to fight inflation? Do they add up to a "many-sided attack on inflation"? The key elements among them are: (i) impounding of one-half of the additional dearness allowance for two years and all increases in wages and salaries for one year; (ii) a compulsory deposit scheme for the higher income brackets, primarily intended to tap a part of the incomes of the self-employed for two years; (iii) restraint on dividends for two years; (iv) strict adherence to the declared budgetary deficit of Rs 125 crores, even at the cost of cutting Plan expenditure; (v) subjecting the top 50 borrowal accounts of all the major banks to strict scrutiny; (vi) imports of foodgrains from abroad to reinforce the public distribution system.

Besides these measures already taken, the Prime Minister hinted at further action in the following directions in her Bangalore speech: (i) taxation of rich farmers and elimination of losses of irrigation and power projects; (ii) pricing policies for foodgrains and commercial crops calculated to curb inflation; (iii) raising production in agriculture and industry so as to remove shortages of essential wage goods and key industrial products; and (iv) a well organised system of distribution to make available essential consumer goods at reasonable prices.

The policies which the government has pursued in the last few years go contrary to the above objectives. Take, for instance, the public distribution system for foodgrains. Thus in May 1974, wheat supplied through the public distribution system amounted to 4.18 lakh tonnes against 6.82 lakh tonnes in May 1973. During January-May 1974, total wheat distribution aggregated 22.73 lakh tonnes against 27.40 lakh tonnes in January-May 1973. The public distribution system has hardly attempted to cover other commodities like vegetable oils, coarse grains and pulses which have all been scarce. As for prices, the Agricultural Prices Commission is said to be thinking of an increase of Rs 10 per quintal in the procurement price of rice and paddy. This cannot possibly be avoided after having raised the wheat price to Rs 105 per quintal. As for industrial production and employment, mismanagement in key sectors like power, transport, coal and steel continues to affect the overall industrial performance. There is also no likelihood that the declining trend in industrial investment will be arrested.

Coming to the six measures which have already been announced as part of the government's many-sided attack on inflation, what do they really add upto? The real wages of the working class have been severely eroded by the inflation. The stagnation in employment has impoverished it further by adding to the unemployed dependants per earning worker. The Prime Minister's rationale for impounding the growth of wage and salary incomes is indeed strange: "Every rise in wages and dearness allowance becomes a signal for shopkeepers and others to raise prices". Curbing the growth of the money incomes of wage and salary earners is indeed an odd way of showing hoarders and speculators that the government is determined to act!

The compulsory deposit scheme for the higher income brackets will not even scratch the surface of the problem. First, the compulsory deposit is on the basis of the declared (revealed) incomes of the tax-payers and hence the unrevealed income would be outside the purview of the measure. Secondly, in respect of a large number of high salary earners in the private and public sectors, wage and dearness allowance increases impounded under the earlier ordinance will be set off against the compulsory deposit required under the latest ordinance. On the whole, the compulsory deposit scheme is inequitous between revealed and unrevealed incomes. It is also inequitous between employees who get additional wages and those who do not; the latter have to make the compulsory deposit and earn a little less interest (8.5 per cent against 11 per cent). It is also odd that the government should have first opted for a reduction in income-tax rates and hand over about Rs 100-125 crores to tax-payers and should now think of impounding Rs 50 crores through the compulsory deposit scheme.

As for the dividend restraints, it simply is not an anti-inflationary measure. The companies are expected by the government to spend the dividend payments saved. It would be unrealistic to expect that the companies will show these additional funds while applying for credit from the banks. On the other hand, dividend-receivers are not a spending class; over 85 per cent of dividend income going to individuals is received by those earning more than Rs 25,000 per annum.

In sum, about Rs 550 crores may be impounded with the Reserve Bank as a result of the three measures. Would that prevent traders and rich farmers from continuing their speculative and hoarding activities?

Government spokesmen have talked of a ruthless fight against black money, but nothing tangible has been done. At his Poona meeting, the Finance Minister chose to refer to black money in philosophical terms: "it is very illusive. It comes from everywhere but can be seen nowhere".

The Finance Minister also talked of the 'human factor' involved in punishing 'economic offenders' like tax evaders. The Prime Minister too chose similar terms at Bangalore: "Does the grave crisis which confronts the world economic system not portend the end of the old economics and of conventional economic theory? Is it not time for renewed emphasis on the study of non-material factors — the psychological and social — side by side with the intensive speculation of the various branches of economics and econometrics?" In fact the accent on restraining money supply and restricting deficit financing at the Centre to a very low figure is an exhibition precisely of conventional wisdom. The implications of these measures for long-term development and expansion of capacity, output and demand for industrial goods have been ignored. As for the overdrafts of state governments, it appears that they have started relying on commercial banks for a number of their needs which should have been met from the budgets. It remains to be seen what major redeployment of bank credit in favour of the small borrowers and against large borrowers is brought about as a result of the scrutiny of 50 major borrowal accounts by everyone of the major banks. Here too there is ground for misgivings on one major count — leaving aside the banks' willingness to be ruthless about the scrutiny. The major units generally have inter-connections down the line in terms of size and, therefore, even if some credit rationing is done after the present exercise they will be able to get their overall credit needs met. One of the Deputy Governors of the Reserve Bank recently told a press conference in Madras that all he was trying to do was only to obtain the seasonal return flow of funds "so that there could be redeployment of funds during the next busy season". Excluding food credit, bank credit has already expanded by Rs 181 crores so far during the current slack season upto July 5, against Rs 41 crores during the corresponding period last year. This was in addition to credit expansion of Rs 985 crores during the 1973-74 busy season (October-April) against Rs 910 crores during the 1972-73 busy season.

Lastly, the additional imports of foodgrains could be anti-inflationary in the strict sense of augmenting supplies through the public distribution system. But at what cost?

In sum, all these measures put together do not touch even the fringe of the problem. The excessive preoccupation with curbing money supply without emphasising adequately the purposes for which the funds are deployed will do more harm than good to the economy.

Grapevines and Nitwits

(From a Delhi Correspondent)

WHO makes economic policy now, and what is the process by which it gets accepted? It is not an easy question to answer. There was a time when the honours were divided between the Planning Commission and the Ministry of Finance. That illusion is no longer entertained, even by those involved. It must then be some trusted political colleagues, say C Subramaniam and a few like him, who have the ear of the Prime Minister and tell her what is to be done. This view is widespread, not only among the few who are so persuaded to believe that they make policy but among a large number who claim to know what is going on inside. But the *real economik* of Delhi does not seem to be all that simple.

Of course, the Prime Minister decides economic policy, as she decides all other policies. But she cannot be making it all herself, so someone must be advising her. The question is who. Everyone knows the sound dictum about foreign policy, that a nation has only permanent interests, no permanent friends. Why shouldn't that apply to domestic matters as well? A Prime Minister too can have only permanent interests, no permanent advisers. Her shrewder advisers know it as well as she does, and that is both the strength and weakness of their relationship.

When the going is good, as after a bumper harvest or two and when prices are stable, it is the turn of the radical slogan mongerers and nothing can stop them. Garibi must be hatoed here and now, reliance on foreign aid has to be stopped, and death to the monopolists and their running dogs. The Prime Minister goes along with it all, knowing fully well that its all moonshine. But they create the right image, and it suits her very well. If some simple-minded economists are naive enough to imagine that a multi-sector model which shows how it can be done is the need of the hour she does nothing to discourage such well-meant exercises. At least it keeps their morale high, and the implicit support of intellectuals has its uses. Should they quarrel among themselves about the specifications of the models to be used, or about something else, it is still better since one does not then have to look around for other alibis.

But that's old hat now. The going has turned rough, something has to be done, and one cannot just afford to waste time depending on or even listening to such stuff. One needs men of sterner fibre. Fortunately they are there, in fact standing close around, and do not even need to be told. They know the answers too, have worked out the strategy, and even the operations in some detail. It is almost like Bangladesh over again. But this time it has to be executed within the country, and needs more time legitimising all the unpleasant things that unfortunately have to be done.

The first thing to do, of course, is to put everyone off the trail. So the wistful thought about financial wizards. Financial jugglery cannot by itself do very much, nor does the Prime Minister believe in wizards any more than she does in hobgoblins and gobbledeygooks. But demand stimulates supply, so the economists say, and at least they should therefore fall for it. No one can say that the calculation has gone wrong, considering the plentiful supply of food, money, semibomblas and fullbomblas that have sprung up in less than two months.

Meanwhile the doers are on the job. They know that what is needed is more supplies of food, but they know too that getting them out of the rich farmers is simply not practical politics. So out go instructions first to buy more food abroad, wherever it can be had. If the gods are also kind, and there is a good harvest to supplement imports, perhaps even the kulaks and the hoarders will start unloading the stocks and help bring down prices. But that is still far away. The immediate problem is to prevent further rise in prices by wage-adjustments and the like.

The threat of the railway strike comes as a boon. George Fernandes is Yahya Khan resurrected. He puts on all the right postures and does all the right things to legitimise an all-out police action. True, a lot of nasty things have to be done, but what is the alternative? A decent, all-too-hesitant government is forced to act all too unwillingly, but once it decides to, it has to go all the way. The result is a bonanza, a lesson well thought, one which will not be forgotten for a long time.

But victories too have their price. The trouble with this victory was that it was too victorious. It showed that the government could act, if it so wished, and make a success of it. So if the hoarders were getting away with their hoards, and tax-evaders were prospering as never before, it was not for lack of executive power but just plain lack of political will. This had become much too obvious, and it wouldn't do to let that kind of feeling grow. So something had to be done to restore the right image.

Several moves are initiated. One is to get enacted an ordinance for imposing more severe penalties on hoarders, as if the existing legislation was not enough for an earnest government to do what it wanted. Another is to make a great display of police searches aimed at tax-evaders and their kin. The image restoration needs also some public demand for such action from respectable radicals to whom the Prime Minister still appears ever ready to listen and even be responsive. So discussions on the subject are arranged by the All-India Radio, carefully selecting the participants.

Even a new theory is launched as to how things get done in India. The theorist-to-be is carefully chosen too. All this follows now a set pattern. Journalist X is a discreet, thoughtful chap, capable of figuring it all out by himself with a little hint or two; Journalist Y is much dimmer but is as faithful as a gramophone record; Journalist Z is out only for sensational stories. So to each according to his capability and his need.

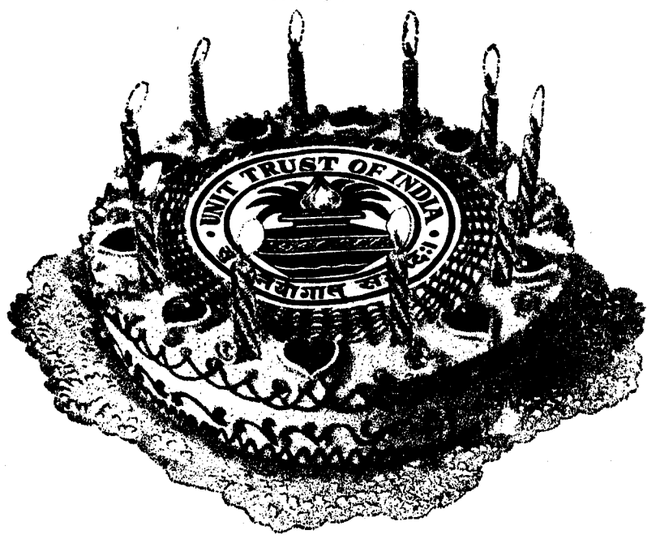
Briefly the theory is as follows. The Prime Minister acts only when she is angry, and the best comes out of her secretariat itself only in a crisis. Inflation and the crisis it has sparked off have given the urban middle class elite just the right setting to press for changes in policies which were too radical for their liking. This has worked so far: state take-over of foodgrains has been reversed, industrial licensing policy has been liberalised, railwaymen have been tamed, etc. But let no one take it for granted that the wind will continue to blow in their favour. If her new policies do not prove effective her wrath is sure to turn against those whom she considers responsible for the failure, and then heads will again roll.

Journalist X states the theory in a pretty sophisticated form in his weekly column. It may even go unnoticed, but it does not matter. For Journalist Y spells it out with fewer intellectual doubts or political reservations than Journalist X. And thank God the ones like him are more numerous, for it is only through the more prosaic that the essentials can be put across to a wider reading public. Journalist Z too has

his role in this brain-washing through the Press, for he avidly devours all the gossip about whose heads are likely to roll and who would replace them (even if the names leaked out relate only to members of the Cabinet or of the Planning Commission).

Sometimes things do go wrong here and there. In a recent AIR broadcast on tackling inflation, one of the economists spoke out of turn and said things he should not have (such as about the brutality of the methods used for breaking the railway strike and the class character of the government). This created an awkward situation. But a country that can explode or implode nuclear devices need not be derailed by such indiscretions. There is enough technical expertise around to erase the tapes, and the job was so well done that none of even his radical admirers could have suspected that three long sentences, full of pearls of revolutionary wisdom, had been quietly cut out before the actual broadcast.

The same economist figures now among the names disclosed as under consideration by the Prime Minister for advising her on economic matters. This may surprise him, and he may even be persuaded to think that no harm was really meant when those offending three sentences were erased from the AIR tapes. But it should not, if he has a fraction of the shrewdness that the present advisers of the Prime Minister have. The leak is meant not so much to lure him but to give notice to some others in the inner circle who are no longer wanted.



So the game will go on. Economists of different persuasions will keep doing different things with different motivations, many imagining perhaps that they are furthering the great cause (whatever they think it to be). But economic policy will continue to be made by those who know what makes the Prime Ministry angry and to what use the anger can be put to!

JULY'74
An extra-special offer
price of **Rs.10·30** per unit.
by Unit Trust of India
to celebrate the completion of its first decade.

The Trust is 10 years old and **BIG** for its age!

As it steps into the second development decade it offers its best wishes to its 5,82,000 unit holders, particularly to about one lakh unit holders who are with the Trust from its inception. (It also congratulates itself to a moderate extent).

Above all it looks forward to an even more impressive growth in the coming years.

Many Happy (Financial) Returns!.

NEW DELHI

Delusions of Demand Management

B M

THE ordinance promulgated last weekend imposing a virtual wage freeze on workers and salaried employees in the organised sector was not entirely unexpected. As for the ceiling on dividends announced simultaneously, it was obviously intended to cushion the shock of the wage and DA freeze and to make it look that the government was holding the scales even between workers and dividend-earners. Though official spokesmen have denied it, the government has been thrown on the defensive by the sharp reaction of the trade unions to the wage and DA freeze. It has, therefore, begun to talk of a comprehensive package of anti-inflationary measures. But the main emphasis of government policy is now set. The emphasis is on arresting further growth of money supply with the public which, it is hoped, will reduce aggregate demand and thereby relieve pressure on prices.

Some show of restricting bank credit to the commercial sector, impounding of a portion of bank deposits and a compulsory savings scheme for professionals and other self-employed groups who pay income-tax are said to be some of the anti-inflationary measures that the government has in view. These measures are to be combined with a drastic reduction in the expenditure of both the Central and state governments, especially on social services. There are also hints of a supplementary budget, the main aim of which will be to raise indirect taxes on items of luxury consumption. The state governments are being pressed to balance their budgets and to fill the gaps between their revenue and expenditure by raising additional resources from the farm sector.

Whether or not these measures will achieve the objective of reducing the inflationary pressures is a debatable point. It is also questionable to what extent they will be implemented ultimately. But there is a conscious attempt on the part of the government to give the impression of being up and about, in contrast to the prolonged drift that had characterised government behaviour for the last nearly two years. The impetus in this regard has come from the Finance Ministry which appears to have taken the initiative, pushing the Planning Commission to the side-lines. After some feeble protests and sulking, the Planning Commission too appears to have fallen in line and acknowledged that the approach projected in the draft Fifth Plan stands no chance at all of being accepted by the political leadership.

The principal assumption of the government's approach, as it is emerging, is that — as against the strategy promoted by the Planning Commission since the Second Plan period, of building up excess demand in the economy and then trying to regulate supplies through administrative controls — monetary and fiscal policy has to be assigned a leading role in controlling aggregate demand in relation to the available supplies in the economy. As the policy-makers in the Finance Ministry see it, the government can either opt for rigid management of available supplies while trying to step up investment, specially in the core sector — the line advocated by the Planning Commission — or restrain demand through drastic fiscal and monetary measures, hold bank investment and restore stability in the economy. This, it is expected, will pave the way for tackling the problems of the growth of the economy on a new basis.

Whether or not one agrees with the Finance Ministry line, the government's attempts at supply management have been an unqualified failure. The high water-mark of these attempts was reached with the take-over of the wholesale trade in wheat. But this step was found to be beyond the government's capability, given social and political set-up. The panicky retreat from the wheat trade take-over and the failure to organise an effective public distribution system even in foodgrains, let alone other essential commodities of mass consumption, put the seal on the government's failure to manage supplies. This is what seems to have paved the way for the shift in policy. The government had been tinkering with demand management for some time; the wage and DA freeze — and other measures said to be in the offing — marks the shift in emphasis to demand management.

The reasons for the government's failure at supply management are well known. This course was too risky in items of the powerful economic and political interests which the government would have had to offend. It involved confrontation with the rich farmer-trader combination as well as with the industrialists, for which the government had no stomach. On the other hand, the apparent success in crushing the railwaymen's strike, through use of the most brutal police methods, emboldened the government to press on with the alternative course of demand management. How far this will succeed is, of course, another matter. The major weakness of this approach is that the scope of available policies for managing demand is extremely narrow. Thus the government will find it impossible to go beyond the 18 milllion wage and salary earners in the organised sector in the enforcement of measures calculated to curb demand. But demand originating from the salaried sector, which alone pays its taxes, makes contributions to saving funds over which the government exercises control and is generally amenable to fiscal and monetary discipline, is already fairly well regulated. The extent to which it is possible to reduce demand pressures in the economy by further tightening the screw on this sector alone, while the so-called unorganised or black money sector flourishes and the incomes of surplus farmers go scot-free and the farmer-trader-industrialist combination continues to corner surpluses in the economy, will necessarily be very limited.

It will simply not be possible to significantly affect the demand for food and other essential consumer items by merely reducing the money incomes of salary and wage earners. The prime source of inflationary pressure being food prices, there can be no let-up in inflationary pressures under a regime of higher and higher procurement prices coupled with hoarding and profiteering by the rich farmers and traders. In the case of industrial goods, too, the government has recently sanctioned a series of price increases. In these circumstances, if consumer demand declines as a result of reduced money incomes of a section of society, the producer is unlikely to cut prices so much as peg production. Since, as part of the strategy to curb excess demand, investment in both the public and private sectors is intended to be kept at a low key, what is most likely to result in these circumstances is inflation plus recession. The mid-sixties had seen a period of recession marked by rising prices; the experience may well be repeated in a more virulent form.

TAMIL NADU

Petty Issues for Petty Politics

PRICES have kept on steadily rising in Tamil Nadu. Madras City has seen prices of rice rise above Rs 3 per kg. In Kanyakumari district, bordering on Kerala, the price rose beyond Rs 5 per kg. With no control over the situation, the state government for the most part resorted to gimmickry trying to make-believe it was making attempts to hold down the prices.

On an unsuspecting morning, the 40 per cent levy and the ban on the movement of paddy and rice from the district of Thanjavur — the rice bowl of the South — were removed with a flourish. This 'pragmatic' measure was a bonanza to the big landlords and millers who had used their capacity to hoard large stocks with forethought, expecting exactly such a relaxation of the situation. Thus, in addition to the constantly increasing procurement prices, the Thanjavur rice would now fetch the fantastic price that would be offered for it in the other scarce districts. Evidently, it matters little to the government that the rice would be unattainable at such prices for the lakhs of landless tillers and poor peasants in Thanjavur itself. Consequent to the lifting of the restrictions, the price of a bag of paddy shot up from Rs 40 to Rs 75. More than 1 lakh tonnes of paddy moved out in a couple of days. Faced with the furore it created in the district, the government reimposed the restrictions — but not without the familiar 'movement by permit' clause that still leaves ample room for illegitimate exits. Such peripheral gauche tinkerings with the food crisis have left this 'surplus' state — whose Chief Minister is the most jubilant supporter of the Green Revolution — desperately needy.

Muster Roll Scandal

Faced with a food scarcity, failing monsoon, 75 per cent power cut, and nightmarish memories of the recent electoral results, the government once again postponed the municipal elections. Another factor has been the muster roll scandal of the Madras City Corporation, involving a colossal amount which keeps being revised upward every day. The scandal has resulted in the arrests of worshipful mayors, deputy mayors, chairmen of committees, councillors and a bevy of staff, big and small. The scandal shot into public view again recently, when it was discovered that volumes of records showing up the misappropriation of over Rs 1 crore have been consigned to the flames to prevent the investigating authorities from getting to them.

It is against this overwhelming backdrop that the ruling party and its resourceful leader have initiated a dangerous, albeit time-worn, diversionary move. It has been trumpeted that the Keralite eking out a living in Tamil Nadu, as waiter, barber, tea-shop owner, or factory worker, is the main enemy of the Tamil people! On May 26, the Tamizhar Padukappu Peravai (Tamilians' Protection Force), officially led by DMK members and the Chief Minister's followers, took out a procession, shouting anti-Malayalee slogans, and smashing the small Malayalee shops on the way. When the opposition parties demanded a judicial probe into the outrage, Karunanidhi shrugged it off, blaming the Press for having blown it up. The Chief Minister dissociated himself from the organisers of the process with aplomb, but failed to explain how it was that the police, who were refusing permission to processions wanting to show solidarity with the striking Railwaymen, allowed the Tamilians' Protection Force to organise an overtly communal march. Nevertheless, Karunanidhi left his followers in no doubt of his support for them when he told the Keralites to behave 'with restraint'. The poet-politician had indeed recited, at a recent public function, his latest creation: "Could the race of devils who come here to eke out a living, flourish, while the children of this earth languish?" (translation).

It may seem ironical that the Dravidian Progressive Association, which once aimed to unite everyone south of the Vindhyas in a confrontation with the 'Aryan aggressor', should now turn its venom against a Dravidian brother-people. The covert fact of the matter is that MGR — the chief rival of the DMK and its Chief Minister — is a Malayalee by birth. One of the ministers openly stated that, while minorities had the right to live in Tamil Nadu they could by no stretch of imagination claim the right to rule it. Organised attacks on MGR movies go on. Apparently, any stick to beat MGR with is okay with Karunanidhi. However, the DMK has largely failed to enthuse the masses with its anti-Malayalee hysteria, despite the everyday 'hate Malayalee/MGR' campaign carried on by the pro-DMK papers and politicians.

One can trace the regional chauvinism and Tamil fanaticism of the DMK to its earlier themes. The chief enemy of the Tamils, the DMK had said, was the Baniya who was the political and economic oppressor. Hindi had to be fought as the language of the oppressor. As Annadurai wrote: "The Roopchands, the Jeevanlals, the Shiv Narayans have camped in every nook and corner of Dravida Nadu doing business in everything from groundnut to diamonds. And yet, is there any place for the Danapals, the Annamalais, the Arumugams in the North?" He pleaded for a tougher strain of southern capitalism capable of fighting back the Baniyas. While the Roopchands were gaining technical expertise from the Western capitalist centres, he moaned, the Chettiars were going from temple to temple seeking divine blessings. Economic well-being became synonymous with political liberation from the Aryans. The slogan 'Separate Dravida Nadu' was thus simple to offer and easy to swallow.

Communal Cauldron

But never did DMK's regional chauvinism ever hurt the capitalists — Dravidian or Aryan. If in the past it helped the up-and-coming local bourgeoisie against the all-India northern giants, the party today is in the service of the bourgeoisie as a whole. As the ruling party, the DMK is in fact trying to underplay its anti-North image, and in a 'pragmatic' spirit is sending its ministers to the 'Aryan' North to welcome, with open arms, the once-hated Jeevanlals and Roopchands to come South with their money-bags and avail of the excellent 'law and order' situation. Addressing a Chamber of Commerce meeting recently, the Industries Minister assured the dignitaries that any move of the government to "protect the interests of the Tamils" would not hurt them. Apparently, while the non-Tamils have no right to rule the land of the Tamils they have every right to exploit Tamil labour. Whether it be a British monopoly or a Malayalee capitalist, the communal cauldron has been stirred up by the DMK in order to defeat labour struggles. Whether in Ashok Leyland or the Madras Rubber Factory the Tamil worker was set against his Malayalee brother, with official sanction to break his struggles.

The ADMK's weak counter to this — apart from verbal condemnations — has been to call a meeting to discuss the issue. The Marxists boycotted the meeting because of its inclusion of the ruling Congress, whose governments in Maharashtra and West Bengal have been the forerunners of Karunanidhi in pandering to linguistic proclivities for more than linguistic ends. In fact, Karunanidhi quoted the examples of these states and the Prime Minister's approval of their action when he announced his government's proposal to reserve 80 per cent of the jobs for domiciled Tamilians. The CPI(M)'s suggestion, that only a united action to strengthen mass democratic struggles can help weaken the fissiparous tendencies and diversionary manoeuvres of the DMK, evoked no response. MGR's reluctance to lead a mass struggle was clear in his pale response to the All-India bandh on May 3: mass fasting was the most that the 'revolutionary leader' could envisage by way of protest.

Meanwhile, the India-Sri Lanka pact, ceding Kachchativu, a barren rock claimed as part of Tamil Nadu, to Sri Lanka, was a god-send to some political parties. It was time for all true Tamilians to climb the high horse of regional patriotism. And there could be none truer than MGR, who had great need to establish his 'Tamil' credentials since the DMK stuck out the Malayalee tongue at him. His reaction has therefore been the most jingoistic, and quite uncomfortably so for Karunanidhi. He has called upon the DMK government to resign in protest and join the mass movement to retrieve the islet! Not to be outdone, the Chief Minister called an all-parties meeting, unattended by the CPI and CPI(M), and passed a resolution urging the Centre to renegotiate the agreement; there still is a lot of sound and fury, but little evidence of serious intent.

NORTH

The Ineffective Spirit

ON grounds of administrative feasibility, the Punjab Government has opted for retention of the traditional land revenue in consolidated form and has turned down the Raj Committee's recommendation of an agricultural-holdings tax on operational holdings. Revenue Minister Umrao Singh stressed that the state government had accepted the 'spirit' of the Committee's report; the Committee's recommendations, he said, were "very cumbersome and impracticable". So, instead, the basic and extremely low land revenue rate, which has remained unchanged for half a century, is to be enhanced by 150 per cent on an average; this would also more than make up for the loss resulting from the abolition of the surcharges.

The rate enhancement is supposed to partially remove a glaring anomaly in the tax structure of the predominantly agricultural state of Punjab which is also the most prosperous in the country in terms of per capita income of Rs 1,054 per annum. Land revenue has constituted less than 0.5 per cent of the state's annual revenue. The estimate for 1974-75 was Rs 1.16 lakhs in a Rs 2.35-crore budget. In fact, the low yield does not cover even the costs of collection.

Although the agriculturists' income has been rapidly rising — thanks to the price hikes in foodgrains and other farm products — receipts under 'Land Revenue' have been actually diminishing. In 1969-70, the land revenue yield was Rs 1.72 lakhs, in 1970-71 Rs 1.69 lakhs, in 1971-72 Rs 1.19 lakhs, and the Revenue Minister put the receipts for 1973-74 at Rs 1.05 lakhs. The budget estimate for 1974-75 was Rs 1.16 lakhs. Punjab has had the lowest direct taxes on agriculture. Even after the modest increase in the rate of land revenue, to be effective from the next kharif harvest, the state will still rank lowest in this respect.

The Raj Committee had pointed out that, in Punjab, the direct agricultural tax as a percentage of agricultural income (average for 1967-68 to 1969-70) was 0.24, against the all-India average of 0.94. The direct agricultural tax as a percentage of the total state revenue (taking the average for the same three years) was 2.83 against the national average of 11.09. The corresponding figures for UP were 22.36, for Assam 24.57, and for Haryana 5.12.

Together with the reimposed cess on commercial crops — which had been abolished in 1970-71 following strong protests from farmers — the enhanced land revenue is expected to yield an additional income of Rs 3 crores per annum. As against this, the Raj Committee's expectation following from its own recommendations was about Rs 20 crores for the Fifth Plan period.

Nevertheless, the state can be said to have at long last taken a step in the right direction. Though the Revenue Minister is non-committal, the possibility remains too of a further enhancement of the progressive land revenue rate in the coming years. However, the Congress ministry would have to risk the displeasure of the influential farm lobby which dominates the state's administrative and political life. Already, the Akali leaders have denounced the new levies on the farm sector as 'extortion' and are reported to be working out a strategy for causing the maximum discomfiture to the Zail Singh ministry on this score.

It is significant that actual payments by agriculturists often fall far short of the obligatory dues — as is evident from the Revenue Department's mounting arrears, the latest estimate of which is Rs 253.7 crores or 150 per cent more than the annual yield from land revenue. The recent disclosure of substantial outstanding arrears of co-operative loans due from the Punjab farmers would further diminish the net yield from the farm levies.

Haryana's experience strengthens such apprehensions. Scoring yet another 'first', the Haryana government had announced in its 1973-74 budget the imposition of a consolidated land holdings tax in accordance with the Raj Committee's recommendation and estimated an additional revenue of Rs 3 crores under this head. But early this year, in his 1974-75 budget speech, the Finance Minister admitted that this measure had still to be fully implemented. Owing to partial implementation, the additional income was only about Rs 70 lakhs. A higher yield is expected during the current year, but whether the Rs 3-crore target for additional receipts will be achieved is far from certain, considering the political fall-out in case of strict implementation.

The risk of a political fall-out also explains the inadequate yield from the wheat de-hoarding drive, launched in Haryana and, to a lesser extent, in Punjab. Official collusion with wholesale traders, many of whom maintain stocks in the rural areas, is suspected. Reports from the districts suggest that the drive has been a virtual farce. None of the bigger sharks has been arrested, and no large stocks have been seized

Firestone tyres- made in India to suit Indian road conditions.

Firestone has been making strong tyres in Bombay for over 33 years. Tyres that meet the demands of the most difficult Indian road conditions.

Specially developed Firestone rubber compounds have the toughness and resilience needed to withstand wear and tear on rough roads.

The exclusive Triple-Strength Construction of Firestone tyres can take the friction of high speeds on highways.

Firestone tread patterns give the tyres a safety grip on wet roads and at intersections, for smooth braking and take-off. The wrap-around shoulder improves control on curves with road-hugging grip.

in any district of either of the two states.

Unlike in Punjab and Haryana where hardly any member of the ruling Congress has actively participated in unearthing hidden stocks of essential commodities, in Himachal such initiative has recently come forth from a nationalist youth organisation — the 'Him Sena'. In Simla town, the Sena, following the example of some student groups in Bihar, raided the godown of a leading businessman and located sizeable stocks of vanaspati, toilet soaps, and some other commodities. The authorities have not extended any co-operation to this organisation. There have been no seizures of stocks and no arrests of guilty traders in the town, though shortages and high prices have been rife. The frustrated Him Sena volunteers then gheraoed a senior food and civil supplies officer who had allegedly hushed up the case. But since then, enthusiasm has waned and shortages are being generally accepted as inevitable under the existing set-up.

AUTONOMOUS COLLEGES

Feeding Petty Chauvinisms

D Prempati

AFTER witnessing the many and various post-Independence educational reform measures — each coming to grief with the same alacrity as it was hailed with — one cannot believe that the creation of autonomous colleges is going to be the ultimate solution of the ills of higher education. The manner in which this proposal is being bandied about, almost like a swear-word, goes only to reinforce the impression that our academics have lost even the capacity to deduce lessons from one experiment before rushing on to another. One does not have to be cynical to conclude that as we tackle one problem, we create ten other problems, that being perhaps the only knack we have.

The most pressing problem of higher education is of identifying and tackling the problem of undergraduate teaching. The problem is so frightening that no academic wants to continue with ugly undergraduate teaching beyond the first five years of his career. The attractions of research and post-graduate teaching, as also of university and college administration, have been in no small measure due to a desire born of frustration to escape from undergraduate teaching. Understandably we have hardly any professors in our colleges who may have been recognised as such for their contribution to the organisation and teaching of their disciplines at the undergraduate level. Among the consequences have been a sharp devaluation of the college lecturer and a general erosion of the undergraduate teaching responsibilities of the senior faculty members. In the existing varsity structures which vary only slightly from centre to centre, the college organisationally is neither an academic constituent of the affiliating university nor a viable nucleus of higher learning. The shaping of the Indian college is so outlandish that it does not have the organisational scope to allow a senior faculty to grow, nor does it have any measure of prestige and attractiveness to retain the few bright youngsters who may have chanced upon this stepping stone.

Some such colleges are said to have reached a certain growth point where if given some academic autonomy they could further develop. Such autonomy means: (1) framing syllabi (2) enrolment (3) recruitment and determination of service conditions (4) teaching (5) conducting examinations and awarding degrees. Though the concept of autonomy from one affiliating university to another varies, the type of autonomy now being pressed for boils down substantially to framing syllabi and awarding degrees through home-examinations. To insist on this meagre basis that academic autonomy exists and can gainfully operate in the present Indian society which is a battlefield of big and small sectarian interests is on any reckoning a feat of naivete or a subtle gambit to accommodate the thousand and one contradictions of this disintegrating order. As with secondary education, whose problems we claim to have tackled through a few pace-setting model schools (perhaps modelled on public schools), we bring a similar elitist approach to bear on higher education and conclude that autonomous colleges which conceivably are collegiate counterparts of model or public schools, would similarly do the pace-setting and the field of higher education would be cleansed. It is symptomatic that the same old elitist approach which is as much a legacy of Macaulay's filtration theory as of the pretended Oxbridge orientation of our present rulers has been allowed such unrestricted free play even today when we talk so much about national education to integrate above all with our political objectives and vindicate itself as an instrument for social change.

National unity and social advance ought to be the minimum national objectives which no blueprint, educational or otherwise, can afford to overlook without serious loss to the nation. One could in this connection examine how secular forces already bruised and mauled badly are going to be finally defeated by colleges all in the name of autonomy. Our political understanding of secularism has meant a sort of equal state encouragement to all creeds and religions which in actual practice means the real difference between Pakistan and India is that while the former is an Islamic uni-religious state, the latter is a multi-religious state. Needless to say this meaning of secularism which at once gives the Indian ruling class the comfort of feeling advanced without any organic loss to its deep-seated obscurantism has proved rather handy and helpful in accommodating the several contradictions which political independence has brought in its wake. As if not to lag behind, the academics gleefully plumped for this perversion of secularism. How else can one explain its sequacious understanding by the last Education Commission (presided over by a well known physicist, to boot)? As a consequence, the academic problem today is not merely that of lack of secularisation but of de-secularisation now invoking autonomy and now constitutional safeguards.

About a secular and scientific approach which two Indian universities have the same terms of reference? Aurangzeb and Shivaji continue to receive outspokenly communal assesements. It is common knowledge how faced with revivalistic fury Jodhpur University capitulated and purified its conscience by dropping a piece of secular Hindi fiction. Take Tulsidas or the so-called Indian Renaissance literature or even the remote English literature: from classroom discussions one does not know what the teachers are discussing — whether scriptures plain and simple or some bizarre 'secular scriptures'? Not only Indian historical scholarship, but every other branch of knowledge as discussed on the campus has yet to be emancipated from the bonus-yielding 'secularism' of Government of India variety.

When the universities in their primary responsibility to control and eliminate non-secular forces have failed, it is not far-fetched to ask how the autonomous colleges are going to behave. Most colleges owe their origin to denominational or caste or communal initiative. How unabashedly the college names proclaim their sectarian and communal interests — SD, Christian, DAV, Muslim, Khalsa, Jat, Ahir, Kayastha, Agarwal! After witnessing the unedifying Aligarh spectacle of the Government of India slinking away from its own earlier secular protestations, it will be puerile to expect the smaller fry, that is the state governments and affiliated universities, to stick to the norm of academic excellence in giving autonomy to their colleges. Needless to say, academic excellence will be determined in direct proportion to the number of votes the college-sponsoring caste or community can muster locally. And to expect the universities to have the political orientation and intellectual guts to say no to these local political giants is to shut one's eyes to the quality of the recent academic leadership in our universities. Once autonomy is wrested, these colleges whose academic component more often than not tends to follow the dominant non-academic segment of their management will soon try to justify their academic utility by incorporating in, and reorienting, the syllabus to suit the special world view of their managements. For instance, one autonomous college will teach, as indeed one university does right now, that the Aryans being original natives did not come to India from outside, while the other college will religiously hold that all Brahmins, being survivors of foreign aggressors, must be banished forthwith. So much so that at no two autonomous colleges will they teach even a vaguely related Indian history or political science. Any extension of autonomy from university to college will further hasten the divisive politics and, in the process, academically institutionalise the swing from communalism to casteism — almost the only advance we have made all these years. This, in all probability, will preclude enrolment and recruitment of all such candidates as may not share the denominational or sectarian bias of the institution. And those who do will get admission and assessment at the expense of others having sounder qualifying claims. Such limited chauvinisms sprouted in and shrouding the syllabi, students and teachers of no two colleges will have any common norms and approaches. And between the two a big divide of incomprehension, incommunication and hostility will come to stand rocklike as indeed is already so between a Gurukul and a Jamia Millia, which are about the two institutions most colleges will graduate to, should autonomy be given institutionwise. Multiplying Gurukuls and Jamia Millias is no solution. What these institutions have done with their autonomy and what standards they have been able to achieve is, of course, no lesson to the elitist and non-secular forces which are pressing for autonomous colleges.

SHIPPING

Some Light on an Area of Darkness

THE India-Pakistan-Bangladesh Conferences, which control eastbound and westbound liner shipping trades between the Indian subcontinent and UK and the Continent, have published their Annual Report for the year 1973. This is indeed a commendable step, particularly because public knowledge of the operations of most shipping Conferences and rate agreements controlling liner trades of the Indian subcontinent is very limited. It is to be hoped that the lead given by the India-Pakistan-Bangladesh Conferences in this aspect of public relations will be emulated by other Conferences in this region. In the USA, for instance, shipping Conferences and rate agreements are subject to control and regulation by the Federal Maritime Commission, a government agency. The Indian subcontinental trades are not subject to such statutory control and shippers and traders do not get information from governmental authorities about the activities of shipping Conferences in the manner that their counterparts do *in the* USA. The Annual Report for 1973 of the India-Pakistan-Bangladesh Conferences will, therefore, be heartily welcomed by traders in these countries.

The Report is mainly concerned with the problems of member lines of the Conferences. It discusses subjects such as pooling and rationalisation, voyage time, bunker costs and availability of bunkering, consultation, the Code of Conduct, cargo-handling, port congestion and currency adjustments.

The Conferences have established an administrative structure with centralised control over all possible Conference actions resting with their London office. For maintaining close contact with traders in Conference spheres, local chairmen have been appointed at principal seats of Conference trades in India, Pakistan and Bangladesh, i e, Bombay, Karachi Calcutta and Dacca. Local secretariate have been established at Bombay, Calcutta, Chittagong, Cochin, Karachi, Madras, Tuticorin and Visakhapatnam.

Ever since 1960 the Conferences' main services have been organised on a pooled basis and sailing opportunities are offered on the basis of continuous assessment of trades' requirements. When pooling was introduced in 1961 the main argument advanced was that it would result in economy of scale in Conference lines' operations without affecting the flow of trades. The prices and costs of Conferences are susceptible to the prices and costs of other factors upon which Conference services are sustained and unless the Conferences' rate structure take care of the effects of cost and price variations on their services, their existence would be at stake. This is true, no doubt. However, the Report does not give any indication as to the measures taken by the Conferences to achieve economies of scale, excepting for the introduction of rationalised sailings which ensured 89 per cent to 93 per cent utilisation of space of ships offered in service. From the point of view of the economics of transportation it may be accepted that in a public utility service like shipping unutilised capacity remains a constant factor throughout a ship's life and in any pricing structure of services care is taken to allow for this phenomenon. Utilisation of 89 to 93 per cent of total capacity offered to the trades could be achieved only under pooling and rationalised sailings, with profits secured at higher levels by constant review of costs of service and increases in rates. However, some of the items of costs such as delayed port-time, rise in bunker prices, depreciation in value of tariff currency and deviation *via* Cape of Good Hope are covered by independent surcharges, with higher or lower percentages depending upon the actual conditions. Even so, between 1961 and 1973 the Conferences have imposed general rate increases of 114 per cent in the aggregate on their trades which falsifies their argument that pooling ensures economy of scale.

The Report, however, argues that because profit margins were falling or were non-existent in the period preceding pooling, rate increases would have been more frequent and higher had pooling not been introduced. Thus pooling appears to be a device to ensure a stable level of profits, with economy of scale, if it can be achieved, emerging as a byproduct. Pooling of trades has caused a measure of disappointment among traders as, in spite of promises, the standard of Conference services leaves much to be desired. Another aspect of pooling which it will be worthwhile to examine is to what extent it has effected the capacity of the Indian lines to cater to cross trades since these lines have to bear the major burden of carrying the Indian trade. Has their share of about 48 per cent in Indian trades been ensured at the cost of development of their capacity for serving other trades and therefore development of their shipping tonnage?

Apart from highlighting service problems the Annual Report covers an interesting issue. The Conferences have been thinking about the introduction of an advanced system of sea transportation and had constituted a committee to study as to which of a number of systems — unitisation, containerisation, barge carrying — would be suitable for the trades of the subcontinent. Here several problems as to draft length of ships, port facilities, etc, have got to be studied and port authorities have to be approached for their opinion on such systems. The Report of the Committee must be ready by now and its recommendations as to the most suitable system that can be adopted in the subcontinent to serve its sea trades with efficiency and without much extra cost will be eagerly awaited.

The Report alludes to visits of Conference delegations for consultations with shippers' associations and concerned government department in the subcontinent. The international shipping cartels were the first to appreciate the utility of mutual consultations with shippers and had evolved a 'discussion formula' even before the CENSA "Code of Conduct" was prepared in 1963. Although full cost data as prepared by independent chartered accountants formed the basis for all past negotiations for general rate rise between the All-India Shippers' Council and the India-Pakistan-Bangladesh Conferences, the method and processing of items of costs require scrutiny to understand the impact of cost increases on the Conferences.

The report holds out the possibility of another general rate rise in 1974. Since the majority of flag groups in the Conferences represent those countries which have endorsed the UNCTAD Code of Conduct, there should not be any difficulty in the way of the Conferences adopting the code to regulate their conduct.

Traditionally speaking, it is correct to say, as the Report does, that the ship's responsibility begins and ends at the ship's rail. However, in liner trades a custom has been built up over the years at some ports to absorb preshipment costs. This may not be called 'subsidy' in the true sense, but such costs are absorbed by the lines to ensure quicker despatch to ships which would otherwise suffer excessive costs for lifting in relation to the costs absorbed by them. Thus the absorption of preshipment costs by liners has an economic significance. The absorption of stevedoring costs is a complicated process and lines can be uncertain whether they are squaring up with such costs while absorbing them in liner rates of freight. If they are not, it means a stevedoring subsidy extended to cargo and a net outgo from their legitimate service dues. If the inter-Conferences committee finally decides to resort to FIO rates for the liner freight, most of the liner freight tariffs will represent the actual costs of liners for services rendered to shippers, with stevedoring costs to be absorbed by each of them.

Congestions at ports occur because of labour trouble, inadequacy of berths, seasonal breakdowns, as at Bombay in the rainy season, and terms of shipping time such as obtaining in contracts for sale at Calcutta. Surcharges are imposed by Conferences after observation of port performance over a period, during which lines stand to lose not only on expenses on standing charges but at times owing to rise in cargo claims on perishable goods or on account of inherent vice in cargoes carried. However, as the Report points out, the shipping lines cannot do much more than express their anguish and hope and make representations to port authorities through their committee at ports to improve turnround of their ships.

The world's principal currencies have been under pressure for some time. As a result of this, the India-Pakistan-Bangladesh Conferences, which quoted rates of freight in UK sterling, switched over to the US dollar which was then considered a stable currency. The US dollar also has been under pressure of late and in order to stall depreciation of their freight revenues because of fall in the value of the tariff currency, Conferences throughout the world have been imposing additional charges for maintaining the levels of their freight revenues. There is need for evolving some structure for taking care of such contingencies and a formula, which may not be hard upon either shippers or lines, is expected to ultimately emerge from the deliberations which are at present going on between this Conference and Shippers' councils in Europe and the Indian subcontinent.

DACCA

Faith, Hope and Poverty

Harish Chandola

BANGLADESH, which was very keen to normalise relations with Pakistan in order to bring about normalisation of relations in the entire subcontinent, had prepared a draft agreement of four points which it placed before Bhutto at the formal talks between the two governments on June 28, 1974. The four points were all-round co-operation between the two, particularly in trade, education, culture and sports; acceptance in principle of division of assets of Pakistan as they stood on March 25, 1971 when Bangladesh declared its independence, with Pakistan apportioning to Bangladesh within two months its share of easily quantifiable assets; repatriation of the remaining persons registered with the International Committee of the Red Cross for going to Pakistan, with appropriate appeals to the United Nations and its agencies for arrangements for their transportation from Bangladesh to Pakistan; establishment of diplomatic relations at embassy level.

Bhutto did not agree to any of these four proposals. All he said at the talks was that he had come on a goodwill visit and his talks were exploratory and therefore the question of his signing an agreement on any of the above points during the visit did not arise. But he did not close the door to further discussion on these subjects and has in fact invited the Bangladesh Prime Minister to Pakistan. The invitation has been accepted. A hopeful sign of the possibility of some measure of agreement in the future was indicated in Bhutto's message to Mujib from his aircraft after takeoff expressing the hope of opening trade relations between the two nations.

Bhutto was given a massive welcome by the people of Bangladesh the day he arrived, June 27. There were about 5,000 people at the airport to greet him and about 100,000 had lined up the streets along the three-mile stretch from the airport to Bangabhaban where he was to stay. As his car passed the people, shouts of "Pakistan Zindabad" and "Bhutto Zindabad" were raised all along the route.

This happened in spite of the fact that for over a week before his arrival, the Bangladesh press, radio and television had launched an intense campaign to remind the people of the national oppression of Bangladesh by Pakistan, of the atrocities of the Pakistani army less than three years ago and of Bhutto's support for the Pakistani army in its efforts to crush the resistance and his diplomatic efforts in Peking and the United Nations to mobilise material and moral assistance for Pakistan to keep Bangladesh in bondage. The Bangladesh campaign had become so intense that two days before Bhutto's departure for Dacca, a spokesman of the Pakistan government announced that the Prime Minister was considering whether he should proceed on his goodwill visit in view of the campaign by Bangladesh radio and TV against Pakistan. The Bangladesh government then promptly said that it would take to task those responsible for the campaign and that it was looking forward to the visit. The campaign died down abruptly.

By relating the horrors Bangladesh had suffered during the Pakistani days, the government was obviously trying to tell its people that they should not forget what Pakistan and Bhutto had done in the past to oppress and suppress Bangladesh while receiving him. But the Bangladesh people who now face the kind of economic hardships which they never did during the Pakistani days forgot, in spite of the reminders, their bitterness towards Pakistan and looked with great hope to Bhutto's visit which they believed might result in resumption of trade between the two countries and in Bangladesh then receiving cheap rice and cloth and consumer goods at reasonable prices from Pakistan again, like before.

Rice now sells in Bangladesh at taka (rupees) four a seer (metric measures have not been introduced here yet), while in the Pakistani days it hardly ever sold for more than 75 paise. The cost of almost everything has risen by 400 per cent or over and many consumer goods are just not available. Bangladesh government circles now openly acknowledge that hoarders, profiteers and smugglers have become very active and together with corrupt officials they are causing very serious problems to a country whose economy is already stagnant.

The welcome given to Bhutto by the people and their shouts of "Pakistan Zindabad" did not mean that they were seeking the re-establishment of Pakistan over Bangladesh. It only showed that the hopes and aspirations of a better life they had nurtured at the birth of their nation had faded considerably and that they were now looking forward to the benefits that trade with Pakistan might bring. The popular welcome given to Bhutto was not a commentary on the popularity of Pakistan but on the sad state of affairs in Bangladesh.

The economic and political difficulties of the Bangladesh government must have become apparent to Bhutto immediately on his arrival. The mainstay of Bangladesh's economy, the jute industry, has not picked up production, which is now not even half of what it used to be in the Pakistani days. Foreign assistance to Bangladesh has been greatly curtailed from the two billion dollars received in the first two years of its coming into being. Because of the problem of law and order, the climate for foreign investment is not favourable. Management and technical skills are lacking and generally there are gaps in its economy which nobody knew how to fill.

Bhutto hinted that Pakistan, by the opening of trade with Bangladesh, and the oil-rich Islamic nations by providing credits to it and perhaps even investments, could come to the help of Bangladesh. Bhutto was on very good terms with the Islamic countries which had met at the Lahore summit, last February, on his invitation. If he spoke for Bangladesh's needs with them, they would listen and come forward with help. But Bhutto perhaps wanted a price for this. He did not say what that price would be.

He, however, kept on saying that the balance of power in the Indian subcontinent had changed with India becoming a nuclear state. He said the subcontinent now had a nuclear state and two non-nuclear states, Pakistan and Bangladesh. As far as Pakistan was concerned it was seeking international guarantees for its political independence and sovereignty against "India's nuclear blackmail". He did not say that Bangladesh should join it in seeking such guarantees. But there is absolutely no doubt that he wants political support from Bangladesh for his argument that India has changed the balance in the subcontinent by becoming a nuclear state.

In Dacca he also said that efforts to normalise relations between his country and India had suffered a "setback" because of India exploding a nuclear device. Because of this development, he was not prepared to normalise relations with India until his political objective was achieved. The objective seems to be to portray India as a country which has opened the way for other nuclear aspirants to develop nuclear devices and as a country which has become a threat to its non-nuclear neighbour, Pakistan. He named the other nuclear aspirants as Israel and South Africa and his purpose in naming these two was to try to isolate India in the developing and non-aligned worlds by implying that should Israel follow India's lead in ignoring the plea for non-proliferation of nuclear weapons then it would become a much greater threat to the Arabs and so would South Africa to the African states.

Yet, it was apparent that Bhutto had not come empty-handed to Dacca. He had for instance brought with him M Haroon from an eminent industrialist family which had run an insurance firm in the then East Pakistan with which Mujib had been connected. Haroon is reported to be still on the friendliest of personal terms with the Bangladesh Prime Minister. The whole lot of people who came from Pakistan with Bhutto kept on saying that they had already selected Haroon as their future ambassador to Bangladesh, and that they had even brought him with them. There would have been no point in selecting an ambassador if it was not taken for granted that diplomatic relations were to be opened. Bhutto had obviously come prepared to announce establishment of diplomatic relations with Bangladesh. But when he arrived in Dacca something made him hold back. Nobody knows what that was. It was however certainly not true that Bangladesh wanted Pakistan to agree only to a division of assets and to taking back the remaining Urdu-speaking people who wanted to go to Pakistan. Bangladesh had also asked for the opening of trade and the establishment of diplomatic relations, to which Pakistan did not agree at Dacca.

This is only an announcement and not a prospectus.

WG FORGE & ALLIED INDUSTRIES LIMITED

formerly Wyman-Gordon India Limited (Incorporated under the Companies Act, 1956) Registered Office: Central Bank Building, Mahatma Gandhi Road, Bombay 400 023.

Announcement regarding issue of 13,80,000 Equity Shares of Rs. 10/- each for cash at a premium of Rs. 2.50 per share.

Persons interested in full details may obtain copies of the Prospectus and Application Forms from the Registered Office of the Company, Brokers or Bankers to the Issue mentioned hereinunder.

The subscription list for the issue will open at the commencement of banking hours on Wednesday July 24, 1974 and will close at the close of banking hours on Friday August 2, 1974 or earlier at the discretion of the Directors but not before the close of banking hours on Saturday July 27, 1974.

An application will be made to the Stock Exchange, Bombay for permission to deal in and for an official quotation for the equity shares of the Company.

History and Development of the Company

The Company was incorporated on November 9, 1959 originally under the name of Almag Foundry Private Limited. The Company entered into a technical and financial collaboration with Wyman-Gordon Company of U.S.A., in the year 1961 and changed its name with effect from February 23, 1962 to Wyman-Gordon India Ltd. at which time it also became a public limited company by virtue of Section 43-A of the Companies Act, 1956. Again, with effect from March 22, 1973 the Company changed its name to the present name, namely, WG Forge and Allied Industries Limited.

The Company was incorporated with the objects stated in its Memorandum of Association.

Present Operations

The financial and technical collaborators of the Company are Wyman-Gordon Company, U.S.A., leaders in the field of manufacturing forgings. The Company had entered into an agreement for knowhow and other services with the collaborators on November 28, 1961 for a period of 10 years, in the manufacture of forgings and castings. During this period, the Company has assimilated the sophisticated technology provided by the collaborators and has improved on it.

The Company commenced production of forgings in 1962 and since then has expanded its operations considerably. Its products have found wide acceptance in all industries where forgings are used. The Company also caters to the requirements of Defence, Atomic Energy Establishment, Railways and Aeronautics industry.

Proposed Activities

The Company proposes to expand its production of existing range of forgings and manufacture new forgings by Pour Forge process and diversify into machining of crankshafts for which letters of intent have already been obtained from the Government of India. For the purposes of manufacturing forgings by the Pour Forge process, the Company has entered into a new technical and assistance agreement with the collaborators for a period of five years from June 24, 1974. As per this agreement, the collaborators will provide the technical knowhow and information relating to equipment, raw materials, specifications and drawings. The collaborators would also provide the qualified engineers and technicians to aid the Company. The Pour Forge process will contribute to improvements in efficiency and effect economies in production. The demand for crankshafts is expected to grow considerably with the expansion of manufacturing capacity for products such as agricultural tractors, commercial vehicles, multi-cylinder diesel engines and automobiles. With the implementation of the above programme, the Company expects to achieve a commanding postion in the forging industry in India.

The cost of the proposed expansion scheme and the crankshafts project is estimated at Rs. 284 lacs which will be partly financed through the proceeds of this issue including premium.

Profitability, Prospects and Dividends

The Company is one of the leading manufacturers of steel forgings in the country. The products of the Company have a ready market. Demand for steel forgings has grown rapidly in the recent past and the Company's working results have shown a commendable improvement. The Company declared dividends of 10% from 1969 to 1972. For the year ended December 31, 1973, the Company stepped up the dividend to 15% on the capital as increased after issue of three bonus shares for four shares in 1973.

After the implementation of the expansion scheme and the diversification project for the manufacture of finished crankshafts, the profitability of the Company is expected to improve still further. The Board of Directors is of the opinion that barring unforeseen circumstances, the Company will make sufficient profits to pay a satisfactory dividend on the equity share capital.

SHARE CAPITAL

	Face Value (Rs)
A. Authorised: 50,00,000 Equity Shares of Rs. 10/-each	5,00,00,000
B. Issued, Subscribed and Fully Paid-Up: 17,50,000 Equity Shares of Rs. 10/- each of which Wyman-Gordon Company, USA holds 8,75,000 shares.	1,75,00,000
C. Present Issue: For cash at a premium of Rs. 2.50 per share. 13,80,000 Equity shares of Rs 10/- each at a premium of Rs. 2.50 per share	1,38,00,000
D. Out of the Present Issue: 1,60,000 Equity Shares of Rs. 10/- each at a premium of Rs. 2.50 per share have been reserved for allotment to Life Insurance Corporation of India for cash	16,00,000
80,000 Equity shares of Rs. 10/- each at a premium of Rs. 2.50 per share have been reserved for allotment to Unit Trust of India for cash.	8,00,000
3,00,000 Equity shares of Rs. 10/- each at a premium of Rs 2.50 per share have been reserved for firm allotment to the directors and employees of the Company (who are Indian nationals resident in India), for cash provided the value of shares which may be so alloted to any one individual director or employee shall not exceed Rs. 2,000/-	30,00,000
	54,00,000
E. Now offered to the Public for Cash at a Premuim of Rs. 2.50 per share: 8,40,000 Equity Shares of Rs. 10/- each at a premium of Rs. 2.50 per share (to which will be added the unsubscribed portion of the 3,00,000 equity shares reserved for firm allotment to the directors and employees of the Company).	84,00,000

TERMS OF PAYMENT

	per share (Rs.)
On application	4.00 (Rs. 2.50 on capital account & Rs. 1.50 on premium account).
On allotment	3.50 (Rs. 2.50 on capital account & Rs. 1.00 on premium account).

The balance of Rs. 5.00 per share will be called in one or more calls to be made by the Board of Directors within 12 months from the date of allotment.

BOARD OF DIRECTORS

1. Shapur Phiroze Rao (S/o late Mr. Phiroze M. Rao)
6-A, Sakar Apartments, Sir Pochkhanawala Road, Worli Bombay 400 025.
Chairman & Managing Director.

Many Faces of Untouchability

S D Kulkarni

The Untouchables in Contemporary India by J Michael Mahar (ed); Tucson, University of Arizona Press; p xxxii + 498.

TILAK once publicly declared that he would denounce even God if He accepted untouchability. Gandhi was also equally emphatic and wrote "Swaraj is as unattainable without the removal of the sin of untouchability as it is without Hindu-Muslim Unity". The Constitution of India abolishes untouchability and forbids its practice in any form. The enforcement of any disability arising out of "untouchability" is made an offence punishable in accordance with law (Article 17). In pursuance of this objective, Parliament passed the Untouchability (Offences) Act in 1955.

In spite of all this the spectre of untouchability still haunts India. Persons belonging to the scheduled castes are still victims of inhuman atrocities. In December 1968 upper class landlords burnt down the houses of scheduled caste labourers, killing 42 men, women and children. Surprisingly enough, all the 23 landlords prosecuted in this case were acquitted, 15 in the Sessions Court and 8 in the Madras High Court.[1] In August 1972, in Erangawn in Nagpur district a Buddhist youth Ramdas Ran-navare was tortured and killed as he was suspected of having used black magic to spread cholera in the village.[2] Recently in a riot between caste Hindus and scheduled castes, two scheduled caste persons were killed in Ranmalpur village in Gujarat.[3] Numerous other such instances can be given. Besides these major atrocities, minor insults and conflicts are a daily occurrence everywhere.

This is a collection of papers contributed by American scholars belonging to different disciplines; there is also one paper by an Indian sociologist, Andre Beteille. The book is divided into four parts. This makes the reviewer's task difficult because the contents of the different parts overlap.

In his introduction Opler has expressed what may be called the general consensus of the studies:

> "Thus it seems fairly certain that caste and one of its polar expressions, untouchability, will not soon be swept away by a frontal attack. Caste will weaken noticeably only when the themes which lend it dignity and meaning lose momentum and general acceptance. Several of them are undergoing some slow erosion, and the sharpest edges of caste contrast can be expected to undergo continual blunting. Still, the total edifice shows no signs of crumbling yet, and what many beholders consider to be an anomaly in a modern state — caste and untouchability in India — are quite sure to persist for some time to come to perplex those scholars who have been impatiently waiting for class or national consciousness to erase them from the scene" (p 12).

The first part of the book deals with the untouchable's role in rural communities. It contains three essays. In one of these Mahar describes various disabilities suffered by untouchables in a north-Indian village. He also points out that, in spite of common disabilities, the four untouchable castes in the village do not think of themselves as sharing a common group identity. This is, of course, true of the country at large. One of the reasons for the slow progress in eradication of untouchability is the lack of unity among the untouchables themselves. Mahar also shows how adult franchise has given a new instrument of power in the hands of the untouchables. The essay is based on two surveys of Khalapur, a village in Uttar Pradesh, the first conducted in 1956-58 and the second in 1968-69. The latter investigation "revealed some improvements in the economic conditions of the untouchables, but little overt change in their social and political status in the village" (p 31).

Mencher, however, feels differently in her study of some untouchable castes in Tamil Nadu. She remarks that "the ultimate resolution of the many problems confronting the Paraiyans, and other untouchable castes, is dependent in large measure upon the overall economic development of the region... The Paraiyan's problem in the village is the problem of the rural proletariat everywhere, with the added stigma of poverty" (p 56).

The most interesting paper in this part is by Neale who studies harijans as a "marginal" group in rural India: marginal in the economic sense and marginal in the view of non-Harijan members of Hindu society. Most of the untouchables do not own land or enjoy the benefits of protected tenancy. They earn their living by working on the land of others and/or attaching themselves to landholding cultivators. How will they fare in the changing rural structures and activities? Medium farming is taking root in India. It is possible that the families of farmers may work longer and meet a large part of their need themselves. With the increase in population the rural labour supply is increasing. The increase relates to caste Hindus as well as untouchables. It is quite possible that caste Hindu labourers may get preference in employment, forcing the untouchables out of work. Their position will depend upon whether the demand for agricultural labour increases substantially with the introduction of modern farming techniques. Neale remarks that "any specific predictions about the effect of new capital must be made case by case and crop by crop". This is quite an interesting field for researchers in socio-economic matters. With capitalist commercial and medium-scale farming the untouchable agricultural labourers will face a dilemma. If they demand higher wages they will lose employment, if they don't their condition will not improve in spite of a general improvement in economic conditions. One must point out that the leaders of scheduled castes particularly, B R Ambedkar, have been aware of this problem and have consistently demanded nationalisation of land. Whether this is probable and desirable is, of course, a different matter. This reviewer feels that Neale should have expanded this theme. His analysis of scheduled caste agricultural labourers as marginal labourers both from an economic and a social point of view is quite right and needs elaboration, particularly in regard to its policy implications. Land ownership is the most important status symbol and source of power in rural areas. All the states have declared that scheduled castes will be given priority in the redistribution of land becoming available as a result of the imposition of ceilings. But in actual practice very little land is given to them. Caste Hindus use their power (and they have ample power) to grab the land through fair means and foul. In a study of land distribution in some of the villages in Maharashtra, Mulla points out that most of the landless households from the backward classes could not secure any government lands,

in spite of the first place given to them in the priority list.[4]

The second part of the book covers religion and reform and contains five essays. Zelliot's study of Gandhi and Ambedkar brings out the contrast in their approaches and yet the complementary nature of their work so far as the eradication of untouchability was concerned. Ambedkar's approach seems to have gained the upper hand as post-Independence efforts to eradicate untouchability have been mainly through legislative and political measures. However, the inadequate results of these do point to the necessity of social reforms through a change of heart. Thus it seems that only a combination of the approaches will deliver the goods. There can be no two opinions about Zelliot's remark that "the paths of Gandhi and Ambedkar, while they often diverged, ultimately converged, forcing on the Indian conscience the problem of untouchability as an issue of national concern" (p 91).

However, economic stagnation has to some extent nullified their efforts. As Zelliot puts it:

> "For the majority of untouchables, who are landless villagers, the only open road to a higher economic and social status entails leaving the security of their village and somehow obtaining education. Gandhi may have softened the Hindu heart. Ambedkar may have awakened self-respect and an interest in politics among the untouchables, but economic dependence upon others continues to restrict the upward movement of the untouchables" (p 95).

One may point out that experience shows that even "leaving the security of their village and somehow obtaining education" does not in many cases lead to a higher social status, though they may lead to a higher economic status.

Lynch's perceptive description of the myth and charisma of Ambedkar that led to the conversion of Agra jatavs to Buddhism will be of interest to students of sociology. Fiske has described the working of the scheduled caste Buddhist organisation. He has pointed out that even prior to the Ambedkar-led conversion movement, there were some such minor movements in India. His conclusion is that there are many (Buddhist) organisations and that "the intangible network linking the different groups, their leaders, and the masses, possesses a power that is difficult to deny". Indeed, if a powerful leader is able to bring all the Buddhist organisations and masses under one leadership, it will be a formidable force which will facilitate the work of the eradication of untouchability. However, the chances of this being done appear very remote.

Babb's essay on the Satnamis illustrates how a religious movement gets involved in political strifes if it is confined to a consolidated group. Alexander's study of neo-Christians of Kerala shows how the caste system with its ugly aspect of untouchability has crossed the frontiers of Hindu religion and has spread its influence even in other religions. Conversion of low caste Pulayas has not brought them into the fold of Syrian Christians, though many of the latter follow "polluting" occupations such as dealing in fish, toddy, leather and meat. Pulaya Christians are not given food inside the house of a Syrian Christian, but only outside it in broken dishes or leaves. After eating food served in a dish the Pulaya must wash the dish before returning it. Syrian and Pulaya members of the same church conduct religious rituals in separate buildings. Thus, there is a great distance between the Pulaya and Syrian Christians in all spheres of life. However, there appears to be some difference in the caste character among the Hindus and Christians. Converts to Christianity from the Izhava caste considered untouchable have been accepted as members of the Syrian Christian community, because of their relatively high economic status. Alexander concludes that "consequently it appears that the reason for the non-integration of the Pulaya Christians must be due to considerations other than their identity as untouchables" (p 161). This reviewer feels that the conclusion does not follow logically from the facts stated. What about poor converts from high castes? Are they not accepted as equal by Syrian Christians? If so, the right conclusion would be that the reasons for the non-integration of the Pulaya Christians are poverty and untouchability, and not poverty alone.

The third part of the book is titled "Government Efforts to Abolish Untouchability" and is, in the opinion of the reviewer, the most important part of the book. The actual coverage of the two essays in this part goes beyond what is indicated by the title. Dushkin in her essay 'Scheduled Caste Politics' describes government attempts to deal with the problems confronting the scheduled castes. These fall in three categories. First, there are several constitutional and other legal provisions which remove discrimination against untouchables and grant them the same rights as other citizens. Second, general development and welfare programmes to aid landless agricultural labourers, municipal slum-dwellers, or other low-income groups benefit scheduled caste individuals who form a large part of such groups. Third, there is 'protective discrimination' which includes scholarships, loans, grants and job reservations. According to the author, government efforts to remove untouchability deal more with the secular condition than the untouchability of the scheduled castes. "By design or by happenstance, it [the government] has been more concerned with power and poverty, education and employment, than with pollution and related disabilities."

The benefits offered to the scheduled castes are of two main types: (1) reservations in legislatures and local government institutions, government employment and higher educational institutions; and (2) financial assistance, administered through a variety of welfare schemes. The author finds that "caste welfare schemes have indeed been small and quite scattered. The only programmes of any real size or importance have been in education" (p 178).

However, in spite of these measures, the untouchables lag behind the general population in educational attainments. So far as government jobs are concerned the author finds that "it is the clerical and other petty white-collar posts in the class III category that are most affected by reservations". He concludes that for almost all forms of protective discrimination "even on paper, in the actual legal provisions and administrative rules, the concessions are much more limited than they seem to be at the first glance. And this is only what is on paper. Poor implementation reduces them still more" (p 186).

The author has analysed the system of reservations for the scheduled castes in the legislatures. Adult franchise has given some political power to the scheduled castes. Some scheduled caste leaders have used their people as 'vote banks' to bargain for political privileges, sometimes for the community but many times for themselves. The political goals of the reserved seat system were power and integration. The weak minority was given a fair share of power to represent its political view and to protect its interests and to provide opportunities for full participation in the political life of the country on honourable terms. Experience shows

that the scheduled caste representatives in legislatures have sometimes used their strength to get more benefits for the community, but on the whole for various reasons they have not acted *en bloc* and have not used their strength effectively.

Protective discrimination has also its disadvantages. It has fostered the growth of a "new class". These concessions have been utilised by a small fortunate class and "with the operation of the system over years, the gap between these more fortunate ones and the rest of the untouchables seems to have widened". The gap exists among castes as well as within castes. Protective discrimination has also created a sort of animosity between the recipients and others. This is particularly so in the case of admissions to institutions imparting higher education and promotions in service. It has also created a belief that removal of untouchability is a state responsibility. "The very existence of all the government provisions, or the belief that they exist, seems to justify inaction by private citizens. Again and again, we are told that untouchability does not exist any more because it was abolished over twenty years ago by the Constitution. The Untouchability (Offences) Act, 1955, takes care of the few places where it may still exist. Besides, the scheduled castes have all those benefits now" (pp 214-15). Again it is argued that because of protective discrimination there is danger of building a vested interest in the survival of untouchability. Four ways are proposed to eliminate protective discrimination: shifting the concessions to bases other than caste, imposing time limits on them and gradually letting them lapse, stratifying the castes on the schedules into less and more backward, with the concessions adjusted accordingly, and taking the more advanced castes off the lists of those eligible for benefit. All these ways are fraught with innumerable difficulties and their acceptance appears to be a near impossibility in the near future.

The author finds that protective discrimination as a whole has become a mechanism for social control, an instrument of distributional politics, a game played by both sides, recipients as well as donors. Reserved seats do not appear to confer effective power in the hands of the scheduled castes to improve their general position. "The kind of power that will be respected in the long run will have to be generated outside the legislatures and beyond the devices of protective discrimination" (p 226).

The second essay in this part by Marc Galanter, "The Abolition of Disabilities — Untouchability and the Law", is the best paper in the whole book and deserves careful study. According to Galanter the British in the early years of their rule took care not to offend the caste Hindus by giving any support to the so-called low castes against them. Civil laws protected the exclusion practices of the caste Hindus particularly in religious and social affairs. The courts were reluctant to provide remedies in cases where caste Hindus tried to enforce their prerogatives against the lower castes. Even the criminal law was interpreted to give a broad immunity to the efforts of higher castes to keep the lower castes in their place. The author sums up: The overall impact of the law on untouchability in the (early) British period is difficult to assess. The law opened some possibilities for advancement and change to the lowest castes, as it did to others ... It did not provide an instrument for aggressively suppressing the untouchables, but the law provided a resource with which higher castes could protect their claims and in some instances perhaps even tighten their hold on valued resources to the exclusion of lower castes (p 237).

After the beginning of the twentieth century some legislative measures were adopted by various provinces to remove some of the disabilities suffered by the scheduled castes. Later on in 1950 the Constitution abolished untouchability "in all its forms". However, as the author points out, the Constitution does not define untouchability, nor is it clear what constitutes its "practice in any form" or a disability arising out of untouchability. Various courts have interpreted these terms in different ways. The Untouchability (Offences) Act of 1955 was designed to eradicate untouchability. However, the author has, with the help of some tables, pointed out "that the Untouchability (Offences) Act has not fared well in the High Courts, in contrast with the earlier state legislation, which generally received favourable interpretations from these courts". The Act forbids denial of facilities and services "on the ground of untouchability". This makes conviction difficult since states of mind are difficult to prove. Again, conviction may not be possible if discrimination is not exclusively aimed at untouchables. Thus the Allahabad High Court reversed the conviction of a hotel keeper who had put up a sign stating that the hotel would serve only some specified castes. Similarly, in a case where the dhobis refused to render services to chamars on the ground that they would lose the trade of other Hindus, it was held that this was not a discrimination 'on the ground of untouchability'. Moreover, the Act is not clear in the case of facilities which are used by the "public" but are not technically public. These problems are not insurmountable as such but the author feels that less and less effective use of the Act will be made in future.

In general it appears that there has been some decline in the level of disabilities suffered by the untouchables. Even in rural areas there is a general softening in the vigour of the disabilities. However, resistance to change is great, though it is often indirect and is rarely articulated publicly. Galanter offers a few generalisations: Disabilities have, it seems, declined more in urban than in rural areas; they have declined more in public and occupational life than in social and family matters; they have declined more among the educated than among the uneducated; more among men than among women. The highest castes are, it seems, generally more accepting of change than the middle groups. The higher among the untouchables are the greatest beneficiaries of these changes; their disabilities have declined more than those of the lower groups, especially the sweepers (p 262).

This reviewer who has some experience of surveys of scheduled castes can add that the disabilities are less in villages which are multi-caste than those where the majority of the population belongs to one caste. Again, the disabilities are severe where the majority caste is rich than where it is poor. The rich middle caste peasants sure of their pecuniary and political power take a special pride in denying the scheduled castes their newly acquired privileges. This was the experience not only in villages where the Maratha was the prominent caste but even when other castes, e g, Banjari, were prominent.

Galanter concludes: "Most untouchables continue to suffer under disabilities which are both onerous in themselves and which severely restrict their life chances. The public disabilities most often reported are exclusion from restaurants and hotels (and restrictions on the use of utensils), restrictions on the use of wells and other water sources, denial of services by barbers, *dhobis*, etc, and, in rural areas, denial of equality in seating arrangements, and exclusion from accommodation ... All of this exists against a background of widespread harassment of those who assert their right to equality and a pervasive discrimination which bars even the more fortunate urban and educated untouchables from full social acceptance and full participation in society" (p 262).

There is at present a wide gap between the law on the books and the law in operation. Equivocal law has helped power-holders, intellectuals and educated urban dwellers to believe that untouchability is gone or is going, without paying the political cost that a strenuous attack on it would entail.

In fact, it is possible to make the law more effective. For this Galanter has offered certain useful suggestions. At present it is an offence to enforce a disability on grounds of untouchability. This can be changed to "arising out of untouchability" as stated in the Constitution. This will widen the scope of the Act. Secondly, the Act should be amended to make it clear that it applies to any property by whomsoever owned, which is used by the public and not only to property that the public has a legal right to use. Thirdly, improvements should be made in the implementation of the Act by appointing special magistrates and by the establishment of machinery to guide and co-ordinate enforcement activity.

Part IV of the book deals with social and psychological responses to change of status. It is probably the weakest part of the book and the first two essays contain translations of some Marathi stories dealing with this issue, interpreted in psychological jargon. Some of the actual incidents described by Isaacs illustrate the problems faced by the scheduled castes in different parts of the country in a better way than these stories. One can easily accept his conclusions about educated ex-untouchables: They want to leave their past but the society does not allow it. They get separated from their own community but do not get assimilated in the wider community. They have to depend on their caste for marriage and other things.

However, it would have been better if Isaacs had avoided suggesting that some common surnames among the scheduled castes have been adopted because of certain reasons like 'Gaikwar' coming from Gaikwar of Baroda or 'Shinde' from the famous social reformer Vithal Ramji Shinde.

Beteille in his essay "Pollution and Poverty" emphasises the economic aspect of this problem. Genuine attempts to raise the social position of the scheduled castes have been defeated by a variety of material constraints. The scheduled castes suffer from the twin stigmas of poverty and pollution, the one strengthening the other. Due to various tenancy laws there is large-scale eviction of scheduled caste tenants and more and more of them are becoming agricultural labourers. The tendency to pay wages in cash rather than in kind has also affected them adversely.

Beteille thinks that in a sense both Gandhi and Ambedkar failed. Gandhi failed because the change of heart did not go deep enough and Ambedkar failed because conversion has not led to escape from the stigma of pollution. This reviewer is unable to accept this conclusion. It is not proper to expect that the practice of untouchability prevailing in Hindu society for more than two thousand years would disappear completely in a few years. This reviewer feels that in a way both Gandhi and Ambedkar have succeeded in starting the process of eradication of untouchability, one from the side of the caste Hindus and the other from the side of the scheduled castes, one with emphasis on change of heart and the other on legislation and similar measures. If these efforts are pursued with vigour it will be possible to get rid of this evil for good by the end of this century.

In spite of being a compilation of essays, this book is a good aid to the understanding of the problem of untouchability. The reviewer feels that as the practice of untouchability and the progress made to eradicate it as also the conditions of the scheduled castes differ from state to state, state-wise rather than all-India studies of the problem will be more useful both for understanding of the problem and formulation of policy. One hopes that Indian scholars will pursue the problem further. The book will provide them some guidelines; besides a very exhaustive bibliography. This is a book which deserves close study by students of social problems and social workers.

Political Mismanagement of the Economy

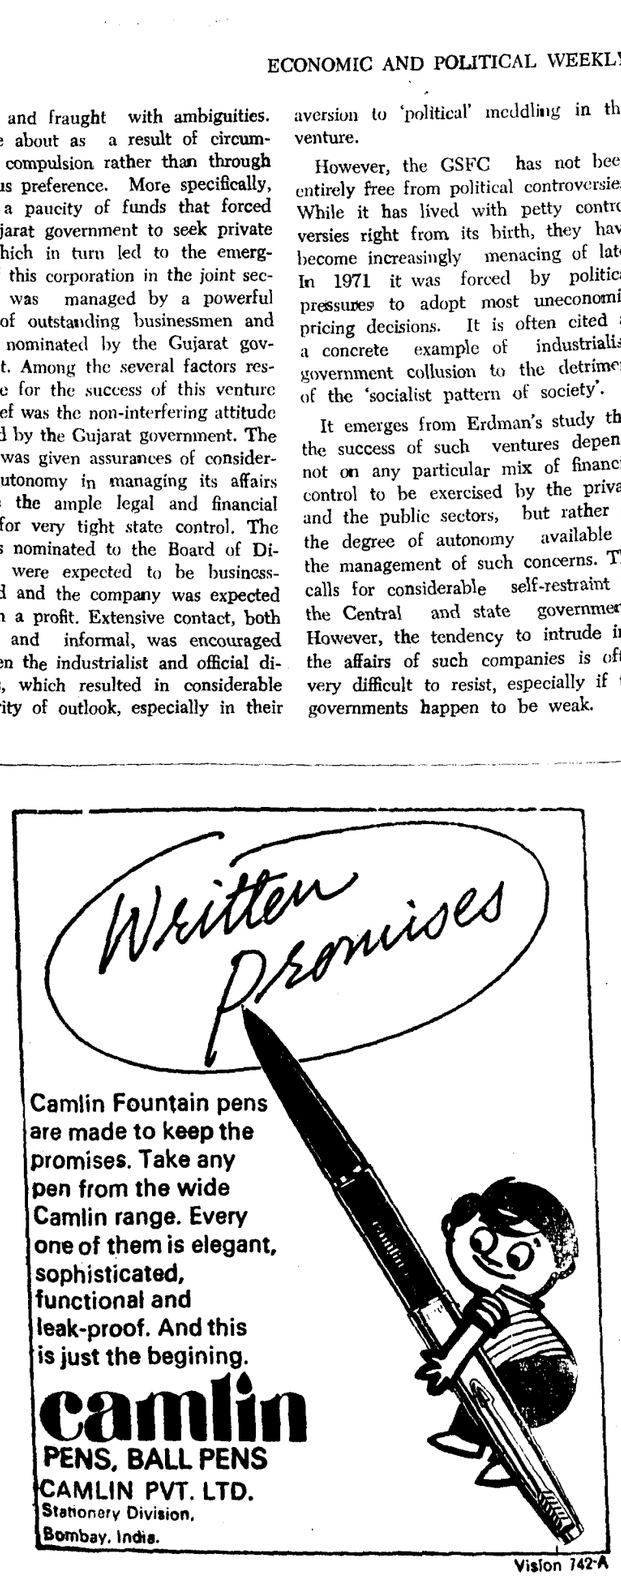
Rajesh K Agarwal

Crisis of Indian Economy by Balraj Mehta; Sterling Publishers, Delhi, 1973; pp 192; Rs. 20.

Politics and Economic Development in India by Howard L Erdman; D K Publishing House, Dehli, 1973; pp 136; Rs 25.

WRITTEN in journalistic style, Mehta's book presents a bird's eye-view of the major problems presently besetting the Indian economy. His book is not purely an economic analysis but rather a study of India's political economy. "The more the political leadership, which runs the affairs of the state, weakens and is either unwilling or unable to make the requisite effort to organise and carry out economic development, the more anxious it becomes to take shelter behind slogans and vague phrases in an unsuccessful attempt to impress in an unsuccessful attempt to impress public opinion". This appears to be the author's main criticism which runs through his entire study. Anyone familiar with the current state of our economy would indeed be hard pressed to dismiss this stand.

The Indian economic scene has been divided into three distinct periods — the first four years after the turmoil of Independence and partition of the country were a period of taking account of resources and preparing for development; the next 15 years saw the implementation of three Five-Year Plans with significant progress on a wide front; since the mid-sixties the economy has been subjected to severe strains making little progress and essentially marking time. Mehta's main concern is with this last period. The first half of his study is a scathing attack on the benign neglect, incompetence and lethargy of our political leadership. The period following the close of the Third Plan has seen a three-year plan holiday followed by a half-hearted implementation of the Fourth Plan. This has resulted in creating a wide gap



between stated objectives and actual achievements, which in turn has ushered in an atmosphere of uncertainty and increased social tensions within the country. The role of the Planning Commission, which was responsible for the impressive achievements of the first three Plans, has been greatly diminished. "Reappraisal of plans", according to the author, "has become the primary activity of the Planning Commission even as plan implementation has become nobody's business for the last ten years".

The second half of the book presents an interesting appraisal of policies and performance since the mid-sixties of such sectors of the economy as agriculture, foreign aid, the private and public sectors, wages and prices, and industrial relations. Here again the impression conveyed is of indifference, mismanagement, political interference and tension between the bureaucrats and technocrats resulting in poor performance at heavy cost to the nation. The steel industry is one such example — from a cry of surplus capacity and production in the sixties, the country today is confronted with a severe steel shortage acting as a major bottleneck in the functioning of the national economy and compelling large and costly imports. "The indifference of the bureaucracy in the steel ministry and of the top management of the steel enterprise in the public sector, Hindustan Steel Limited, except to their personal power and ambition, was so overwhelming at one time that it would be incomprehensible to ordinary minds", the author states. The mismanagement of the Fertiliser Corporation of India is attributed entirely to the infighting and tension between bureaucrats and technocrats. The author feels that the role of the technocrats has become subservient to that of the bureaucrats since the end of the Nehru era, and the latter, who know little about industry, now occupy all the top jobs in the public sector enterprises or foreclose them as cushy sinecures for their post-retirement period.

Unable to improve the functioning of the public sector and under pressure from private industry, the government is now promoting what has come to be called the joint sector. Erdman's book is a timely and scholarly case study of the emergence and working of the Gujarat State Fertiliser Corporation (GSFC) — perhaps India's first joint sector venture. This study suggests that the birth and evolution of the GSFC as a joint sector venture was difficult and fraught with ambiguities. It came about as a result of circumstantial compulsion rather than through conscious preference. More specifically, it was a paucity of funds that forced the Gujarat government to seek private help which in turn led to the emergence of this corporation in the joint sector. It was managed by a powerful group of outstanding businessmen and officers nominated by the Gujarat government. Among the several factors responsible for the success of this venture the chief was the non-interfering attitude adopted by the Gujarat government. The GSFC was given assurances of considerable autonomy in managing its affairs despite the ample legal and financial bases for very tight state control. The officials nominated to the Board of Directors were expected to be business-minded and the company was expected to earn a profit. Extensive contact, both formal and informal, was encouraged between the industrialist and official directors, which resulted in considerable similarity of outlook, especially in their aversion to 'political' meddling in the venture.

However, the GSFC has not been entirely free from political controversies. While it has lived with petty controversies right from its birth, they have become increasingly menacing of late. In 1971 it was forced by political pressures to adopt most uneconomic pricing decisions. It is often cited as a concrete example of industrialist-government collusion to the detriment of the 'socialist pattern of society'.

It emerges from Erdman's study that the success of such ventures depends not on any particular mix of financial control to be exercised by the private and the public sectors, but rather on the degree of autonomy available to the management of such concerns. This calls for considerable self-restraint by the Central and state governments. However, the tendency to intrude into the affairs of such companies is often very difficult to resist, especially if the governments happen to be weak.

Scheduled Castes in Andhra

Some Aspects of Social Change

Uma Ramaswamy

This paper attempts to examine, with data from census documents, how far the Scheduled Castes in Andhra Pradesh have benefited from the various measures for their advancement.

The author is concerned with the extent to which the Scheduled Castes have left behind their traditional occupation, whether it be scavenging, leather work or agricultural labour, their entry into salaried occupations, particularly government service, and their exploitation of educational opportunities.

It emerges from the discussion that the policy of preferential treatment to Scheduled Castes which has been in practice for over two decades, discounting the pre-Independence period, has barely scraped the surface of the problem. The Scheduled Castes continue overwhelmingly in their traditional occupations in rural areas. Even in the urban areas only a fraction of the posts in the administration which are reserved for them is actually filled. Similarly, they are still stepped in illiteracy and only a small proportion of the population of school-going age actually attends school. Completion of formal education even upto the secondary level is negligible.

THE Scheduled Castes constitute a sizeable and well-defined segment of the population which is backward in a number of ways and for whose betterment systematic efforts have been made. This paper attempts to examine with data contained in census reports, census village monographs and other related documents, how far these castes in the state of Andhra Pradesh have benefited from the various privileges provided for their advancement.

The category Scheduled Castes is at best a legal one. While the wider society may treat them as if they are undifferentiated, there are deep divisions within them in terms of their numerical strength, geographical spread, ritual status and occupation. There are 60 Scheduled Castes in Andhra numbering 44,21,528, or 13.8 per cent of the total population. Two castes, the Malas and Madigas, make up three-fourths of the Scheduled Caste population. Most of the other Scheduled Castes are merely the off-shoots of these two castes. It is interesting to note that none of these castes even found mention in the censuses before 1931 under the category "depressed classes". The mushrooming of Scheduled Castes since then is attributable in large measure to the various privileges extended to them by the British.[1]

The distribution of the Scheduled Castes also varies sharply within the state. Andhra Pradesh is divided into three distinct regions. The Circars, comprising the seven coastal districts, contain some of the most fertile soils. This region has been traditionally prosperous and culturally and politically active. Rayalaseema, containing four districts adjoining Tamil Nadu, has been economically backward. Much the same is true of the nine districts of Telengana which were part of the erstwhile princely state of Hyderabad. Malas are the predominant Scheduled Caste in the Circars whereas the Madigas dominate in Telengana. In the case of Rayalaseema the proportion of the Malas and Madigas is about the same. It is rare to find these two castes equally represented in different areas even within a region.

Contrary to popular notions, not all the Scheduled Castes are untouchable. Untouchability is intimately associated with the pursuit of a defiling occupation but even traditionally there were occupational differences among the Scheduled Castes. As between the Malas and Madigas, it is the latter engaged in leather work who approximate to popular notions. However, not all Madigas are leather-workers. Even as early as 1901 (Census of India 1902: 228-231) just about one-eighth of the working population of this caste was engaged in this defiling occupation. Similarly, weaving, the traditional occupation of

Source : Census of India 1964c.

Malas, accounted for a mere 2.5 per cent of the population of this caste. Three-fourths of the Malas and 60 per cent of the Madigas were engaged in agricultural labour. It is then obvious that even in the traditional system the bulk of the Scheduled Castes were engaged in the non-defiling occupation of agricultural labour.

In this paper I am concerned with the extent to which the Scheduled Castes have left behind their traditional occupation, whether it be scavenging, leather work or agricultural labour, their entry into salaried occupations, particularly government service, and their exploitation of educational opportunities. While being concerned with the Scheduled Castes in general, I shall in particular refer to the Malas and Madigas.

I

The predominant occupation of the Scheduled Castes in the rural areas of Andhra, where most of them in any case reside, is agricultural labour. Table 1 gives the proportion of agricultural labourers and cultivators among these castes separately for the three regions. While the overall proportion of agricultural labourers for the entire state is 61 per cent, it is considerably more in the Circars (71 per cent) and least in Telengana (51.7 per cent). The high proportion of agricultural labour in the Circars may be related to the pressure on land and fragmentation of holdings. It is also well known that due to the labour intensive nature of paddy cultivation, paddy growing regions all over the country are able to sustain a high proportion of landless labour. One observes that in the rich alluvial districts of Krishna and East and West Godavari which are almost exclusively paddy-growing 78, 71 and 89 per cent, respectively, of Scheduled Caste workers are agricultural labourers.

Even in agricultural labour it is generally the most arduous type of work which is assigned to them. Beteille (1972: 415) writes, "The most onerous types of work are left to the Harijans. In wet paddy areas, for example, the so-called 'cultivating castes' perform very few of the physically exacting tasks which are done by the Harijans — or as in some parts of West Bengal — by tribal migrants or settlers." This association can be seen in Andhra too. Falling in this category are the attached labourers who are bound to a ryot on an yearly tenure of service. Although there is little evidence of the exact incidence of attached labour, it is worth noting that, according to Reddy (1954: 66-67), practically every upper caste ryot cultivating paddy has an attached labourer from a Scheduled Caste. *Neerukattu* (watering the fields) and *Bandila* (guarding the fields from stray cattle) are two important tasks demanded of them. Besides, a wide variety of services is extracted from the attached labourers. To illustrate, "Each attached agricultural labourer is paid 2 *kundalu* of jowar or paddy per month towards his food and Rs 120 to Rs 200 as annual payment by the cultivator who engages him . . . They have to work in the fields or look after the livestock and engage themselves throughout the day and they feed the cattle and sleep at the cattleshed itself in the nights" (Census of India 1964a: 60).

Often agricultural labourers combine their main occupation with a number of subsidiary ones. The family budget of a Mala household (Census of India 1964b: 43), for instance, shows that besides the Rs 420 earned annually through agricultural labour Rs 50 was earned through the practice of carpentry and Rs 110 by guarding a coconut

garden. In spite of all this the household had to borrow Rs 50 to meet its annual expenditure. What is more, this household did not acquire any assets during the 30 years from 1932 to 1962 except tools and equipment worth Rs 11.

At the level of the state 24.6 per cent of the Scheduled Caste workers are engaged as cultivators. But the proportion of cultivators is more in the arid regions where dry lands are plentiful and productivity low and least in the fertile areas. The proportion is as much as 31.9 and 27.7 per cent in Telengana and Rayalaseema, respectively, but goes down to 14.8 in Circars. While the lot of cultivators is certainly better than that of agricultural labourers it is relevant to ask what proportion of the cultivators own their lands and what proportion are merely tenants or sharecroppers, and further what is the size of their holdings. It once again comes out from Table 2 which is derived from figures given for a 20 per cent sample of households in the 1961 census that the proportion of owner-cultivators is most in the arid regions. Thus while 82.7 per cent of the Scheduled Caste cultivators own land in Telengana, only 69.7 per cent in the Circars do. Correspondingly, the proportion of sharecroppers and tenants to total Scheduled Caste cultivators is more in Circars and less in Rayalaseema and Telengana. The extent of relative deprivation is extended to the size of holdings. The proportion of Scheduled Caste owner-cultivators possessing more than five acres of land is 19 per cent for the entire state. But once again, there is considerable regional disparity. Just 7 per cent own more than 5 acres in the Circars as compared to 25 and 23 per cent, respectively, in Rayalaseema and Telengana. Similarly the acreage of land cultivated by the Scheduled Caste tenants is considerably more in the arid regions.

The occupational pattern of the Scheduled Castes in urban areas is more varied than in the rural. As we shall see, it is in towns and cities that they have taken greater advantage of reservations in secular jobs. Interestingly, it is also in the urban areas that their identification with defiling occupations such as scavenging and leather work is more pronounced than in the villages. Nevertheless, it needs to be noted that even in urban areas the total number taking to such occupations is only a negligible proportion of the Scheduled Caste population.

It is evident from the foregoing discussion that the Scheduled Castes by and large continue to predominate in their traditional occupations, meaning thereby not so much the defiling ones as agricultural labour which they have always performed. There has been minimal mobility away from their traditional occupations. This can be seen from Table 3 based on data on occupational mobility among Malas in seven villages and Table 4 based on similar data for Madigas in eleven villages.

First of all, a majority of the households have not changed their occupation. Whatever mobility there has been is confined to 57 households. Even in these cases the actual variation between the former and present occupation in terms of the nature of work and economic prospects has been minimal. Fifteen out of 22 Mala households which have experienced occupational mobility have taken to agricultural labour which in any case has been the predominant traditional occupation of this caste. It is only with respect to the other seven households which have taken to the occupations of talari, trader and cultivator that there has been any significant change. Similarly, 27 of 37 Madiga households which have changed their occupation have gone over to agricultural labour. One household has taken to sweeping, a menial job. Only nine households which have taken to cultivation have experienced any significant change of occupation.

II

Reservation of jobs in government service has always been a crucial part of the programme for the advancement of these castes. Their emancipation cannot be complete unless they are freed from their degrading occupations and introduced to salaried employment for which they cannot compete with the upper castes in a free market situation. The data regarding the actual representation of the Scheduled Castes in government service in Andhra is at best fragmentary. The Elayaperumal Committee which went into the problems of the Scheduled Castes in 1969 severely censured the state government for its failure to furnish the necessary data in spite of repeated reminders. However, what little information there is indicates certain trends. It is in the urban areas that the Scheduled Castes have gained the most in the field of salaried employment. The census category 'other services'[2] accounts for 30.3 per cent of the Scheduled Caste workers in the urban areas. It needs to be emphasised that the census category 'other services' includes a variety of employments and at least one of them is clearly scavenging. Hence we should not be misled into thinking that one-third of the urban Scheduled Caste population has experienced a sharp upward mobility.

TABLE 7: SCHEDULED CASTE APPLICANTS REGISTERED AND PLACEMENTS EFFECTED BY EMPLOYMENT EXCHANGES IN ANDHRA BETWEEN 1954-1969

Year*	Applicants Registered	Placements Effected (Per Cent)
1954	5,498	10.0
1955	6,800	11.9

Total	2,55,028	10.2

* Figures for 1966 not available.

Source: Commissioner for Scheduled Castes and Scheduled Tribes 1954-70.

The Elayaperumal Committee (Government of India 1969) gives combined figures for the Scheduled Castes and Scheduled Tribes regarding employment in government service for the year 1961-62. In the absence of separate data for the Scheduled Castes we can only speak in terms of approximations. The greatest concentration of these castes is in the lowest paid jobs. While they account for 11 per cent of the employees in Class IV jobs with a basic salary of less than Rs 35 a month, their proportion goes down steadily as we move up to the higher categories of employment and is a mere 2 per cent in the gazetted ranks.

A large proportion of reserved posts in fact go unfilled. Table 5 gives the representation of the Scheduled Castes in the police service as of 1966. I have grouped the 17 categories of jobs into five heads and shown the actual number of appointments. Of the 50 posts allotted to them in the rank of superintendent of police and above just one had been filled. The largest number of appointments were in the lowest categories of services. But even in the lowest category 90 per cent of posts went unfilled.

Table 6 gives the representation of Scheduled Caste employees in the judicial services. Once again, the largest number of appointments were in the lowest categories. The proportion of Scheduled Caste employees in Class I and II posts in the judicial service was less than one per cent in 1965. Even in Class III and IV services the Scheduled Caste employees amounted to a bare 2.5 per cent of the total.

There has been a steady increase in the number of job-seekers among these castes over the years. Table 7 indicates that between 1954 and 1962 the number of Scheduled Caste applicants increased more than fourfold. On the average only about 10 per cent of the applicants had been placed in employment. At least part of the blame for this rests with the recruiting authorities. The Elayaperumal Committee (Government of India 1969), for instance, observed, "It is evident... that the Central and state government employers did not notify correctly the number of vacancies to be reserved for the Scheduled Castes. [They] do not specify in their requisition sent to the employment exchanges the number of posts that are to be treated as reserved." The Andhra government was found to be particularly guilty in not fulfilling its constitutional obligation to reserve 14 per cent of the posts in a number of departments. A further reason for the above feature is the lack of qualified candidates. An analysis of the qualification of candidates from these castes on the live registers of employment exchanges reveals that the bulk of them possessed a low level of formal education and few had professional or vocational training. Table 8 gives the educational qualification of Scheduled Caste applicants in four employment exchanges as of December 1960. Non-matriculates account for more than 75 per cent of the candidates. Graduates, on the other hand, amount to less than one per cent.

This takes us on to the education of these people, a most important variable in their emancipation. Their progress in this field, despite extensive efforts, is indeed very slow. Only 10.3 per cent of the Scheduled Castes in the state are literate. The rural population is still way behind its urban counterpart. Among the former, 99.2 per cent is illiterate. A mere 1.9 and 0.1 per cent respectively have primary and matriculate education. But even in the urban population the extent of literacy is only 21.7 per cent. Only 8.2 per cent have primary education and 1.2 per cent are matriculates. Those possessing higher educational qualifications are indeed negligible.

A prominent feature of the educational pattern of the Scheduled Castes is the successive and marked decline in the proportion of students as they proceed from primary and secondary levels to higher education. This, for instance, is reflected in the enrolment of Scheduled Caste students in the educational institutions in Andhra during the year 1965. Whereas their enrolment in primary school is 14 per cent of the total students, it goes down to 9.6 in middle school, 8.2 in higher secondary and 5.4 in higher education (Commissioner for Scheduled Castes and Scheduled Tribes 1969: 162). The NCERT reports that even at the national level upper caste students do not drop out in the same proportion as students from the Scheduled Castes (Commissioner for Scheduled Castes and Scheduled Tribes 1969: 159). The data of seven villages surveyed by the Census of India, 1961, show that of the 303 Mala and Madiga youths in the age group 14 and below, 88 per cent is illiterate and non-school going. Of the literates, 50 per cent have no formal education and the rest have only completed primary school. The reasons for the low proportion of school-goers and the high drop-out ratio appear to be the poverty of the parents and the prevalence of child labour (Census of India 1964e).

TABLE 8 : DISTRIBUTION OF SCHEDULED CASTE APPLICANTS IN SELECTED EMPLOYMENT EXCHANGES BY EDUCATION IN 1960

Kurnool	—	51	415	466
Total	16	416	1,301	1,733

Source : Government of India 1969 : 293.

It is also important to note the striking difference between Malas and Madigas in the exploitation of educational facilities. Malas have, by and large, done well for themselves and are educationally way ahead of the Madigas. In the urban areas the rate of literacy among Malas is 26.8 per cent as against 15.8 for the Madigas. Even in the rural areas where literacy is far less there are twice as many literates among Malas as among Madigas. This difference between the two castes is pronounced at every level from primary to higher education. Indicative of this is the relative cornering of scholarships by Malas and certain numerically small Scheduled Castes such as Adi Andhras who are offshoots of Malas. The Malas secured 43 per cent of the total scholarships for Scheduled Caste students in 1968. The Adi Andhras, although a bare 12 per cent of the population, cornered nearly a third. In contrast, the Madigas secured only 22.8 per cent of the fellowships although in terms of their proportion to the total Scheduled Caste population they far exceed the Malas (Commissioner for Scheduled Castes and Scheduled Tribes 1969: 116-117).

The sharp difference between these two castes can be explained in a number of ways. Their regional background has an essential bearing on this question. It is well known that social reform movements aimed at the emancipation of the weaker sections of society have been far more active in the coastal districts where Malas predominate. They were also recipients of preferential treatment under the British. In contrast, Telengana where the Madigas predominate, was part of a princely state where there was no comparable attempt at social reform or deliberate effort at improving their lot.

A further contributing factor lies in the occupational difference between the two castes. If one may hazard a generalisation, the very existence of a secure source of livelihood for which other castes cannot compete, although such an occupation may be low in the hierarchy, is a factor inhibiting the exploitation of secular opportunities for mobility. The Malas who had to compete for agricultural labour with several other castes, besides facing the uncertainties inherent in this occupation, took more readily to formal education than the Madigas who were secure in leather work. Moreover, the Madigas were also involved in jajmani relationships with upper caste landlords which helped to keep them in their traditional occupations. Reddy (1954: 61) observes that the "jajmani system which cultivates a sense of security has itself bred sluggishness in the Madiga, and the lack of it among the Mala drives them to strive at many a job and secure a living in several ways".

III

It emerges from the foregoing discussion that the policy of preferential treatment to Scheduled Castes which has been in practice for over two decades, discounting the pre-Independence period, has barely scraped the surface of the problem. The Scheduled Castes continue overwhelmingly in their traditional occupations in rural areas. Even in the urban areas only a fraction of the posts in the administration which are reserved for them is actually filled. Similarly, they are still steeped in illiteracy and only a small proportion of the population of school-going age actually attends school. Completion of formal education even up to the secondary level is negligible.

Even though the Scheduled Castes as a whole have failed to make significant use of the privileges, some sections among them have been far more enterprising. If the current educational level is at all indicative of the future prospects of these people, it is certain that the Malas would outstrip the Madigas in course of time. It is then likely that the cleavages among the Scheduled Castes which are at the moment barely visible would sharpen and may even lead to the emergence of an elite. I am not here thinking merely of the emergence of a small upper crust of educated and well-placed individuals within caste groups but also of the emergence of status distinctions as between the castes themselves.

Notes

[This paper is based on data collected for an M Litt thesis. I am thankful to Andre Beteille who supervised this research.]

1 For an elaboration of this point, see, Uma Ramaswamy 1973.

2 The census category 'other services' is defined as follows: "This class includes all persons engaged in services like electricity, gas, water and sanitary services, public services, religious and welfare services, legal and business services, trade and labour associations, recreation services, personal services and thus practically covers all such persons who do not fall under any of the 8 industrial categories" (Census of India 1964: 10).

Working Capital and Credit Needs of Foodgrains Distribution in India

D K Desai

V Ramachandran

This paper attempts to estimate the working capital required for the procurement and distribution of foodgrains. To arrive at the financial requirements for foodgrains distribution, estimates of the marketed surplus are needed. Instead of assuming a certain percentage of the total foodgrains production as the marketed surplus, a different technique was employed to estimate the marketed surplus. Based on the prices and stocks of foodgrains required at the beginning of the months and the marketed surplus of foodgrains, the working capital requirements were estimated for different years.

The estimates of working capital for foodgrains show that the available bank credit met only 38 per cent of the maximum working capital required in 1972-73. Hence bank credit cannot be blamed for making possible the hoarding of foodgrains.

In fact, by not supplying the necessary working capital for foodgrains, the banking system has forced foodgrain distribution to depend on non-banking sources. It has thus increased the cost of financing the working capital and helped the price increase of foodgrains.

POLICIES on procurement and distribution of foodgrains in India have attracted much attention. The policy for wheat has shifted from complete takeover to reinstatement of the wholesalers. In the formation of policies, however, the financial implications to the exchequer do not seem to have been taken into consideration. The general assumption has been that prices of foodgrains rise because of the tendency to hoard on the part of the middleman, hence this tendency should be curbed. At one extreme it was considered necessary to remove the middleman (wholesalers) and manage the distribution of wheat through the public distribution system. But it was subsequently found that the task involved was stupendous, and that it was therefore advisable to allow wholesalers to function under stipulated conditions. Again, no attempt has been made to find out how the wholesalers would finance their operations in the procurement and distribution of foodgrains. The selective credit control policies of the Reserve Bank of India are framed with a view to making it more difficult to obtain credit against a hypothecation of foodgrains. It is necessary to examine the magnitude of the working capital required for the procurement and distribution of foodgrains, and from such an assessment to find out the credit needs. This paper attempts to estimate the working capital requirements of foodgrains — particularly rice, wheat, and coarse grains.

Credit for Foodgrains' Distribution

The data obtained on the advances for food procurement operations from all banks reveal that the major share (75 per cent in 1972) of the bank credit is of the Food Corporation of India (Table 1). The total advances for food procurement varied from Rs 19 crores in January 1966 to Rs 542 crores in June 1972.

The advances for foodgrains procurement formed 5.58 per cent of total bank advances in 1972-73. They fluctuated between 2.9 per cent and 9.66 per cent between March 1971 and July 1973 (Table 2).

Data on advances for foodgrains to the private sector are not available. The sectorwise break-up of advances shows that the advances to wholesale trade, including credit for food procurement, formed 16 per cent of the outstanding advances by the end of April 1973 (Table 3). If the advances for the procurement of foodgrains are deducted from these advances, the percentage of advances to the wholesale trade (including foodgrains) is lowered to 11.4 per cent.

Data on the advances from scheduled banks against the security of foodgrains show that, in June 1972, Rs 316.31 crores were advanced. This formed 6.54 per cent of total advances (Table 4). If it is assumed that these advances were inclusive of the advances given to the private sector, the total advances for foodgrains do not seem to have exceeded 16.2 per cent in 1972. Because of the restrictive policies towards advances against foodgrains to the private sector, the advances to the private sector must have declined since 1972. By 1973, total advances for foodgrains will not have exceeded 15 per cent of total bank advances (Table 2).

To judge whether these advances help hoarding of foodgrains, it would be useful to look into the financial requirements for foodgrains distribution.

To arrive at the financial requirements for foodgrains distribution, estimates of marketed surplus are needed. Techniques used to estimate marketed surplus and its working capital requirement are discussed in this paper.

During the decade of the 1960s, the production of foodgrains varied from 72 million tonnes in 1965-66 to 108 million tonnes in 1970-71. The statistics of foodgrains production for the last three years show that foodgrains production has exceeded 100 million tonnes. Rice and wheat accounted for 66.5 per cent of the total foodgrains production in 1972-73 (Table 5).

Various studies have indicated that the marketed surplus ranges from 30 to 40 per cent of the foodgrains production.[1] Instead of assuming a certain percentage of the total foodgrains production as being the marketed surplus, a different technique was employed to estimate marketed surplus. Thamarajakshi estimated the marketed surplus

Imagine Rural Electrification...

...without Petrochemicals

Plastics like PVC and Polyethylene, derived from petroleum, are extensively used to manufacture insulated cables which carry electricity to thousands of villages, thus providing the motive power for irrigation pump sets and industries all over rural India.

Insulated cables are also essential to the telecommunication network that integrates the nation into a single socio-economic unit.

The Government proposes to invest over Rs. 9,000 crores in power, irrigation and telecommunications during the Fifth Plan period. This would greatly increase the demand for insulated cables for rural electrification and communication systems.

Growth of the petrochemical industry will not only accelerate the pace of rural electrification, but will also contribute to the growth of many other key sectors of our economy.

Petrochemicals—essential to many crucial sectors of our economy.

on the basis of the expenditure on foodgrains by the non-agricultural sector.[2] The quantities of foodgrains consumed were thus derived from the consumption expenditure on foodgrains. These were then adjusted for the supplies of foodgrains to the non-agricultural sector from imports. An estimate of the marketed surplus from domestic production of foodgrains was thus arrived at. The estimates showed that the percentage of marketed surplus to domestic production varied from 22.3 per cent in 1965-66 to 34.5 per cent in 1955-56.

In the technique used in this paper to estimate marketed surplus, apart from the agricultural population, small cultivators and agricultural labourers have also been included in the population buying foodgrains from the market. Small farmers and agricultural labourers buy foodgrains from the market because (a) small farmers do not produce enough for their consumption and (b) agricultural labourers are not always paid wages in kind.

MODEL FOR MARKETED SURPLUS

The assumptions used for arriving at an estimate of marketed surplus were:

(1) The marketed foodgrains are supplied from domestic production and imports.

(2) The market arrivals from the total domestic production will follow the same seasonal pattern as the market arrivals of foodgrains at the selected markets in India (Table 6).

(3) To arrive at the estimates of the market arrivals by months within the season, the following procedure was used:

(a) Wheat: the pattern was evolved from a study of the monthly average arrivals of wheat in the markets in Rajasthan during 1959-70 (Table 7).

(b) Rice: a normal distribution was assumed for market arrivals from October to December for the kharif production and from January to March for the rabi production. For the rest of the months, a uniform distribution was assumed.

(c) Other foodgrains: a uniform distribution pattern was assumed.

Notations*:

The following notations were used for the model:

N_i = Total population

I_i = Quantity of imported foodgrains

A_i = Availability of foodgrains

C_i = Per capita availability of foodgrains

L_i = Population buying foodgrains

N_{1i} = Non-agricultural population

N_{2i} = Population of cultivators with operational holdings less than 2.02 hectares in size

N_{3i} = Population of agricultural labourers

X_{ik} = Production of a particular type of foodgrain

M_i = Marketed surplus of a particular type of foodgrain

M_i = Total marketed surplus of all foodgrains

Equations:

$$L_i = N_{1i} + 0.5\ N_{2i} + 0.^5 N_{3i}**$$

* Unless otherwise specified
i varies from 1 to 8 years
j Varies from 1 to 12 months
k varies from 1 to 5 types of foodgrains
l varies from 1 to 2 types of foodgrains

** It is assumed that 50 per cent of the total foodgrain requirements of small farmers and agricultural labourers will be met from the marketed surplus.

TABLE 4: SCHEDULED BANKS' ADVANCES AGAINST THE SECURITIES OF FOODGRAINS OUTSTANDING

$$C_i = \frac{A_i}{N_i}$$

$$M_{ik} = X_{ik} \times \frac{M^i}{\sum X_{ik}} \text{ where}$$

$$M_i = \sum M_{ik}$$

$$M_i = C_i L_i - X_i$$

The population buying foodgrains from the market is composed of (a) the non-agricultural population, (b) small farmers having operational holdings of less than 2.02 hectares, and (c) agricultural labourers. Only 50 per cent of the foodgrain requirements of small farmers and agricultural labourers will be met by the marketed surplus; the rest will be met from the farm production and wages paid in kind.

The population figures for the years from 1965-66 onwards were arrived at by assuming a 2.466 per cent linear growth with the base year (1961) population as 439.07 million. The non-agricultural population plus half of the small farmers and half of the agricultural population formed 57.7 per cent of the total population of 1971 (Table 8). This percentage was applied to the total population for the different years from 1965-66 onwards, to arrive at the figures of the population buying foodgrains (Table 9).

The per capita availability of foodgrains per day was arrived at by dividing the net availability of foodgrains by the population figures (Table 10). The quantity of foodgrains purchased by the population buying foodgrains was arrived at by multiplying the figures of this population with the per capita availability. From this quantity, imports were subtracted to arrive at the marketed surplus (Table 11). The per cent of the marketed surplus to the total production of foodgrains varied from 44 in 1965-66 to 55.5 in 1969-70 (Table 12). These estimates are very different from those obtained by Thamarajakshi and others.

TABLE 5: PRODUCTION OF FOODGRAINS

(In thousand tonnes)

Year	Total Foodgrains Produced	Rice	Rice Production as Per Cent of Total Foodgrains Produced	Wheat	Wheat Production as Per Cent of Total Foodgrains Produced

Production figures for 1970-71 and 1971-72 are taken from *Reserve Bank of India Bulletins*, (September 1972 and September 1973) (See Current Statistics). Production figures for 1972-73 are taken from *Reserve Bank of India Bulletin*, Supplement, (August 1973).

WORKING CAPITAL REQUIREMENT

Having obtained the estimates of marketed surplus, the working capital requirements for the marketed surplus can be estimated.

Assumptions

(1) The arrivals of the marketed surplus for different months will be according to the pattern described earlier.

(2) The purchases of foodgrains made by the foodgrains buying population will be uniform in all the months.

(3) The stocks at the beginning of the month required to meet the demand for foodgrains will vary according to the following two situations:

(a) The minimum stocks required to meet the demand of the foodgrains buying population at least for 60 days; and

(b) The minimum stocks required to meet the demand of the foodgrains buying population at least for 90 days.

TABLE 7: MONTHLY AVERAGE ARRIVALS OF WHEAT IN THE MARKETS IN RAJASTHAN: 1959 TO 1971

Month	Wheat Arrivals (quintals)
January	4115.16
February	3621.14
March	6923.39
April	7504.13
May	20102.89
June	25039.55
July	7363.03
August	5058.83
September	3845.29
October	4181.09
November	4210.69
December	3513.47

Class of Workers	Total Workers (millions)	Percentage to Total	Population Corresponding to These Workers (millions)	Percentage of Population Buying Foodgrains to Total Population in Column 4	Population Buying Foodgrains (millions)	Population Buying Foodgrains as Percentage of the Total Population
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Cultivators	78.7	42.9	234.64	31.16*	73.11	13.4
Agricultural labourers	47.3	25.8	141.02	50.00	70.50	12.9
Other workers	57.6	31.3	171.74	100.00	171.74	31.4
Total	183.6	100.0	547.4	—	315.35	57.7

* Percentage of cultivators having operational holding size less than 2.02 hectares was 62.31 according to 1971 census. 50 per cent of their purchase was assumed to be from the open market.
Source: Basic data taken from *Indian Agriculture in Brief*, (September 1971), p 6.

TABLE 9: POPULATION BUYING FOODGRAINS

(in millions)

Year	Total Population	Population Buying Foodgrains*
1965-66	483.42	278.40
1966-67	493.25	284.64
1967-68	504.08	290.90
1968-69	514.91	297.15
1969-70	525.74	303.40
1970-71	536.57	309.65
1971-72	547.40	315.90
1972-73	558.23	322.15

* Population buying foodgrains formed 57.7 per cent of the total population.

The quantities required for these two situations will vary considerably and the finances required for these stocks will form the working capital requirements for foodgrains distribution.

(4) It is assumed that the cost of handling, storage, and marketing of foodgrains will be covered by the prevailing wholesale prices.

(5) The prices of foodgrains for different months were calculated as follows:

The prices prevailing in January 1971 were obtained for different foodgrains. The wholesale price indice of wheat, rice, and cereals for different months and different years were obtained. Using these prices indices, the actual prices for different foodgrains were calculated.

MODEL FOR ESTIMATION OF WORKING CAPITAL

Based on the prices and the stocks of foodgrains required at the beginning of the months, the working capital requirements were estimated. The notations used for the model to estimate the working capital requirements were:

R_{ijk} = Arrival of foodgrains

TABLE 10: POPULATION, NET AVAILABILITY, AND PER CAPITA AVAILABILITY OF FOODGRAINS

Year	Population (million)*	Net Availability (thousand tonnes)**	Availability Per Capita Per Day (gm)
1965-66	482.42	75,478	417
1966-67	493.25	73,889	410
1967-68	504.08	86,716	471
1968-69	514.91	85,721	457
1969-70	525.74	89,447	466
1970-71	536.57	97,033@	509
1971-72	547.40	93.774@	480
1972-73	558.23	89.566@	452

* The population figures were arrived at by assuming a 2.466 per cent linear growth, with the base year (1961) population as 439.07 millions.
** The net availability figures are taken from *Bulletin on Food Statistics* (1971), p 163.
@ From the production figures, net production was worked out as given in Footnote 2 in *Bulletin on Food Statistics* (1971), p 163. To this were added the figures of net imports.

Equations:

D_{ijk} = Purchase of foodgrains by the foodgrains buying population

Z_{ijkl} = Minimum stock of foodgrains at the beginning of the month

P_{ijk} = Price of foodgrains

V_{ijkl} = Value of Z_{ijkl}

$$R_{ijk} = r_j (M_{ik}) \ldots \text{where } r_j < 1$$

$$D_{ijk} = \frac{1}{12} (M_{ik})$$

$$Z_{ijkl} = F(R_{ijk}, D_{ijkl})$$

$$V_{ijkl} = P_{ijkl} \times Z_{ijkl}$$

TABLE 11: MARKETED SURPLUS OF FOODGRAINS

(in thousand tonnes)

Year	Foodgrains Bought by the Population Buying Foodgrains	Net Imports of Foodgrains	Marketed Surplus
1965-66	42,734	10,311	32,423

1970-71	57,528	2,758	54,770
1971-72	55,300	2,054	53,246
1972-73	53,097	2,446	50,651

Source: Net imports figures are taken from *Bulletin on Food Statistics*, (1971), p 163.

R_{ijk} the market arrival of a particular type of foodgrain for a particular month in a particular year is dependent on the total market surplus and the pattern of market arrivals. The patterns of market arrivals for different types of foodgrains are described earlier. D_{ijk} the purchase of a particular type of foodgrain for a particular month in a particular year is assumed to be one-twelfth of the total marketed surplus. Z_{ijkl} is a buffer stock required to meet the demand of foodgrains for varying conditions.

Interpretation of Results

In the model for working capital, two situations were assumed. These were:

(1) The stocks of foodgrains at the beginning of each month will be sufficient to meet the demand of foodgrains at least for a period of 60 days. As the total marketed surplus from the domestic production was based on the total annual purchase of foodgrains and the monthly purchase pattern was assumed to be uniform, the initial stock at the beginning of the year will be at least equal to next two month's purchase of foodgrains. The stocks at the beginning of other months will be this initial stock plus the difference between the arrivals and disposal of foodgrains for the subsequent two months.

(2) In the second situation, the initial stocks should meet the demand for at least 90 days. The stocks at the beginning of other months will be this initial stock plus the difference between the arrivals and disposals of foodgrains for the subsequent three months.

The values of these stocks at the prevailing wholesale prices indicate the working capital requirements. The monthly requirements of working capital for 1972-73 for 60-day and 90-day inventories are given in Table 13. For a 60-day inventory the maximum working capital requirement was Rs 1,909 crores in July 1972 and the minimum working capital requirement was Rs 973 crores in October 1972. For a 90-day inventory the maximum and minimum requirements of working capital were Rs 2,401 crores in June 1972 and Rs 1,355 crores in September 1972. From December 1972 to March 1973 the monthly working capital requirements for 60-day and 90-day inventories remained at a stable level with minor fluctuations.

February	523.14	372.60
March 1973	363.34	217.03
Average	749.31	851.84

The maximum working capital required for foodgrains as a whole during a year varied from Rs 602 crores in 1965-66 to Rs 1,909 crores in 1972-73, while the minimum working capital required varied from Rs 234 crores in 1965-66 to Rs 973 crores in 1972-73.

In Table 15, data are presented with the base of inventory changed from 60 to 90 days. For a 90-day inventory, the average working capital required varied from Rs 643 crores in 1965-66 to Rs 1,892 crores in 1972-73. The maximum working capital required for a 90-day inventory in 1972-73 (which was the highest in the eight years considered) was Rs 2401 crores. The minimum working capital required for a 90-day inventory in 1972-73 (which was the highest in the eight years considered) was Rs 1355 crores.

Relationship of Bank Credit with Working Capital Requirements for Foodgrains

If it is estimated that on an average 15 per cent of the total bank advances were available for foodgrains, the credit available from 1969-70 to 1972-73 would be as shown in Table 16.

The data of credit available during the last four years show that the average requirement of working capital for a 60-day inventory cannot be met. At most, the minimum requirement of the working capital can be met. For a 90-day inventory, the credit available cannot meet even 50 per cent of the average requirement of working capital.

If the estimates of working capital requirements are near reality and if the available credit for foodgrains does not exceed 15 per cent of the total bank advances, it implies that the private sector meets the additional requirement from the non-banking source. This additional requirement amounts to a minimum of Rs 445 crores and a maximum of Rs 1,491 crores in 1972. The cost of finance from the non-banking sources is likely to be much higher than the cost from the banking sources. Is it a wise policy to force foodgrains distribution to depend on the non-banking sources? Does the selective credit control on fodgrains achieve the objective of bringing down foodgrain prices? By providing adequate credit to foodgrains business it is possible to bring better discipline and control on the stocks and the tendency to hoard can be curbed. It will also decrease the cost of financing.

Take-over Foodgrain Trade

At the time of wheat take-over, no estimates of the working capital requirements seemed to have been made. The working capital requirements for 1972-73 according to these estimates are given in Table 17.

In 1972-73, the average working capital required for wheat for a 60-day and 90-day inventory was Rs 749 and Rs 852 crores, respectively. For a 90-day inventory, the average working capital requirement for wheat is 94 per cent of the available credit of Rs 910 crores for foodgrains as a whole. Based on the past figure if a projection of the working capital required in 1973 was made when the policy of the wheat trade take-over came into operation, its implication on the banking system would have been obvious. In a way the non-implementation of the policy of wheat trade take-over has saved the situation.

Conclusions

The estimates of working capital for foodgrains clearly indicate that the available bank credit met only 38 per cent of the maximum working capital required during 1972-73. Hence bank credit cannot be blamed for boosting the hoarding of foodgrains. By not supplying the legitimate working capital for foodgrains, the banking system has forced foodgrain distribution to depend on non-banking sources and has thus increased the cost of financing working capital and helped the price increase of foodgrains.

Bank of Maharashtra

Head Office: **1177, Budhwar Peth, Poona 411002**

Directors' Report for the Year 1973

1973 WAS one of the most difficult years for the country since Independence. On the agricultural front despite the crash programme and other steps taken by the government, serious imbalances between aggregate demand and aggregate supply prevailed in the economy. Production in industries sector recorded a slow rate of growth mainly due to widespread power shortage, inadequate supply of critical raw materials, labour troubles and transport bottlenecks.

The resources position of the banks remained buoyant during the major part of the year. The Indian banking system recorded a sharp increase in credit in 1973 as against sluggish demand in the previous year.

Thanks largely to the normal monsoon in Maharashtra, which is the principal area of our operation, the year 1973 has proved to be a better one than the previous from our point of view. The working of the Bank during 1973 resulted in a net profit of Rs 16.8 lakhs as compared to about Rs 14.0 lakhs in 1972. In appropriating the net profit, a sum of Rs 4.0 lakhs was transferred to the Reserve Fund and Rs 10.5 lakhs for the provision of gratuity. Unlike 1972, the Board of Directors have been able to earmark Rs 2.3 lakhs to be paid to the Government of India as residual amount from out of the Bank's profits after making all the necessary provisions.

The Bank has a significant percentage (41 per cent) of priority sector advances as against about 25 per cent for all the public sector banks. This is no doubt a welcome feature in the Bank's working, but its effect on our profitability cannot be overlooked. The Board of Directors hope that the Reserve Bank will consider this aspect of the credit facility to the priority sectors and provide certain incentives to the banks providing credit facilities to this sector above a certain level.

The year witnessed a further intensification in the deposit mobilisation efforts, as reflected in the substantial rise in deposits of the Bank. The total deposits of the Bank reached Rs 175.1 crores by the year end (Table A).

Component-wise, the fixed deposits showed the highest buoyancy showing an increase of 23.9 per cent as against 15.1 per cent in 1972. The tempo of growth in savings bank deposits slowed down marginally from 21.3 per cent to 21.0 per cent in 1973. The rate of growth of current deposits was considerably low at 8.6 per cent to 19.9 per cent in 1972.

The new deposit schemes introduced by the Bank in the recent past like the Annuity Deposit, Cumulative Deposit and Lokmangal Daily Deposit scheme have shown impressive progress during the year. The growth in the number of accounts under these schemes reflects the satisfactory service that the Bank has been able to render not only across the counter but also at the doors of the depositors. The number of accounts under these schemes increased by about 6,000 to reach upto 16,000. Simultaneously the amount increased from Rs 1.7 crores to reach Rs 6.9 crores.

The Bank's advances during the year increased from Rs 90.4 crores in 1972 to Rs 20.8 crores. The increase over last year amounted to Rs 30.4 crores or by 33.6 per cent.

(Rupees in crores)
(No of accounts in lakhs)

	1971	1972	1973
Accounts	37	53	80
Amount	81.82	90.40	120.75

There was a significant increase in our assistance to the priority sectors registering a rise of Rs 13.5 crores or 37.1 per cent during the year. Of the total credit expansion of Rs 30.4 crores in 1973, the advances to priority sectors accounted for Rs 13.5 crores or 44.5 per cent of the total. The magnitude of credit apart, the number of persons benefiting through the Bank's assistance to these sectors grew significantly from 31,910 at the end of 1972 to 53,898 at the end of 1973 representing a rise of 68.9 per cent as compared to 47.5 per cent in 1972. The priority sectors accounted for 67.7 per cent of the total number of borrowal accounts. The details are given in Table B.

The notable feature about our agricultural advances is that of the total increase in the number of accounts, almost 93 per cent were under direct finance. The Bank continued its policy of giving special attention to small farmers. Efforts were directed towards financing the development of land and thereby increase the productivity. The Bank actively participated in the crash programme of digging wells sponsored by the State Government and also by the World Bank in Aurangabad district. Loans amounting to Rs. 7.49 crores were sanctioned to the Maharashtra State Electricity Board under its Rural Electrification Scheme in Poona and Satara districts.

The Bank's participation in the social experiment to eradicate poverty in the tribal areas of Thana district in collaboration with 'Bhumiputra Pratishthan', an enlightened social organisation, deserves special mention. Bank has provided finance at Manor in Thana district to the tribals, who are marginal farmers, for digging wells, development of land, purchase of oil engines, electric motors and power tillers. The Pratishthan provides these farmers with inputs and technical guidance. The farms are supervised regularly by their volunteers and new experiments encouraged. The innovation has succeeded in reducing the dominance of money lenders in this area. The Bank and Pratishthan are endeavouring to use these experiences as a model at other

places where similar conditions prevail.

Similarly the Bank agreed to finance the various schemes of Maharashtra State Co-operative Tribal Development Corporation. The Bank in consultation with the Forest Department of Government of Maharashtra prepared a scheme of giving bullock carts, to drought-affected people from Nasik district who migrated to Chandrapur, for the transport of forest products.

The Bank's assistance to small-scale industrial units continued to grow during 1973. The number of units assisted by the Bank went up from 6430 in 1972 to 9211 in 1973, an increase of 43.2 per cent. The outstandings reached upto Rs 23.1 crores with a growth rate of 20.9 per cent which was significantly higher than the one recorded in 1972 (6.8 per cent). The Bank has established a small cell of technical officers to expedite and facilitate the technical appraisal of credit applications.

Credit disbursed to other weaker sections of the society such as retail traders, small businessmen, professional and self-employed persons, artisans, etc, increased in aggregate by Rs 3.0 crores to Rs 8.2 crores, the number of accounts going up by about 10,300.

As a part of our social responsibility, a scheme of financial assistance to educated unemployed to set up their own enterprises was taken up in collaboration with the regional development corporations set up by the Government of Maharashtra.

The Differential Interest Rate Scheme is designed to help indigent and economically backward sections of the community by providing credit at a concessional rate to help them to improve their economic condition through an increase in their earning capacity. The scope and coverage of the scheme was widened by the Government of India during the year. The scheme is now implemented through 165 branches in 23 districts in three states and one Union Territory. The Bank has registered a steady progress in 1973 which can be seen from the following ing table:

(Rs in lakhs)

Year	Accounts	Amount
1972	313	0.78
1973	4813	19.30

The Lead Bank Scheme was conceived as a right approach to creative banking. As a first step towards fulfilling the objective of providing integrated banking facilities, the Bank not only extended the network of its own branches but also encouraged the other banks to open their branches.

The Bank is well aware that the newly opened branches should not remain mere flagposts. The district-level consultative committees have been set-up in all the districts and they have been meeting regularly for the last two years. Steps are being taken to make them more effective. Reorientation of the staff engaged in the district is very essential for the success of the Lead Bank Scheme. As a step towards achieving this, special week-end courses for agents and field officers of our branches were conducted at Satara, Aurangabad, Thana and Nasik during the year.

The Bank continued to lend support to Government's planning efforts by subscribing to government and other trustee securities to the extent of Rs 46.7 crores in 1973. The total investments increased by 10 per cent to Rs 51.1 crores.

After a very big stride in the branch expansion in the immediate post-nationalisation period, the Bank had to consolidate its position and review its future course of expansion. The changes in the distribution of its branches can be seen from Table C.

Starting with mere 47 branches at the time of nationalisation, the Bank has opened the largest number of its branches in the lead districts. Of the 197 branches opened in the post-nationalisation period, 110 branches were in the lead districts. At the end of 1973, the number of branches in lead districts was 157.

The growing size and complexity of the Bank's activities and the mounting expectations of the society has made the adoption of an appropriate system to ensure effective management of business inevitable. Performance budgeting as a tool of planning and control has come to occupy a vital role in business strategy. Conscious of the prominent role it wants to play in future, the Bank has initially introduced the performance budgeting system

TABLE C

in its two lead districts, *viz*, Thana and Aurangabad and plans to extend this system to all the branches in a phased manner.

Shri C V Joag retired as the Chairman and Managing Director of the Bank and Shri V M Bhide took over charge of the office with effect from October 1, 1973. The Board of Directors take this opportunity to place on record their appreciation of the services rendered and the able guidance given by Shri Joag in managing the affairs of the Bank.

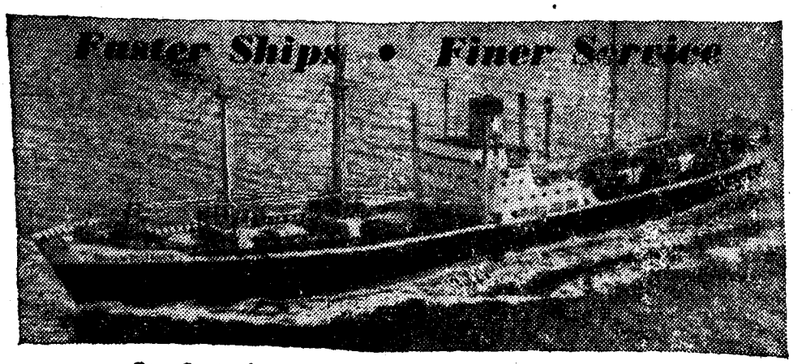
The Board meetings were also held at Satara and Aurangabad during 1973. These meetings helped the members of the Board to have a better idea of local problems.

The process of reorganising the Bank's administrative set-up took further shape during the year. The functions at the Central Office have been reorganised and in the field, during the year, the divisional offices were strengthened by appointing supporting staff in the executive cadre to help the divisional managers in the office as well as in developmental activities.

The total staff strength of the Bank has more than doubled between 1969 and 1973, from 2,999 to 6,035, as a result of the large number of branches opened during the period and the growth of business at existing branches. By the end of 1973, there were 1,194 offices, 110 special assistants, 3,214 clerks and 1,517 subordinate staff.

The expansion in the branch network and diversification in activities demand a continuous flow of trained staff. Considering the need for adequate trained manpower for the development of business, the Bank had to augment training facilities by arranging crash training programmes and organising refresher courses to make the best use of the available manpower resources.

The relations between the staff and the management were cordial throughout the year. Frequent deliberations were held with the representatives of the employees to discuss and solve issues affecting service conditions of the employees.



For and on behalf
of the Board of Directors,

V M BHIDE
Chairman and Managing Director

Poona May 16, 1974

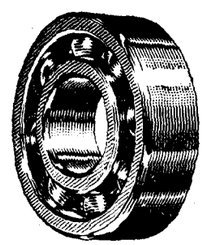
This rough sketch sparked off one of the smoothest innovations of all time...

This original sketch of the self-aligning ball bearing was made by its inventor Dr. Sven Wingquist in 1907.



It was a significant contribution to the development of bearing technology, responsible for the earliest major expansion of SKF—The organisation that has done more for the techniques, quality, diversity, expansion and progress of the bearing industry than any other corporation in the world.

As a result, SKF is the world's largest manufacturer of rolling bearings, offering the biggest range:

8000 basic types and over 20,000 variants to meet the needs of practically every type of industry and transport.

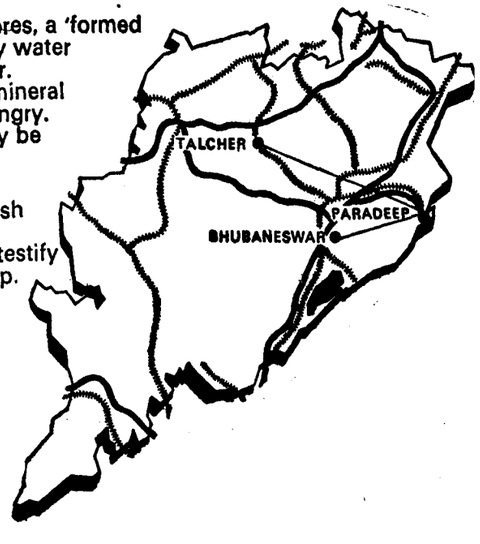
Orissa offers two new places of interest to industrial site-seers

Talcher and Paradeep



TALCHER :

An F.C.I. fertiliser plant worth over Rs. 100 crores, a 'formed coke' plant of N.C.D.C. and a Rs. 21-crore heavy water project will become familiar landmarks in Talcher. So ideally suited for engineering, chemical and mineral based industries and others which are power hungry. The coal-based 250 MW power plant will shortly be increased to 500 MW to feed new units.

PARADEEP :

An over Rs. 240-crore fertiliser plant, a soda ash plant costing more than Rs. 20 crores, besides a brewery and marine and chemical industries all testify to the growing industrial importance of Paradeep. Massive exports of iron ore are made from this strategic port—one of the deepest in India—possessing modern handling facilities.

Talcher and Paradeep will live up to all your expectations : an established industrial infrastructure that includes ample power, communication facilities and developed land; sufficient raw materials; a responsible work force; and finance. And above all, the motivation to get things done for a more productive tomorrow—today.

Shadow-Boxing

THE government has been talking of a package of anti-inflationary measures, which it is unwrapping bit by bit. Of the measures announced so far, only the ordinance impounding increases in wages and dearness allowances can be expected to have an impact, though this impact will be felt more in terms of hardship caused to salary and wage earners than of any perceptible effect on the inflationary situation. The other measures — the restriction on dividend distribution by companies and the compulsory deposit scheme for income-tax payers with annual incomes of Rs 15,000 and above — are obviously intended to deceive salary and wage earners, and their trade union organisations, into believing that the rich are being made to share the burden of fighting inflation.

The next weapon to come out of the government's anti-inflation armoury will be, we have been told, the supplementary budget to be presented to Parliament at the end of this month. There is some more deception in this, but of a different kind. It has been obvious for quite some time that the government would be forced to come forward with a supplementary budget to raise additional revenue — unless it was prepared to see the budgetary deficit rise to many times the figure of Rs 125 crores indicated in the Budget for the year presented at the end of February. The government itself had appointed two committees to consider ways of pruning Plan and non-Plan expenditure so as to ensure that the budgetary deficit did not exceed Rs 125 crores. These committees have reportedly completed their work and come to the altogether predictable conclusion that while some Rs 200 crores could be lopped off the outlay on the annual Plan for 1974-75, there was no scope at all for any paring of non-Plan expenditure. On the contrary, the non-Plan expenditure of the government is threatening to far exceed the original Budget estimates.

It has been reported that even with the cut of Rs 200 crores in Plan expenditure, the budgetary deficit in 1974-75 is likely to be in the region of Rs 600 crores. This implies a net deterioration of about Rs 675 crores in the government's budgetary position over the estimates of the February Budget. The largest contribution to this deterioration must necessarily be that of a sharp rise in non-Plan expenditure over the Budget estimates. A part of the increase in non-Plan expenditure is no doubt the result of such expenditure having been wilfully understated in the Budget — so as to keep the figure of deficit at the impressively low level of Rs 125 crores. A part can perhaps be attributed to the rise in prices subsequent to the framing of the original Budget estimates.

Even if the government would rather not admit to the deliberate underestimation of expenditure in the Budget, the best face it can put on the sharp rise in non-Plan expenditure is that this has occurred because of the rise in prices. And, insofar as the supplementary budget is being presented to raise the wherewithal to meet this increase in expenditure, it must be seen as the consequence of inflation and cannot, surely, be counted among the measures being taken to curb inflation. This will be so even if the Finance Minister proposes substantial additional taxation, as he necessarily will have to do. Indeed, if the figures quoted above are anywhere near the mark, even a mighty tax effort in the supplementary budget will not help to keep the deficit down to the original estimate of Rs 125 crores. That apart, as we have seen, the proportion of Plan expenditure in the government's total expenditure has fallen sharply over the estimates of the February Budget, as a result both of a cut in Plan expenditure and of a steep rise in non-Plan expenditure. This, even the government will agree, can scarcely be deemed a contribution to checking inflation.

Nor can the government expect to perform any anti-inflationary miracles through the precise manner in which it raises the additional revenue required to meet the rise in non-Plan expenditure. Not that there is much room for play here. A large part of the additional revenue will necessarily come from indirect taxes on so-called semi-luxury items. It is known well enough that these taxes hardly dampen either the consumption of these goods or the investment in their production. Purely from a revenue-raising standpoint, there is considerable scope for mopping up a part of the manufacturers'/traders' super profits on products like steel, cement, fertilisers and a number of chemicals. As for direct taxes — at least those on personal incomes —, the February Budget's proposals were based on the presumption that the rates of personal taxation were too high and needed to be lowered. Is the government prepared to go back on this approach? If it is, then it can straightaway recoup an estimated annual loss of Rs 100-125 crores by returning to the earlier rate structure for taxation of personal incomes.

However, even the most steeply progressive tax system can have an impact on inflation only *via* the tax revenues being used for investment to enlarge flow of wage goods. But in fact what is being proposed is a cut in investment!

Even as the government has made much of so-called measures which have either nothing to do with inflation or are of peripheral significance, all is quiet in the one area in which action could have a swift and sharp impact on inflation — controlled distribution of the basic necessities of life. Instead, in this area there has been a marked regression. For instance, the scale of operation of the public foodgrain distribution system has been slashed to less than one-half of what it was around this time last year. The Prime Minister has talked soothingly of large quantities of foodgrains, mainly wheat, which are proposed to be imported this year. What is forgotten is that, as far as public distribution is concerned, these imports will barely make up for the government's dismal failure to procure foodgrains internally. An idea of the shape of things to come can be had from the announcement that the Maharashtra government is considering a further cut in the foodgrains ration quota in Bombay so as to increase supplies to the rural areas where, according to representations received by the government, the availability of foodgrains through the fair price shops is "almost nil"!

Foodgrains Production

Limits of New Technology

THE officiating Union Minister of Agriculture has now come round to admitting that the output of foodgrains in 1973-74 is going to be in the range of 106 to 108 million tonnes. Going by the past pattern of official confessions, the lower figure is the likely final estimate. This would be some 9 million tonnes less than what was being claimed about this time last year, 8 million tonnes less than what was anticipated for the year in the draft of the Fifth Plan, and 4 million tonnes less than what had been alluded to in the considerably chastened *Economic Survey*. True, in recent years, figures given out on foodgrains production have been largely affected by the political weather. The days of 'pure', 'non-biased' estimates are past: politicians determine, on the files, what the compound rate of growth — whether of agriculture or of industry — *ought to* be. Even so, the general trend is by now obvious, and the time has certainly arrived for assessing the country's experience during the past decade in the context of the various efforts to raise the level of grains output.

This decade has more or less coincided with the induction of the so-called new technology in agriculture which, in turn, supposedly heralded the great 'green revolution'. How green, however, is the valley? The authorities have now and then admitted to occasional setbacks in the agricultural production programmes because of specific factors — such as lack of rains or shortage of fertilisers — but no attempt has been made to appraise the total substance of the new technology. Indeed, to question the impeccability of the package of policies stemming from the new technology has been considered very nearly unpardonable heresy.

But must one not find out whether the emperor has in fact any clothes? Between 1949-50 and 1964-65, the compound rate of growth of foodgrains production in the country was approximately 3.4 per cent. At least half of the increase in output during this period was on account of the lateral expansion of acreage; nevertheless, the rate of increase in productivity per acre worked out to around 1.2 per cent per annum. Has the performance been even a shade better since 1964-65 — the year when the new technology made its debut? If equal weightage is given to the estimates of output in the individual years, the compound rate of growth of foodgrains production in the country between 1964-65 and 1973-74 would work out to barely 1.3 per cent per annum. Were a trend line to be fitted on the basis of three-year moving averages, the rate of growth per annum would improve to only 1.5 per cent. And, in case the share of wheat in this growth is left out, for the other crops considered together, the compound rate of growth is hardly 0.6 per cent.

In wheat, too, the rise in production and productivity, it is now generally agreed, has been a once-over increase. The irrigated tracts having been utilised to the hilt for the cultivation of the crop, the rate of growth has begun to drop perceptibly — at least, so is being stated by the officials from Punjab and Haryana. In more recent years, questions have also been raised regarding the pest-resistance of new wheat varieties which has apparently stunted growth. As for the other food crops, 'green revolution' or no 'green revolution', new technology or no new technology, the position continues to be exceedingly grave, and productivity per hectare has actually declined in quite a number of instances — with perhaps the exception of maize.

If, despite these facts, Krishi Bhavan still continues to lean on the so-called 'progressive' farmers who control the larger-sized holdings and have superior command over resources, the country would sink into even deeper trouble than it has been in the past few years. The shrinking level of procurement ought to suggest to the authorities that the policy package of the 'new technology' has become altogether counter-productive, and that the rise in the holding capacity of the big farmers cannot but further induce the emergence of a negative supply curve. The problem of Indian agriculture is not primarily one of the induction of new technology, nor of providing adequate price incentives, but of *structural* readjustment. There are here two essential elements of policy: first, a drastic realignment of the ownership and tenurial arrangements such that particularly in the *kharif* belt small farmers and landless labourers begin to have a greater stake in land, and so that co-operative bodies, banks and other public financial institutions too are compelled to readjust *their* policies and attitudes: second, a re-drawing of the country's irrigation plan with a shift in emphasis away from the traditional *rabi* to the traditional *kharif* tracts, thus ensuring that the latter areas too can take to the new technology which requires controlled water administration.

The established predilection, of course, is to pursue more of the same. But to persevere with the kind of agricultural policy followed since 1964-65 — with its accent on quick and large marketable yields — would not only not lead to any perceptible improvement in the rate of growth of foodgrain output, it would cause considerable harm — both by further aggravating the existing inequalities in the rate of growth of foodgrain output among the different regions and hence in the pace and pattern of income growth as well as in further concentration holding and political power in the hands of the few, and by accreting farm production in specific areas could increase the difficulties of equitably distributing food around the country.

The caveat needs to be underscored at this stage because C Subramaniam was Union Minister in charge of Agriculture when the new technology was initiated a decade ago; the danger of an altogether closed mind cannot therefore be ruled out. Subramaniam's only major policy statement since his assuming charge, once more, of the portfolio of Food and Agriculture concerned an exposition of how procurement could be raised through linking it with the supply inputs — thus indicating hardly any advance in thinking. Rummage through the newspapers circa 1964-65, and C Subramaniam was making more or less the same statements.

Political Prisoners

The Maimed and the Dead

EVIDENCE of the barbaric treatment of so-called 'Naxalite' suspects by the police continues to pile up. A ghastly account of how women detenus are subjected to the most savage torture has recently been provided by members of the All-India Women's Association. The Association has no particular pro-'Naxalite' sympathies and in fact it was by sheer accident that some of its members got to know of the police treatment of women 'Naxalite' suspects. On May 3, some members of the Association were arrested in connection with the anti-price rise demonstrations organised by nine Left parties in Calcutta. Because of overcrowding, some of the arrested were kept in a cell in the Calcutta Presidency Jail close to the women 'Naxalites'. This enabled them to gather facts about torture of the suspected women 'Naxalites'. Some excerpts from the account provided by the All-India Women's Association are given below:

"After arrest and the usual police interrogation (which often included routine physical torture) they [the 'Naxalite' suspects] were detained in jail. One month after their detention most of these girls were taken to Lal Bazar [headquarters of the Calcutta police] ... There they were taken to an underground cell for interrogation (who are there in your group? give their addresses and names, etc) and if their answers failed to satisfy the police bosses, they were immediately subjected to physical torture.

"These girls were stripped naked and made to lie on a table. Then they would begin with burning by cigarette — neck, breast, stomach and other soft private parts not excluded — accompanied by all conceivable humiliation. And after this, if any of the girls refused to speak, an iron ruler would be inserted into her rectum. (As a result of repeated torture, the *rectum* and vagina of some of these victims have become one.) After this, the unconscious bodies of these girls were brought back to jail by police van. After 20 or 22 days, when they recovered, the girls would be once again taken to Lal Bazar and subjected to the same treatment.

"Although most of these girls are under trial, they were never presented before the magistrate. The police had their necessary documents signed by the magistrate, while the girls were kept waiting in the police van ..."

Clearly, in its treatment of those who pose a political threat to it, the Government of India has nothing to learn from the most repressive regimes in the world. But the women prisoners whom the members of the All-India Women's Association saw are at least still alive. On the other hand, scores of alleged 'Naxalites' have been killed in so-called incidents inside jails or in what are described as attempts to escape from jails. Recently, a Calcutta paper published statistics of alleged 'Naxalites' killed and injured in some of the jails in West Bengal and Bihar. These figures are reproduced in the accompanying Table. (Figures in parentheses in the Table are unofficial estimates of casualties.)

TABLE: NAXALITE PRISONERS AND DETENUS KILLED AND INJURED IN SO-CALLED JAIL INCIDENTS

Name of Prison	Date of Incident	Dead	Injured
Midnapore Central Jail	17.12.70	8	60
Presidency Jail, Calcutta	4.02.71	Nil	24
Midnapore Central Jail	4.02.71	2	60
Beharampur Jail	21.02.71	10(47)	62(100)
Dum Dum Central Jail	14.05.71	16(32)	88
Howrah Jail	16.05.71	NA	NA
Sewri Jail	7.06.71	NA	5
Alipore Special Jail, Calcutta	31.06.71	6(9)	NA
Alipore Central Jail	26.12.71	6(60)	200
Hazaribag Jail	25.07.71	17	60
Asansol Jail	5.08.71	9	21
Hooghly Jail	7.02.72	1	24
Beharampur Special Jail	26.02.72	NA	NA
Jalpaiguri Jail	26.02.72	1	NA
Bhagalpur Jail	8.05.72	7	160
Burdwan Jail	28.05.72	2	26
Gaya Jail	9.9.72	1	55
Bankipur Jail	9.09.72	NA	10
Alipore Central Jail	1.10.72	1(4)	80
Beharampur Special Jail	27.11.72	—	65

The jails of West Bengal are still overcrowded with alleged 'Naxalite' detenus. In fact, the number of such detenus has been perhaps going up, with the number of fresh arrests exceeding that of those released. According to the Legal Aid Committee of Calcutta, not less than 15,000 alleged 'Naxalities' are in prison in the state.

From time to time the Legal Aid Committee makes public instances of illegal detention and torture of alleged 'Naxalites'. Recently it has revealed how in Basirhat district in West Bengal six boys were kept in jail for two years on an unproven charge of murdering a landlord. Two of the boys are still in the Alipore jail. There is another case of five brothers; two of them were shot dead; the eldest, about 29, has been in the Dum Dum jail for four years on 19 different charges; and the youngest, a young boy of 13, has been crippled by police torture. Another alleged 'Naxalite', Biren Nayak, 21, was recently produced in court with extensive burn marks on his forehead. Now he is in Calcutta's notorious Presidency Jail, reportedly with his rectum ripped by the torturer's stick.

Under British rule, the police firing in Higle Jail in Midnapore had sparked off a nationwide stir, forcing the impe-

rialist rules to institute an enquiry into the killing. Under Congress rule, however, killing and torture of political prisoners can be carried on with impunity — and, it appears, without fear of public protest.

Research Establishments

Unproductive Empires

IN spite of having one of the largest scientific communities in the world, choosing chief executives for scientific organisations has always been a vexing problem in this country. Whenever a vacancy arises or a new programme is initiated, the choice again and again narrows down to a select few. These few invariably already hold other positions of leadership. The latest example is the appointment of M G K Menon as Scientific Adviser to the Ministery of Defence, Director-General of Defence Research and Development, and Secretary to the Government of India. Menon, it is reported, will continue as Secretary to the Government in the Department of Electronics and Chairman of the Electronics Commission, though he has kindly consented to give up the post of Director of the Tata Institute of Fundamental Research. This decision of the government is unfair to R and D programmes in both Electronics and Defence. Both need full-time chief executives because they are critical to the country's development, are of large size, and are different from each other. One person, however gifted he may be cannot devote enough attention to the two organisations. As a result, both Electronics and Defence R and D will suffer for want of leadership and timely decision-making.

As it happens, the Defence R and D organisation needs all the leadership that it can get. Acute staff dissatisfaction, low productivity, and cynicism are rampant in it. This organisation, which spends nearly Rs 25 crores of public money annually, gives out very little information about its activities to the public. Much of its work has non-defence applications as well but, thanks to the cloak of secrecy, very little is known of such possibilities. Meanwhile, imports and foreign collaboration for meeting defence needs continue on a massive scale. To appoint a part-time chief executive for this organisation is therefore to invite disaster,

It is becoming fashionable for heads of scientific organisations to secure two or three high positions for simultaneous occupation. M G K Menon has continued to hold the Directorship of the Tata Institute of Fundamental Research after his appointment as Chairman of the Electronics Commission and Secretary to the Department of Electronics. In the last two years, it has been the experience of TIFR scientists that they can hardly find the Director in the Institute. Under a highly centralised form of Management, with nearly all powers vested in the Director, such a situation can be frustrating indeed. For a few months in between Menon was also Chairman of the Indian Space Research Organisation, and even now continues to be a member of the Space Commission similarly, the present Chairman of the Space Commission, Satish Dhawan, continues as Director of the Indian Institute of Science, a major educational institution in advanced science and technology. That the headquarters of the Space Programme was shifted from Ahmedabad to Bangalore to suit his convenience, seems perversely to follow from the logic of such a concentration of office, in one man!

Is the country so lacking in scientists that we have to keep offering the top positions in science and technology organisations to a small coterie of individuals? Haven't these organisations developed any second-level scientific leadership worth the name after so many years? Would it not be far better to let some of them develop even by risking minor mistakes rather than condemn the organisations to stagnation under part-time leaders?

As for the individuals concerned, it is clearly irresponsible on their part to accept appointments to so many positions at the same time. As it is, much of their time is frittered away in constant travel, official engagements, parties, inaugurations, committee meetings, etc. If any one of them maintained an account of their activities on behalf of the various organisations with which they are connected and the pattern of time spent in a typical month, it would hold interesting revelations.

Top government appointments are made in India by invitation. Unlike in the US, they do not have to be ratified or approved by a Parliamentary Committee. If they had to be, then the public hearings would reveal the person's capability and time commitment in relation to the needs of the organisation to which he is being appointed. Yet, the consultative committee of Parliament attached to the Department of Personnel could initiate some action in this regard.

Compulsory Deposits

False Flourish

THREE comments appear to be in order on the latest ordinance introducing the compulsory savings scheme for the higher income groups. First, viewed purely as an exercise in public relations, it would have been altogether more sensible if this ordinance had accompanied the other two ordinances issued in the preceding week; it might have partly assuaged the impression that the major thrust of the government's current series of anti-inflationary jousting is against the workers and other low-income groups. There is, after all, nothing particularly novel about the announced scheme for compulsory deposits. It cannot even be claimed that its announcement had to be held back because the details needed to be worked out: the details are yet to be announced. In the second place, the Government, in claiming that the scheme would net Rs 50 crores annually, has again taken recourse to verisimilitude. It will do no such thing. Interest on these deposits, at 8.5 per cent — though not compounded — will, over a five-year period, earn not very much lower than what can be earned on fixed deposits. Besides, repayment will start flowing at the end of the second year itself. The opportunity cost of the compulsory deposit could be zero, or negligible, for several people who, might be simply transferring to the government amounts that they would otherwise keep in fixed deposit accounts. The net accretion of additional savings is certainly going to be substantially lower than Rs 50 crores. Thirdly, whatever might be the claim of the authorities, the brunt of the measure will in the final analysis have to be borne once again by the salary-earning tax-payers. The professional groups — who are but barely within the tax net — will escape even the marginal rigours of this compulsory deposit scheme.

This last point can be elaborated. Some scattered data were made available last week on lawyers, doctors, engineers and contractors, who have recently been brought under the tax orbit. It is quite clear that the majority of these professional groups continue to escape taxation; even the few amongst them, who condescend to file returns and pay taxes, often cheat on the declaration of their aggregate income. Besides, scarcely any steps have been taken to track down the thousands of traders across the country whose gross incomes exceed, by several

times, the incomes of even the relatively affluent lawyers, engineers, and physicians. The authorities at the Centre have an alibi for not touching the high-earning farmers — namely, that the taxation of agricultural income is the domain of the state governments. But it has no alibi at all for not corralling the traders, whose speculative avarice has largely contributed to the price spiral. Where there is a total lack of endeavour even to identify the people who eminently deserve to pay income-tax, it is folly to entertain exaggerated notions about the efficacy of compulsory deposits as an anti-inflationary device. Those who do not pay income-tax will not be called upon to make compulsory deposits: the scheme will, therefore, provide an additional excuse for some people to stay away from declaring their incomes.

The major question mark about the present ordinance — as also about the two earlier ones —, however, pertains to the more basic issue. In announcing these ordinances, the authorities have stuck to a particular view of the unfolding economic phenomena. They have reached the conclusion that the current bout of inflation is all because of happenings on the demand side. This is scarcely a correct representation — unless one is referring specifically to the so-called 'reserve demand' on the part of speculators, traders, and rich farmers. The Prime Minister's occasional philosophising apart, there is not a hint that anything is to be done to restrain this kind of demand of these categories.

Even assuming that the compulsory savings scheme would trap Rs 50 crores of income-flow in the net, and not in the gross, the same result could have been achieved by merely asking the banks to cut down their advances by less than one per cent. The Government has seemingly little intention or capability to exact any such things from the banks. The so-called scrutiny of the big accounts is, of course, a much-used *mantra*, but hints liberally emanating from the Reserve Bank of India suggest that the ritual is not to be taken seriously. And have not the big accounts already passed through the sieve of the Credit Authorisation Scheme?

But, then, the Congress Working Committee had just passed a firebrand resolution for combating inflation, and the All-India Congress Committee was about to meet. The compulsion for an ordinance invoking compulsory savings was therefore understandable.

Industrial Countries

Oil Crisis eEclipsd by Inflation

AT the beginning of the year the oil crisis was generally regarded as the most ominous development which the developed Western countries had had to face in the post-War period. Now, however, they appear far more preoccupied with the threat of an unbridled 'double-digit' inflation. Saudi Arabia's firm stand against any further rise in prices of crude oil and the consequent dissensions among the oil-exporting countries have been a soothing development for the oil-importers, with the prospect of oil prices stabilising slightly below $ 10 a barrel.

France, Italy, Japan and the UK were expected to be the hardest hit by the rise in the petroleum import bill. Italy and the UK among them already had large balance of payments deficits and so they were expected to be in serious trouble as a result of the oil crisis. But as things have worked out, the balance of payments problems of at least France, Japan and the UK appear to be manageable.

The recent agreement between France and Iran under which Iran is to purchase goods and equipment worth $ 5 billion will go a long way to help France which is trying to get other countries, including the Soviet Union, also interested in such agreements. As regards Japan, it is doing exceedingly well on the exports front. In May Japan's exports rose by a record 62 per cent over those in May 1973 and were over $ 4.5 billion. The light credit squeeze at home has forced Japanese producers to sell more abroad and Japan's balance of payments deficit is expected to be cut sharply in 1974 and be further reduced in 1975. With total external reserves of well over $ 15 billion (including concealed reserves) and its borrowing programme abroad, Japan can weather the oil crisis without much difficulty. Moreover, both Japan and France have started attracting Arab funds, though as yet in driblets.

The UK's trade deficit in 1974 is likely to be around $ 10 billion, or one-quarter the expected combined deficit of all industrial countries. However, the UK too is not likely to be in any particularly serious difficulty. The North Sea oil discoveries have altered the long-term outlook for the British economy. By 1980 the UK is expected to emerge as a small exporter of oil. The oil-rich Arabs have grasped the significance of this and have put sizeable funds in medium and long-dated UK government securities. Secondly, after the failure of three prominant US, West German and Swiss banks, the UK has emerged as a safe centre, for Eurocurrency deposits. This will help to increase the UK's invisible earnings. Another significant development, particularly for Japan and the UK, is the crash in the prices of primary products which will reduce the import bills of both countries.

Italy continues to face a serious balance of payments problem. However, even in this case the seriousness of the crisis appears to have been exaggerated. Italy has not used any of the $ 4 billion worth of inter-central bank swap lines available to it to defend its currency. It has reportedly not drawn on the IMF stand by credit of $ 1.2 billion either. At the current market prices, its gold reserves are worth over $ 12 billion. Italy is also taking action to control demand-push inflation within the country. In the event of a serious payments crisis, Common Market partners like West Germany will come to Italy's rescue though they have not yet come out with a definite statement to that effect — perhaps to put pressure on Italy to try to help itself to the maximum by reducing its non-oil-induced trade deficit.

With the balance of payments problems of even the most vulnerable countries thus appearing manageable, the latest OECD forecast released this week is more concerned over inflation than with the balance of payments deficit of $ 40 billion facing the industrial world during the current year. Despite the near stagnancy in output in seven prominant developed countries put together, viz, the US, the West Germany, Japan, France, the UK, Italy and Canada, the inflation rate is around 13 per cent. According to the OECD, Japan and Italy will have very high inflation, at 25 per cent and 18 per cent, respectively, while in the US and West Germany the rates will be 7.7 per cent and 9.5 per cent, respectively. In 1975 the inflation rates are expected to come down to 11.7 per cent for Italy and 15.7 per cent for Japan, while those of the US will rise to 10 per cent and the UK to 18 per cent. Thus next year the UK will have one of the highest inflation rates in the industrial world. This is likely to force the sterling parity down further. One need not be surprised, therefore, if the pound sterling eventually slips to a new parity of around $ 2.10 against the present $ 2.39.

Calcutta Diary

A M

THE item below was carried by what is considered to be the leading Bengali newspaper on July 14, 1974:

> Following the decision that, on July 16, the Prime Minister, Shrimati Gandhi, will cross the Hooghly river not by the Howrah bridge, but by motor launch, detailed studies are being made of tidal movements and the water level of the river at different hours of the day. Apart from soliciting the views of experts and specialists, senior officers belonging to the Calcutta and Howrah police and the Department of Marine are travelling up and down the river by motor boat to study the drift of current in the river. In addition, the State Inspector-General of Police, Ranjit Gupta, and the General Manager of the South-Eastern Railway visited on Saturday the Howrah Maidan Station and Ramkrishnapur Ghat to check on the arrangements.
>
> On Tuesday, the day of the Prime Minister's visit, the ferry service between Chandpal Ghat and Ramkrishnapur Ghat will be closed from 3 pm till 6 pm. The Howrah *hat [market]* will be closed at 12 noon; no business will be permitted after that hour. Brisk repairs are going on of the roads around Ramkrishnapur Ghat. Two thousand and five hundred policemen have been assigned for duty in the area; they will be under the supervision of DIG (Armed Police), Partha Basu Roy Chowdhury.

Pray, what was the gala event giving rise to all this commotion? Indira Gandhi briefly visited Calcutta on July 16. She was to go across the river to Howrah, to address a meeting in connection with the inauguration of work for laying a broad-gauge railway track. The Howrah bridge, which connects Calcutta to the other side of the Hooghly river, is a little more than a quarter of a mile long; if there is no jam, a car can cross the bridge in a couple of minutes or less. But traffic on the bridge can be heavy. When this happens, cars have to slow down. The Prime Minister, however, cannot waste her time. Hence the decision that she should cross the Hooghly, not by the bridge, but by motor launch. Coming and going together, her journey across the river could not have taken more than six minutes. The ferry service for the public was nonetheless closed down for a full three hours. The daily market was wound up at noon, while on other days transactions continue till dusk. Experts of assorted hues were pulled out from their regular assignments to study the hydraulic details of the river. Senior officers chug-chugged, for several hours of the day for a number of days, up and down the river, measuring its currents. Two thousand and five hundred policemen were assigned duty. The roads were temporarily freshened up. Hundreds of street-dwellers, with no shelter above their heads, were forcibly removed from the route along which the Prime Minister and her entourage were to travel to and from the venue of the meeting.

One can of course offer sad, caustic comments on how strong a spell is still cast by mediaevalism in this great republic of ours. Time used to come to a stop, time still comes to a stop for the rest of the nation as the sovereign fleetingly passes by their neighbourhood. The resource-wasting rituals — which the above news item typifies — have little to do with the normal requirements of security; they are a reflection of a near-mediaeval system of values which, deliberately or otherwise, has been integrated into the country's politico-cultural norm. Till as long as there is no organised and sustained protest, these rituals will continue.

The enactment of such rituals has an economic implication; it involves an opportunity cost. The economic consequences of the charade, which marked the Prime Minister's visit to Howrah on July 16, were there for all to see. The ferry service across the river between two extremely busy focal points was completely suspended for three hours, all because the Prime Minister was around for a total period of six minutes. Traffic between these points, therefore, came to a halt during those hours, and one can work out the direct and indirect economic loss of the stoppage of the ferry service. The market was forced to close early; it worked at least six hours less than normal. Two thousand and five hundred policemen, dancing attendance on the Prime Minister's party, who could have been deployed elsewhere — for example, helping with the procurement of foodgrains — represented yet another facet of the opportunity cost. Because the Prime Minister was crossing the river for a bare six minutes in a motor launch, several motor launch-hours worth of diesel, furnace oil, and petrol, were used up by officers who studied for days on end the tidal bores and water levels of the Hooghly. Hydraulic experts, who ought to have better things to do, were set busy taking the measurements of the river at the particular stretch where the Prime Minister was to cross and re-cross.

Is this making a mountain out of a mole hill? Or do not these facts lay bare an aspect of the Indian reality, an aspect which has considerable relevance for explaining the current economic situation? Pundits berate the slow pace of economic activities in the country. With deeply felt anguish, they draw attention to the assorted sloths affecting the system; for instance, how workers while away time on shop-floors making small talk or in the name of tea or coffee-breaks. Bitter complaints are lodged over the poor rate of turn-around of railway wagons, or how power plants cannot work effectively for lack of co-ordination among the units. The private sector complains about the meaningless procedures laid down by the government, which take up a whole lot of precious time and energy. Every day, some eminence or other inveighs against bureaucratic procrastinations and the fuddyduddyness of rules which choke all creative endeavours. Management experts lament the erosion of the work ethic; the Prime Minister condemns wastage and lethargy, and broods over the lack of motivation among employees of public sector undertakings including nationalised banks. The economic stagnation may be mostly on account of the inadequacy of capital formation, but economists all the time refer also to the latent inefficiencies, to the miserably poor rate of utilisation of productive capacity, and so on.

But do not rituals and sloth go together? Where a society is organised along tribal lines, taboos, and totems, do not these take precedence over every other thing else — including essential economic activity? Work becomes secondary, sedentary; rituals get pride of place. It is impossible for ordinary mortals to differentiate between categories of social behaviour. Each time the Prime Minister visits a place, normal transactons — including vital economic transactions — are ordered to come to a stop, and rituals take over. It is thus that social norms are laid down: what has precedence over what, what is relevant, and what is not. These norms then permeate through the various organisms of the nation. The opportunity cost of subverting crucial economic goals is obviously considered worthwhile.

It was an inaugural occasion which took the Prime Minister to Howrah. Will it be unpardonably rude to say: a ritual a day perhaps keeps the hour of reckoning away? The other day, when the Prime Minister read out a long essay on economic ethics in Bangalore, the occasion, again, was the lay-

ing of the foundation stone for a particular institution. She was preaching the need for all-round economy in the use of resources even as she was abetting in the act of wasting some: this is the inherent contradiction from which none is seemingly at all keen to opt out. The amount of time which ministers spend in inaugurating seminars or laying foundation stones or pressing buttons for opening a factory or a fish market could have been usefully deployed for more coherent economic tasks. There is also a second-order effect of the wastage of time — and hence resources. Ministers waste their own time and of course government resources by travelling to these inaugural shows; and since mediaeval heritage insists that, as the chariots pass by, the commoners too must stop work and pay them obeisance, more time and resources are brought to nought. As a direct consequence, certain other notions also get implanted in the nation's stream of consciousness — that appearance is reality, that ritual is sustenance, that invocation is the essence of economics. Each of these may be dangerously misleading or false.

All power to the people. If people want to set up an administration based on the adulatory principle, it is their affair, even if we happen to be in the twentieth century and in the dying third quarter of it. After all, monarchies are still around, including one or two absolute ones. It is, however, the combination of mediaevalism with tribalism which spells danger and agony, for then adulation and economic sloth tend to be inseparable joint products. It may take the people quite some while to comprehend the implications of this joint supply. After that, again, it is a matter of their own decision.

CAPITAL VIEW

JP Haunts the Congress

Romesh Thapar

THE Congress Party is very thick in the head and seldom learns from its mistakes. First, there was that scandalous attempt to smear the personal reputation of Jayaprakash Narayan. I say 'scandalous' because the persons making the accusations about corrupt living are regarded as the notorious characters in the Indira Gandhi entourage. Then, when this assault recoiled, a kind of sniping was resorted to. This also failed to make a monkey out of JP. Now, the AICC jamboree in Delhi has thought it fit to single out the aged Sarvodaya leader as the main threat to the future of the Congress.

Whoever thought out this strategy, deserves a special dunce's cap made of terrycot (in the style now urged upon the fake followers of Gandhi!). JP should be happy that he has now been elevated to undisputed, partyless, leadership of all those striving to reform, purge, and restructure the politics of India. It is a role which he has always sought; he could hardly have believed that it would be thrust upon him by his own sworn enemies. The more JP talks about the failure of governance, the spread of corruption, and the harassment of the people, the more these corrupt politicians charge him with fascistic leanings. As the wag sums it up: If that's what fascism is, let's have more of it.

What has happened to the fabled political touch of Indira Gandhi? Why is she at the mercy of men like L N Misra? Is the Bihar situation being kept dangerously at explosion point merely because the Assembly in the state must vote in the presidential election? How much of the state is already 'a law unto itself'? Will JP manage to stir another state into action? Uttar Pradesh? Is this the real fear? These are some of the questions being asked. However, it is clear that the muddled leadership of the Congress Party is itself exciting interest in the possibility of a poltical alternative — however vague and nebulous, as it emerges in the dreamings of Jayaprakash.

Naturally, the interest in shaking the ruling party into a new awareness of the economic and political crises building around it is also intensifying. Those who place ther faith in the PM's capacity to retaliate effectively are expecting what they call a *'maha qatal'* of the Council of Ministers after the presidential election — itself a prime ministerial operation which will at the same time attempt to give a new face to the Congress Party by reorganising the AICC. How this connects with the credibility of the Congress in the states is anybody's guess.

Beyond personalities, and their shuffling around, attention is focused upon the new programmes and policies to curb inflation, to encourage productivity, and to lift the morale of the nation. Despite the differences over the Ordinances, and the many speculations around them, the attack on the hoarder, the smuggler, and the businessman-racketeer, is considered by all as an essential element of the remedial package. This attack, however, remains marginal, intermittent and ineffective. Is the leadership reluctant to be effective in this respect for fear of toppling itself in the process? Is the alliance as close as is alleged?

The experts know that all the Ordinances in the world cannot halt the drift towards economic — and political! — anarchy, unless 'the underground sector' is dealt a massive blow. There is only one person in the country who can trigger off this blow-up at the Central and state levels — the Prime Minister. If she fails to act, then she will increasingly be seen as a protector of this sector.

Already, it is possible to sense a mood of anger developing among the still honest elements in the fixed salary areas. As the squeeze develops through Ordinances, and no attack develops on black money, they begin to ask themselves whether honesty is a sucker's posture, whether the time has not come to dip their fingers in the tempting pie, whether it is not good sense to join the rate race. The leaders of the ruling party cannot be unaware of these currents.

Significantly, even as Jayaprakash Narayan awaits the next foolishness of the government which will give him more power to move the people, Members of Parliament are assembling for the short monsoon session, exhausted and listless. It indicates a growing despair with the way our democracy is being managed and a developing reliance on mass action. The strike weapon may have been blunted by the adventurism of the trade unions, but the stir against official inaction, against open corruption and blackmail, and against harassment, could build up rapidly.

If Indira Gandhi is acting according to the content of her speeches — which may well be, despite the credibility gap — the fact remains that she appears also to be powerless in her efforts to move the machine of government towards performance and productivity, which alone can provide the basis for change. The Prime Minister needs to assess her own effectiveness within the maze of government.

Tailpiece: Alas! we are now exporting cross-bar telephone exchanges to friendly countries in the developing world ...

July 22

COMPANIES

A Roaring Business

Hansavivek

INDIAN HOTELS' chairman, J R D Tata, is of the view that the country's earnings in foreign exchange from visitors to India can, within a few years, reach the equivalent of Rs 1,000 crores per annum and become by far the largest single source of foreign exchange earning, if adequate hotel accommodation, air transport, and first class rail capacity available. He bases his assessment on the fact that the number of foreign visitors to India is only a fraction of what it is to many other much smaller countries and which offer much less to foreign tourists — such as Spain and Greece, which received last year about 35 million and 3 million visitors, respectively, compared to only 4,10,000 received from overseas by India. According to the Department of Tourism, the foreign exchange brought to India by foreign visitors was about Rs 70 crores and is expected to reach Rs 100 crores this year. Tata, therefore, advocates that expansion of hotel capacity to international standards be given highest priority to achieve a favourable balance of payments. He concedes that government has been helpful in providing funds to industry, but reiterates that government should provide even greater fiscal and monetary facilities and amenities to attract investment to this industry.

IHC's new hotel project and the renovation and expansion of 'Taj Mahal' in Bombay have been completed. The 'Taj Coromandel' in Madras, sponsored by it, began operations under its management in April last though it was not yet complete. Construction of the 'Fort Aguada Beach Resort' hotel in Goa expected to be open by November. The company's expertise and reputation in the field of hotel and restaurant management has attracted enquiries from many quarters for rendering technical assistance or providing consultancy and management services for new hotels and restaurants. It has appointed consultant and adviser to the 'Covelong Beach Resort' hotel situated 15 miles from Madras. Negotiations are also under way for hotels in Agra, Banaras, Bangalore and Delhi. Operation of the Jaipur hotel, under the company's management has been satisfactory, but that of the 'Lake Palace' at Udaipur has been dogged by misfortune. The drought of 1972, which dried the lake, forced its closure for four months, and floods coupled with the prolonged Indian Airlines' strike severely affected its operations last year. But the chairman envisages good tourist potential for this hotel, but

* The recommended dividends will have to be reduced in accordance with the provisions of the Ordinance restricting payment of dividends.

feels that this potential cannot be fully realised unless Udaipur airport is expanded to make it usable by jet transport aircraft.

GUJARAT STATE FERTILISERS COMPANY will start setting up manufacturing facilities for styrene-polystyrene and various grades of nylon chips on receipt of government approval to the agreements made by it with Badger of the UK for styrene-polystyrene and with Inventa of Switzerland for nylon chips. Meanwhile, the company has received a 'letter of intent' for expansion of its existing nitrogenous fertiliser capacities by setting up ammonia and urea plants with daily capacities of 1,350 tonnes and 1,600 tonnes, respectively. The company takes pride in having completed the caprolactum plant within 15 months of the final clearance by government for the project. During the year ended March 1974, GSFC's total production of feritiliser was 4,58,825 tonnes against 5,47,145 tonnes in the previous year. The shortfall was chiefly due to drought conditions over a long period which resulted in high salinity in the water the company receives from the river Mahi, the heavy floods during the last monsoon, the voltage fluctuations and power failures, and the longer shut-downs of the plants for maintenance. The second urea plant had to remain closed for over three months during February-May last on account of extensive repairs to the reactor, the titanium lining of which developed leakage so that fabricator's experts had to be called in from Japan. Reduced output apart, considerable increase in manufacturing costs and other expenditure owing to steep rise in prices of raw materials, stores, spare parts, power, etc, is claimed to have eroded profit-margins. While net sales were only 9 per cent lower compared to the previous year, gross profit fell by 30 per cent. Although there was no tax liability as before, net profit was more than halved. The directors recommended a dividend of 18 per cent, against 20 per cent paid last year; but this had to be reduced to 12 per cent in accordance with the ordinance.

MAFATLAL FINE has undertaken full plant-scale production of miscellaneous fluorides, developed by its own research and development department, to meet the industry's increased requirements. The company has also been granted increase in the licensed capacity for fluoro-carbon gases from 1,500 tonnes to 2,250 tonnes per annum. The chemicals division, which made a modest export of 12 tonnes of fluoro-carbon gases and 11 tonnes of miscellaneous fluorides to Singapore, Dubai and Australia, is intensifying its efforts in this direction. The production pattern of this division had to be regulated last year according to the demands of the aluminium industry, some units of which worked substantially below capacity on account of severe power restrictions. Even so, the divisions' total sales were 41 per cent higher than those of the previous year. The textiles division experienced shortage of fuel oil and power coupled with sharp rise in prices of cotton, and irregular supplies and very high prices of polyester fibre. These constraints notwithstanding, the overall performance has been fairly good. The company met its controlled cloth obligation. As against its export obligation of 74 lakh square metres, actual exports stood at 112 lakh square metres. Even in the current year, the company hopes to fulfil its controlled cloth obligation, which has been doubled from April last. With higher sales and enhanced margins, gross profit rose by 31.5 per cent to Rs 509 lakhs. Dividend, stepped up three points to 20 per cent, was covered over 2.8 times against 1.2 times previously. The company had made an application for issue of bonus shares on a one-for-two basis. The proposal as framed by it was not acceptable to government and the company was asked to submit a fresh application, which it subsequently did.

TRACO CARBIDE is entering the capital market on July 29 with a public issue of 8.58 lakh equity shares of Rs 10 each at par. The subscription list will close on August 8 or earlier, but not before July 31. The public issue will finance a part of the cost of the company's project for manufacture of 14,850 tonnes of calcium carbide per annum. The cost of the Rs 3.23 crore project is proposed to be met through share capital (Rs 1.4 crores) and term loans (Rs 1.83 crores). Located in a backward area, the project will be entitled to government subsidy and tax benefits. Apart from its application in the manufacture of acetylene and calcium cynamide, calcium carbide is used in the manufacture of a number of chemical compounds. The company estimates that given the acute shortage of petroleum products, the annual requirement of calcium carbide might go up to 2 lakh tonnes by 1978-79. Against this the present installed capacity is 69,000 tonnes. Traco Carbide is obtaining the main plant and machinery as well as process knowhow from the well known Norwegian firm of Elkem. Most of the raw materials are available locally. The company expects a turnover of Rs 2 crores and a gross profit of Rs 50 lakhs in the first year of operation, Rs 3 crores and Rs 75 lakhs, respectivelv, in the second year and Rs 4 crores and Rs 1 crore in the third. It expects to pay a dividend of at least 10 per cent for the second year of operation.

AGRICULTURE

Whistling in the Dark

(From a Special Correspondent)

SOME of the measures taken by the government, faced with the prospect of a prolonged crisis on the food front, are so jejune as to raise doubts about the government's seriousness. Take, for instance, the week-long discussions the-then Agriculture Minister held in June with individual state ministers of agriculture. Among the conclusions which emerged from the meetings were that states like Gujarat should make extensive use of dry farming technology, that Assam should give priority to bamboo tubewells, that West Bengal, Bihar and Orissa should emphasise better water management for higher rice production, that Rajasthan should get enough aluminium conductors to energise its tubewells, that Tamil Nadu should encourage cultivation of tapioca in the unirrigated areas and, finally, that despite serious resource constraints food production in the country could be increased through streamlining input supplies and reorienting extension services. None of these propositions are so unknown as to have warranted the costly meetings; on the other hand, the factors which have hitherto stood in the way of their being translated into practice are unlikely to disappear because of the former Agriculture Minister's personalised discussions and paternal advice.

More recently it has been reported that a high-powered Cabinet committee, headed by the Prime Minister herself, will suggest ways of boosting food production under what has been described as the Emergency Food Production Plan. But with the experience of so many 'special drives' and 'crash programmes' behind us, talk of yet another emergency production plan seems like another attempt to create the impression that something radical is being done by the government when nothing of the sort is intended. Falling in the same category is the government's claim that despite the fertiliser shortage, the country would be able to achieve higher agricultural production through better allocation of scarce resources. As usual the government has made use of so-called technical experts to impart credibility to its claims. A number of seminars have been organised on maximising farm production in a situation of fertiliser scarcity. The economists have, through their models, demonstrated certain theoretical possibilities. Farm scientists have tried to justify the government's optimism by reference to results achieved on experimental farms. Unfortunately, the credibility of scientists too has suffered in the past because of their collaboration with politicians in making tall claims about the yield potential of new crop varieties in complete disregard of farm level constraints. Notwithstanding this unhappy experience, scientists are now busy with all manner of suggestions, ranging from the renewed emphasis on legume crops and harnessing of atmospheric nitrogen to the curtailment of per acre fertiliser dose to cover larger acreage so as to maximise overall production despite slight fall in per-acre yield. Some of these propositions deserve a closer look.

On paper, the possibility of supplying nitrogen to the soil through growing legumes is well known. The real question, however, is whether the changes in the crop calendar, in input use intensity and in relative profitability brought about by widespread introduction of HYVs permit this.

'Back to cow dung' is another pat solution suggested by scientists and planners alike for saving chemical fertilisers. An outlay of Rs 9 crores under Centrally Sponsored Schemes has been proposed for exploitation of manurial resources and compost-making in the Fifth Plan. The new-found fascination for gobar gas plants to produce methane gas for fuel without affecting the fertilising capacity of the dung, is part of this fad. According to the report of the National Commission on Agriculture, about 400 million tonnes of cow dung are burnt as fuel every year. If this dung is fed into gobar gas plants, it would, in addition to producing fuel, yield organic fertilisers equivalent to eight times the production of the Sindri fertiliser factory. The Planning Commission has already approved of a project of the Khadi and Village Industries Commission under which 20,000 gobar gas plants would be set up in rural areas immediately. It has been estimated that the plants will produce 190 lakh cubic metres of methane gas (equivalent to 318.5 lakh litres of kerosene valued at Rs 190 lakhs) and would convert cow dung into enriched organic manure, valued at Rs 96 lakhs per year, with 2 per cent nitrogen. The ICAR has constituted an expert group to estimate the potential for gobar gas plants in the country. Needless to say, members of the group have been on a 'Bharat darshan'. The group's report is awaited.

The fact, of course, is that gobar gas plants were first introduced more than a decade ago, put have failed to catch on. The reasons for this are many. The farmer's calculations in regard to dung are completely different from those of the experts. The cost of a three cubic metre gas plant at Rs 2,800 is too high and most farmers would prefer an energised well at the same or slightly higher cost. Even in the early days, when prosperous farmers in Gujarat and Maharashtra put up gas plants, they did so largely because of the very high subsidy provided by the block authorities. Once the subsidy was withdrawn, the installation of gobar gas plants too slumped.

There is, besides, a technical problem with the gas plants. As the generation of gas is affected by temperature, in most parts of north India the plants cannot supply adequate gas during winter. Supply of dung also fluctuates according to the season and the extent of stall feeding of the animals, which again varies from area to area and farm to farm.

Scientists have come up with some other ideas as well. For instance, it has been suggested that rice production can be substantially improved through the use of blue green algae and that changed methods of fertiliser application and supplementing fertiliser by neem cake can considerably improve crop yields. Thus, it has been claimed that 75 kg of fertiliser if placed in the soil with drills instead of being broadcast can raise wheat yield from 38 quintals to 43 quintals per hectare. Using 100 kg of nitrogen per hectare, the corresponding increase in yield of rice would be 69 to 73 quintals. Similarly, it has been claimed that if 40 kg of neem cake is added to 100 kg of nitrogen, the rice grain yield could be raised from 32 quintals to 37 quintals per hectare. Again, it has been estimated that more than 50 per cent higher yields can be achieved even from lower use of fertilisers if fertiliser application is made after detailed soil analysis of the plot.

These prospects may appear promising. But most of these efforts are yet at the experimental stage. Their re-

sults have been shown on the display panels at various agricultural exhibitions and information about them has reached the minister's technical speech writers. However, it will be a long time before they reach the farmers' fields. And who knows how they will work at the farm level?

Some experiments were initiated in 1973 for exploring the technical possibilities of maintaining or raising food production with reduced fertiliser supplies. Reports from some wheat growing areas show that yield can be optimised with even 75 per cent fertiliser application provided irrigation supplies are adequate. Rice growing areas similarly report that 75 per cent fertiliser application is sufficient provided plant protection is adequate. But where all crucial inputs — including water, power and pesticides — are in short supply, what is the basis for the bold claims of maintaining food production despite fertiliser scarcity?

Even as these technical debates go on, it is clear what will finally determine allocation and use. The Agriculture Minister told a press conference some months ago that fertiliser should be allocated to areas which have the highest response potential. And how is the response potential to be judged? By the political muscle of the food surplus regions, of course.

KASHMIR

The Sheikh's Blind Side

Balraj Puri

THE first challenge to Sheikh Abdullah, after long years of near supremacy in the politics of Kashmir, came about a year ago from a section of students. Though the students raised political slogans in the few anti-Abdullah demonstrations they organised, their challenge was wider and is aimed against the values of the older generation which Abdullah has come to symbolise.

Far from taking such criticism lying down, the Kashmir leader confidently asserted: "Other parts of the country may condone indiscipline in the educational institutions, but in Kashmir we shall not permit the younger generation to go astray". And he expressed his determination "to build a strong public opinion to check this rot".

A public campaign followed against student indiscipline and violence. Abdullah also persuaded the Governor of the state to convene a conference of political leaders, educationists, and administrators, to discuss what was termed 'student unrest'. The conference, which met at Srinagar for three days in the third week of June, decided to continue its deliberations, through committees, till the causes and cures of the malady were settled upon.

The conference was attended by a fairly representative cross-section of the older generation, and it echoed Sheikh Abdullah's concern over the problem. In fact, the Sheikh appeared as the most authentic spokesman of his generation and set the tone of the conference. It was a conference of elders who presumed that the future of the country, including that of its students, was the exclusive concern of the elders. It therefore did not appear odd to most of the participants that the problem of student unrest was being discussed without even a single student representative being there. Nor had any college teacher been invited to the conference, though it is the college teacher — not the vice-chancellors or the principals — who have a day-to-day direct contact with the students. At last, the Governor, who had convened and presided over the conference, conceded that representatives of students and teachers would be associated with the deliberations of the conference at a later stage.

The self-righteous, patronising, and pedagogic tone of most participants left little hope that the proposed 'inter-generational dialogue' could be conducted on the basis of mutual respect and equality. The presumption underlying the discussions at the conference was that the students were a sick community; and the sickness needed diagnosis and treatment — albeit sympathetic — at the hands of the elders. But who would heal the physician? And what was the root cause of the physician's own sickness? These questions were evidently not even considered relevant.

There was general consensus at the conference that the students should not take part in politics. Why was it presumed that the students are any less informed and intelligent than their elders?

The real, though overtly condescending, concern at the conference was over the so-called 'exploitation' of the students by the politicians — which was another way of showing concern that political forces different from those to the liking of the elders have had influence over the young. The elders did not even touch the argument that student behaviour might become more disciplined and responsible and the political parties might become more answerable, if the students are encouraged to take more than academic interest in politics. There is indeed a case for conceding a greater share to the students in the management of their own affairs and that of the institutions in which they study. In this respect, the state of Jammu and Kashmir has a longer leeway to make up compared to the other states. In allowing students' unions to get formed in colleges and universities, in organising student activity in diverse fields including social work in the community, and in democratising the statutes of universities with a provision for an elected decision-making body of representatives of students, ways might be opened of understanding and redressing students' problems. But all that would presume a deeper faith in democratic institutions, which the conference failed to show any glimmerings of.

The problem of alienation as a cause of student unrest received scant attention at the Srinagar conference. The modern student is alienated not only from the campus but also from the society at large. What also specifically uproots and alienates the students of Kashmir from their cultural moorings is the language policy of the state. Total neglect of the mother-tongue at the college and university levels in the state is in glaring disregard of the opinion of the expert committees, the constitutional directives, and the language policy resolution passed by both Houses of Parliament. It is also at variance with the practice in the other states of the country. In fact, Kashmiri is the only language listed in the eighth schedule of the Indian Constitution, which has not received the Central subvention of Rs one crore for its development. Paradoxically, while Punjabi is one of the options for the compulsory language paper in the colleges of Kashmir — the other two being Hindi and Urdu — Kashmiri is not. Nor has the Dogri been given this privilege in the Jammu region.

It is partly the Kashmiri student's search for a sense of identity, beyond the limits of his language and culture, that has led him mostly in the direction of communal solidarity. Nevertheless, the relevance of language, culture,

1 year	Rs 35
2 years	Rs 60
3 years	Rs 80

Concessional rates are not applicable to students and teachers outside India

and history, in moulding the student mind hardly figured in the Srinagar Conference. The conference shared the widely-held convenient belief that the student unrest is a temporary by-phenomenon — one of the teething troubles of our developing economy —, and that it would automatically disappear when — thanks to our Five-Year Plans — job and career opportunities become plentiful. Thus many papers on student unrest, read at the conference, turned out to be simplistic essays in economic development. Another pet theme at the Srinagar conference was that films, TV, coffee houses, freer contacts between boys and girls, and decline of faith in religion, were responsible for the mischiefs of the students.

The elders of the state thus have little clue to the problems and motivations of the youth. In fact, out of fear and distrust of the emerging student power, the ruling leadership deliberately seeks to sanctimoniously block the avenues to its meaningful and constructive articulation. Indeed, instead of providing adequate institutional arrangements for evolving recognisable and responsible student leadership, the established political leadership have often picked up the already corrupt elements among the students for their own support, or have corrupted the more vocal elements from among the students to disrupt student movements. These have then been rewarded by licence for copying, appearing in examinations without completing lectures, etc. The so-called student leaders even acquired a say in the transfers and appointments of teachers and supervisory staff at examinations. Instances were cited at the conference of the way senior personages in politics and administration influenced the examiners to increase the marks of their wards. Small wonder that, by the current year, the examination system in the state has collapsed, and unrestricted mass copying has reduced the system to a farce.

However, what the elders' conference underlines more than anything else is the fact that the Sheikh — long acknowledged as the unchallenged leader of the Kashmiris in the tussle between India and Pakistan over Kashmir — is a nationalist but by no means a people's leader. As the tallest member of the older generation, who is acquiring an even more dominant voice in the establishment, he is accustomed to conformism and obeisance on the part of his vast following. While he preaches the rigid moral virtues of a bygone age and has taken upon himself the task of putting the students "on the right track", he has failed to comprehend the economic and linguistic problems of the people of the state *vis-a-vis* the state establishment itself.

It would, however, be an undeserved compliment to Pakistan to attribute defiance to the established authority and leadership by a part of Kashmiri youth to Pakistani instigation. While the appeal of religious solidarity from across the border to the students, who are alienated from their own community and culture, has been referred to earlier, the students' compulsion to fall back upon an extremist pro-Pak posture reflects their deeper helplessness and their incomprehension of the formidable power that is arrayed against them, and that no one of the elders who represents that power has shown them the alternative path that could both explain their situation to them and lead them out of it.

SOUTH

The Wrong Target

Mohit Sen

THE food situation in Kerala is acute. Only meagre quantities of cereals are available at the controlled prices. In the open market, the prices are prohibitive — rice, for example, sells for as much as Rs 5 per kilo in some places. Yet only a few miles across the border in Tamil Nadu or in Karnataka, prices are as much as 100 per cent lower. If there has been no starvation in the state, this is partly due to the wide public distribution network that has been maintained, however precariously. Partly it is also due to the dietary resilience of the people — fish, tapioca and jackfruit are being consumed in large quantities and by sections of the people who do not usually eat them. Having said this, it has to be emphasised that the suffering of the majority of the people is acute.

This is precisely the reason why the recent statement of the acting Union Food Minister, C Subramaniam, was not only so widely resented but contained so much of malicious menace. The strike in the FACT factory was used as a pretext to try to browbeat people who have already demonstrated much stoicism.

Equally questionable is the determination of E M S Namboodiripad to launch a movement to remove the Achuta Menon Ministry from office. According to the CPI(M), the earlier agitations had been concerned with piecemeal and economic issues. Their demand had been that the Ministry must resign. This time it was proposed to unleash such a struggle that the Ministry would be overthrown, the Assembly dissolved, and fresh elections made inevitable.

Namboodiripad has appealed to all to join his latest movement but covered up the call with a 'theoretical' postulate — the Left would initiate the movement, the 'non-Left' could join it! What he has not cared to explain is how the overthrow of the Ministry, the dissolution of the Assembly, and fresh elections are going to help to solve the problems of Kerala. If there is a semi-fascist regime in the country and if nothing can be done without the total destruction of the present system, what is the guarantee that elections would at all be held and even if held would provide opportunities for revolutionary change? From the point of view of the CPI(M) the most favourable possible outcome would be that, after all the dust and din has settled, the party would be back in power. But Namboodiripad had quit Chief Ministership in 1969 precisely because he felt that for a CPI(M) leader to be the Chief Minister only encouraged constitutionalist illusions among the people! Why should he now want to encourage these same illusions five years later?

The CPI(M) has to admit either that its entire programmatic understanding is wrong and that Ministries of Left and democratic forces are useful for the furtherance of the Indian revolutionary process or that the overthrow of the present Ministry in Kerala would be the prelude to, in the state and as an integral part of similar happenings elsewhere, precisely the kind of chaos that Jayaprakash Narayan is attempting to bring about on an all-India scale. Besides, if Kerala's food situation is serious, as anybody would agree, what are the solutions that the CPI(M) has to offer? And has it made even the least effort to try to contact all those who might agree not only with regard to the problem but also the means to solve it? On the contrary, why has EMS decided to make common cause with those, e g, elements in the Kerala Congress, with whom he cannot conceivably have agreement as to either diagnosis or cure?

What Namboodiripad has again overlooked, as in the agitations of the past, is that the Achuta Menon Ministry has survived not because of parliamentary manipulations but because of the mass prestige that it has earned through its record in office. Any number of flaws, failures and even exasperating delays can, of course, be pointed out. But there is a shine about the Ministry's performance that has enabled it to become the longest-lived in Kerala's parliamentary history. Moreover, the alliance on which it is based, in class terms, is the one that not only Kerala needs but is India's requirement as well. Its mass base is, however, incomplete because of the antagonism that the CPI(M) displays towards it. Quite a number of opportunities are lost because of this.

Against the threat of the CPI(M)'s movement, the Ministry and the coalition of parties on which it is based would have not only to close their ranks but commence a concerted political campaign also on a coalition basis. Naturally, law and order problems would have to be dealt with. At the same time, the political attack has to be countered by a political counter-attack. In addition, it is essential for the Left and democratic parties and forces, including those in the Congress, to face the attack on an all-India scale. A joint campaign will have to be initiated at various levels so that while the thrust of reaction is blunted, simultaneously the cutting edge of the forces of democratic transformation is sharpened.

NORTH

Heavy Power Leakages

A MAJOR dispute has developed between Punjab and Haryana over the distribution of river waters. Punjab has a well-developed irrigation system which is part of the Bhakra complex; in addition, it has nearly 2 lakh tubewells. On the other hand, several parts of Haryana are still dry. And, while ambitious canal projects have been launched in recent years — especially for the benefit of the 'real Haryana', i e, the southern districts — some of the canals remain without water for the greater part of the year and some others depend on regular supplies of Beas waters.

Thus Haryana's Chief Minister, Bansi Lal, has further stepped up Haryana's claim for Beas waters. The Punjab government has conceded to Haryana only 9 lakh acre feet of Beas waters, which is only a small part of the Beas project's total capability. And it is not prepared to let Haryana have any share in the Ravi waters. On the other hand, Haryana had earlier claimed 4.8 mn acre feet and has now raised its claim even further. An official spokesman of the Punjab government described the Haryana Chief Minister's claim as "totally divorced from realities"; he said it might prejudice the Centre's decision on the issue under the Punjab Reorganisation Act, 1966. The Ravi and Beas waters, he said, became part of Punjab's natural resources as they fell in Punjab's territory when on November 1, 1966, Haryana emerged as a separate state. These rivers do not even touch Haryana's territory and Bansi Lal's case is hence "untenable". Besides, as Haryana has no link channels as yet, it would not be able to utilise this water for quite some time.

However, Punjab had conceded that, taking a liberal view of and with full consideration for Haryana's growing needs, Haryana could have 9 lakh acre feet of Beas waters. But Haryana had in October 1969 staked a claim to 4.8 mn acre feet of the Ravi-Beas waters, although the Reorganisation Act had not mentioned the Ravi river waters. The gap between Haryana's demand and the supply conceded by Punjab is too wide to be easily bridged. During his visit to Chandigarh on May 21, the Union Irrigation Minister, K C Pant, announced that the dispute had been referred for decision to the chairman of the Central Water and Power Commission.

Power Board Mess

Meanwhile, the Punjab State Electricity Board has been directed by the Centre to eliminate speedily the abnormally high leakages of power and hence of revenue, as these have plagued the Board's finances. Data collected by the Centre has underscored that about 30 per cent of the power consumed by the state's farmers and traders brings virtually no revenue to the public exchequer. Most of the tubewells have no meters, and power bills are paid on an *ad hoc* basis. Thus while the average per head monthly consumption of Punjab farmers is between 5 and 6 kw, most of them pay for only 2 kw. The consequent annual loss to the government under this head is estimated to be approximately Rs 50 lakhs. Line and transmission loss and pilferage occur on a large scale. The Board's functioning is evidently grossly mismanaged.

The Board's latest report reveals some more disconcerting features. The percentage of working capital to sales increased from 149.1 in 1970-71 to 203.9 in 1972-73 and that of gross profits to capital employed fell from 4 to 2.7 during the period. Even the additional income of Rs 6 crores expected this year from an upward revision of the power tariff since the beginning of May last will not help the State Electricity Board to come out of the red. The deficit estimated for 1974-75 is Rs 20 crores. The gross profit of Rs 5.12 crores in 1972-73 turned into a net deficit of Rs 12.84 crores, owing to the unduly heavy interest payments. The burden of interest is also mounting. The total interest charges during 1973-74 were Rs 20.37 crores — including Rs 8.57 crores on the loans for the Beas project and Guru Nanak thermal plant. With the total debt rising to Rs 318 crores (Rs 273 crores from government alone) interest charges will amount to over Rs 23.77 crores in the current year. Mismanagement, inefficiency and widespread corruption in the State Power Board are common knowledge.

To the Punjab's insistent plea for more power to the extent of the 30 per cent shortage, the Union Finance Minister has given a firm answer: No financial assistance would be forthcoming for this purpose unless the leakage of power in the state is stopped. As if anticipating this reaction, Punjab had expressed its opposition to the Centre's hegemony over the state's power projects. The Electricity Board is in fact a drag on Punjab's economy, and its continuous and heavy losses are recovered from the general public via taxes.

Punjab's excessive dependence on Bhakra hydel power has meant that shortages and power cuts can be endemic — which both agriculturists and industrialists greatly dread. Out of the 29 lakh acres of the state's irrigated area 17 lakh acres are fed by tubewells. Though this underlines the vital role of electricity in stepping up farm production, when the Himalayan snows do not melt sufficiently the Bhakra reservoir does not get filled. Indeed this has become a regular feature, causing much economic dislocation. Hence the plea for more power projects and the frustration over the Centre's delay in giving sanction to them.

JAPAN

A House of Cards?

V L Rao

AN important factor in Japan's post-War growth, which is often ignored, is the peculiar financial structure of most Japanese companies. An analysis of the balance-sheets of the industrial and trading companies listed on the First Section of Tokyo's stock market shows that, on average, equity capital and capital raised from internal sources account for only 15 per cent of the total capital employed in these companies. The remaining 85 per cent is borrowed. The President of Sumitomo Chemicals is reported to have once said that if he took his company's balance-sheet to an American bank and asked for a loan, he would be laughed at.

During the American Occupation, the Financial Adviser of the Occupation Administration advised the Japanese government to put a rein on bank lending. Otherwise, the whole economy would collapse one day like a house of cards, he predicted. However, this was one piece of advice which the Japanese government ignored, once the Occupation was over. On the contrary, the government decided to actively encourage the banks to lend.

The linchpin of the system is the ordinary Japanese householder, one of the most thrifty in the world. In preparing the family budget, every Japanese puts aside a fixed amount of savings, and he does not touch it except in times of dire need. The salary structure also helps to maximise savings, with workers receiving annual bonuses ranging from 6 to 12 months' wages and salaries. The only savings most Japanese know is money in the bank, and almost all the savings of millions of Japanese flow into the Japanese banks. The banks engage in bitter competition to attract these savings.

Traditionally, Japanese companies are not very keen to raise capital by issue of shares. If at all they issue capital, they do so mostly in the form of 'rights' issues to existing shareholders. Partly, this is because Japanese companies believe it is necessary to have a good dividend rate, and a large increase in equity capital would result in watering down of the dividend which in turn would cause the price of the shares to go down. It is a matter of 'face' to maintain high dividends and command respectable share prices in the stock market. An equally important reason for the companies' reluctance to issue shares is that they do not want too many shares floating around in the market lest they lose control to others. Companies can, of course, raise funds by issuing bonds, but the bond market in Japan is still not very well developed, and bonds contribute only about 3 per cent of corporate funds supply.

Thus companies have perforce to turn to banks for their capital needs. An added inducement is that, unlike dividends, which have to be paid out of tax-depleted profits, interest payments to banks can be legitimately debited to business expenses. And the banks lend to them freely, for long periods and in virtually unlimited quantities — subject to but one condition: that the money is used for increasing production or building new plants. The more new plants were built and the more production rose, the workforce increased. This in turn meant that savings increased and banks lent the increased savings for further production and expansion. This process of massive and continuous investment in expansion of production has been one of the key factors in Japan's economic growth.

Promissory Note

But this is not the whole story. Almost all wholesale buying and selling in Japan is done on 'tegathas' or promissory notes, usually payable after three months. Companies buy raw materials as well as plant and machinery from their suppliers on three months' credit. In turn, they sell their products to their customers and to wholesalers on three months' credit. And everyone discounts the 'tegathas' with the banks or draws loans against them. It is all one big credit spree with banks at the centre.

The extraordinary part of it is the enormous risks the banks have taken and continue to take. On March 31, 1962, the ratio of loans made by Japanese banks to their deposits was 107 per cent; that is to say, the loans made by the banks exceeded their deposits! The banks simply borrowed funds from the Bank of Japan and the short-term money market. Such borrowings amounted to 27 per cent of their deposits on the above date. It is clear, therefore, that the Bank of Japan actively encouraged the banks in their lending spree, though, since then, it has compelled the banks to bring down the loan/deposit ratio somewhat. Still, the Japanese banks' credit-deposit ratio was 97 per cent at the end of March 1970. The banks had on that date borrowings equal to 9.5 per cent of their deposits from the Bank of Japan and 10.8 per cent from the short-term money market. A look at the funds position of a Japanese bank is guaranteed to make any Indian banker's hair stand on end!

What all this means is that if there is a really severe recession, the whole structure would collapse like a house of cards. If for various reasons, the demand for goods and services drops sharply and factories are forced to reduce production, firms all over the country would be unable to pay off their creditors, resulting in a large number of bankruptcies. In view of the large credits given by firms to each other, this would set off a chain of bankruptcies. This in turn would trigger a run on the banks which, in their over-loaned and illiquid position, would have to close their doors and the whole structure would come crashing down.

But this has not happened. No doubt, it was touch and go in the beginning. But the Korean war gave the initial impetus and the ensuing growth was self-sustained. Now the system has taken too deep roots to be easily changed. The pattern of personal savings is slowly changing, with more money going into shares and securities, and over a period of time the system will no doubt be gradually strengthened and eventually secured. In the meanwhile, it feeds on growth. If the rate of growth comes down too sharply and stays low over a long period, the danger of collapse would be very real indeed.

In spite of this danger, the government and the Bank of Japan deliberately create minor recessions once every three to five years. Of course, the word recession here must be understood in the Japanese context — when the GNP rises by 6 per cent instead of 12 per cent, the Japanese call it a recession! Nevertheless, its effects are very similar to those of a real recession. The necessity for these periodic 'recessions' is built into the system. When GNP grows rapidly, demand rises and supply cannot catch up, leading to price increases; these lead to substantial wage rises, which in turn lead to further price rise. Price rises make exports less competitive and less profitable, and exports fall. At the same time, demand for raw materials and imported goods goes up and imports rise. When exports fall and imports rise, the balance of payments is threatened and the government and the Bank of Japan step in to correct the position. All that the Bank of Japan has to do is to reduce its lendings to the banks, thereby forcing the banks to reduce credit to business and industry. In fact, the Bank of Japan exercises detailed controls, known as window controls, regulating banks' credit not only to particular industries but to individual firms. The companies then have to cut down on investment in plant and equipment and reduce their stocks — and a Japanese style recession is created. These days, due to the accumulation of enormous foreign exchange reserves, the balance of payments is not much of a problem. But, meanwhile, the Japanese public has become conscious of inflation, which is constantly eroding their savings and their standard of living. The government has therefore to create these mini-recessions periodically in order to check inflation.

In fact, these recessions have been good for the economic system; like a purgative, they have flushed out the under-capitalised (by Japanese standards) and inefficient firms. Every recession inevitably results in a spate of bankruptcies. In 1970, for example, 9,765 firms with liabilities of 729 billion yen (Rs 2,187 crores) went bankrupt. A bankruptcy usually has a domino effect, not only on firms to whom money is owed, but also on subcontractors who proliferate in Japan. Almost all the bankruptcies are of small firms and bankruptcies of large firms are very rare, as the large firms have strong ties with the government and the banks, and can generally manage to get credit even when the situation is precarious In any case, the government will not allow a large firm to fail, as one such failure could trigger off a collapse of large parts of the economy. To illustrate, let us take a look at the funds position, as of March 31, 1971, of the Mitsubishi Corporation, Japan's largest trading firm. Its total liabilities (consisting of bills payable, accounts payable, short-term loans, long-term loans and other liabilities) were 1,628 billion yen (Rs 4,884 crores). But the company's net worth (*i e*, equity capital plus self-generated funds) was only 56 billion yen (Rs 168 crores). In other words, the liabilities were 2,900 per cent of net worth. Bank loans alone were 900 per cent of net worth. What is more significant is that as much as 1,363 billion yen (Rs 4,083 crores) of the assets were in the form of credits and loans to customers and subsidiaries. If a sufficiently large number of Mitsubishi Corporation's customers failed, Mitsubishi would be in serious trouble. And, in view of Mitsubishi's enormous liabilities, that of course means that the Japanese economy itself would be in trouble. Naturally, the government would never let that happen.

What has helped the government in managing this lop-sided financial structure is the confidence and the faith of the ordinary Japanese in their country and government. There has not been a single case of a run on banks since the War, recession or no recession. In the seemingly big risks they have taken, the financial managers of the economy were betting on the average Japanese citizen's blind confidence in his country.

SOUTH VIETNAM

Liberated Areas Consolidated

Harish Chandola

DURING the first six months of this year the Saigon administration utilised over a million troops and police to launch thousands of operations in order to narrow down the areas under the control of the Provisional Revolutionary Government of South Vietnam (PRG). Supported by artillery and aircraft, the Saigon forces launched multi-division attacks to push back the area of control of the PRG and simultaneously tried to eliminate the leopard spots with battalion-size operations. (When the ceasefire came into being in January, last year, it was discovered that the PRG, besides the continuous areas under its control from north to south, held several other areas right in the midst of territory held by the Saigon troops. These are now called leopard spots.) The Saigon administration also moved police officers into all jobs of hamlet chiefs and other key positions in order to conduct large-scale "pacification" operations. But after a few initial losses, PRG forces have now recovered all the liberated areas. In the process, they wiped out 115,000 Saigon troops involved in these operations in the first half of this year.

What is generally asked about the new situation in South Vietnam is whether all this fighting is necessary after the ceasefire? It would have certainly not been necessary had the Thieu administration accepted the provisions of the Paris Agreement of last year and agreed to the setting up of a Council of National Reconciliation and Concord of the three segments (Thieu administration, PRG, neutralist forces), which was to arrange free and fair elections in South Vietnam to bring about lasting peace. Instead of implementing the provisions of the Paris Agreement, the Thieu administration has tried to hold its own elections to its Senate and so-called local bodies so as to 'strengthen' its position.

Thieu had earlier called upon his troops to "launch pre-emptive strikes" and attack "areas controlled by communists in order to destroy their grass-roots". He had also proclaimed the "three nos" — "no acceptance of peace, no democratic liberties and no national reconciliation and concord". Faced with such an uncompromising policy and the consequent attacks, the people of the liberated areas had no option but to defend themselves and push back the invading forces.

This process of defending the liberated areas has led to their consolidation and prosperity. The cultivated acreage in the liberated areas has been increased to a million hectares, several hundred thousands of which are reclaimed land. Thanks to the expansion of cultivation and the building of water conservancy projects, in many areas an increased output of grain has been achieved through double and treble cropping. Almost all the rubber plantations in Binh Phouc province, in the east of South Vietnam, have resumed production. A good harvest of early rice has been reaped in the liberated areas of the Mekong delta this year. The per hectare yield has been between three and six tons. In some districts of Tra Vinh province, the areas planted with early rice this year are treble the size of 1972. The people have solved the grain shortage problem caused by the Thieu administration's "economic blockade" policy. With the rehabilitation and development of agriculture production, communications, transport, handicrafts, education and public health have all recovered and made good progress. Many roads have been repaired and built. A recent US press report stated that in the liberated areas the "north-south journey by truck which once took two to three months, now takes only 15 days".

Partly due to the increasing prosperity of the liberated areas, thousands of people who had been driven into the concentration camps called "strategic hamlets" by the Thieu administra-

tion, rose in struggle and returned to or crossed over to the liberated areas to build a new life. From April 20 to May 21, this year, over 18,000 people in areas held by the Thieu administration in the provinces of Quang Da, Quang Nam, Quang Ngai, Binh Dinh and Kontum set themselves free from the Saigon regime's control and went over to the liberated areas. During the past year, some 100,000 Saigon troops have mutinied and deserted after refusing to carry out orders to attack the liberated areas. Many of them crossed over with their weapons. The PRG has warmly welcomed all these people and the deserting Saigon troops and given them work and the means to build a new life.

In the past year, the prestige of the Provisional Revolutionary Government has also increased in the international arena. The PRG now has diplomatic relations with 40 countries. Many countries and international conferences have strongly supported the PRG. Diplomatic envoys of many countries have gone to the liberated zone to present their credentials to the leaders of the PRG and a number of friendly countries have sent delegations there on visits. All this has been a heavy blow to the Thieu regime which tries to deny the existence of the revolutionary administration, the people's army and the liberated areas of South Vietnam, all of which have been recognised by the Paris Agreement.

REVIEW

Presidents or Puppets?

Manju Mehta

Struggle for Rashtrapati Bhavan: A Study of Presidential Elections by Z M Quraishi; Vikas, Delhi, 1973; Rs 35.

POLITICAL events in India during the last few years present an unedifying spectacle and all norms of representative and responsible government are at vanishing point. While the entire political structure is under question, recent events have focused attention on whether the president should continue to be the helpless abettor of the frequent "constitutional breakdowns" in the states. This brings us to the position and powers of the president. Quraishi asserts that the position of the president is equivocal as a result of the Constitution's ambiguities. For instance, in the Constituent Assembly the position of the president was interpreted as the "president in consultation with the cabinet". Quraishi further states that though the constitution-makers design was to establish the supremacy of parliament, ample scope was left for presidential initiatives within the framework of parliamentary responsibility. The author here seems to have confused the two levels of authority and power. He even works up the hypothesis that a president could assume power within the existing constitutional set-up, but neither by logic nor by empirical evidence does he convince the reader of his assumption.

Here it would be of some help to go back to the proceedings of the Constituent Assembly, especially to Ambedkar's definition of the president. Ambedkar defined the president as "the head of the state and not of the executive. He represents the nation but does not rule the nation. He is the symbol of the nation". It must also be remembered that the Constituent Assembly was dominated by Congressmen who strongly felt that Congress rule in the country would be eternal and they equated the president with the British monarch in the hope that through the years conventions would develop.

Conventions did develop. But they have all tended to make the president an instrument of the prime minister and cabinet in Delhi. For example, the president takes office under Article 60 pledging, "I will to the best of my ability preserve, protect and defend the constitution". In practice, the presidential office has been used by the executive to declare collapse of the constitution whenever the latter so desires.

The president's capacity for action is very limited and even in this limited field his influence can only be indirect — depending on his personal relationship with the prime minister. The crux of the matter is that a powerful president who can view a situation objectively and independently is inconsistent with party dictatorship.

Some presidents have been conscious of these limitations. Rajendra Prasad publicly questioned the functions and powers of the office he occupied and asked the Law Institute to undertake a study of them in their socio-political context. But the Congress party failed to appreciate the spirit of the suggestion. However, Quraishi quite optimistically predicts that a weak presidency is no enduring phenomenon as its power position is dependent on a number of variables like the views of the Supreme Court, the president's personal equation with the prime minister, the configuration of parties in parliament and the country's federal structure.

The author proceeds to give a detailed account of the electoral process. The presidential electoral system was fashioned to suit the prevalent concept of presidential functions. The constituency — an electoral college consisting of members of Union and state legislatures with variously weighted votes — that elects the president is such as to keep the event far from public involvement. The weighted, preferential voting system in the presidential election involves so complex a calculus that the ordinary citizen cannot easily comprehend it. These arrangements are calculated to ensure the leading role of the prime minister on the one hand and to make the election a political non-event on the other.

Quraishi also takes up each presidential election and studies its results in the larger context of the changing political environment. The first three presidential elections were routine affairs. The Congress process of selecting a presidential nominee was an intra-party settlement struck between its contending factions. No factional leader staked his own claim for the position but instead put forward prestigious and non-controversial figures for consideration. Initially the opposition made futile attempts to secure a non-party man for the presidency. Then in 1957 the opposition formulated a new demand for national consensus in the choice of a more acceptable presidential nominee. But the sense of complacency pervading the Congress frustrated the opposition's efforts to engage in dialogue and a deep political apathy set in as revealed both in the 1957 and 1962 elections when the opposition simply accepted the Congress' presidential nominee. "The Congress and the opposition became willing parties to a strange conspiracy of making the presidential elections a futile ritual, an opportunity for attracting national attention towards their obscure personalities and obscurantist ideas".

The fourth general election in 1967 accelerated the process of structural differentiation. For the first time, the non-Congress parties made a determined bid to emerge from their role of pressure politics into a role of forming alternative governments. To make the process of Congress disintegration at the Centre complete, the opposition tried to impose a president of its own choice.

Under such critical conditions the Congress nominated a Muslim candidate, Zakir Husain. Quraishi explains this seeming paradox. The decision-making group in India consists of a kaleidoscopic configuration of minorities. This configuration has built-in safeguards against sectarian and extremist encroachments. It is, therefore, possible to elect a representative of a particular minority to responsible office with the help of a collection of other minorities. Zakir Husain's nomination also demonstrated a desire to uphold the secular commitment. It was hoped that the secular initiative, besides boosting the party's morale, would 'revitalise the masses and integrate the country'. The choice of Zakir Husain was, of course, also motivated by his personal prestige and by Indira Gandhi's confidence in him which was most necessary in the new political circumstances.

The opposition parties put up Subba Rao as their nominee. (This raised an important constitutional question regarding the propriety of the political aspirations of judges.) The opposition, at the same time, indulged in smear politics and invited defections from within Congress ranks through communal and regional appeals. The Congress, however, relied on its own strength and mobilised its organisation to ensure the Congress vote. The Congress party whip's decrees in this regard were denounced by the opposition as illegal interference in the free choice of members. But such a denunciation would not be upheld in any court of law.

The sudden death of Zakir Husain while still in office led to the presidential election of 1969. This election was very important in that it crystallised schisms within the Congress party. For the first time, Congressmen did not solidly support the party's official nominee and a large number of them helped a non-Congressman to defeat him with the backing of the prime minister. Schisms also permeated the opposition which could not agree about a jointly sponsored candidate. In effect, the election reinforced the predominant role of the prime minister in decision-making *vis-a-vis* the party bosses.

Though V V Giri's tenure is not covered in this book, a major issue concerning his position re-occurs. Giri was an important prelude to Indira Gandhi's "Garibi Hatao" programme. He was a controversial figure before his election to the presidency. He was the first president elected by the backing of a substantial number of non-Congress legislators. He had repeatedly declared that he was an independent personage and not a mere appendage to the ruling class. All these factors had built up expectations that he would be able to operate with some degree of judicious independence. But during his entire term he could do nothing more than dissolve state assemblies. This, perhaps, proves that within the confines of the present constitutional-political system the possibility of a strong president is extremely remote. Quraishi's book would have been more useful if it had been critically analytical on such issues. Statistical data and impressive bibliographies are abundantly distributed throughout his book, but the reader has to be satisfied with a schematic framework which reveals little that is new or provocative. His study remains at the convenient level of the obvious.

POPULATION IN INDIA'S DEVELOPMENT 1947-2000

Editors: Ashish Bose, P. B. Desai, Asok Mitra and J. N. Sharma

The book, specially prepared for the World Population Year, is a landmark in population studies in India.

It is the first interdisciplinary study of the population problem and presents a strikingly new perception of the problem.

The book contains original papers by leading demographers, economists, sociologists, family planning experts, and census administrators. Organized in a futuristic framework, it provides projections and prognostications and suggests alternative approaches to development.

TRACO CARBIDE LIMITED

(Incorporated under the Companies Act 1956) Registered Office—77/1A Park Street Calcutta 700 016 .

Subscription list opens on Monday the 29th July, 1974

HISTORY AND PROPOSED ACTIVITIES :

The company was originally incorporated on 14th October, 1965 as Traco Traders Private Limited and was converted into a public Limited Company on 30th November, 1972. The name of the company was subsequently changed to TRACO CARBIDE LIMITED and a fresh certificate of incorporation was obtained on 29th November, 1973. The objects of company are fully stated in its Memorandum of Association and the main objects of the company are to carry on the business of chemical and allied products and manufacture of Calcium Carbide.

Chemical and Metallurgical Design Company (P) Limited, New Delhi have established that this project is technically and economically viable. The project comprises of setting up of a sub-merged Electric Arc furnace for the manufacture of Calcium Carbide together with captive lime kiln and other auxiliary services. It is proposed to manufacture 14,850 tonnes of Calcium Carbide annually.

The Project comprises of setting up of a sub-merged arc furnace for the manufacture of Calcium Carbide together with captive lime-kiln and other auxiliary services.

The factory will be set up at Ikra, Dist. Burdwan and the Company has already obtained approx, 6 hectares of land on long term lease from the Government.

The factory site is very close to the Ikra Railway Station on the Broad Gauge Sitarampur/Andal — loop line. This location together with the proposed erection of the railway siding will be advantageous for raw materials as well as finished products. Since the Damodar Valley Corporation is agreeing to supply the entire power requirement of the Company it is anticipated that there will be no difficulty in maintaining regular producton.

Calcium Carbide is now used as a basic industrial raw material finding extensive uses in the production of Acetylene Gas, Synthetic Organic Chemicals, Graphite Cast Iron, Illuminating Lamps and it has numerous other uses.

The Company has entered into agreement with M/s. ELKEM of Norway and their collaborators M/s. Binny Limited of Madras for the supply of equipment and process know-how.

There is a considerable gap between demand and supply of Calcium Carbide and the consumers of the product are at present finding great difficulty in obtaining the required quantity.

The Directors are therefore confident that there will be no difficulty in marketing the product and the maiden dividend may be expected for the working of the Company for the Financial Year ending March 31, 1976.

APPLICATION TO THE STOCK EXCHANGE :

Application will be made to the Calcutta and Bombay Stock Exchanges for permission to deal in and for an official quotation for the Equity Shares of the Company.

SHARE CAPITAL :

Authorised :	Rupees
17,50,000 Equity Shares of Rs. 10/- each	1,75,00,000
25,000 9.5% Cumulative Redeemable Preference Shares of Rs. 100/- each	25,00,000
	2,00,00,000
Issued, Subscribed and Paid-Up :	
5,400 Equity Shares of Rs. 10/- each at par fully paid-up (of which 4700 Equity Shares of Rs. 10/- at par each have been issued as fully paid up for consideration other than cash) to original promoters of the Company (non-project)	54,000
24,600 Equity Shares of Rs. 10/- each at par fully paid up for cash (non-project) to promoters and Directors.	2,46,000
	3,00,000
Present Issue :	
14,00,000 Equity Shares of Rs. 10/- each at par for cash	1,40,00,000
Out of the Present Issue :	
18,000 Equity Shares of Rs. 10/- each at par fully paid-up for cash to promoters, directors and friends.	1,80,000
5,24,000 Equity Shares of Rs. 10/- each at par for cash allotted to Promoters, Directors and their friends on which Rs. 5/- per share has been paid-up	26,20,000
	31,00,000
Now offered to the Public for Subscription, for cash-at-par in terms of this prospectus :	
85,800 Equity Shares of Rs 10/- each at par.	85,80,000

The Oil Crisis: An Economic Analysis and Policy Imperatives

Ramesh Bhatia

Higher costs and uncertainties of crude oil imports portend a major crisis for India. The estimates are that crude imports may account for around 50 per cent of our export earnings in 1978.

The crisis cannot be met without appropriate policies which aim at curbing the misuse of oil products as is currently happening, and at the same time, providing for maximum of essential oil products from a minimal quantum of crude oil.

A major proportion of the residual heavystock from crude oil is currently used as furnace oil in industries where alternative sources of energy are domestically available. The same heavystock could, through secondary processes such as hydrocracking, yield large quantities of petrol, kerosene and diesels.

About 4.3 million tons of heavystock, if diverted from its use as furnace fuel and reprocessed (through hydrocracking) would yield about 3.2 million tons of kerosene and diesels. The same quantity of these essential products is obtained, through simple refining, by processing about 7.6 million tons of crude oil.

Thus, a diversion of 4.3 million tons of heavystock from furnace fuel to hydrocracking would reduce oil imports by as much as 7.6 million tons, reducing the import bill by about Rs 456 crores per annum.

HIGHER costs and uncertainties of crude oil imports portend a major crisis for India if appropriate decisions are not taken in time. In 1972, India imported about 63 per cent of its crude oil requirements spending nearly Rs 200 crores in foreign exchange. The cost of oil imports in 1973 is estimated to be of the order of Rs 500 crores, more than 25 per cent of our export earnings. If the price of crude oil increases to 12 dollars per barrel, the foreign exchange costs of crude oil imports may be around Rs 1,000 crores in 1974. The outflow of foreign exchange resources on account of crude oil imports (24 million tons) in 1978 is then likely to be of the order of Rs 1,700 crores, accounting for more than half the country's export earnings. The implications of this for the country's other priority imports of machinery and raw materials are obvious. It can seriously jeopardise the efforts for the growth of the economy.

The crisis can be averted only by policies which aim at rationalising the use of crude oil and thus reduce our dependence on crude imports to the minimum. Although efforts at economic diplomacy in securing the best possible terms for payments for oil imports should be made, solutions to the crisis lie in other directions.

The success of our economic diplomacy would depend on persuading the oil exporting countries to charge concessional price for their oil sent to developing nations such as India. The establishment of the OPEC Bank by the Organisation of Petroleum Exporting Countries (OPEC) to provide soft loans to developing nations would only mean that the burden of the oil import bill would be deferred for a few years. Bilateral arrangements for increasing commodity exports from India to oil producing countries would not be a desired solution either. Higher exports of commodities such as sugar, vanaspati, cement, machinery, iron and steel, structurals and transport machinery to these countries would be either at the cost of exports to other countries or would further aggravate shortages of these commodities within the country. Rather than relying on foreign exchange reserves (IMF borrowings in the short-run) and increased exports of scarce consumer and capital goods to foot the increased oil import bill, the policies must aim at reducing the imports of crude oil.

The above could be done by (i) increasing the indigenous production of crude oil; (ii) reducing the demand for oil products and (iii) the optimum utilisation of available crude oil through appropriate secondary processes in refining. The efforts to step up indigenous production of crude oil are being made and the additional quantities available would correspondingly reduce imports. Demand for kerosenes and diesels (which determine the quantum of crude throughput) can be minimised by providing coal and/or electricity in place of these products for use in homes, irrigation and railways. However, this substitution can affect the demand only marginally because nearly 80 per cent of diesel is currently used for road transport alone. At any rate, the substitution would be subject to the considerations of other 'economic costs'. Finally, an alternative way of reducing crude imports can be the reprocessing of the residual heavystock (obtained in the first round of refining crude oil) to produce again the maximum of essential products such as kerosenes and diesels. However, before the merits and demerits of this alternative are examined, it would be useful to review the trends of product demands and the decisions to meet them.

II

Consumption Trends and Refining Policy

Consumption of petroleum products in India has increased from 3.9 million tons in 1951 to 22.6 million tons in 1972. In 1951, consumption of petroleum products was 3.9 million tons of which 3.5 million tons were imported (Table 1). In 1961, product imports declined to 30 per cent of the consumption of 8.4 million tons. In 1971, the proportion of product imports was only 9 per cent of the total consumption of 20.6 million tons of oil products.[1] This import substitution was achieved by processing more crude oil in Indian

We're changing... to growth

Today, we are Hindustan Petroleum Corporation Limited, Not just another name for Esso, but a change that heralds new dynamism. In keeping with national objectives, Government recently acquired 74% ownership in Esso's interests in India, with 100% takeover by 1981.

With national ownership and fuller utilisation of refining and marketing facilities, to us in Hindustan Petroleum, the changeover offers new opportunities and new challenges in meeting the requirements of the nation.

Shri D. K. Borooah
Union Minister for Petroleum & Chemicals formally inaugurated
HINDUSTAN PETROLEUM CORPORATION LIMITED
in Bombay.

And we have a rich inheritance. Ninety years of petroleum marketing and twenty years of refining experience have produced a generation of men who have shared their expertise nationally, and also internationally. Men who will now contribute to the technical, professional and commercial competence in the public sector oil industry.

National ownership, unrestricted utilisation of facilities and technical expertise blend into a new combination—Hindustan Petroleum—designed to grow.

Yes, we are changing—to growth.

HINDUSTAN PETROLEUM CORPORATION LIMITED

HP

The future is ours

refineries. Although indigenous production of crude oil steadily increased from 2.9 million tons in 1965 to 7.4 million tons in 1972, crude imports accounted for about two-thirds of the crude throughput of Indian refineries during the period 1965-1972.

The requirement of crude throughput depends on the interaction of various economic and technological factors owing to the fact that all the oil products are obtained simultaneously from one raw material, namely the crude. The proportion in which these products are obtained depends (a) on the type of crude oil that is used and (b) the extent of complexity in refining operations. Simple refining of crude oil is essentially a process of separating gases, gasolines, naphtha, kerosenes, diesels and residue in a distillation column. A simple refining of crude oil (34° API) will yield about 14 per cent of naphtha or petrol, about 19 per cent kerosenes and jet fuel, about 23 per cent diesels and about 42 per cent residual heavystock. A complex refinery, with suitable secondary processing, can increase the yield of light distillates (naphtha or petrol) or middle-distillates (kerosenes and diesels) up to 70 per cent of the crude charged. Thus, the type of refining scheme and the level of total throughput are ideally determined by the interaction of the determining factors: (a) the product pattern of demand for oil products; (b) the regional pattern of demand for oil products; (c) the relative costs of importing final products, intermediate products (fuel oil) and crude oil; (d) the prices and possibilities of product exports; and (e) the relative costs of various refinery processes such as atmospheric distillation, catalytic cracking, hydrocracking and coking. But the practice all along has been far removed from the ideal.

Table 2 presents the product pattern of consumption and production of petroleum products in 1971.[2] Petrol or gasoline which is used in cars, scooters and light vehicles accounted for 7.8 per cent of total consumption of 19.49 million tons. Naphtha, which is nothing but unrefined petrol and is meant for use as feedstock for fertiliser and petrochemical plants, accounted for about 5.5 per cent. Kerosene for cooking and lighting and aviation turbine fuel used in jet engines constituted about 18 per cent of the total. Of the 4.22 million tons (21.6 per cent of the total) High Speed Diesel (HSDO) about 80 per cent was used in trucks and buses, about 12 per cent in railway engines and about 1 per cent in tractors. About 40 per cent of the Light Diesel Oil (LDO) consumed was for irrigation pumps, about 7 per cent in power generation and about 10 per cent in industry. The residual heavystock available from crude refining is used as fuel oils, refinery boiler fuel and as feed for special products such as bitumen, lube oils, petroleum coke, etc. The bulk of the fuel oils (4.97 million tons) is currently used as furnace oil in various industries such as power generation, textiles, cement, iron and steel, sugar, fertiliser, chemicals, etc. In addition, about 1.15 million tons of residual heavystock was used as refinery boiler fuel in 1971.[3] The pattern of demand for petroleum products, particularly kerosene and diesels, has been the primary basis for estimating the requirements of refining capacity (crude throughput) in the country.

Briefly, this approach assumes that it is more economic to import crude oil than petroleum products. The quantum of crude throughput is estimated in terms of the quantities of middle-distillates (kerosene, aviation fuel and diesels) required. To illustrate, if the demand for kerosene and diesels is estimated at 1 million tons, the quantity of crude to be processed is estimated as 2.38 million tons. On this basis, a total crude requirement of 36 million tons has been estimated for 1978 in order to yield about 16.26 million tons of middle-distillates.[4]

By employing this simplistic approach the country has committed itself to a much higher refining capacity than was necessary. Indeed, the case for progressively higher crude refining was built upon the argument of increasing demand only of kerosene and diesels. However, when the benefits of crude importation were questioned, the justification was inevitably given on the basis of comparing the costs of importing all the products obtained by refining crude with the cost of importing crude alone. The approach ignores the fact that if at the margin only one or two products are required, it would be more economic to import the products rather than import crude oil required to obtain the given quantity of these products.[5] Apart from revealing the unclarity and irrationality underlying the policy all along regarding the overall requirements of the country, it does raise serious doubts as to the disposition of our decision-makers.

The gravity of mistakes committed so far is yet to be fully assessed. In the early years, surpluses of petroleum products such as naphtha and fuel oil (together accounting for about 50 per cent of all the products) were treated as by-products to be disposed of indiscriminately and thereby hangs a tale.

TABLE 1: IMPORTS OF CRUDE OIL AND PETROLEUM PRODUCTS

(million tons)

Year	Consumption of Petroleum Products (1)	Imports of Petroleum Products (2)	Crude Throughput in Indian Refineries (3)	Imports of Crude Oil (4)	Crude Imports as Per Cent of Total Crude Throughput (4)÷(3)
1951	3.89	3.51	0.27	—	—
1955	4.82	2.07	3.34	3.03	90.1
1961	8.39	2.48	6.44	5.97	92.7

Notes: (1) Consumption of naphtha as feedstock for fertiliser units was 0.77 mn tons in 1971; the rest was used in petrochemical units.
(2) Other products include petroleum coke (0.15 mn ton) and wax (0.04 mn ton), jute bleaching oil, SPB spirit, etc.

Source: "Indian Petroleum and Chemical Statistics", 1971 Ministry of Petroleum and Chemicals, New Delhi.

As pointed out in a detailed study[6] on investment planning for petroleum and petrochemical industries this approach to estimating refining capacity rules out any considerations of foreign trade options, refinery process choices, fertiliser feedstock choices and use of alternative sources of energy for many industries. Not only that this simple method does not permit a detailed evaluation of techno-economic options but it leads to distortions in choices at various levels and overall extravagance in the economy. We shall examine these aspects in detail in the forthcoming discussion.

The naphtha surplus of the sixties which was a direct consequence of higher crude throughput was used as a plea for fixing a very low price for naphtha (by reducing excise) thus making it the 'best' feedstock for fertiliser production. The price of naphtha was kept so low that every business house wanted to build a naphtha-based fertiliser plant resulting in the dependence of the country on imported naphtha or crude oil. It is necessary to recall that naphtha-based plants were more profitable because the relative price of naphtha was kept lower than that of fuel oil though social benefit-cost analyses showed that fertiliser plants based no fuel oil were more beneficial from the nation's point of view.

The temporary surplus of naphtha and its artificially low price were responsible for the neglect of other feedstocks for fertiliser production. Natural gas which can be used as feedstock for fertiliser and petrochemical units and has relatively lower investment costs was either flared in the atmosphere or used as source of fuel. The result is that even in 1972, only about 60 per cent of the total natural gas produced has been utilised.[7] Of the total gas utilised, fertiliser plants accounted for around 30 per cent, the rest being used for purposes where domestic fuels could have been substituted. For example, the total natural gas used in two power houses (Uttaran and Dhuvaran) was higher than the total used in the Gujarat Fertiliser Plant and other industries in Baroda. Utilisation of natural gas in fertiliser industry would have meant lower demand for naphtha[8] as well as lower investment costs. However, the most deleterious effect of the surplus (and low price) of naphtha has been the vitiation of the country's fertiliser technology and delayed development of coal-based fertiliser plants appropriate for our country.

It is not as if due to arbitrary pricing policies naphtha alone was used in place of other feedstocks. Indeed similar misuses occurred in the case of fuel oil. Given the fact that the country was landed with huge quantities of fuel oil (which need not have happened in the first place) its more beneficial — although not the optimum — use would have been as feedstock in fertiliser plants rather than as furnace fuel in many industries. Many units in power generation, cotton textiles, cement, iron and steel and various other industries are now using residual heavystock as boiler fuel where alternative domestic sources such as coal and coal gas should have been used. Since there are very few industries where fuel oil is absolutely necessary on account of technological considerations, substitutes like coal could have been provided in place of fuel oil. Requirements of fuel oil were not subject to scrutiny because of higher availability from higher crude throughput apparently required for meeting the demand for kerosenes and diesels. The resulting pattern of use of residual heavystock in 1971 can be seen in Tables 3 and 4. Table 3 shows that out of a total consumption of 4.97 million tons of fuel oils power generation accounted for 26 per cent, various industries for 47 per cent, coastal shipping and international bunkers for about 6 per cent and other uses for about 11 per cent.

The regional pattern of consumption of furnace oil in power generation are presented in Table 4. It may be noted that the bulk of the furnace oil is used as the main boiler fuel in some power stations in Gujarat, Maharashtra and Bihar. Use of furnace oil as auxiliary fuel for coal-based thermal power plants in all the states other than Gujarat, Maharashtra and Bihar accounted for about 10 per cent of the furnace oil consumed in power generation. When an estimate of furnace oil for auxiliary consumption in thermal plants in these three states is included, the total comes to around 0.18 million tons (15 per cent). The rest of furnace oil consumption in power generation (about 1.1 million tons) can be easily substituted by coal by using existing dual-fire system of some plants and by converting others to multi-firing system.

As already pointed out, fertiliser was the crucial industry where fuel oil should have been used as feedstock. Instead, it was mainly used as boiler fuel in place of coal for steam generation. The estimates are that in 1972-73 about 206,000 tons of fuel oil was thus burnt for steam generation (Table 5). Estimates for future show that around 600,000 tons of additional furnace oil would be used as fuel for steam generation in the fertiliser plants which are under construction. The entire fuel oil so misused as source of energy could be substituted by coal which is domestically available.

Further, about 47 per cent of the total fuel oils consumed in 1971 was used as furnace fuel in various other industries. In most of these industries, furnace oil is used for steam raising in place of coal. Use of furnace oil is not technologically necessary in most industries except in ceramics and glass, aluminium and some chemicals. In many units of major industries such as cotton textiles, iron and steel, cement, inorganic heavy chemicals and non-ferrous metals use of furnace oil is hardly justifiable on technological considerations (Table 6).[9]

III

Future Investment Pattern: Available Alternatives

Thus, the method of estimating total refining capacity in the sixties did not take into consideration the various options with regard to foreign trade, refinery process choices, fertiliser feedstock choices and the use of alternative fuels in many industries. This has led to distortions in choices at various levels delaying the development of technology which can take into account the resource-base and the demand pattern of the economy. As a consequence, many sectors/industries have come to use oil products where alternative domestic sources of energy should have been used. Today, the country has to depend on oil imports requiring recurring outflow of scarce foreign exchange.

It seems that the same method of planning investments in petroleum industry continues to be used for the seventies. A crude throughput of 36 million tons in 1978-79 is estimated to meet the projected requirements of petroleum products in that year. Plans for expansion of Koyali refinery from the present capacity of 4.3 million tons to 7.3 million tons have been finalised. Construction work on the 6 million ton refinery at Mathura has begun. Discussions on expanding the Madras refinery from 2.8 million tons to 3.3 million tons have been reported. With these expansions and construction of new capacity, the total refining capacity (including the spare capacity in three private sector refineries) would increase to around 39 million tons by 1978 or 1979.

A total crude throughput of 36 million tons as envisaged in the draft Fifth Plan, without the use of secondary processing, would yield the following quantities of oil products: 5.46 million tons of light distillates, 16.26 million tons of middle distillates and 13.7 millions tons of heavy-ends.[10] As compared to 1972, this would mean an additional availability of 2.29 million tons of light distillates, 6.86 million tons of middle distillates and 6.86 million tons of heavy-ends (heavystock or fuel oil). The product availability and foreign exchange outflow under the assumption of 36 million tons of refining capacity are presented as Alternative I in Table 7. The total foreign exchange outflow on account of crude imports at an average price of 10 dollars per barrel (FOB Persian Gulf) would be of the order of Rs 1,440 crores.

TABLE 3 : CONSUMPTION OF FUEL OILS, 1971

Industrial Consumption			Other Uses		
Industry	Consumption (000 tonnes)	Per Cent of Total Consumption	Specific Use	Consumption (000 tonnes)	Per Cent of Total Consumption
(1) Power generation	1,289.0	25.9	(11) Coastal shipping	245.0	3.10
(2) Textile	524.0	10.5	(12) International bankers	204.0	2.59
(3) Chemicals and allied industries	495.0	9.9	(13) Agriculture and plantations	199.0	2.50
(4) Iron and steel	415.0	8.3	(14) Mining and quarrying	52.0	0.65
(5) Engineering	248.0	5.0	(15) Road transport	13.0	0.14
(6) Ceramics and glass	202.0	4.1	(16) Railways	57.0	0.72
(7) Cement	148.0	3.0	(17) Others	579.0	8.16
(8) Fertilisers	143.0	2.9			
(9) Aluminium	120.0	2.4			
(10) Sugar	41.0	0.8			
Sub-total	3,625.0	72.8	(18) Total	4,974.0	100.0

Notes : (1) Consumption of Refinery Boiler Fuel in 1971 was 1.15 million tons.
(2) About 0.98 million tons of heavy-ends were imported in 1971; the imports of fuel oil in 1972 was 1.8 million tons.
(3) About 1.21 million tons of residue was used as Low Sulphur Heavy Stock (LSHS) and Hot Heavy Stock (HHS) in Oil-fired power plants.
(4) Gujarat and Maharashtra accounted for about 60 per cent of the total consumption of fuel oils (Furnace Oil+LSHS+HHS).

Source : "Indian Petroleum and Chemical Statistics", 1972, Ministry of Petroleum and Chemicals.

An alternative to the above for the year 1978 would be to use only the existing refining capacity of 28.4 million tons[11] (i e, not to increase the refining capacity by 7.6 million tons) and install 4 million tons of hydrocracking capacity. This alternative is presented as Alternative II in Table 7. The availability of kerosene and diesels is the same as in Alternative I. However, the production of light distillates is lower by 0.95 million tons and the production of heavy-ends (fuel oils) is lower by 7.2 million tons. The total outflow of crude oil imports in Alternative II would be considerably lower, Rs 984 crores as compared to Rs 1,440 crores in Alternative I. Thus, the import bill of crude imports can be reduced by Rs 456 crores per annum if the consumption of naphtha and petrol together is kept at 4.51 million tons and the consumption of heavy-ends is restricted to 6.50 million tons.

A comparison of these two alternatives[12] suggests that although there is substantial difference in foreign exchange outflows, the main difference in the availability of oil products is in the case of heavy-ends only. The question is should the direct demand for fuel oil to be burnt in place of coal become the main determinant of total requirement of crude throughput and crude oil imports? The second alternative, unlike the first, brings out the significance of the use of residual heavystock as feed for secondary processes as against its current use as furnace fuel and fertiliser feedstock. The comparison indicates that the import bill on crude oil can be reduced considerably (Rs 456 crores per annum) if residual heavystock is not treated as a surplus by-product which has to be burnt in place of coal.

In Alternative II, the total availability of light distillates in 1978 is about 4.51 million tons. Actual consumption of naphtha for fertiliser plants in 1972 was 0.95 million tons. Estimated consumption of naphtha for petrochemical units in 1972 was around 0.3 million tons. The requirements of naphtha in 1978 would depend on the number of new units which are commissioned and the capacity utilisation of these units.

TABLE 4: CONSUMPTION OF COAL AND FURNACE OIL IN THERMAL ELECTRICITY GENERATION: 1971-72

States	Thermal Electricity Generation (Mn Kwh)	Consumption of Coal (000 Tons)	Consumption of Furnace Oil (000 Tons)
(1) Andhra Pradesh	1,020	1,250	7.47
(2) Bihar	1,525	800	109.24
(3) Gujarat	3,308	578	643 32

(12) UP	3,887	3,046	16.81
(13) West Bengal, including DVC	8,035	4,785	38.28
(14) Delhi	1,461	806	19.61
All-India	31,237	19,210	1,322.20

Notes: (1) Consumption in kilolitres has been converted to metric tons by using a conversion factor of 0.9337 tons per kilolitre (KL).
(2) Consumption of furnace oil is mainly for those power plants which use furnace oil as boiler fuel, i e, Ahmedabad and Dhuvaran in Gujarat, Trombay in Maharashtra and Barauni thermal plant in Bihar.
(3) The figures of total consumption of furnace oil in thermal power generation in Tables 3 and 4 are different due to difference in the reckoning of the years.

Source: Public Electricity Supply All India, Stat 71-72 CWPC, Ministry of I and P, Fuel Consumption, table 32, page 75.

The consumption of naphtha for the eleven projects already in operation has been estimated at 1.1 million tons in 1978.[13] The estimates of consumption of the eleven new firm projects are of the order of 1.4 million tons. Some of these projects may not go on stream by 1978 while in the case of others the requirement of naphtha would depend on the level of capacity utilisation. It is assumed that the consumption of naphtha in 1978 in the new units would be of the order of 1.0 million tons. This indicates that in 1978 the total requirements of naphtha for fertiliser plants would be of the order of 2.1 million tons.[14] The requirements of naphtha for petrochemicals is estimated at 0.9 million tons.[15] Thus, out of a total of 4.51 million tons of light distillates, 3.0 million tons of naphtha is required for fertiliser and petrochemical plants. The remaining 1.5 million tons can be used as petrol or motor gasoline. Thus, the availability of petrol in 1978 would be 25 per cent higher than its estimated post-price-hike consumption in 1974. This suggests that there is sufficient margin in petrol availability to take care of the unexpected increase in naphtha demand.

The residual heavystock obtained from crude oil in the first round of refining can be used as fuel oils or as feedstock for fertilisers; as feed for bitumen, lube oils and petroleum coke. Consumption of fuel oils (including LSHS and HHS) has increased from 1.9 million tons in 1961 to 5.5 million tons in 1972. About 70 per cent of total fuel oils are used in industries (Table 3) where other indigenous sources of energy (coal or coal gas) could be used. If higher quantities of residual heavystock is made available, it would again be used as furnace fuel in industries where its use is not technically necessary. To avoid this, the consumption of fuel oil should be strictly curbed through a steep increase in its price as well as by subjecting the fuel oil requirements of large users to a strict scrutiny.

Table 8 presents a comparison of various uses of residual heavystock in 1971 and 1978. The suggested consumption of 6.5 million tons in 1978 is equal to the production of residual heavystock in 1971 and is slightly lower than the actual consumption of 7.86 million tons in 1971. However, the suggested pattern of use of residual heavystock (heavy-ends) meets all the increased indispensable and priority needs of the economy. It provides 0.44 million tons of furnace oil to be used as auxiliary fuel for generation 74,000 million kwh (out of the total of 130,000 million kwh) in thermal plants in 1978.[16] This would require that about 1.1 million tons of fuel oil currently used as boiler fuel in four power plants be substituted by coal.

Consumption of bitumen was around 0.50 million tons per annum during 1964-68 and around 0.65 million tons in 1968-69. Consumption in 1971 was unduly high, about 26 per cent higher than the consumption in 1970. Demand in 1972 was also very high, about 21 per cent higher than in 1971. It is assumed that bitumen demand can be kept low, around 1.0 million tons in 1978. Production of lube oils in 1972 was 0.30 million tons while the consumption was 0.56 million tons. By establishing facilities for re-refining of lubes, the consumption of lube oils can be reduced significantly. Since some of the special lube oils will have to be imported, 0.5 million tons are provided for lube oils while it is assumed that the production of petroleum coke would increase from 0.15 million tons in 1971 to 0.20 million tons in 1978. The demand for fuel oils in coastal shipping, agriculture and plantations and railways would also be met.

In 1972, about 200,000 tons of fuel oils was used as raw material for steam generation in fertiliser plants. This could be easily substituted by coal as boiler fuel. However, the suggested utilisation of residual heavystock in 1978 provides 1.0 million tons of fuel oil as feedstock for fertiliser plants.[17]

Consumption of fuel oils in other industries in 1971 was around 3.0 million tons. As discussed earlier, in most of these industries, use of furnace oil is not technically necessary. A changeover from furnace oil to coal would require some investments as well as timely availability of coal. For ceramics and glass industry, about 200,000 tons of furnace oil is provided in the suggested utilisation of residual heavystock. In addition, about 600,000 tons of fuel oil would be available for industrial units where fuel oil cannot be substituted by coal on certain considerations. Besides, it is assumed that marginal quantities of fuel oil can always be imported to meet the demand from units where the resource cost of substituting coal or coal gas is higher than the 'economic cost' of importing fuel oil.

Thus, it can be seen that a refining capacity (crude throughput) of 28.4 million tons along with a hydrocracking capacity of 4 million tons can meet all the non-substitutable demands for oil products. This combination (Alternative II) would provide 4.51 million tons of naphtha and petrol, about 7.26 million tons of kerosene and jet fuel and about 9.0 million tons of diesels. It would also meet all the priority needs of bitumen, lube oils, petroleum coke; furnace oil

for power generation; fuel oil to be used as fertiliser feedstock; furnace oil for coastal shipping, agriculture, railways and ceramics and glass industry. This means that import of crude oil can be reduced by about 7.6 million tons if (a) coal is substituted for about 1.1 million tons of fuel oil in power plants and for about 2.4 million tons of fuel oil in various industrial units; (b) coal is used as boiler fuel in all the new industrial units except in those where the demand has to be met through imports.

IV

Investment Costs in the Two Alternatives

The reduction in imports of crude oil has the following implications:

(a) the new refining capacity to be added at Koyali and Mathura is not required for the year 1978. Instead, four hydrocracking units one each at Bombay, Koyali, Cochin and Barauni should be considered;

(b) the pipeline to transport imported crude oil from Salaya to Mathura is not required. Instead, a pipeline to transport products from Koyali to North-West region could be considered;

(c) some initial investments would be required for changeover from oil to coal in power plants and industrial units; and,

(d) certain investments for additional production and efficient transportation of coal would be required.

Table 9 presents approximate investment costs in the two alternative patterns of crude processing, estimated on the basis of demand in 1978. We shall have to content ourselves with these approximations because, given the information, the exact investment costs of certain components, chiefly that of transport, cannot be worked out at this stage. In Alternative I, for processing 36 million tons of crude oil, about 9 million tons of additional capacity is being planned at Koyali and Mathura. The investment costs of expansion of Koyali refinery by 3.0 million tons have been estimated as Rs 27 crores in the draft Fifth Plan. The estimated capital costs of Mathura refinery (6 million tons per annum) are Rs 93 crores. Unit investment costs in Mathura are higher on account of costs of offsite facilities as well as because of additional costs of secondary process unit envisaged for the refinery. Since the type and scale of this secondary process unit is not yet known, it is difficult to estimate the exact capital costs of Mathura refinery without the secondary process unit. However, the combined capital costs of Koyali (expansion) and Mathura would lie between Rs 81 crores and Rs 120 crores. We may assume a total capital cost of Rs 90 crores for this purpose.[18]

If hydrocracking units are to be added to the existing process units in four refineries, the investment costs would include the costs of hydrocracker as well as the costs of vacuum distillation and hydrogen plants of appropriate capacities.[19] The capital costs of one million tons of hydrocracking capacity are about 2.5 to 3 times the capital costs of a simple refinery of one million tons.[20] Assuming that the latter is Rs 10 crores, the former would be of the order of Rs 30 crores. This estimate would imply Rs 120 crores as the approximate investment costs of installing four hydrocracking units of one million tons each at four different locations.

With a lower refining capacity of 28.4 million tons, the proposed pipeline to carry 6 million tons of crude oil from Salaya to Mathura (1,344 kms) is not required. This implies that an estimated expenditure of Rs 120 crores in Alternative I would not be incurred under Alternative II. However, the latter may require a product pipeline to move around 3 million tons of products from Koyali to North-West region. Approximate capital costs of a 3.0 million ton product pipeline from Koyali to Mathura (1,062 kms) would be of the order of Rs 55 crores. Besides the change in the investments in pipelines, the two alternatives of crude processing would differ in the rail movement of petroleum products.[21] It is difficult to quantify the investment implications of the pattern of rail movement of petroleum products under different alternatives since this would involve detailed information about the overall railway movement projected for 1978. To the extent that the quantum of products to be moved is lower in Alternative II, the rolling stock requirements would be lower. On the other hand, if the products are to be carried over longer distances its requirements would be higher. Therefore, it is assumed that the differences between the two alternatives in regard to investment requirements for rail transportation of oil products would be negligible.

The substitution of coal for fuel oil used in power generation and other

TABLE 5: CONSUMPTION OF NAPHTHA AND FUEL OIL IN FERTILISER INDUSTRY

(000 tons)

Name of the Unit	Consumption of Naphtha as Feedstock in 1972	Consumption of Fuel Oil as Raw Material for Steam Generation in 1972-73
(1) Sindri	16.6	—
(2) Trombay	75.5	26.4
(3) Gorakhpur	68.5	0.0
(4) Rourkela	36.2	0.0
(5) FACT, Alwaye	50.4	26.5
(6) Madras	168.0	56.0
(7) Ennore	14.8	0.0
(8) Vizag	78.1	32.7
(9) Gujarat State Fertiliser Corporation	106.5	15.0
(10) Kota (DCM)	120.5	—

(13) Cochin	6.0	
(14) Goa	20.7	11.9
(15) EID-Parry	—	12.5
Total	954.6	205.3

Notes: (1) In 1972-73, there was no fertiliser unit which used fuel oil as feedstock: New units are proposed which will require 760,000 tons of fuel oil as feedstock.
(2) Fuel oil requirements as raw material for steam generation have been estimated as 600,000 tons by 1978.

Source: "Indian Petroleum and Chemicals Statistics", 1972; Ministry of Petroleum and Chemicals, New Delhi, pp 142-143 and 119.

units would also require some investments. In the case of four power plants which use fuel oil as primary fuel, substitution of coal would require marginal investments. Ahmedabad and Barauni power stations can change over to coal immediately without any investments. About two-thirds of the total capacity of Trombay power plant can be converted to coal firing without additional investment. Similarly, in the case of Dhuvaran power station, more than half of the total capacity can be converted to coal-firing with marginal investments. Thus, the estimated capital costs of changeover from oil to coal in power plants may be of the order of Rs 10-15 crores.

Use of coal for furnace oil in other industrial units such as textiles, cement, chemicals, aluminium, sugar and engineering, etc, would require conversion of equipment in some of them while many others would have only to restore themselves to an earlier practice. In the case of the former, an idea of the likely

investment costs can be obtained by comparing the capital costs of installing steam generation plants based on fuel oil and coal. It has been estimated that the capital cost of a steam generation plant with an installed capacity of three (2 + 1) boilers (of 40 ton/hr of steam at 65 kg/cm²g) using 45,000 tons/year of fuel oil are around Rs 2 crores. The capital costs of the coal-based plant (using 90,000 tons of coal per annum) are of the order of Rs 3 crores. Thus, if the entire consumption of about 2.4 million tons of furnace oil currently used in these industrial units is substituted by coal the capital costs of the changeover would be around Rs 53 crores. Since all the units would not require this conversion and the investments in some cases may be marginal the sum of the capital costs of conversion from oil to coal in power plants and industrial units have been placed at Rs 60 crores.

Substitution of coal for oil in power plants and industrial units would require that additional quantities of coal are produced and transported to consuming regions. Estimation of the investment costs of coal production and transportation would require the identification of the coal mines from which additional quantities of coal could be supplied, and a knowledge of the regional pattern of consumption of fuel oils. The total consumption of fuel oils in 1971 in Maharashtra and Gujarat was about 2.5 million tons. Tamil Nadu, Bihar, UP and West Bengal accounted for another 1.2 million tons. All the other states together used only around 0.7 million tons. The coal requirements of most of the industrial units and power plants in the Western region (Maharashtra and Gujarat) would have to be met from the Central Indian coalfields of Kamptee, Umrer, Korba, Chirimiri, Korea Rewa, Pench and Karhar and Bisrampur. The requirements of Tamil Nadu could be met from the Singareni coalfields. Coal requirements in Western and Southern regions could also be met from the Bengal-Bihar coalfields if coastal shipping is used.[22]

The investment costs in coal mining depend crucially on the type of mine (open cast, underground or deep underground), the extent of mechanisation of the mine and the nature of coal deposits (nature and ratio of overburden, gaseousness, etc). The capital costs would depend on the proportion of additional output which is expected to come from open cast, underground or deep underground mines. An average estimate of investment cost of additional production of coal in India has been placed at Rs 50 per tonne.[23] Assuming as an average, the investment costs of additional coal production at Rs 70 per tonne the total capital costs of producing 7.0 million tons (to replace 3.5 million tons[24] of fuel oil) would be of the order of Rs 50 crores. Alternative I provides for additional 3.5 million tons of fuel oil for meeting the requirements of new industrial units.[25] If this is also substituted by coal, the total capital costs on coal production of 14 million tons to replace 7.0 million tons of fuel oil in 1978 would be of the order of Rs 100 crores.

The investment costs on transportation of coal would include the costs of additional rolling stock (locos and wagons) and the capital costs of new line capacity wherever required. The requirements of locos and wagons would depend on the quantity of coal to be moved and the distances over which it is to be carried. The actual distance over which coal would have to be moved will mainly depend on the regional distribution of demand in Maharashtra, Gujarat and Tamil Nadu. In the absence of detailed information of this type, an average distance of 900 kilometres is assumed for these three states since the major centres (Ahmedabad, Bombay and Madras) are about 750 kms to 1,000 kms away from the nearest coal field. About 500 wagons (box type) would be able to transport 1.0 million tons of coal per year over a distance of 900 kms. Movements of 7 million tons of coal would require around 3,500 wagons.[26] If the cost of one wagon (box type) is taken at Rs 0.60 lakhs,[27] the total cost of 3,500 wagons would be of the order of Rs 21 crores. The cost of 70 locomotives at the rate of Rs 25 lakhs per loco would be around Rs 18 crores. Thus, the total rolling stock for moving 7 million tons of coal would cost around Rs 39 crores.[28]

It is difficult to make an estimate of the capital costs of additional railway line capacity that may be required to move additional traffic. The capital cost of the new line would depend on the number of sections where doubling of track capacity will become necessary on account of increased movement of coal. This would require projections of traffic on major sections in the region and identification of those routes where line capacity will become a bottleneck. In the absence of such a detailed study on the projected levels of utilisation of line capacity in Maharashtra-Gujarat-Tamil Nadu region, it is not possible to make any judgment on the likely capital costs of additional line capacity for moving 7.0 million tons. However, to get an idea of the order of magnitudes involved, the capital costs under different assumptions can be estimated. The costs of doubling of railway track on broad gauge estimated for 1973-74 varied between Rs 6.2 lakhs per kilometre to Rs 8.8 lakhs per kilometre. The average cost of adding new line capacity can be taken as Rs 9 lakhs per kilometre. If the additional movement of coal requires doubling of 100 kilometres of track in various sections, the total cost would be of the order of Rs 9 crores. If new railway line is required for a distance of 900 kilometres of the trunk routes, the total capital cost may be of the order of Rs 81 crores. Thus, the likely investment required for additional transportation of 7 million tons of coal to Western and Southern region would be of the order of Rs 120 (39 + 81) crores.[29] It would be about Rs 112 crores if coastal shipping is used for this purpose in place of railways.[30] The investment requirements of transporting another 7 million tons of coal would depend on the pattern of location of the new industrial units. Since this is not known, it is assumed that the capital costs of transporting coal or fuel oil to these units would be equal.

Table 9 presents a comparison of the above mentioned investment costs in the two alternative patterns. It may be seen that investment costs under Alternative II are higher by Rs 245 crores. However, the bill for crude imports is lower by Rs 456 crores per annum.

A simpler comparison of relative costs of using fuel oil and coal in furnaces can be made in terms of their relative prices. The costs of 3.5 million tons of fuel oil (at the current price of $ 60 per ton) would be $ 210 million. At the shadow price of Rs 10 for a dollar the cost would work out at Rs 210 crores. Approximately 7 million tons of coal would replace 3.5 million tons of fuel oil as discussed above. At an assumed delivered price of Rs 150 per ton (current price being about Rs 100 per ton) the cost of coal would be Rs 105 crores. Thus, by replacing 7 million tons of fuel oil consumption (in 1978) assumed in Alternative I by 14 million tons of coal in Alternative II a direct saving in terms of relative prices alone would be of the order of Rs 210 crores on the most conservative estimates. It is thus clear that even if the delivered price of coal were to be doubled (*i e*, Rs 300 per ton) it would still be economic to substitute fuel oil by coal.

TABLE 7 : ALTERNATIVE MODES OF CRUDE PROCESSING

(million tons)

		Alternative I	Alternative II
(A)	Mode of Processing		
	Refining capacity	36.0	28.4
	Hydrocracking capacity	0.0	4.0
(B)	Product Availability		
	Light distillates (petrol, naphtha)	5.46	4.51
	Middle distillates (kerosene, diesels)	16.26	16.26
	Heavy-ends (residual heavystock)	13.70	6.50
	Total products	35.42	27.27
(C)	Crude Requirements		
	Total crude throughput	36.00	28.40
	Total indigenous production	12.00	12.00
	Total crude imports	24.00	16.40
(D)	Foreign Exchange Outflow on Crude Imports (Rs crores per year)	1,440	984

Notes : (1) Based on the product demands for 1978.
(2) It can be seen that Alternative I broadly corresponds to the pattern of refining capacity envisaged in the Draft Fifth Five-Year Plan. Alternative II is the combination suggested here which minimises crude imports.
(3) The availability of different oil products has been estimated by the following method : In 1972, the yield of different oil products by processing 19.67 million tons of crude oil was 3.17 million tons of light distillates, 9.4 million tons middle distillates and 6.84 million tons of heavy-ends. In Alternative I, 16.33 million tons of additional crude oil (34°API), without secondary processing, will yield 2.29 million tons of light distillates, 6.86 million tons of middle distillates and 6.86 million tons of heavy-ends. The availability of these products from additional crude throughput of 8.71 million tons in (Alternative II) would be 1.22 million tons of light distillates, 3.66 million tons of middle distillates and 3.66 million tons of heavy-ends. Hydrocracking capacity of 4.0 million tons reduces the availability of heavy-ends by 4.0 million tons but adds 3.2 million tons (80 per cent of feed) to the availability of middle distillates and 0.12 million tons of light distillates.
(4) Net availability of light distillates would be higher by 500,000 tons if naphtha is not used for manufacturing hydrogen required for hydrocracking. The higher requirements of refinery boiler fuel for hydrocracking units are allowed for in the utilisation of residual heavystock.

V

Implications of Suggested Alternative

Thus, by installing about 4 million tons of new hydrocracking capacity and incurring an extra (once-for-all) expenditure of about Rs 245 crores, the country can save about Rs 456 crores in foreign exchange per annum. The availability of kerosene, jet fuel and diesels is 16.26 million tons, the same as in Alternative I. The availability of fuel oil to be used as furnace fuel is substantially lower in this case. This alternative pattern of crude processing implies optimum utilisation of crude oil by retrieving the maximum of essential products (kerosene and diesels) from a minimal quantum of crude oil. This is achieved by putting the residual heavystock (obtained in the first round of refining crude oil) to its optimum use as feed for secondary processing units such as hydrocrackers. This use of residual heavystock (fuel oil) is decidedly more advantageous than even its use as feed-

TABLE 8 : UTILISATION OF RESIDUAL HEAVYSTOCK (HEAVY-ENDS) IN INDIA

(million tons)

	Use of Heavystock	Actual Consumption in 1971	Suggested Consumption in 1978
(A)	As Feed		
	(1) Fertiliser feedstock	0.00	1.00
	(2) Bitumen	0.95	1.00
	(3) Lube oils and wax	0.56	0.50
	(4) Petroleum coke	0.15	0.20
(B)	As Furnace Oil		
	(5a) Power generation (as auxiliary fuel)	0.18	0.44
	(5b) Power generation (as boiler fuel)	1.12	0.00
	(6) Coastal shipping	0.25	0.30
	(7) Agriculture and plantations	0.20	0.20
	(8) Railways, roadways and mining	0.10	0.10
	(9) Ceramics and glass	0.20	0.20
	(10) Other industries	3.00	0.60
	(11) Refinery boilers fuel	1.15	1.96
	(12) Total	7.86	6.50

Notes : (1) Bitumen, lube oils, petroleum coke and wax require residual heavystock as feed in the special process plants such as bitumen blowing units, lube processing units and coking and coke calcination units.

(2) Requirements of international bunkers are not included since the earnings from sales can be used for importing the required quantities of fuel oil. In any case, the international bunkers account for only 2.5 per cent of the total consumption of heavy-ends.

(3) Availability of refinery boiler fuel will increase from 1.15 million tons to 1.96 million tons. After allowing for 1.7 million tons as boiler fuel at 6 per cent of crude throughput it would provide about 0.26 million tons as additional fuel oil for hydrocracking units. With improvement in boiler efficiency and use of other substitutes, consumption of refinery boiler fuel may, in fact, be lower than estimated here.

stock in fertiliser plants,[31] to say nothing of its colossal misuse as furnace fuel. Being abundantly supplied with coal, our country would find optimum use of coal both as fertiliser feedstock and furnace fuel in place of naphtha and fuel oil. By wrong manipulation of the relative prices for natural gas, naphtha, fuel oil and coal these inputs have been all along used for low priority purposes. The result is that the country has become dependent on oil imports requiring recurring outflow of scarce foreign exchange.

The introduction of correctives is urgently required and the earlier it is done the better. It would be difficult to correct the situation later when wrong practices have been extended into wider industrial fabric. The present oil and foreign exchange crisis has provided compelling reasons enough to take these corrective measures now. This implies establishment of secondary processing facilities in some refineries, of adequate capacity and not merely a token gesture.

Among the various techniques of reconversion of residual heavystock, hydrocracking would be most suitable[32] because it yields the maximum middle-distillates (kerosene and diesels) and brings about maximum reduction in crude throughput notwithstanding its lower capacity utilisation initially. If an adequate hydrocracking capacity[33] is not established to undertake reconversion of residual heavystock even at this stage, the available heavystock would continue to be misused as furnace fuel in industries where alternative domestic fuels can be used. This has indeed been happening all these years, and nothing would be more disastrous than its continuation over the coming years.

The crude imports in Alternative II can be further reduced if demand for kerosene and diesels is reduced by providing alternative fuels in domestic sector, irrigation and railways. Coal can be directly substituted (as soft coke) for kerosene in domestic cooking. It can be converted into coal gas or solid smokeless fuel through gasification or carbonisation to be used in place of kerosene and furnace oil. Indirect substitution of coal for light diesel oil in irrigation can be achieved by electrification of regions where diesel pumps are used. Similarly, electrification of railways would substitute for dieselisation on sections where traffic density is high. Direct conversion of coal into oil products (petrol or diesels) is also possible either through hydrogenation of coal and tar or by gasification of coal or by the Fischer-Tropsch method. However, in these sectors use of alternative sources of energy would be subject to the considerations of the 'resource costs' of this substitution. The 'resource costs' of substitution of coal for oil would vary from region to region depending upon the costs of coal production and transportation; the costs of electricity generation, transmission and distribution; the costs of gasification, carbonisation or hydrogenation; and, the costs of utilisation of the alternative fuel (e.g. costs of piping coal gas, costs of distribution of electricity for irrigation and transport, etc). In some sectors and in some regions, the 'economic costs' of substitution may be lower than the 'shadow price' of the relevant oil product duly corrected for the premium on foreign exchange. This type of selective substitution may reduce the demand for naphtha, kerosene, diesel as well as furnace oil. The extent of substitution in each product would depend on a number of economic and technological factors. In the absence of such a detailed study on 'economic costs' of substitution of coal for oil, it is not possible to indicate the optimum pattern of crude processing. However, with lower demand for oil products, the level of refining and hydrocracking capacities would be lower than those considered in the two alternatives above.

VI

Conclusions

To conclude, this paper is an attempt to present the following points in connection with the oil policy of the country:

(1) The present method of planning investments in petroleum and petrochemical industries is not based on detailed evaluation of economic and technological options available to the country. The method employed for estimating total refining capacity rules out considerations of foreign trade options, refinery process choices, fertiliser feedstock choices and use of alternative fuels in many industries. In the sixties, the requirements of refining capacity in India were overestimated resulting in surpluses of naphtha and fuel oil in the country. These temporary surpluses led to distortions in choices at various levels delaying the development of technology which can take into account the resource-base and the demand pattern of the economy. As a consequence there has occurred a continuous dependence of the country on oil imports requiring recurring outflow of scarce foreign exchange.

(2) Application of comprehensive investment planning techniques indicates that an adequate refining capacity in India in 1978 could be as low as 28.4 million tons as compared with the present estimate of 36.0 million tons. The former magnitude of crude throughput along with a hydrocracking capacity of 4.0 million tons would be sufficient to meet fully the demands of naphtha, kerosenes, jet fuel and diesels as well as all the priority demands for petrol and heavy-ends. Thus, the alternative implies a reduction of 7.6 million tons in crude oil imports reducing the import bill by Rs 456 crores ($ 570 million) per annum.

(3) In view of the above the new refining capacity proposed at Koyali and Mathura in the draft Fifth Plan is not required for the year 1978-79. Instead, four hydrocracking units one each at Bombay, Koyali, Cochin and Barauni should be installed. The establishment of requisite hydrocracking capacity can be undertaken without much delay at the existing refinery locations.

(4) Under the proposed alternative the pipeline to transport imported crude oil from Salaya to Mathura (and Koyali) is not required in 1978-79. Instead, a pipeline to transport oil products from Koyali to North-West region should be considered.

(5) There should be a sharp increase in the price of fuel oil with a view to curbing its consumption for low priority uses. The price should be raised so as to reflect its opportunity cost to the economy. For the consumer, its price should be higher than the import cost of fuel oil duly corrected for the shadow price of foreign exchange. In addition, there should be a very strict scrutiny of fuel oil requirements of large industrial units. For the producer, on the other hand, there should be a marked reduction in the sale price of fuel oil for its use as furnace oil so as to ensure its maximum conversion into petrol, kerosene and diesels.

(6) The current practice of using fuel oil as furnace oil should be stopped; instead, coal should be used as furnace fuel. The investment requirements of changeover from oil to coal in some power plants and industrial units may be subsidised, if necessary. This process of conversion of oil-fired equipment to dual-firing equipment could be undertaken without much time delay.

(7) The investments required for additional coal production should be made and the targets of output revised accordingly. This would also require that additional output in the coalfields in Central India (Korba, Kamptee, Chanda, Pench and Singareni) is accorded priority in terms of allocation of financial and managerial resources.

(8) Provisions for the new pattern of transporting coal from mines to new demand points should be made. This may require doubling of rail lines on certain sections, increased rolling stock as well as substantial improvement in loading and unloading facilities. It may also require purchase of ships for coastal shipping. There is need to finalise the installation of coal dumps at major demand centres to ensure timely availability of coal.

The need for the alternative pattern of crude processing which substantially reduces import costs has become acute with the steep hike in oil prices. The policy decisions suggested above would have to be taken now or we would be unable to arrest the increasing burden of oil imports and thereby paralyse the entire economy.

TABLE 9 : APPROXIMATE INVESTMENT COSTS IN ALTERNATIVE MODES OF CRUDE PROCESSING

(Rs crores)

Mode of Processing	Alternative I	Alternative II
Refining capacity	36.0 million tons	28.4 million tons
Hydrocracking capacity	0.0 million tons	4.0 million tons
(1) Investment costs of refinery process units	90	0
(2) Investment costs of hydrocracking units		120
(3) Capital costs of crude pipeline	120	0
(4) Capital costs of product pipeline	0	55
(5) Capital costs of conversion of industrial units from fuel oil to coal	0	60
(6) Capital costs of coal production (14 mn tons)	0	100
(7) Capital costs of coal transportation	0	120
(8) Total	210	455

Notes : (1) These investments costs are only to show the order of magnitudes involved. The actual investment costs may be somewhat different in the two Alternatives.

(2) The details of estimation of approximate investment costs are given in the text and relevant footnotes.

(3) The capital costs for crude oil pipeline are the costs for transporting 6 million tons over a distance of 1,344 kilometres (Salaya to Mathura/Koyali).

(4) The product pipeline is for 3 million tons over 1,062 kilometres (Koyali to Mathura).

Notes

1 Oil products accounted for 49 per cent of the total consumption of commercial energy (197 million tons of coal replacement, MTCR) in 1970-71. Coal accounted for 26 per cent while electricity, accounted for 25 per cent. Commercial energy itself was about half of the total energy consumed, the rest contributed by sources of non-commercial energy such as firewood, cowdung and vegetable wastes.

2 Consumption of oil products (energy products) increased at a rate of 8.6 per cent per annum during 1953-54 to 1970-71 while the rate of growth of coal consumption was 3.5 per cent per annum. In the mining and manufacturing sector, oil accounted for about 14 per cent of the commercial energy consumed in 1970-71. In the same year, oil accounted for about 80 per cent of commercial energy consumed in transport and domestic sectors. Share of oil in agriculture was about 50 per cent.

3 The consumption of refinery boiler fuel depends on the complexity of the refinery and the use of alternate source of energy. In the simplest refinery with only an atmospheric distillation unit and related process units, boiler fuel consumption would be about 4.2 per cent of the crude throughput.

4 Production of middle-distillates (by processing 19.67 million tons of crude oil) in 1972 was 9.4 million tons. If the demand for 1978 is estimated as 16.26 million tons of middle-distillates, there would be a deficit of 6.86 million tons. This deficit could be met by processing additional crude throughput of 16.33 million tons, assuming a middle-distillate yield of 42 per cent of crude charged in the case of a representative Middle-East crude oil. These would give a total crude throughput requirement of 36.0 million tons (19.67 + 16.33 million tons) in 1978.

5 Taking a crude oil import price of Rs 177 per ton ($ 3.0 per barrel f o b Persian Gulf) and the corresponding prices for naphtha, ke-

rosene and diesel, the foreign exchange outflow on account of import of naphtha, kerosene and diesel is lower than that on account of crude imports. The foreign exchange costs on import of naphtha, kerosene and diesel obtained from one tonne of crude oil is Rs 174 compared to Rs 177 required for importing one ton of crude. If only kerosene and diesel are imported at the margin, product imports would cost only Rs 145 as compared to the crude import cost of Rs 177. At higher crude price of Rs 550 per ton ($ 10 per barrel) the foreign exchange costs of import of kerosene and diesel obtained from one ton of crude oil is Rs 474 as against Rs 550 required for importing crude. Import of products is more economic when all the products, including fuel oil, have to be imported at the margin. The significance of considering product imports in estimating refining capacity was demonstrated in "Investment Planning for Petroleum Industry: Preliminary Results of an Optimising Exercise" by Ramesh K Bhatia and Shiv K Khetan in *Economic and Political Weekly*, February 27, 1971.

6 Ramesh K Bhatia: "Investment Planning for Petroleum and Petrochemical Industries: An Interregional Programming Model for India", Institute of Economic Growth, Delhi, May 1973; Mimeographed.

7 "Production and State-wise Utilisation of Natural Gas in India" in "Indian Petroleum and Chemicals Statistics", 1972, Ministry of Petroleum and Chemicals, New Delhi, p 29.

8 As a rough approximation, it may be estimated that if the entire natural gas produced in 1972 was utilised as feedstock for fertiliser plants, the total output of nitrogen would have been of the order of one million tons of nitrogen, thus reducing naphtha demand by about one million tons.

9 Although there is no information for each unit on its technically minimum requirements of furnace oil, some indirect evidence can be presented to show that in each industry the units which are located near a refinery (or port) are using furnace oil while there are many units in the same industry which are using alternative fuels such as coal. An analysis of the data of Annual Survey of Industries for 1965 shows that Maharashtra accounted for about 31 per cent of the gross value of output in cotton textile industry in 1965 and consumed as much as 73 per cent of the total consumption of fuel oil in the industry. Gujarat's share in output was 24 per cent while its share in consumption of fuel oil was only 9 per cent. In the same industry there are units in other states which together accounted for about 30 per cent of total output but consumed very little of furnace oil. In iron and steel, Bihar which accounted for 26 per cent of the gross value of output consumed about 43 per cent of the total fuel oil used in the industry. On the other hand, the three states (Madhya Pradesh, Orissa and West Bengal) which together accounted for 60 per cent of the output consumed only 25 per cent of furnace oil. In cement industry, Gujarat and Madras produced about 31 per cent of output and consumed as much as 65 per cent of total furnace oil. Also, in the case of inorganic heavy chemicals Maharashtra and Gujarat accounted for 49 per cent of output and 71 per cent of furnace oil consumption. Notwithstanding the differences in process, end-product, age of capital stock, type of equipment used and quality of raw material, it is clear that furnace oil is not technologically necessary in all the units hitherto merrily burning fuel oil in furnaces.

10 It is mentioned in the draft Fifth Plan that secondary processing facilities have been included for the Mathura refinery. However, the details regarding the type and scale of secondary processing have not been provided.

11 The capacities of different locations are: (in million tons) Bombay (including latent capacity) 9.0, Vizag 2.0, Koyali 4.3, Barauni 2.4, Haldia 2.5, Cochin 3.3, Madras 2.6, Digboi 0.5, Gauhati 0.8, and Bongaigaon 1.0.

12 It is possible to think of innumerable other alternatives of meeting different levels of patterns of demand for oil products. For example, a crude throughput of 28.4 million tons along with an import of 3.2 million tons of middle-distillates (kerosene and diesels) can meet the demand for light distillates and middle-distillates as in Alternative II and provide additional 4.0 million tons of heavy-ends. Yet another alternative would be to process 36.0 million tons of crude oil, instal about 7.0 million tons of hydrocracking capacity and export about 5.6 million tons of middle-distillates. The foreign exchange outflows and capital costs in each of these alternatives would be different depending upon the assumptions regarding relative prices of importing crude oil and products; relative prices (earnings) of exporting different oil products; foreign exchange components in investment refinery process, etc. In addition, the location aspects of capacity expansions would require considerations of transport costs of crude oil and oil products by different modes, economies of scale in various process units and the regional pattern of demand for oil products. Moreover, there is significant interdependence between investment and operating decisions of petroleum and petrochemical (including fertiliser) industries. A decision regarding the location and choice of raw material for a fertiliser plant can significantly affect the choice of process and size of units in refining industry. At the same time, the location and feedstock choices in these consuming industries are themselves dependent on the decisions in petroleum industry through the efficiency prices of these oil products. Thus, various options with regard to foreign trade, size and location of refinery processes and feedstock mix in petrochemical industries would have to be analysed simultaneously in the framework of a mathematical programming model. Such a study has already been completed and the results for 1978 and 1984 have been reported in "Investment Planning for Petroleum and Petrochemical Industries: An Interregional Programming Model for India" by Ramesh K Bhatia, Institute of Economic Growth, Delhi 7 (mimeographed) May, 1973.

13 "Indian Petroleum and Chemicals Statistics", Ministry of Petroleum and Chemicals, New Delhi, p 144.

14 Fertiliser plants using partial oxidation process can use fuel oil in place of naphtha. This changeover can save about 1,40,000 tons of naphtha (per year) used in the Gorakhpur and Trombay units. About 2,00,000 tons of naphtha is used in GSFC (Gujarat State Fertiliser Corporation) and IFFCO plant at Kalol. This could be easily substituted by providing more natural gas to these units. If naphtha is not used as a source of hydrogen for hydrocracking, availability of naphtha would increase by about 5,00,000 tons.

15 In addition to the present consumption of 0.3 million tons, a naphtha cracker in Gujarat and petrochemical complexes in Assam and Tamil Nadu would require around 0.6 million tons. For new units which may come up, naphtha imports can be considered if a proportion of the total production is exported. These possibilities have not been examined in this paper.

16 Out of the total power capacity of 33,680 MW in 1978-79, thermal plants will account for 19,008 MW, i e, 57 per cent of the total. The generation of energy from different types of units would depend on a number of factors. In the absence of details, 57 per cent of energy (MnKwh) is assumed to come from thermal plants. Also, consumption of fuel oil as auxiliary fuel has recently increased in some power stations. However, with better working of the regional grid system and more efficient load-despatch techniques, the auxiliary consumption could be kept at the suggested level.

17 1.0 million tons of fuel oil used as feedstock would provide about 1.0 million tons of nitrogen (N). Available fuel oil would be sufficient for the new projects including those in the north-west region. However, this would require consideration of projects such as Sindri (modernisation) which, as an oil-based plant in the midst of the Jharia coal mines was an odd proposition even at those lower crude oil prices.

18 These investment costs include the costs of the following process units of appropriate capacities: atmospheric distillation, vacuum distillation, naphtha caustic wash, catalytic reforming, hydrodesulphurisation, bitumen blowing plant and power plant.

19 The costs may vary depending upon the existing capacities for vacuum distillation and hydrogen manufacturing at a given refinery-petrochemical complex.

20 The foreign exchange components of the capital costs can be estimated as follows: 30 per cent of simple refining units; 50 per cent for hydrocracking units and 60 per cent for pipelines. The approximate foreign exchange component of costs would be around Rs 100 crores in each of the two alternatives. The annualised charges corresponding to these investments in foreign exchange are about Rs 15 to 20 crores, i e, a small proportion of the reduction in import bill in Alternative II.

21 The mathematical programming model which minimises the sum of total costs, including the costs of transporting petroleum products, indicates that the total costs are lower in Alternative II.

22 The optimum pattern of coal transportation would depend on the production of coal in various mines and the demand for coal for power generation and railways. It has been estimated (Kumaramangalam, *op cit*, page 65) that production of coal in 1978-79 in Central India and outlying fields (Korba, CIC, Singareni, Maharashtra, Pench-Kanhan-Tawa) would be 42.8 million tons as compared to 19.2 million tons in 1971-72. The estimated proven reserves of these coalfields are around 1,167 million tons while the estimates of total reserves are put at 20,000 million tons. The output of non-coking coal in Bengal-Bihar region is estimated to increase from 31.5 million tons in 1971-72 to 53.1 million tons in 1978-79. Production of coal in Bengal-Bihar can be increased more quickly than in other coalfields and hence its transportation through Haldia to Bombay/Madras/Kandla by coastal shipping can ensure availability of coal in the consuming regions.

23 'Coal Industry in India' by S Mohan Kumaramanglam, Oxford Pub Co, 1973, p 43. The Draft Fifth Plan envisages an investment of Rs 205 crores in NCDC mines, Rs 125 crores in development of mines taken over, Rs 85 crores for other coal mines (existing schemes) and Rs 30 crores for Singareni coal mines. However, the estimated annual output from these mines is not available. If the entire investment is assumed to increase the production of coal from 79 million tons to 135 million tons, the average investment costs comes to Rs 80 per tonne.

24 The quantity of coal required to substitute for one ton of fuel oil would depend on the grade of coal (in terms of kilocalories per kilogram) and the fuel efficiency of the equipment used. If fuel oil is used mainly as a source of heat in boilers and industrial furnaces, two tons of good quality coal (more than 5,250 kilocalories per kilogram) can replace one ton of fuel oil. Since in most of the industrial units and power plants furnace oil is used as boiler fuel, it is assumed that 7.0 million tons of coal would be adequate for substituting 3.5 million tons of fuel oil.

25 The availability of heavy-ends in Alternative I is 13.7 million tonnes against 6.5 million tonnes in Alternative II. Assuming that under Alternative I, 6.5 million tons of residual heavystock would be used as suggested in Table 8, about 3.5 million tons would be used in power plants and industrial units and an additional 0.2 million tons would be required as refinery boiler fuel, Alternative I provides for an additional 3.5 million tons of fuel oil to be used for industrial units. Although, Alternative I also provides about 1.0 million tons of extra petrol, since petrol consumption can be reduced by reducing the movement of vehicles, it is not necessary to provide for an alternate fuel.

26 This assumes that a 40 ton wagon would cover the distance of 900 kilometres in 30 hours. Assuming 100 per cent empty return and 4 days required for loading/unloading, one round trip would require 7 days. If a wagon makes 50 such trips in a year it can transport 2,000 tons of coal per year. Thus, 500 wagons can transport about 1.0 million tons per annum. With the use of unit train or integral train and the mechanical loading system, the turn-around time may be lower than 7 days.

27 The anticipated cost of one box-type (Bogie open) wagon varies between Rs 0.50 lakh and Rs 0.63 lakh. The cost of Bogie open wagon (Boy Gondola type) is around 0.28 lakh as indicated in "Works, Machinery and Rolling Stock Programmes of Railways for 1973-74" Ministry of Railways, Railway Board). The average export price of a railway wagon was Rs 0.47 lakhs during the period April 1972-March 1973. The cost of diesel electric loco ranges between Rs 18.6 lakhs and Rs 27.5 lakhs.

28 The capital costs would be of the same order if smaller wagons (23 tons) are used. Also, the actual cost would be less because some of the wagons and locos currently being used for transporting furnace oil to industrial units would be released and used for transporting oil products.

29 The operating costs for moving 7.0 million tons of coal would include: Rs 1.8 crores at Rs 1.32 per ton of terminal costs plus Rs 11.2 crores at Rs 0.008 per tonne-kilometre of line haul costs. The operating costs of 7.6 million tons of simple refining crude oil would be of the same order as the operating costs of 4.0 million tons of hydrocracking since the additional costs of hydrogen manufacturing (naphtha costs) and boiler fuel in hydrocrackers has already been taken into account by providing required quantities of naphtha and fuel oil. Since the differences in operating costs in the two alternatives would be a small proportion of the differences in crude oil costs, these details of operating costs have been ignored. However, it does not affect the basic argument of the paper.

30 Assuming that one ship (15,000 DWT) carries 14,000 tons of coal per trip, the total number of days at sea (round trip) is 11 and it takes 6 days for loading/unloading, it can transport 0.28 million tons of coal in 20 trips during the year. 25 ships would be required to transport 7 million tons of coal from Haldia to Bombay/Kandla and would cost about Rs 112 crores.

31 At an import price of $ 60 per ton for fuel oil, coal-based fertiliser plants are more economic even when the capital costs of coal-based plants are substantially higher than those based on fuel oil as feedstock.

32 The cost-minimising mathematical programming model referred to earlier has evaluated the available secondary processes such as hydrocracking, catalytic cracking and coking. It has suggested that hydrocracking is the optimum conversion process for all locations where furnace oil demand is substantially reduced.

33 The measure of adequate capacity would depend on the total availability of fuel oil released from its misuse as furnace fuel.

The Tata Iron and Steel Company Limited

Statement of the Chairman, Mr J R D Tata

THE following is the Statement of Mr J R D Tata, Chairman, The Tata Iron and Steel Company Limited, for the year 1973-74:

A Year of Crisis

From the production point of view, the past year has been perhaps the most difficult year in the history of the Company, for never before have we had to close down parts of our plant or curtail output continuously because of lack of coal and shortages and interruptions in electric power. In fact, in February this year, we were more than once on the verge of total closure in order to protect our plant from damage.

These serious obstructions to sustained production have not been our lot alone. Practically all industries in the country have suffered from them at a heavy cost to our hard-pressed economy. Already burdened with a runaway inflation, massive shortages, the oil crisis, and other grievous problems, the country could well have done without this added man-made affliction which has aggravated the severity of all the other factors. Man-made it clearly was, for, although none of all the basic inputs of industry are more vital to production than the availability of raw materials, fuel, electric power and transport, these are the very items the supply of which Government failed to ensure after twenty years of all-embracing planning and economic controls.

These were not the only industrial inputs from the dearth of which industry and the whole economy have suffered in the past year. Steel, cement, soda ash, amongst others, were all in short supply, due largely to the primary shortages in coal, power and rail transport. As was to be expected, these multiple shortages added further fuel to the fires of inflation already more than sufficiently fed by massive deficit financing and country-wide shortages in consumer goods.

To err is certainly human and one would not feel so critical about these failures were it not that the advice, pleas and warnings, offered and submitted year after year by leaders of business and industry regarding the consequences of Government's economic policies, were consistently ignored or rejected.

In India, partly for ideological reasons, partly for a lack of trust in the private sector and, perhaps, partly also for reasons of misplaced prestige, the views of industry have been, and are, consistently ignored or rejected whenever they differ from the official view, which means most of the time. The few formalised consultative forums like the Central Advisory Council of Industries and annual meetings of Chambers of Commerce are generally treated as futile occasions for making, or listening to, set speeches, while Chairmen's annual statements, although usually well reasoned and documented, are wholly ignored.

The High Price of Unrealism

We all realise that the task of promoting a rapid rate of economic growth, with social justice, is an immensely complex one with controversial overtones in which there is, therefore, much room for divergent views, particularly where ideological considerations are allowed to impinge unduly upon the subject as they do in India. We also know that there can be no simple solutions to difficult human problems. But, in their urge to nationalise or control all economic activity, Government and Parliament still fail to face certain obvious realities, including such simple ones as that there can be no real social justice in a country like ours without economic growth for, today there is only poverty to distribute; that industrial production cannot rise without an increased supply of raw materials, electric power and transport; that these cannot be ensured without adequate investment years in advance of needs; that a high level of production cannot be obtained solely by expending large sums of money on physical assets which, as so often happens in India, break down or operate at a fraction of their capacity unless backed by high standards of maintenance, managerial skills, training and experience and by a reasonable degree of discipline in industry. Most of these simple and obvious facts have been widely neglected in the past the consequences of which are at the very root of the present crisis.

Is there any doubt, for instance, that most of the infrastructural shortages which are crippling industrial production today are largely due to a dearth of investment in recent years on railway wagons and other essential needs, to poor maintenance and management, to labour disputes? Is it not true that, if instead of the 50 per cent average utilisation of thermal generating units achieved in India today they were operated at the level of 80 per cent to 85 achieved throughout the world, including, I am glad to say, by the Tata Thermal Plant at Trombay, much of the overall power shortage from which the country suffers today would disappear overnight?

A New Dawn?

Paraphrasing the well known adage, Night is supposed to be darkest before the Dawn. Two recent developments arouse hope that a new economic dawn may be breaking. The first one is Government's newly evinced determination that a minimum degree of peace and discipline be maintained in industry. While the workers' right to a fair deal, whether employed by Government or by the public or private sectors of industry, is undoubted and must be respected, their claims can no longer be judged in isolation from the claims of the far greater number of the country's under-privileged citizens, whose needs are even greater than theirs, nor in total disregard of available resources. In the dire straits in which our economy finds itself today, an irresponsible exercise of the immense economic powers trade unions have acquired since Independence, largely used for political ends, can no longer be allowed repeatedly to disrupt production and transport and hold the country to ransom. It may now be hoped that, following such determination to keep production going, the country has entered upon a new era of increased production and productivity.

The business and industrial community should, however, realise that any retraint imposed on or voluntarily accepted by labour in regard to wage demands and work interruptions places an even greater obligation on them to exercise similar restraint and discipline in regard to the pricing and distribution of their products, a restraint which today is too often conspicuous by its absence.

A Welcome Break from the Past

The other development, which directly concerns the steel industry, is Government's new approach to the pricing of steel. Every year, for the last 25 years or more, I have argued and pleaded that Government's price fixing policies should be such as to ensure, in the country's own interests, the continued health of this most basic of all manufacturing industries. Yet, year after year, Government have continued to fix steel prices at levels much below those earned by steel producers elsewhere in the world, thereby denying to the Indian industry the minimum financial means required to keep its plants in good condition, let alone to expand their capacity. Upto October 1973, Government allowed the industry, usually with a costly time lag, only increases in prices sufficient to compensate it, not always in full, for increases in costs beyond its control. The basic price structure, however, which compelled the main producers to sell their steels at prices far below those at which they could be imported, remained largely unchanged.

The argument sometimes advanced in the past that the Indian consumer was entitled to some return for the sacrifices he had made in paying higher prices during the period of protection from 1923 to 1939, was wholly specious, for it conveniently ignored the fact that the sum total of these sacrifices was less than Rs 11 crores spread over sixteen years, whereas the amount by which the industry in both sectors was made to subsidise the consumer in subsequent years, has come to the formidable total of over Rs 4,400 crores, of which no less than Rs 1,565 crores were contributed by our Company alone!

Apart from being grossly unfair to the industry, this policy was thoroughly unsound because, in the resulting scarcity of steel which prevailed most of the time in the country, the main beneficiaries of the low prices allowed to the producers were the blackmarketeers, while the industry, deprived of adequate resources, stagnated to the country's detriment.

With effect from 15th October 1973, Government have taken an important step towards a more rational and fair steel pricing policy. While retaining the old formula in respect of plates, structurals and Railway materials, they have increased the prices of certain categories of steel to levels which, while still substantially below foreign prices, allow the industry a badly needed accretion to the resources it can devote to replacement and modernisation. The results of this change in Government's policy are reflected in the accounts for the year.

Unfortunately the unchecked inflation which continued to stalk our economy has already eroded much of the increase granted in October; still the new policy provides at long last a welcome indication of a more realistic approach, at least in regard to steel, to the question of price controls, and I would like to take this opportunity to express to Government our gratitude for their courageous decision. I can only hope that this new approach represents a permanent change in Government's thinking and that it will be extended, in due course, to other industries, such as cement, which have suffered for years in the same way as we have from the unrealistic policies of the past.

One feature of the new price policy, which shareholders will perhaps have noted with concern, is the condition imposed by Government that the excess of the new prices over the retention prices is to be used exclusively towards financing schemes of modernisation and development, none of it, therefore, being available for any increase in dividends. I am sure, however, that they will appreciate that, by enabling the plant to be modernised and made more efficient, the new policy is in their own long-term interests as well as those of the country as a whole.

Expansion Project

As indicated in the Directors' Report, the Nippon Steel Company's Report for a large-scale expansion of steel capacity at Jamshedpur has been received. Their proposal, based on the technical aspects of the project, is for the construction of new capacity for producing three million tonnes of raw steel to be rolled into about 2½ million tonnes of flat products. Such an expansion would be 50 per cent larger than that originally contemplated, and would bring the total capacity at Jamshedpur to about 5 million tonnes of raw steel or 2½ times the present capacity.

Unfortunately, the cost of the project is a correspondingly formidable one, estimated at about Rs 1,800 crores, including the cost of development of our ore mines and collieries, power generating capacity, and a large raw material bedding and blending yard at Jamshedpur.

The estimate, so far as the plant itself is concerned, is based on Japanese costs which, oddly enough, are today higher than in the USA or Europe. In view, however, of the continuing world inflation, combined with the fact that such a large project would take some four years to complete, the cost is not likely to be substantially lower than the figure mentioned unless the scope of the scheme itself is curtailed.

In the face of such an astronomical financial requirement, shareholders may wonder what role their Company can play in the project. There is no answer to such a question at this stage. It is obvious, however, that the project is far too big for the Company to tackle alone and that Government and/or other institutional finance would have to bear the major part, if not the whole, of the burden.

Such a project cannot be considered in isolation, but must be viewed as part of the expansion of the Indian steel industry as a whole. That the industry must be expanded to meet growing demands is, of course, clear, but where, how and at what rate are complex problems which, ultimately, can only be resolved by Government in the context of the total economic development of the country and the constraints of available resources. An admittedly difficult problem of priorities arises here, for steel is only one of the many infrastructural needs in short supply today.

Infrastructural Needs

The fact must also be borne in mind that steel capacity cannot be expanded by itself. Along with it, must also be expanded sources of raw materials, electric power, rail transport, engineering products of all kinds, and, equally important, the human inputs required to engineer, build, manage, and efficiently operate them. As things are today most of these are in such short supply, that even the relatively low existing steel making capacity of the country cannot be fully utilised.

An indication of the magnitude of some of these requirements, especially significant in the light of the present situation, is that at least six tonnes of materials, including the finished steel itself, have to be moved in and out of a steel plant for every tonne of finished steel produced.

I sincerely hope, therefore, and would earnestly urge that, in considering the overall problem of expanding the country's steel capacity, Government will attach the full importance it deserves to the need for ensuring that the growth of all the required physical

and human inputs of steel making keeps pace with the expansion of the steel making capacity itself. Few industries, if any, are more capital intensive than steel making, and India just cannot afford to spend vast sums on projects and then find that they can only be operated at a fraction of capacity because of inadequate raw materials, power or rail transport.

To revert to the Jamshedpur project and to the Steel Company's possible role in it, all I can say at this stage is that we have offered to Government our full co-operation in the national interest, with due regard to the legitimate interests of the shareholders. It may be of some reassurance to them to know that by far the largest amongst our shareholders are the Government financial institutions, which have made large investments in the Company out of funds belonging to millions of small policy holders and investors whose interests, which coincide with those of the thousands of our own shareholders, they will presumably do their best to protect.

Our Modernisation Programme

The exciting prospect of participating in the engineering, construction and operation of a new and large steel plant at Jamshedpur is not being allowed to divert our and our Engineer's attention from the need to bring and maintain the present Works to the highest possible level of efficiency. We are therefore taking further steps to strengthen our engineering organisation, including its design capabilities, and to add to our ability to manufacture and fabricate scarce replacement items of plant and equipment, some of them of a sophisticated nature. It is not sufficiently realised in India how essential such activities are to the maintenance and development of any large factory or plant in a developing country lacking a strong design-cum-manufacturing infrastructure. The fact that it is sadly neglected in India explains much of the low plant utilisation and general stagnation prevailing in so many of our industries.

Because of the inadequacy in the past of internally generated funds to plough back into the rehabilitation and modernisation of our plant, some units of which are over fifty years old, there is now a vital need for us to undertake a large programme of renovation and improvement if the plant is to be able to operate at full capacity, when coal, power and rail transport become fully available again.

The new pricing policy of Government, to which I have referred earlier, and the resulting accretions to the modernisation and development fund make possible at long last a higher tempo of expenditure on renovation. Had we not been starved of funds all these years, the plant would be a more modern and efficient one today, and probably a larger one too, to the great benefit of the country.

We have, therefore, embarked upon a five year capital expenditure programme at an estimated cost of about Rs 180 crores, of which a substantial part will be spent on our coal mines in order to make ourselves self-sufficient in our requirements of high grade coking coal.

Self-Sufficiency in Coal

In view of the serious coal shortage which has recently developed and because of the much larger future requirements of the growing steel industry, it is now imperative that we should as soon as possible draw all our requirements from our own coal mines, the large scale development of which will be all the more necessary if and when the three million tonne expansion project materialises.

Such a mine development programme was not undertaken earlier, partly because of a lack of funds, but also largely, as stated in last year's Directors' Report, because of the inordinate delay, first, in getting Government's approval to our obtaining technical advice from France where coal seams and, therefore, mining conditions are similar to India's, and later in obtaining an industrial licence and the necessary import licences. This, incidentally, is another case of the industrial licensing system being, in my view, wrongly applied. I would urge Government to exempt from the obligation to secure industrial licences, projects for mining raw materials or manufacturing products required only for captive use and not for sale. It is a strange fact that in our country, in which there is such an obvious need for maximum production and rapid industrial growth, the licensing system is so often applied in a way which not only delays and slows down growth, but also seeks to punish those who produce too much rather than those who produce too little.

The years ahead will continue to be difficult ones for us, as I fear they will for the country as a whole, but the deep economic crisis in which we have been floundering, climaxed by a terrifying rate of inflation, seems to have aroused a new and refreshing sense of realism in Government quarters. Although still only a gentle breeze, the beginnings of the winds of change can be felt in the air and because of it I, for one, feel greater confidence in the future than before. One thing at least of which I am sure is that our Company will rise to any challenge and will, with efficiency and dedication, continue to play its role in the economic recovery and future progress of the country.

On the retirement of Mr R S Pande, appreciation of whose services has been recorded in the Director's Report, the burden of top management responsibility has fallen from the 9th April 1974 on the broad shoulders of Mr Russi Mody after 34 years of distinguished service with the Company. Able and energetic, Mr Mody has shown qualities of leadership, a consciousness of the importance of high morale at all levels and the need to pass on responsibility and initiative down the line, all of which, will I am sure, stand him in good stead in leading the organisation.

Since the last Annual General Meeting, the Board of Directors has taken on a new look with the appointment of three Institutional and three Executive Members. I am sure the shareholders will welcome this change which is in keeping with evolving circumstances and modern managerial trends.

As usual, I am happy to close my remarks with an appreciative reference to our management, staff and workers at Jamshedpur and elsewhere. Rarely in the whole of our long history have they had to function under such grievous handicaps and with so many obstacles to surmount as in the past year. They rose to the occasion magnificently and our unstinted thanks are due to them. The sense of pride in Tata Steel, the independence of spirit and judgment and the hard realism displayed year after year by our workers and staff have made Jamshedpur an oasis of industrial peace and discipline unique in our country torn by recurrent industrial strife. This, perhaps, is our greatest asset for which we and the whole country may indeed be thankful.

J R D Tata
Chairman

Bombay, 3rd July, 1974.

The Indian Hotels Company Limited

Statement of the Chairman, Mr J R D Tata

THE following is the Statement of Mr J R D Tata, Chairman, The Indian Hotels Company Limited, at the Seventy-third Annual General Meeting of the Company held on July 23, 1974.

Year's Results

The Accounts before you reflect the increased tempo of the Company's operations during the year under report as a result of the completion of its construction-cum-renovation programme.

The results would have been still better were it not for the prolonged disruption of Indian Airlines' operations during the year and the severe inflation which greatly increased our costs. In these circumstances, the Government of Maharashtra's imposition of a mandatory reduction of prices was difficult to understand and its withdrawal from 1st November was overdue.

Prospects

With hotel and restaurant tariffs still appreciably lower in India than in most other countries, and with the flow of foreign visitors to India a fraction of what it is in many countries much smaller than ours and offering much less to foreign tourists, it is clear the that the international hotel trade in India still has an enormous potential for profitable development despite such inhibitory factors as the oil crisis, increased air fares and severe inflation throughout the world which discourage international tourism.

Impediments to Progress

Our Company may, therefore, look forward to continued profitable and growing operations, provided strikes, "bandhs" and similar public demonstrations do not unduly restrain travel to and within our country. We in Bombay have had more than our fill of such exhibitions in recent months. While gratefully recognising the effective action taken by the Government of Maharashtra to protect the movement of tourists to and from this city, during the various "bandhs" one cannot help feeling that Government have treated these disruptive activities with undue complacency and seem to accept them as a normal way of life.

Assaults on Law and Order

I doubt that there is any country in the world where a single individual, or a small group of labour-cum-political leaders can, at his or their whim, hold a great city to ransom and compel its citizens to suspend their normal activities.

This state of affairs is a total negation of any Government's claim that the state or country it governs is a peaceful and stable one which should attract foreign tourists.

The citizens of a city or a country should certainly be allowed to express by peaceful means their resentment against their Government's failure to control prices, thus subjecting them to severe economic hardship, but the forced closure of Bombay's normal life four times in five months, deliberately planned and inflicted on a defenceless citizenry, goes far beyond the tolerable limits of such public expressions of protest.

Furthermore, in many instances, these assaults on law and order have taken the form of destroying or damaging public service vehicles and other assets which are used not by the affluent but by the poorer inhabitants of Bombay, thus aggravating the grievous hardships already endured by them. Is it not the primary duty of any government to protect its peaceful citizens from lawless interference with their legitimate activities?

The situation in Bombay and other parts of India is in striking contrast with that prevailing in the magnificently clean and orderly cities of Singapore and Kuala Lumpur which I have recently visited. There will, I fear, be little hope for our country to develop into one of the great and prosperous democracies of the world if Central and State Governments are unwilling to curb anti-democratic activities because of their fear of the adverse effect that firmness on their part might have on voters.

In their search for a better life for themselves and their children, the people of India want and are entitled to, good, clean and firm government. Continued failure to meet these criteria can only lead to despair, revolt and ultimate chaos. We are running out of time for the situation has aleady reached a point of no return.

Apart from the impact of mass demonstrations on the flow of tourism to India, the lack of cleanliness, discipline and the harassment of tourists by beggars, hawkers and others in the streets of Bombay and other major cities in India, are also a severe deterrent to foreign visitors who compare these conditions with those prevailing not only in their own country but also in other countries in Asia.

The Problem of "Zopadpattis"

The freedom allowed to a million or more people in Bombay illegally to occupy every open piece of ground, however small and unsuitable, to build hutments totally unfit for human habitation, and to live in them with their families in squalor and at the risk of causing serious epidemics, provides futher evidence of Government's unwillingness to take firm action to prevent unlawful activities despite the risk to citizens' health and safety.

The problem of providing alternative accommodation and even, when available, of inducing occupants of zopadpattis to vacate them, is admittedly a difficult one and I can well understand Government's reluctance to eject people already settled in them in view of the hardships it would inflict on them. Yet, some of these hutment colonies are under the control of criminal elements who extract tolls from their hapless inhabitants, while in many cases gainfully employed occupants who could afford to pay a modest rent for decent accommodation prefer to live free of rent even in the appalling conditions prevailing in these hutment colonies.

It is high time that a study in depth be made of the problem along with a detailed survey of zopadpatti inhabitants, their employment, income and needs on which a practical long-term plan can be devised. Any such plan will take many years but in the meantime it is within the power of Government and Municipal authorities and therefore their duty to stop the spread of this plague by preventing further encroachments and unauthorised construction of hutments as a first step towards an ultimate long-term solution to the problem.

Such action can be taken at small cost in effort, manpower and money, by the simple means of deploying a few mobile task forces, each consisting of one jeep with a police officer or constable and a municipal officer and one truck with two or three mazdoors. These flying squads would continuously patrol the city and remove to dumping grounds all materials collected on any unauthorised spot by encroachers before or at the very beginning of their assembly into a hutment. Such measures are common in most cities in Asia largely visited by tourists and even in our own country have been taken at Jamshedpur

for many years, peacefully and without causing hardship.

Expansion Plans

Our programme for the expansion of our activities outside Bombay is making good progress.

The Taj Coromandel in Madras, sponsored by us and under our management, began operations in April 1974. Although it is not as yet complete, most of its rooms and amenities are now open to occupation and it has already created an excellent name for itself. It is, in fact, the only first class hotel in Madras.

Construction of the Fort Aguada Beach Resort Hotel in Goa has also made excellent progress and the resort is expected to open by November in time for the exposition of the body of St Francis Xavier. It will offer beach resort facilities comparable to the best in the world.

Our expertise and reputation in the field of hotel and restaurant management is well-known both in India and abroad, and we are being approached from many quarters for rendering technical assistance or providing consultancy and management services for new hotels and restaurants.

In view of the heavy financial commitment we have made on our Bombay hotels and in investment in other hotels, the expansion of our activities in India as well as outside India must, for the time, lie principally in such consultative and managerial activities. We are, therefore, concentrating our efforts in this direction and have already made appreciable progress.

Apart from undertaking the management of the Madras and Goa hotels, we have been appointed consultants and advisers to the Covelong Beach Resort Hotel situated 15 miles south of Madras city. Our collaboration will, we believe, be benefical to both this hotel and to the Taj Coromandel at Madras. Negotiations have been started for hotels in Agra, Banaras, Bangalore and Delhi.

Udaipur and Jaipur Hotels

In regard to the two hotels under our management at Udaipur and Jaipur, while the operation of the latter has continued to be satisfactory, the Lake Place at Udaipur has continued to be dogged by misfortune. After the drought of 1972 which dried the lake for the first time within memory and necessited closure of the hotel for 4 months, floods coupled with the prolonged Indian Airlines' strike, which almost totally cut off its accessibility to tourists, severely affected its operations during the past financial year. I hope that this beautiful hotel, which with its magnificent setting in the middle of the Udaipur Lake is perhaps the most unusual and romantic hotel in the world, has exhausted for good its quota of bad luck and will from now be allowed to reward the heavy investment recently made by its owners in its expansion and renovation and fulfil its fine tourist potential. This potential, however, cannot be fully realised unless and until Udaipur airport is expanded so as to make it usable by jet transport aircraft, which is not the case today.

Personnel Development

The success of all our long-term programme of expansion in India and abroad will depend largely on the training and efficiency of the personnel at all levels that we deploy for our growing activities. Apart from the basic qualifications and training required by any form of service industry dealing directly with its customers, the hotel industry requires from its personnel special qualities, attitudes and skills, which must be specially sought and developed by effective means of recruitment, training and on-job experience. I am glad to say that our Management has, from the start of our expansion programme, been fully conscious of this need, and a process of man power organisational and succession planning has been established and actively pursued. The appraisal of all categories of staff has been formalised, and different types of training to develop personnel and plan their careers are in operation at the three levels of craftsmen, supervisors and managers. External and internal courses are in operation and a batch of management trainees specially recruited and inducted, is being trained to fill the growing managerial needs of the organisation.

Tourism Foreign Exchange and Hotels

I have referred earlier to the scope and the need for the development of the Indian hotel industry. I doubt that the true magnitude of the foreign exchange earnings potential of the Indian hotel industry is fully appreciated by the Government of India despite the fact that, according to Government's Department of Tourism the foreign exchange brought to the country by foreign visitors was about Rs 70 crores last year, and is expected to reach Rs 100 crores this year. When one realises that this valuable contribution to the solution of our balance of payments problem has been obtained from a mere 4,10,000 visitors, from overseas, whereas even small countries like Spain and Greece received about 35 million and 3 million visitors respectively, one can appreciate the extraordinary large potential of this source of foreign exchange.

While all the foreign exchange earned is obviously not that spent by foreign visitors in hotels, full availability of hotel accommodation is crucial to the growth of tourist traffic, along with sufficient air transport and first class rail capacity within the country. If both were fully available, I personally see no reason why our earnings in foreign exchange from visitors to India could not, within a few years, reach a thousand crores annually and become by far our largest single source of foreign exchange earning.

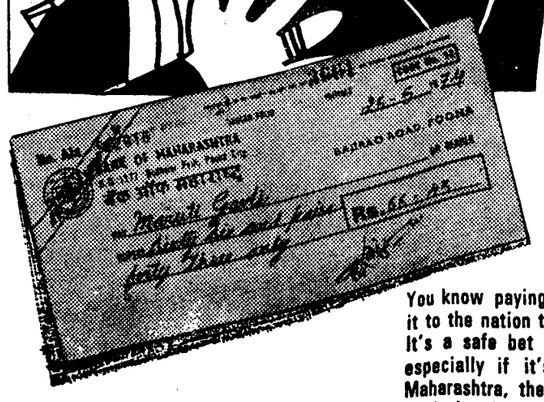
It is, therefore, imperative that the expansion of hotel capacity to international standards be treated as a first priority in our struggle for achieving a favourable balance of payments.

Government can themselves put up only a limited number of hotels and must therefore, rely on the private sector for a major part of the expansion of the industry. However, the cost of putting up new hotels, because of rocketing prices of the building materials, air-conditioning, lifts and other equipment required for hotels, has risen to such an extent that, in combination with heavy taxation in various forms, the hotel industry is today hardly in a position to offer a return sufficient to attract the investment of funds required.

One must gratefully recognise that Government has, in the past, been helpful to the industry, particularly in providing funds through the Hotel Development Fund and through loans from their financial institutions, but much more is needed today to promote quick and adequate development of hotel accommodation in various parts of the country. I must once again urge, as I did last year, that Government should review their present policies and provide much greater fiscal and monetary facilities and amenities to attract investment to this vital industry.

Conclusion

In closing, I am happy to refer to the excellent relations we continue to have with all members of our Company's staff. In no other business, except perhaps airlines, is success and growth so dependent on individual effort and personal service obtainable only from a highly trained conscientious and enthusiastic staff, often working under great stress and emergency conditions such as have unfortunately become endemic these days in our country. I am sure I shall reflect the feelings of the shareholders in recording here our warm appreciation of the initiative, drive and hard work of the Company's officers and staff under the dynamic leadership of Mr Kerkar, our Managing Director, for it is primarily to them that we owe the growth of our Company's activities and profitability.



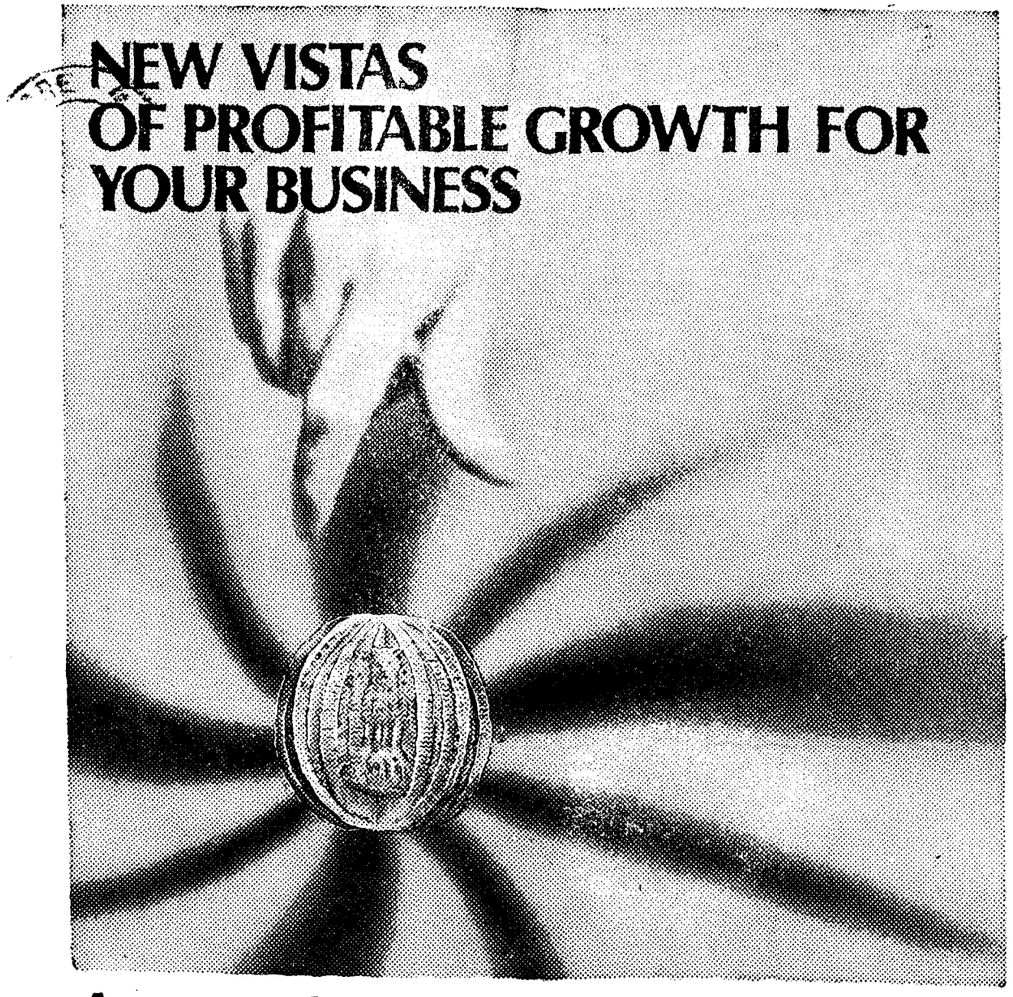
J R D Tata
Chairman

Bombay, 21st June, 1974.

YOU OWE IT TO THEM

Not just the amount they bill, but also an awareness of the advantage of transactions through a bank-cheque.

A cheque is so safe, so easy to handle, so convenient to cash or carry.



You have experienced it all. Let your trades people and hired hands share your experience to be richer and wiser.

You know paying by cheque is a good habit. You owe it to the nation to teach it to all around you.
It's a safe bet they will accept payment by cheque especially if it's drawn on your bank - Bank of Maharashtra, the Bank known to all people and the Bank that knows and serves the people.

Bank OF Maharashtra

The Final Option

THE government's attempts to cope with the inflation have not only been ineffective but are also becoming increasingly ludicrous. The supplementary budget, presented this week, had been advertised as a major item in the package of anti-inflationary measures and accordingly the Finance Minister's speech introducing it in Parliament was full of bombast. It described the presentation of a second Finance Bill only five months after the Budget proper as "an event of unusual significance" which "derives its justification from the fact that we are faced with a difficult economic situation". The decision to come forward with a second Finance Bill was, the Finance Minister further claimed, "not only an indication of the seriousness of the economic situation, but also a measure of the government's determination to grapple with it effectively". All this is so much laughable nonsense. It was pointed out in these columns last week that the supplementary budget had been forced upon the government by the fact of its having lost all control over the volume and pattern of its expenditure. This is not an altogether new development. Last year, for instance, the revised estimates of the government's non-Plan expenditure had turned out to be nearly Rs 1,000 crores higher than the Budget estimates. A continuation — perhaps acceleration — of these tendencies has now compelled the government to raise additional revenues. Hence, quite simply, the supplementary budget.

However, even in narrow, revenue-raising terms, the proposals presented to Parliament last week are a damp squib. Their combined yield during the current financial year will be a paltry Rs 123 crores. Compared to the emerging gap between the government's expenditure and its revenues, this is a drop in the bucket. The Finance Minister himself confessed that "the potential deficit can by no means be covered by fresh taxation only", though he baulked at disclosing to Parliament the true state of the government's finances. Thus all that he would say was that the burden of food subsidy would be "much higher" than the provision of Rs 100 crores made in the Budget; that the deficit in the railway budget would "increase substantially" beyond the original provision of Rs 52 crores; that the budgetary provision for additional dearness allowance would have to be "substantially increased"; and that there would be "some increase" in the expenditure on defence. This coyness was altogether unnecessary, for it is known that the two committees of senior officials which reviewed the trends in government finances have estimated the net deterioration in the financial position of the government compared to the estimates of the February Budget to be of the order of Rs 600-700 crores. The incidental nature of the Rs 123 crores of additional taxation proposed in the supplementary budget has to be seen in this context. Inevitably, therefore, there will follow further cuts in the government's developmental expenditure and a further tilting of the balance in government expenditure in favour of non-developmental expenditure. This is indeed some way to curb inflation!

Equally noteworthy is the manner in which the additional tax revenue is sought to be raised. Except for the tax on the interest income of banks, the entire amount is to be raised through indirect taxation. Such exclusive reliance on commodity taxation in a budget supposedly intended to make an impact on inflation is indeed fiscal unorthodoxy with a vengeance. For a government which has recently shown so much concern for demand management and curbing purchasing power in the economy, the decision not to touch personal incomes and wealth can be explained only in terms of political cowardice. And that being the case, the Finance Minister's exhortation that state governments should tax agriculture rings hollow. Worse still, though the Finance Minister has made appropriate noises about discouraging "conspicuous consumption", the major burden of his indirect tax proposals falls not on items of "conspicuous consumption" — among which there were many obvious candidates for taxation — but on intermediate goods like iron and steel, cement, copper and zinc. Given the acute scarcity of these items and the government's total lack of influence over their market prices, the impact of the imposts on them is likely to be felt on the prices of a wide range of end products — and *not*, as the Finance Minister fondly hopes, on the "windfall gains" of manufacturers and traders.

The Finance Minister has pleaded that the options open to the government are "narrow". Since the government has failed to do anything about deliberate withholding of supplies and speculative stock-building, by farmers as much as by trade and industry, it does seem that it has come to the dead-end in its policies. The impact on prices, if any, of the measures it has taken so far is likely to be more than offset by the worsening situation with regard to

the physical availability of major agricultural and industrial products.

The output of kharif foodgrains in 1973-74 had shown a rise of 10 mn tonnes. It was the kharif output which had been responsible for the increase in foodgrains production from about 95 mn tonnes in 1972-73 to 106-108 mn tonnes in 1973-74. Considering the behaviour of the monsoon so far, it is unlikely that the kharif output this year will reach last year's level of 67 mn tonnes. Indeed, we should be lucky if it is around 60 mn tonnes (against 57 mn tonnes in 1972-73). Likewise, production of cotton (at 66 lakh bales), jute (65 lakh bales), oilseeds (94 lakh tonnes) and sugarcane (12.6 mn tonnes) had been reasonably satisfactory in 1973-74. Almost all these crops are concentrated in the kharif season and — with the unsatisfactory weather conditions, the poor supplies of fertilisers and the continuing power shortage — their production is bound to be adversely affected this year. The outlook for industry is hardly better. The index of industrial production showed total stagnation in 1973 on account of the decline in the output of the basic and consumer industry groups — among them, particularly, chemical and agriculture based industries — as well as in electricity generated. The decline ranged from 1 per cent to 10 per cent among the major industrial groups. This trend in industrial output appears to have been accentuated in 1974. Some key industries such as mill-made cotton cloth and cotton yarn (during January-March 1974) and jute (January-June 1974) have shown declines of 14 per cent, 11 per cent and 31 per cent, respectively. Similarly, production of vanaspati has declined by 6 per cent and that of cement by 7 per cent during January-March 1974. There are also no signs of any improvement in steel, coal, power and transport.

Given these trends in physical output and the fatuity of the monetary and fiscal measures it has taken so far, the government's options appear to be narrowing to just one: suppression by force of all protest against the mass suffering caused by the inflation. This, one may be sure, is the option which the government will exercise more and more in the months to come.

Police

Deadly 'Interrogation'

A SUPPOSEDLY basic tenet of the legal system that we pride ourselves on in this country is that an accused cannot be made to give evidence against himself. Following from this, confessions made by accused persons are not admissible as evidence in courts of law. That is the law; the practice is, of course, very different. It is well known that virtually every single police investigation proceeds on the basis of information extracted from suspects in the course of so-called 'interrogation'. That the 'interrogation' really consists of the use of physical torture in varying degrees is equally well known. The police are helped in this by the practice of the courts of remanding suspects to police custody for long periods as a matter of routine and refusing bail even where the alleged offences are relatively trivial and bailable. Of course, in a large number of cases, the suspects are too poor and too ignorant to engage lawyers and to assert their legal rights. This very greatly simplifies matters for the police.

The beating up of suspects in police stations is thus a routine matter and normally attracts no attention, much less any protest. Once in a while, things do get a bit out of hand. The torture is particularly severe or the suspect is rather less hardy and he dies of injuries sustained during the police 'interrogation'. By the letter and spirit of the law this is murder. Yet police functionaries know that they can belabour suspects without any fear of the consequences; they have to fear only if they *do not* manage to extract enough information.

Sometimes when a person dies as a result of police torture, the event merits a cautious, often garbled, report in the newspapers. That way the last one week has been rather unusual; during this period Bombay papers have reported the cases of four persons, all of whom died in circumstances which give rise to reasonable suspicion that their deaths might have been the result of the treatment meted out to them while in police custody. Of the four, three died while in police custody and one within two days of being released from such custody. Excerpts from the relevant newspaper reports (all from *Free Press Journal*) are reproduced below :

"Allegations were made by a bereaved mother in the Court of City Coroner H J Chinoy that her college-going son had died of injuries sustained by him when he was 'severely beaten up' in the police lock-up . . .

"Dharampal Madanlal Kud, 20, a student of the Chetna College of Commerce, was arrested on June 26 by the Azad Maidan Police on suspicion of being involved in theft of a car belonging to a police officer. On June 28, the case was taken over by the Detection of Crime Branch, Bombay CID.

"Dharampal was released on bail on July 16 and admitted to the KEM Hospital on July 18 where he died within five hours of admission. The hospital authorities treated the case as one of natural death and performed a post-mortem without informing the Coroner. The cause of death was given as: 'acute yellow atrophy of the liver with epatic filla'.

"Mrs Kamla Madanlal Kud, mother of the deceased, in her application to the City Coroner, said that her son had been 'badly beaten up in the police lock-up and was vomitting blood and complained of acute pain in his body on account of severe beating'."

*

"A pavement-dweller, mistaken for a thief and allegedly beaten up by members of the public, died in the city hospital on Wednesday morning of ruptured intestines.

"Shriram Ramchandra Brahmane, 35, who had no particular occupation and lived on a pavement of Kumbharwada, was walking along the road at 12-30 a m on Tuesday when two constables attached to VP Police station became suspicious of his movements and challenged him.

"When Shriram started running, the cops shouted 'chor, chor' which was a signal for members of public to join in the chase and catch him and beat him up before handing him over to the police. He was searched and nothing incriminating was found on his person.

"After first aid at J J Hospital, he was hauled to the police lock-up and 'interrogated' which also did not reveal anything incriminatory. On Tuesday evening, he complained of stomach-ache and he was admitted to the J J Hospital where he died on Wednesday morning."

*

"Era Somalu Gurayya, 25, was arrested by Vile Parle Police on Tuesday last from the Sahar bus stop, as he was suspected of being involved in some crime.

"On Friday night, he was brought out of the lock-up and taken to the detention room for interrogation. As he was being questioned, he asked for a glass of water, saying that he was feeling unwell. The very next day he complained of pain in his chest and was sent in the police jeep to the Cooper Hospital where he died before admission."

*

"A person who was arrested by the Dadar Railway Police died in somewhat mysterious circumstances before admission to KEM Hospital.

"Bhagwan Motandas Sindhi (40) was arrested by the police on July 6. Since then he was in the lock-up at the Dadar railway police. On Saturday he complained of pain in the stomach and was taken to hospital but was declared dead before admission.

"Since the death had taken place in the jurisdiction of Bhoiwada police station a report was made to them. An officer of the police station went to the hospital and took charge of the body. When the body was examined the officer found 14 old injuries. Both the feet of the deceased appeared white and the skin on the surface had gone."

Scheduled Castes

No Social Way to Justice

Our Maharashtra Correspondent writes :

SONAGE is a village in Kagal taluka in Kolhapur district. Situated on the state highway between Nipani and Radhanagari, it is just 30 miles from Kolhapur city. Sonage has a population of over 2,000, of whom 300 are scheduled caste Mahar converts to Buddhism. Till early July the caste Hindus and the scheduled castes of Sonage had not clashed openly. In fact, officials could boast that a scheduled caste youth, Sitaram Kamble, who is a post-graduate student, was chairman of the village milk society. Sitaram Kamble and Prakash Kamble, another graduate, are acknowledged leaders of Sonage's neo-Buddhist community. As always, the neo-Buddhists live in the 'Buddhawada' — traditionally known as the 'Maharwada', which is invariably located on the outskirts of the village. What happened in 'Buddhawada' one late evening in the first week of July reflects how little the Ambedkar-led mass conversion of Mahars to Buddhism has altered the scheduled castes' low status in Hindu society.

Late that evening, four caste Hindus entered the scheduled caste locality. One of them, Londhe, has some notoriety in the village. The Mahars claim that the four men were quite drunk as they approached one house and knocked on its door. Evidently fearing molestation of their womenfolk, the inmates of the house resisted and barred its doors. As the four, led by Londhe, continued to misbehave and abused the womenfolk of the family, the Mahars led by Sitaram Kamble and Prakash Kamble first urged the four men to leave and then, as their pleas went unheeded, tied the riotous foursome to nearby trees. They then decided to call the police from Murgud, some four miles away, where the police chowki is located.

Meanwhile, news of the incident had spread to the rest of the village. The caste Hindus, angered at the 'temerity' of the scheduled caste in tying caste Hindus to trees, gathered around the Buddhawada in large numbers and attacked the residents. Mahar families were dragged out and severely beaten, houses were attacked with stones, and doors were even broken open to get at the hiding women and children.

The caste Hindus later justified their actions on the ground that, if they did not react sternly, the Mahars "would sit on our heads one day". Clearly, the emergence of a few educated men among the upper stratum of the scheduled castes — *viz*, the Mahars — instead of leading to their further acceptance among the caste Hindus, can lead to greater resentment towards the new aspirations of the scheduled castes in the village.

It was Sitaram Kamble finally who lodged a complaint about the incident with the police when they appeared on the scene. He reported that he had lost Rs 600 from his house as well as his wrist watch. Sitaram Kamble complained against 93 caste Hindus. The police arrested 27 persons and filed cases against them.

The incident, and the arrest of the 27, has brought into the open the latent tension in Sonage between the scheduled castes and the caste Hindus. The Collector of Kolhapur district a scheduled caste himself, arrived on the scene and took prompt action against Londhe and other caste Hindus. The caste Hindus have retaliated by removing Sitaram Kamble from chairmanship of the milk society; his term was to end in September. Further, they have decided to use the usual economic sanctions against the scheduled castes. Thus caste Hindu grocers, carpenters, barbers and others have refused to deal with the scheduled castes of the village. The Collector has not much to offer against such social and economic boycott. Since the fair-price grain shop, run by the caste Hindus, was closed to the Mahars, he did however sanction a separate fair-price shop for the Buddhawada; the shop has started to function. The Collector has also got transferred Raghunath Shintre, chairman of the primary co-operative society who is also the primary school teacher and known to be a caste Hindu leader, to a distant village.

The legislator from the constituency to which Sonage belongs is a 'rebel' Congressman, Sadashiv Mandalik. Mandalik went to the village and held two separate meetings, one with the caste Hindus and the other with the Mahars. His intervention has proved totally ineffective. The caste Hindus demand that the cases against the 27 persons be withdrawn; only this, they say, will help reduce 'tension' in the village. Kamble and the neo-Buddhists, on the other hand, say that the hatred of the caste Hindus against them cannot be overcome so simply; fear of attack by caste Hindus and apprehension of the economic consequences persist among them — though police have been posted in the village.

Development Assistance

Unshared Prosperity

IN both 1972 and 1973 the industrially developed countries enjoyed the highest growth rates they have seen in the entire post-War period. Yet they did not show any inclination to share even a small part of their prosperity with the less fortunately placed developing countries. Total official development assistance increased by 9 per cent from $ 8.7 billion in 1972 to $ 9.4 billion in 1973, but in real terms there was actually a decline of 6 per cent, if account is taken of the 15 per cent depreciation of the value of aid due to exchange rate changes and increased domestic prices in the aid-giving countries. The United Nations, it may be recalled, had called on the developed countries through a special resolution at the beginning of the present decade to step up their development assistance to at least 0.7 per cent of their GNP. In fact, however, development assistance as a percentage of the GNP of members of the Development Assistance Committee (DAC) of the Organisation for Economic Co-operation and Development (OECD) fell steeply from 0.34 in 1972 to 0.30 in 1973, or almost by 12 per cent. What is more disquieting is that this figure has declined continually since 1965 when it was 0.44.

The so-called grant element in total development assistance had, after fluctuating between 64 per cent and 68 per cent from 1965 to 1971, risen to 72 per cent in 1972; but in 1973 it again dipped to 71 per cent. Incidentally, the concept of grant as defined by the DAC of the OECD — and unques-

Special Number 1974

The Special Number of *Economic and Political Weekly* will be published in the third week of August. It will be priced Rs 10 per copy, but will be supplied free to subscribers.

In view of the Special Number there will be no weekly issues on August 10, 17 and 24.

tioningly accepted by even such regional development financing bodies as the Asian Development Bank — is rather misleading. The concept takes into account the maturity, the grace period and the interest on the loans. The grant element is deemed to be equal to the difference between the face value and the discounted present value of the stream of repayments, including interest, to which the loan will give rise, expressed as a percentage of the face value. The rate of discount of 10 per cent used for such calculations by the DAC is definitely on the high side if it is supposed to reflect the cost of funds for the aid-giving governments. Since the aid-giving governments disburse the funds primarily out of their budgetary resources, the opportunity cost of these funds would be the rate of growth of national output, since had they not been used as development aid the funds could have generated almost the same growth of output at the margin as the rate of growth of national output. During the 10-year period upto 1971 the average annual growth of output in the developed countries as a whole was about 5 per cent and it was only during 1972 and 1973 that it went up to 6 per cent. Thus looking at the long-term trend of 5 per cent growth, it could be said that a discount rate of 5 per cent instead of the 10 per cent used by the DAC would be more appropriate for computing the grant element of development assistance. With a 5 per cent discount rate the grant element of development assistance would come to less than one-half of the 71 per cent computed by the DAC.

The grant element would totally disappear if one took into account the tied aspect of development assistance. It has been noted that the real worth of tied loans is at least 30-35 per cent lower than their face value due to the higher prices that the aid recipients have to pay for their tied imports. If the figures of development assistance are accordingly scaled down to reflect the real worth of the assistance and if a discount rate of 5 per cent is used, the grant element would be quite close to zero!

Harekrishna Konar

Literacy, Idealism and Combative Activism

A Correspondent writes:

THE Indian Left has been having a lean time in recent years. There are quite a number of objective factors to explain this phase of vacuity. One particular reason must be an absence of both clarity and depth in thinking through the issues currently confronting the working class movement in the country. The capital stock built in the 1930s is by now nearly exhausted, and, as one looks around, one increasingly becomes aware of the lack of men who can combine intellectual capability with experience of combative activism.

Harekrishna Konar was a rare exception, which is why his death, at a relatively early age, is such a grievous loss to the Left. In his early life, Konar had passed through the circuit of terrorism and a stint in the Andamans, which was then the standard form of initiation into the fire of Bengali radical politics. There was thus a danger of his sliding into romantic nihilism. His agrarian roots however stood him in good stead. From the late 1930s till his last days, he stuck to the cause of the lower echelons of the peasantry. Unlike many of his associates, when he spoke on the peasant question, he spoke with a certain flair for analytical rigour and a considerable feel for the historical setting. For three decades or more, he moved continuously amongst the peasantry, studied the impact of tenurial arrangements on the modalities of cultivation, observed the nuances of antagonistic as well as non-antagonistic contradictions amongst the landless labour, the small peasant and the middle peasant. It was altogether a rich fare of experience, which was placed at the disposal of the party he preferred and helped to build up.

Perhaps it is this experience which also endowed him with a deep insight into the mutual relationship between the political and the economic aspects of the struggle for land reform. He was perceptive enough to realise the bread-and-butter underpinning of a viable political coalition between the various strata of the lower and middle peasantry. These underpinnings were not always such as would optimise, in the short run, the economic interests of the down-and-out peasant cultivator. But Konar had no illusions: a broadbased political movement, howsoever circumscribed in terms of immediate objectives, was necessary to put the heat on a hostile administration. A movement of this kind, in case it succeeded in neutralising the class-biased bureaucracy and judiciary, would, he argued, more than justify itself, and the long-run pay-off could thus telescope a long series of dialectical steps.

Konar's tenure as Land Revenue Minister in the two brief spells of the United Front government in West Bengal was a remarkable milestone in the annals of the peasant movement in the country. He of course utilised his official position to impart a certain thrust to the legislative and administrative processes; what was immensely more impressive was his purposive use of the political arm of the movement to apply pressure upon these processes. His open avowal of controlled land seizure by the deprived peasantry, under the supervision of political cadres, has been condemned out of hand by the votaries of the *status quo*. For all one knows, that specific strategy, if allowed a wider opportunity to being put to practice, might yet be the only sensible alternative which could keep this country away from a bloody revolution.

Such is the stuff constituting the ironies of history. The pretensions of the Indian National Congress are fairly well exposed; its record of achievement with land reforms and in related matters is negligible, if not negative. Perhaps a certain atrophy of class biases has already set in within the party, and, regulation phrase-mongering notwithstanding, it is a prisoner of the forces which have captured its ideology. A recipe of survival might not therefore interest it any more. In case it did, it should have then considered itself fortunate to be able to offer a helping hand to individuals like Konar and actively support the programmes and policies the latter stood for. Instead, he was given the label of an ogre and systematically hounded out of his precincts.

In a different climate, men like Harekrishna Konar would have been acclaimed as nation-builders. Because of the exigency of circumstances, he remained perpetually on the periphery, a suspect in the eyes of as much the revolutionary romantics as the conventionally wise. It was a great wastage of talent, for rarely has one come across such a combination of literacy, idealism and pragmatic instinct.

Portugal

Popu'ism through the Military

IN the three months since the coup of April 25 in Portugal, the junior officers who had planned and executed it have, with studied deliberation, moved towards taking all the important decisions. The Armed Forces Movement which consists of about 200 junior officers now not only holds sway over the cabinet but also over the junta headed by General Spinola. The junta, composed mostly of generals and other high-ranking officers, had to bow to the pressures of the Armed Forces Movement and appoint its nominee, Colonel Vasco Gonsalves, as the new prime minister on July 13, replacing Palma Carlos, a conservative lawyer.

Of the 16 ministers appointed by Gonsalves to his cabinet, five are colonels and majors and one a captain, the rest being civilians. Such key ministries as labour, information, and interior are held by these officers, though the two Socialist politicians, Soares and Santos, retain their respective posts of foreign affairs and overseas territories. Alvaro Cunhal, the Communist leader, remains a minister without portfolio but his party colleague, Avelino Gonsalves, who was the Labour Minister in the last cabinet, has lost his job to a young officer. It is notable that despite Spinola's best efforts the new cabinet has a much more Left-wing complexion than the last one. The statements of the Armed Forces Movement, however, indicate that while the junior officers will take some radical measures they will not allow the Communist Party, which is the best organised party in Portugal, to have more than a marginal influence on policy decisions.

Among the radical measures announced recently is the decision to grant independence to the overseas territories. This is a clear departure from Spinola's earlier idea of granting some degree of self-rule within the framework of continued Portuguese sovereignty. Spinola agreed to this departure only under duress and it is possible that he may resign if he is asked to put his signature to some more unpalatable decisions. The decision to withdraw from Africa is a pragmatic one as the junior officers, most of whom have taken part in the counter-insurgency warfare in Africa, realise that the army must be withdrawn before it mutinies. Already, army units in Guinea-Bissau have begun to fraternise with the guerillas of the PAIGC and in Mozambique entire battalions have refused to budge from their barracks and go into the field against FRELIMO's soldiers. In Angola, the army is not so dispirited largely because of the lack of cohesion among the three guerilla groups — FLNA, MPLA and UNITA. But in Angola too, the new prime minister sees no alternative to handing over power to the Africans though it will be a much longer process than in Guinea-Bissau or Mozambique, especially as Angola has a sizeable population of whites, numbering 500,000, many of whom are poor and have nothing to go back to in Portugal. It is partly to keep these whites in control that the Governor-General of Angola, General Marques, who was sympathetic to them, was last week replaced by a group of liberal officers.

Within Portugal, the unwieldy Armed Forces Movement is likely to undergo a process of pruning with those elements who feel that the military should hand over complete power to the civilians being pushed into the background. This means that the cabinet will be reshuffled once again in the next few months to include some more junior officers. As this happens, the uninhibited freedoms the Portuguese have been enjoying for the last three months are bound to be curtailed. There have already been some moves against strident newspapers and threats of government action against labour strikes.

To maintain their radical stance the officers will probably turn towards the familiar gimmicks of symbolic socialism — nationalisation of some banks and companies, legislation of some social welfare measures, rhetoric against American interference and renegotiation of the agreement by which US military bases were set up in the Azores group of islands. There will also be moves towards closer ties with the EEC. The general pattern likely to be followed in Portugal will be that of the regime of General Velasco Alvarado in Peru. Such a pattern is at least useful in preventing the emergence of brutal regimes like those of the Greek colonels or the Chilean generals.

LETTER TO EDITOR

Cooked Up?

IT would have been only fair if before questioning the veracity of vanaspati production figures of June ("Vanaspati: Cooked Up", July 6) an attempt was made to ascertain how these figures are collected. Every vanaspati factory having capacity of more than 50 tonnes a day has to send a telegram to government every day of production on the previous day. Every week every factory has to submit a return of production, despatches and different oils consumed, to government. This Association also collects copies of these returns. It is, therefore, possible to estimate production figures fairly accurately within few days of the close of the month. Production in June declined sharply because government had withdrawn the use of imported oil from June 1 but revised prices only on June 15. Therefore, in the first half of the month the industry was expected to use indigenous oils costing about Rs 8,500 and sell vanaspati at about Rs 7,500, giving oil cost of Rs 6,300. Consequently, production declined sharply to about 3,900 tonnes in the first half of the month with most factories closed. After price increase based on 3-monthly average of the oil cost of the industry, factories did resume production to use up their stocks of oils because the loss was sharply reduced as stated by you. The production in the second half of the month was about 13,000 tonnes.

There is hardly any need for the manufacturer to conceal part of his output because there is control only on the price and not on the production or distribution of vanaspati. With exhaustion of oil stocks, output in July is again declining. Low level of output is also a clear indication of the fact that most producers cannot realise economic prices through circumvention of government regulation in the manner suggested in the note.

Calcutta Diary

A M

ANYTHING goes. At party conventions and in debates in Lok Sabha, even the Cabinet minister with the most impeccable record of corruption can pontificate on the evils of corruption and on how blackmarketeers ought to be socially segregated. *Blase* is the word; there is not even a hint of a derisive laughter from any quarters. Three or four years ago, the minister might have felt somewhat uncomfortable in making such speeches. No longer. There has been a levelling up—or is it levelling down?—since. For those who want to attack corrupt practices, the phase of aiming with a rifle is over; given the nature of circumstances, it is now the season for spraying with a shot gun, for there are few hands left that are clean. And, besides, after Richard Milhous Nixon, our tribe of politicians could claim to be pictures of moderation.

Be reasonable, the kind of parliamentary arrangement we are trying to run, it will be said, makes this slide into degeneracy inevitable. Freedom of speech and organisation makes it relatively easy to foment sectarian emotions, which have to be countered if the nation is to survive, and, what is more basic, if the party in power is to survive. One has therefore to organise one's defence. In the short run, there is no substitute for money to take care of this matter. It is a parliamentary process featured by adult suffrage, which means that, by hook or crook, the inert rural masses must be mobilised on your side. Unless the work is farmed out to intermediaries and agents — such as the *kulaks*—, it may be very difficult to accomplish the goal. You therefore reach an understanding with these species. There is widespread urban discontent. Provided things remain as they are, the people in towns and cities will do their utmost to hound out the party in power. For sheer survival, you therefore go for publicity binges, strong-arm methods, stealing of ballots, and so on. Each of these costs money. You have to gather the money. You can gather the money only against favours rendered or promised to be rendered. If you constitute the government, and occupy key slots in it, you cannot therefore afford not to be corrupt. You *have* to collect money, and you collect it. Whether the entire funds that you raise go to the party's coffers or a part is held back for bettering the lot of the immediate kinsmen then becomes a matter of detail. After all, in ancient Hindu kingdoms, when the services of a courtesan were quietly commissioned for enabling the consort of an impotent royalty to produce a heir, the courtesan did also derive a certain private pleasure from out of the arrangement. Till now, no molecular engineering has been heard of which could prevent the germination of joint supply of this kind.

Certain other consequences inevitably follow. Politics are reduced to the ritual of survival from this election to the next one. Ideology has little to do with survival, the garnering of money has. All branches of moral philosophy are accordingly subjected to one merit test, namely, whether one can get any change out of it. Josef Stalin enquired how many divisions the Pope commanded; in the India of today, the parallel question is how many crores of rupees is this or that preacher of ethical conduct in a position to deliver to the party coffers. A new morality is thus being evolved. And once this one digs roots, conventional notions concerning integrity — or the lack of it — are pushed to the background. Hard-boiled economic analysis takes over. A corrupt individual is no longer *per se* an undesirable individual; for judging him, you must first apply the cost-benefit criteria. The one who steals a crore for himself may be also the one who delivers twenty-five to thirty crores to the party in a single season: the person, it may be decided, instead of being sent to Coventry, deserves a seat in the Cabinet, or, if he is already there, a portfolio more to his liking.

No confidence debates in Parliament are thus robbed of their context. The opposition presents a lurid list of how much money has been taken from whom by which minister for rendering what particular favour. Naturally, it is an interminable list. As the list is read out, the air turns unsavoury; members feel listless, even impatient. One detail is as purposeless as another; why wear out your colleagues? The details are not important, the underlying hypothesis is. You are in a position to confront the hypothesis only when, at the level of grassroots, you have succeeded in joining the battle. In case the masses, in a magnificent, immense avalanche of revulsion, rise in unison to protest against the persistent debauching of parliamentary democracy, the hypothesis would be in danger of crumbling, and the punctilious cataloguing of the crimes perpetrated by the ruling politicians would then assume a sparkling relevance. As one looks around, any such possibility appears to be altogether remote and grotesque. Such being the prospect, alligator, see you later.

The unfolding events nonetheless connote a tragedy. Parliamentary democracy is a murky process; it turns murkier when a nation's heritage happens to be tainted with traces of authoritarianism. For then it becomes an issue of my-technique-of-flipping-the-coin-is-always-superior-to-yours. Even worse, since each act of corruption is a purposive act of deviation from the economic optimum, the country's material progress is placed in hock. Propitiating those who control the purse strings becomes the first principle of economic policy; the instruments in the hands of the State are deployed not for maximising the rate of capital formation, nor for ensuring price stability, nor for improving the level of managerial or any other efficiency, but simply, to further the short-term interests of the money-givers.

There is no reason to feel excessively scandalised that a democratic system gets transformed into such a narrow and bigoted spoils-sharing arrangement. This happened, and is happening, all over the world, and at all levels, beginning with the city administration. This is what Tammany Hall was about, this is what has been happening with Mayor Richard Daley's Cook country *apparitchik*, this is how the Liberal Democratic Party is exploiting its mandate in Japan, this is also how the Whigs and the Tories, in the not-so-distant nineteenth century, shared the hegemony, *via* the Enclosure legislation and all that, in Great Britain featured by the mighty Industrial Revolution. There is however just one difference — a crucial, vital one — between what happened and is happening in other lands and what is currently benumbing India. If you take away something from the full, the full nonetheless stays full, so said the sages. They knew what they were talking about. A stable society, which has already licked the problem of economic growth, can afford an occasional Teapot Dome; one dares say it can even, from time to time, afford to bear the cross of a Watergate. The outrages that are perpetrated, and the resulting diversions of public revenues, do not reach the proportions

where the nation's central urges and goals are shunted off — irretrievably, or at least indefinitely — on to wrong rails. In eighteenth and nineteenth century Great Britain, similarly, corruption only rarely rose above the level of the South Sea Bubbles or the genteel pinching of somebody's mistress or pocket borough; besides, the working class movement was still nascent, and the ruthless exploitation of the toiling masses provided ample wherewithal for satisfying the private avarice of the lords, squires and the *nouveau riche* capitalist class; accumulation for economic growth therefore continued without interruption.

This is where the Indian ship has run aground. It is a rather sombre case of only rock, and no water. Political amorality has outpaced the compulsions of economic progress. Survival necessarily has to take precedence over growth, and it has taken precedence. Further, the concept of survival has been interpreted as the survival of a few. These few have concluded that they can manage to live only by ditching airy-fairy ideology and popularising a gross, coarse arrangement, where you pays your money and takes your pleasure, cash down, and by the hour. The vast majority, who remain outside this arrangement, have of course the choice not to abide by it any time they feel like it. But they have not been much seen of late. Therefore, *kismet* being *kismet*, one cannot escape the fate of listening to the Union cabinet minister with the most impeccable record of corruption pontificating on the acute necessity of blackmarketeers not being invited to tea and crumpets.

The trouble with so much of Indian political activity is that it lives entirely on the patronage and sponsorship of political parties which by their nature are only interested in the seizure of power for a class or an alliance of classes. We lack the institutions and formations for limited but vital and critical struggles. The Gandhians, if they understood the life of the Mahatma, could comprehend this but they have also become imitators of the political parties.

This country needs to take a few judicious lessons from a society which has usually been discussed as power-manipulated. The USA, on the eve of impeaching its President, has exhibited a rare moral courage, solidly sustained despite the lobbies which obfuscate. And the Press, let our pontificating editors note, has led the struggle for a public and political morality. In India, we are content with fearless gossiping in private. Little else. Indeed, appropriately, in the style of the US President, we could use a number of four letter words to describe the moral degradation of our democratic situation.

I am aware that it is the habit of this same amoral elite to draw many comforting lessons from the apparent stability of this situation. This capacity is based on a studied refusal to take note of the dangerous seepage into the foundations of the continental democratic structure so carefully nurtured by Mahatma Gandhi during the freedom struggle and by Jawaharlal Nehru in the early years of freedom. The monumental effort of many decades is being slowly suffocated because of our repeated failure to distinguish the grain from the chaff, the wood from leaves, the truth from the falsehood.

Unless action by citizens is geared to specific, clear-cut tasks, and at several separate levels of conscious objectives, there is danger that every stirring ends in a fuddled mess because it attempts to seize the total State and splinters. The continental polity of India is too vast and varied to be tackled in this way. Freedom struggles and wars with neighbours release different chemicals. We are concerned with the mundane business of day-to-day governance. This is basic if dissent and equality are to live side by side.

We have seen the propulsions of Indira Gandhi's 'Garibi Hatao'. We have yet to master the motivations behind the "partyless democracy" pro-

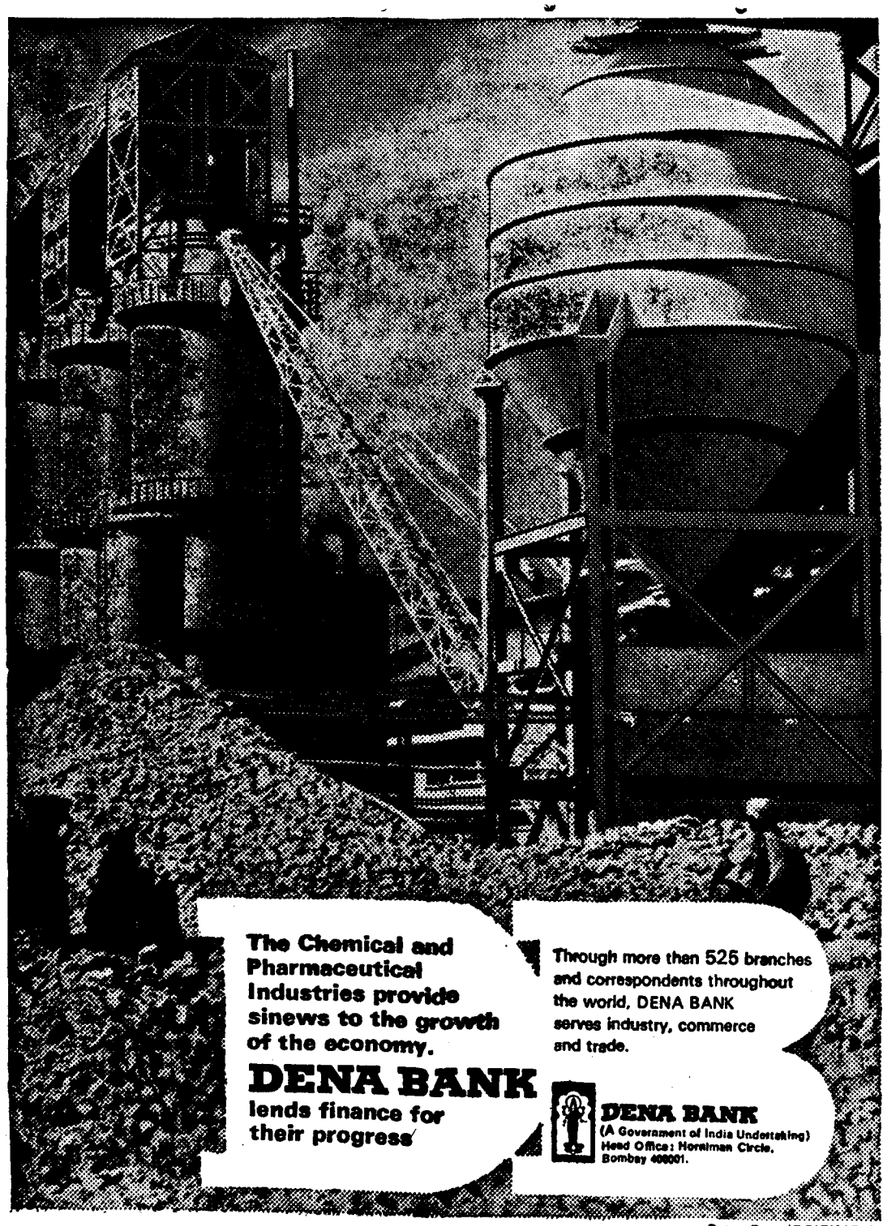
CAPITAL VIEW

An Amoral Political Elite

Romesh Thapar

CONVERSATIONS in the Capital these days are thick with references to an amoral political elite, cynical in its pursuit of black money and brutal in exploiting its privileged position against the obvious interests of the country and its people. The sharpness of the attack, and the fact that it embraces everyone, including Indira Gandhi, is not due to the 'fascistic' conspiracies of Jayaprakash Narayan, but directly to the 'squeeze' on honest-to-goodness citizens.

It is doubtful whether the Prime Minister has even given thought to the political and social consequences of a policy which calls upon the people for sacrifices of all description but leaves the kings of the parallel black money economy free to operate. Apart from the anger that develops against a thoroughly corrupt political elite, wide sections of honest people are persuaded to taste the benefits of the parallel economy by joining the scramble for hot money.



Government's promise to break the back of the parallel economy is not being honoured despite the valiant attempts of AIR to depict a situation where the possessors of black money and undeclared wealth are trembling in their rubber sandals. The raids are directed against minor offenders, and often suggest a marked political flavouring. The real king-pins, whose names are no secret, pursue their activities unhindered. Indeed, the ruling Congress Party is usually not ashamed to parade them as friends and allies.

Ask the enforcement agencies why action on a more co-ordinated and drastic scale is not being taken against the men and organisations who are condemning India to a permanent state of shortage and famine, the answer is an indulgent smile which suggests that the questioner is naive and unaware of the *realpolitik* of present-day Indian economics. The impression is now deeply etched that the enforcement agencies have become instruments of the power hierarchy.

Naturally, in this atmosphere of deep suspicions, where no one of consequence appears to measure up to any standard of public accountability, the despair is total and millions turn to movements sparked by JP and his collaborators hoping that even a tenuous unity at the mass level will frighten the corrupt politicians who now sit astride a tragic land. This hope, too, will dissolve rapidly unless specific perspectives for clean, humane government are set and fought for without mixing extraneous issues on which the movements are disparate and confused.

pounded by Jayaprakash Narayan. We are asked to respond to these immediately impossible populist themes. Others will follow with equally theoretical invocations. Where are those who think of the foreseeable present and future? Admittedly, the creative age of Gandhi and Lenin and Mao has passed. We are only the begetters of Nixons and Kissingers — and their imitators, believe it or not. Maybe, the challenges of today call for collectives of leadership, and these are taking long in crystallising. Maybe . . .

July 29

Price Increase to the Rescue

Hansavivek

TATA IRON AND STEEL COMPANY has received Nippon Steel's report on expansion of capacity. The proposal is for construction of new capacity for producing three million tonnes of steel to be rolled into about 2.5 million tonnes of flat products. This would be 50 per cent larger than the originally contemplated expansion and would bring TISCO's capacity to about 5 million tonnes, or 2.5 times the present capacity. The cost, including that of development of ore mines and collieries, power generating capacity and a large raw-material bedding and blending yard at Jamshedpur, is estimated at Rs 1,800 crores. The project, which will take some four years to complete, is far too big for the company to tackle alone and it is felt that government and institutional finance would have to bear the major part, if not the whole, of the burden. Meanwhile, TISCO is concentrating its efforts on maintaining the present works at the highest possible level of efficiency. Steps are being taken to strengthen the engineering organisation, including its design capabilities, and to add to its ability to manufacture scarce replacement items of plant and equipment.

The new pricing policy of government and the resultant accretions to the modernisation and development fund will make possible a higher tempo of expenditure on renovation. A 5-year capital expenditure programme, estimated to cost Rs 180 crores, has been taken up. A substantial part of it will be spent on coal mines to achieve self-sufficiency in high-grade coking coal. The programme of phased replacement and rebuilding of old coke oven batteries suffered a setback last year as a result of delays in the receipt of refractories. Battery number three, which had earlier been expected to be back in operation by mid-1974, will now be commissioned by mid-1975. The new 54-oven battery, commissioned in March 1973, as well as the first batch of Sijua 'beehive' coke ovens, have been operating to capacity. The second batch of 'beehive' ovens were completed and commissioned by the end of the year.

TISCO also proposes to make additional investment in the capital of Tinplate Company of India, one-third of whose paid-up capital of Rs 125 lakhs is already held by it. TCI has on hand a project for manufacture of electrolytic tinplate and tin-free steel, estimated to cost Rs 18 crores, which is intended to be financed partly by long-term loans from financial institutions, partly by a public issue of capital of Rs 375 lakhs and partly from internal resources. TCI has paid dividends of

* 15 months

17.5 per cent for 1970, 1971 and 1972. However, the financial institutions which are financing the expansion project have stipulated that the company should not declare any dividends until the new unit goes into commercial production.

During 1973-74, TISCO experienced "unprecedented" shortages of coking coal and electric power almost throughout the year. Production of saleable steel slumped from 1.46 million tonnes to 1.2 million tonnes, the lowest since the completion of the last major expansion programme in 1959. Output of steel ingots was down from 1.69 million tonnes to 1.51 million tonnes, of iron from 1.68 million tonnes to 1.44 million tonnes and of coke from 1.26 million tonnes to 1.14 million tonnes. Dislocations in rail movements and shortage of wagons affected despatches of finished steel. Despatches of steel were lower than in the previous year by as much as 315,000 tonnes, although fall in production was only about 258,000 tonnes. If, despite a sharp fall in production and despatches, the company's profits were considerably higher than in the previous year it was due to the two increases in prices of steel allowed by government. From mid-September 1973, a uniform increase of Rs 75 per tonne in prices of all categories of steel was allowed. This was followed by a further increase in mid-October 1973 in prices of certain categories of steel, excluding plates, structurals and railway materials, which, on TISCO's product-mix, amounted to an average increase of Rs 245 per tonne. Amongst the conditions laid down by government while sanctioning the latter increase were that (1) no part of the additional profit resulting from such increase would be utilised for paying dividends or issuing bonus shares; (2) for three years, the company would not increase dividend on equity shares beyond the 11.5 per cent paid during the last few years; and (3) the entire excess of the selling prices over the retention prices, still to be announced by government, would be deposited, after deducting the tax payable thereon, into a separate fund administered by SAIL. Such deposits could be withdrawn by the company only for expenditure on approved schemes of modernisation and development. Accordingly, the board maintained dividend, but this had to be revised to 6.33 per cent to fall in line with the provisions of the ordinance restricting distribution of dividends.

MAFATLAL INDUSTRIES, formerly New Shorrock Spinning and Manufacturing, has vastly changed its complexion following amalgamation with it of Mafatlal Gagalbhai from April 1972. It has come to own investments of substantial value by virtue of the amalgamation. As at the end of March last, cost or book value of aggregate of quoted investments amounted to Rs 4.44 crores and their market value was in the neighbourhood of Rs 28.20 crores. Besides, unquoted investments were of the order of Rs 81 lakhs. The company has sold its jute undertaking known as Gagalbhai Jute Mills located in West Bengal to New Gujarat Cotton Mills of Calcutta for Rs 140 lakhs. A sum of Rs 40 lakhs has been already received, and the balance of Rs 100 lakhs is to be received in three years with interest at 11 per cent per annum through a bank. Steps are also being taken to amalgamate the wholly-owned subsidiary, Sahyadri Dyestuffs and Chemicals. The accounts given in the table are not strictly comparable, since the latest set of figures relate to a 12-month period while the earlier figures pertain to 15 months. The working of the jute division was adversely affected by power crisis, labour dispute and inflationary pressures. The textile division's working was also upset in the last quarter on account of power shortage. Even so, the financial results turned out to be impressive, with gross profit two-thirds better despite a 5 per cent shortfall in net sales. The board has recommended a dividend of 20 per cent, which will have to be lowered in accordance with the restrictions imposed by the government on payment of dividends. The company's earlier application for issue of bonus shares in the ratio 1:4 was turned down on technical grounds. The directors have now proposed to issue these shares on a one-for-two basis. The company last year spent Rs 60 lakhs on additions and replacements in the textile division and Rs 33 lakhs in the jute division. Orders for plant, machinery and equipment for the textile division worth about Rs 10 lakhs were placed after the close of the year. Exports of textile products amounted to Rs 240 lakhs and of jute products Rs 140 lakhs against Rs 138 lakhs and Rs 123 lakhs, respectively, in the preceding year. The directors say that the doubling of the quantum of controlled cloth production, rising costs, wage hike and load-shedding during peak hours together make the outlook as "almost unpredictable".

ENGLISH ELECTRIC COMPANY OF INDIA has secured industrial licences to effect expansion of manufacture of low tension cartridge fuses, fuse switch units and various types of relays and control panels and also 'letters of intent' for production of distance protection and automatic semaphore indicator relays and control panel accessories. The company also expects to receive shortly industrial licences for certain specialised products for which there is demand in the country. When the licences applied for have been granted, there will be a better utilisation of the company's funds. Not only has the company not borrowed any money from banks, but it has placed its surplus funds as short term deposits. Interest from deposits last year brought in over Rs 10 lakhs of revenue. The 18-year-old company, two-thirds of whose capital is owned by the parent UK company, says its export earnings showed a further improvement last year. Total earnings in foreign exchange, however, were less than Rs 11 lakhs, including about Rs 2 lakhs by way of commission. On the other hand, value of imports amounted to about Rs 45 lakhs, provision in respect of royalty in foreign exchange was of the order of Rs 7 lakhs, and net dividend remitted to the parent company for 1972-73 was Rs 20 lakhs. During 1973-74, the company produced good results with higher sales and margins despite "the heavy burden of cost increases which the electrical industry had to bear". Dividend has been stepped up from 18 per cent to 20 per cent, but this will have to be reduced in line with the provisions of the ordinance restricting payment of dividends.

INDIAN DYESTUFF INDUSTRIES has received a 'letter of intent' to expand capacity for production of vat dyestuffs from 625 tonnes to 825 tonnes per annum and another for manufacture of pigments with an annual capacity of 500 tonnes. Last year the company had to contend with the problem of procurement of strategic raw materials, import of which, even where permissible, became difficult with the cut-back in world production due to the oil crisis in the Western world and increase in awareness of the problem of maintaining the ecological balance. Even so, IDI's results have been good with higher sales and profits although trading margins were slightly lowered owing to higher prices of raw materials and overall increase in operating costs. The directors have repeated a 16 per cent distribution on equity, a part of which is expected to be exempt from tax, but this will have to be revised downwards in pursuance of the Ordinance restricting payment of dividends. A remarkable feature of the company's performance has been a 21 per cent expansion in exports to Rs 193 lakhs, a peak in its 20-year career.

BOMBAY'S SHANTY-TOWNS

Come the Fire...

HALF of Bombay city was in knee-deep water on July 5. Rail and road transport came to an abrupt halt. Indeed, railways took nearly a month to recover from the worst-ever multiple paralysis in their history.

There were stories of how-I-spent-nine-hours-sitting-in-my-car and when-Dev - Anand - had - to - push - his - own-car. And more stories of how-this-and-that - welfare - organisation - helped - those-marooned-in-cars-and-buses - with-tea-and-biscuits, and the like.

But, with what they call 'self-protective' callousness, Bombay's middle-class was none too concerned about what happened to the city's two million slum-dewellers. For these, the deluge meant death, disease, misery, hunger, dirt and loss of their few belongings. This is what nearly one-third of Bombay's population lives through, every monsoon. The country may pray for timely and bountiful rains, but for Bombay's hutment-dwellers, the monsoon intensifies an already precarious struggle for existence. The monsoon to them is three months of wet clothes, leaking roofs, and damp muddy floor. It means nights spent crouching, or often standing in waist-deep water, clutching babies and rags in a bid to keep them dry. It means even more flies and diseases.

In Bombay, this metropolis of small islands of luxury amidst a sea of sprawling slums, one-third of the population lives in 250,000 huts grouped together in 560 make-shift slums. These are the official figures. There are many more 'unaccounted' slums and hundreds and thousands of huts which dread catching the authorities' eye. And, each day, hundreds of new huts sprout in different localities, as if from nowhere, but put together ingeniously with material sifted from the city's garbage-heaps.

Visit any open space (if there are any left) in the suburbs, and you will find people frantically erecting new huts. By now, Bombay might well have surpassed Calcutta in the number of shanty towns. The state government and the municipal corporation at one time had a grandiose 'slum-clearance' scheme for building single-room tenements for slum-dwellers. But démolition of slums is not easy. After all, slums reflect not only the lack of better housing but the entire economic condition of the slum-dwellers and unless this condition is improved schemes which seek to physically transplant the slum-dweller from the slum to a brick-and-mortar tenement are unlikely to succeed. That apart, there are strong political pressures against slum clearance. The votes of slum-dwellers can be easily controlled, most often through the 'dadas' of the slum who act as agents between those living in the slums, the politicians, and the executive authorities. Consequently, Bombay has rarely seen a slum demolished in recent times.

There thus followed the 'slum improvement' scheme, which promised instead to provide basic amenities such as water, drainage, streets and lighting to the existing slums. Since 1972-73, nearly Rs 2 crores are supposed to have been spent on improving the city's slums. But the slums show no improvement, for all the money that has been spent. In fact, with each monsoon, their condition has actually deteriorated.

A pre-deluge study of Dharavi, probably one of the largest slum-complexes in the world, is revealing. Here, in the heart of Greater Bombay, nearly 300,000 people live in 70,000 to 80,000 huts, in conditions so obnoxious that the chasm that divides humans in this country *via* their utterly different levels of living hits you in the face. The slum has sprung up over the last 15 years in 600 to 700 acres around Dharavi, a one-time fishing village. Social workers have claimed that a new hut appears in Dharavi almost every hour of the day and night. The stinking slum-town is now bursting at the seams.

The Bombay Municipal Corporation is reported to have spent nearly Rs 35 lakhs on improving Dharavi over the last two years. Nine localities in the area, with a population of 150,000, were selected as beneficiaries of the schemes. According to the records, 144 public taps have been provided, nearly 225 public toilets constructed, 10,000 metres of sewage gutters laid, and 17,000 metres of streets completed.

But the taps are not visible. Most of the public water taps have been removed, damaged or are unworkable. The water stands are filthy. When the taps do work, a thin stream can run for an hour or two, but that is all. However, private taps abound in the vicinity, and these have eight to ten hours of water supply with adequate pressure. The contrasting fates of the public and private taps may well be related: the private tap-owners do booming business, selling water at 20 paise a bucket. A public toilet in Dharavi most times has no water or sewage connections. The toilets stink from a hundred metres away. Those which do not stink, are really illicit liquor distilleries — and predictably, toilets so used are well-connected with water tanks. Most of the 'roads', recorded on paper as having been completed, have turned into open gutters. Indeed, it takes investigative skills of a high order to locate any of the 'roads' constructed under the municipal scheme. The gutters, in their turn, are half constructed; the construction is unscientific and with inferior material, and even a brief downpour sends water and human excreta from the gutters gushing into the adjoining huts.

This was Dharavi before the latest deluge. And Dharavi is a low-lying area. Two or three times in every monsoon flood waters inundate the slum-town. This year, half the huts were in knee-deep water for three days on end from July 5.

To understand why the people in the slums cannot have hopes of official help for better houses, one has only to look at the record of the Maharashtra Housing Board which had been entrusted with the task of providing cheap houses on hire-purchase and instalment basis to the slum-dwellers. The Board has now almost abandoned the scheme, and has brazenly gotten itself busy constructing large, well-appointed flats and selling them on an outright basis. Anyone wanting to buy a Housing Board tenement has to pay over Rs 35,000 cash down. Social housing was abandoned for the perennial reason that under hire-purchase schemes it takes many years for the Housing Board to recover its investment, whereas the Board wants money here and now — to build bigger and costlier houses which it can proudly flaunt.

In the circumstances, slums are here

National and Grindlays Bank Limited

(INCORPORATED IN THE UNITED KINGDOM. THE LIABILITY OF MEMBERS IS LIMITED)

REQUIRE

TWO ASSISTANT MANAGERS

ASSISTANT MANAGER, TAX

Should be an Income Tax specialist with a qualification in law or chartered accountancy. Will be based in Calcutta.

ASSISTANT MANAGER, INDUSTRIAL RELATIONS

Should possess a law degree and have specialised knowledge of the practices and procedures of industrial relations in India. The assignment will initially be based in Calcutta.

POSITION

Both are challenging assignments which will require extensive travel in India, and applicants should possess a keen and innovative mind with considerable experience in their respective fields.

Highly responsible jobs that would eventually lead to confirmation in the management cadre of the Bank.

EMOLUMENTS

Salary and terms of service are negotiable—but will not be less than Rs. 2,500/- per month. Candidates will be eligible to join the Provident Fund and Pension Schemes.

AGE

Ideally, 40 to 45 years

Applications will be treated in confidence and should be sent along with a passport size photograph within 15 days to:

Mr. P. C. Tomkins,
Manager, Manpower Development,
National and Grindlays Bank Limited,
Office of the General Manager,
PO Box 725, Bombay.

to stay — and will multiply as the city continues to act like a magnet to job-seekers from all over the country. As more and more people flock here, and as investments and jobs fail to grow commensurately, there will be even less hope of any improvement in the sub-human conditions in the shanties.

MONETARY POLICY

Too Little, Too Late

(From a Special Correspondent)

IT has become the established pattern for the Reserve Bank to be pushed into reacting to economic events and trends — and then, too, reacting inadequately. The credit policy measures which the Bank announced towards the end of last month fit into this pattern. The measures, stiff though they may seem in the Reserve Bank's own terms, may have had some effect had they come, say, a year and a half ago; but as it happens the Reserve Bank has been once again outpaced by trends in prices and demand for bank credit. One of the ironical consequences of this is the opportunity it provides to those who have a vested interest in cheap money policies to argue that raising interest rates and making credit dearer can have little impact on the price situation.

The Reserve Bank's approach to the question of interest rates in the economy has been based on the conventional premise that high interest rates discourage investment. As a result, the role of interest rate policy as an adjunct to credit rationing and qualitative controls on credit dispensation, its role in more rational application of short-term and long-term capital, and its role in channelling savings into the organised financial system, over which alone the monetary authority can hope to exercise some control, have all been neglected. For their part, low interest rate policies have wrought serious distortions.

First, there has occurred a disproportionate growth in reliance on bank funds. According to the Reserve Bank's studies of the finances of the private corporate sector, short-term bank borrowings accounted for 20 per cent of inventories in 1950, 34 per cent in 1955-56, 48 per cent in 1960-61 and 59 per cent in 1970-71. This vast expansion of bank credit has undoubtedly augmented financial liquidity outside the banking system and, as a result, rendered the Reserve Bank's occasional mild credit curbs and small increases in interest rates relatively ineffective.

Second, the commitment to keep the cost of credit low to borrowers has compelled the monetary authorities to keep interest rates on bank deposits low. As a result, bank deposits, even after the minor increases in interest rates that have been allowed from time to time, have hardly been a competitive medium for savings. There has been, therefore, a large diversion of funds from the banking system into company deposits, etc, over which the monetary authority has little or no control. Here it is immaterial whether the level of interest rates has any influence on aggregate savings. What is relevant is whether it influences the forms in which savings are held. And there is considerable evidence to show that it does. The Banking Commission, for instance, found that the demand for time deposits showed a high elasticity with respect to interest rates.

Third, easy availability of loan capital has placed equity capital at a discount and companies have had little incentive to widen their equity base. Low interest rates have also kept the yield rates on equity low. Low dividend rates on narrow capital bases have enabled well established companies to build up large internal resources and this has played no small part in the growth of concentration of economic power in the hands of the large business houses. If loan capital were made relatively costly, company managements would have to widen their equity base and show better working results so as to be able to pay satisfactory dividends. An incidental result of company managements' preference for borrowed capital over equity capital has been that institutions such as the Unit Trust of India — which are exempted from the control on deposit interest rates — have opted for direct lending rather than investment in equity capital! The chairman of the UTI was reassuring unitholders the other day that the UTI would be able to ride out the effects of the restrictions imposed by the government on dividend distribution by companies through its interest earnings on loans and deposits.

These wider and longer-term considerations apart, the developments of the last two years have clearly called for more stringent measures from the Reserve Bank than have been actually forthcoming. Despite the low growth of industrial output, the relative scarcity of most industrial raw materials and the restrictions imposed on the level of industrial activity by the severe shortage of power, there has ocurred a sharp expansion of bank credit during this period. This has also been a period of very large deficit spending by the government which has injected vast additional liquidity into the economy. In the context of the trends in physical output, this should have called for tight control on bank credit to the commercial sector, both through raising the cost of credit and use of quantitative restrictions. The very sharp increase in liquidity in the economy, the result of simultaneous budgetary deficits and expansion of commercial bank credit, encouraged speculative inventory-building all-round and accentuated the pressure on prices caused by shortfalls in output. Every rise in prices, in turn, caused, in the face of the passiveness of the monetary authorities, further monetary expansion. Inflation and monetary expansion soon became parts of a vicious circle and after a while the Reserve Bank was actually referring to the rise in prices to *justify* its failure to control credit expansion.

The criticism that the latest monetary policy measures have come too late has to be judged against this background. Seen by themselves, the measures are the strongest so far taken by the Reserve Bank. The Bank rate has been raised from 7 per cent to 9 per cent; the banks' minimum lending rate has been stepped up from 11 per cent to 12.5 per cent; the minimum rate on advances against selective credit control commodities has been raised from 13 per cent to 15 per cent and from 12 per cent to 14 per cent, as the case may be; the minimum rate of discount on bill finance for drawers' bills has been increased from 9.5 per cent to 11 per cent and that on drawees' bills from 11 per cent to 12.5 per cent; the maximum rate of interest on export credit has been raised from 9 per cent to 10.5 per cent; and, finally, the interest on food procurement credit has been stepped up from 9 to 11 per cent in respect of advances to the Food Corporation of India and from 9 to 12 per cent in respect of advances to state governments and their agencies. Interest rates on fixed deposits of 91 days and longer maturity have also been raised, the maximum rate, on deposits for 5 years and longer, going up from 8 per cent to 10 per cent.

Criticism of monetary and credit policies as inadequate or as coming too late is certainly not to suggest that the

current inflation is primarily a monetary phenomenon. The principal causes of the inflation are the failure of the government to procure and distribute a minimum quantum of foodgrains through the public distribution system; speculative holding of commodities, mainly with 'black' money; financial mismanagement by the public and private sectors alike giving rise to vast current (consumption) expenditure and consequently low real savings and investment, particularly in the public sector; and the low investment, in turn, resulting in a series of shortages of key industrial commodities as well as of power and transport.

Such being the basic causes of the inflation, to give maximum effectiveness to the recent interest rates increases, the Reserve Bank has to undertake a series of supporting measures. These measures have a rationale extending beyond the immediate objectives of controlling inflation. Most important of all, the Reserve Bank cannot evade any longer the vital task of framing a comprehensive credit plan, prescribing credit limits by sectors, industries and banks. This would necessarily involve a careful scrutiny of the borrowing limits already enjoyed by large parties. In dealing with large borrowers, as has been repeatedly emphasised in these columns, it is necessary to take groups of related companies or industrial houses as the relevant units for assessment of permissible credit limits. Since inter-unit transfer of funds are frequent and easy, unless total bank funds available to an industrial house are restricted, stockpiling of commodities with bank funds cannot be stopped. The Reserve Bank will have to operate an effective differential interest rates system, depending upon, for instance, the purpose of the loans, the industry concerned, the size of the borrower or the borrowing group, etc. The Reserve Bank will also have to bring about some basic changes in the different systems of commercial bank lending. The archaic system of cash credit, for instance, deserves a long hard look. Finally, the effectiveness of any rise in the lending rates of banks will continue to be undermined so long as private sector companies are allowed to accept deposits from the public. Following last month's increase in the banks' lending rates, many well established companies have put up their interest rates on public deposits so as to attract larger amounts of such deposits. The growing importance of public deposits is evident from the Reserve Bank's company finance studies. While separate data are not available for public deposits, borrowings other than institutional borrowings increased from about 24 per cent in 1965-66 to 32 per cent in 1972-73 for large and medium public limited companies. For the Reserve Bank's sample of 350 large companies, the amount of such 'other' borrowings was Rs 495 crores or 27.3 per cent in 1970-71; but by 1972-73 it had increased to Rs 630 crores or 32.1 per cent. It is necessary, therefore, that the Reserve Bank tighten controls on acceptance of deposits by companies by completely prohibiting acceptance of short-term deposits and restricting other deposits to, say, 5 per cent of the companies' net worth as against 25 per cent at present.

The measures outlined above will have to be accompanied by some basic changes in the system of financing of industrial projects in the private corporate sector. First, the prime interest rates on long-term capital need to be raised sharply to around 15 per cent against the present 9 to 9.5 per cent. Interest cost in total production costs is today so small — 2 to 4 per cent for the major industries — that industrialists have no incentive to save on capital. Second, the term-financing institutions and banks together today provide over 66 per cent of the total cost of industrial projects. The term-lending institutions should be required to restrict their lending to 20 to 25 per cent of the cost of a new project. This will compel companies to attract more equity capital with altogether beneficial effects on the efficiency of their operations.

NEW DELHI

Hands Up, without Fight

B M

THE much advertised anti-inflationary drive of the government may be said to have already petered out. The supplementary budget, presented on Wednesday by the Finance Minister, Y B Chavan, was a tacit admission to that effect. The most striking feature of his speech presenting the supplementary budget was its defensive tone and meagre content. Chavan repeatedly conceded that all the measures taken so far had had little effect on the upward march of prices. Even the budgetary exercise was only a pedestrian revenue-raising effort devoid of economic thrust.

Chavan went so far as to declare that the government had very 'narrow options'; indeed, these are limited by the narrow frame the government has allowed itself for its fiscal and monetary policy. But, within that frame too, the supplementary budget was a disappointment all round. The apprehensions as well as the expectations entertained by diverse sections of society about the budget's likely scope and content turned out to have been altogether misplaced. The only beneficiaries of the advance notice of a second finance bill were thus those who had played upon these fears and expectations to bid up sales and prices — mostly of luxury goods that were expected to be taxed. It passes comprehension why the government gave a clear seven days' notice of its intention in this instance when it uses its ordinance-making powers with such effective suddenness for measures which have no direct relation to the markets.

In any case, no luxury commodity has been subjected to additional tax. Nor is there any increase in the direct taxes on incomes and wealth. All the additional taxes are indirect — and mainly on industrial raw materials. This is bound to push up prices all round *via* the increases in raw material costs — whether these be of items of mass consumption, or items for use in the so-called core sector under the Plan, or items of luxury consumption. In the final analysis, a good part of the incidence of these increases will fall on planned investment in the public sector. Before announcing his tax proposals, Chavan had made familiar noises about how his proposals were designed to discourage conspicuous consumption and would mop up windfall gains (presumably also undeclared and untaxed profits) of producers and middlemen in certain sensitive commodities. But there is no traceable connection between his objectives and the actual proposals.

The additional tax effort in fact only amounts to an attempt to bridge the gap between the revenues and the expenditures of the government. The Union Government deficits are known to have increased way beyond the estimates made at the time of the main budget presented barely five months ago. However, according to Chavan's own admission, even that gap will not be bridged significantly, and yet other measures — by way of cutting of expenditures — will be necessary. It has been already forcefully argued in Finance Ministry circles that, as the scope for economies in non-Plan expenditures is non-existent, the cut will have to be mainly in the Plan expenditures. The definition of the 'core sector' has accordingly been made narrower than before : it is now to consist of only power and fertilisers.

A glaring absence in Chavan's strategy for containing the inflation is any mention of the public distribution system. That option having been left to disintegrate by the wayside, the residual options left for the government to control inflation must be seen to be very limited indeed. While the Finance Minister talked of sustained increases in agricultural production as the only way to remove the imbalances in the economy, his speech did not indicate that the government was in any way relying on its ability to bring about the desired increases in production.

It is clear that the nation's policy-makers have reached the end of their tether, in terms of political capabilities and ideas. Once the ineffectiveness of the so-called 'drastic' measures to arrest inflation becomes clear, the leadership might well find that, in having made life impossible for the majority of its electorate, its political options too are limited and it can no longer revert to helpless drifting as before. And then, it might start to think of the promulgation of other types of ordinances — for which it has developed capabilities of late.

BIHAR

Misleading Quiet

Arvind Narayan Das

TO an outsider who comes to Patna hoping to see the storming of the Bastille, the city presents a tranquil face today. Only an occasional pathetic wail scrawled on a temple wall — *'he bhagwan, vidhan sabha bhang karaa de!'* ("O God, get the Legislative Assembly dissolved!") — is a reminder of Jayaprakash Narayan's much-publicised "mass upsurge". Yet the traveller would be wrong to conclude that the agitation has ended.

The feverish activity of March and April has ended. There are no more hunger-strike camps, hardly any torchlight processions, very few demonstrations. Even the small number of students offering dharna outside the Assembly have disappeared. By and large, people seem to have realised the uselessness of the demand for dissolution of the Assembly. But they have at the same time realised the uselessness of the Assembly itself. Similarly, the demand for the reform of the educational system has been forgotten and the debate has moved on to whether the present educational system, reformed or otherwise, can at all be continued. During the last few months, when JP was hogging the headlines, the anti-hoarding aspect of the agitation had receded into the background. Today as JP is commuting between Allahabad and Calcutta, the militant students are hitting the hoarders and the government where it hurts — in the godowns.

It was, ironically, not JP but the CPI which fathered the Bihar agitation. Under pressure from disgruntled workers in its trade union bases, the CPI leadership had been forced to call a 'Bihar bandh' on January 21. The bandh was supported by all Opposition parties and was a complete success. It released the pent-up frustrations of the people as a result of the galloping prices, rising unemployment and rampant corruption.

The bandh was followed by a month of hectic consultations amongst the various groups taking part in the movement. Joint Action Committees were set up and meetings were held. At this point, polarisation of sorts started. The politically inexperienced students, who were influenced more by labels than the real character of organisations, started dividing between 'Leftists' and 'Rightists'. When a convention of all the student organisations in Bihar was held in the last week of February, the CPI(M) students' wing, SFI, and Marxist-Leninist students belonging to the Bihar Student Association (BSA), walked out of the meeting and formed a separate front. This Left-wing students' organisation called itself the Chhatra Naujawan Sangharsha Morcha with a long-term programme of struggle, starting from March 16. The rest formed the Chhatra Sangharsha Samiti, which started its agitation from March 18. Its leadership was subsequently taken over by Jayaprakash Narayan.

The second phase of the agitation thus started from the middle of March. The character of the agitation was different in different areas. In those areas where the politically more mature youth was in the lead, from the very beginning the agitation was militant and attacked hoarders, blackmarketeers and corrupt officials. On March 16 there took place a ding-dong battle, lasting several hours, between students and peasant youth and the armed police in Bettiah. Several people were killed and injured in the clash. But news about this struggle was virtually suppressed, possibly because the peasantry in the area is known for its communist, though non-CPI, sympathies.

News about the Bihar agitation started to fill the front pages of newspapers only from the morning of March 19. The previous day, almost the entire armed force available to the state government had been pressed into service to 'protect' the Assembly, the Secretariat and the Raj Bhawan against a relatively small procession of students led by the Chhatra Sangharsha Samiti. The rest of Patna was left unpoliced against loot and arson by anti-social elements. The police themselves let loose a reign of terror against the Chhatra Sangharsha Samiti demonstrators. Many persons were killed and injured in police firing. Curfew was clamped on the city. In Gaya, the CRP, the BSF and other paramilitary personnel entered houses and brutally attacked innocent citizens. This sparked resistance against the government. The agitation spread to different parts of the state. JP entered the scene at this point.

The Sarvodaya leader, whose anger knew no bounds when a few landlords were allegedly killed by 'Naxalites' in Musahari, asked the people to tie saffron cloth over their mouths and take out a silent procession when scores of young men had been shot or bayoneted to death by the police. But the people were desperate and disgusted with corrupt and power-hungry politicians, both Congress and Opposition. They, therefore, found in JP a plausible messiah. There followed extensive propaganda campaigns, through relay hunger-strike camps, torchlight processions, fair-price vegetable shops run by students, and street-corner meetings. Poets recited poems, artists exhibited paintings and lecturers took open-air classes. The theme was the same: "This corrupt government, which is unable to check prices, hoarding and profiteering, and which cannot provide employment to the youth, has unleashed brutal repression on the people. This government must go!" The remarkable fact was

that all of JP's programmes were programmes of propaganda; there was no programme of agitation. After a few weeks, when the memory of the bloodshed began to fade, the movement began to lose momentum. At this point, JP left Bihar for medical treatment, leaving behind a set of apostles to 'guide' the movement.

The railway strike gave the movement a new dimension. Up to then, the agitators had been mainly middle-class students and youth, largely convinced that they would be able to carry on the movement on their own steam. The railway strike made some of them ask questions such as "who are our permanent allies?" Some of them also started getting disillusioned with the wishy-washiness of the leadership. For instance, when the Patna Town Student's Action Committee gave a call for 'Patna bandh' in support of the 21 lakh striking railway workers, it was opposed by the top leaders of the agitation. Yet the bandh was a success not only in Patna, but in Bhagalpur and other towns. In fact, around this time the students and youth in towns other than Patna started acquiring a militancy and sense of direction largely lacking in the capital. The railway strike made large numbers of students look outside their own movement for potential allies, perhaps even leaders.

By now the CPI had emerged as the strongest defender of the Ghafoor government. After some initial confusion in its ranks, the determination of its national and international leadership to support the Congress government at any cost prevailed. The party's line then became one of militant constitutionalism: "*vidhan sabha agar bhang hogi, to khoon bahega sarkon pe!*" ("blood will flow in the streets if the Legislative Assembly is dissolved!"). The Socialist Party and the CPI(M) have acquired a reputation in Bihar as parties which split at least once a year. So, in spite of the militancy of their cadres and the fact that their own youth organisations were operating actively within the joint youth front, the Chhatra Yuva Sangharsha Samiti, they were not able to give direction to the movement. The large number of factions among the elements to the Left of CPI(M) — popularly known collectively as 'Naxalites' — and the supercilious attitude of some of them towards mass movements, also stood in the way of the politicisation of the activists in the student movement. This is not to deny that some of the 'Naxalites' have intervened in the movement, but only to point out that their intervention could have been much more effective.

If the Left was not able to put its best foot forward, neither was the Right. The refusal of large numbers of Congress(O) and Jan Sangh legislators to resign from the Assembly and their barely-concealed links with big businessmen, who were the targets of the students anti-hoarding campaigns, cut into their hold over the movement.

Unable thus to find political leadership, the students and youth threw up their own leadership. And it was under this leadership that the movement was going on. But, as is inevitable in such circumstances, the movement started to lose its mass character and the activities that were still being carried on were undertaken by small activist groups.

The movement seemed to be simmering down, but just then three events took place which gave it another shot in the arm. First, the CPI, with the active co-operation of the administration — trains which had been cancelled during the railway strike were specially run for that day — staged an impressive, partly armed, demonstration on June 3 to affirm its faith in 'constitutional and parliamentary democracy'. Second, on June 4 the government staged a flag march by the army and the para-military forces through the streets of Patna to cow down the students. On the same day, Hajdeo Singh, the Inspector-General of the BSF, threatened to put tanks on the streets of the city to bring back law and order. On June 5, the government tried at first to hinder a JP-led demonstration of students and the people by sealing off all vehicular traffic routes into Patna; later, when the procession was returning after having been rebuffed by the Governor, it was fired upon by members of the Indira Brigade, an organisation known to be closely linked with some Congress legislators. All these development, predictably, built up the people's resistance and the movement acquired momentum once again.

In the next phase of the movement the emphasis was on anti-hoarding operations. Several raids were carried out and large stocks of hoarded essential commodities were recovered and sold to the people at fair prices. Wherever possible the help of the administration was taken. In the course of one such raid in Patna, in the presence of the District Magistrate, lakhs of bars of soap were unearthed from a godown. Coincidentally, orders transferring the District Magistrate were passed just a few days after this incident.

By the time JP returned after another one of his long trips outside Bihar, the movement was acquiring the character of an anti-repression agitation. The major factor in keeping the students active and the people in general sympathetic towards them was the muscle-flexing presence of the police everywhere. The government seemed to be bent on opening the universities and colleges on the strength of the armed police. The fact that thousands of students have been herded into over-crowded jails, the presence of the armed police in the university campus, the sight of hundreds of policemen loitering about in knickers in the Srikrishna Memorial Auditorium which has been turned into a camp for the para-military forces and the generally rough behaviour of policemen with the people have built up the people's resistance once again. Thus, though there were differences among the students over JP's call to them to leave their studies for a year, there was complete unanimity that educational institutions would not be allowed to function normally till the police was removed from the campuses. Overestimating the capacity of the police, the government reopened the universities. However, the pathetically thin attendance and the need for repeated use of the police against the students speak for the failure of the government's move. The government is now bent on holding the examinations and students are being literally dragged to the examination halls. Lathi charges and firing have become routine matters and arrested students and other political prisoners are beaten and tortured in the jails. Except for the maintenance of 'law and order', all other governmental work has come to a halt.

The Bihar movement has an essentially progressive character, as a movement against repression and for the protection of democratic rights. Through this movement the mass of the people are acquiring a democratic consciousness, probably for the first time in semi-feudal Bihar. In the face of brutal repression, increasingly the people are losing faith in JP's slogan: "*hamlaa chahe jaisa hoga haath hamara nahi uthega*" ("whatever be the method of attack, we shall not hit back"). The most popular slogan today, indicating the direction of the movement, is: "*daman me kitna jor hai tere, dekh liya hai, dekhenge!*" ("we have seen the force of your repressive machinery, we shall see it in the future also!")

WEST GERMANY

'Detente' Exposed

Ramesh Jaura

WEST BERLIN which, it had seemed, had ceased to be the source of tension in Europe with the signing of the four-power accord among the US, Britain, France, and the USSR three years ago, now appears as a roadblock in the way of continental and international detente. This is occasioned by the decision of West Germany, to establish in West Berlin the headquarters of the Federal Environmental Authority which formally comes under the Home Ministry in Bonn.

A declaration of the intention to set up the Authority in West Berlin was made last year by the previous socialist-liberal coalition led by Willy Brandt. But a bill to this effect was not passed by the West German lower house, the Bundestag, until June 19 this year. Three weeks later, the upper house, the Bundesrat, gave its assent to it. With the formal approval of the federal president, Walter Scheel, the Act came into effect on July 23.

While, by itself, the setting up of a West German environmental authority in West Berlin may seem politically insignificant, the location has in fact been regarded by some as symbolic of Bonn's decision to extend its political authority to West Berlin which, even under the four-power accord of September 3, 1971, is not a constituent part of the Federal Republic of Germany (FRG).

The three western signatories to the accord — *viz*, the US, Britain, and France — have evidently made no objection to West Germany extending its sphere of influence to West Berlin, though reports suggest that they did caution Bonn about its insistence on making West Berlin the headquarters of its federal environment board. The lone signatory to the four-power accord which has voiced a strong protest is, of course, the Soviet Union, which regards the West German decision as an attempt to unilaterally affect a change in the status of West Berlin. While the Soviets continue to regard the four-power accord as essential to the development of the detente in Europe, they have let it be known that no international treaties are unconditional or for ever. Moscow radio even warned that, if the West Berlin accord continues to be violated in this insidious manner, the Soviet Union might be left with no option but to regard it as null and void.

The Soviet Union's sharp protest has also been accompanied by a strongly-worded statement emanating from the German Democratic Republic. As a first step in the protest, the GDR has closed the transit roads, passing through its own territory, to the personnel and material of the West German environmental board. However, it has expressly stated that these measures would not in any way affect the rest of the transit traffic between West Berlin and West Germany.

Both the West German government at Bonn and the West Berlin Senate have denounced the restrictions on transit ways, newly enforced by East Germany, as unjustified and against the letter and spirit of the traffic agreements under the four-power accord. They have claimed that the setting up of the Federal Environment Authority in West Berlin does not violate the four-power accord. On the contrary, it is in line with the 1971 agreements which provided for the maintenance and further development of 'ties' between the Federal Republic of West Germany and West Berlin. A couple of West German newspapers have claimed that the current controversy would hinge on the interpretation given to the word 'ties' whose counterpart in the German text is '*Verbindungen*' ('binding connections'). In the view of the West German Left, however, whether or not the accord spoke of simple 'ties' or 'binding connections', the fact remains that it expressly ruled out that West Berlin is a constituent part of West Germany. And the establishment of a federal German authority in West Berlin can only be seen as a deliberate political attempt to extend FRG authority into West Berlin — which constitutes an act of provocation.

There is a certain well known method in this kind of provocation. According to informed circles, ex-Chancellor Brandt's acquiescence in the declaration of intention to set up the federal authority in West Berlin was no more than an attempt to demonstrate that Bonn had not written off the city — the 1971 accord, the eastern treaties, and the basic treaty with GDR, notwithstanding. It is regarded as significant, too, that the efforts to convert the intention into reality were made by the remodelled socialist-liberal coalition led by Chancellor Schmidt (SPD) and Foreign Minister Genscher (FDP).

While the new ruling coalition in Bonn has distanced itself from the promises of social and educational reforms, which were the keynote of the previous coalition, it has had to search other ways of winning back the disillusioned electorate. One obvious way was to get through some prestige bills before the Bundestag went into its summer recess. The Opposition, comprising the Christian Democrats (CDU) and the Christian Socialists (CSU) — who continue to command a majority in the Bundesrat —, made the smooth passage of the governmental bills conditional upon subsequent legislation about the Federal Environment Authority. This way, the Schmidt-Genscher coalition has succeeded in killing two birds with one stone: it now has something to offer the electorate in the forthcoming State-level elections, as well as something to go on at the polls in West Berlin. The city has been continuously ruled by the Social Democrats over the last two decades. Both the SPD and the ruling Mayor have traditionally spoken and acted in a more Right conservative manner than their counterparts in the Federal Republic of Germany.

An example of this was provided during the celebrations on July 20, to commemorate the anniversary of the unsuccessful attempt on Hitler's life 30 years ago. An invitee to the celebrations at the Reichstag in West Berlin was a man called Dr Filbinger — one of the many untouched, well-placed, keymen from Hitlerite Germany who also continue to hold important positions today. The career of Filbinger too did not end with Hitler's: he joined the CDU, later became chief minister of the West German state of Baaden-Wuerttenburg, and continues to be the president of the Bundesrat. The presence of Filbinger at the celebrations organised in memory of those who died fighting against fascism has angered even the otherwise conservative Press in West Berlin — leaving out of course Axel-Springer. What has made the Filbinger episode important, is that it comes in the wake of a recent controversy involving a former Gestapo boss in Paris, Kurt Lischka. Lischka was sentenced in 1950, in absentia in Paris, to life-long imprisonment. Since West Germany has not ratified the repatriation treaty with France, Lischka continues

to live undisturbed in Cologne. Three years ago, a woman journalist, Beate Klarsfeld, possessing West German and French citizenship tried to kidnap him to France; earlier this month she was sentenced to a two-month jail internment for 'physical assault' on the former Gestapo boss!

The Klarsfeld affair came up for discussion even during the recent state visit of French President Giscard d' Estaing to Bonn. West German Chancellor Schmidt promised d'Estaing that the repatriation treaty would be ratified — latest by the end of the year. For the last three years, it has been awaiting clearance by a reviewing committee in Bonn, whose president is another Nazi eminence — Ernst Achenbach. There is evidence that, as a Nazi diplomat in Paris, Achenbach had been involved in the deportation of at least 2,000 Jews to Auschwitz and Maidanek.

Such revelations, as also the inclusion of West Berlin in an overseas broadcasting series about FRG by the Deutsche Welle, have played into Soviet hands and against the present coalition in Bonn. The broadcast has also brought forth protests from the Soviet Union and other East European countries. Moscow might not be planning anything concrete presently in the face of what it is making out to be a violation of the four-power accord. But the tenor of its protests reflects that, unless Chancellor Schmidt decides to spare some time and attention for his eastern neighbours, his remodelled coalition might succeed in undoing what its predecessor had ostensibly committed itself to achieve. Perhaps the re-entry of Egon Bahr, who masterminded the detente with Eastern Europe, as Minister of Development, is intended as a conciliatory gesture, not only for the Brandt supporters in the SPD, but also towards the Soviets. But, then, Eppler whom Bahr has replaced was not a Right-wing Social Democrat; and Bahr himself has been at pains to demolish hopes that he would be undertaking any extra-curricular activities outside of the government lines.

NAGALAND

Waiting for the Peace That Never Comes

M Horam

TWENTY-SEVEN years is a long time to be agitating for independence and apparently getting nowhere though there have been longer standing cases of frustrated nationalism. If all attempts to reach a satisfactory solution of the Naga problem have so far failed it is not for want of trying. Despite blunders on both the Indian and the Naga sides it must be stated in fairness to New Delhi that there was a time when a negotiated settlement through political dialogue was not ruled out by it. But this was not to be and the problem remains as intractable as ever. While all political goings-on are on record what has never been fully gauged is the sum-total of human suffering during these 27 long years. And there has been suffering, plenty of it. It must be so till a settlement is reached.

When the September 1972 ban was announced declaring illegal the three wings of the Federal Government of Nagaland, it was hoped by many that a fatal blow was thus struck to the activities of these underground bodies. Again when the Revolutionary Government of Nagaland, a splinter underground organisation, decided to surrender on August 16, 1973, it began to look as though the Naga underground movement was at last petering out and indeed this idea was conveyed in most press reports at that time. Today, almost two years after invoking the Unlawful Activities Prevention Act, and despite all reports and statements to the contrary, the situation remains unchanged for the Naga villagers. Military operations continue and villagers live in suspense and fear. Thus things are not what they seem in these troubled hills. The true picture is either kept deliberately hidden or it is possible that at the official level it is genuinely believed that the back of the problem has been broken and that given time it must fizzle out. If problems could evaporate in this fashion then many administrative headaches could be avoided but in this case one must reckon with the Naga psyche and the present set-up in Nagaland.

The decade long rule of the Naga Nationalist Organisation ended when early this year the United Democratic Front, the erstwhile opposition party, came to power. The UDF has been fairly consistent in its avowals, aims and political colour. While the NNO has always been associated in the Naga mind as leaning towards New Delhi, the UDF has been openly spoken of as being a pro-underground body. The UDF victory, after years of patient waiting, was hailed by the underground Nagas as their own victory. Indeed it is openly voiced that the fortunes of the UDF are dependent to a great extent on the support extended to it by the underground Nagas. In the cabinet now are formerly active NNO men.

Underground traffic to China continues unabated and small batches of China-trained guerillas return to the country at regular intervals. There are agreements recently arrived at between the Naga underground of Kachin, Mon and Chin insurgents in Burma. Though all this may pose little or no threat to the nation, the fact remains that these goings-on give the lie to the claim that the north-eastern region is silent or silenced.

A single visit to the five states and two union territories constituting the north-east mosaic and a few interviews with the youth of the region will apprise one of the general discontent that prevails in these states. The deep-seated suspicion, distrust and bitterness will be disconcerting to anyone who may have been given to understand that all this was a thing of the past and that any anti-government activity here is blown out of all proportion and is in fact a non-happening. Granting of statehood and union territory status notwithstanding, there is seething mass unrest. The people of Assam resent the dismembering of their state and besides Assam has its own problem of the Ahoms demanding a separate homeland. Miri and Garo tribals in the plains want, respectively, a separate state and merger with Meghalaya. Anti-Indian feeling rides high among the youth in Meghalaya and provides the main topic of conversation even between strangers. Mizo hostile activity has reached a crescendo and an independent Mizoram is still the cherished goal of the guerillas and the secret dream of many Mizos. Mizo rebels continue to use China and Pakistan as allies. Youth in Arunachal fear the swamping of their culture and identity by Indian ways and influence and often organisations founded ostensibly to safeguard culture become centres of feverish political activity. Manipur takes the cake for political instability and chaos and here matters are further worsened by a pan-Mongoloid movement and the Kangla League stridently demanding an independent Manipur. Meanwhile responsible leadership in the Naga Hills region of Manipur continues to carry a sizeable population with it in the demand for Greater Nagaland by integrating all contiguous Naga areas. The Kukis and Lushais in Manipur wish to merge with Mizoram. With so many groups pulling in as many directions, it is little wonder that peace cannot even find a perching place in this region.

While political opportunism is bound to thrive in situations such as these, another puzzling fact is the total indifference of a fairly large section of Nagas all of whom have one common aspect — they are among the more educated and better qualified among their people. They seem to be dispassionate onlookers. Their apathy may be construed as being either the cynical aloofness of the modern educated man or a deliberate and appalling disregard of their responsibility to society and the nation. They could do a great deal to inject sanity and moderation in a situation like this where opposing parties, arguing from different premises, have taken all of 27 years to reach nowhere. The underground Nagas continue to be "patriots" in the eyes of all Naga nationalists and "rebels" in the eyes of India. A curious fact often overlooked is that this educated section of Nagas so indifferent to the Naga milieu, are the very persons who have benefited most as it were from all the happenings.

This needs some enlargement. The underground movement precipitated the formation of the state of Nagaland. The Government of India since then has poured aid into Nagaland. Even the semi-educated, not to mention those with adequate qualifications, benefited job-wise when Nagaland came into existence. Then with aid from New Delhi a new generation of Nagas received the very best education and training without incurring practically any expense of their own. Having thus been educated and finding their future ready-made most of them have not felt it necessary to exert themselves in any way. They have steered clear of controversy and have slid into lucrative careers. Instead of being a sound middle-of-the-road body, working for peace and understanding, many of them are guilty of sitting on the fence or deliberately turning their faces away from the needs of the people. Some have indeed done worse; with all their learning and knowledge, they have not hesitated to use their brains in misleading their innocent brethren thus wounding where they should have brought the balm of healing. They talk to please and act only after carefully observing which way the cat will jump. When with representatives of the government one may hear them conveniently run down the "hostiles". When back in their own villages or face to face with underground men or sympathisers they execute a *volte face* and speak movingly of independence for the Nagas. There are hardly any who will speak out boldly against New Delhi's shortcomings and then unequivocally point out the blunders which the Naga underground has made and go on to suggest how the present impasse can be removed. This is a time for truth not smooth platitudes. When this is realised by the hitherto indifferent intelligentsia a reliable way will be paved for peace to come to Nagaland. For in spite of all claims to the contrary there is no peace in Nagaland.

It is becoming a matter of course to cite India's new found superiority in the subcontinent as effective match against any foolhardy rising on the part of a handful of Nagas. The recent nuclear device acquired by the nation may further enhance that feeling of euphoria. True India is not the India of 1962 and it has come a long way since then as a military power in its own right. But the increase in India's military strength has not in any way decreased the political aspirations of the underground Nagas. The problem therefore remains. But what is heartening is that even among the Phizoites there are people who will settle for less than independence. This in itself is a step in the right direction and towards peace. What is required is tactful handling, concessions and magnanimity on the part of the Government of India and rational thinking, practicality and graciousness on the part of the underground leaders. The Church leaders alone cannot do much. For a lasting solution of the problem public involvement is required. Public leaders must be more forthright than they have been. Politicians will have to stop thinking of themselves and of staying in power but must utilise their office in resolving the problem which has dogged the footsteps of their suffering people for so long.

This will entail sacrifices all round as well as some hard and level-headed thinking. New Delhi and the Federal Government of Nagaland have been at cross purposes too long and the stalemate can easily continue with no one suffering too much except of course the poor Naga villager whose disenchantment with all parties and governments is by now complete. This is not the time to stand on national prestige or worry about loss of face for this is a matter involving human lives and much tragedy. If extreme views and demands are modified and if an accommodating spirit is shown then there is no reason why the Naga question cannot be settled within a fairly short time. Failing this the long suffering Naga public will have to make its presence felt and come up with an answer and solution which will only hold up more glaringly the diminishing credibility of both the Government of India and the so-called representatives of the Naga people.

There is yet another aspect of the problem which needs consideration and requires farsighted action. India's relations with China continue to remain cool and China's abetment of hostile activity in the north-east has not endeared that country to India. Again, if India has become a nuclear power, China's nuclear arsenal is also well equipped. International relations and actions are no longer predictable in a world taut with tension. The territory of the north-east areas of India is not to be scoffed at. Wars have been fought for lesser prizes. Of course, in such an event the hill areas will have played directly into China's hands but by then it would be too late.

Perhaps, the greatest weakness on the Naga side is the fact of tribal rivalry which may be said to have been transcended in the wake of Naga nationalism inspired by Phizo way back in 1947. Recent happenings however have repeatedly shown that this unity is often only an illusion. The only binding factor among the tribes is the fact that they are 'different' from the Indians. It is this theory which is the focus of Naga nationalism. As Barclay has said, "A Nationalist needs a theory. But it is no more than the truth to assert that any theory will do. What is really important is not an intellectual argument, but a physical fact of difference ... Race obviously provides the most satisfactory rallying call for the new Nationalism." So, as long as the Underground groups pursue this theory — and many among them confidently speak of holding out indefinitely, having held out for 27 years — and as long as the Government of India takes up the issue piecemeal or hopes to solve it by ignoring it, in short as long as the two sides continue to behave in impractical and uncertain ways, peace in the Naga hills will remain a myth.

United Commercial Bank

Head Office : 10, Brabourne Road, Calcutta-1

REPORT OF THE DIRECTORS

THE Directors have pleasure in presenting their Fifth Annual Report on the working of the Bank for the year ended 31st December 1973. The audited Balance Sheet as at and Profit and Loss Account for the year ended 31st December 1973 are appended hereto.

Impact of Monetary Policy on the Operations of the Bank

The year 1973 will stand out significantly as the year in which the banking system had to face the consequences of a sharp rise in world prices of several essential raw materials and capital goods following the rise in the price of crude oil and the unprecedented rate of inflation in the country. In contrast to the position which obtained in 1972 the demand for Bank credit was of a much higher order and although the deposit resources of the banking system increased during the year by as much as Rs 1,650 crores as against Rs 1,444 crores in the previous year, the credit expansion was disproportionately higher at Rs 1,294 crores as compared with Rs 518 crores in 1972.

During the course of the year, the monetary authorities initiated a series of measures to contain credit expansion by banks as an essential step towards curbing the galloping inflation in the country. These included:

(1) Increase in the Bank Rate from 6 per cent to 7 per cent.

(2) Impounding the cash balances of the banks by enhancing the statutory cash reserve from 3 per cent to 7 per cent in three stages.

(3) Increase of the statutory liquidity ratio from 30 per cent to 32 per cent thus making it necessary for banks to invest more funds in Government Securities.

(4) Restricting recourse to refinance from the Reserve Bnak of India by imposing quantitative ceilings.

(5) Making refinance expensive by raising the rate of interest on borrowings in relation to the net liquidity ratio.

(6) Prescribing initially a minimum lending rate of interest of 10 per cent per annum on advances other than certain specified categories and later raising it to 11 per cent per annum.

(7) Instructions to banks to raise the margin on advances against inventories and book debts.

For the best part of the year the Bank's resources position remained comfortable and it was possible for the Bank to carry on its normal lending operations, along with compliance with the various monetary measures introduced by the Reserve Bank of India. At the end of the 1972-73 busy season, the Bank's advances and bills in India amounted to Rs 240.63 crores which formed 67.58 per cent of the deposits. During the 1973 slack season, the Bank's deposit resources in India went up from Rs 356.07 crores to Rs 395.19 crores showing an increase of Rs 39.12 crores. Advances and bills went up by Rs 12.69 crores from Rs 240.63 crores to Rs 253.32 crores bringing down the credit-deposit ratio from 67.58 per cent to 64.10 per cent. The high liquidity position built up by the Bank during the slack season enabled it to meet the situation arising from the restrictive measures introduced by the monetary authorities, though towards the close of the year the impact of the tight liquidity position made itself felt.

Operations of the Bank

Branch Expansion

During the year 1973, the Bank opened branches at 139 centres — the highest number in any one year since its inception. Of these, 87 were in rural centres, 18 in semi-urban and 17 each in urban and metropolitan centres. At the end of 1973, the total number of branches in India was 670 distributed as under:

Rural	252
Semi-urban	180
Urban	133
Metropolitan	105
Total	670

During the five-year period 1969 to 1973, the number of branches in rural centres increased from 33 to 252 and those in semi-urban centres from 107 to 180. The percentage of branches in rural and semi-urban centres to total number of branches in India at the end of 1973 was 64.4 as compared with 44.6 at the end of 1968.

In its plan for Branch Expansion in 1974, the Bank has laid emphasis on opening branches at centres in underdeveloped states which have remained unbanked though such centres are headquarters of Talukas and Blocks.

Lead Bank Scheme

The Bank's activities in the Lead Districts have been stepped up. Out of the 139 branches opened during 1973, 67 were located in the Lead Districts assigned to the Bank bringing the total number of branches in Lead Districts to 210. The state-wise distribution of these branches was as in Table A.

During the year 1973, the Bank commenced making in-depth studies of the Lead Districts with a view to drawing up credit plans for each Block. It has completed the depth survey of Four Blocks in the district of Hooghly. Similar studies in respect of some of the Blocks in the districts of Birbhum and Howrah in West Bengal, Jodhpur, Nagaur and Jaipur in Rajasthan, Kamrup and Darrang in Assam and Balasore in Orissa are under way.

Follow-up meetings of the District Co-ordination and District Consultative Committees in the Lead Districts were held at regular intervals in order to make an assessment of the progress made by different banks in implementing the programmes taken in hand.

The number of borrowal accounts falling under priority sector advances at the branches in the Lead Districts increased from 7,546 at the end of 1972 to 15,883 at the end of 1973. The outstanding balances in such accounts increased to Rs 7.60 crores at the end of 1973 from Rs 4.42 crores at the end of the previous year.

Table A

State	No. of New Branches Opened in 1973	No of Branches at the End of 1973
West Bengal	17	47
Bihar	4	15
Orissa	9	31
Assam	7	28
Himachal Pradesh	5	18
Punjab	12	35
Rajasthan	13	36
Total	67	210

Deposits

The deposits and other accounts of the Bank at the end of 1973 stood at Rs 480.65 crores as against Rs 416.14 crores at the end of the previous year. The increase in deposits and other accounts excluding those from banks was of the order of Rs 66.77 crores — the percentage increase being 16.94. The Savings Bank deposits were higher by Rs 17.62 crores and stood at Rs 109.67 crores as against the increase of Rs 13.18 crores during the previous year.

The contribution of branches situated in rural and semi-urban areas to the increase in deposits was Rs 19.53 crores forming 29.25 per cent of the total increase in deposits in India.

The number of deposit accounts in India went up from 14,32,550 to 16,27,410 — an increase of 1,94,860 accounts.

The deposits and other accounts of branches outside India showed an increase of Rs 5.35 crores which was marginally higher as compared with the increase of Rs 5.28 crores during the previous year.

Advances and Bills

The aggregate advances and bills of the Bank outstanding as at 31st December 1973 was Rs 315.28 crores as against Rs 243.68 crores, showing a rise of Rs 71.60 crores as against Rs 14.82 crores during the previous year. The average credit-deposit ratio of the Bank in India during 1973 was 65.16 per cent as against 66.48 per cent during the previous year. The credit expansion of the Bank which had remained at a low level as a result of the sluggish tempo of economic growth during the year 1972 showed improvement during 1973, particularly during the last quarter of the year, coinciding with the commencement of the busy season.

The advances in India at Rs 286.15 crores showed an increase of Rs 59.59 crores over the figure of Rs 226.56 crores for the previous year. Out of the increase of Rs 59.59 crores, Rs 30.52 crores being 51.22 per cent, went to Priority Sectors, Public Sector Undertakings and advances for Food Procurement.

Of the increase of Rs 59.59 crores in advances in India, the Eastern and North-Eastern Regions comprising the States of Assam, Bihar, Meghalaya, Orissa, Tripura and West Bengal accounted for Rs 20.81 crores. The deposits of the branches in these States showed an increase of Rs 16.95 crores during the year.

The Bank's credit to large and medium scale industries was of the order of Rs 138.01 crores at the end of 1973 as against Rs 112.37 crores at the end of the previous year. In extending credit to large and medium scale industries foremost consideration was given to the importance of the industry in the economy of the country, particularly in the export field. Though due to rise in prices of raw materials, industries required larger quantum of credit for normal inventories, additional credit in the existing accounts was extended after a close scrutiny of the inventory position and turnover. During the year, the Bank extended new credit lines to medium and large scale industries for their operations or expansion and also for the setting up of new units in backward districts in the States of West Bengal, Bihar, Orissa and Tamil Nadu.

The advances of foreign branches at Rs 29.13 crores showed an increase of Rs 12.01 crores as compared with the increase of Rs 4.35 crores during the previous year. This expansion was met by the branches out of their own local resources.

Priority and Preferred Sectors

In the deployment of credit, the Bank continued to lay emphasis on advances to priority and preferred sectors. At the end of the year, the total credit to these sectors amounted to Rs 79.40 crores as against Rs 60.49 crores at the end of the previous year and Rs 52.74 crores at the end of 1971. The percentage of advances to priority sectors to the total advances of the Bank in India at the end of 1973 was 27.75 as against 24.82 at the end of the previous year and 23.04 at the end of 1971. The increase in credit to these sectors formed 28.32 per cent of the deposit accretion during the year and 31.73 per cent of the rise in total Bank credit in India. The number of

borrowal accounts at 76,735 showed a rise of 16,646 as compared with the rise of 7,347 during the previous year. The sector-wise position of the priority sector advances for the years 1971, 1972 and 1973 is given in Table B.

Advances to Small-scale Industries

The advances to Small-scale Industries sector inclusive of transport operators at Rs 26.59 crores recorded an increase of 17.70 per cent over the previous year's level of Rs 22.59 crores. The number of new borrowal accounts during the year went up by 1,929 as against 681 during the previous year.

Agriculture

The advances to the agricultural sector improved from Rs 17.15 crores at the end of 1972 to Rs 21.60 crores at the end of 1973. The number of borrowal accounts at the end of 1973 rose to 47,657 from 38,848. Out of these 47,657 accounts, 20,130 accounts or 42.24 per cent were of farmers having land holdings of less than five acres. The direct finance to agriculture amounted to Rs 12.42 crores and out of this Rs 4.13 crores or 33.25 per cent went to the category of the small farmers.

A number of schemes for financing agricultural and allied activities was formulated by the Bank on its own or with the help of the Agricultural Finance Corporation Ltd, during the year 1973.

Exports

The Bank recorded good performance, during the year in Export Finance. At the end of 1973, the total exports credit outstanding amounted to Rs 22.10 crores as compared with Rs 12.82 crores at the end of 1972 reflecting an increase of 72.39 per cent. The major portion of such finance was extended to exporters of Cotton textiles, Jute and Jute goods, Tea, Shellac, Engineering goods and Handicrafts. Some of the Bank's customers have won Awards for outstanding export performance.

Assistance to Other Preferred Sectors

The total advances to other preferred sectors at the end of 1973 amounted to Rs 9.11 crores showing an increase of Rs 1.18 crores over the previous year. The number of borrowal accounts at 19,833 showed an increase of 5,843. With a view to helping the revival of film industry in the State of West Bengal, the Bank extended financial assistance for construction of small capacity cinema halls in rural and semi-urban areas and for production and exhibition of documentary and feature films. The main consideration which has weighed with the Bank in extending finance for construction of cinema halls is to help generate additional employment potential in rural/semi-urban areas as a result of establishment of cinema halls. Similarly, financial assistance to documentary and feature film producers has been given to enable them to get finance at reasonable rates of interest instead of borrowing from private money lenders at usurious rates. Likewise, financial assistance has been extended to a mobile theatrical group which performs plays in and around Calcutta supporting a large number of artistes. The Table C gives the comparative position of the Bank's performance in extending credit to other preferred sectors for the years 1971, 1972 and 1973.

Special attention was paid during the year for implementing the Government scheme for providing half a million jobs to educated unemployed persons. A Special Cell was created at the Head Office of the Bank for processing the applications received under the scheme as well as for ensuring prompt action in the disbursement of credit at the branch level. This scheme gathered momentum towards the end of the year and substantial progress is expected during the current year.

We have so far approved 389 applications and sanctioned loans upto Rs 2.08 crores in West Bengal. Special mention may be made of the scheme at Industrial Estate Patulia, Titagarh — where the Bank has sanctioned 18 schemes involving Rs 12.75 lakhs covering manufacture of machinery spares, machine needles, printing press, dairy products, ceramic products, radio receivers, corrugated boxes, and confectionery items. The 18 units have provided employment to 262 youngmen of whom 42 are educated unemployed.

Differential Interest Rates Scheme

The scope of the scheme for lending at the concessional rate of interest of 4 per cent per annum which was introduced in the middle of 1972 was widened in the month of March 1973 by:

(1) covering SFDA/MFAL districts,
(2) increasing the number of districts from 163 to 265,
(3) adding new categories of beneficiaries,
(4) raising the ceiling of family income from Rs 2,000 to Rs 3,000 per annum in urban and semi-urban areas and from Rs 1,200 to Rs 2,000 per annum in rural areas and
(5) raising the ceiling on term loans from Rs 2,500 to Rs 5,000 and working capital finance from Rs 500 to Rs 1,500 to any single borrower.

The Bank had initially introduced the scheme at 70 branches. With the widening of the scope, the scheme has been extended to 221 branches. As at the end of December 1973, the advances under the scheme amounted to Rs 16.30 lakhs as compared with Rs 3.08 lakhs at the end of the previous year. The number of beneficiaries under the scheme stood at 3,520.

Investments

The investments in Government and other Securities which stood at Rs 139.94 crores at the end of December 1972 rose to Rs 169.26 crores as on 7th September 1973. In order to comply with the Reserve Bank directive to maintain the higher cash reserve ratio of 5 per cent from 29th June 1973, 6 per cent from 8th September 1973 and 7 per cent from 22nd September 1973 as also to meet the expansion in credit during the busy season, the Bank had to dis-invest some Government and other Securities. During the same period, the Bank had lent support to the new Issues of the Central and State Governments and State associated Bodies/Corporations. At the end of the year, the investments portfolio at Rs 150.86 crores showed an increase of Rs 10.92 crores over the previous year's figure of Rs 139.94 crores.

Working Results

On account of the increased volume of business, the income under the heads 'Interest and Discount' and 'Commission, Exchange and Brokerage' rose by Rs 6.61 crores and Rs 0.55 crore respectively as compared with the increase of Rs 2.76 crores and Rs 0.11 crore respectively during the previous year.

On the expenditure side 'Interest paid on deposits, borrowings, etc' went up by Rs 4.63 crores as against Rs 1.41 crores during the previous year. Salaries and allowances and contribution to Provident Fund and Gratuity Fund went up by Rs 2.10 crores as against Rs 0.92 crore during the previous year. Due to low credit-deposit ratio for the best part of the year, increase in the cost of short term funds, the unprecedented rise in the rates of Dearness Allowance of employees and the higher cost of rents, stationery, printing, etc, the profit for the year at Rs 180.68 lakhs was marginally lower than the profit for the previous year.

Out of the profit, the amount transferred to Reserve Fund at Rs 39 lakhs was marginally higher than in the previous year. After providing Rs 96.00 lakhs for payment of bonus to staff a sum of Rs 45.68 lakhs has been transferred to the Central government in terms of Section 10 (7) of the Banking Companies (Acquisition and Transfer of Undertakings) Act, 1970 which works out to 5.5 per cent of the compensation amount of Rs 8.30 crores paid by the Government for the acquisition of the undertaking of The United Commercial Bank Limited.

Overseas Operations

The Bank's foreign branches in Hong Kong, Singapore and London, made good progress in their working during the year.

The United Asian Bank Berhad with Head Office at Kuala Lumpur promoted jointly by Indian Ovearseas Bank, Indian Bank and United Commercial Bank, commenced functioning from May 26, 1973. The new Bank has taken over the assets and liabilities of the branches in Malaysia of the three Indian Banks that were operating there at the time of nationalisation of Banks in India.

Training of Personnel

The training of personnel in various fields was continued during the year. 90 Promotee Officers attended the foundation course designed for them. Induction courses on financing agriculture and allied activities were conducted at Ahmedabad, Ranchi, Madras, Kalyani and Jaipur for the benefit of 116 agricultural graduates appointed during the year as Field Officers and 37 Rural Branch Managers. Special courses for credit management were also held at some of the centres for the benefit of Managers of Branches and Heads of the advances departments of the bigger Branches. The Bank also imparted induction training to 182 clerks recruited during the year. 39 Inspectors and Auditors were deputed by the Bank to the Inspection Orientation Course conducted by Bankers' Training College (RBI), Bombay. A training college with hostel facilities is being set up in Calcutta shortly. At this centre it is proposed to impart training to staff at various levels in rural banking, agricultural finance, credit operations, foreign exchange, audit and inspection, etc. The necessary faculty staff for the purpose has been detailed from within the Bank.

USE OF HINDI

Further steps were taken in the matter of using Hindi in the Bank's operations. Two officers with specialised knowledge of Hindi were appointed at Head Office and an Official Language Implementation Committee consisting of some senior officers of the Bank was constituted. The Branches situated in all the Hindi speaking areas have been advised to bring into use a larger number of forms, particularly those used by the public, printed either in Hindi or bilingually in Hindi and English. In the Hindi speaking areas, Bank's signboards and names of departments are being displayed in Hindi. At the Divisional and Zonal Offices situated in such areas, typewriters in Hindi language have been introduced and efforts are being made to send replies in Hindi to the letters received in that language.

MEETING OF THE BOARD OF DIRECTORS AND THE MANAGEMENT COMMITTEE

During the year 1973, 8 meetings of the Board of Directors were held. The Management Committee constituted under the provisions of the Nationalised Banks (Management and Miscellaneous Provisions) Scheme 1970 met 17 times during the year 1973. The term of the Management Committee expired on 10th December 1973 and since then the Board of Directors has been meeting on an average twice a month.

STAFF

During the year 1973, the Bank recruited 403 persons in the subordinate cadre, 1,194 persons in the clerical cadre and 180 persons in the officers cadre including Field Officers and Technical Staff. At the end of the year 1973, the strength of staff of the Bank in the various cadres was as under :

Subordinate Cadre	3,170
Clerical Cadre	6,710
Officers Cadre	2,770
Total	12,650

The staff relations during the year were satisfactory.

The Board of Directors wishes to place on record its appreciation of the services rendered by the staff at various levels and looks forward to their continued co-operation in building up the image of the Bank and in fulfilling the objectives of nationalisation.

The Board of Directors is grateful to the Bank's clients and well-wishers in India and abroad for their wholehearted support and patronage.

For and on behalf of the Board of Directors

Calcutta, V R DESAI
5th July 1974 *Chairman*

United Commercial Bank

NOTES:

1. In accordance with the past practice, the Assets and Liabilities of the Foreign Branches (excluding Karachi branch) of the Bank including fixed assets and capital funds have been converted at the basic rate of exchange as on 31st December 1973.
2. The Assets and Liabilities of the Karachi branch of The United Commercial Bank Ltd., stand entrusted to the Bank on its nationalisation. Such Assets and Liabilities continue to vest in the Custodian of Enemy Property, Pakistan, and since no further information was available about the Assets and Liabilities in Pakistan after 27th August 1965, these have been incorporated in the Balance Sheet at their net book value (at pre-devaluation parity) as on that date.
3. (a) Branch Adjustment Account at Head Office has been reconciled upto 30th June 1970 and reconciliation upto 31st December 1973 is in progress. Reconciliation statements in respect of balances as on 31st December 1973 in the case of some branches and bank accounts are under preparation.
   (b) The tallying of balances in some accounts as per General Ledgers with those as per Subsidiary Ledgers/Registers/Detailed Statements could not be completed at a few branches: appropriate steps are being taken in this regard.
4. In accordance with past practice, a lumpsum provision for Rs. 10,00,000 has been made in these accounts for contribution to a Gratuity Trust Fund from which Fund gratuity payments are met. The actual liability on account of gratuity accrued for the year as well as the extent of the additional contribution to be made to the Gratuity Trust Fund to cover the total liability on account of gratuity as at 31.12.73 have not been ascertained.
5. Included in unsecured Loans, Cash Credits and Overdrafts (considered good) is an amount of Rs 1,97,88,016 24 due from several Coal Companies/Colliery owners in respect of which necessary claims have been lodged/will be lodged with appropriate Authorities under The Coking Coal Mines (Nationalisation) Act, 1972 and The Coal Mines (Nationalisation) Act, 1973. In the absence of adequate information, it has not been possible to ascertain the shortfall, if any, that may arise on the final settlement of these claims and accordingly, no provision has been made in these accounts in respect thereof.
6. Previous year's figures have been rearranged where necessary.

TOTAL Rs. ..	6,26,58,69,156 44		5,19,77,70,728

The above Accounts have been drawn up in accordance with the provisions of Section 29 of the Banking Regulation Act, 1949.

REPORT OF THE AUDITORS

THE PRESIDENT OF INDIA

1. We have audited the foregoing Balance Sheet of United Commercial Bank as at 31st December, 1973 and also the foregoing Profit and Loss Account of the Bank for the year ended upon that date in which are incorporated the returns of 47 branches audited by us, 303 branches audited by other auditors and unaudited returns in respect of 326 branches not visited by us. The branches to be audited by us and the branches to be audited by other auditors have been selected by the Bank in accordance with the guidelines issued to the Bank by the Reserve Bank of India.

2. The Balance Sheet and Profit and Loss Account have been drawn up in forms 'A' and 'B' respectively of the Third Schedule of the Banking Regulation Act, 1949. Accordingly, they disclose such matters as were required to be disclosed in the case of banking companies prior to nationalisation by virtue of the provisions of the said Act as read with the related provisions of the Companies Act, 1956. Subject to the limitations of such disclosure and on the basis of the audit indicated in the first paragraph, we report that:—

(a) Subject to notes (2), (3), (4) and (5) on the Balance Sheet regarding Karachi Branch, Branch Adjustments, etc, Provision for Gratuity and Loans, etc, due from Coal Companies/Colliery owners respectively, in our opinion and to the best of our information and according to the explanations given to us and as shown by the books of the Bank.
  (i) The Balance Sheet read with the notes thereon is a full and fair Balance Sheet containing the necessary particulars and it is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December, 1973.
  (ii) The Profit and Loss Account read with the notes thereon shows a true balance of profit for the year covered by the Account.

(b) Subject to notes (2), (3), (4) and (5) as aforesaid, we have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory.

(c) The transactions of the Bank which have come to our notice have been within the powers of the Bank.

(d) The returns received from the offices and branches of the Bank have been found adequate for the purposes of our audit.

Less-Developed Countries and Private Foreign Investment

Sanjaya Lall

I

THIS paper is partly a review of an important new work by G L Reuber and associates on the economics of private foreign manufacturing investment in less-developed countries (LDCs),[1] and partly an attempt to examine some of the larger issues facing the study of such investment. Reuber's book is an interesting and provocative one, and in this essay I shall concentrate on the first 250 pages which contain the analytical sections, and which constitute a vigorous defence of foreign investment in LDCs. The book also contains 5 appendices on its structure and distribution, the characteristics of selected projects, the interview procedure and the sources and definitions of the data. The analysis is based on published and unpublished information as well as on direct interviews with about 80 investing firms, and claims to be a major contribution to our knowledge in this field.

"Private Foreign Investment in Development" is the first work which deals exclusively with the general problem of foreign investment in LDCs, and, as such, is destined to become a standard text in the field. The argument and methodology of the book seem academic and thorough, and its tone appears to be neutral and objective. The authors have, however, a large axe to grind: they are concerned to establish the benefits of foreign investment for LDCs, and to prove their case they summarily dismiss many valid criticisms of foreign investment; their conclusions are, moreover, derived from a set of value judgments which are not explicitly defined and which may be regarded as invalid or unacceptable by many groups affected by foreign investment.

A review of this book may, therefore, serve as an appropriate place to discuss some of the basic values underlying the study of foreign investment. Part II uses a simple taxonomy to highlight some of the important elements on which different approaches to foreign investment are based; Part III evaluates Reuber's work in terms of this taxonomy and in terms of his treatment of some specific issues related to foreign investment.

II

The analysis of the phenomenon of private foreign investment, and of its recent manifestation in the form of the multinational enterprise (MNE), has been undertaken by schools which represent every shade of political and economic belief. There is at present hardly any subject in economics which arouses so much controversy and such a variety of interpretation, the differences arising not so much from disagreements about the data (though these are also present) as from disagreements about fundamental values and definitions in the context of economic and political development. The approaches to foreign direct investment may, at the risk of some over-simplification, be grouped into six categories, three for it and three against.

A Pro-Foreign Investment

(i) At the extreme right of the spectrum lies the business-school approach. The essential characteristics of this approach are: an implicit belief in the moral and practical virtues of the free enterprise system; an acceptance of the existing distribution of income within and between countries; a disregard for the overall economic, political and social effects of an extension of the system to other countries; and, consequent on the above, prescriptions for government policy that centre on the well-being of business enterprises as opposed to all other groups, and call for an environment of stability and non-interference conducive to 'good business'. Business-school analysts not only provide firms with guides to greater efficiency, but also serve to rationalise and defend their evolving structure or practices to the outside world. There is an enormous collection of this sort of literature, ranging from purely organisational analysis to recommendations on how to counter expropriation, how best to use 'financial tools' to minimise tax burdens,[2] and how to plan the most profitable ownership strategies.

(ii) A more academic line of analysis which closely resembles the previous one but which explicitly formulates the economic theory involved may be termed the 'traditional economic' approach. While this is not at all concerned with the organisational and motivational analysis of foreign investors, the assumptions on which it is based lead to very similar prescriptions of *laissez faire* and maximisation of foreign capital flows.[3] These assumptions are the essential ones of the bulk of Western normative economics, and cannot be properly discussed here; however, the ones most relevant to foreign investment in LDCs are as follows:

(a) Foreign investment constitutes a net addition to investible resources in host countries, and as such raises their rates of growth. This is based on a further set of assumptions about the competitive nature of product and factor markets, mobility of factors between occupations, incremental capital-output ratios, use of capacity, and so on — in short, all the standard premises of 'growth model' economics, (usually with 'externalities' assumed absent).

(b) The pattern of growth which results is desirable. This presumes a host of specific conditions and values which underlie welfare economics, mainly that the market is the best determinant of economic and social welfare — thus the distribution of income reflected in the market is desirable, or, more subtly, is not the concern of economists at all, and that the preferences revealed are independently formed and the true indicators of 'welfare'. In the particular case of foreign investment in LDCs, the implications are that the products introduced and marketed, the tastes created, and the needs met, all benefit the countries, as long as the ventures earn profits.[4]

(c) The freeing of international trade and capital flows is conducive both to total world welfare and to the welfare of each individual country — another fundamental tenet, this time of trade theory. The assumptions required for this are similar to those mentioned above; in the case of LDCs the desirability of foreign investment is increased because of its integrative effect on host economies. The operation of foreign firms, especially of modern multinational firms, knits countries closer into the web of international commerce, both by (vertical and horizontal) economic integration and by the transmission of tastes, designs, ideas, and technology.

(d) Foreign investment also brings benefits which are not recognised in the orthodox literature, but which are central to much of the recent work on the subject. These concern the introduction of new technology, better management and organisation, superior marketing and sometimes cheaper finance. The beneficial nature of these contributions is generally taken for granted, though clearly the economic rationale is derived directly from (b) above, i e, it must be 'good' if it is profitable, even though the circumstances are very different from the perfectly competitive situation envisaged by the early welfare economists. The new schools of technology- and management-oriented analysts, whose roots lie partly in business schools, assume essentially that the free enterprise system as it operates in the leading capitalist countries represents the best form of economic and social organisation, and that its wholesale extension, including the forms of technology produced, the differentiation of products, the methods of advertising and selling, and the philosophy of corporate operation, to LDCs is *per se* desirable.

What has been termed the 'traditional economic' approach therefore embraces vast tracts of received economic wisdom as well as accretions of hard-headed business pragmatism. Since the free enterprise system is assumed to be the most efficient means of promoting well-being, the policies which are prescribed for LDCs naturally entail minimisation of controls, interference and public ownership. The recent proponents of this approach include Kindleberger (1969) and Vernon (1971), though sometimes exhibit features of (iii) below.

(iii) There are some analysts concerned with the oligopolistic, predatory and concentrated nature of MNEs who, while holding a basic belief in the desirability of foreign investment, recommend controls and official regulation; this may be called the 'neo-traditionalist' approach. Its proponents believe in the good, old-fashioned virtues of early capitalism and are worried by the giantism and power of the present MNE; they are more realistic than the real traditionalists in that they realise better the extent of change and the problems created, but they share the same fundamental economic values and believe in the same framework of analysis. The distinguishing characteristic of this approach is a free admission of the potential for a divergence of interest between foreign investors and host countries; the remedies range from setting up multinational political units to cope with MNEs (Goldberg and Kindleberger, 1970) and implementing various national measures (Behrman, 1970) to drastic reversals of policy to attack 'bigness' and restore competition (Bannock, 1971). In general, the proponents of this school take the MNE as the more powerful and lasting — and often more desirable — entity than the nation-state, and see the latter evolving to catch up with the former rather than any tendency in the reverse direction.

(B) Anti-Foreign Investment

(i) A shift of emphasis from the virtues of international capitalism (in some form) to those of nationally-owned development leads to the 'nationalist' approach. In this approach, the standpoint is usually that of the less-developed host country rather than of the investing firm or the capital-exporting country: the change is significant, because the basic virtues of the international free market system are brought into question and its various implicit values criticised. The main arguments of this approach can be summarised as follows:

(a) There may be various external effects of foreign investment which damage host economies, such as the suppression of domestic entrepreneurship, the effects on the economy of the importation of unsuitable technology and of unsuitable products, the extention of oligopolistic practices such as unnecessary product differentiation, heavy advertising, or excessive profit-taking, and the worsening of income distribution by a self-perpetuating process which simultaneously re-inforces high-income elites and provides them with expensive consumer goods. In a nutshell, the market no longer provides an infallible guide to national welfare.

(b) The cost of private foreign investment may be too high as compared to the next best alternative, even in the absence of external effects, because the foreign investor is able to extract monopoly profits or use superior bargaining power to gain concessions, or because there are costs inherent in the mode of operation, such as the introduction of unsuitable products or technology, or the misuse of transfer pricing and other tools to remit hidden profits, or the imposition of export restrictions and unfair marketing practices.

(c) The degree of integration with the international trading system implicit in allowing MNEs to enter an economy may not be acceptable either because LDCs may consider free (or freer) trade more damaging than beneficial to their economic growth, or because the pattern of production and distribution entailed by such integration may be regarded as undesirable.[5]

It should be noted that the nationalist school says little about the internal strategy of development (whether it should be socialist or capitalist). Its main emphasis is on minimising the cost and extent of foreign investment while extracting to the full its more suitable elements, especially technology, and it is assumed that the domestic industrialist class is capable to undertake and sustain a desirable pattern of growth and distribution. This leads to policy recommendations stressing stringent regulation of foreign investments, case-by-case bargaining, shopping around for better deals, and exchange of information between LDCs; some examples of this sort of approach are Streeten (1973), Streeten and Lall (1973), Vaitsos (1970).

(ii) The 'dependence' approach, which has its origins in Latin America, incorporates most of the features of the nationalist school, but stresses the broader ramifications of the whole capitalist development process of which foreign investment is one element. It analyses the social, political and economic consequences of the penetration of capitalist institutions and methods into LDCs, and concludes that the inherently dependent status of these countries can never permit real development. The greatest contribution of the dependence school is its broad perspective and its analysis of the internal political/economic forces which reinforce the historical dominance of the central capitalist countries. The remedies are seen, consequently, in sweeping changes in both external relations and internal power structures; in a very mild form, however, the prescriptions are not very different from those of the nationalists, while in an extreme one they come close to the Marxist school.

The conventional economic framework cannot accommodate the dependence approach: no amount of discus-

sion of 'externalities' and 'utility from nationalism' can capture its full implications. Though some dependence-school economists tend at times to give the impression that they are only employing orthodox economic tools, their most interesting reasoning, about the very *nature* of 'genuine development' and its contrast with dependent development, lies outside the scope of such tools. The dependence-school still has to formulate its analytical apparatus fully, but as it stands it does afford a novel standpoint to the subject, not quite Marxist and not simply nationalistic; Dos Santos (1970), Sunkel (1969-70), and Hymer (1972) may serve as good examples.

(iii) The Marxist approach to foreign investment is conducted more explicitly in terms of class conflict; modern Marxists (such as Baran, 1957) employ the concept of 'economic surplus' which in this context is extracted from LDCs by foreign investors. Where the dependence school talks of the dangers of dependence, this approach talks of 'neo-imperialism' and 'exploitation'; the analysis lies further outside the scope of conventional economics, and *all* the values of the capitalist system are under attack. The dependence school is concerned with *national* development, in which the final class-structure is left ambiguous, while the Marxist school is concerned with socialist development, in which the final class-structure is clearly defined, and it is one which is not attainable within the framework of the existing system of ownership within LDCs or within that of integration with the international capitalist system. The remedy is, therefore, seen as internal revolution and complete rejection of foreign capital. Recent Marxist analysts, such as Magdoff (1969) and Sweezy and Magdoff (1972), have advanced the theory of imperialism to take account of the emergence of MNEs and their effects on LDCs; in the particular context of LDCs, the work of Frank (1972) and Weisskopf (1972) has great value.

The six approaches sketched out above each embodies a different interpretation of economic reality, a different emphasis on certain aspects of that reality, and a different concept of the value and meaning of changes in it. Even given the basic premise that everyone wants to promote the well-being of LDCs and some measure of agreement on the hard data (investment flows, value of output, employment, growth rates, and the like), there is bound to remain a fundamental divergence in views about the desirability and contribution of foreign investment to LDCs. There cannot, in other words, be a 'value-free' or 'objective' assessment of foreign investment[6] — hardly an original or startling fact, but one which is often forgotten or hidden in the polemics that rage round the subject.

If there cannot be an objective assessment, and no consensus on any particular system of values is likely to emerge, how then should one set about discussing the problem? There are two possibilities: first, the values on which the analysis is based can simply be taken for granted as *a priori* postulates; or, second, they may be defined, rationalised and stated explicitly. In the first case, though the conclusions may be derived by legitimate logical steps from the premises and appear perfectly rational and acceptable to those who share those premises, the *real* argument is concealed and the debate cannot really begin. In the second, it can at least be seen *where* the disagreement lies, which does not by any means provide a solution but does represent some progress, if only in an intellectual or moral sphere.

Both pro- and anti-foreign investment schools have examples of the the concealed premises approach. The former, however, has used it far more because the values on which it is based are in the established tradition of Western economics. This does not make it any the less objectionable, because alternative systems have been proposed and tried, and because an unalloyed transfer of that system to less-developed nations, where the assumptions are not really valid and whose aspirations are not really taken into account, leads both to morally unjustifiable conclusions as well as to practical problems of hostility and incomprehension.[7] Ultimately, therefore, the practice of economics in LDCs cannot remain simply an 'economic' exercise but must step into the realm of politics; it it would be self-deception to pretend otherwise.

The general observations may be useful in understanding the nature of the present controversy about foreign investment in LDCs; they are also helpful in reviewing the book at hand, to which we now turn.

III

This section is a critical evaluation of "Private Foreign Investment in Development". Though it concentrates on the negative aspects of the book, mainly in order to redress its bias in favour of foreign investment, it is not intended to denigrate many of its positive qualities. The book contains a number of valuable facts about foreign investment in LDCs, and its analysis is clear and logical; it offers a welcome antidote to various vague and emotive debates on the subject, and opens up many possibilities for useful research. This being admitted, let us consider the other side.

"Private Foreign Investment in Development" stands firmly with one foot planted in approach (A)(i) (business school) and the other in approach (A)(ii) (traditional economic). Its business-school orientation derives from the fact that its original research is based almost entirely on interviews with and data given by the parent companies of firms investing in LDCs; there is no attempt to discover and present the viewpoints of host governments, locally-owned enterprises or even the local subsidiaries of foreign firms. Thus, a discussion of the motivation of the investors figures rather prominently, and the emphasis throughout is on their preferences, practices and aversions, as though these were more real and important than those of LDCs. The 'traditional economic' approach is more pervasive; Reuber tends to be even more 'traditional' than other present representatives of this school, and the basic assumption is that foreign investment provides a net increase in capital formation, raises output and employment, and is therefore beneficial, except for a strong qualification in cases where the investment is highly protected (for which the blame is put squarely on the host government's shoulders) and results in very low or negative value-added at international prices.

The 'traditional economic' beliefs are so firmly held that the entire structure of the reasoning and policy conclusions follow from them as self-evident propositions. The data adduced neither prove nor disprove the social desirability of foreign investment, since no attempt is made at a social benefit-cost analysis (despite strong recommendations that LDCs apply such techniques to foreign investment projects).[8] The argument basically proceeds by starting from a competitive model (with market prices measuring social values) and allowing for distortions (which are mostly the fault of government policies) in the form of tariffs, taxes and controls; foreign investors are seen as neutral providers of capital, expertise and technology, superior in all these to local alternatives; putting the two together, it follows that foreign investment is necessarily beneficial unless the host government has adopted incorrect policies.[9] Some harmful effects of foreign investment are discussed but are not taken very seriously; we return to these below, but Reuber's general case could really have been made much more briefly and without appeal to the rather spurious support provided by his data.

Criticisms of this sort of reasoning at the most general level have already been mentioned in the previous section. To what extent do market prices, corrected for the sort of 'distortion' mentioned above, measure welfare in LDCs? Is growth in per capita GNP at these prices really what LDCs should be striving for? If the pattern of consumption, technology, distribution of power and wealth are at all important, how much relevance does conventional welfare economics have? If the dependence school has a valid point to make, does it make sense to leave their reasoning completely out of account, simply because it is not 'purely economic'? An aspect of Reuber's which may be found especially unsatisfactory is the direct link assumed between the firm's profitability and the host country's welfare: is a less developed country's welfare really increased by 'market development' (high pressure sales tactics), product differentiation, oligopolistic market structures, transmission of certain types of technology which displace labour or lead only to frequent model changes? One could go on and on, but the basis of disagreement is clear, and concerns the values involved as well as the concealed premises of the analysis. Let us now briefly consider a few specific aspects of Reuber's treatment of foreign investment.

(a) Foreign investor-host government relationships. It follows logically from the framework of Reuber's analysis that government policies should aim at removing tariff, tax and direct control 'distortions' in LDCs, at encouraging the inflow of foreign capital, and at minimising specific controls on foreign investors. Over the long run the ideal situation would presumably be a fully integrated international production structure dominated by MNEs, with few or no government controls or national restrictions. A number of objections can be raised to this 'ideal' and to its policy implications. First, the conflict of interests between MNEs and LDCs may be much more serious than Reuber makes out. He avoids mentioning not only the extensive literature on the MNE-state conflict (such as Behrman, 1970, or Menderhausen, 1969), but also the ITT Chile fiasco, or the excellent political-economic study of India by Kidron, 1965 (though India is one of the LDCs covered by Reuber). He argues that foreign investors do not constitute a particularly strong pressure group, but ignores historical evidence from Latin America and the dependency and Marxist-schools' literature on this. Second, though the possibility of bargaining with MNEs is mentioned at several points Reuber in fact ignores this when considering policy. Proponents of the nationalist school argue, with reason, that strong controls are needed on every aspect of foreign investors' activities because of their oligopolistic powers, ability to transfer profits undetected, and numerous other damaging effects; and that, given the distribution of power and resources, it is possible for host countries to get a much better deal from them by tough bargaining than by doing nothing.[10] Third, by dismissing the desirability of control and bargaining Reuber also ignores any consideration of how an LDC's bargaining power can be improved, by means of collecting information, international co-operation, shopping around, and so on. This is a serious fault of the book, because it is here that LDCs' governments look most for guidance at the operational level.

(b) Transfer Pricing and Export Restrictions. These constitute serious practical problems in the operation of foreign enterprises. As far as export restrictions are concerned, Reuber brushes off the problem by saying, "Little evidence of such restrictions was uncovered in our survey" (p 163), and does not mention several studies in existence which have found such evidence (UNCTAD, various) in a number of countries; when favourable effects are concerned, of course, he quotes widely from the literature.[11] Similarly with transfer pricing, Vernon is quoted as saying that there does not appear to be a "systematic bias in favour of assigning the largest profits to the parent";[12] Vernon's statement is based on reports given by the MNEs themselves, and, moreover, is quite consistent with the proposition that LDCs as a whole lose *via* transfer pricing to developed countries (see Lall, 1973, and Vaitsos, 1970).[13] When he argues that there is not enough evidence, it may be answered that while it *is* very difficult to get evidence on transfer prices and their appropriateness, the few investigations which have taken place have *all* shown that transfer-prices are used against LDCs (UNCTAD 1971-b).

(c) Technology. Reuber draws a peculiar distinction between 'techniques', which are easily available internationally, and 'technology', which is new and under the control of MNEs; he then pays little attention to the former, which in fact comprises a major part of the technology (in the sense of productive knowledge) needed by LDCs, and argues that foreign investment is the best way to transfer the latter. Whether or not direct investment is preferable to licensing for LDCs is not proved; it is assumed on *a priori* grounds that the former is cheaper (mainly because MNEs prefer it). The real costs of technology transferred by direct investment, comprising a substantial element of profits and not only royalties and fees, are not compared to the costs of licensing. As for the problem of the appropriateness of the techniques transferred, the possibility of intermediate technology is summarily dismissed, and it is argued that the technology transferred by MNEs "seems as appropriate to the factor endowments found in LDCs as the transfers made through other channels", which begs the question of the real alternatives.[14] As with the general recommendations on government regulation, the potential for bargaining is minimised; this again is a pity, because the highly imperfect nature of the technology market and the weak position of LDCs in fact calls for a much more active role on part of their governments (see Streeten, 1972-b).

(d) Costs of Foreign Investment.[15] The net economic costs of foreign investment may be calculated by comparing it with the costs of the next best alternative. Reuber tends generally to assume that in the absence of foreign investment the project would not be undertaken at all, or, at least, much less efficiently; again, he simply assumes superior management and organisation on part of foreign firms on the basis of the fact that they find it easy to compete, ignoring their numerous oligopolistic advantages which may be much more significant in this respect. The fact that many projects actually run by foreigners could be just as well, if not better, run by local enterprises, the basis of the so-called 'Streeten dilemma',[16] is dismissed as resting on "special and highly implausible assumptions" (p 38). In fact, an empirical survey of a number of countries and foreign firms leads one to believe that there is nothing special or highly implausible about this (Streeten and Lall, 1973); undoubtedly a number of foreign enterprises could not be fully locally replaced, but, equally undoubtedly, a number could. An aspect of the financial cost of foreign investment which is not properly treated is that of local gearing. On page 213, Reuber misrepre-

sents the case of critics who argue that foreign investors put in relatively little capital of their own but gear themselves highly on local borrowing. He puts the argument (source unspecified) as relating to locally reinvested profits, while in fact that area of concern is local *borrowing*; he then proceeds to knock down the straw man. It may be of interest to note that for a sample of 56 firms in Colombia, foreign loans provided only 38 per cent of total loans, and that gearing, especially based on borrowing from local banks, had a significant correlation with profitability.[17] The higher the extent of local gearing, the higher, of course, is the profitability of the foreign capital invested; and investigations have shown that foreign investors try to gear themselves as highly as possible in their host countries.

Reuber's analysis is interesting and consistent — once the general premises are accepted — but it cannot claim to have contributed greatly to our understanding of the phenomenon to which it is addressed. No new analytical tools are forged, and most of the sample data adduced add little to the force of the argument. Large sections serve simply to review the literature in a highly selective fashion; the policy prescriptions are, at best, inadequate and, at worst, very misleading.

Notes

[I would like to thank Deepak Nayyar and Paul Streeten for their comments and suggestions.]

1 Grant L Reuber, with H Crookel, M Emerson, G Gallais-Hammonno, "Private Foreign Investment in Development", Oxford, Clarendon Press, 1973, pp xiv, 371, £ 5.50. Prepared under the auspices of the OECD Development Centre, Paris.

2 A recent work which aptly illustrates these characteristics is by Robbins and Stobaugh (1973), who build a sophisticated model of how MNEs can greatly raise their profits by a better use of transfer prices and other financial channels. The fact that the loss from such 'revenue shifting' will be borne by host governments, and certainly by most host LDCs, is not considered relevant to the 'optimum strategy' proposed; even the use of technical euphemisms (in quotation marks) is intended to raise possibly objectionable practices to the status of efficient — and therefore desirable — business tactics.

3 With minor exceptions for the imposition of 'optimum' tariffs and taxes on flows of commodities and capital.

4 This would be qualified to "earned profits in an internationally competitive framework" if protection were introduced.

5 See, for instance, Stewart (1973) for a discussion of the undesirable effects of free trade on LDCs' technology and consumption patterns.

6 The place of value judgments in economics has been treated at great length in Myrdal (1968), especially in the Prologue and appendices 2 and 3.

7 "....studies of the problems of underdeveloped countries are now undertaken, not with a view to the universal and timeless values that are our legacy from the Enlightenment, but with a view to the fortuitous and narrow political or, narrower still, military-strategic interests of one state or bloc of states .... Sometimes its intention is stated, though not in the form of a reasoned presentation of specific value premises logically related to the definition of the concepts used. More often it remains implicit in the approach. This type of reasoning must often make the public and scholars in the underdeveloped countries irritated, as they naturally want their problems analysed from the point of view of their own interests and valuations." Myrdal, *ibid*, pp 8-10.

8 For an application and discussion of the limitations of such methods in the context of foreign manufacturing investment in LDCs see Lall and Mayhew (1973) and Streeten and Lall (1973).

9 For instance, in discussing the distributive effects of foreign investment, Reuber states: "The broad distributive effects of private foreign investment seem reasonably clear, assuming government policy to be the same after foreign investment occurs as before. In the long run, after all general equilibrium effects have worked themselves out, one may expect capital inflows to lower the real incomes of local capitalists and to raise the real income of labour and other complementary factors. Moreover, by enhancing the supply of capital available to the country and thereby reducing capital costs from what they would otherwise be, investment in industries and localities with less favourable access to capital markets becomes economically feasible. In addition, by keeping capital costs down foreign capital inflows make feasible more long term projects ... for which capital service changes ... are an important cost" (p 218). This paragraph graphically illustrates the model underlying the whole study; the reader may judge for himself its relevance to LDCs.

10 Reuber refers to local control as being "under the thumb of local governments and bureaucrats" (p 215).

11 For Canada, for instance, Safarian is often mentioned, while the Canadian Government's massive, and often critical study, of 1972, and Levitt, 1970, are completely ignored. Safarian is, as is to be expected, a solid 'traditional economist'.

12 Vernon, 1970, p 139.

13 Even the US Tariff Commission's massive study, 1973, which supports MNEs, says on page 133, "The chief strategy of tax minimisation by multinational companies is manipulation of transfer prices". Robbins and Stobaugh, 1973, conclude, "we foresee continued opportunity for MNEs to make extensive use of revenue-shifting tools, especially transfer pricing" (p 186): and they are business-school economists proper.

14 See Griffin, 1974, who makes a fascinating case that the whole process of the international transmission of technology worsens inequality between nations.

15 By costs I mean the cost to the host economy of having foreign investment rather than costs of production.

16 See Chapter 11 of Streeten (1972-a) where the implicit assumption of the sort Reuber makes is attacked.

17 Lall and Mayhew, 1973. A similar investigation of 21 firms in India and 9 in Iran with foreign majority equity holdings showed that foreign long-term borrowing comprised 28 per cent and 12 per cent respectively of total long-term borrowing (Lall and Elek, 1971).

Small Farmers' Development Agency

Experience in Surat District

Mahendra D Desai

The limited experience of the working of the Small Farmers' Development Agency programme in Surat district suggests that the strategy devised by the Agency for small and marginal farmers in the district is such that these farmers in the relatively backward areas would not be able to benefit much in the short run, whereas farmers in the relatively better-off areas would benefit substantially from the programme.

Even in the long run, to what extent the weaker sections in farming in the backward areas would gain from the programme would depend upon the efficient functioning of the infrastructure of the co-operative and other institutions which the SFDA is endeavouring to develop and on the availability of other infrastructural facilities which are a precondition of the success of activities, like dairying, development of which is considered to be strategic by the Agency for the betterment of the weaker sections in these areas.

In the light of the Surat experience, two general observations about the SFDA programme may be made. First, since the SFDA programme covers 'potentially viable' small farmers, it deserves to be considered whether the concept of viability should be uniform for all parts of the region or whether it should be determined with reference to the significant variations that might obtain within the region in such matters as customary standards of living.

Secondly, having formulated the appropriate strategy, the implementation of which would help small farmers become viable, the SFD Agencies must work out the financial as well as other requirements of putting the programme through. Having worked out the full financial implications of the goal of making small farmers viable, the programmes can be phased out over a few years, keeping in view the availability of financial resources.

AMONG the measures and programmes that have been specially designed to improve the economic conditions of the small farmers, the Small Farmers' Development Agency Programme, which currently covers 46 districts in the country, is remarkable in more than one respect. For the first time, a programme for the exclusive benefit of this weaker section has been formulated. Secondly, the assistance under the programme is to be extended not only to

farming but also to other activities which might help small farmers raise their incomes (e g, dairying, poultry, soil conservation, household industry etc). Thirdly, these are separate Agencies in the 46 districts whose business it is to formulate and execute the programme. The Agencies are registered corporate bodies, fully autonomous and free from the control of the Central or state governments. The scope for the efficient functioning of the Agencies should therefore be considerable. Most of the Agencies were set up in 1970-71, but they really got off the ground only during 1971-72. Though it is not possible as yet to undertake a comprehensive evaluation of the SFDA programme, some aspects of the working of the Agencies may be examined in order to understand their *modus operandi* and their implications. An attempt has been made on a limited scale in this note to study the working of the Small Farmers' Development Agency in Surat District, Gujarat.

Organisational Set-up

A unique feature of the SFDA programme is that it is sought to be carried out with the help of the existing developmental machinery and by utilising the existing institutional framework though a small nucleus staff functions at the Agency headquarters. Accordingly, in Surat district, the technical staff includes, besides the Project Officer, two Assistant Project Officers — one each in co-operation and agriculture. Actually, there is provision for three posts of Assistant Project Officers, the third post being for a specialist in animal husbandry. But in Surat the Agency has appointed two relatively junior-level 'Veterinary Extension Officers' in place of the third Assistant Project Officer.

The Project Officer directs and co-ordinates the formulation and implementation of the Agency's programmes at the taluka level. Besides, the Project Officer is responsible for the formulation of schemes intended to benefit the small farmers of the entire district or a group of talukas.[2] One of the important functions of the Project Officer is to involve the financial institutions such as the commercial and co-operative banks, the district level marketing organisations, etc, in appropriate programmes and so to make available to the small farmers facilities which were hitherto unavailable to them.

Out of the two Assistant Project Officers (APO) the one who specialises in co-operation acts as the co-ordinating officer of all taluka-level extension officers (co-operation) and keeps track of their work. The APO (agriculture) looks after both agriculture and animal husbandry in the programme. Like the APO (co-operation), he also co-ordinates the work of extension officers (agriculture) in the talukas of the district. In addition, he is entrusted with the function of making surprise and random checks on the benefits received by the small farmers for agricultural and animal husbandry programmes. The APO also provides technical guidance to the small farmers in all matters pertaining to agriculture and animal husbandry.

In order to guide the Agency officials and to take policy decisions, a district-level Governing Body has also been constituted. The chairmanship of the Governing Body is held by the District Development Officer, and the Project Officer of the SFDA is the Governing Body's member-secretary. Among the members of the Governing Body are district-level officers of all the departments which are associated with the work of the SFDA, a representative of the Union Ministry of Agriculture, and two non-officials. Besides these regular members, there are special invitees, who include local MLAs and MPs, representatives of the commercial banks, and the State Bank of India operating in the district, etc. Thus the Governing Body represents all the institutions and interests involved in the development of the district. The Governing Body takes appropriate decisions, provides guidelines, and recommends ways of removing the difficulties in implementation. The fact that the District Development Officer is the chairman of the Governing Body has been very helpful in effective implementation of the Agency's programme, because the development works in the district are carried out directly under his supervision by the Taluka Development Officers (TDO), who also act as the Project Officers of the SFDA at the Taluka level.

As seen above, the Agency has only a nucleus staff at the district level. The Agency does not take upon itself the task of implementing its programme in the talukas of the district — because that would mean either duplication when there are other development agencies and hence needless waste of resources, or becoming rivals to the existing developmental agencies. By utilising the existing developmental machinery for the Agency's programmes, the benefits, it is believed, can be spread to a large number of people, since the Panchayats can implement their own and the Agency's development programmes in a co-ordinated manner.

Thus the Agency has involved the Taluka Development Officers in the implementation of its programmes in the district. Indeed, the Taluka Development Officers are vested with full powers to implement the programmes in their respective talukas. They are empowered to take decisions as to whom and to which activities the benefits should be provided. The TDOs are not even required to obtain the Agency's permission for these decisions though they may, on their own, refer a problem to the Agency for guidance. This arrangement means that the funds of the SFDA are placed at the disposal of the TDOs and not the Taluka Panchayats. Thus, the arrangement is expected to enable utilisation of the Taluka Panchayat funds and the SFDA funds in a co-ordinated manner, while avoiding the interference of the Taluka Panchayats in the implementation of the SFDA programmes. As it actually happens, Taluka Panchayats do take into account the benefits likely to become available from the SFDA for their talukas and accordingly devise their own programmes. It is claimed that the above arrangement for implementation of the SFDA programmes at the taluka level has reduced red tapism to the minimum. The other two SFD Agencies in Gujarat have recently emulated the above pattern.

Identification of Beneficiaries

The general experience of a number of schemes which have been aimed at providing relief or benefits to the weaker sections has been that it is somehow the better-off sections who get the lion's share of even these schemes. Since the programmes undertaken by the SFDAs were intended for the exclusive benefit of the small and, to a lesser extent, of the marginal farmers, identification of these was the first vital step in the functioning of the Agencies. In Surat — as also in the other two districts of Gujarat covered by the SFDA programmes — the 'ownership holding' as recorded in the Talati's records has been taken as the main basis in identifying of beneficiaries. Farmers holding lands between 2 and 5 acres, have been defined as Small Farmers,[3] and those holding less than 2 acres have been defined as Marginal Farmers — irrespective of whether the lands are irrigated or not. However, since the Talati's records are imperfect and since there are considerable time-lags between the changes in land-holdings and their recording, the Agency in Surat has added the following provisos to the land ownership criterion: (i) Members of the family staying and cultivating lands jointly, should not be treated as small farmers even if they have lands on their individual names within the limits prescribed for identification. (ii) If a farmer possesses lands at different places and if his total land holding exceeds 5 acres, he should not be treated as a small farmer. (iii) As a converse to (i) above, it is provided that, if members of one family are staying separately and are cultivating lands individually, and if their lands are within the limit prescribed for identification, they should be recognised as small farmers — even if, on the revenue records, lands cultivated by them appear in the name of only one of the members.

There is, however, one lacuna in the identification procedure adopted by the Agency. The Agency also takes into account assets such as milch animals, irrigation equipment, and other income-generating assets, along with the land holdings of farmers. Yet, the likely income from these assets is not taken into account while deciding the eligibility of the farmers for assistance. Indeed, a small or marginal farmer is entitled to benefits under the Agency's programme even if one of his family members earns a fair amount of salary (upto Rs 800 per month), or if he runs a cottage or household industry. It is argued that, while identification of beneficiaries by the income-criterion would be ideal, it is a difficult task.

On the basis of the village records, the Agency had first identified about 32,000 small farmers. Later, with the application of the above provisos and with on-the-spot verification of the numbers originally identified, carried out by the extension officers and TDOs, the numbers of the identified small farmers came down to 29,089.* The numbers of marginal farmers identified by the Agencies is 18,193.* It is possible that, in spite of such checks, certain discrepancies or anomalies might still persist. But the Agency evidently decided to draw the line at this stage. The Agency has printed taluka-wise lists of the identified farmers, giving essential background information, and has supplied the list to all the other concerned agencies and institutions so that when a farmer applies for assistance, his eligibility for the same can be easily established.

* These figures are as on August 31, 1973.

Table 1: Number of Identified Small and Marginal Farmers in the Three Taluka Groups of Surat District

Taluka Group	Number of Identified Small Farmers	Number of Identified Marginal Farmers
Advanced	6240 (21.4)	5405 (29.7)
Average	7058 (24.3)	6162 (33.9)
Backward	15791 (54.3)	6626 (36.4)
All talukas	29089 (100.0)	18193 (100.0)

Note: Figures in brackets denote per cent share in total.

On the basis of data pertaining to 13 indicators of agricultural development, a recent study classified the 13 talukas of Surat district into 'advanced', 'average' and 'backward', according to the level of agricultural development attained by each of them.[4] For convenience of analysis and presentation, we shall follow the above classification in the discussion to follow.

The numbers of identified small and marginal farmers in the three taluka groups are as shown in Table 1.

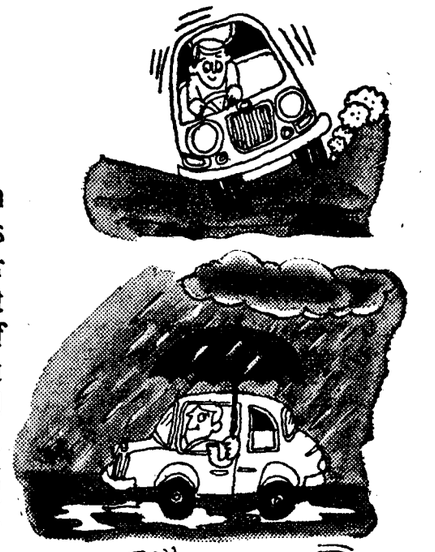
Thus the numbers of small and marginal farmers, together in the three groups of talukas, are: Advanced — 11645 (24.6 per cent), Average — 13220 (27.9 per cent), and Backward — 22417 (47.5 per cent).

Enrolment of Identified Farmers in Co-operatives

As important as a proper identification of the potential beneficiaries is the task of enrolling such of these beneficiaries in the co-operative institutions as have not been brought under the co-operative fold — since the benefits to the small and marginal farmers are to be channelled through the co-operatives. We may, therefore, briefly mention the achievement of the Agency in this direction.

Out of the 29,089 identified small farmers, as many as 11,884 were members of co-operative institutions prior to the establishment of the Agency. By August 31, 1973, 7,926 other small farmers were enrolled as members of multi-purpose or service co-operatives, thus bringing the total number of small farmers brought under the co-operative fold to 19,810. The number of marginal farmers who were already members of co-operatives before the establishment of the Agency was 7,321; by August 31, 1973, 1,728 more marginal farmers had been enrolled as members of co-operatives.[5]

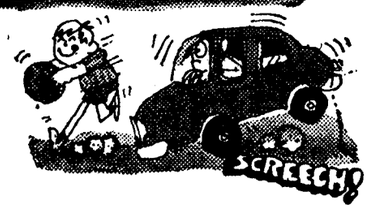
Programmes and Their Formulation



The programme of the Agency consists mainly of providing direct assistance to the small and marginal farmers and of strengthening and/or creating institutions which would benefit these farmers. Direct assistance to small and marginal farmers takes the form of subsidies on expenditure which these farmers might incur for developing their agriculture or supplementary activities, such as dairy, poultry, etc. Assistance to institutions is provided to help them improve their working (e g, through strengthening managerial or supervisory cadres), providing better facilities of marketing (e g, storage, transport, etc), or for covering risk involved in financing small and marginal farmers.

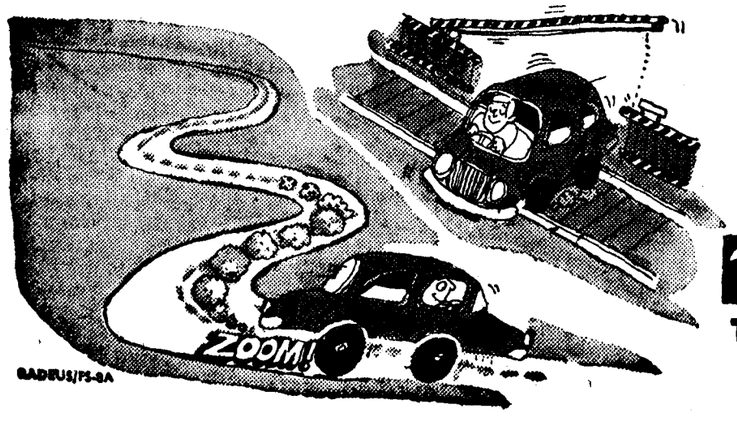
The Agency has prepared a working plan entailing an estimated expenditure of Rs 160 lakhs for the entire project period. Out of this amount, the Agency has so far prepared definite programmes requiring Rs 130 lakhs; the remaining Rs 30 lakhs have been kept as reserves to be utilised in the other new programmes which the Agency will formulate later. The details of the programmes prepared together with the financial allocations made for them are given in Table 2.

The Agency emphasises development of dairying and improvement of marketing and storage facilities. These two programmes account for a little over 55 per cent of the estimates of expenditure to be incurred during the entire project period (Rs 130 lakhs). Development of agriculture, through soil conservation, horticulture, bunding, use of insecticides and pesticides, and minor irrigation would take up only about 21.5 per cent of the estimated expenditure; the strengthening of the credit co-operatives, through which small and marginal farmers are to receive assistance, is another important plank of the programme. Finally, the Agency has allocated nearly Rs 5 lakhs for assisting rural artisans through provision for training and for purchase of raw materials, and tools and equipment.



Seen from a somewhat different angle, the programmes to assist individual

Firestone tyres- made in India to suit Indian road conditions.



Firestone has been making strong tyres in Bombay for over 33 years. Tyres that meet the demands of the most difficult Indian road conditions.

Specially developed Firestone rubber compounds have the toughness and resilience needed to withstand wear and tear on rough roads.

The exclusive Triple-Strength Construction of Firestone tyres can take the friction of high speeds on highways.

Firestone tread patterns give the tyres a safety grip on wet roads and at intersections, for smooth braking and take-off. The wrap-around shoulder improves control on curves with road-hugging grip.

Firestone

THE STRONG TYRE

beneficiaries take up Rs 78 lakhs, or a little over 60 per cent of total estimated expenditure; financial assistance to institutions will entail an expenditure of around Rs 43 lakhs, or about 33.4 per cent of total estimated expenditure. Among the first category of programmes, assistance for development of dairying

TABLE 2: SUMMARY OF THE WORKING PLAN OF SFDA, SURAT

(Figures denote estimates of financial expenditure to be incurred under the SFDA Programme)

(Rs in lakhs)

Sr No 1	Name of the Scheme 2	Individual Item 3	Total for Major Head 4
I:	*Agriculture:*		
	(a) Soil Conservation	0.37	
	(b) New Kyari Bunding	4.00	
	(c) Horticulture (supply of fruit grafts)	1.00	
	(d) Improved Agricultural Implements	1.00	
	(e) Insecticides and Pesticides	6.00	
	(f) Plant Protection Appliances	2.50	
	(g) Demonstration Plots	1.00	15.87 (12.3)
II:	*Minor Irrigation:*		
	(a) Dug Wells	6.00	
	(b) Deepening of Wells	0.50	
	(c) Oil Engines, Electric Motors and Pumping Sets and Persian Wheels etc.	5.70	12.20 (9.4)
III:	*Animal Husbandry and Dairying*		
	(a) Milch Cattle	40.00	
	(b) Supply of Poultry Units	1.60	
	(c) Cattle Sheds	0.60	
	(d) Chilling Plant, Cooling Cabinets etc.	9.00	51.20 (39.6)
IV:	*Strengthening of Co-operatives:*		
	(a) Share capital (Loan)	1.50	
	(b) Managerial subsidy to service and functional co-operative societies	2.40	
	(c) Subsidy for supervisory staff of Surat District Central Co-operative Bank (DCCS) and Land Development Bank (LDB)	2.64	
	(d) Risk fund contribution to co-operative societies, DCCS and LDB	5.80	12.34 (9.6)
V:	*Marketing and Storage:*		
	(a) Subsidy for construction of Godowns	2.50	
	(b) Subsidy on transport vehicles to co-operatives	7.00	
	(c) Assistance to Poultry Societies	0.70	
	(d) Interest rebate subsidy to Primary Agricultural Credit Societies at 2 per cent	2.50	
	(e) Assistance to Market Committees	8.00	20.70 (16.0)
VI:	*Custom Services:*		
	(a) Land Development	0.50	
	(b) Purchase of costly Agricultural Equipment, Tractors, etc.	2.00	2.50 (1.9)
VII:	*Supply of Bullock and Carts*	2.50	2.50 (1.9)
VIII:	*Rural Artisans and Workshops:*

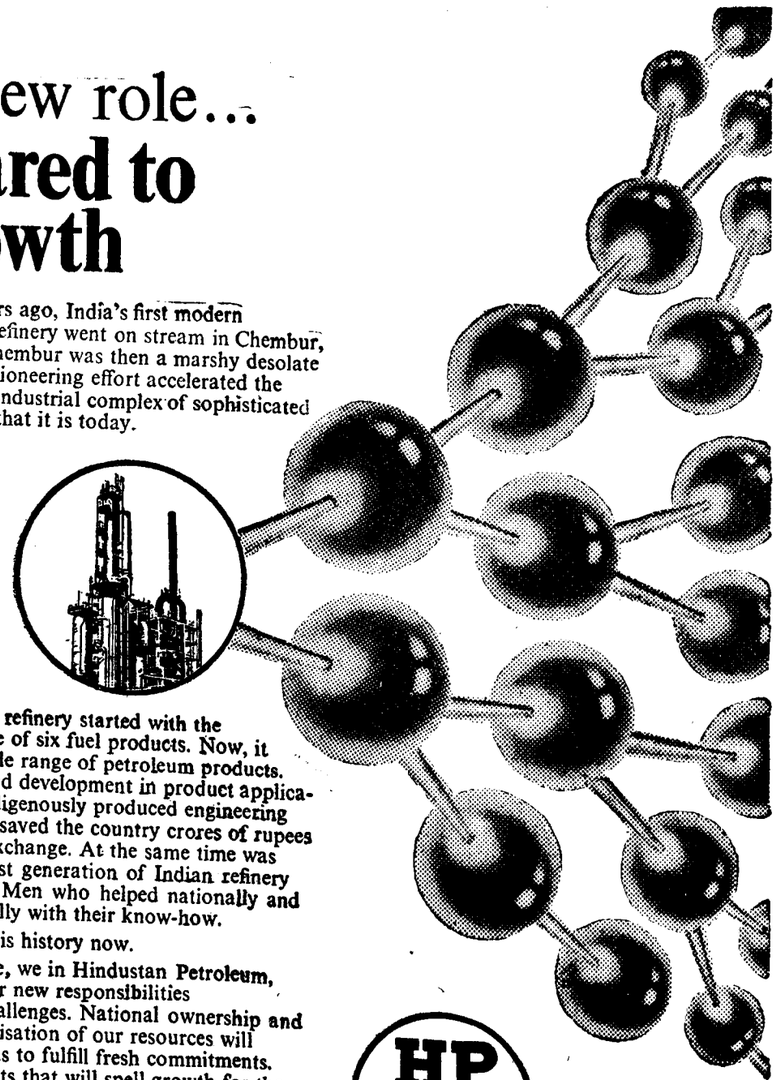
	(b) Rural Workshops	0.67	4.97 (3.8)
IX:	*Administration Expenses* (Including Publicity)	7.10	7.10 (5.5)
GRAND TOTAL			129.38 (100.00)
Amount Reserved for New (Unspecified) Schemes to be prepared			30.62
Total Financial /Expenditure for the Project Period.			160.00



Note: Figures in brackets indicate percentages to total expenditure.

claims the lion's share, (Rs 40.60 lakhs); of this, Rs 9.00 lakhs is for the SUMUL dairy for establishment of a chilling plant and cooling cabinets so as to give a fillip to dairying in the backward eastern talukas of the district, a subsidy of Rs 7.00 lakhs is for transport vehicles purchased by co-operative societies, and assistance of Rs 8.00 lakhs is to Agricultural Produce Market Committees for development of market yards and other ancillary facilities.

Some observations about the allocations to dairying and to strengthening of marketing co-operatives may be made. As stated earlier, the justification for providing large financial assistance to the SUMUL dairy is the expected benefit to the small and marginal farmers in the agriculturally undeveloped talukas in the eastern part of the district, through development of dairying which is expected to be facilitated by the chilling plant and cooling cabinets. It is true that the scope for development of agriculture in these talukas is limited, because of the adverse physical conditions characterised by rocky soil and forests. But, judging from the present state of dairying in these talukas, the development of dairying will also be an extremely difficult task. People in these talukas are not well-versed in dairying; their management practices in regard to livestock are primitive; they cannot afford to provide the kind of concentrates and and other feeds which would be essential for making dairying a profitable proposition. It is, therefore, anybody's guess as to how long and how much effort it will take on the part of the official agencies to make dairying the lever of economic development — as the SFDA is apparently hoping it will become in these areas. Secondly, there are other aspects of infrastructural development, besides assured marketing facilities, without which development of dairying cannot take place. These include transport facilities, veterinary aid, and extension of knowledge about dairying practices. As regards transport facilities, it is important to have all weather roads for transportations of milk throughout the year; secondly, there should be a satisfactory arrangement for transporting milk from the villages to the cooling cabinets and chilling plant.[6] In regard to availability of roads, the five talukas in the eastern part are ill-developed as can be seen from the statistics of road-length (pucca) per 100 sq km of geographical area in respect of each of them; the road-length (pucca) per 100 sq km is 11 km each in Valod and Vyara, 10 km in Son-

A new role... geared to growth

Twenty years ago, India's first modern petroleum refinery went on stream in Chembur, Bombay. Chembur was then a marshy desolate land. This pioneering effort accelerated the pace of the industrial complex of sophisticated technology that it is today.

In 1954, the refinery started with the manufacture of six fuel products. Now, it refines a wide range of petroleum products. Research and development in product application and indigenously produced engineering goods have saved the country crores of rupees in foreign exchange. At the same time was born the first generation of Indian refinery technicians. Men who helped nationally and internationally with their know-how.

But all that is history now.

In the future, we in Hindustan Petroleum, will shoulder new responsibilities and new challenges. National ownership and effective utilisation of our resources will strengthen us to fulfill fresh commitments. Commitments that will spell growth for the nation's economy.

We have a new role to play—a role geared to growth.

HINDUSTAN PETROLEUM CORPORATION LIMITED

HP

The future is ours

gadh, 6.5 km in Uchhal and 7 km in Nizar; in the Mandvi and Mangrol talukas, in which also dairying is expected to develop because of the establishment of the chilling plant, the road-length is 10 km per 100 sq km. In the absence of adequate road facilities, the capacity of the chilling plant might remain underutilised; this danger is all the greater in the monsoon, which is quite heavy in the district which also has many small rivers and rivulets. With respect to veterinary aid, in addition to the normal facilities of veterinary dispensaries which are available in the talukas, the SFDA has appointed two Veterinary Extension Officers who are stationed at Valod and Mandvi, and who look after the entire 'hinterland' in which dairying is to be developed. Obviously, in areas where dairying is as yet largely undeveloped, its development on scientific and commercial lines would necessitate more satisfactory veterinary aid than is available under the above arrangement; this is more so in the eastern talukas of Surat district where the people are not quite familiar with dairying and dairy animals. For the same reason, provision of satisfactory and efficient extension service in dairying is an essential prerequisite for development of dairying in the area.[7] Of course, the SFDA alone cannot be expected to ensure provision of the above essential infrastructural facilities, but if these are to be developed as part of the normal planning process, dairying may not develop as well as might have been anticipated by the SFDA. If this analysis is valid, the assistance of the Agency for the chilling plant, and, more importantly, the strategy of the Agency to develop dairying as an important means to raise the income and employment levels in the backward eastern talukas would appear to be not wholly sound.

The other important activity which accounts for a sizeable financial allocation is the assistance to co-operative societies for purchase of transport vehicles. The societies which deal in pooling and marketing of agricultural produce of their members and supply of inputs to their members are eligible for a subsidy of 50 per cent of the capital investment in trucks and other carriers of goods (subject to the maximum of Rs 30,000) — provided they agree to do the work of small farmers at the rate of 25 to 50 per cent of the usual freight charges. It may be noted that trucks purchased under this scheme are not to be used *exclusively* for transporting goods of small farmers; nor is there any specification as to the capacity of the carriers to be utilised for small farmers. In the relatively well-developed talukas of the district, small farmers also grow such commercial crops as cotton, banana, and sugarcane; however, it can be easily imagined that the relatively large farmers will benefit more than the small farmers. Though the small farmers who have marketable surplus are able to transport their goods at concessional rates, the advantage which the schemes might incidentally provide to large farmers would be considerable.[8]

Barring the emphasis on dairying and on strengthening of co-operative institutions in the relatively backward parts of the district, the programmes formulated by the Agency reflect a general, rather than selective, approach; the Agency, for example, could have formulated some programmes of forest-based activities for the far-eastern talukas of the district such as Songadh, Uchhal and Nizar, in which development of dairying as well as agriculture has limited scope. Of course, the Agency has included a special item of assistance to small farmers of these talukas, *viz*, subsidy for purchase of a pair of bullocks and a bullock cart, which would help them raise income through hire of these assets. The programme, however, is quite small, and it would have been better if the Agency had supplementd it by other similar programmes, keeping in view the local conditions and scope for development of activities suited to these conditions. Not only would such programmes have a greater chance of success, but their benefit too would be more quickly felt than those of programmes like dairy development.

Programme Formulation at Taluka Level

The programmes for individual talukas are formulated keeping in view the broad strategy devised by the Agency for the different parts of the district. These programmes are prepared annually by the Taluka Development Officers. Considerable discussion between the Project Officer of the SFDA, and the TDOs and Taluka Pramukhs, precede the preparation of programmes and estimates of expenditure for a year. If necessary, further discussion on the size and nature of programmes is held among the above parties before these are finalised. In this way, the Agency seeks to have its strategy implemented leaving scope, at the same time, for local involvement in the formulation of the programmes. The involvement of TDOs — who are the implementing agency — at the formulation stage of programmes, gives them the feeling of greater participation and responsibility in the execution of the programmes.

It is noteworthy, however, that as

Table: 3 Estimates of Financial Expenditure on Major Heads of SFDA Programme for the Period June 1971-March 1973, for the Three Taluka Groups

(Rupees in lakhs)

Major Head	Advanced Talukas	Average Talukas	Backward Talukas	Total
1. Agriculture	4.65 (48.60)	2.26 (23.64)	2.66 (27.76)	9.57 (100.00)
2. Minor Irrigation	6.09 (34.14)	5.18 (29.03)	6.57 (36.83)	17.84 (100.00)
3. Animal Husbandry and Dairying	7.78 (27.98)	13.75 (49.45)	6.27 (22.57)	27.80 (100.00)
4. Strengthening of Co-operative Institutions	1.60 (34.64)	1.44 (31.49)	1.54 (33.67)	4.58 (100.00)
5. Marketing and Storage	2.24 (40.49)	1.96 (35.38)	1.33 (24.13)	5.53 (100.00)

7. Rural Artisans	0.75 (26.71)	0.88 (31.24)	1.19 (42.05)	2.82 (100.00)
Total	23.26 (33.92)	25.63 (37.35)	19.67 (28.70)	68.56 (100.00)

Note: Figures in brackets indicate percentage share in total.

the conditions of successful implementation are usually more favourable in the relatively progressive talukas than in the relatively backward talukas, more ambitious plans are prepared and implemented in the progressive talukas than in the backward ones. This, as we shall presently see, is borne out by the experience of the working of the SFDA programme in Surat district, and it has important implications for achieving the most important objective of the programme — *viz*, helping the small and marginal farmers to raise their incomes.

Information on the programme in each of the 13 talukas of Surat district is available for the 22 months from June 1971 (when the implementation of the SFDA programme really began) to March 1973; data about the implementation and progress achieved in these programmes are available for the 19 months, from June 1971 to December 1973 (see Table 3). The following analysis is based on these data.

An examination of the financial estimates of expenditure entailed by the programmes for the three groups of talukas shows that, out of total estimated expenditure of about Rs 68.5 lakhs for all the talukas, the share of the backward talukas is only about 29 per cent. The corresponding percentages for the advanced and the average talukas are: 34 and 37, respectively. Further, the relative shares of expenditures for the individual benefit of small and marginal farmers are, generally speaking, low in the backward talukas. As far as expenditure for improvement of agriculture is concerned, the relative small shares of the backward areas in total estimated expenditure on such programmes are understandable; but, surprisingly, even in respect of estimates of expenditure for dairy development (on which the SFDA puts considerable stress and hope), the backward talukas have been allotted a proportionately small expenditure; out of a total estimated expenditure of about Rs 25.80 lakhs for all talukas on this programme, the share of the backward talukas is only 22.7 per cent.

The share of the backward talukas in estimates of expenditure for infrastructural development such as subsidies for godowns to marketing societies (33.7 per cent), loans for share capital contribution of new members to be enrolled in co-operative institutions (44 per cent), subsidies for managerial cadres of co-operative institutions (38 per cent), are somewhat large. But even in this field of infrastructural facilities, the estimates of expenditure for items like risk fund contribution to co-operative credit institutions, subsidy to co-operative societies for purchase of transport vehicles, are proportionately low for the backward talukas — which claim 19.5 per cent and 21 per cent, respectively, of the total estimates of the expenditure on the above two items in all the talukas.

TABLE: 4 STATEMENT SHOWING ACHIEVEMENTS OF THE SFDA, AS ON 30TH JUNE 1973

Sr No	Item	Actual Expenditure (Rs in lakhs)	No of Beneficiaries	
	I : Individual Beneficiaries			
A:	*Agriculture*:			
	Supply of Fruit Grafts	0.42	3191	
	Insecticides and Pesticides	2.40	3933	
	Improved Agricultural Implements	0.15	735+1	society
	Plant Protection Appliances	1.92	1636+7	societies
	Demonstration Plots	0.64	499	
	New Kyari Bunding	0.25	278	
	Soil Conservation	0.01	40	
B:	*Minor Irrigation*:			
	Dug Wells	2.15	263	
	Deepening of Wells	0.33	60	
	Pipe Line	0.04	15	
	Oil Engines, Electric Motors	2.34	290	
	Persian Wheels	Negligible	2	
C:	*Animal Husbandry*:			
	Milch Cattle	19.82	5074	
	Supply of Poultry Units	0.31	102	Units
	Cattlesheds	0.02	8	
	Poultry Feed	0.04	7	
D:	*Custom Service*:			
	Land Development	0.01	31	
E:	*Storage and Marketing*:			
	Supply of Bullock and Carts	1.51	526	
	Rebate on Interest at 2 per cent	0.59	3379	
E:	*Rural Artisans*:			
	Stipend to Trainees/Subsidy on Raw Materials, Tools and Equipments	2.34	655	
H:	Enrolment of Membership	0.92	8580	
	Sub-Total	36.21		
	II : Institutional Beneficiaries			
1	Managerial Subsidy to Primary Societies	1.18	162	
2	*Subsidy for Supervisory Staff*			
	Surat District Central Co-operative Bank	1.73	1	
	Land Development Bank	0.74	1	
3	Dairy Co-operative (Chilling Plant to SUMUL dairy)	6.00	1	
4	Subsidy for Godowns	0.47	9	
5	Subsidy for Transport Vehicles (Trucks)	5.55	20	
6	Assistance for Market Yards	4.00	6	
7	Supply of Tractors to Co-operatives	1.28	13	
8	Rural Workshop	0.10	1	
9	Risk Fund Contribution to Co-operative Institutions	2.65	274	(including District Co-operative Bank and Land Development Bank)
10	Assistance to Co-operative Poultry Farming Societies	0.11	2	
11	Assistance to Co-operative Farming Society	0.10	1	
	Sub-Total	23.91		
	III : Establishment			
	Establishment Expenditure	3.03	—	
	Grand Total	63.15		

Thus there are appreciable differences in the magnitude of the Agency's efforts between the relatively developed and the relatively backward parts of the district. The SFDA authorities need to ensure that the programmes for the relatively backward talukas are so devised — both in terms of priorities and financial allocations — that they may help in making a success of the strategy of development evolved by them. Specifically, programmes in the backward talukas as well as in average talukas, might put greater emphasis on dairy development and building of infrastructure necessary for this. Otherwise, the large investment of the Agency *via* the subsidy to the SUMUL Dairy would fail to serve its real purpose.

PROGRAMME IMPLEMENTATION

As stated earlier, the real working of the SFD Agency started in June 1971. The data about its achievements are available for the two years ending June 30, 1973, for the Agency as a whole; the corresponding data for individual talukas are available only up to December 31, 1972. We examine below the progress in implementation of programmes on the basis of these two sets of data.

Progress of the Agency:

During the first two years of its working, the Agency spent Rs 63.15 lakhs or 39.5 per cent of the total financial estimate for the project period. This expenditure made possible the achievement of the following important physical targets: provision of milch cattle to 5,074 farmers; digging of 263 wells; installation of 290 pumpsets; supply of plant protection appliances to 1,636 farmers; supply of agricultural implements to 735 farmers; setting up of 102 poultry development units; organisation of one poultry farming co-operative society; share capital contribution (on loan basis) for 8,580 farmers; supply of transport vehicles to 20 co-operative societies; assistance to 162 primary co-operative societies for strengthening managerial cadres; subsidy to 9 co-operative societies for construction of godowns; assistance to 655 persons for their training in rural arts and crafts; supply of pairs of bullocks and carts to 526 farmers. (For details, see Table 4.)

When the expenditure incurred and the physical achievements are related with the respective targets for the entire project period, some schemes are found to have progressed quite briskly while the pace of progress of the others has been slow.

Among the schemes which have shown relatively quick progress are certain items under 'agriculture' (horticulture, insecticides and pesticides, plant protection appliance and demonstration plots), 'minor irrigation' (dug wells), 'animal husbandry and dairying' (milch cattle, chilling plant, etc), share capital contribution to co-operative societies, subsidy for supervisory staff for Surat District Central Co-operative Bank and District Land Development Bank, risk fund contribution to co-operative institutions, subsidy for purchase of transport vehicles and costly agricultural equipment such as tractors, and assistance to rural artisans.

Among the schemes which are progressing rather slowly are those of soil conservation and the new Kyari bunding, cattle sheds, supply of poultry units, and subsidy for irrigation equipment.

It can be seen that, among the relatively fast progressing schemes, a good many are those which benefit institutions (some of which do not carry any direct obligation to help small or marginal farmers): Subsidies to co-operative institutions for better managerial and supervisory staff, assistance by way of risk-fund contribution, and assistance to the SUMUL Dairy for establishment of chilling plant etc fall in this category. Achievement of financial progress in these types of schemes is relatively easy.

The other types of schemes, in which progress has been relatively quick, are such as would benefit individuals rather soon. Beneficiaries are ready to make necessary investment of their own (and become eligible for the SFDA subsidy) in 'quick-maturing' and relatively safe lines such as milch cattle or use of insecticides or pesticides or purchase of plant protection appliances or schemes listed under rural artisans programmes. It is noteworthy that progress is somewhat slow in schemes like building cattle-sheds, poultry units, soil conservation, kyari bunding, improved agricultural implements, etc, benefits of which are not immediately available, or require greater support and extension work.

By and large, however, most of the important items of the programme such as have been undertaken are progressing quite satisfactorily. To what extent they would eventually make any significant dent on the problem of poverty and unemployment of the weaker sections, is difficult to gauge. The nature of the strategy evolved by the Agency is such that, apart from the efforts by the beneficiaries themselves to make the most of the facilities directly offered to them by the Agency, the real impact on the incomes of the weaker sections would depend considerably upon the observance, by various institutions, of the spirit in which the Agency was designed to provide certain benefits to them, e g, assistance for transport, vehicles, for purchase of tractors, construction of godowns contribution towards share capital of small and marginal farmers.

Secondly, as in the case of preparation of estimates on programmes, the execution of the programmes and hence the magnitude of their impact on poverty and employment would also depend a good deal upon the efficiency and involvement of the respective Taluka Development Officers. We may, therefore, examine the extent to which the programmes were implemented in the different talukas.

Progress of Programmes in Talukas:

The programmes, which were finalised for the different talukas, and for which the estimates of expenditure for the two years were prepared, could not be implemented in full. As on December 31, 1972, the actual expenditure on the various programmes for all the talukas taken together was a little less than 54 per cent of the estimates prepared for the two years. Among the three categories of the talukas, the progress in terms of expenditure was relatively more in the case of the agriculturally advanced talukas (63 per cent), followed by backward talukas (nearly 50 per cent); in the case of average talukas the expenditure in the first two years was 48 per cent of the estimates prepared by the respective talukas. Thus, there were considerable shortfalls in expenditure compared to the estimates prepared for the first two years in the case of average and backward talukas. Even in the case of advanced talukas the shortfall in expenditure was of the order of 37 per cent (see Table 5).

A detailed examination of the progress of the programmes in the different talukas shows that, except for items intended to develop or create infrastructural facilities to indirectly help small farmers, the pace of implementation in the backward talukas has been generally slower — in as subsidies for agricultural programmes, minor irrigation, and animal husbandry — as compared to the progress achieved in the case of rela-

TABLE 5: ACHIEVEMENTS OF THE SFDA PROGRAMME IN THE THREE TALUKA GROUPS DURING THE PERIOD JUNE 1971-DECEMBER 1972, IN TERMS OF ACTUAL FINANCIAL EXPENDITURE ON MAJOR HEADS

(Rupees in lakhs)

Major Head	Advance Talukas	Average Talukas	Backward Talukas	Total
1. Agriculture	2.00	1.26	0.64	3.90
	(51.25)	(32.38)	(16.37)	(100.00)
2. Minor Irrigation	1.39	1.19	1.28	3.86
	(36.10)	(30.81)	(21.09)	(100.00)
3. Animal Husbandry and Dairying	7.04	5.76	3.40	16.20
	(43.44)	(35.55)	(21.01)	(100.00)
4. Strengthening of Co-operative Institutions	0.92	0.85	0.70	2.47
	(37.21)	(34.39)	(28.40)	(100.00)
5. Marketing and Storage	2.60	2.02	2.85	7.47
	(34.79)	(27.04)	(38.17)	(100.00)
6. Custom Services	0.28	0.50	0.30	1.08
	(26.35)	(46.11)	(27.54)	(100.00)
7. Rural Artisans	0.47	0.77	0.64	1.88
	(24.85)	(40.99)	(34.15)	(100.00)
Total	14.70	12.35	9.81	36.86
	(39.88)	(33.50)	(26.62)	(100.00)

Note: Figures in brackets indicate percentage share in total.

tively advanced and average talukas. In the backward talukas, the actual expenditure on agricultural programmes worked out to 24 per cent of the financial estimates for the programme for the period ending March 31, 1973; the corresponding percentages in the case of advanced and average talukas were 43 and 55.8, respectively. The actual expenditure on minor irrigation programmes in terms of the financial targets was 19 per cent in the backward talukas, against 23 per cent each in the advanced and average talukas. In respect of provision of milch cattle, while the advanced talukas exceeded the target (106 per cent), only 60.6 per cent of the estimated target expenditure could be incurred on the programme in the backward talukas; in the average talukas, the corresponding percentage was 48.2. We have already pointed out that, the estimates of expenditure prepared by the backward talukas are generally on the lower side as compared to the estimates prepared by the other talukas. The slow pace of progress in terms of even financial expenditure would imply that the implementation of the programmes in the backward talukas is progressing at a fairly slow pace. This is especially true of those schemes for which subsidies are given directly to the beneficiaries.

The comparison of backward talukas with the advanced talukas becomes relevant because, as we have shown earlier, 47.5 per cent of the identified small and marginal farmers reside in these talukas. Unless the effort of the Agency in these talukas is sufficiently intensive, the impact on poverty and unemployment in the district as a whole may remain small and confined mostly to the economically better parts of the district. From this point of view, it would be interesting to examine the proportionate shares of the actual expenditure on the various items in the two years in the three groups of talukas. An analysis of the relevant data reveals that the direct benefit of subsidies available to identified beneficiaries has been availed of to a considerably larger extent by the beneficiaries in the advanced talukas. This is particularly so of most items included under the head 'Agriculture' and 'Animal Husbandry' and 'Dairy'. The relative shares of the three groups of talukas in total expenditure incurred in all the talukas on the agricultural programmes during the period under review were 51.2 per cent in the advanced talukas, 32.4 per cent in the average talukas, and 16.4 per cent in the backward talukas; the corresponding percentages in the case of the animal husbandry and dairying programmes were 44.4, 35.6 and 21 per cent in the advanced, average and backward talukas, respectively. In the case of minor irrigation, the benefit of the subsidies has been availed of by the beneficiaries in the three groups of the talukas in nearly equal proportions.

Even in the case of programmes intended to develop or create infrastructural facilities, the share of backward talukas in the total expenditure incurred by all talukas is not proportionately large in the case of most of the items. Their relative shares in the total expenditure under the broad heads, "Strengthening of Co-operative Institutions" and "Marketing and Storage", were 28.4 per cent and 38.1 per cent, respectively.

Further evidence of the disproportionately large benefits of the SFDA programme having gone to the advanced areas, is provided by the proportions of small and marginal farmers who have actually received the benefits for one or more items (see Table 6). It is clear that the proportion of small and marginal farmers who have received the benefit of the programme is smaller in the backward talukas compared to in the advanced talukas; secondly, the proportion of actual beneficiaries who have been assisted for more than one item is also considerably large in the advanced talukas than in the backward (and also average) talukas.

The above examination would suggest that as in the case of similar other programmes, the benefit of the various programmes undertaken under the SFDA is availed of more by beneficiaries in the agriculturally advanced areas of the district than by their counterparts in the backward talukas. This is in spite of the fact that only about 25 per cent of the beneficiaries are in the advanced talukas against 47.5 per cent in the backward talukas.

Secondly, the above examination also shows that even those programmes which are intended to benefit the weaker sections in the backward areas (such as those of dairy development) are not progressing as fast as they should; since the strategy evolved by the SFDA for helping the weaker sections in the backward areas emphasises dairy development, intensive efforts to promote dairying on reasonably scientific lines would now seem to be imperative.

CONCLUSIONS

The limited experience of the working of the SFDA programme in Surat district would suggest that the strategy devised by the Agency for small and marginal farmers in the district is such that such farmers in the relatively backward areas would not be able to benefit much in the short run, whereas such farmers in the relatively better-off areas would benefit substantially from the Programme in the short run. Even in the long run, to what extent the weaker sections in farming in the backward areas would gain from the implementation of the Programme would depend, to a very considerable extent, upon the efficient functioning of the infrastructure of the co-operative and other institutions which the SFDA is endeavouring to develop and on the availability of other infrastructural facilities which are a pre-condition of the success of activities like dairying, development of which is considered to be strategic by the Agency for the economic betterment of the weaker sections of these areas. The Agency must ensure that its efforts in these directions are commensurate with the dimensions of the problems; indeed, large concentrations of the small and marginal farmers in the backward areas would make more intensive efforts imperative there if a significant dent on the problems of low incomes and inadequate employment of the weaker sections in the district as a whole is to be made.

In the light of the Surat experience, two general observations about the SFDA programme may be made.

"The aims of the SFDA are to identify the problems of small farmers in its area, prepare appropriate programmes, help to ensure availability of inputs and services and credit, and evaluate the progress from time to time.[9] Since the SFDA covers 'potentially viable' small farmers, the fulfilment of the above aims would hopefully make them viable. It is a moot point whether the concept of viability (which is not clearly spelled out anyway) should be uniform for all parts of the region or whether it should be determined with reference to the significant variations that might obtain within the region in such matters as customary standard of living.

Secondly, having formulated the appropriate strategy, the implementation of which would help small farmers become viable (whatever might be the concept of viability), the SFD Agencies must work out the financial as well as other requirements to put through the programme. At present, the given financial resources are allocated by the Agencies among the different activities but in this process, the physical target fixation is constrained by the availability of resources. It would be better instead to work out the *full* financial implications of the goal of making small farmers viable and then phase out the programmes over a few years, keeping in view the availability of financial resources from period to period. It is in this context that the point made earlier about the fixation of norms of viability of small farmers in different parts within a region becomes relevant.

TABLE 6: NUMBER OF BENEFICIARIES AND NUMBER OF ITEMS FOR WHICH ASSISTANCE RECEIVED BY BENEFICIARIES (UPTO THE 31ST AUGUST 1973) IN THE THREE TALUKA GROUPS

Taluka Group	Total Number of Identified Small and Marginal Farmers	Number of Actual Beneficiaries	Number of Small and Marginal Farmers Assisted for	
			One Item	More than One Iem
Advanced	11645	2931	1760	1171
	(100.0)	(25.1)		
Average	13220	3470	2671	799
	(100.0)	(26.2)		
Backward	22417	3317	2630	687
	(100.0)	(14.7)		
Total	47282	9718	7061	2657
	(100.0)	(20.5)

Notes

[This paper is an outcome of a part of a research project on Rural Development undertaken by Professor M L Dantwala. This study was conducted by the author at his instance and in collaboration with him. The information about the SFDA Programme appearing in this paper was very kindly provided by the Project Officer, SFD Agency, Surat.]

1 Gujarat state has three of the 46 districts in which the Small Farmers' Development Agencies have been set up. These are: Sabarkantha, Junagadh and Surat. In these districts, the Agencies were registered towards the end of 1970. But the first few months were spent in setting up the office and in finalising the procedures. In Surat district, the real functioning of the Agency started only in June 1971.

2 An instance of the latter type of schemes is provided by the recently concluded efforts to induce the co-operative dairy at Surat (SUMUL) to locate a chilling plant at Bajipura, about 45 km east of Surat and for erecting two cooling cabinets near Songadh and Nizar, which are expected to give a fillip to dairying in the eastern talukas in which the scope for developing agriculture is rather limited. The Agency will provide subsidy of Rs 9 lakhs (50 per cent of the total cost) to the Sumul Dairy for this purpose.

3 The corresponding range of owner ship holding is 2 to 8 acres in the Junagadh district and 2 to 5 acres in the Sabarkantha district.

4 See, Pathak, Mahesh T, Maheridra D Desai and A S Charan: 'Development of Agriculture in the Backward Regions of Gujarat — Facts and Issues', *Artha-Vikas*, Volume IX, Numbers 1 and 2, January-July, 1973. The talukas included in the three groups are as follows:

Advanced	*Average*	*Backward*
Choryasi	Olpad	Mandvi
Bardoli	Mahuva	Mangrol
Kamrej	Valod	Vyara
Palsana		Songadh
		Uchhal
		Nizar

5 The number of small and marginal farmers who were enrolled as members in co-operative institutions after the establishment of the Agency in the three groups of talukas is as follows:

Taluka Group	*Small Farmers*	*Marginal Farmers*
Advanced	3196	447
Average	1235	481
Backward	3495	800

6 It may be pointed out that one of the conditions governing the subsidy given to the SUMUL dairy is that until milk co-operatives are set up in these talukas, the SUMUL will be responsible for transporting milk from villages to cooling cabinets or the chilling plant.

7 Under the Intensive Cattle Development Project, currently being implemented in the district, 70 stockman centres have been set up to provide veterinary aid to dairy farmers in the six backward talukas. Roughly one stockman caters to 10 villages and 1,000 cattle. The stockmen do not possess advanced technical knowledge or qualifications about veterinary aid or extension.

8 According to the information provided by the Project Officer of the SFDA, the societies which have been given assistance under this scheme have already provided benefit worth Rs 59,000 to small farmers in the form of concessional freight/charges and rebate on interest on loans.

9 See, "Small Farmers Development Agency — Central Sector Scheme"; Farm Information Unit, Directorate of Extension, Ministry of Food, Agriculture, Community Development and Co-operation, (Department of Agriculture), New Delhi, March 1971.

Traditional Communist Parties

Lajpat Rai

Conformity has slowly become a 'Marxist' habit and Lenin's imperative for communists to think boldly, speak boldly and act boldly has been thrown overboard.

Their total allegiance to the orthodoxies consecrated in Moscow and in other centres of state power has interrupted every reflex of critical thought. Parroting meaningless phrases, mouthing outworn cliches and indulging in sterile quotation-mongering, the traditional communists have emerged as nothing more than comprador intellectuals living off the crumbs of other people's thoughts.

WHAT ails the traditional communist parties? What has led to their slow transformation from revolutionary vanguards into defeatist staffs, shorn of all fighting spirit and absolutely incapable of seizing power? What has led to their disorientation — their search for respectability, their opportunistic alliances with the bourgeoisie, their giving up the ghost even of revolutionary pretence? What has prompted revolutionaries like Fidel Castro to brand them as "spurious vanguards" and declare that revolutions shall now be made "with or without party"? The defeat of the Communist-Socialist candidate in the recent French elections and the disastrous events in Chile added a further sense of urgency to such questions.

Of the factors responsible for the situation, the corrupting influence of economism injected into the working class movement by the communists and others stands out prominently. The traditional communists stress the role of the organised working class. According to them the peasant is basically petty-bourgeois because his main concern is obtaining land for himself. The worker on the other hand is not tied to the factory or place of work; he has nothing to lose but his chains and hence can be genuinely proletarian in his way of thinking. But thanks to the poison of economism the worker's desire for higher wages and worldly possessions has acquired over time, petty-bourgeois overtones. Besides, modern capitalism still has some dynamism left in it which permits it to create enough social mobility to generate the myth of overall mobility, especially in the industrially advanced countries. By giving into demands for higher wages and better working conditions (recouped through higher prices and added efficiency, etc), the capitalist can and often does reinforce the reformist, Fabian aspect of the labour movement, thus corrupting the proletarian consciousness of the workers. The peasant's demand on the other hand can only be satisfied by such total restructuring of the economy that it necessitates full-scale revolution. There is not much one can promise the landless, exploited peasant besides land, which is a revolutionary demand, whereas the worker's demands for higher wages, better working conditions, etc, can be met within the existing framework of capitalism and the union leadership can gain a strong following simply by promising and obtaining shorter hours of work, higher wages, bonuses, none of which is especially revolutionary.

It is this false sense of growing prosperity and the rising standard of living of unionised labour which has deradicalised the working class. The trade union has become the culminating agency in the deradicalisation of the workers. It is now as inbuilt in the system as the corporation and almost as readily acceptable to the capitalist class. And as the unions become more powerful their vested interests in the existing order increase proportionately. The leadership acquires satisfaction in terms of money, influence and honour. Soon it begins to have a separate interest from the rank-and-file — it no longer stands for the working class, but for the union organisation's own instinct for survival, the specific interests of the organisation's top leadership, and finally, the narrow sectarian interests of the communist party which supplies leadership to the trade union. (The CPI's role in the recent railway strike is a case in point.)

Precisely because of this the communist leadership is trapped in the economist well of its own digging. It must constantly agitate for trade union demands, and since it keeps winning them (except when they are declared unreasonable by a 'socialist' prime minister), it must keep making such demands lest it loses hold on the workers now accustomed to fighting only for bread-and-butter issues. As the communist party becomes more and more respectable, more and more "patriotic", more and more Fabian, so does the labour organised under its wings and *vice versa*. The next step in the process is elections, positions of responsibility and finally a big respectable party like in France and Italy, complete with a bureaucratic establishment housed in a palatial building, a private telephone exchange, official cars, a string of newspapers and other such paraphernalia that are associated with a "national party" whose worries extend from keeping the economy afloat to the defence of the bourgeois constitution.

Minions of the Establishment

Placed in this situation, though they are strong and disciplined, the communist parties cannot even envisage seizing power except through the ballot box. Instead of acting as the vanguard of the proletariat, they not only abandon their revolutionism, they become a part of the Establishment. The French Communist Party is a classic example. It generally speaks with two voices, combining Leninist ideological phrases with electoral reformist practices — during May 1968, when the French bourgeois establishment was in danger of being overthrown, the party's language and practice became one, all in defence of the established order. The Western proletariat is thus deprived of its glorious battle-flag. Strong communist parties such as those of France and Italy, whose powerful influence no one can deny, are brought to an unthinkable condition in which instead of organising the seizure of power by taking advantage of favourable conditions, they have preferred to co-operate with the bourgeoisie in the consolidation of the capitalist economy, all in the name of peace, peaceful transition and other repugnant phrases that make up the present ideological arsenal of the traditional communist parties. This has made most of Europe, where the first socialist revolution exploded with an elemental force shaking the world, and where more such explosions were predicted, a safe haven for the free and unfettered development of capitalism.

In the third world, the communist parties which were once the focal point of the liberation movements are no more so. These movements have now a tendency to bypass the communist parties, to evolve outside them, without them and sometimes in opposition to

them. The only socialist revolution in Latin America — the Cuban — totally bypassed the Communist Party, which did not initiate the event, but only rallied to it at the end after opposing it in its initial stages. Elsewhere in the continent great social forces are unfolding themselves creating an explosive situation in which the traditional communists have a marginal role or no role at all. In black Africa, where the people are locked in struggle with colonialism and neo-colonialism, the communist parties are almost non-existent. The communists from only a tiny segment of the great movements in the Portuguese colonies, often held in suspicion by other sections within the movements. Amilcar Cabral, leader of the PAIGC, on more occasions than one had to tell the communists some home-truths. Similarly in the Arab world, the socialist movement is bypassing the communist parties who have often to trail behind this or that reactionary regime for sheer survival. In Asia the communist movements — except in Vietnam and North Korea — have either been decimated as in Indonesia or split asunder as in Japan, Burma and India.

Another factor which has led to the disorientation of the communist parties is their pathetic subservience to the leadership of the CPSU. When Fidel Castro declared that the duty of a revolutionary was to make the revolution, the traditional communists looked the other side for they have always accepted another definition of a 'revolutionary' supplied to them by Joseph Stalin 35 years ago which said: "A revolutionary is one who is ready to protect and defend the USSR without reservations, without qualifications, without wavering, unconditionally ... In the unconditional support and defence of the USSR lies the true essence of internationalism." And it is not the defence of the USSR against foreign oppression alone. It is the defence of the totality of the internal and foreign policies of the Russian State and the CPSU, including its mistakes and aberrations, its purges and persecutions, its highhandedness against other parties (Yugoslavia, China), even its aggression against brother socialist countries (Czechoslovakia). By accepting this perverted definition of a revolutionary, the traditional communists have emerged in a new light. From the vanguard of the world revolution, they have become more or less the pacifist frontier guards of Soviet Russia, a mere appendage of the successive Soviet bureaucracies defending Stalinism as a creed when Stalin lived, supporting the "deStalinisation" of Khrushchev when he occupied the seat of power in the Kremlin denouncing him when he was overthrown and now proclaiming the revisionist line of Brezhnev and company as the eternal truth. No Soviet bureaucracy was ever wrong so long as it controlled the CPSU and the Russian State. And plague be on the homes of those who dare criticise the official line current at the moment; they overnight change into "anti-Soviet", "anti-communist reactionaries" and "supporters of US imperialism". This abject falling in line of the communist parties before the successive Soviet bureaucratic groupings has cost the movement dear.

Sartre was not exaggerating when he remarked that the "allies of the communists in the United Fronts do not heed as much the programme of the party as how the wind blows from the Kremlin". In India, Indira Gandhi knows the direction of the wind from the Kremlin and finds no difficulty in roping in the communists in defence of her 'socialist' bastion, unmindful of what a Bhupesh Gupta or a Dange may occasionally say about the "capitalist path" or "yielding to the Right", etc. All this adds up to making the communist party a counterfeit political force, a distortion of the idea of a revolutionary party, a parody of a working class party, which is not only not indispensable for revolution but entirely superfluous to it, and sometimes even harmful to revolutionary advance.

Undemocratic Character

A third factor which has led to dissimulation of the communist parties and their isolation from the revolutionary broad stream is their undemocratic character. Lenin organised the Bolshevik Party on the principle of democratic centralism whose purpose was to combine internal democracy with unity and discipline. However, the content of the Bolshevik Party has been distorted through Stalinism. Stalin overthrew democratic practices within the Communist Party in the Soviet Union and succeeded in transforming it into an instrument of his own domination and that of the bureaucracy he headed. Stalinist parties elsewhere began to be characterised by an almost total lack of internal democracy, an increasingly disciplined and hierarchical membership. They ceased to be parties of the people and became political elites which used all means available to modern dictatorships to enforce the "dictatorship of the proletariat" in the socialist states. The functions of the party were merged with those of the administrative apparatus till they were indistinguishable. This resulted in the emergence of totalitarianism, obsession with command, mania for governing through political and administrative fiat carried to unheard of extremes and to vanity, intolerance, domination of influence and privilege. In such a system the political leadership looks down on the party and non-party masses as perpetual minors without minds of their own, incapable of deciding for themselves what they can and should know, what they can and should do. The identification of the leading role of the party with the ruling position of an elite group creates a situation in which the party is controlled by a ruling minority which claims the exclusive right to speak on behalf of the party mass which just fulfils the function of a transmission belt, and society is split into two groups, an anonymous majority and its manipulators.

In such a system the working class ceases to play a political role and becomes isolated from its natural allies, the peasantry and the intelligentsia. While the ideology of the leading role of the working class is promoted to the level of a state religion, any genuine activity of the workers is reduced to a minimum. It has now become obvious to all, except the traditional communists, that the working class cannot play a political role in a socialist system without freedom of the press, freedom of expression and information. Without these democratic rights it is blocked within the horizon of one factory or workshop.

As for the peasantry and the intelligentsia, they hardly play any political role in the present-day socialist states — the former being confined to their farms and the latter to their libraries. Thus the old slogan of the alliance of the working class, peasantry and intelligentsia has been reduced to a meaningless cliche. The ideal of the party-state bureaucracy is a closed society based on the sectarian limitation of various classes and rationing of information. This deprives each of these classes of its individuality and transforms each into a politically uniform and expressionless mass.

It is this travesty which led a revolutionary like Fidel Castro to say: "We want to liberate man from dogmas and free his economy and society without terrorising or binding anyone. We have been placed in a position where we

must choose between capitalism which starves people and (bureaucratic) communism which resolves the economic problem but suppresses the liberties so greatly cherished by man."

This dilemma facing revolutions can be resolved only by democratising the communist party from base upwards, by providing safeguards for the rights of dissenting minorities within the party — their right to be heard by the entire membership, their right to circulate documents on the same basis as the leadership's documents and in general to organise legitimate campaigns based on their policies to take over the leadership. This dilemma can be resolved by democratising the existing socialist societies, where the party should not enforce its authority, but win this authority again and again by sustained and continuous party activity. It should not enforce its line by means of directives but by the work of its members and by the truthfulness of its ideals. There are, however, no indications that such efforts are likely to be made.

Cretinous Conformism

Another ailment from which the traditional communist parties suffer is their incapacity for independent thinking. Conformity has slowly become a 'Marxist' habit of thought and Lenin's imperative for communists to think boldly, speak boldly and act boldly has been thrown overboard. Their total allegiance to the orthodoxy consecrated in Moscow has interrupted inside their brains, as it were, every reflex of critical thought. Parroting meaningless phrases, mouthing outworn cliches and indulging in sterile quotation-mongering, the traditional communists have emerged as compradore intellectuals living on the crumbs of other people's thoughts. They claim they have the monopoly of revolutionary truth as revealed in the holy books and manuals. This has also resulted in putting a strait-jacket on ideas and smothering the critical spirit which is so essential to effective revolutionary action. Disgusted with the "cretinous conformism" of the Cuban and Latin American communists, Fidel Castro exploded with titanic wrath on the Soviet leaders and the communist parties. He refused to accept the so-called "self-evident truths" traded about by the communists and asked for the renewal of Marxist literature.

Attacking the traditional communists and their "famous thesis" about the role of the national bourgeoisie, Castro declared: "Meaningless phrases are bad, of course, but so are the supposed meanings of certain phrases ... there are those that are forty years old — the famous thesis concerning the role of the national bourgeoisie, for example. How hard it has been to become convinced that this idea does not apply on this continent; how much paper, how many phrases, how much empty talk has been wasted waiting for a liberal, progressive, anti-imperialist bourgeoisie."

Denouncing the "covent-like narrowmindedness" and "bigotry" displayed by the communists, Castro said: "And they believe that they have a monopoly on revolution or on revolutionary theory. And poor theory how it had to suffer at their hands; poor theory how it has been abused and how it is still being abused!" Castro clinched the issue by advising revolutionaries to think with their own heads and not to take anything for granted, not to consider anything as sacred: "And we shall always think with our own heads and if we make mistakes we shall make our own mistakes ... how hard it is to make other people's mistakes!"

FROM THE CHAIR

Our responsibility lies, not only in understanding the issues involved in the prevailing chaotic conditions, but also putting forth our own effort to ameliorate the situation*

***Extract from the Address of Managing Director, Shri Hari Shankar Singhania.**

ADDRESS of Shri Hari Shankar Singhania, Managing Director, at the 35th Annual General Meeting held on Friday, the 19th July, 1974:

Ladies and Gentlemen,

I am very happy to extend you all a warm and hearty welcome to the 35th Annual General Meeting of the Company, convened to discuss Statement of Accounts and the Directors' Report for the year ended on the 31st December, 1973. With your permission I would like to take them as read.

As well-informed citizens, you are all aware that a not-so-happy situation is prevailing in the economy marked by shortages of all essential commodities and soaring prices. We know that our responsibility lies, not only in understanding the issues involved in the prevailing chaotic conditions, but also putting forth our own efforts to ameliorate the situation. This is a gigantic task but in our own humble way we must set out in a manner to help the realisation of the supply targets of the Paper industry at the national level. Looking at the problems confronted by the Paper industry from many sides, this does not appear to be an easy task. I would like to identify and discuss with you some of the obstacles in the way of your and other companies in the Industry which are responsible for the state of affairs.

First I would like to refer to the last year's performance and future plans of your Company and then go to the general issues of the Paper industry.

Performance in 1973

The sales and other incomes during 1973 at Rs 12.84 crores were nearly Rs 3.25 crores higher than the previous year's earnings. Production went up to 40,721 tonnes during the year from 36,549 tonnes in 1972. But for the power-cut of 40 per cent imposed for about 2½ months at J K Paper Mills and the shortage of Coal and Lime, the production and profits would have been higher. The Speciality Paper Plant, commissioned in October, 1972, is on its way to substantially better performance in terms of quantity and quality. The sophisticated varieties of Papers like Tissues, Bond, Airmail and Manifold made on the Speciality Paper Plant have been exceedingly well-received in the market. Gross Profits before depreciation went up to Rs 1.83 crores in 1973. The Gross Block at the end of 1973 stood at Rs 21.68 crores as a result of investment of about Rs 13 crores during the last three years by way of substantial expansion. This expansion shall substantially increase the earnings of the Company from 1974 onwards.

Dividends

Your Directors have recommended a dividend of 12 per cent on Equity Capital. However, this can no more be implemented in view of The Companies (Temporary Restrictions on Dividends) Ordinance, 1974. Since the Company has increased its Gross Block very substantially in the recent years, the depreciation it has to provide is heavy. In view of this, the net profit available for dividend in accordance with the Ordinance results in limiting the payment of dividends to 4.4 per cent on the Equity Capital as compared to 12 per cent recommended by your Directors.

Expansion

The augmentation of capacity by 3,000 tonnes per annum on Paper-Machine Number 1 and of the pulping side at J K Paper Mills is now complete by installation of balancing equipments. The Plant to manufacture 4,500 tonnes per annum of Coated Papers and Boards has been installed and will be commissioned fully within the next three months.

Industry — Problems and Prospects

Of late, Papers required for all needs, have been in short supply. Newspapers and other publications have had to severely curtail their consumption of Newsprint in view of the acute supply position. In this situation, the consumers belonging to almost all segments of the society, whether students, publishers of Newspapers, periodicals, books or Government or Industrial users, have been groaning under the impact of Paper shortage. Why has such a situation arisen? It is very well known that the creation of additional manufacturing capacity and increase in production has not kept pace with the growing demand. During the Fourth Plan only 2.37 lakh tonnes capacity of Paper and Paper Board was created as against the target of 4.00 lakh tonnes. Production rose by only 1.57 lakh tonnes against a target of 3.00 lakh tonnes. The production of Paper and Paper Boards at the end of the Fourth Plan was hardly 8.00 lakh tonnes from an installed capacity of 9.67 lakh tonnes. The position with regard to Newsprint was much more dismal. As against the target of production of 2.60 lakh tonnes at the end of the Fourth Plan only a production of 0.44 lakh tonnes per annum was achieved. With such wide gap between targets and achievements, the shortages emerged with all their consequences.

Why adequate capacity was not created and why production did not increase as planned? This question becomes all the more important in view of appreciable increase in production and capacity in other Industries. After all, why has Paper industry languished? Answer is obvious. Investment in Paper industry, whether by way of substantial expansion of existing units or by way of creation of new capacities by new entrepreneurs was not found attractive on a comparative basis. In fact, in Paper industry, new investment was not even viable. This is one of the main causes and is the direct result of the pricing policy of Paper followed for nearly a decade, when there has been either official or unofficial control on Paper prices.

The problem of growth of Paper industry has been further compounded by steep rise in the prices of capital inputs of Paper industry which results in appreciably higher investment needed for new capacities. The selling price of Paper would have to be adequate to meet the requirements of higher interest charges and depreciation in case of new capacities. The difference is so substantial that it cannot be offset by technological gains of new investments alone. I do hope that this matter, which has remained unattended to for such a long time, will receive careful consideration at the hands of the authorities who are undoubtedly concerned at the lack of growth of Paper industry.

Recently, Paper industry has agreed to make available to the Government about 25 per cent of its production at subsidised rate in order to meet the needs of Government, manufacturers of Exercise Note Books, and publishers of nationalised text books. By so doing, the Paper industry has displayed a sense of social responsibility in the present conditions of strain. The pricing policy for Paper industry would have to strike a balance between such social imperative on the one hand, and an adequate return for the industry on the other, to ensure much needed growth.

While considering the viability of new investments *vis-a-vis* the pricing policy, another angle that must also be kept in mind is that the inadequate return in Paper industry scares away new entrepreneurs and thus inhibits broad basing of entrepreneurship in the Industry.

There is yet another dimension to the issue of growth of Paper industry. The minimum economic capacity of an integrated Pulp and Paper unit is considered to be 200 tonnes per day which, on the current estimates, will need an investment of about Rs 65/70 crores. Such massive investment is possible only if there is adequate nucleus capital available from after-tax profits. In my opinion, this calls for an urgent review for introducing in some form the benefits available from development rebate which could enable the Companies to retain profits for plough-back for expansions and new investments. Further, the problem can be somewhat eased by allowing a higher debt: equity ratio than the prevalent 2:1. In certain industries like shipping in view of urgent need for expansion the Government have accepted the principle of higher debt: equity ratio. Even certain developed countries like Japan operate on very much higher debt : equity ratio to promote rapid industrial development. While there are points for and against increasing debt : equity ratio, I feel in the net it would not be imprudent to operate on a debt : equity ratio of 3:1 for such highly capital intensive industries like Paper specially in view of the fact that its products are so vitally needed for education, communication, industry and Government.

It is also noteworthy that due to their proximity to raw material resources, most of new units in Paper industry would come up in backward areas and would thus contribute to their development. This also makes a case for the industry for softer loans, i e, loans on lower rate of interest with longer repayment period.

In the long-range planning of Paper industry, another factor which has a crucial role to play is the availability of raw materials. This calls for development plans for our forest resources to be so geared that we meet the requirements of a growing industrial economy. Unfortunately, the present thinking and management of these forest resources does not have the forward looking orientation. Intensive plantation programme and investment in infrastructure like roads, etc, are urgently required to enable fuller utilisation of our natural forest resources and provide the raw materials for industrial growth. Short-term policies must give way to policies which would increase yield and quality of our forest resources on a long-term basis.

Though in the background of present state of economy the task is formidable, I have no doubt that with bold and fresh approach to the problems and with stress on achieving definite results according to a time-bound programme, we can turn the corner. Paper is not only an essential input for education, communication and administration. It is an equally important input for many industrial activities including packaging where it can replace scarce and costlier metals like tin-plates, etc.

Industrial Relations

This speech would be incomplete without putting on record my deepest

appreciation for the devotion and untiring efforts of the staff at all levels and the labour in various fields. But for their co-operation and efforts, the performance of your Company would have been hampered. As far as possible, your Company has been trying to enter into long-term agreements with the workmen which would, on the one hand, confer substantial benefits on the employees and also, on the other, ensure uninterrupted production and industrial peace at the works site.

My thanks are due to the financial institutions and banks for their continuous interest in our activities and assistance in various forms. The Government of Orissa also have extended valuable co-operation and support from time to time and my thanks are due to them.

Thanking you.

This does not purport to be a record of the proceedings of the Annual General Meeting.

STRAW PRODUCTS LTD.

BANK OF BARODA

DIRECTORS REPORT

1. This is the Fifth Directors' Report on the Bank's working after nationalisation. Along with it are submitted the Profit and Loss Account of the Bank for the year ended December 31, 1973 as well as the year-end Balance Sheet.

2. Bank of Baroda made all-round progress in 1973. There was a record growth in deposits of Rs 143.98 crores or 24.6 per cent, which took the Bank's aggregate deposits on to a peak of Rs 729.56 crores as on December 31, 1973, excluding about Rs 10 crores of deposits of our Uganda Subsidiary and Rs 11 crores of financial institutions. The growth rate of the Bank's deposits was higher than the corresponding rate of 18.8 per cent for the banking system. The share of current account deposits was 23.1 per cent, of savings bank deposits 24.4 per cent and of term deposits around 52.5 per cent. The share of rural and semi-urban branches in total deposits was 24.59 per cent while that of metropolitan and urban branches was 75.41 per cent.

3. In 1973 Bank's credit portfolio expanded at a higher rate both in percentage as well as absolute terms than in the previous two years. The credit portfolio expanded by Rs 84.49 crores or by 22.4 per cent as compared to an expansion of Rs 38.87 crores (11.5 per cent) in 1972 and of Rs 27.33 crores (8.80 per cent) in 1971. Yet the rate of credit expansion for the Bank was slightly lower in 1973 than that of the banking system as a whole at 23.2 per cent.

4. The Bank increased the flow of its credit to backward regions, particularly in the lead districts, weaker sections of society under the Differential Interest Rate (DIR) Scheme, self-employed people under the Multi Service Agency (MSA) Scheme and also granted loans to drought affected persons in Rajasthan and Gujarat States under specially tailored schemes. The Bank's outstanding advances to agriculture, small-scale industries and other small borrowers rose from Rs 83.93 crores at the end of December 1972 to Rs 108.05 crores at the end of 1973, recording an increase of Rs 24.12 crores or 28.74 per cent. The number of 'other small borrowers' (excluding transport operators) increased over the year by more than two and half times from 10939 to 28866. The average balance per account was Rs 2,600 and the total outstanding credit in respect of such accounts was Rs 7.56 crores.

5. Advances to the export sector, both for pre-shipment and post-shipment purposes, increased during 1973 with the balance outstanding at Rs 54.58 crores as against the corresponding figure of Rs 35.75 crores for December 1972.

6. The profit subject to bonus for the year was marginally lower at Rs 237.57 lakhs as against the profit of Rs 240.51 lakhs during 1972. The rise in dearness allowance and the higher establishment costs accounted for the slight fall in the profits.

7. The Bank opened during the year 80 branches of which 11 were in metropolitan areas, 20 in urban areas, 14 in semi-urban areas, 34 in rural areas and 1 overseas. This took the total number of Bank's branches in India to 759. Including 26 overseas branches, the Bank had thus 785 branches spread far and wide throughout the country and abroad. Of the total Indian branches 36.50 per cent were in rural areas, 24.11 per cent in semi-urban areas, 20.55 per cent in urban areas and 18.84 per cent in metropolitan areas.

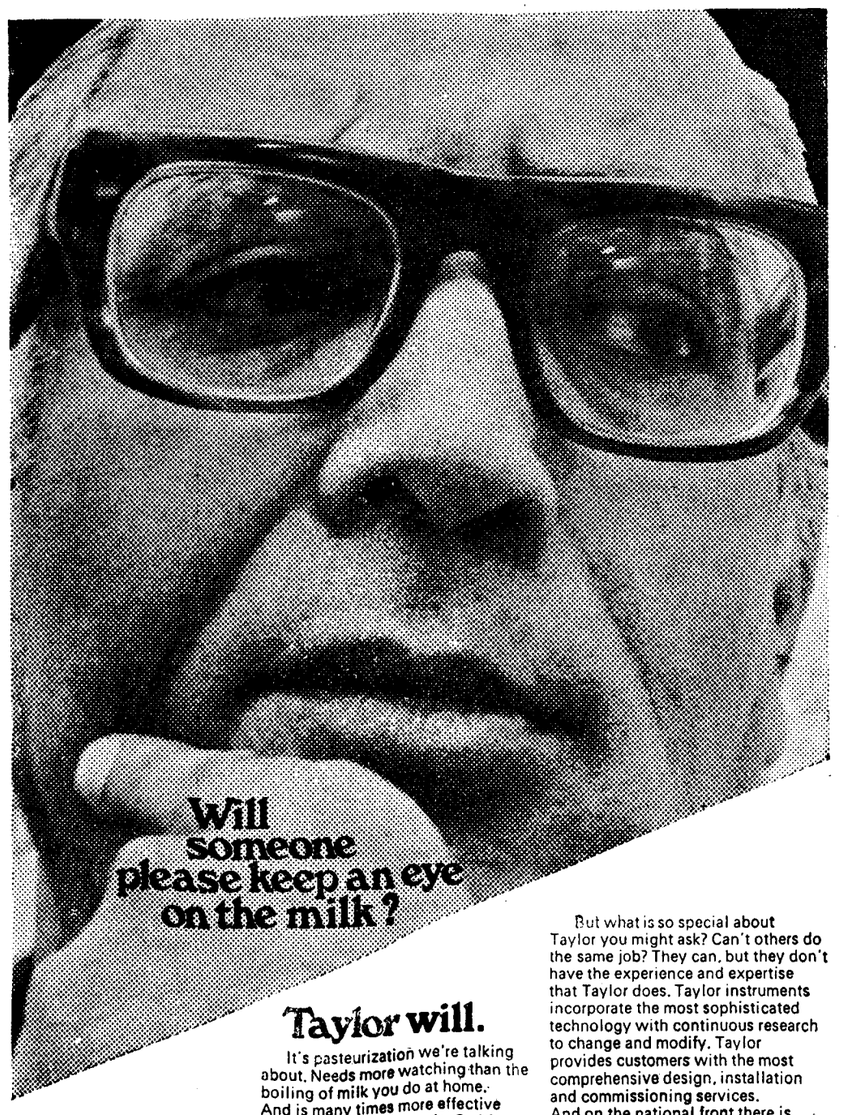
8. A group of Afghan bankers was deputed by Da Afghanistan Bank for training in India. Da Afghanistan Bank is a nucleus of banking system of Afghanistan performing both commercial and central banking functions. Under the training scheme, managers and officers of Da Afghanistan Bank were trained in commercial banking by Bank of Baroda. The training course was inaugurated by our Chairman and Managing Director in March 1973.

9. On November 21, 1973 Bank of Baroda opened its first overseas Multi Service Agency (MSA) Cell in Mauritius. The MSA venture abroad bears testimony to the interest evinced by developing countries in the MSA as an employment promoting and stabilising device. Presided over by the Prime Minister Sir Seewoosagur Ramgoolam, the Hon'ble Finance Minister of Mauritius, Mr V Ringadoo inaugurated the Cell. He also inaugurated our fourth branch at Royal Road, Rose Hill.

10. The year witnessed an encouraging performance of our overseas Branches in the UK, Kenya, Fiji, Mauritius and Guyana (South America). Pending discussions with the Bank of Uganda about the declaration of dividends, the Balance Sheet and Profit and Loss Account for the year ended December 31, 1973 of the Uganda Subsidiary, namely, Bank of Baroda (U) Limited have not been finalised on time. The permission of the Reserve Bank of India has been obtained for not publishing the final accounts of the Uganda Subsidiary in this Report.

11. In keeping with the expansion of business, the number of staff members in all categories increased by 1358 to 18116 over the year. At the end of December 1973, there were 4030 officers, 9589 clerks and 4497 subordinate staff members.

12. The Board would like to thank the members of the staff at all levels for the efficient role played by them in making possible the satisfactory overall performance of the Bank.



For and on behalf of the Board of Directors

V D THAKKAR

Chairman and Managing Director

Taylor will.

It's pasteurization we're talking about. Needs more watching than the boiling of milk you do at home. And is many times more effective in killing harmful bacteria. So it's absolutely vital for the safety of your health. And Taylor helps in pasteurization at the most critical times. Take temperature for instance. You can't control 71.66°C manually, can you? Or pressure, flow, liquid levels, humidity, specific gravity, force, load? All process variables that need very precise instruments for control, recording and measurement. And Taylor has been making these for 120 years! Making them to help make sugar, rubber, paper, synthetic fibres, fertilizer, cement, pharmaceuticals.

But what is so special about Taylor you might ask? Can't others do the same job? They can, but they don't have the experience and expertise that Taylor does. Taylor instruments incorporate the most sophisticated technology with continuous research to change and modify. Taylor provides customers with the most comprehensive design, installation and commissioning services. And on the national front there is Taylor's active participation in industrial progress, the generation of employment, the complete stress on indigenisation. And the pride in knowing that there will continue to be a lot of Taylor in the nation's life.

REVIEW OF MANAGEMENT

The world would be out of its element if India had not generated atomic thought

Today the world is in its element as it finds itself in the atomic age. But the discoveries of modern times echo the atomic theories of ancient India—theories that were brilliant explanations of the physical structure of the universe. An atomic theory was taught by Pakudha Kātyāyana an older contemporary of Buddha. Indian atomic thought thus originated before Democritus the great Greek philosopher—one of the founders of the atomic theory. In physics and other spheres Indian talents have enriched the world. We at L&T continue the tradition by enriching life through industrial development. The source of our energy is the vast reservoir of technical know-how generated over 35 years. It has spurred us on to manufacture equipment for India's nuclear power projects. The reactor vessel, fabricated for the first time in India, is an example. In order to foster the growth of nuclear power we have set up modern fabrication facilities; formed a specialist cell for handling design, fabrication, application of new techniques. We are a vast industrial complex designing, manufacturing installing plant and equipment for every vital industry. The secret of our success lies in the individual talents of over 10,000 people in our associate and subsidiary companies and our network of offices all over India.

The President as Product

THE American catharsis has taken place along expected lines. The *impeachment* of an incumbent President would have been a severely gruesome ritual; more horrendous tales of gross immorality and skulduggery would have been brought into the open; the outcome would have been a total shattering of American self-confidence, and a further fading of the external image of the nation's administration. Nixon was prevailed upon to spare the country — and its establishment — the trauma of that experience. What final lure was offered — or what threat was held out — to shore him out of office is of little import now. More relevant is the fact of his departure, and the consequential sense of relief on the part of those regulating the governmental processes in the United States.

The skill, determination and ruggedness with which men belonging to the Washington establishment themselves laid bare the unsavoury details of Watergate is remarkable. Even within the confines of the amorality which the American *official apparitchik* now epitomises, some rules of the game obviously still need to be respected, and some etiquettes need to be observed. Nixon and his entourage breached these rules, and have been called upon to pay for their indiscretion. This is of course the first occasion that such a cataclysm has overtaken the American system. But this was bound to happen sooner or later. For, it will be difficult to deny, it is a number of other attributes afflicting that system which have also been responsible for the phenomenon of Richard Milhous Nixon.

From 1946 till August 1974, Nixon, after all, exemplified one ethos which was specifically American in all its features and symptoms. He assumed the matter of politics and statecraft to be indistinguishable from any other species of business operations, where you indulge in ruthless competitive sport, and try to ascend to the top of the hierarchy through a diversity of means, quite a few of which often border on the shady. Even when the most elevated peak has been scaled, a kind of inverted zealotry hangs in the air. Dangers, howsoever imaginary, always appear to lurk in the corner; tension remains high; the executive suite becomes the arena for plots and ploys, counter-plots and conspiracies, strategies and manoeuvres, either for effecting a magnificent take-over or for doing in assorted corporate enemies. Gross acts of criminality are not unknown in this context; business executives are often caught out in the game of either trying to make a quick personal kill at the expense of the shareholders or sabotaging, through illegal means, the economic prospects of competitors.

Richard Nixon slipped, but only because he took the American business ethics and the nation's order of administration to be analogous all the way. This hurt the susceptibilities of Middle America, who want their President to be a somewhat abstracted entity and not to be confused with an ordinary journeyman in downtown New York or lakefront Chicago. Success went to Richard Nixon's head; the metaphysics of the Presidency, he thought, could be moulded to suit his personal proclivities. He could have got away with it, but only if he were not discovered in the act. Thus viewed, his greatest sin was not the common crimes he indulged in, but the fact that he was found out. As in the American business world, again, he has been made to pay the price of his incompetence.

Everything is once more *fine* and *in order*; he was a bad egg and we have got rid of him, seems to be the attitude of the American establishment. The Republican party will try to salvage the situation as much as they can between now and the November elections. Even were the elections to turn out badly, there will be enough time fully to repair the damage now that the Ford-Rockefeller combination has been so smoothly installed in office. For the first time in history, the Americans are having a President and a Vice-President neither of whom has been elected by a popular mandate. The Democratic party has acquiesced in the arrangement, but the basic malady will remain. It is the cynicism of American bourgeois civilisation which gave rise to the spectre of Richard Nixon. For the present, there will be a temporary lull, but one sees no evidence that the grim episode has provoked any deep soul-searching within the American nation. Crookery will thus continue, though one crook is out.

Taxation

Trick Is in the Terminology

CLASSIFYING taxes has long been the tax theorist's nightmare. Though commonly associated with taxes that are "either directly assessed or directly collected", like the income-tax, many of the taxes classified in official documents as 'direct' are not direct after all. For instance, local rates. Neither does the history of these terms show much consistency in their usage — the most famous aberration being the declaration by the US Supreme Court in 1962 that income-tax is not a direct tax.

Generally, however, after the income-tax made its appearance, taxes levied immediately on the persons "who are to bear the burden" came to be called 'direct' and others not so levied, 'indirect'. But, of how many of the taxes (barring perhaps the poll tax) can it be said that the persons on whom they are levied also bear the burden? While disputes rage among experts over the extent to which the burden of the corporation tax is shifted, doubts arise whether the income-tax paid by company executives on their salaries and perks is also not passed on at least partly to consumers through higher prices of products.

Uninhibited by any such doubts, the bureaucracy continues to clothe taxes levied by government in the familiar 'direct' and 'indirect' jackets. And that has its uses, unsuspected by the theorist — as the supplementary budget of the Union Government illustrates.

Of the Rs 230 and odd crores proposed to be raised through additional taxation, Rs 160 or about 70 per cent has been shown under the 'indirect' category. Of the Rs 70 crores expected from the direct taxes, as much as Rs 60 crores are to come from a tax on interest earnings of scheduled banks. In classifying this tax as 'direct' does the government expect the banks on whom it is to be levied to bear the burden? Surely not, for, with over 80 per cent of banking business in the public sector, that would make little sense. The banks, it must be presumed, are expected to recover the tax fully from their borrowers. Would the borrowers pay it out of their own pocket either? Even those uninitiated in the intricacies of shifting and incidence can see that it all depends on what the traffic, that is, the market will bear. And in a sellers' market, there is no limit to what the consumers can be made to pay. Borrowers will thus pass on the tax to buyers of their products though it is conceivable that it will impose some discipline in the use of bank funds by making it costlier.

What then is the logic of labelling the new levy as a direct tax? The answer hardly needs spelling out. Rightly or wrongly, in the public eye, the 'directs' are the good ones among the taxes, being those that are realised from the rich, and the 'indirects' are those that push up prices. If the criterion — who bears the major burden — was consistently applied, almost the whole of the taxes burden in the supplementary budget would have to be shown as 'indirect'.

Youth Congress

The Corrosive Base

HOW the Youth Congress went home, like so many rowdies and smugglers, following the luxurious rally in the nation's capital earlier this month, could be considered as an early — or not-so-early — indication of grimmer things to follow. Within the Youth Congress, no doubt, elements do exist who are motivated by nobility of intentions and integrity of objectives. But the periphery does not determine the central impulses. As far as the ruling party is concerned, since 1969, ideology has been supplanted by slogan-mongering with a certain acceleration, and solid work at the grass-roots has been replaced, over the decades, by the strategy of the *blitzkrieg* — often accompanied by strong-arm methods applied against political adversaries. Students and other youth have been gathered in, in large numbers: both *ersatz* glamour and lure of easy lucre have been used for the purpose. In several regions, through the mass of the Congress youth movement may consist of impressionable, unemployed, young men, the superstructure comprises persons hardly distinguishable from common louts. Funds, from mysterious but guessable sources, have been available aplenty to these structures of youth groups. The Youth Congress unit of West Bengal exemplifies this composition — despite its several warring factions. It is no accident that the principal organiser of the New Delhi caper — Priya Ranjan Das Munshi, President of the All-India Youth Congress — is from the West Bengal wing of it.

The details of what happened during, and after, the New Delhi rally are in a profound sense mere manifestations of an inevitability. The fault of their youth, the leaders must explain away, did not lie in their orgies — young people, after all, will be young people — but in their being too brazen in organising them. In their present state of demoralisation, the leaders can hardly summon enough courage to remonstrate with the entrepreneurs of the Youth Congress. They, after all, continue to need the services of the toughs of the Youth Congress for launching the pincer-thrust against the working class and the various opposition groups in the country. Those from whom you seek favour must remain beyond rebuke. Besides, there is another aspect of the matter. It is that, by now, most top leaders too have been found to have feet of clay, and many unsavoury details of their daily manoeuvrings are common knowledge among the Youth Congress boys and girls. A balance of mutual blackmailing is hence to be maintained.

A cumulation of such events as happened at Delhi and Bulsar cannot but lead to the gradual convergence of the polity towards an authoritarian order. That order will have the underpinning of a generation of young people, spoiled by bribe and amorality, who will have captured vital political positions. And as the economic situation deteriorates, official slogans will turn even more ferociously populist. But slogans cannot cover all the walls in the land nor fill the ever hungrier bellies. The Congress leaders, young and old, must be aware that the *djinn* is occasionally known to turn on its own creator.

Universities

Of Irrelevance with Irreverence

SOON after the government's victory against its railway employees, Bombay University's ruling circles too scored their own little triumph over the subordinate staff of the University at the end of June. After a protracted period of work-to-rule and a few token strikes, the employees' union withdrew its agitation without having received redress of even a single major grievance. The total defeat of the employees has brought in its wake an atmosphere of frustration, which threatens to render the running of the University ever more chaotic. Already, demonstrations and occasional morchas have been resumed, and the agitation may be intensified again in the near future.

The University of Bombay which started as an apparatus for conducting examinations and distributing degrees for a number of colleges 'affiliated' to it, has of late been trying to become a teaching-cum-research institution. Thus, over the past two decades, the university has opened several new departments — mainly catering to post-graduate instruction. The University authorities have also undertaken an ambitious building programme. Yet, all the while, administrative arrangements have lagged and degenerated. And, in the process, power has got concentrated in a few hands.

Indeed, the state of affairs in Bombay University illustrates how a manipulative and determined bureaucracy can allow an academic institution to slowly atrophy. With the Vice-Chancellor (always a part-time official) and an indulgent Syndicate (generally dominated by non-academic and ageing individuals) meeting only infrequently and seldom more than once a month, the effective authority in the University has passed into the office of the Registrar where a few individuals reign supreme. Archaic rules and procedures have helped such concentration. Almost every communication to and from the university has to go through the office of the Registrar, who is also *ex-offico* member of almost every committee of the University. With initiative and power so closely held by a few individuals, the university administration has got neatly split into a few king-makers on the one hand and a large army of minor functionaries on the other. Overstaffing at the base of the hierarchy — an accretion resulting from the spoils system at work — has merely aggravated the general frustration and lack of initiative.

The benefits of the spending and appointing powers of the system have slowly poured into the laps of the chosen few. The resentment against this has been sharpened by the fact that there has been no revision in the salary structure of the subordinate staff for over a decade — though the senior staff has meanwhile received two revisions with probably one more in the offing. However, in the present situation of high unemployment and with no other means to force the hands of the authorities, the employees' agitation was doomed to fail. Indeed, even the most reasonable of their demands — *viz*, recognition of their union — was thrown overboard.

But the delay in the completion of examination schedules — for which the Railway strike was a convenient alibi — has delayed the formation of new classes. Indeed, the new academic year could not start till July 1. And, even by the middle of August — almost six weeks after the supposed 'opening' of term — little post-graduate instruction (a direct responsibility of the university) had begun. The students have thus been short-changed of a quarter or more of their terms' fees. If the students are indifferent to such treatment, it only reflects their perception of the irrelevance of the academic mumbo-jumbo to their own future or their real earning power.

Nor is the academic leadership in the university equipped to provide any change of direction in this morass. Not only does the present administrative set-up give them next to no voice in the running of the university, but many of the top faculty themselves have but passing interest in the university, given the predilection of the authorities for employing persons who have retired from other institutions. Indeed, some professorships seem to circulate only among retired persons.

The university continues to proliferate — its numerous administrative problems notwithstanding. It has recently opened a new department, not included in its development plan, and appointed a retired gentleman to head it. Often, men so appointed have been on the Syndicate which is supposed to appoint them! It should be too much to presume that those who have done so well out of the present system would want to change it.

The Vice-Chancellor has now announced plans to open a department of Agriculture Management — when there already are two agricultural universities with four campuses in the state and the university has yet to start the departments of Biological Sciences to which it had committed itself several years ago. In view of what has been said above only the very naive will imagine that this decision has been motivated by academic considerations.

Sikkim

Another Peaceful Implosion

THE 36th Constitution Amendment Bill which will be rushed through Parliament next week cannot be regarded as a great step in the onward march of democracy for the people of Sikkim; it is one more shrewd tactical manoeuvre by the Prime Minister — akin to the 'peaceful' nuclear explosion, the ending of princely purses and privileges, the nationalisation of banks and the build-up over Bangladesh in 1971 — which may serve to divert the attention of the nation from her government's gross mismanagement of the economy. The seating of one Sikkimese in the Lok Sabha and another in the Rajya Sabha can hardly be regarded as of great value to the peoples of Sikkim or of India.

Unlike in the states of the Union, Sikkim's Cabinet and Assembly do not have the powers that the state governments and legislatures have. Under the Constitution adopted by the Sikkim National Assembly in June 1974 — which reaffirmed much of the tripartite agreement signed in May 1973 by the Government of India, the Chogyal of Sikkim and the leaders of the political parties in Sikkim — the Government of India along with its pro-consul in Sikkim, known as the Chief Executive, wields enormous veto and reserve powers in the guise of furthering "communal harmony, good administration, and economy and social development". In addition to these vast reserve powers, the Chief Executive — and not the Chief Minister and his council of ministers — controls the following subjects: finance, home, police, ecclesiastical department, palace establishment, judiciary and the Sikkim Guards.

In effect this clearly means that Sikkim continues to be a protectorate of India, with the nominal difference that this protected area will now have two nominees in New Delhi, who, it seems from incomplete press reports, will be chosen by the Sikkim Assembly and will not be directly elected by the people of Sikkim. It thus appears that purely for their own tactical political reasons, the Prime Minister and her government are landing India in a situation fraught with all kinds of possibilities. At the moment the leader of the Sikkim Congress identifies himself very closely with India much as he did not so long ago with the Chogyal's court. His so-called popular movement has always sought India's backing. This

could be because the movement has never been too sure about the extent of its popularity. The elections, last April, which gave the Sikkim Congress an overwhelming majority in the Assembly, were not clearly indicative of the party's mass support; they were probably more indicative of an upsurge of feeling against the Chogyal which had been building up for many years. Now that the Chogyal has been reduced to a figurehead it does not follow that the people of Sikkim will bestow their loyalty on the Kazi or on India. It is even possible that in the not too distant future the Kazi may turn anti-India if he begins to feel more insecure about his position within Sikkim. All this raises the question whether the 36th Constitution Amendment Bill is not also a clever precedent to tighten control over other regions like Kashmir while providing the window-dressing of 'associated' status.

DO YOU SEEK EXPANDING NEW MARKETS ?

Then, advertise your goods in these journals...and also subscribe to them.

JOURNAL OF INDUSTRY AND TRADE

A profusely illustrated monthly mainly devoted to the promotion of India's export trade and projecting the image of the country's growing industrial potential and technical competence. Through articles and features, it presents a comprehensive picture of industrial progress and trade. It also highlights the success of individual firms in product development and exports.

ANNUAL SUBSCRIPTION (including postage in India) Rs. 22/-

INDIAN EXPORT SERVICE BULLETIN

A weekly aimed at helping exporters, it contains tender notices, trade enquiries and information on market potential for Indian goods aboad. The publication also furnishes information on important changes in trade control and tariff regulations abroad. A veritable guide for export houses.

ANNUAL SUBSCRIPTION (including postage in India) Rs. 45/-

ECONOMIC AND COMMERCIAL NEWS

A weekly containing vital information on the latest developments in export marketing, industrial growth, scientific research, product development, quality control, etc.

(Not open for advertisements)

ANNUAL SUBSCRIPTION (including postage in India) Rs. 30/-

Anyone of these journals is an ideal medium among commercial journals available to trade interests and those who make purchase decisions.

Calcutta Diary

A M

DESPITE the hopelessness in the air, despite the claustrophobic listlessness, to dream remains an inalienable human right, permitted even to a citizen of this bedevilled nation. The plight of the economy could not be worse, inflation rages unfettered and uninhibited, the distress of the masses mounts from week to week and month to month, the central objectives of the nation appear to be stuck deep in a morass. Yet dreamers there will be, who will continue to dream. They will keep hoping that, come the next corner, a new vista is bound to be revealed. They will keep dreaming that once this Saturday's particular unsavoury episode passes into history, the subsequent events will be wholesome and honest, and gloriously straightforward. They will keep imagining that, once the present series of official and quasi-official unscrupulousness runs its course, in the coming days everyone will turn Simon Pure. One can contemplate what the model of such a dream could be, the dream that will be at the top of the heap, that will put into shade all other bold and wonderful dreams that one could think of.

For one individual, the fondest dream could be as follows: Come the Sunday morning following the Saturday night, as he rolls out of bed and goes to the door to collect the paper, a most magnificent news item hits his eyes. A statement has been issued by the Prime Minister's secretariat. The Prime Minister, it informs him, has decided that the nation's predicament has matured enough, there has to be a turning back, this far and no further. The Prime Minister, the statement says, is going to revoke a particular decision announced by the Ministry of Industrial Development on its own and on which she was only perfunctorily consulted in the past. She, the statement goes on to elaborate, is aghast at the gumption of the Ministry in issuing an industrial licence to Maruti Private Limited. Even when a letter of intent was first issued to Maruti, she had very strong doubts and reservations. After all, the Planning Commission had long ago decided that projects for the manufacture of a small car, whether in the private or in the public sector, would not harmonise with national priorities: at the present juncture, it was not at all necessary — nor desirable — to expand the capacity for passenger-car production. Even though it was being claimed that the cost of production of the Maruti car would be considerably less than that of the makes currently available in the country, the clientele for this car will continue to belong to the affluent sections of the community. Things have in fact deteriorated a great deal, the Prime Minister feels, since the Planning Commission sat in judgment on the so-called small-car project. Given the grave economic crisis that has overtaken the nation, there is absolutely no reason for setting aside precious resources for the further production of passenger cars, big or small. It was already sheer folly to waste so much of the nation's assets on the three existing car units; let there be no extension of that folly. The plea that Maruti is in the private sector and, therefore, will not cause any draft on the government's resources, the statement goes on to point out, is altogether specious; for, it is still the stock of scarce resources in the nation's command which the company will erode, and this, the Prime Minister has not the least doubt, cannot be permitted. The other argument too — namely, that Maruti cars will be manufactured with indigenous materials and without foreign collaboration — is considered by the Prime Minister to be equally fallacious; for, the indirect import costs — which will be diffused all over — are in any case going to be heavy. In view of the acute foreign exchange scarcity, the Maruti proposal has to be regarded as a luxury — and hence cut back. From now on, the emphasis in the field of transport, the press note suggests, should be exclusively on expanding the capacity of public transport. The production of trucks must, of course, continue to receive the major attention. In addition, whatever resources are worth being deployed marginally for producing mass transport vehicles — such as double-decker buses — would be considered for allocation. But, according to the Prime Minister, it would be criminal wastage of resources to allow the manufacture of Maruti.

But what about the outlay already incurred by the sponsors of Maruti Private Limited in setting up the pilot plant, and what to do with the capital already raised for the venture from various sources? The sponsors have perhap raised as much as Rs 30 crores from private industrialists for setting up the company; they have also borrowed funds from public financial institutions, including commercial banks. Land has been acquired; steel and other scarce materials have been used up to a considerable extent. In view of all this, if Maruti is not permitted to proceed further, the Prime Minister realises that there could be a lot of heart-burning here and there. But — the press note from the Prime Minister's secretariat goes on to explain — while admittedly some diversion of national resources has already taken place on account of Maruti, that cannot be used as an alibi for a further — and greater — diversion of resources.

The statement, at this stage, refers to the government's recent decision to cancel the plan for an international trade fair in New Delhi in view of the economic difficulties. Several crores of rupees had been spent, meanwhile, by the Union government, the state governments, and a large number of public and private undertakings, to set up pavilions and to make auxiliary and ancillary arrangements in connection with the fair. Since the authorities were of the view that such initial expenditures notwithstanding, it would be most improvident to hold the fair, they took the decision to abandon it. The government decided to cut its losses and scrap the fair; so be it with Maruti. The plant set up by the latter, it is explained, is proposed to be taken over at cost and utilised for assembling trucks and other public vehicles.

The press note is candid all the way. The government, it mentions in passing, is fully aware that land belonging to the Ministry of Defence was appropriated for Maruti; that the public steel plants issued special quotas so that Maruti could lift the necessary steel; that cement and other precious materials were allotted for Maruti, which could jump the queue. The press note admits that those industrialists, who helped to raise the bulk of the share capital of Maruti, were accorded import quotas and other special entitlements as reward for their co-operation with the venture; this was scandalous, and an enquiry into how this came about and where the culpability lies in each case is being instituted. The statement from the Prime Minister's secretariat goes on to admit that prospective dealers have been made to transfer, in the name of advance dealership fees, close to Rs 2 crores to Maruti Private Limited; the Department of Company Affairs is being asked to find out whether there

With Best Compliments

of

BRAKES INDIA LIMITED

Padi, Madras 50

was any infringement of law in the way these funds were collected.

The Prime Minister, the statement says, realises that there are broader issues involved in Maruti. It is not just a car project initiated by an individual. It is not even a bland symbol of so much first-order and second-order nepotism: that is only a minor aspect of the matter. It has a much broader, greater import namely, whether or not this nation ought to take at face value the exhortation to economise and conserve resources. Everybody from the Prime Minister down talks of the crisis the country is passing through. Each official statement dilates on the theme of abstinence, and on the need to push up the national rate of savings. What you consume, you do not save. If you consume in the way of having more of private passenger cars, to that extent you deviate from the goal of augmenting national savings. Thus Maruti could not only use up precious resources which might be used for higher national priorities; if permitted to go ahead, it would also release the flood-water of indulgence; once you permit Maruti, you will have no moral grounds to prevent similar other projects to go ahead. The Prime Minister, the press note says, recognises only too well that ultimately her call for sacrifice on the part of each and every member of the nation must be backed up by firm practice; she has decided that she must really set the example for others by taking this personal decision — to ban Maruti. She is full of admiration for the energy, initiative and imagination demonstrated by those who set up the prototype of the car. If these persons were born in any private enterprise economy, there is no question that they would have gone very far; but, as it happens, they were born in India, a poor country whose resources must be conserved for ameliorating the conditions of the most wretched ones, and accordingly savings must be encouraged at all levels. Therefore, these people have to be called upon to make the supreme sacrifice; she, as Prime Minister, has decided to step in and cancel the industrial licence accorded to them. Steps are being taken on the consequential arrangements she has elaborated. She hopes that this example will inspire others to make similar gestures.

So goes the dream. This is somebody's favourite dream not because this person is by nature crooked or holds a jaundiced view of things. He believes in the old-fashioned virtues which once upon a time ruled the world. He believes that the Prime Minister has the nobility and the sagacity to see the inter-connection of things. The Prime Minister, he is aware, is Chairman of the Planning Commission, the body which determines where the national priorities lie. She is, at the same time, head of the government, and knows more than anybody else the gravity of the present crisis. He has every hope that she will ensure that his dream comes true. It is after all such dreams which sustain a nation and whose fruition constitutes its pride. And the person who dreams this dream is firm in his conviction that once his dream comes true, the emotions that will be released round the country will be a thousand times more potent than those that were let loose in July 1969.

CAPITAL VIEW

Swadeshi Theorising

Romesh Thapar

AS the desperation about the sterile *status quo* mounts, all manner of theorising is under way around the central question: What makes the Indian and his 'style' what it is? Frankly, there's little point in recording all the usual serious pontification which ambitious, scheming academicians have popularised in the strangest jargons — and that goes not only for our over-paid professors, but also for their distinguished colleagues abroad who are active partners in what could be termed the global crime of obfuscation. Let's turn to more populist theories for relaxation.

I very much enjoy the 'line' that is current among the female — or feline! — supporters of the Prime Minister these days. And when I say female, I am not talking about those rotting mountains of flesh whom you espy as women's leaders in the newspapers so frequently. I refer to younger, more intelligent activists who are looking for excuses to explain away the non-action. Here goes ...

Apparently, the real trouble is the fact that the Prime Minister is a woman. Try as she does to put on tantrums and flashes of temper she remains for a male-dominated system, a mercurial sort of female capable of changing her mind frequently. Numerous notes or memoranda are cited as evidence of her alleged grasp of the details of a wide variety of problems. These missiles sent regularly to the ministries are seldom honoured by the system, which is, we are earnestly told, in the clutches of the "male chauvinist pigs". These pigs deliberately don't act. They, then, put all the blame for failures on female philandering and take the credit for whatever little is done.

Again, it seems we have not really appreciated or even begun to comprehend the true Indian character because we are obsessed by the moral cliches of a Christian colonial past. It is pointed out that over centuries of foreign oppression, the toiling masses of India, and their grasping leaders now risen to sovereign power, have only developed real expertise in one critical activity, namely how to evade the so-called law in the interests of individual survival. This heritage seems to have mutated the Indian gene, to use a pseudo-scientific analogy, and today we are doing at every level what comes naturally, so to say.

Ah, yes, it wasn't always like that. When the British were here, a handful of *koihais* ruling a vast and complex population, a certain morality, largely Christian, was imposed on public life and activity. One big corrupt killing in a life time — not more. This principle sort of survived, fitfully admittedly, through some hundred years from Raja Ram Mohan Roy to Jawaharlal Nehru. Yes, Nehru was the last of the flawless practitioners, drawing deep sustenance from Gandhi. But, then, did he not represent something akin to an exhausted *finale*? The authentic *deshi* style was soon to take over under his daughter. Poor thing, what can she do about it? Swim or sink.

But that's not all. Even the intellectualism of the earlier theories is rejected by a solid phalanx of the supporters of the present free-for-all order. At this level it is argued rather overpassionately that there is so much insecurity in the business of living in India that no reasonable norms, or whatever you call them, can apply. Everything is fair in the war for survival. Only those wretched people are horrified who are sitting on cushions, khadi and silk.

So long as this situation of deep insecurity persists, there is no hope of evolving mass motivations and what

have you. And that goes for Indiraji, JP and what have you. In other words, get the price fixed of one square meal every day. Guarantee it. Then the chatter about the removal of poverty may make sense. Here, even salt can disappear from Bombay-on-the-sea. That's an epitaph for about the most incompetent, lazy society on the face of this earth.

Of course, with re-thinking in ruling circles proceeding at these profound levels of enlightenment, we cannot ignore the Hindu philosophers who quote and misquote scripture and commentary to prove that we are passing through a temporary aberration, that out of every suffering good will ensue, that eventually the blood of a ruler will run through the veins of the ruler, that 'playthings' cannot be installed on thrones, that inauspicious periods are followed by auspicious, that the stars and planets are changing their course.

This mumbo-jumbo, taken by many millions as an opiate and obviously the main contributor to the high tolerance level of the suffering Indian, fails to explain a single specific problem. But it's important to propitiate the Gods. If the Prime Minister feels like that on Janamashtami, old President Fakhruddin takes no risks. He invites the entire pantheon of priests, drawn from every faith, to invoke blessing on him. Hari Om!

What a heaven-sent opportunity for Jayaprakash Narayan, despite his age and health. Never was a vacuum more complete. But, alas, JP keeps the focus too much on himself. He fails to name trusted lieutenants his instruments, acclaim them, publicise them, create the alternative leaders. What is viable in Bihar could be anywhere in the country. Who will take the plunge? Clearly, those who are politically exploiting JP must be sent packing. New elements will have to be chosen and entrusted with major political enterprise.

Maybe, we are moving, Indian style, to a massive, continental boycott of elections and all the plethora of corrupt organisations spawned by a government impervious to need to solve problems by firm command and through ruthless follow-up. Maybe ... One never knows in India.

Tailpiece: Meanwhile, Karan Singh has certainly devised a compact, single-line formula for the dissolution of one of the major areas of his portfolio. He has declared at the World Population Conference in Bucharest that "development is the best contraceptive" — or Health, for that matter. Passing the buck to humbled friend D P Dhar at the Planning Commission, no doubt. And D P is only too willin', what with the Planning Commission in the doldrums.

August 26

he burnt diamonds, but helped save money on telegrams

Antoine Lavoisier, the French chemist, (1743-1794) was a crack scientist, if you know what we mean. Positively nuts about chemistry. Once he burnt two whole diamonds, while his poor wife stood by, burning with indignation. Whether it was to prove that the result of their combustion was carbon dioxide, or to disprove the slogan, 'A diamond is forever'—well, it was anybody's guess.

But something of a smashing success, M. Lavoisier. In his laboratory, there were no fewer than 13,000 glass containers, tempting enough objects, to have pot-shots at, but he wouldn't. Either his conscience made a coward of him or he was afraid his own lab. assistant might riposte with a retort or two, courteous or otherwise, so he preferred to break his own head ... against reaction.

A rich and leading farmer general, Lavoisier also believed in calling a spade a spade, not an agricultural implement. Oxygen was simply oxygen, not dephlogisticated air. Easier to spell and one word less in telegrams, he said.

And he also showed up caustic soda (which had been fooling other chemists) for what it was— an alkali.

At Mettur, we make caustic soda, both rayon and commercial grades. In solid, flake and lye form.

Here's the full range of the chemicals we produce:

INORGANIC CHEMICALS:

Caustic soda • Stable bleaching powder • Hydrochloric acid • Liquid chlorine • Calcium chloride • Aluminium sulphate • Potassium chlorate • Silicon tetrachloride • Bromine

ORGANIC CHEMICALS:

Methyl chloride • Methylene chloride • Chloroform Carbon tetrachloride • Chlorinated paraffin wax

MAHARASHTRA

Alienation of Adivasis' Lands

Government Not Serious

S D Kulkarni

IT is an established fact that large-scale alienation of lands belonging to the scheduled tribes into the hands of non-scheduled tribe persons has taken place in the post-Independence period. Adivasis all over India have been victims of this process.

Adivasis in Maharashtra, and in Dhulia district particularly, have carried on a prolonged agitation to regain possession of alienated lands. A non-official committee headed by S M Joshi toured the adivasi areas in Shahada taluka in Dhulia district and expressed the view that about 10,000 acres had passed into the hands of non-adivasis in Shahada taluka alone. This alienation took place in various ways: (1) Moneylenders took possession of lands of adivasis who owed them debts. In many cases, this took place under oral agreements. The lands so taken over were never returned. (2) Rich landlords took possession of adivasi lands on promise of exchange which never took place. (3) A number of moneylenders took adivasi lands on long-term lease with or without the Collector's consent. They got themselves registered as tenants and became owners under the Tenancy Acts. (4) Non-transferable adivasi inam lands were made transferable on payment of a certain amount after Independence. Non-adivasis purchased these lands after they became transferable. (5) Adivasi lands were auctioned by co-operative credit societies because of non-payment of dues. These were purchased by non-adivasis. A number of these transactions took place through force and fraud.

Since 1972 the adivasis of Dhulia have carried on a struggle against these alienations. In 1973 the Government of Maharashtra appointed three special tahsildars to inquire into the legality of the alienations. Their reports have not been published. But it is learnt that they have reported that these alienations were more or less in accordance with the provisions of the law. This naturally did not satisfy the adivasis and their leaders. In February 1974 the adivasis in Dhulia district launched a satyagraha to regain these lands. The government has now come up with an Ordinance (No 13 of 1974) supposedly to meet the adivasis' demands issue.

The statement of the Ordinance admits that "in a number of cases, particularly from Dhulia, Thana and certain other districts, lands previously held by persons belonging to the scheduled tribes have gone into the hands of non-tribals. In many of these cases, the transfers are found to have been made in contravention of the provisions of the Maharashtra Land Revenue Code, 1966, or the Tenancy Laws in force in the state. It has, therefore, become necessary to provide for restoration of these lands to the original Tribal land-holders." It is difficult to accept the government's contention that many of the transfers were in contravention of the law. A mention has already been made of the 'tahsildars' reports. Moreover, the contention conflicts with the remark in the statement that "it is also proposed to provide that no non-tribal person shall have the right to purchase under any of the Tenancy Laws in force in the state, any land belonging to a Tribal which may be duly leased to such non-tribal under the Maharashtra Land Revenue Code, 1966".

Objectives

The Ordinance has two objectives: (1) to prevent transfers of land to non-tribals by amending the existing laws; and (2) to provide for the restoration of already alienated lands to the original tribal holders. Let us see the ways in which the Ordinance purports to achieve these objectives.

The following provisions are made to prevent transfers of lands to non-tribals. It is laid down that in future no transfers of land from tribals to non-tribals shall take place by way of sale (including sales in execution of a decree of a civil court or an award or order of any tribunal or authority), gift, exchange, mortgage, lease or otherwise, except on the application of such non-tribal and except with the previous sanction of the Collector in case of lease or mortgage for a period not exceeding five years, and of the Collector with the previous approval of the state in all other cases.

The Ordinance further empowers the Collector to restore the possession of land on the expiry of the period of the lease or the mortgage on his own or on an application by the tribal. This power cannot be by-passed by any law in force or any decree or order of any tribunal or authority. This power extends to all cases where a transfer has taken place in contravention of the provisions of the Ordinance. But in these cases the occupancy shall vest in the state after the Collector decides that the transfer is of such a nature. The time-limit laid down for such an inquiry is three years from the date of transfer. After the vesting of the occupancy in the government, the Collector shall notify the tribal-transferor to state his willingness to purchase the land and shall give him the occupancy provided that he is ready to pay the purchase price and to cultivate the land personally and also that the total land held by such tribal-transferor does not, as far as possible, exceed an economic holding as defined in the Ordinance. No civil court shall have jurisdiction over the type of cases to be settled, decided or dealt with by the Collector under these provisions.

Section 181 of the Land Revenue Code empowers the Collector to cause the right, title and interest of the defaulter of government dues in any immovable property, other than the lands on which the arrears are due, to be attached and sold. Under the amendment effected by the Ordinance this power will hold good only if the defaulter is not a tribal.

Section 182 of the Land Revenue Code lays down that if the Collector deems it inexpedient to adopt any of the processes specified in the Code for the recovery of arrears, he may cause the immovable property of the defaulter to be attached and taken under the management of himself or any agent whom he may appoint for the purpose. The Ordinance makes this provision compulsory wherever the defaulter is a tribal, by substituting the words 'he shall' in place of 'he may'. Thus in future in case he is unable to recover the arrears through other processes from the defaulting tribal, the Collector will have to take the land under his own management.

The Ordinance has amended the Bombay Tenancy and Agricultural Lands Act (47 of 1948) in certain respects to prevent alienation of adivasi lands. Section 4B of the Act lays down

that no tenancy of any land shall be terminated merely on the ground that the period fixed by agreement or usage for its duration has expired. This section, because of the new amendment, will not prohibit the Collector from taking possession of the tribals' land which is in the hands of the non-tribals. The same Act makes certain provisions for the termination of tenancies and the right to purchase the land (Section 88C). This has now been amended so that no non-tribal shall have the right to purchase any land duly leased to him by a tribal.

All the above provisions are made to prevent alienation of adivasi lands into the hands of non-adivasis. On paper, they do appear to be quite effective for achieving their objective.

Restoration: The Real Problem

However, the major problem of the adivasis is not the prevention of land alienation in future. The alienation process has been going on for years and very few adivasis have now lands of their own. Besides, they are now aware of the problem of alienation and even under the unamended law the process of alienation was bound to be difficult The real problem is, therefore, that of the restoration of lands which, according to the government, have passed into the hands of the non-adivasis *in contravention of law*. Let us see how the Ordinance proposes to set this right.

Sub-sections 2 and 3 to Section 36 of the Maharashtra Land Revenue Code lay down that occupancies of persons belonging to scheduled tribes in parts of the state so declared by the government shall not be transferred except with the previous sanction of the Collector. If such a transfer is made the Collector may on application by the transferor or his heir for re-possession made within two years of the transfer determine the liabilities of arrears of land revenue and other dues and shall dispose of the application in accordance with the prescribed procedure. Under the new Ordinance a new proviso has been added to sub-section 3 described above. Under this proviso if a tribal has transferred his occupancy to a non-tribal in contravention of sub-section 2 (i e, without the previous sanction of the Collector) or any law for the time being in force, and if such occupancy is in the possession of such non-tribal or his successor-in-interest and has not been put to any non-agricultural use before the commencement of the Ordinance (i e, July 6, 1974), the Collector may, notwithstanding anything contained in any law for the time being in force, either on his own or on application by the tribal made at any time within three years of such commencement, after making such inquiry as he thinks fit, declare the transfer of the occupancy to be invalid and direct the restoration of possession to the tribal or his successor-in-interest.

Thus the tribals can now ask for the restoration of possession of lands that have been transferred to the non-tribals in contravention of the Land Revenue Code, or any other laws in force. They have to do this within three years of the commencement of the Ordinance.

This is the only provision which deals with the restoration of transferred occupancies. However, the provision is limited in a number of ways.

It has been already pointed out that the state government was empowered to declare the areas to which sub-section 2 of section 36 of the Code prohibiting alienation of tribals' lands was to apply. The government accordingly declared these. The restoration provision is applicable only to these areas, so far as lands alienated in contravention of the Code are concerned. This has deprived a number of adivasis living in the areas not covered by the sub-section of their right to apply for restoration. Thus, the restoration provisions coming under sub-section 2 of section 36 of the Code will apply to only a few villages in Shahada taluka which consists of 179 villages and to only one village Umarpati from Sakri taluka which has a number of villages predominantly populated by the adivasis. This restriction on restoration is the most serious limitation of the Ordinance depriving it of its utility.

It is also laid down that the restoration of possession can be ordered only if the occupancy is in the possession of a non-tribal (to whom it was transferred in contravention of the Code or any other law) or his successor-in-interest, and only if the occupancy has not been put to any non-agricultural use before the commencement of the Ordinance. Thus if the occupancy has been sold or exchanged by the original non-tribal who took it from the tribal, the tribal's claim is lost. The same is the case if the occupancy is in the hands of the non-tribal but the land is being put to a non-agricultural use.

Even these restricted provisions do not apply if a non-tribal was rendered landless by reason of acquisition of his land for a public purpose. This exemption appears to have been added to exempt the non-tribals in Kolaba district who were displaced after the construction of the Koyna Dam and who acquired some of the adivasi land in the area of Kolaba district.

Procedure of Enquiry

All this clearly indicates that the government is not very keen about the restoration of land to the adivasis. The restoration provisions apply to transfers which took place in express violation of the then prevalent law. Lands alienated under Sections 181 and 182 of the Code now amended are not given any retrospective coverage. The very fact that these Sections have been amended now to prevent alienation shows that alienation could take place earlier without violation of the Code. This is also true of the Tenancy Laws now amended. The fact that considerable transfers of occupancies took place under these laws has already been mentioned. The amendments of these laws are also not given any retrospective effect. Thus the restoration provisions apply only to transfers which took place in contravention of law and not in contravention of law as it is now amended. In many cases the legality of transfers depends upon the 'previous consent of the Collector'. One is afraid that this may lead to manipulation of records.

The government has to prescribe the procedure of inquiry to be made under the Ordinance. This will have to be done very carefully so as to avoid the pressure of influential parties on the persons conducting these inquiries.

Thus it can be said that while the new Ordinance is likely to be quite effective in preventing future alienation, it will not be at all effective in the restoration of the already alienated adivasi lands. The restoration provisions are very timid and will not meet the problem of the adivasis.

Full Circle

TAMIL NADU, the much-vaunted surplus state, has seen a near-collapse on the food front. It has seen the doubling of food prices within four months. It has seen the government offering to landowners a price double that required for them to make a handsome profit. It has consequently seen the price of ration rice upped suddenly in cities other than Madras and Coimbatore, from Rs 1.40 to Rs 2 per kg, with the open market prices ranging between Rs 3-3.50 per kg. In the wake of the agitations then in the major urban centres, where earlier those earning less than Rs 300 per month were entitled to ration rice, it has seen those earning upto Rs 500 were made eligible for the rice distributed. Tamil Nadu has seen its government appealing on bended knees to co-operatives that they sell rice at Rs 2.80 per kg — a price which only a month ago it had held unjustifiable. It has witnessed, and continues to witness, sudden disappearance of rice stocks from the market and ensuing eruptions of food riots. It has seen lathi charges, tear gassing, and the arrest of over 5,000 people in the food agitations. It can also perceive that the crisis will continue to build up in the months to come as the Kuruvai harvest will be considerably delayed following the late release of the water from Mettur Dam.

When, in January this year, 200 women in Madras city took out a procession to the state Food Minister, protesting against the steep rise in prices and demanding more fair-price shops, the Minister had the temerity to preach that they should consider themselves lucky to be living in Tamil Nadu and not in any other state: "Do you know the price of wheat in Bombay? Have you not heard that there is no food in Gujarat?". Six months later, that complacency has vanished. There is panic, as his own partymen are demanding his resignation for fear of a Gujarat in Tamil Nadu, with rice prices reigning at heights unimaginable even a month ago. One could, in fact, sense the gathering storm over the past few months. Yet, when the storm finally broke out in late July, its intensity surprised everyone — including the usually unflappable Karunanidhi.

The epicentre of the storm was naturally Thanjavur, the rice-bowl of

Tamil Nadu. Thanjavur's surplus production feeds not only Tamil Nadu but other deficit states as well. When, in November last year, the government sharply increased the procurement price in Thanjavur, from Rs 53 to Rs 75 per quintal, the landlords of Thanjavur made a windfall profit on the very sizeable surpluses that have been resulting from the 'green revolution'. One of the smaller landlords, cultivating only 23 acres, glibly estimated his profit on the three-month crop to be as much as Rs 20,000 on an expenditure of Rs 8,000; the bigger landlords, of course, would have gleaned far larger dividends. And this, at a time when the state government along with the FCI was effectively the sole buyer, and in a season during which crops cannot be stored owing to rapid deterioration and during which ruling market prices were much lower.

Their appetite whetted, the big landowners thereafter demanded further price increase for the Samba crop, harvested about this time. The Samba crop can be dried and stored; and sure enough the big landlords stored it. An expectant air thus hung over Thanjavur district, while the government's procurement lagged and the price of rice in the other districts crept upward: In Madras, rice was already being sold at Rs 2.50 per kg. The landlords and the paddy dealers did not have to wait long. On the morning of June 12, the state government announced that its 40 per cent levy on traders was abolished and that the ban on rice movement from Thanjavur was removed. Of course, four days later, the ban had to be reintroduced: but, within those four days — an MP of the ruling party announced recently — more than 1,38,332 tonnes of rice from Thanjavur had fled to other districts, at prices 50 per cent higher than the ruling free market prices. While it may be endlessly debated as to whether the landlords and the traders had prior intimation of the lifting of the ban on movement and had therefore stocked up in anticipation, the fact remains that the time-span before the reimposition of the movement restrictions was known to all who needed to beat its deadline for their profit-gathering jamboree. Thus caravans of lorries moved thousands of tonnes of paddy overnight. At places, overworked labourers were paid as much as five rupees a bag to load the paddy into lorries that were queued up to move out with efficiency.

The mission accomplished, the state Food Minister and his officials announced that the price of rice in the state was indeed dropping by 20 to 30 paise per kg. However, the ordinary citizen found that there was no change in the price; instead, the price of rice rose slowly, after a while rapidly, and then the rice became simply unavailable. Meanwhile, in Thanjavur itself, the price shot up by 50 per cent overnight. The wholesale-traders and the rice millers, who had lifted the Thanjavur stocks, clearly had no intentions of parting with them without collecting as handsome a margin as had the landlords of Thanjavur. Thus, one hoarding led to another — despite the official order restricting the stock-level for wholesalers — and the price shot up to Rs 3.50 per kg; in several other places, again, rice simply vanished from the market.

It was the people of Red Hills, a suburb of Madras city, who first decided to solve their food problem by their collective action. Three days after rice had disappeared from the retail shops of the area, a desperate crowd, including a large number of women, stopped a speeding lorry carrying rice. They unloaded the rice and had it distributed. Their action triggered off a series of similar actions throughout the state, with mostly women in the forefront. Retailers in most parts downed shutters, adding to the distress of daily wage earners who had to trek miles, bag in hand, to buy the day's supply of foodgrains. In spontaneous actions all over the state, irate mobs broke open locked godowns, unearthed hoarded stocks, and had them distributed at fair prices.

The Chief Minister was nettled. He admonished the opposition parties for fomenting the agitation, ordered the police to come down heavily on the side of 'law and order', and assured full protection to traders — thus showing himself most sensitive to the plight of the hoarders consequent upon the public mobilisation. He sternly warned the people that they should consider their duty done, once they had passed on the information about hoarding to the relevant authorities!

A group of students of the Madras Christian College, Tambaram, affiliated to the Students Federation of India, decided not to be so dumb as to trust such advice. On August 1, they unearthed 350 bags of rice and 11 barrels of kerosene, and distributed them within a few hours to the women of the area. The police arrived soon enough, but their attempts to round up the students were foiled by the women, armed with broomsticks and kitchenware. The women threw themselves along with their children in front of the police van. The police left without a single prey that day. But that night, plots were evidently hatched between the DMK strongman, the police, and the blackmarketeers. The following morning, the ruffians of the locality beat up the students wherever they could find them. Student leaders — including the national Vice-President of the SFI who went to the spot to investigate the attack on the students — were arrested stealthily, in lonely spots, away from public gaze.

The Tambaram incident is typical of several others that have taken place in the state. Yet, behind the show of force can be discerned a new nervousness in the government. When the CPI (M) declared its intention to hold a demonstration, on August 15, to protest against the price rise, the police started a week before the date to put into preventive custody CPI(M)'s leading cadres.

The Chief Minister, who had as late as on July 16 declared the food situation in the state to be 'satisfactory', had a tough time explaining away the facts staring him in the face. At first, he attributed the price rise to the fertiliser price increase, then to the reported shortage of production, and finally to the fact that "the food scarcity has been artificially created by a few landholders, traders and politicians"! A very strict law, he said, was 'under consideration' to deal with hoarders: The severest action taken to-date, however, has been the cancellation of licences of a few wholesalers and retailers.

But it was in his performance *vis-a-vis* the recalcitrant landholders that Karunanidhi donned his most ferocious mask for the benefit of the public. He demanded that they sell all their surplus rice after setting aside their own six-months requirement; but before this he announced a purchase price of Rs 140 per quintal — double the procurement price of Rs 70.

Thus, Tamil Nadu has come full circle indeed. In the early days of DMK rule, Annadurai had announced a levy of the entire surplus of landholders owning more than 10 acres and vowed to supply rice to the people of the state at 63 paise per kg. He actually achieved this if only for the cities of Madras and Coimbatore, by procuring 8 lakh tonnes of paddy in a year. His successor in the DMK, Karunanidhi, has by now discontinued the levy on farmers, done away with the rupee a measure scheme, and opted to rely more and more on the market forces. With his government having procured less than 1.5 lakh tonnes this year — and most of it at market prices — he has but little choice!

SOUTH

Decisive Conflicts

THE indecisiveness of the Government when confronted with the most challenging crisis since Independence underlines the decisiveness of the conflicts that are now plaguing the country. The vacillation of the Centrists is always greatest when the two main contenders are not only somewhat evenly matched but are also moving forward their respective battalions.

The pace of the inflation threatens to tear asunder the fabric of our national economy. Unless the pace is halted, little will remain of our polity too. The inflation is a declaration of a call to arms by the most reactionary forces in our country. It is these forces, holding strong positions in the state and in the ruling party, that are now making a bid for total power. The path of independent capitalist development having reached a dead-end, the neo-colonialists, the monopolists, and the landlords, have taken over in India. They cannot be held at bay by a defence of the *status quo*. They have to be defeated by a radical change in the balance of forces and a radical transformation of our socio-economic structure. But these require the defeat of these forces, which cannot be secured except by frontal attack by mobilising and uniting all the forces threatened by reaction, by winning the active support of some and securing the neutralisation of others.

The South has been, and is today, an integral part of what is clearly a nationwide process.

In Tamil Nadu, in particular, it is evident that attempts are under way to make the state one of the springboards of an all-India reactionary offensive. The passing by the Tamil Nadu Assembly of the DMK's resolution on the so-called autonomy of the state was not a mere formality. It showed the direction of the political campaign. Creation of anarchy is an integral part of the Right offensive, which seeks to utilise the acute discontent, frustration, and anger of the overwhelming majority of the people — but for the victory of the very forces that are responsible for the present miserable state of affairs. One of the best ways of doing this is to work upon regionalism; and this is the role assigned to the DMK, the leadership of which has willingly taken it up. The resolution, the implementation of which would nullify our national identity, came significantly at a time when anti-Malayalee riots were also worked up. Even more significant was the remark that there could not be two Keralas in the South. While the target of this aphorism of Karunanidhi was M G Ramachandran and the ADMK, which has just walked away with a major part of the ruling party's mass base, its historical implication can not be lost sight of. Kerala, after all, is not only the homeland of the Malayalees. It is also the scene of the real alternative to the Right — a Left and a democratic coalition. It is not only chauvinism that Karunanidhi is using against the Malayalees. It is also an economic squeeze. It is an intolerable fact that rice which was bought in Tamil Nadu at less than Rs 2 per kilo was sold at over three times that price in Kerala. And now, the chickens have come to roost with the shooting up of the price of rice in Tamil Nadu itself. The extensive smuggling network, with its headquarters in Madras, has worked its way down into the villages and seeks to build an entire system of parasitic trading capitalism which is nothing but the commodity face of black money.

Tamil Nadu thus presents something of the classical case of the perverted transformation of the petty bourgeoisie — or, rather, of segments of it. Petty commodity production is sucked up into merchant capital whose trading profits depend on contrived difficulties in production and obstacles in the way of exchange. It is an illustration of the fact that when monopoly capital is superimposed on a weak industrial base, the capitalist breakthrough at the grassroots and on a wide foundation is rendered impossible. The breakthrough of the productive forces in India, therefore, is not possible along the capitalist path given the structuring of contemporary Indian capitalism. The downfall of the DMK and its present degeneration is a symptom of this disease at the petty bourgeois level just as the decline of the Congress and its degeneration is more indicative of this at the bourgeois level.

But the transitional difficulties it creates is demonstrated in the case of Kerala. The Left and the democratic coalition government there suffers from the important weakness of not having the support of the CPM. What is emerging as a significant point of contention is the relation between the implementation of the democratic programme in Kerala and the present shift to the Right in the economic policies of the Central government. Radicalism in Kerala has to be combined with a struggle against anti-radical or even non-radical policies at the Centre. One cannot support the shift to the Right at the Centre and at the same time press for decisive and speedier thrusts to the Left in Kerala. More particularly it is quite impossible not to struggle, in appropriate forms, to secure the acceptance by the Centre of certain radical measures which have already been unanimously accepted in Kerala, e g, the nationalisation of foreign plantations. At the same time radical democratic transformations cannot finally be carried through without doing much to raise the living standards of the masses. Failure to show material results for the lives of the people creates extremely critical situations. It requires a very high level of political and social consciousness among the masses if they are not then to fall a prey to the siren songs of reaction. Soaring prices and severe scarcity are creating a great deal of frustration and demoralisation, and even anger among the people. But, in this sphere, the chief responsibility lies with the Centre and unless it moves in the correct direction the state government can do very little. The energetic youth wing of the KPCC has to realise this.

Perhaps, Kerala's record can be seen in its best light when compared with that in Andhra. It is true that the rains have behaved more than a trifle erratically in Andhra but the food position in the state is comfortable. Yet the prices of essential commodities are rising at a pace which is discomforting for the masses. There is also a freeze on significant development, lack of growing job opportunities, and a stagnant society which presents an altogether depressing picture. Though all the objective conditions for Andhra outpacing Kerala exist, the subjective factor lags so much behind that one can scarcely compare the two states in this respect.

The separatist storms in the Telengana and Andhra regions seem to have taught the Congress leadership in the state next to nothing. The separatists have all streamed back and been given vantage positions in the organisation and the Ministry. They are lying low at the moment, but there is no guaranteeing that their acquiescent mood would persist. Such a knocked-together or-

ganisation is also totally incapable of carrying out any basic radical agrarian reform which Andhra so desperately needs. This stagnant *status quo* is almost as dangerous as the Rightist stance of Karunanidhi in Tamil Nadu and the agitation that Namboodiripad is planning against the United Front in Kerala.

1,400 Organisations in the Public and Private Sectors have joined the progressive club.

by using Group Insurance to set new norms in social Securities for Employees.

A new norm in employee benefits

19,00,000 low-income employees now have the life-saving security of life insurance. Either by a *token* contribution or sometimes even without it.

A new norm in Industrial Co-operation

Employees' organisations have also joined together to get the benefit of Group Insurance under an LIC master policy. Employees and employers all over the country are getting together and helping to extend social security to the needier sections of society.

The members of this enlightened group are drawn from a vast spectrum of organisations. From the U.P. primary & secondary school teacher organisations and police force, to state road transport corporations, to electricity boards. Add to this a vast array of industrial corporations which vary from electronics to tourism, from warehousing to antibiotics, from banking to petrochemicals, from textiles to tractors. It's a club *you* could join with profit.

Life Insurance Corporation of India

NORTH

Power for the Sake of Power

THE pursuit of political ends has lately taken the form of pursuit of electric power. Having realised that adequate supply of electric energy to the rural areas yields handsome political dividends, Ministers have been spending much time and energy on this problem. On June 6, at Simla, Punjab and Himachal Pradesh agreed in principle to collaborate in the execution of various projects aimed at utilising the vast hydel potential of the hilly state of Himachal. The two states decided to define the mode of co-operation. They then appointed a 'working group' to work out the details of the accord. This group included the chairmen of the states' Electricity Boards, their financial and technical experts, the Chief Irrigation Engineers, and representatives of their respective Law and Finance Departments. Although several basic issues — including the share of each state — remained unsettled, Punjab and Himachal Pradesh got Haryana to join them in suggesting to the Centre that plans should be formulated for the region as a whole for power generation over a decade — instead of, as earlier, over a five-year period.

At the high-level talks in Chandigarh on July 27, Punjab and Himachal Pradesh officials claimed to have made satisfactory progress, especially on inter-state collaboration for exploiting the hydro-electric potential of the Sutlej and Beas basins. Among the projects agreed to at the meeting was Naptha-Jhakri with a total power-generating capacity of over 900 mw and firm power capability of about 300 mw. Since then, Himachal Pradesh has gone on to oppose the idea of the inter-state power tariff being fixed by the Central Electricity Authority (CEA). A spokesman of the state government said mutual agreements on tariffs would be ideal, as that alone would safeguard the interests of the smaller states against the big power consumers. Smaller states, like Himachal, he urged, should also have the choice to split up their State Electricity Boards according to their financial and administrative convenience. But, with the Bhakra experience in mind, the Himachal government's main demand has been for substantial royalties and the right to at least 50 per cent of the power generated from a project at generation cost by way of compensation for having tackled the economic, human and social problems created by the location of hydro-electric projects in its territory. Rehabilitation of those displaced and loss of fertile river banks are problems that are posed for the states in which power projects are located; hence the case for adequate compensation. The resettlement of those displaced by the Pong Dam in Rajasthan led to prolonged disputes between Himachal Pradesh and Rajasthan.

While the discussions between Punjab and Himachal on power have so far proceeded without a major hitch, there is a major deadlock in the talks between Haryana and Himachal. While Himachal is firm on the issue of handsome royalties for the irrigation and power resources emanating from its territory, Haryana finds that it cannot afford such a high price. Haryana's bargaining position is, however, weak; it has hardly any hydel source of its own, and has to depend almost entirely on the neighbouring states for its power requirements. Haryana contends that Himachal Pradesh is entitled to only the profits on the funds it invests in a particular project. While Himachal's financial resources are extremely limited, it is rich in natural resources — including river waters. The state has an influential supporter in the Union Planning Minister, D P Dhar, who recently supported Y S Parmar's contention that water flowing through a state should be regarded as a natural resource of that state. Thus, Haryana is fully aware of its handicap; its main hopes are thus pinned on the fact that Himachal has extra resources. The total generation from its own two major thermal plants, at Faridabad and Panipat, is anyway far short of its requirements. Himachal, reportedly, has now climbed down on the issue of royalties — which may pave the way for an early settlement. Idle tube-wells and crippling power cuts on factories may thus yet be overcome.

While Haryana's Chief Minister, Bansi Lal, may have much to worry about on hydel and thermal power, he should be gratified over the manner in which he has lately consolidated his political power. The Haryana Assembly's 22-day monsoon session, which concluded on July 29, established his supremacy. He managed not only to ward off all attacks — even on such explosive issues as the Riwasa and Barwala scandals — but also queered the pitch for his critics on many other fronts. The victory of the Congress candidates in the Rajya Sabha by-elections, held on July 29, was another feather in his cap; the poll results revealed that in the 81-member state legislature, only eight members are opposed to the Chief Minister: four of these opponents belong to the BKD, two to the Jan Sangh, and two to the Congress(O). His hegemony in the state's politics today is also evident in the fact that the strength of the opposition has dwindled from 29 — when the present Assembly was elected — to barely eight today. The defectors have been won over with baits of lucrative posts or just demoralisation.

While Bansi Lal has adroitly managed to eliminate the dissidents in his state, his counterpart in Himachal, Y S Parmar, currently the seniormost Chief Minister in the country, finds himself in troubled waters — again owing to the revival of activity by the 18-strong breakaway group in the legislature Congress party. These dissidents, who seem determined to disoldge him from the party leadership, have decided to submit a fresh memorandum of charges against him to the Prime Minister and the Congress High Command. The memorandum, which was recently carried to New Delhi by a three-member delegation headed by Salig Ram (a former Minister who was dismissed by the Governor last winter on Parmar's suggestion) contains charges of corruption, abuse of power, and victimisation of political rivals within the party. Though the High Command had not pursued the charges against Parmar contained in the earlier memorandum, the dissidents claim that they are now being examined at the highest level.

Parmar's supporters derive comfort from the fact that, despite sustained efforts, the 18 dissidents have not been able to muster further support but there are rumours that a Minister had offered to join them provided he was made leader of the group. Sarla Sharma, the only remaining dissident minister in Parmar's team, disavowed that she had defected to the majority group; she has in fact pleaded with the dissidents not to actively associate her name with their anti-Parmar activities because she does not wish to defy the High Command's directive. Another leading dissident, Gian Chand Totu has also discounted rumours and reaffirmed his loyalty. Parmar, meanwhile, is reported to have privately expressed his desire to make way for a younger man — possibly PWD Minister, Ram Lal, whose claim he strongly espouses.

The Islamic World and Muslim Minorities

Pran Chopra

THE dominant theme at the recent fifth Islamic Conference of Foreign Ministers in Kuala Lumpur in June was Palestine, an issue which evokes a strong Islamic affinity between many Muslims. But so closely does it mingle with two other affinities — the ethnic between the Arabs and the recognition even by non-Muslims of the political rights of the Palestinians — that Palestine is not a correct barometer of the strength of the Islamic affinity. Nor is a correct measure of Islamic affinity to be found in the strong support extended by the Kuala Lumpur Conference to the liberation movements in Portuguese Africa or other territories which are still under colonial rule as this is a case of an affinity between peoples who have recently won freedom and those who are struggling for it.

But when the Conference took up the question of the treatment of Muslim minorities in free and independent non-Muslim countries, especially the Philippines, it came close to furnishing a true measure of how far Muslim countries think it proper to carry religious affinity. The discussion on this question showed a most interesting play between constitutional rectitude and concern for fellow Muslims. The way this play works out in future will largely help to determine how trans-national Islamic affinities will adjust themselves to the demands of national sovereignty. The play will fluctuate according to the intensity of the feelings aroused by individual situations. But it is the general direction of the future adjustment which matters and the beginning of that may have been set by the Kuala Lumpur Conference.

The most conspicuous case which came up for discussion was of course that of the Moro Muslims of the southern Philippines. The case is recent but has been marked by turbulence — concern for the Moros contending furiously with a desire not to interfere in the internal affairs of the Philippines. The subject first came up at the third Islamic Conference of Foreign Ministers, held at Jeddah early in March, 1972. The Conference expressed "serious concern" but at the same time "deemed it necessary to seek the good offices of the government of the Philippines to guarantee the safety and property of the Muslims in the Philippines *as citizens of that country*" (emphasis added).

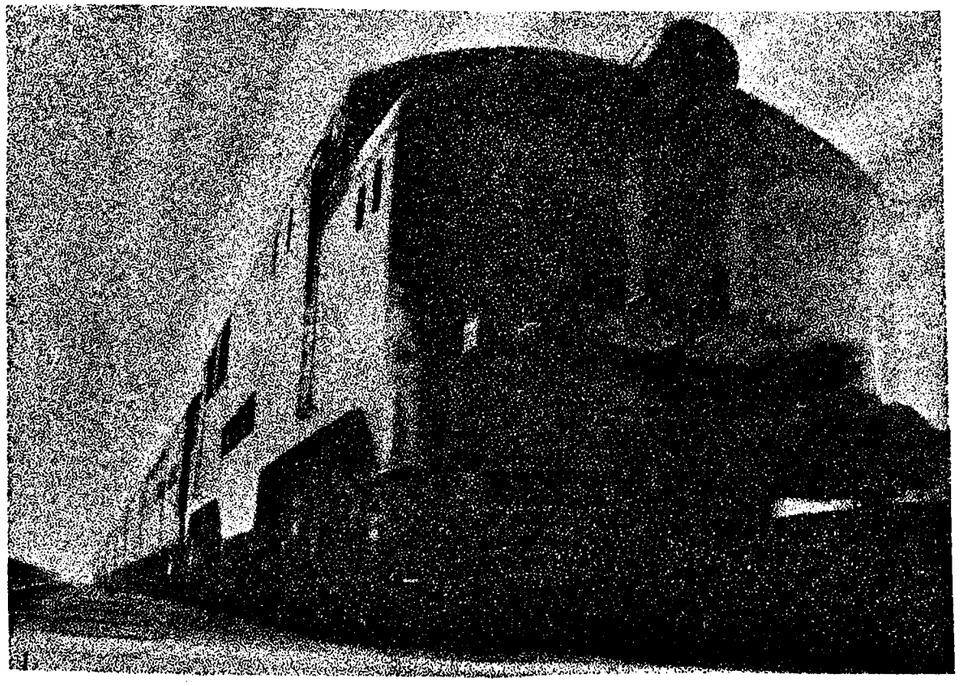
With reports of a more alarming situation before it, which spoke of "repression and mass extermination of Muslims", and meeting in the relatively more heated atmosphere of Benghazi, Libya, the fourth Islamic Conference of Foreign Ministers "called upon" the government of the Philippines to protect the lives and property of the Muslims and to "halt organised Christian migration from the north". (No hesitation about domestic interference here). It also decided to create a fund to help the Moros.

But the subject was given a quieter treatment by the Conference at Kuala Lumpur. This could be because the situation was now a little less bloody, though bloody enough, because the diplomatic temperature of Malaysia is usually much lower than that of Libya and because ASEAN diplomacy had intervened in the meantime.

But whatever the reasons, the resolution adopted at Kuala Lumpur first of all took note of the "steps taken by the Philippines government to improve the condition of the Muslims" and only then "urged" it to "find a political and peaceful solution through negotiations with the Moro National Liberation Front". At the same time, while "calling upon the Philippine government to bring about the necessary climate of confidence ... by immediately desisting from military operations" against the Moros, the Conference made it clear the solution should be "within the framework of the national sovereignty and territorial integrity of the Philippines".

While appealing to peace-loving states to use their good offices with the Philippines government, the Conference recognised "the problem as an internal problem of the Philippines". It decided to set up a relief welfare agency for the Moros under the control of the proposed Islamic Solidarity Fund, but it also undertook to discuss the modalities of the agency's work with the Philippine government.

There are other more interesting and revealing reflections of attitudes. In spite of a long and frequently active dispute between the Philippines and Malaysia over the Malaysian territory of Sabah, and Manila's largely unjustified allegation that Kuala Lumpur is aiding the Moros militarily and financially, neither the Malaysian Prime Minister in inaugurating the Conference nor the Deputy Prime Minister in his speeches as chairman of the plenary sessions nor the Information Minister as the *de facto* leader of the Malaysian delegation made any reference to the problem.



Secondly, out of the fifty or so speeches made at plenary sittings by the delegates of the 38 participating countries, there was a reference to the Philippines only in five — the Turkish, Afghan, Indonesian, Libyan and Somali — so that public airing of the subject was confined (apart from these speeches) to the publication of the resolution which was the product of a closed door committee discussion.

The Turkish delegate referred to the subject only, as the context made it clear, to buttress his demands on behalf of the Turkish minority in Cyprus. The Afghan delegate only urged that the right of the Moros be upheld as "loyal citizens of the Philippines". The Indonesian delegate, Adam Malik, while expressing "legitimate concern", urged avoidance of "any semblance of infringement upon the sovereignty of the Philippines", thanked President Marcos for accepting the establishment of a Muslim welfare agency and praised him for "sincerity and willingness" in working towards "an integrated Philippine society in which Muslims can assume their rightful place". Malik added, "The first positive steps have already begun".

The Libyan delegate was more forthright. This was both because Libya is an admitted source of "all kinds of aid to the Moros" as the delegate put it at a press conference later and because it was a member of the four-country deputation sent to the Philippines by the fourth Islamic Foreign Ministers Conference. The delegate talked of the "plunder, killing and liquidation" of the Moros and denied that Marcos was doing much for them. He also asked the Conference — the only delegate to do so — to hear an unofficial and uninvited Moro delegation which was waiting outside. It remained outside. But the Libyan also made it clear at his press conference that he was opposed to secession and all he meant by the "political settlement" demanded by him was some form of local autonomy; he claimed the Moros would accept it.

It was the Somali delegate who dwelt longest on the subject: he presented the report of the four-country deputation. The report is very damaging for Manila and condemns "the renewed wanton killings of Muslims". But, he presented with prefatory thanks to Marcos for the welcome extended to the deputation and for his efforts "to find socio-economic programmes as a means to solve the problems of the Muslims", all that it specifically demands for the Moros is restoration of property wrongfully taken away from them, protection against future persecution and equal rights in the south in the political field, in econo-

Over 40 years ago SKF designed axleboxes for the Deccan Queen Coaches.

They are in service even today!

It calls for expertise of high order to manufacture axleboxes that easily cope with high speed service even 40 years later. Some of the axleboxes designed for the Deccan Queen coaches around 1929 are still operating satisfactorily.

This is just one instance that vividly proves SKF's futuristic outlook and policy of planning ahead.

For the Indian Railways, SKF offers the finest in :

- Axleboxes
- Traction motor bearings
- Railway Bearing Units
- Before-and-after-sales service

Skefko India Bearing Co. Ltd.

mic institutions, power organs, the administration and the armed forces.

Both facts are important: that these demands were made by foreign countries on behalf of a minority in a sovereign country and that what was demanded was only equal rights, somethink which most governments normally do give to all their citizens or at least claim they do. Marcos himself defends a similar solution, ruling out a military answer, and he did so again on June 29 while honouring the Foreign Minister of Lebanon, one of the delegates to the Kuala Lumpur Conference and party to the resolution adopted by it.

South-East Asia's only other Muslim minority problem, that of a Muslim dissidence which is going on in southern Thailand (though with nothing like the violence going on in the southern Philippines) and which some Thais, but not the Thai government, allege is being aided by some Malaysians (not by the Malaysian government, even according to the allegations), figured much in Kuala Lumpur and Bangkok simultaneously but outside the Conference. A senior cabinet minister who represents the small Islamic party in Malaysia's coalition government, addressing a meet- of his own party, supported the Thai Muslims' demand for autonomy. The Thai Foreign Office and the National Assembly took strong exception to this, Thai students demonstrated outside the Malaysian embassy in Bangkok and for a day the subject looked hot enough to break into the Conference.

But what is relevant in this context is that it did not. The Malaysian government bent over backward to say officially that what the minister had said was not the government's policy, which remained one of strict non-interference. The Thai government fully and publicly accepted the assurance and asked the students to go home. The Thai government also invited the secretary-general of the Conference to visit southern Thailand and see the conditions of the Muslims himself.

Bangkok, Kuala Lumpur and Conference sources equally emphasised the fact that it was the Thai government which extended the invitation on its own, without pressure from anyone — the relevant point about this being that the very existence of the Conference has its impact even upon non-Muslim countries but does not always amount to uninvited external interference.

Of greater importance and wider significance and interest is the impact of the Conference upon the views of Islamic countries about the larger question of Muslim minorities in general. In various forms, the item has been before the Islamic countries as a whole ever since they came together in Rabat in 1969 to form the Islamic Conference; it has been before individual Islamic countries, for example Pakistan, for much longer. Among the Conference objectives listed in the Declaration adopted at Rabat is "to strengthen the struggle of all Muslim peoples with a view to safeguarding their dignity, independence and national rights". In the communique of the third Conference held in March, 1972, this is amplified to mean "the welfare of Muslim communities throughout the world" and the secretary-general was directed by that Conference to "collect statistics and prepare studies on the condition of Muslim communities in non-Muslim countries".

The fourth Conference, held a year later, for the first time had a full item before it on "the situation of Muslims throughout the world" and in the resolution adopted by it the Conference appealed to "countries with Muslim minorities to respect those minorities and their culture and beliefs and grant them their rights in accordance with the UN Charter and the Universal Declaration of Human Rights." What is more, the Conference appealed to "Islamic states to extend aid to Muslim minorities in order to raise their religious, cultural and social standards".

Thus primed, the subject was firmly placed before the fifth Conference at Kuala Lumpur by the secretary-general. Believing, as he said in his report, that the Conference was "'greatly interested in linking the fate of the Islamic minorities with the march of the Islamic nations throughout the world", he proposed that a conference be called of "representatives of the Islamic minorities in the various continents of the world".

Here was an occasion, then, with a more than adequate and meaningful background, for the Islamic countries of the world, of whom more had gathered at Kuala Lumpur than at any other Conference in the Islamic series, to take up their posiitons on the comprehensive general issue of Muslim minorities, unencumbered by the particularities of any situation. Therefore, what they did or did not do so is of some significance.

First, what they did not do. They did not support the proposal of the secretary-general. In fact no one spoke about it at all in the plenary sessions and if the subject came up at all in the committees it did so inconspicuously. Regarding the general issue of the minorities (other than the Palestinian sand Moros), 35 of the 38 delegates did not speak about it at all in the plenary sittings.

Of the three who did, one was Turkey, whose reason for doing so has been discussed already. The second was Libya, which urged "political support at least" to help safeguard "the rights of Muslims everywhere and in all countries". The third was Indonesia, the country with the largest Muslim population in the world. What its Foreign Minister, Adam Malik, said is therefore at least as significant as what the Libyan said.

Malik described the Muslim minority problem as "rooted either in the legacy of a colonial past or in the neglect by central governments towards outlying regions or both". (Among the outlying regions he probably had southern Thailand and the southern Philippines in mind.) Political and sometimes physical strife, he said, has resulted, "often seriously affecting the integrity of the nation concerned and further aggravating the plight of the minorities". But he added, "Being essentially an internal problem, the best possible way that we could assist is to persuade and urge the government concerned to take positive and deliberate steps to create such conditions that would enable the minority group in question to integrate into the mainstream of national life as full-fledged citizens, without in any way having to lose its cultural or religious identity. In fact not only the government but the minority group in question should participate and contribute actively towards the creation of those conditions".

This is not very different from the advice Nehru used to give about communities of Indian origin in countries strung out along the Indian Ocean or the advice China's leaders give today about Chinese communities around the Pacific Ocean. But it is very different from the thoughts implicit in the proposal and comments by the secretary-general, which makes it more significant still that the Conference did not accept the secretary-general's proposal and did not in any way encourage his comments.

This then is the view the Kuala Lumpur Conference took of the general problem of Muslim minorities and its particular manifestations in Palestine, the Philippines and Thailand. How representative and deliberate is this view and how durable? Representative enough, I think. No Islamic country of any consequence, that is with a majority of Muslims in its population and with a leadership which is by and large Islamic, was unrepresented. Deliberate as well. The issue was clearly

before the delegates, both in its general and specific aspects, with a choice of two broad approaches on each aspect. The choice of the sides taken by the delegates was therefore not without meaning, even if many signified their choice only through silence, for example by not speaking about the Thai Muslims.

Durable? There are some doubts here. The secretary-general, Tohamy, an Egyptian, is not very popular with many delegates, especially the Saudis, and Saudi preference tells; that may have added to the unpopularity of his proposals and thinking. Secondly, many countries have strong domestic reasons for being cautious on the question of minorities and in some like Indonesia and Egypt there is a conflict between the ruling regimes and extremist Islamic parties. Neither Tohamy nor these reasons enjoy political immortality. But these doubts are marginal to the main issue. Foreign Ministers do not commit their governments for or against a proposal on the basis that they like the proposer or not. And the domestic reasons, when you analyse them, are the natural products of durable situations. Many Islamic countries are themselves as pluralistic in different ways as many non-Islamic ones and therefore equally vulnerable to 'interference' in their domestic affairs. If they opened the door to interference of one kind, many other kinds may rush in too, and examples of this vulnerability are plentiful in Africa, West Asia and South and South-East Asia.

Therefore, it can be firmly concluded: that the extent and type of interest which Islamic countries take in Muslim minorities in independent countries is not to be judged by what they do about Palestine or various colonies; that they will take an active interest where Muslims face the kind of grim situation which confronts the Moros in the southern Philippines — this interest may well amount to interference in the domestic affairs of the country concerned, but even in such cases they will seek to proceed with the consent if not approval, of the country concerned; that they will not as a group support the secessionist aspirations of any Muslim minority, whether they refrain out of prudent regard for their own domestic situations or out of respect for constitutional propriety; and that they will, however, seek to promote the cultural and social well-being of Muslim minorities, but not without the approval of the country concerned.

These views of theirs may not be permanent but no causes of a drastic change are visible at present.

REVIEWS

Muslims in India: Part of the Larger Problem

Imtiaz Ahmad

The Muslim Dilemma in India, by M R A Baig; Vikas Publishing House, Delhi, 1974; pp 169; Rs 25.

MANY stereotypes are current about Muslims in India. It is widely held that they are socially and economically backward, that they are characterised by a separatist political orientation, that they are keeping themselves aloof from the mainstream of Indian national life, and that their religious faith constitutes a serious barrier to their 'modernisation' in a changing world. The first task of any serious attempt to understand the group should be to test the validity of these stereotypes in the light of factual evidence. However, there have been few attempts of this kind so far. On the contrary, the more pronounced tendency in the writings on Muslims has been to accept as valid these ideas and stereotypes. There are many reasons for this tendency.

First, the empirical study of Muslims has been rather slow to develop in India. To date, the Muslims have been treated either within a framework of 'classical oriental studies' or even less satisfactorily as an ancillary subject of historical studies. One of the consequences of these approaches to the study of Muslims has been that a highly textual and scriptural study of Islam has been used to generalise about the group as a whole — without heeding the chasm which usually divides the scriptural religion from the actual beliefs and behaviour of the Muslims.

Secondly, the tendency is fostered by the common belief that it is easy to speak about Muslims without any scholarly study of their beliefs and behaviour. Everyone 'instinctively' feels that he is an expert on Muslims, and that what he knows about the group from personal experience can be an adequate basis for generalising about them. There is scant perception of the fact that, what one knows from personal experience about a group is a strange blend of fact and fiction — indeed, even prejudice — so that commonsense generalisations from such experience can be both erroneous and misleading.

The third factor responsible for such glibness is the prevailing demand for studies and information on the Muslims. It would be unnecessary here to go into a discussion of the reasons for the current interest in Musilms. But that there has been a sudden spurt of interest in information on the Muslims, can be easily seen from the commercial success of the few studies on the group which have appeared in recent years. The specialists have failed to respond to this growing need for work on Muslims, as they have been reluctant to produce scientific analyses in an area where even basic research has not been done. In the circumstances, books on Muslims have been written usually by non-specialists — many of whom have readily pronounced views about the group without having any special understanding of the group's ethos or of the material and political conditions under which they live out their day-to-day relationships.

This is the background against which we should view M R A Baig's recent study of the Muslims in India. Baig examines the problems facing the Muslims in contemporary India. In doing so, he seeks to trace — albeit briefly — the origin and development of Islam : its theological make-up, the theological, socio-cultural and psychological origins of what has been termed 'Muslim separatism' as it culminated in the creation of Pakistan, and the nature and sources of the problems facing the Muslims since Independence. The author's contention is that Islam represents the quintessence of a dogmatic and institutional religion and that the community's destiny in India has been inextricably influenced by the character of that faith conceived as a unity.

This is too wide a canvas to try to paint with the available colours. That the author attempts the task at all bears testimony to his sense of enterprise as well as to his refusal to be daunted by the paucity of reliable data about Muslims. That he has been only partly successful is, therefore, easily understandable. What results is a combination of factual statements, personal impressions, polemical arguments, and sweeping generalisations. And these are asserted with an uncanny boldness, though they are rarely supported by any systematic body of scientifically derived data.

Let me illustrate this briefly. At the

outset, Baig postulates a series of what he calls 'theses' about Muslims in India. Some of the theses are hardly more than propositions. For example, he postulates that the Muslims, as a group, are steeped in backwardness. He explains this by reference to the relatively static character of their faith. Now, it is true that there is a widespread belief among the Muslims themselves that they are sinking into backwardness, but a really dispassionate analysis of the group would show that the effect of economic development and social change upon the Muslims has been quite varied. Some Muslims have benefited from the developmental process and social changes since Independence. Others have remained largely unaffected. Still others have experienced a decline. The right approach in the face of such diversity, would be to examine the validity of such propositions in the light of empirical details. Instead, presumptions (such as that of backwardness) are usually accepted as valid, and certain generalisations are then deduced from them.

The 'dilemma' identified by the author is thus merely the direct outcome of the propositions with which the book starts. It is his contention that Muslims in India are continuing to adhere to a version of their faith which is completely out of tune with contemporary times. The dilemma, therefore, is whether they should continue to adhere to an outmoded version of the Islamic faith or whether they should undertake its revision and reform in accordance with the demands of the times. Baig's conclusion is that Islam is eminently capable of such reform. And he pleads for the acceptance of humanism as a way out of this dilemma.

The central argument of the book is likely to arouse a strong reaction among orthodox Muslims. But, more important, the author's contentions about Islam and Muslim failure to respond to changing historical situations, are questionable on the purely scientific plane. Can one presume that Islam, as practised in India, is truly a derivation from the Koran and the Shari'a? Or, is it a very specialised version of that faith, showing the unmistakable impact of the local situation and the national environment? Is Islam actually a static tradition, frozen in time, as it were? Or, has it been an evolving and accumulating tradition? One wishes that an attempt had been made to deal with these questions.

I mention these points because my own studies of Muslims in India over the years have led me to conclude that the social reality that characterises Islam and the Muslims in India is far too complex to lend itself to facile generalisations. Even as the author himself admits, adherence to orthodox Islamic tradition in India — as indeed elsewhere — persists side by side with a continuing tendency towards accommodation and compromise reached through *ijtihad* or interpretation. No doubt, this *ijtihad* is being exercised on a personal plane and that those who exploit it are hardly believing Muslims. But it is therefore interesting that they are nevertheless so regarded by Muslims and non-Muslims alike.

To point to the book's inability to come to terms with the complex social reality and the difficulties in generalising about Muslims, is not to undermine the book's specific usefulness. Something is to be said for sketches as for oils: the author's sketch should be able to generate a process of critical thinking and discussion among Indians — Muslims and non-Muslims alike — about the serious implications of the presence of a group that carries an essentially poor estimation of its own future prospects.

This brings us to the author's plea for the acceptance of humanism by Muslims as a way out of their contemporary social and religious dilemma. While humanism has a great deal to commend itself, the question is not whether it should be adopted by Muslims. As I was reading this book, newspapers carried reports of a man having killed his two sons in order to propitiate a local deity in Rajasthan, of several persons having died of starvation in Bihar, and of ten persons being killed in 'communal' riots in Delhi. The question is whether one can talk of acceptance of humanism in a society characterised by widespread poverty, superstition, human indignity and deprivation. Should not our effort be directed to the creation of those structural conditions that can give substance to secularism as a way of life?

The Origins of Mozambique's Revolution

Lawrence J Sakarai

Eduardo Mondlane by an anonymous author; Panaf Great Lives, Panaf Books Ltd, London, 1972.

PANAF Books' Great Lives series has been written by people involved in Africa's revolutions who can thus write from first-hand knowledge. These writers were given the task of critically assessing the lives and work of great African revolutionaries. One of the anonymous authors has written two books in this series — on Patrice Lumumba and on Mondlane.

The author has been painstaking in his work; he has examined Frelimo's documents, has had several interviews with Mondlane's wife, Janet, and has been able to go through some of Mondlane's unpublished essays. From these primary sources, the author has attempted to construct Mondlane's role in Mozambique's revolution.

This book flows out of a commitment to revolution in Africa. In various ways this is perhaps the book's strongest point. It traces Mondlane's early life, his period of academic work and his activities at the UN and ultimately his formation of the Front for the Liberation of Mozambique (Frelimo). From 1962 to 1969 (when Mondlane was assassinated), Frelimo advanced from one position of strength to another under Mondlane's guidance. Its guerilla forces grew from 250 men to 8,000 in under five years. These numbers do not include its unarmed cadres and People's Militias.

Mondlane's views on tribalism, racism, the role of women, the Caborra Bossa Project, the class struggle in Frelimo — all are discussed, not in great detail, but just enough to appeal to the reader who desires a firm basis for understanding Mondlane's dedication to the downtrodden, oppressed and exploited people of Mozambique.

The strength — and basic weakness — of this book is its simplicity. For example, the class struggle within Frelimo, which is a national liberation movement, is not suitably analysed, so that one cannot understand how Frelimo is able to contain the contradictions that arise within the movement. The important questions which are left unanswered are: Whether the class struggle will force Frelimo which is fighting a bourgeois democratic revolution to change its character? Will Frelimo be forced to move on to newer, higher forms of struggle? Another point that is glossed over is the Frelimo split in 1965 leading to the birth of the Revolutionary Committee of Mozambique (Coremo). On what basis did this split occur? What were the essential points of difference between Frelimo and Coremo? The author does not discuss these key questions. This leaves too many things unsaid and unanalysed. The book concerns itself primarily with documenting Mondlane's revolutionary life in Frelimo. And this it does well.

Sign of the Times

Nireekshak

IN the national daily circuit, the editorial musical chairs have about them the same mystique that goes with Union cabinet reshuffles. There are contenders from within, besides expatriates and superannuated editors from without. And with every round of reshuffle, each daily looks so much more like the other, adding to the monotony.

A chair vacant for a long time and coveted by many is that of the late Nandan B Kagal, Delhi editor of *Indian Express*. It is not going to be filled yet. But in a few weeks, Ajit Bhattacharjea, a former editor of *Hindustan Times* who is now a senior Assistant Editor of Times of India in Bombay will begin functioning from the Express Building in New Delhi. He will be the editor of *Everyman*, described in ads as JP's weekly.

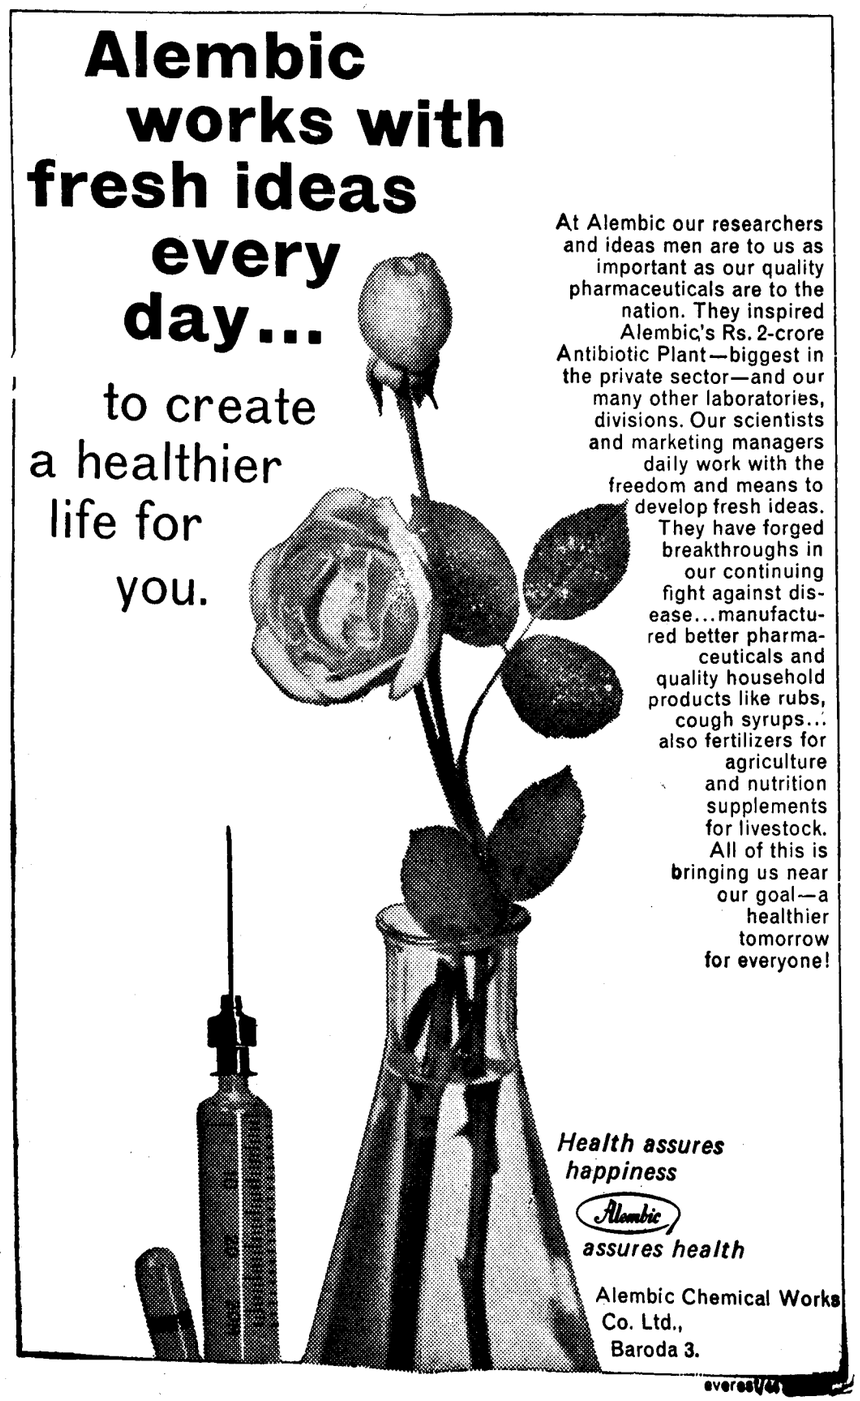
Everyman has a complex geneaology. It was launched as the weekly journal of the Lok Niti Parishad. Jayaprakash Narayan was to find the funds for the editorial expenses of the weekly and *Indian Express*, Delhi, was to print and distribute it. It was launched with elaborate preparation, with the well known Hindi writer Vatsyayan ("Ageya") as its editor. It was produced largely by non-professional journalists of semi-Gandhian persuasion and did not quite take-off. A few months ago, when JP found he could not raise funds for the editorial expenses, the weekly quietly changed its home. It began to be edited from the Express Building. The founder editor had left. An agreement had been made between the Lok Niti Parishad and *Indian Express* (Madurai) Ltd, which runs the southern editions of *Indian Express*. Ramnath Goenka, India's number one newspaper wizard, has offered to run the weekly for the Parishad for five years and make it a viable proposition during this period.

But in practice, the new look *Everyman* purveyed very little Lok Niti besides publishing signed articles and public statements by JP and lapsed into a by-product of *Indian Express* whose editor-in-chief, S Mulgaokar, is also a member of *Everyman*'s board of advisory editors. Nevertheless, the weekly has begun to look more professional and picked up circulation, from 2,000 to some 16,000. The acting editor, Radhakrishna, is a functionary of the Lok Niti Parishad which still technically owns the weekly.

Under Ajit Bhattacharjea's editorship, *Everyman* is expected to become completely independent of *Indian Express*, though it would continue to be run under the same managerial set-up. It might well acquire the virile political tabloid personality it lacks now, of course within the constraints JP's own politics will impose. Ajit Bhattacharjea was the centre of a mini-controversy recently. He wrote a very critical assessment of Jawaharlal Nehru to mark his birth anniversary on May 27 in *The Times*, London. The Left Establishment weekly, in New Delhi, *Mainstream*, could not stand this. It reproduced the article under the tendentious caption, "A Harlot's Pen", and a prefatory paragraph insinuating that those who dare not write things in their own dailies choose to say them in foreign papers. Judging by the ire of the weekly, the powers that be in New Delhi have not taken kindly to Ajit Bhattacharjea's article. Incidentally, *Times of India*, which lent full support to the government's strong-arm methods during the railway strike, is upheld in official New Delhi as the ideal left-of-centre newspaper the right-of-centrists would do well to emulate. So much so, the government has decided to hand back full control of the *Times of India* chain to the Jains sometime in 1975.

In recent weeks, the government was annoyed with a national news agency over the cables of its Gangtok stringer during the June developments there. The agency was quietly told not to use the stringer's copy anymore. Worse, the agency began fudging stories from New Delhi — on the basis of official briefings — with the Gangtok dateline. The stringer ruefully pointed out that such a practice created a great deal of embarrassment for him in Gangtok.

There is yet another instance. The news editor of a national daily sent out a circular to his correspondents in Uttar Pradesh to file detailed reports on the progress of the numerous development projects the Prime Minister had inaugurated as part of the pre-February election bonanza. Someone in the government came to know of the circular and the news editor was told over the telephone by someone claiming to be from the Prime Minister's Secretariat not to be too smart and zealous about his role as news editor. So that was that. No paper has thought it fit to do a follow-up on all those mythical paper projects which netted a few million votes in the cause of socialism, secularism and democracy under the infallible leader.



An event that restored sunshine to the hearts of ye olde *Statesman*'s readers was the resumption of its Delhi edition on August 11, after a three-month suspension of publication due to something which was not exactly a strike or a lockout. The management won, virtually smashing the CPI(M)-led union which had linked up some of its demands with the general five paise rise in the price of the big dailies. The staff refused to put the new price line on the paper unless their demands were conceded. In the war of nerves that followed, the management decided not to declare a lockout lest the government got a chance to intervene. In *Statesman*'s red-brick-offices in Connaught Circus, it was business as usual, except that the morninger which was reaching its readers in the afternoon, stopped coming out. A limited airlift of copies of the Calcutta edition kept the *Statesman* banner flying in the capital until the union gave in. The Delhi union seemed to be out of joint with its counterpart in Calcutta and it was sad to see it lose. A management could 'run' a daily without bringing the paper out until it could break up the solidarity within the union, giving the government no chance to intervene. And *Statesman*'s Delhi manager is migrating to *Hindustan Times*, perhaps to repeat his triumph there.

EFFICIENCY AUDIT OF PUBLIC ENTERPRISES IN INDIA

Too Late for Priorities?

THE goal of self-reliance has evaporated in the face of the economic crisis. It is with considerable pride that the Finance Ministry recently noted that "judging by the encouraging aid trends, foreign aid availability this year would be higher by Rs 50 crores than the Budget estimate of Rs 552 crores". The government is clearly out to get all the aid, including food aid, that it can. Inevitably, the doors are to be opened wider for foreign private investment as well. The concerned circles in the government, according to newspaper reports, are satisfied that the exit of Nixon from the American presidency will result in an increase in the flow of American private investment to India.

Outwardly not much may change. The appearance of screening foreign investment and collaboration proposals will continue and lip service will be paid to the 'norms' which supposedly exist for all manner of things — such as the proportion of foreign equity ownership, the rate of royalty payment, export obligations and dilution of foreign equity. But the signals have been quietly exchanged to the effect that foreign private investment has to be encouraged in the interests of industrial investment and production as well as exports — not to talk of making possible import of much-needed technology and equipment. Barkis, in other words, is more than willing. If in the coming months the flow of foreign capital into this country, in one form or the other, does not go up visibly that will only be because the party of the other resort is lacking in enthusiasm.

This is not, then, the best of times to be persuading the government to take a closer look at the costs and benefits of foreign investment. According to the Reserve Bank's latest survey of foreign financial and technical collaboration in Indian industry, covering the period 1964-70, the foreign holding in subsidiaries of foreign companies in India declined from around 82 per cent in 1960-61 to 71 per cent in 1969-70 and that in companies with minority foreign holding went up marginally from 29 per cent to 30 per cent. From these figures no conclusion can be drawn about the degree of foreign control which does not depend upon a fixed proportion of equity and certainly does not require an absolute majority of the share-holding. For instance, the study brings out that even in foreign minority companies and in companies which have only foreign technical collaboration the foreign collaborator was remarkably successful in insisting upon import of plant, machinery and materials from sources of his choice.

Even without taking into account items such as head office expenses charged to the Indian subsidiaries, the survey shows a net outflow of as much as Rs 891 crores on account of the companies covered by it during the six-year period ending 1969-70. This is explained as being due to "the sustained high level of imports as against a low level of exports and the large quantum of dividend remittances, particularly by subsidiaries". This, too, says little about the cost-benefit of foreign private investment and collaboration. The Reserve Bank study makes a valiant attempt to assess the extent of research and development activities in foreign collaboration companies. It finds that only one-third of the companies which supplied information on the subject even had a research and development department and that their total expenditure on R and D added up to an average of Rs 2 crores per annum on capital account and Rs 9 crores on revenue account.

Given its financial orientation, the study cannot throw much light on the worthwhileness of foreign collaboration in terms of the industries in which it has taken place and the types of technology that has been imported. The industry-wise classification used is too general. Categories like "machinery and machine tools" and "electrical goods and machinery" are not particularly illuminating. However, other evidence on this point is scarcely encouraging. Thus a casual scanning of one of the lists of collaboration agreements approved, which the government publishes periodically, revealed sometime back that the import of foreign technology had been deemed absoluteley essential for the manufacture of automatic door-closers, razor blades, gramophone records, caustic soda, footwear with PVC soles, plastic toys, beer, locks and latches, cigarette filters, automobile switches and dashboard instruments.

This may not be the fault of the appraisal machinery with regard to foreign investment and collaboration. For it is plainly unrealistic to expect rational regulation of foreign investment when the government has lost all will to regulate industrial investment generally according to any scheme of priorities.

Capital Expenditures in Corporate Sector

Forecast for 1974

C Rangarajan

An attempt is made in this paper to forecast investment in the private corporate sector for 1974, by using the data available with the three leading term-lending institutions. Most relevant, in this context, is the time-phasing of capital expenditures on the projects sanctioned by these institutions in the current and in the previous years.

Since there is at present a long time-lag in obtaining and analysing the data on company finances for estimating the capital formation in the corporate sector, our method offers a way out by providing — within the end of a year — an indication of the direction and quantum of investment in the corporate private sector in that year.

Even after allowing for price changes, the total capital expenditures by the corporate sector in 1974 would be higher than those in 1973. The new commitments made in 1973 and in early 1974 indicate that investment in certain key industries may however lag behind. Unless there is a dramatic change in the investment climate during 1975 itself, the picture for 1975, moreover, is not encouraging.

ALL available indications are that the level of public investment, in real terms, will be less this year than it was last year. There is, therefore, considerable concern about the likely level of private investment this year. An estimate is made here of the capital expenditures that would be incurred in 1974 by the non-financial private corporate sector.

Method of Estimate

The present author had, in some of his earlier writings, outlined a method for making a forecast of capital expenditures by the corporate sector by using data available with the long-term lending institutions.[1] Most projects in the corporate sector approach one or the other of the term-lending institutions for obtaining finance. The companies provide the lending institutions with the most complete data on projects for which they seek assistance. The cash-flow statements, appended to a project report, show not only the total cost of the project but also the expenditures to be incurred in each of the years during the period of construction. By aggregating, over projects, the information available on the phasing of capital expenditures, one can indicate the expenditures to be incurred during a year on the projects for which assistance has been provided. The projects covered would include not only those sanctioned in the previous one year but also those sanctioned in all the previous years and on which expenditures are likely to be made in the current year. Of course, the estimate arrived at refers strictly to the projects which have taken assistance from the term-lending institution. Nevertheless, since the bulk of the projects come before the financial institutions for assistance, the estimate is a true reflection of the entire corporate sector.[2]

Limitations

The limitations of this approach have been mentioned in the articles referred to earlier, but some of them are worth recalling. 'Capital expenditures' include expenditures on land, buildings, and plant and machinery. The terms 'capital expenditures' and 'investment' are not synonymous. If by investment is meant the creation of physical assets, there can be a lag between the incurring of expenditures and the creation of assets. However, these lags are not likely to be long and, therefore, an estimate of capital expenditures may be taken to give an estimate of investment.

The validity of the estimates depends upon how closely companies adhere to the expenditure pattern outlined in the project proposals. Cost over-runs are common. In 1968, a survey done by the Reserve Bank of India[3] pointed out that out of the 73 projects surveyed 62 projects involved cost over-runs. According to that study, the overall magnitude of the over-runs in project costs was 26 per cent. Therefore, to the extent that there are distortions in the total cost of the project as well as in the phasing of the expenditures, some modifications will have to be made in the estimates obtained using the originally-outlined phasing of capital expenditures. We have tried in the case of projects sanctioned in the previous years to modify the expenditure patterns, wherever such data were available. However, since such data are not readily available with the term-lending institutions, we may not have completely succeeded in getting the true picture.

Part of the expenditures incurred in any year would come out of the projects sanctioned in that year itself. By the very nature of the method adopted by us, these data would not be available. It is seen from Table 1 that the percentage of total capital expenditure to be incurred during a year which comes out of projects sanctioned in that year varies between 12 and 22 per cent. Thus there is a segment of the total expenditures that has to be guessed — and for which internal data available with the term-lending institutions will not be of help. It is this segment which depends upon the investment climate prevalent in the year, which in turn becomes difficult to forecast. To some extent, we can forecast the projects to be sanctioned by looking at the applications pending at the beginning of a year. Our method, at any rate, gives a clear indication of the level below which expenditures will not fall.

So long as the term-lending institutions do not operate under a supply constraint, these estimates may provide a good indicator of what the private corporate sector wants to do. But the moment the supply of funds becomes a constraint, the number of companies that will seek the entire finance from elsewhere may increase. In such circumstances, these estimates may prove to be an underestimate of what the corporate sector as a whole invests.

Collection of Data

Our previous study had incorporated the data on the phasing of capital expenditures of projects sanctioned by the three term-lending institutions — The Industrial Credit and Investment Corporation of India, The Industrial Finance Corporation and the Industrial Development Bank of India — upto 1971. We updated the information, by collecting data on projects sanctioned for 1972, 1973, and upto May 1974. Since a number of companies approach more than one institution, care has been taken to see that no project is counted more than once. Companies covered included those in the private sector and those in the joint sector. The total number of projects taken into account, in 1972 and 1973, was 146 and 156, respectively. Wherever possible, revisions to the original project proposals were taken into account.

Evaluation of Forecast for 1972

Before attempting a picture of corporate investment in 1974 as it emerges from our study, we might say a word about the prediction that had been made about 1972. Our earlier prediction — made at the beginning of 1972 — was that 1972 would be better than 1971 and that the total capital expenditures in 1972 would be approximately Rs 305 crores. The forecast that 1972 would be better than 1971 was borne out by subsequent events. But the estimate for 1972 understated the capital expenditures by almost Rs 150 crores. This happened because, while we had put the capital expenditures coming out of the sanctions of 1972 at around Rs 50 crores, they actually turned out to be approximately Rs 160 crores during 1972 simply for the projects sanctioned in that very year.

We have checked our forecast of 1972 with the data generated by our own scheme. But the appropriate method would be to see how far our forecast agrees with an independent estimate of the capital formation in the corporate sector. The Reserve Bank of India no longer publishes data on investment in the entire corporate sector. Even their sample study, published as recently as in January 1974, relates to the finances of the medium and large public limited companies for 1971-72. However, from the study of the 350 large public limited companies[4] done by the Reserve Bank, it is evident that their gross fixed assets in 1972-73 were Rs 363 crores — as compared with Rs 288 crores during 1971-72. This can be taken to indicate that fixed gross asset formation in the corporate sector in 1972-73 was higher than that in 1971-72, which is also the conclusion which emerged from our own study. Given the long time-lag involved in obtaining and analysing the data on company finances, it can be legitimately claimed that our method fills an important gap in the data on corporate investment by providing, within the short period of the end of a year, an indication of the direction and quantum of investment in the corporate sector in that year. Since our estimates relate to the last five or six years, we will have to wait some time to find out how closely our estimates correspond with those obtained from company finance data.

Table 2 : Industry-wise Expected Capital Expenditure for 1972 and 1974 for Projects Sanctioned by ICICI, IFC and IDBI

(Rs in lakhs)

Industry	1972	1974 (Upto May)
Chemicals and Pharmaceuticals	12786 (27)	20409 (36)
Electrical	2301 (5)	1981 (4)

Textiles	4246 (9)	1738 (3)
Transport	2751 (6)	2438 (4)
Cement	1043 (2)	741 (1)
Miscellaneous	7146 (15)	7614 (14)
Total	46,972 (100)	56,328 (100)

Note : Figures in brackets refer to percentages to total.

Picture for 1974

From Table 1, it can be seen that the total capital expenditures for 1973 was Rs 529 crores. For 1974, based on the projects sanctioned upto May of this year, the expected capital expenditures would be about Rs 554 crores. To this must be added in expenditures that would be incurred out of projects that might be sanctioned between May and December 1974. While we do not have information on this, on the basis of past experience and of pending applications, one could expect another Rs 60 crores at least to be incurred. Thus, the total capital expenditures

Total											

Note : Figures in brackets indicate percentage to total.

would be around Rs 615 crores in 1974.

There is need to adjust these figures for price changes. In fact, no adjustments for price changes would be called for, if the cost over-runs due to price increases were financed entirely by the companies themselves. But to the extent that they have been financed, either in full or in part, by the term-lending institutions through fresh requests to them for assistance, an adjustment has to be made. Further cost estimates, of projects sanctioned in each year, would be at the price level of that year. Thus, when we are aggregating expenditures of projects sanctioned in the various years there is need to reduce it to a common price level. However, when we are comparing any two adjacent years, it may not be necessary to make adjustments for more than two to three years. Nevertheless, for the sake of completeness, we have deflated all the elements in the columns of 1973 and 1974 by a price index.[5] Thus, it is seen that, at the 1960-61 price level, total capital expenditures for 1973 would be Rs 315 crores and total capital expenditures for 1974 (based on sanctions upto May 1974) would be Rs 308 crores. To this have to be added the expenditures coming out of the sanctions made during the rest of the year. This could be about Rs 30 crores as the 1960-61 prices. Thus one could safely assert that, the level of capital expenditures in 1974 will be higher than in 1973 — even in real terms.

PATTERN OF CAPITAL EXPENDITURE IN 1974

Table 2 provides an industry-wise break-up of the capital expenditures to be incurred during 1974. Approximately 36 per cent of the expenditure is in chemical and pharmaceuticals, while another 26 per cent is accounted for by minerals and metals. There is very little investment going into cement and jute. There is a substantial fall in the capital expenditures in engineering and textile industries. In the same Table, we have given corresponding figures for the various industry groups for 1972. The actual investment in the textiles industries may be higher than indicated by our figures — because this industry makes the maximum use of the 'bills rediscounting scheme' of the IDBI which gives assistance to acquire indigenous machinery. During 1972-73, under this scheme, IDBI granted a total assistance of approximately Rs 50 crores out of which 46 per cent went to textiles.[6]

NEW COMMITMENTS IN 1973 AND 1974

We have made a detailed analysis of the projects sanctioned in 1973 and 1974 by the three term-lending institutions, to obtain an idea about where the new investments are being undertaken (Tables 3 and 4). This indicates whether or not there is a shift in investment towards industries where the need is greatest.

The total cost of all projects sanctioned in 1973 comes to approximately Rs 600 crores. The biggest share (40 per cent) goes to the industry group, Metals and Metal products. Then comes Fertilisers and Pesticides (16 per cent), followed by Chemicals and Petrochemicals (13 per cent). The new commitments in Cement amount only to Rs 10 crores.

The projects sanctioned upto May 1974 show that there are no fresh

Total	21613	3279	10217	6448	1611	58	66	24	36	6	—

Note : Figures in brackets indicate percentages.

investments in either Cement or in Fertilisers. The biggest spurt is in the Rubber industries, accounting for 30 per cent of the cost of all the projects. There appears a slow-down in the investment in Metal and Metal products. The time-phasing of projects in 1973 indicates that, out of 147 projects in all, 110 projects are to be completed within two years; 37 projects will take more than two years — and the bulk of these projects fall in the areas of Chemicals and Petro-chemicals and Metal and Metal products. Out of 66 projects sanctioned upto May 1974, 60 are to be completed within two years. An analysis of the time-phasing helps to depict when the output in these industries is likely to increase.

PICTURE FOR 1975

From an exercise like this, it is premature to forecast the level of capital expenditures for 1975. However, since we are in the middle of 1974, we may attempt to take a look at what the situation is likely to be in 1975. From Table 1, it can be seen that total expenditures during 1975, based on projects sanctioned upto May 1974, would be approximately Rs 240 crores. To these must be added the expenditures to be incurred out of projects sanctioned during the rest of 1974 and projects to be started in 1975. We had earlier said that, in the normal course, one could expect projects to be sanctioned during the rest of 1974 to generate capital expenditures of Rs 60 crores in 1974. This will perhaps lead to an expenditure of Rs 100 crores in 1975. Usually, projects sanctioned in the second half of any year will result in higher expenditures in the following year. Thus the capital expenditures in 1975 based upon sanctions upto the end of 1974 may come to Rs 340 crores.

How much more could come out of projects sanctioned in 1975? To reach the level of 1974, approximately Rs 250 crores more had to come out of projects to be sanctioned in 1975. This must be compared with the Rs 170 crores coming out of projects sanctioned in 1974. While such a sudden increase cannot be completely ruled out, there are no indications that the climate will improve sufficiently to bring about such large increases in new projects. We may, therefore, hazard the guess that the level of capital expenditures in 1975 is likely to stay below those in 1974.

Notes

[The author thanks Bipin Rajendraprasad who helped not only in collecting the data required but also in interpreting and analysing them.]

Stock Valuation Rule: Case for Revision

Amaresh Bagchi

Continuance of the 'lower of cost or market' rule for stock valuation is totally indefensible. To allow taxpayers to anticipate losses on inventory valuation but not gains may be prudent on the part of accountants but does not stand to reason for purposes of taxation. It almost amounts to presenting Government Revenue with a heads-I-win-tails-you-lose alternative.

In the context of an inflationary situation, the 'lower of cost or market' rule operates to negate one of the important objectives of progressive taxation by allowing postponement of taxes on the gains of price rise and thus helping to support inventory accumulation. Such postponement is advantageous in more than one way in conditions where credit is scarce.

The conservative rule of stock-valuation directly contributes to the capacity for stock-holding. A rough calculation shows that the amount involved in tax-postponement facilitated by the current rule of inventory valuation is by no means negligible and may amount to an interest-free loan of Rs 300 crores for the organised sector alone, the interest on which, at the rate of 15 per cent per annum, works out to Rs 45 crores.

ONE of the basic postulates on which business income is assessed periodically by accountants is the principle of "realisation"; taxation of business income too proceeds on this basis. This is one of the fundamental reasons for the divergence between the economists' concept of income and what the accountants regard as profit. The problem that holds up the acceptance in practice of the net-accretion-to-wealth concept of income proposed by Haig and Simons — which is widely considered by economists to be the ideal base for the income tax — is the problem of valuation. For the Haig-Simons concept envisages income as the algebraic sum of the money value of all consumption and net increments in the value of wealth held by the taxpayer during a given period. This entails evaluating increments in the value of all assets periodically. Evaluating wealth increments without going through actual market sale is not easy and is likely to introduce a good deal of subjectivity in income measurement. Granting, however, that insuperable problems of valuation stand in the way of the adoption of the net-accretion concept in its pure form as the income tax base, over a fairly large area there is room for closer approximation to the ideal than is possible under the current law. In fact, in some respects the extent of the existing gap between the Haig-Simons norm and the actual base cannot be fully justified even by the standards of objectivity which are so often invoked against the net-accretion concept. The rule by which stocks are valued at present in assessing business profits is a case in point.

Though it is well recognised that in periodic income determination account must be taken of the stocks at the beginning and at the end of the period,[1] the law does not lay down any specific method to be followed in this regard. When the goods purchased in business are not sold during a given period, the ideal method of course is to set off the goods actually sold against the receipts from their sale and to carry forward the cost of the unsold goods to the next year. This course being inconvenient, the method usually followed is to credit the trading account with the value of the unsold stock to cancel the debit on account of the purchases of the stock still remaining with the trader.[2] But the important question is, what value should be put on the unsold stock for this purpose? The Income-tax Act being silent on the point, the principle which has come to be established through judicial rulings is that valuation of stock-in-trade should be made in accordance with ordinary principles of accountancy.[3] Of course, the law allows discretion to the assessing authorities to ignore the accounts of the taxpayer if the real income and profits cannot be deduced therefrom but an obligation is cast on the authorities to respect the method adopted by the taxpayer if it is followed consistently and regularly.[4]

Consistent application of the realisation principle, which, as stated at the outset, is one of the basic postulates on which accountancy practices are said to be founded, would require all unsold stocks to be valued only at cost. But the rule of stock valuation generally followed by accountants is "lower of cost or market value". All losses likely to arise from a decline in the prices of closing stock are thus taken account of in computing the tax base even before their "realisation", but profits resulting from a price rise are kept out. "Cost" in this context has been taken to mean average cost if the taxpayer so chooses.[5] In order that no unrealised profit is included in income, when there are several items in the stock, taxpayers are allowed to follow the "pick and choose" method whereby the "lower of cost or market" is taken separately for each item so that the stock is valued at cost only for items for which the market price has gone up.[6] When the market value has declined, only the lower value is taken. Sometimes, downward revision of stock values in anticipation of a loss goes even beyond that. Thus a dealer in parts of motor cars, import of which was banned, was allowed to value his stock notionally at 50 per cent and for some items, at 100 per cent, less than cost even though the same stock was valued at a higher price for purposes of obtaining overdraft from the bank.[7] When the stock is considered unsaleable for lack of demand the cost is allowed to be taken at nil.[8] The value of the opening stock, it might be supposed, would merely reflect the carried forward figure of closing stock of the preceding period. This however is not always the case. Thus when a dealer in silk goods died leaving a sizeable stock that had cost Rs 2,78,000 and his daughters resumed the business as partners, the stock was allowed to be valued at Rs 3,53,000 which happened to be the market value of the stock on the date of death of the dealer.[9]

It is not as if the courts permit accountancy practice to be followed without questioning in all situations, whatever be the results thereof. In a case involving the valuation of work-in-progress the House of Lords refused to accept the plea advanced on behalf of the Revenue for applying the "on-cost" method whereby indirect costs (that is, proportionate part of the overheads) are also added to the cost of materials and other expenses as against the direct-cost

method (which takes account of only the variable costs) followed by the taxpayer regularly even though the on-cost method is well recognised in accountancy.[10] The result, obviously went in favour of the taxpayer. The Last-in-First-Out (LIFO) method which is recognised for tax purposes in USA was however rejected by the Privy Council in a well known case.[11] Similarly a plea for upholding the base stock method of valuation was turned down by the Court of Appeal in a case even though it is a recognised method in accountancy.[12]

Broadly, however, the position is that accountancy practice is allowed to prevail unless there is an obvious inconsistency with the law. After examining the various alternatives the Taxation Enquiry Commission supported the existing practice and so did the UK Committee on the Taxation of Trading Profits (Tucker Committee).[13] Both the UK Committee and the Indian TEC expressed their opinion against "making in the tax law any rigid provision about the method of accounting of which the stock valuation is only one aspect, that an assessee should follow."[14] For various reasons however this approach does not seem to be either rational or satisfactory. First of all, there is little uniformity in accountancy practice or opinion on the question. This was sharply revealed in a case decided some time ago by the House of Lords in England. The point at issue was the meaning of the word "market value" in the context of the valuation rule — "lower-of-cost-or-market". The tax-payer, a dealer in shoes, wanted to value the stock of shoes which had gone out of fashion at its "replacement cost" and not at its realisable value which was higher (but, presumably, less than the original cost). The Revenue authorities refused to accept the "replacement cost" valuation and the House of Lords upheld the Crown's plea as it tended to produce a less inaccurate result.[15] Expert opinion of accountants tendered before the court in this case was sharply divergent and the court interpreted the expression "market value" in its "natural meaning" to connote "the price which can be obtained for the article in question in the market which offers the best price".[16] The bitter controversy among accounting theorists over the merits of the LIFO method of valuation also testifies to the fact that there is no agreed set of principles in accountancy for stock valuation.[17]

More important, the rule "lower of cost or market", though widely applied, has no sanction in theory. If, on the assumption that the business is a "going concern", the idea is to segregate assets used *for* business (circulating assets) from those used in business (fixed assets) and to regard changes in the value of the latter as of no consequence in yearly income measurement, then the logical course would be to adopt cost as the basis for valuation of the latter and market as that of the former. Application of the realisation principle on the other hand would require valuation of all assets at cost. The lower of cost or market is, as one critic observed, the result of "an illogical and one-sided application" of the going-concern convention.[18] The history of the valuation rule shows that it was born out of the conservatism of the accountants which was innate in the environment in which the English accounting profession grew up.[19] Relevance of this rule for purposes for which financial statements are prepared — stewardship reporting or providing information for investors to help planning and control — is increasingly called into question by accountants. For measuring business profit for managerial purposes, Parker and Harcourt have advocated, following Solomons, the adoption of "replacement cost" rule for valuing assets except where it is greater than the present value of the receipts excepted from its use or its net realisable value (NRV).[20] For measuring *ex post* income, however, as has been pointed out by Gray and Wells, there is no reason why anything other than NRV should be taken.[21]

It will not do to say that adopting market value (of which NRV is the most appropriate index for purposes of income measurement) would introduce a large element of "subjectivity" in financial results. For the operation of the lower-of-cost-or-market rule too involves a large element of subjectivity as its application requires ascertaining the market value. Even historical cost is not always more objective than market value. As Parker and Harcourt point out, depreciation based on historical cost is but an estimate and the "so-called historical cost of a manufactured article depends on a number of rather arbitrary decisions about which overheads are 'inventoriable' and how they should be allocated between jobs or processes", while many assets have easily verifiable market values.[22] The sharp criticism levelled in UK against the decision of the House of Lords in the shoe dealer's case referred to earlier (where the realisable value was upheld as appropriate in preference to replacement cost) also does not seem to be tenable. The argument put forward in support of this criticism, *viz*, that the rule "cost, net realisable value or replacement price, whichever is the lowest" ensures that no element of profit is anticipated before it is earned, appears[23] to be unsound, because, once a firm's liquidity is restored, any new commitment in inventory must be made primarily because management expects net realisable value to be equal to or greater than cost.[24] To allow taxpayers to anticipate losses on inventory valuation but not gains may be prudent on the part of accountants but does not stand to reason for purposes of taxation. It almost amounts to presenting Revenue with a heads-I-win-tails-you-lose alternative. In the context of an inflationary situation, the lower of cost or market rule operates to negate one of the important objectives of progressive taxation by allowing postponement of taxes on the gains of price rise and thus helping to support inventory accumulation. Such postponement is advantageous in more than one way in conditions where credit is scarce. The Reserve Bank's study of company finances shows that the proportion of inventories in the assets of medium and large public limited companies has increased from 32 per cent in 1965-66 to 33 per cent in 1970-71.[25] In the case of 350 large public limited companies the proportion of inventories has increased from 28.8 per cent in 1970-71 to 31.1 per cent in 1972-73.[26] The conservative rule of stock-valuation directly contributes to the capacity for stock-holding. A rough calculation shows that the amount involved in tax-postponement facilitated by the current rule of inventory valuation is by no means negligible and may amount to an interest-free loan of over Rs 200 crores for the organised sector alone, the interest on which, at the rate of 15 per cent annum, works out to more than Rs 30 crores.[27] Availability of funds of this order is itself an advantage the value of which is not adequately reflected in the official lending rates for the organised sector.

Considering everything, continuance of the lower of cost or market rule is totally indefensible and quite unnecessary. As Parker comments after tracing the history of the rule, "The astonishing thing about the lower of cost and market rule is its ability to survive attack".[28] It may be, as Parker laments, that an agreement on inventory valuation is unlikely so long as the more general problem of asset valuation remains unresolved. But, for tax purposes,

there is no reason why valuation at market should not be imposed for stocks for which market values are available regardless of what accountants say. The decision of the House of Lords to take 'market value' in its natural meaning has paved the way for such a course. Conservatism in this regard may be in the interests of business proprietors but is incompatible with the aims of progressive taxation. It needs to be added that the adoption of the NRV rule for inventory valuation would add to the efficacy of the income tax as a counter-inflationary instrument. In terms of rising prices it would enable the government to make a larger draft on business profits and exert pressure against inventory building.

26 "Finances of Large Public Limited Companies 1972-73", *Reserve Bank Bulletin*, February 1974, Table 7.

27 RBI study of company finances referred to in note 26 shows that the net sales of 350 large companies accounting for 63 per cent of sales of 1,650 large and medium public limited companies were Rs 5,538.8 crores at the end of 1972-73. Assuming that the ratio of inventories to sales of large and medium companies is around 31 per cent, the value of inventories of these companies works out to about Rs 2,700 crores $\left(\text{Rs. } \frac{5,538.8 \times 31}{63}\right)$. At an average price rise of 15 per cent per annum, the value of price gain on these inventories comes to Rs 400 crores and the amount of tax postponed as a result of valuation at lower of market or cost approximately to Rs 220 crores (at 55 per cent). The interest on this amount at 15 per cent per annum is about Rs 33 crores. Taking the unorganised sector too the amount of tax postponed, might be around Rs 300 crores and the interest on it about Rs 50 crores per annum. If, as seems more appropriate, the bazaar rates are taken, the interest gain to business concerns through tax deferment might be nearer Rs 75 crores.

Profitability of Nationalised Banks

Sampat P Singh

This paper compares the 14 nationalised banks in terms of changes in their profitability between the pre-nationalisation and the post-nationalisation periods.

The nationalised banks have been ranked on the basis of profitability, volume of business, gross margin, manpower expenses and branch expansion.

Some areas for policy changes at the national level are also suggested in the light of the inter-bank comparisons.

THE fourteen largest commercial banks were nationalised five years ago. Their post-nationalisation performance is now under discussion. One major area of focus in this debate is profits and profitability.

We have taken figures from published annual reports of banks. They represent only the year-end position and are deficient in many other respects. In our analysis we have avoided use of sophisticated statistical tools because the quality of data does not seem to justify their usage. The method used by us is simple: conversion of absolute figures into percentages, straight comparison between pre and post nationalisation periods in terms of per cent change in growth rates, and comparison between banks in terms of their relative positions in ordinal rankings on different indices. All numbers used by us are, therefore, to be regarded as approximations and the results need to be interpreted with a little caution. Since we are highlighting only the dominant trends, this approach may be considered adequate.

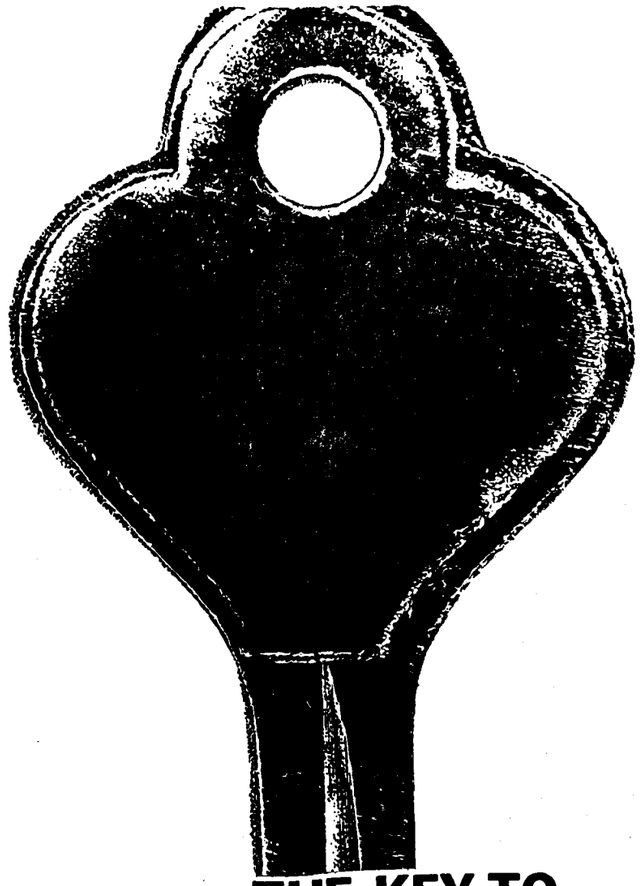
The present note is part of a study in progress. The detailed version will be published when data for 1973 and for some earlier years for these banks as well as data for the SBI are available.

We have taken figures for three pre-nationalisation years (1966 1967 and 1968) and averaged them to represent that period. Similarly, four post-nationalisation years (1969, 1970, 1971 and 1972) have been averaged to represent this period. Thereafter, per cent growth rates have been reckoned and the banks have been ranked in the descending order on the basis of the differences in the percentages between the two periods.

First, we have ranked the banks on the basis of a profit index: per cent growth in volume of profit and change in per cent profitability (i e, profit earned in relation to volume of business), both combined into one composite ranking. As our next step, we make a simplifying assumption: a bank's profit-and-profitability performance is affected largely by four factors: volume of business, gross margin, manpower expenses and branch expansion.

Second we have ranked the banks on the basis of a composite volume of business index. This includes balance sheet totals, deposits and borrowings, loans and investments, and yearly rates of growth of deposits.

Third, we have ranked the banks on the basis of improvements in gross per cent margins: interest received plus commission, etc, earned minus interest paid.



Fourth, ranking has been done in terms of manpower expenses: a composite index based on volume of business divided by these expenses, these expenses per employee, and volume of business per employee. Here, a rise in volume of business per rupee of manpower expense, fall in expense per employee and rise in business per employee have been assumed to be correlated to rise in profit. Accordingly, the bank with the largest per cent gains in manpower expense indices has been ranked first.

Fifth, we have ranked the banks on the basis of a composite branch expansion index: growth rates of number of branches and volume of business per branch. Lower per cent growth of the number of branches and higher per cent growth of volume of business per branch are treated as correlated to rise in profit. The bank with the largest gain on these counts has been ranked first.

Each bank has been ranked on five composite indices: p = profit performance; v= volume of business; m = gross margin; e = manpower expenses; and b = branch expansion. Where differences are minor, the same rank has been accorded to two cases. Each bank has been assigned an alphabet: A to N. In addition, we have introduced bank X to represent the average bank: totals for all banks divided by fourteen. All rankings are put together in our Table of Rankings. Bracketing implies same rank (broken lines, approximately same rank). The three ranges are drawn such that all five averages fall in the Medium range. The other two ranges contain above average (high) and below average (low) cases. Figures for all 12 parameters, maximum, average, minimum and the range are shown in our Table of Statistical Results, so as to focus on inter-bank differences.

We have, so far, confined ourselves to private profitability and ignored social profitability. With the data at our disposal, we cannot really extend our analysis to fully accommodate extend our analysis to fully accomodate the latter. But a reasonable measure of accommodation is possible at the interpretation stage. For example, branch expansion expense because of its debit to profit account of the year is at present treated as a drag on profits of that year. It could also be treated as development cost and hence capital expenditure to be written off over a number of years during which the business at new branch develops. What, therefore, is more significant is the volume of business per branch. The same could be said of manpower expense per employee and volume of business per employee. Or, for that matter, the gross margin and service charges. In other words, profit is one major objective and it has to be fulfilled along with other major social objectives. Traditionally banks have been inclined towards conservative policies: open a branch at a location which is already developed and where the business is ready to walk in. Similarly, they have tried to minimise manpower expense. For more profits, you must watch your manpower expenses or, now in the West; resort to labour-saving devices. This is what we would designate as a conservative policy. As against this more branches with more business per branch and more expenses per employee with more business per employee are indicators

of a progressive policy. While analysing the results of individual banks, we have graded them in a rough and ready way to reflect their performance in the profit area along with their results in other areas, as evidenced by their different profiles, showing positions above or below average. This has been treated as evidence of a policy and its fulfilment and, therefore, of managerial effectiveness.

II

The average bank represents approximately the overall experience of the 14 banks put together. Its yearly average amount of profit earned went up from Rs 40.36 lakhs during pre-nationalisation period to Rs 51.04 lakhs during post-nationalisation period, a growth of 26.46 per cent. Nine banks had a higher growth rate than this and five lower. In respect of profit earned as percentage of volume of business, the average bank was earning 0.174 per cent before and 0.132 per cent after nationalisation, a drop 0.042 per cent, with six banks faring better and eight worse. Taking the two parameters together into one composite index, the average bank ranks seventh, i e, six banks performed above average and eight were below the average.

As for the volume of business, the average bank's yearly average balance sheet total was Rs 219 crores, deposits and borrowings Rs 173 crores, loans and investments Rs 167 crores and the annual average deposit growth rate 13.49 per cent before nationalisation. After nationalisation, the corresponding figures were Rs 360 crores, Rs 284 crores, Rs 279 crores and 23.60 per cent, respectively. This meant growth rates of 64.84, 64.10 and 67.07 per cent for first three parameters and a net rise of 10.11 per cent in the yearly deposit growth rate. Clubbing these four into one composite index and ranking the banks, we find our average bank in the eighth position, with seven banks performing better and seven worse.

The gross margin for the average bank was 2.78 per cent before nationalisation and 3.14 per cent after, an improvement of 0.36 per cent, with seven banks faring better and seven worse.

Broadly, the volume of business and gross margin determine gross profit. Two major cost items then need to be deducted before arriving at net profit. One of these is manpower expenses. In this area, the volume-expense ratio for the average bank was 53.11:1 before and 46.48: 1 after nationalisation, showing a fall of 6.63, with nine banks above the average and five below it. The yearly average expense per employee for the average banks was Rs 6,290 before and Rs 7,880 after nationalisation, registering an increase of 25.28 per cent, with eight banks above the average and six below. As against this, the average yearly volume of business per employee for the average bank was Rs 3,33,000 before and Rs 3,68,000 after nationalisation, registering an increase of only 10.51 per cent, with seven banks performing better than the average and seven worse. On the composite ranking for these three parameters, the average bank was ninth with eight banks above the average and six below it. To remind ourselves, this ranking is in terms of higher advantage, where advantage means higher volume of business per rupee of expenditure on manpower.

Similarly, purely for profit calculation, a lower number of new branches is an advantage because of less debit to profit account; rise in the volume of business per branch is also an indicator of an advantageous position. This fixes our basis for ranking for the second major after-gross profit debit. The average bank had 239 branches before and 450 branches after nationalisation, giving a growth rate of 88.28 per cent, with 10 banks above the average and four below it. As against this, the volume of business per branch for the average bank was Rs 90 lakhs before and Rs 78 lakhs after nationalisation, recording a fall of 13.33 per cent. The average bank was ninth, i e, eight banks fared better and six worse. On composite ranking for these two parameters, the average bank was tenth, with nine banks above and five below the average.

The profit performance of the average bank reflecting the performance of the 14 banks can now be summarily seen as follows. On a comparison of pre and post nationalisation periods, the average bank's yearly profit went up by 26.46 per cent; but profit as per cent of volume of business went down by 0.042 per cent. The latter signal is surely cause for some concern and action but not for alarm. It has to be considered in the proper perspective.

First, the average bank achieved these results along with 64.84 per cent rise in volume of business, a mere 0.36 per cent rise in gross margin, 84.05 per cent rise in manpower expenses and 88.28 per cent rise in the number of branches.

Second, the profitability of the 14 banks was already under pressure during the years immediately preceding nationalisation. For example, compared with 1966, in 1967 three banks showed zero per cent growth and seven a fall in their profits. Almost the same was true of 1968 compared with 1967. A trend had set in and it got extended to the post-nationalisation years. The basis for future rise in manpower expenses had already been fully established. The only significant difference after nationalisation has been the pushing up of branch expansion, particularly to hitherto neglected areas. This could be a constraint on profit in some cases in the short run; but it could be more than compensated by social profitability arising out of development in the somewhat longer run. Further, the chief executive of one of the banks writing in *Commerce* on the eve of nationalisation emphasised that "the trend in profitability in banking industry has been unsatisfactory". By way of explanation he added: "... during the last 15 years the services charges of banks have remained more or less constant ... There is no economic, management or social principle which would require an industry to offer its services indefinitely at constant charges, in the face of increasing costs". He was pleading for an inter-bank agreement on service charges. Nothing happened in this regard then nor during the post-nationalisation period.

Really alarming, however, are big inter-bank differences. The Table of Statistical Results shows very wide differences in the maximum and minimum growth rates: profit amount 166.67 per cent to 36.29 per cent; profit as per cent of business volume 0.040 to —0.151; business volume 121.43 per cent to 44.14 per cent; increase in yearly deposit growth rate 20.40 to 1.69; increase in gross margin 0.74 to —0.02; manpower expense per employee 36.75 per cent to 5.17 per cent; volume of business per employee 27.84 per cent to —4.80 per cent; number of branches 122.22 per cent to 47.29 per cent; and volume of business per branch 6.12 per cent to —27.67 per cent. Some banks made an outstanding success of both profits and branch expansion, despite low gains at the margin and heavy burden of rise in manpower expenses. Some even with a lower burden of rise in manpower expenses and low branch expansion showed poor profit results. In other words, in some cases the position above

or below the average on different indices has been purposeful and in others it has not been purposeful — indicating high or low managerial effectiveness, judged in a somewhat broader context than mere private profitability. Perhaps these differences lie in the organisational set-up, policies, strategies and quality of leaderships.

III

Let us now have a closer look at the profile of each bank separately.

BANK A : This bank raised its yearly profit by 90.80 per cent and profit as per cent of business volume by 0.017 per cent during post-nationalisation period. It ranks second among the fourteen banks, five positions above average. But its volume of business was only one position above average. It doubled its number of branches and was amongst the first three banks in branch expansion. Its business volume per branch fell 18.56 per cent. Similarly, its pay-out per employee went up by 26.10 per cent, as much as the average bank; its volume of business per employee came tumbling down by 12.46 per cent, giving it on these indices a very low position. Its second ranking on profit might be largely because of a 0.73 gain in the margin percentage. Its biggest drag is volume of business : total, per employee, and per branch. In terms of managerial effectiveness we could put it in grade B : low evidence of purposive policy; likely to find it difficult to maintain its position.

BANK B : Its profit record almost coincides with that of the average bank. Goes second from top in volume of business. Keeps itself only one position below average on the remaining three indices. It provides fairly good evidence of the pursuance of a policy; good blending of conservative and progressive outlooks. We may grade it A—.

BANK C : If a bank were to fix the following set of ambitious objectives : highest growth rates of volume of business, profits and profitability along with doubling of number of branches, and, above average on every other count and if it fulfilled them, it should provide clear evidence of the existence of well-defined policies and a high degree of managerial effectiveness. The profile of this bank suggests this, and we could grade it A+.

BANK D : It represents a conservative case, very high restraint on employees pay-out and branch expansion, seven and eight positions removed from the average. The results are rather poor, below average rise in volume of business, 11.85 per cent fall in yearly profit and 0.054 per cent fall in profitability as per cent of business volume. It provides evidence of a policy and its failure. We might grade it C.

BANK E : This bank went in for very rapid branch expansion along with below average rise in the volume of business and 0.02 fall in margin percentage, resulting in 27.67 per cent fall in business volume per branch. In its pay-out to employees, it was two positions above average. It was three positions above average in profit and profitability. But evidence of a policy and managerial effectiveness is weak. We could grade it B.

BANK F : This bank kept itself close to average, a little below in pay-out to employees and a little above on other indices, representing good evidence of policy and managerial effectiveness, and of a purposeful blending of conservative and progressive outlooks. All this with very good profitability results. We could grade it A+.

BANK G: Average on branch expansion, one position above on margin, relatively very little damage on employee pay-out, with the poorest showing in growth of business, it ends up two positions below average on profit record. We do not get here get evidence of purposive policy and managerial effectiveness. We might put it in grade C.

BANK H: Despite very low gain on margin and recording only one position better on manpower expenditure, it performs very high on branch expansion and volume of business. Its volume of business gets more than doubled and rises 11.85 per cent per employee and 6.12 per cent per branch. Its amount of profit earned per year rises by 35.53 per cent, four positions above average. Its low position, three places below average, on profit index is because it loses 0.102 per cent in profitability related to business volume. It does present fair evidence of progressive policy and managerial effectiveness. We could grade it A—.

BANK I: It is two positions above average on business volume, gets highest benefit on margin and is four positions ahead on branch expansion. But it is badly shaken on manpower expenditure. It used to get Rs 72.48 of business for every one rupee spent on manpower. This went down to Rs 53.44, recording the highest drop of Rs 19.04, resulting in 3.13 per cent drop in profit earned and 0.091 drop in profit percentage related to business volume. We could not grade it higher than C.

BANK J: This bank is one position below average on profit index. Gain in margin is four positions below average. But it is fairly high on branch expansion (91.89 per cent) and business volume (71.79 per cent). Moreover, its expenses per employee rises by 17.56 per cent and business volume per employee rises the highest by 27.84 per cent. Good evidence of purposive policy and managerial effectiveness. We could put it in grade A—.

BANK K: Its growth rate of business is almost the same as that of the average bank. It goes in for very high branch expansion and, despite being four positions above average on margin and expense indices, shows very poor profit performance. It hardly shows evidence of presence of a purposeful policy and managerial effectiveness. We could not grade it above C.

BANK L: Here is evidence of a policy of extreme conservatism: low branch expansion, low employee pay-out, low growth of business volume, slightly higher margin, and, of course, low profits. We might put it in grade C.

BANK M: It presents the profile of conservatism with moderate success. Very low effort at branch expansion, very low damage on manpower expenditure, margin one position below average, growth of business three positions below average, and ending up one position above on profit index. Smacks of low managerial effectiveness. We could grade it only B.

BANK N: This bank shows the highest but unpurposive deviation from the average. Very high on margin, very low on branch expansion, very high on rise in manpower expenditure and fairly low on business volume. It ends up two positions above average on profit index. Poor on policy and managerial effectiveness. We cannot grade it higher than B.

Comparing the banks' profit performance in terms of related factors and judging in a somewhat broader managerial and social context, we have approximately rated the fourteen nationalised banks as follows: 2 in grade A+; 3 in grade A—; 4 in grade B, and 5 in grade C. Judged both in terms of private and social profitability, during the post-nationalisation period, 5 banks in A+ and A— grades improved their positions substantially, four banks in B grade improved their positions moderately, and, five in grade C went down.

TABLE OF STATISTICAL RESULTS

		Maximum	Average	Minimum	Range

IV

In the light of our simplified analysis, we might suggest a few areas for policy changes at the national level. These are based on the assumption that the pressure for branch and business expansion in unbanked regions would continue; that the cost of manpower and other costs of business would continue to rise; and that individual banks will not be able to substantially alter the terms on which they do business under highly competitive conditions.

The first thing we would suggest is that the pattern of general policy 'directives' common for all 14 banks should be replaced by specific policy directives for each bank separately after carefully assessing its strengths and weaknesses.

Second, the spirit behind these directives should be that of policy 'guidelines' and should be evolved with the top executives of each bank separately. By way of illustration, asking every bank to double the number of its branches, or to every time call a conference of the chief executives, or to send out cyclostyled copies of directives do not go far enough. Instead, in some cases they might do more harm than good.

Third, the deficiencies in management of banks at the top level should be carefully scrutinised and effectively remedied. Profitability has to be planned, supported by appropriate policies and strategies and continuously watched. Nationalisation of a bank means its running by a team of professional executives. We should not expect that every bank was or is in a position to automatically throw up a team of dynamic leaders at the top, nor is every competent and experienced executive necessarily also fit for the leadership role. Somebody was looking after this function before nationalisation; the government has now to fill this gap most carefully.

Fourth, the banks should be persuaded to get together and rationalise their services charges. There is no reason why this area should have been left untouched for over 20 years. Some studies made by us show that small improvements here and there could improve profitability of banks substantially. If operating costs keep rising faster than the rise in the volume of business, revenues must be pushed up or profitability would have to go down. After nationalisation while business volume on average went up by 64.38 per cent, manpower expenditure, the

major cost item for any service industry, went up by 84.05 per cent.

Fifth, every bank should evolve its own strategy for branch expansion such that it can be carried out profitably. Experience shows that if branch expansion is carried out after careful planning, it need not cut into profits. In fact, some banks have shown that rapid branch expansion can go along with substantial rise in profits.

Sixth, each bank should work out its strategy for raising and maintaining its volume of business per rupee of expenditure on manpower. Once again, experience suggests that if recruitment, promotion, branch expansion, deployment of personnel and business development are carried out in a planned manner, it is possible to make a very favourable impact on profitability and profits. The gap between best and worst performance is too wide and needs to be bridged. Before nationalisation the highest for business per rupee of expenditure on manpower was Rs 72.48 and the lowest was Rs 38.52. After nationalisation the figures are Rs 57.45 and Rs 39.62 respectively.

Finally, a look at the location of averages in the rankings, as shown by profile of bank X, suggests dominance of conservative over progressive outlook in the group of 14 banks taken as a whole. The future shape of things need to be different. The key to profitability should lie essentially in higher volume of business: total, per employee and per branch; and not so much in watching expense per person and expense on branch expansion.

Camphor and Allied

CAMPHOR and Allied Products proposes to offer for public subscription 5,000 unsecured convertible bonds of Rs 1,000 each to raise part of the finance required for an expansion project estimated to cost Rs 146 lakhs. The bonds will carry interest at 10 per cent and will be redeemable at par on expiry of 12 years. The holders will have the right to convert the bonds into equity shares at the end of 5 years. They will get 3 equity shares of Rs 100 each and Rs 250 in cash for each bond, which means that the shares will be issued at a premium of Rs 150 each. If, in the meanwhile, the company issues bonus shares in the proportion 1 : 3, the bondholder will get 4 shares at a premium of Rs 87.50 per share plus a cash refund of Rs 250 for each bond. The project is for manufacture of 60 tonnes of paramenthane hydroperoxide, 500 tonnes of CP resins, 550 tonnes of sodium acetate out of the company's by-products, besides changeover in the process of manufacture of camphor and installation of a new distillation column for improving recovery of alpha pinene and separating beta pinene to the tune of 185 tonnes. The company has already completed considerable work on its expansion programme, having spent about Rs 75 lakhs out of internal cash generation and loans and deposits. CP resins have been already put on the market, and beta pinene is expected to be marketed soon. Commercial production of PMHP and sodium acetate is expected to begin by mid-1975.

Functions of the Nineteenth-Century Banian

A Document

Dipesh Chakrabarty

Ranajit Dasgupta

The first half of the nineteenth century in Bengal saw the beginning of the historical stage of colonialism by raw material extraction for metropolitan exploitation.

The colonial elements in the pattern of entrepreneurship that emerged were collaboration between foreign and native capitalists and the growth of the function of the middleman.

The banian was one form of such early collaboration between foreign and Indian business.

This brief note presents a document which appears to be highly useful in understanding some of the functions of the early nineteenth century Banian in Bengal and the role which he performed in the economic activities of the period.

THE very limited object of this short note is to introduce a document found by the authors in a mass of old records of the Bengal Coal Company, now at the disposal of the Coal Mines Authority Limited. The document, dated April 1, 1847, seems to be highly useful in understanding some of the functions of the early nineteenth century banian in Bengal, and the role which he performed in the economic activities of the period.

The first half of the nineteenth century in Bengal saw the beginnings of the historical stage of colonialism by raw material extraction for metropolitan exploitation. The scale of operations involved in the process meant the formation and proliferation of new enterprises built partially on Western principles of centralisation of work-units — e g, mining, plantation, banking, insurance,[1] etc. But since all this was to take place in a market which (a) was colonial and (b) had an extremely narrow credit supply network, it was almost inevitable that entrepreneurial activities would have to bear the stamp of colonial practice on their appearance. In more specific terms, the colonial elements in the pattern of entrepreneurship here were (i) collaboration between foreign and native capitalists, dictated by the narrowness of the money market,[2] with the indigenous capitalists often playing the role of a junior and dependent partner,[3] and; (ii) growth of the function of middlemanship, necessitated partly by the foreign investor's ignorance of the native market,[4] and partly by the need to gather technical skill and labour from a massively predominant population of non-colonials. It appears that the second element persisted, multiplied itself in time, and came to characterise much of the management traditions that were to emerge and grow in the colonial business and industrial houses of the late nineteenth and early twentieth centuries. (The institutions of the Managing Agency or of jobbing in the labour market would be cases in point.)

'Banianship' was only one form of such early collaboration between foreign and Indian businessmen in the nineteenth century. N K Sinha has explained some of the functions of the banian (like purchase and sales for his company, covering risk of loss of goods shipped through him, etc) on the basis of the records in the Supreme Court archives at the Calcutta High Court.[5] The document we present here seems to supplement and add to his description of the nineteenth century banian.

We found this document in the files containing papers relating to the coal interests of Carr Tagore and Company, which were inherited by the Bengal Coal Company, and more recently, by the Coal Mines Authority. It gives the 'Articles of Agreement' signed by 'Baboo Ramnarain Sein' who agreed to certain stipulations "on condition of being appointed a banian to W P Ewing". We have not so far been able to place them, but it seems Ramnarain may have been a relative of Mathura Mohan Sen, the famous nineteenth-century banker.[6] There is also a remark pencilled against Ramnarain's signature on the 'Agreement', which says: 'Brother to the Banian of Gisborne and Co'. All this apart, the document was presumably about appointing a banian to look after some of the affairs relating to marketing of coal. Perhaps this is why the 'Agreement' put so much emphasis on the management of transport, which was *the* big marketing problem facing the coal industry in those days.[7] The banian here, therefore, appears to be almost a transport sirkar and a transport sardar, rolled into one. We would not, then, cite this document as something giving us an idea of the functions of the banian in general. Ours is rather a particular case within the framework of the general — Ramnarain was being taken on as a banian in the coal industry.

But there are certain other features of the 'Agreement' which suggest interesting hypotheses about the early nineteenth-century banian, which may form starting points for further work. Ramnarain, besides managing transport, insurance-business, and owning a 4 annas share in the boat business, also employs labour, looks after their conduct, and gets *dastoory* on their wages. He is, in other words, a primitive jobber (later called 'sardar' in Calcutta labour management) and a manager (an overseer), to whom these functions have been delegated by the owners in the industry. Does the 'banian' then represent, in an embryonic and personalised form, some of the institutions (e g, Managing Agency, jobbing, etc), having the functions of middlemanship, that characterised, and grew within, the later colonial tradition of business management, with the colonial market (for the factor inputs) providing a relevant context for all of these?

The document is quoted below in full:

I the undersigned do hereby agree to the following stipulations on condition of being appointed Banian to W P Ewing Esq.

1st I shall find good and sufficient security for my own conduct.

2nd I agree to find Boats, Manjees, Peons, Hackeries, Cossids, &c, and all that may be necessary for the transaction of the Boat and Insurance Bu-

A dream today, a reality tomorrow

Today at Mithapur, young India, conscious of the past, urged on by the present, confidently dreams of a glorious tomorrow.

Their immediate dream is of a new complex—massive, self-sustaining, long-range and innovative—harnessing the sea, the sun and ultimately the atom to banish hunger from their land and to generate greater economic self-sufficiency, more and more independence.

There is a beginning but there is no end to the work of bringing purposeful prosperity to the people of India. Harness the sea, the sun, the atom and from Okhamandal—the land of salt—fertility will flow to the entire country.

siness.

3rd I shall obtain good and sufficient security from the Manjees, Peons, &c, and shall be held responsible for their conduct and honesty; I shall by all lawful ways and means recover the amount of such Security in the event of their deserting the boats or otherwise misconducting themselves.

4[th] In the event of any Boat, Hackery, or Cossid, or the same plurally expressed, &c, &c, being delayed in their dispatch after my having accepted the order, I shall pay the usual demurrage for all such delays.

5[th] I shall appoint Sircars, &c, &c, and all such person or persons as shall be actually required for carrying on the Boat and Insurance Business inland and shall be responsible for their good conduct.

6[th] All Money/Monies that may accrue from the Boat business shall be placed in my hands, and all receipts and outstanding claims shall be realised by me and shall be deposited in my charge, and no disbursements whatsoever shall be made by me without the consent of the Secretary or Secretaries for the time being.

7[th] I shall be allowed the usual dustoory from Manjees, Peons, &c, &c.

8[th] I shall be allowed Sixteen Rupees (Rs 16) per month as wages for supplying of one Cashkeeper and one Sircar for whose conduct I shall be responsible, to commence from the date of the dispatch of the first Boat.

9[th] That I shall receive one Quarter or Four annas share of the Boat business alone, after all office and other charges having been defrayed, and shall bear my proportionate loss.

10[th] That all Boats shall be insured during the rainy and stormy seasons.

[Sd] Ramnarain Sein

Witnessed by [Two illegible signatures]

Calcutta

April First, 1847.

Notes

[The authors remain grateful to the Coal Mines Authority Limited for allowing them to examine some of the very old records kept at the office of their Managing Director in Sanctoria (Dishergash) near Barakar in West Bengal.]

1 It is of course well known from the works of Irfan Habib, L C Jain, etc, that there was a pre-British banking system in India. But the services offered were most personalised, and the banking houses were built up on familial bases. For insurance business in the 18th century Bengal, see Gautam Bhadra, "Some Socio-Economic Aspects of the Town of Murshidabad 1765-1793", (unpublished M Phil Thesis, Jawaharlal Nehru University, New Delhi, 1973), Chapter III.

2 See Sabyasachi Bhattacharya "Inequality and Free Trade" (mimeographed) to be published in Proceedings of the 34th session of the Indian History Congress held at Chandigarh in December 1973.

3 Bhattacharya *(ibid)* looks into some of the 'non-market pressures exerted by the government' that resulted in a 'junior partnership' for native capital. One of the present authors has elsewhere argued that the first half of the nineteenth century saw the growth of a culture of dependence (both ideological and economic) of the Bengali intelligentsia on the British. See Dipesh Chakrabarty, "The Colonial Context of the Bengal Renaissance: A Note on Early Railway Thinking in Bengal", to be published in a forthcoming issue of the *Indian Economic and Social History Review*.

4 *Cf* "He [The Banian] knew market conditions, the country and its people very intimately". N K Sinha, "The Economic History of Bengal", (Calcutta, 1970), III, p 107.

5 Sinha, *ibid*, pp 106-7. See also Dilip Basu, "The Banian and the British in Calcutta, 1800-1850", *Bengal Past and Present*, July-December, 1973, pp 157-170.

6 *Ibid*, p 79, n 14.

7 It was this problem of transport that Dwarkanath Tagore emphasised in his 1844 correspondence with R M Stephenson, the father of the railways in India. See Chakrabarty, *op cit*, Appendix. The problems seem to have been there throughout the nineteenth century. Deveria, Manager of the Raneegunge mines of the Bengal Coal Company, wrote to M/s Gordon Stuart and, Company, Secretaries, Bengal Coal Company, complaining about transport problems. (See his letter dated 6-1-1862.) The Bengal Coal papers include bundles of letters (we saw some for the 1890s) relating to the problem of transport of coal.

IOL continues its advance on the technological front

and here are the facts

*A Centre is being set up in Bombay for the production of a range of gases of ultra high purity and special mixtures for the electronic and other industries. Hitherto these were being imported.

*MIG 400, a more sophisticated form of metal inert gas welding set from IOL, will soon be in the market.

*IOL has won the first 1200 cubic metre/hour Oxygen Plant contract for a mini-steel project of the Maharashtra Government. This is the forerunner of a series to be manufactured by IOL in the near future.

*For the first time in India IOL will produce indigenous tubular hard facing electrodes—"Cobalarc"

*Also for the first time in India IOL has established facilities for producing special purpose automatic welding machines.

India's Self-Inflicted Defence Burden

Ved P Gandhi

A comparison of India's defence spending with that of China and Pakistan shows that in 1970 the ratio of defence expenditure to GNP is 3.7 per cent for Pakistan — which is no higher than India's. China's defence ratio, which is at best an approximation, is certainly much higher — it is close to eight per cent —but then China, as we know, has been confronting many adversaries, including at least one super military power, all across its wide borders.

If we use some other indices of defence spending, India is certainly ahead of these two countries. The average rate of growth in defence spending in India over the period 1961-1971 was 16.5 per cent per annum which was higher than that of China and practically all the European and North American countries. Even for the developing countries around the world, the average growth rate was only 12 per cent per annum.

Moreover, the average growth rate of the numerical strength of our armed forces during the same period was five per cent per annum and this was higher than that of most countries of the developed as well as developing world. Against this, Pakistan's armed forces grew at an average rate of 3.8 per cent during 1961-1970, Iran's at 2.9 per cent and China's at 3.9 per cent.

What is far more serious is the dire economic cost of our large military expenditure. The expansion in our defence spending during the 1960s has resulted in a whole decade of slackened development.

Any recommendation that we should further expand our military expenditure must, therefore, be viewed in terms of its economic costs; certainly it must be established that this is the least-cost solution to our defence problems. In addition, in view of the extreme poverty of our people and the stagnant nature of our economy at present as well as the inherent rigidities in defence spending, it becomes doubly important that we compare and evaluate the economic costs of getting involved in yet another war vis-a-vis the costs of attempting to avoid a war.

DURING the decade of the sixties India's defence spending grew five-fold — from Rs 313 crores in 1961-62 to Rs 1,600 crores in 1972-73 — representing a growth rate of 16.5 per cent per annum. Whether or not this very substantial devotion of the government to defence — our defence spending as a percentage of GNP has grown from two per cent in 1961-62 to 3.7 per cent in 1972-73 — has constrained our economic development to any extent has not been a subject of much debate. A paper by K Subrahmanyam[1] has brought the issue to the surface. Subrahmanyam, who is an influential defence strategist, has compared India's defence spending with that of many other countries and examined the fiscal implications of our past defence effort. Implicitly, if not explicitly, he advocates a further increase in our defence spending. As he has voiced a similar opinion elsewhere too,[2] a closer examination of his arguments is called for.

Although Subrahmanyam concludes his paper with the cautious remark that "The [optimum] amount of defence outlay to be devoted to manage the security of a nation without incurring unduly high cost is a matter of sophisticated political and economic judgment", he does implicitly throw in some advice anyway. India's defence spending (as a percentage of GNP), he argues, is far less than the world "average" of six per cent (in 1971) and certainly less than that of many countries despite the fact "none of these countries had to face the hostile environment India has had to during the last 25 years". In addition, he argues that: (a) "high defence expenditure does not seem to have a negative correlation with a high economic growth"[3] and (b) "in the case of economies with much unemployment defence expenditure does not have the same impact" as in full employment economies: if anything, it could absorb the "slack" in the economy. All these arguments lead him to the conclusion that "marginal adjustment of defence expenditure within the overall consumption pattern of the economy... is a matter of good national economic management".

Having concluded this way, Subrahmanyam does admit that certain categories of scarce resources such as foreign exchange, highly skilled personnel, limited raw materials, etc, could become "rigid constraints" on our increased defence effort but then he does not believe that "marginal increase in the level of domestic resources [which will need] to be applied" will be a constraint. Overall, thus, he seems to come out in favour of increasing defence expenditure, particularly military research and development expenditure.

In support of his conclusions Subrahmanyam presents the following three arguments: First, India's defence expenditure as a proportion of GNP which presently stands at 3.7 per cent is less than the world "average" of 6 per cent. Some 24 countries spend more than India and, in fact, three countries surrounding India, i e, Iran, China and Pakistan spend, according to Subrahmanyam, more than the world "average".[4] In addition, the average growth rate of defence expenditure in India over the years 1950-70 was only 5.4 per cent per annum which was smaller than that of a cross-section of some 48 countries in the world. In global perspective, then, it seems to Subrahmanyam that India is not overspending on defence.

Second, Subrahmanyam presents a fiscal argument which has three strands: One, the share of defence spending in total (Central and states) expenditure has been declining since 1964-65. Two, the growth in defence spending since 1964-65 has been less than the growth in civil consumption expenditure (i e, non-development expenditure). And,

three, growth in defence expenditure in the past has not "constrained" our development expenditure. The last one is more a Subrahmanyam belief rather than an argument based on any substantial empirical facts presented by him.

Third, according to Subrahmanyam, there is no evidence of any correlation between defence expenditure as a percentage of GNP and the growth rate of national income in India. Factors like the monsoon or favourable agricultural seasons rather than defence spending seem to him to have governed our growth rate in the sixties.

CROSS-SECTION ARGUMENT

In evaluating the validity of all his arguments, the cross-section argument is perhaps the easiest to reject. The world "average" of six per cent quoted by Subrahmanyam is made up of the very heavy defence expenditures incurred by certain highly developed countries[5] of the world which are super military powers making every effort to stay that way. The fact that the United States spends close to eight or nine per cent of its GNP on defence or that the whole of Europe spends about seven per cent of its GNP could hardly be our "norms". These countries, as everyone knows, enjoy very high levels of prosperity and per capita incomes and can probably afford high defence spending ratios.[6]

India's defence spending should be guided, if at all, by countries similarly placed in terms of economic situation as well as defence situation. And should we do a comparison of this sort we could arrive at a very different conclusion from Subrahmanyam's.

Indian defence consumes about 3.7 per cent of India's GNP which when compared with the "average" of 2.1 per cent for Latin America as a whole or 2.2 per cent for Africa as a whole appears high. In addition, (Table 1) which gives the world defence-income profile also suggests that India is a country with one of the highest defence to GNP ratios among countries with per capita incomes of less than US $100. In fact, it has the sixth highest ratio after Laos, North Vietnam, Burma, Somalia and Guinea,

One can certainly argue that no two countries are alike in respect of the military threats faced by them. Nevertheless, it can safely be argued that defence spending must be a function of the perceived external threat to security; it is precisely this which justifies such high defence spending ratios for Laos and North Vietnam despite the poverty of their peoples. Of course, it is another matter that one does not know for sure how much of their defence spending was financed by the outside world.

It would also be correct to say it is the perceived rather than the actual threat which often determines a country's defence spending. Unfortunately, the latter is never measurable and the former can be greatly influenced by vested interests. For example it is noted above that Somalia spends a higher proportion of its GNP than India on defence — close to five per cent. As against it, Ethiopia — the country which is perceived as a threat by Somalia — spends only 2.5 per cent. Is this because the Somali government perceives an internal threat in addition to the external threat? But then, Nigeria even at the height of its civil war and internal security problems did not spend more than three per cent of its GNP on defence. Take another example: both Zambia and Rhodesia are set against each other on the frontline of the black-white

divide and yet the latter spent only 1.8 per cent of its GNP on defence while the former spent only 1.2 per cent in 1970. Sudan, on the one hand, with its serious internal security problem in the late sixties spent close to six per cent of its GNP on defence while none of the Latin American countries, despite their internal tensions, spent as high a proportion of GNP on defence. All this goes to suggest that defence spending can often reflect more than what can be considered the perceived threat to external security. This makes finding any two countries which are 'defence alikes' extremely difficult.

We can grant Subrahmanyam the expertise to tell us that our "hostile environment" is largely due to countries around India, particularly Pakistan and China. We should, therefore, examine what is happening to their defence spending. The latest year for which we have the comparative data is 1970 and the ratio of defence expenditure to GNP for that year was 3.7 per cent for Pakistan — which is no higher than India's. China's defence ratio, which is at best an approximation anyway, is certainly much higher — it is close to eight per cent — but then China, as we know, has been confronting many enemies, including at least one super military power, all across its wide borders.

If we use, on the other hand, some other indices of defence spending, India is certainly ahead of the other two countries. The average rate of growth in defence spending in India over the period 1961-71 was 16.5 per cent[7] per annum which was higher than that of China, practically all the European and North American countries and most of the Latin American countries. Even for the developing countries around the world, the average growth rate was only 12 per cent per annum.[8]

Then the average growth rate of the number of our armed forces personnel during the same period was five per cent per annum and this was higher than most countries of the developed as well as developing world. Against this, Pakistan's armed forces grew only at an "average" rate of 3.8 per cent during 1961-70, Iran's at 2.9 per cent and China's at 3.9 per cent.

To sum up our cross-section argument: The case for increased defence spending in India cannot and should not be made in terms of cross-section "norms". But if this is insisted on, comparison should be made between India and its economic and defence alikes rather than the world as a whole. And should we do this, no clear-cut case emerges for further expanding our defence expenditure. In fact, if anything, a case can be made on fiscal grounds against further expanding our defence expenditure and to this we turn our attention now.

FISCAL IMPACT OF DEFENCE EFFORT

Subrahmanyam believes that our growing defence expenditure in the past has not "constrained" our development effort. He presents some data which suggest that defence spending has been declining as a proportion of both non-development expenditure and total (Central and states) expenditure since 1964-65. In view of these data he pronounces judgment that "constraints on development expenditure do not arise from increased defence spending".[9]

Everybody would be happy to hear this, particularly since our economy has not been doing very well in terms of growth rates in recent years. But is it true?

Subrahmanyam seems to be playing a numbers game with us. By choosing 1964-65 as the base year when defence spending as a proportion of both non-development and total expenditures was almost at its peak — following the Sino-Indian war of 1962 — he could not have any difficulty in showing that defence spending relative to the other expenditure aggregates has declined since then. Let's see what has been happening since 1961-62 when we started stepping up our defence expenditure. Certain things have happened on the fiscal front which cannot be considered satisfactory from a development angle.

Defence is a Central government function which means that the immediate or most direct effects of raising defence spending are on the additional tax effort of the Central government, on marginal savings of the Central government out of additional taxation after meeting defence needs, on the level of development expenditure of the Central government and on the availability of resources to the Central government at the margin to finance development after meeting all non-development (defence as well as civilian) expenditures. The effect of higher defence spending could, of course, be more than marginal if the Central government so reorients all its expenditures, including its revenue transfers to the state governments, as to economise and make cuts in all its non-defence current as well as capital expenditures. In such a case state finances can also be affected in addition to the Central finances.

Assuming for the moment that (a) the formula determining states' shares in Central tax revenues remains unaffected by defence needs (and there is sufficient evidence to suggest that the Central revenue transfers to states have not been influenced by the defence effort), (b) debt service burden is always a 'given' and somewhat unactionable element in Central government expenditure at least in the short run, and (c) inter-government grants are also predetermined by specific (plan or non-plan) grant formulae, it would appear that the only 'actionable' fiscal parameters in a situation calling

Look how just Rs.10 a month becomes Rs.414...

in State Bank's Recurring Deposit Scheme

In 36 months, when you save Rs. 10 a month, you'd have just Rs. 360. But with State Bank's Recurring Deposit Scheme your savings amount to Rs. 414!

The scheme helps you to save regularly and, with compound interest, you watch your small savings grow into large amounts. It's a habit that pays.

You can start saving now! With just Rs. 5, or Rs. 10 or Rs. 20... upto Rs. 1,000 a month, for a period of 12, 24, 36, 48 or 60 months. At any of our 3,000 offices all over the country.

See our ready reckoner alongside. Visit your nearest State Bank office today. And save and earn.

for higher defence spending would be the growth rate of gross (tax and non-tax) revenues of the Central government, the allocation of additional revenues to defence, the relative share of development expenditure (which frequently is a residual after other 'essential' needs have been met) in total expenditure, and government savings from its own revenues to finance development expenditure.

It would be interesting now to see how these indicators have been performing since the early sixties. Table 2 presents the relevant fiscal data and is suggestive of the following conclusions: First, defence expenditure which absorbed close to two per cent of our GNP in 1961-62 now absorbs about 3.7 per cent of the same. Whereas it absorbed about 30 per cent of the Central government's (allocable)[10] expenditure in 1961-62 — and much less in earlier years — it now absorbs about 42 per cent of the same. The defence effort of the country has thus caused 'structural' shifts in the Central government spending pattern.

Defence and Tax Effort

Second, it appears that the defence needs of the country initially brought to light by the Sino-Indian war of 1962 led to a major tax effort by the Central government. As Table 2 indicates, it is *only* in the war years of 1962-63, 1963-64 (immediately after Sino-Indian war), 1965-66 and 1971-72 that the government was able to achieve an annual revenue growth rate of over 20 and even 25 per cent. And, surprisingly, whenever the war was over and the pressures of defence spending relaxed, the Central government revenue-to-GNP ratio declined. This ratio which was about five per cent in 1951-52 grew to about 5.5 per cent in 1959-60 and to 6.5 per cent in 1961-62. This suggests that when "development" was the aim of the nation, the Central government was able to raise the revenue ratio by 1.5 per cent in a whole decade. But then, when "defence" was called for, the government was able to achieve a similar percentage in a matter of two years — from 6.4 per cent in 1961-62 to 7.9 per cent in 1963-64. We seemed to have slackened in 1964-65 but raised the ratio by another 0.5 per cent in 1965-66. Then, in the mid-sixties, drought, industrial recession and the plan holiday dampened our development initiatives and gave the Central government an excuse to relax. The result was that its revenue ratio consistently declined from 8.5 per cent in 1965-66 to seven per cent in 1970-71. And then there was war and we raised our revenue ratio again to 7.7 per cent. What this suggests is that in the sixties we have needed wars to motivate us to undertake substantial revenue efforts — as if development was not a serious aim to make tax efforts for!

Defence and Marginal Savings

Generally even wars can be considered to have useful fiscal roles in the short as well as long runs. In the short run a war can generate some — though by way of trickle down effect — marginal savings from additional

A gathering of nations

India's ECGC plays host to international trade delegates

International experts paid India a handsome tribute when they gathered at ECGC's office to discuss strategies to evolve export credit systems for developing nations.

Delegates from seven nations participated in the field training programme sponsored by UNCTAD and the UN International Trade Centre and conducted at ECGC.

The selection of ECGC as a centre to impart practical training in Export Financing and Export Credit Insurance, speaks very highly of the degree of professional competence attained by India's National Export Credit Insurer.

revenue effort, while in the long run it can have a 'ratchet effect' on the country's revenue effort.[11]

In the Indian context, wars certainly do not seem to have had much ratchet effect because, as indicated above, our revenue effort slackened substantially after every war. What is interesting is that even in the short run there was no significant trickle down effect on government savings. A very large part of the increased revenue effort during the war years, and surprisingly even in later years, was always absorbed by defence. In 1962-63, over 70 per cent of the substantial revenue increases were handed over to defence and in 1963-64 the increase in defence expenditure exceeded the Central government's entire revenue increase. A similar story emerges for 1967-68 when the increase in defence expenditure was more than twice the increase in Central government revenues and for 1968-69 when defence absorbed over three-fourths of the increase in revenues. Even in most other years during the decade of the sixties, defence took away a quarter to a third of additional revenues generated. This would seem to suggest that the growth of defence expenditure in India has developed an in-built momentum of its own quite unrelated to the economic developments in the country or the automatic improvement in the Central government's revenue position. The degree of rigidity implicit in defence spending could easily pose the greatest threat to our fiscal efforts to develop the economy in the long run.

Defence and Development

Fourthly, and this is the most important consideration from our point of view, war times in India (contrary to Subrahmanyam's assertion) have been associated with periods of constrained development effort. The use of the word "associated" is deliberate here because we have no way of establishing the causal relationship between growing defence expenditure and limited development expenditure.

Since the early sixties several things have simultaneously been happening. On the one hand, the Central government's non-development expenditure has risen over time and this despite the government's attempt to curb civilian non-development expenditure to accommodate defence needs. The ratio of non-development expenditure-to-total expenditure which stood at about 50 per cent in the early sixties consistently rose to be close to 60 per cent in the early seventies. A major element in this growth has of course been the rapidly growing wage bill of the Central government. This has in part been caused by the rapidly growing armed forces and their wages. In part, it also reflects the civilian pay increases prompted by the defence-generated inflationary conditions since the early sixties. The wages bill of the Central government which was about 22 per cent of the total expenditure in the early sixties became close to 30 per cent in the early seventies. As a proposition of GNP the Central government wage bill grew from 1.6 per cent in 1961-62 to 2.1 per cent in 1970-71.

This rapid growth of non-development expenditure generally eroded the Central government's ability to finance higher development outlays during the sixties and resulted in its consistently allocating a smaller proportion of its total expenditure to development projects. Net capital formation of the Central government seems to have remained more or less static during the sixties (Table 2) and has, as a matter of fact, declined consistently as a percentage of GNP over the last decade. The same is true of the development expenditure of the Central government as well. Since 1965-66 the Central government's defence spending (as a percentage of GNP) has in fact exceeded the Centre's development spending (as a percentage of GNP) and the gap between the two (ratios) has been ever widening.

State Government Finances

Of course, in India the Central government is not the only or even the main agency incurring development outlays. The state governments are the main agents of development and they do receive substantial financial transfers to undertake development projects. Theoretically, therefore, a decline in the Central government's development expenditure could be consistent with an increase in development effort by the states. One must, therefore, look into the development effort of the Central and the state governments combined.

Table 3 tells us what the development efforts of both Central and state governments have been since 1961-62. Firstly, the Central and state governments have been allocating consistently smaller proportions of their monies to development. Development expenditure which was over 60 per cent of total expenditure in the early sixties has consistently declined to 55 per cent in the early seventies. Development expenditure as a proportion of GNP which should have been expected to rise, instead declined from about 10 per cent in the early sixties to less than nine per cent in the early seventies. Secondly, and this is most important, the Central and state governments not only slackened their development effort, they did not seem to have much motivation to save for development purposes. They consistently saved less during the sixties, their average savings propensity (defined as the ratio of revenues *minus* non-development expenditures to revenues) declined from more than 50 per cent in the early sixties to less than 40 per cent in the early seventies. At the same time these savings financed a smaller proportion of government development expenditures during the sixties.

Defence and Economic Growth

Lastly, Subrahmanyam tells us that high defence expenditure in the sixties did not have a negative effect on our growth rate. He came to this judgment through a correlation analysis which he admitted could yield a "spurious" correlation.

The fact is that there is a definite trade-off between defence and development which we must admit cannot be scientifically and reliably quantified. An in-depth study conducted at MIT on the effect of defence on India's development came to the conclusion that between 1950 and 1966-67 India's growing defence expenditure had "slowed down the average growth of the civilian economy by as much as 0.4 of one per cent a year — which is about one-eighth of its actual recorded growth rate".[12] This study further established that if India allows a "continued build-up" in its defence capability at its present rates, the ratio of its defence spending to its GDP could rise to 6.3 per cent in 1980, and this, *ceteris paribus*, would limit the annual growth rate of civilian GDP to only five per cent against a rate exceeding six per cent if our defence spending were "frozen" at the 1968 level. The study also warned that should India opt for the development of an "effective nuclear capability", a proposal which has also been vehemently made by some writers,[13] its annual growth rate in the seventies could be reduced to negative levels.

While Subrahmanyam might disagree with some of these calculations, he will certainly have to do a lot of empirical research before he can establish that the beneficial effects of our large defence programme have more than offset its adverse effects on our development.

To conclude, it appears that there has not been any intensification of our development effort since the early sixties; if anything, all fiscal indicators point towards a deterioration in our effort or our remaining standstill at the very best.

Heavy military expenditures certainly have serious economic costs and we have only indicated the major fiscal costs. In addition, we do know that heavy defence spending results in rapid inflation, scarcities, corruption, black-marketing, etc. An expansion in our defence spending during the sixties seems to have resulted in a whole decade of slackened development effort and this much-stretched period of developmental slack could lead to so much fundamental economic disequilibrium in our economy as to ruin the very social fabric and moral character of the people which often form the essential ingredients of any future development programme.

Any recommendation that we should further expand our military expenditure must, therefore, be viewed extremely critically in terms of its economic costs; certainly it must establish that it is *the* least-cost solution to our nationally accepted defence objective. I emphasise this because all government expenditures have a tendency to develop vested interests and military expenditures are no exception. In addition, in view of the extreme poverty of our people and the stagnant nature of our economy at present (as well as the inherent rigidities in defence spending pointed out above), it becomes doubly important that we compare and evaluate the economic costs of getting involved in yet another war *vis-a-vis* the costs of attempting to avoid a war. Unfortunately, we are likely to find a very strong lobby for the military and practically none for the poor who are most critically affected by this game; however, the long-term consequences of our decisions today would be extremely serious for our developmental efforts.

Notes

2 K Subrahmanyam, "Planning and Defence" in "The Crisis of Indian Planning: Economic Planning in the 1960s", Paul Streeten and Michael Lipton, (eds), Oxford University Press, 1968, London, pp 351-377.

3 Subrahmanyam also states that from cross-section data "one is almost tempted to derive a positive correlation between defence expenditure and a high growth rate", *Economic and Political Weekly*, p 1157.

4 This, by the way, is not true for Pakistan.

5 And they do very heavily bias the world "average". In 1970, for example, out of a total world military expenditure of 208 million dollars, developed countries accounted for about 90 per cent of the same. See "World Military Expenditures", United States Arms Control and Disarmament Agency, Washington DC, July 1972, Table 2.

6 The average per capita income of the developed world was over US $2,700 in 1970 while India's was less than US $100. See *ibid*, Table 2.

7 Subrahmanyam gives an annual figure of 5.4 per cent in constant prices for the period 1950-70 (p 1155 *Economic and Political Weekly*). His is clearly a lower figure because he takes 1950 as the base year for his calculations.

8 This and the comparative data given in the next paragraph are taken from "World Military Expenditures, 1971".

9 p 1156, *Economic and Political Weekly*.

10 Debt service burden is assumed to be a given parameter in the short run and hence not an allocable item of expenditure. The same is true of inter-government grants fixed under given transfer formulae.

11 This is the counterpart of the famous 'displacement effect' of public expenditures discovered by Peacock and Wiseman. See Alan T Peacock and Jack Wiseman, "The Growth of Public Expenditure in the United Kingdom", George Allen and Unwin, London, 1970.

Problems in Analysing Rural Class Structure

Joan P Mencher

It is important to understand in detail the socio-economic class structure in rural areas because there is still no satisfactory theory which can explain why various types of peasant associations have developed in certain places and not in others. This paper examines certain aspects of the rural class structure in the Chingleput district of Tamil Nadu. In the process, light is thrown on factors which blur class boundaries. This facilitates understanding of some of the reasons for the lack of sustained peasant organisation in Chingleput district as compared to other areas such as, for example, Tanjore.

Such information is also important for the light it sheds on the sources of internal pressure to implement government policies. Most of the talk of land reform during the past 25 years has been viewed as mere rhetoric by most villagers. Here and there we have got protests. But why here and not there? It is important to know what internal forces exist that may propel people to exert pressure for implementation of official policies.

IN this paper, I propose to examine certain aspects of the agrarian, socio-economic, class structure in Chingleput District, Tamil Nadu. I do not need to emphasise the importance of working out a careful approach in any study of the problem of class, for understanding the social structure and social change in any part of the world. A great deal has been written, in the literature on class, about how it might be defined. For the purpose of this paper, I consider an analysis of the social relations of production to be primary. I do, however, distinguish between existence of classes and class consciousness (Harris 1971). I hope to spell out some of the economic, social, and political ways in which the social division of labour — complex as it is — has been further obscured so as to impede the development of class consciousness.

One of the many reasons for trying to understand, in detail, the nature of the socio-economic class structure is that we still do not have a satisfactory theory which can explain why various types of peasant associations have developed in some places and not in others. Thus, in the context of complex hierarchical societies, it is important to understand why people in one area are involved in continual revolt, while those in another area are relatively quiescent. Eric Wolf (1969) has hypothesised:

> that it is middle peasants and poor but 'free' peasants, not constrained by any power domain, which constitute the pivotal groupings for peasant uprisings ... any factor which serves to increase the latitude granted by that tactical mobility reinforces their revolutionary potential. One of these factors is peripheral location with regard to the centre of State control. (292-3).

But this does not completely explain the Indian situation. If one looks at those parts of India where there have been strong movements (apart from tribal regions, such as Naxalbari, parts of Assam and NEFA, or the tribal belt in Andhra Pradesh), one finds that organised movements have occurred in areas where there is a strong polarisation between the landless and all others (among the latter, even the small 2-acre men, who identify with the landed). Thus, materials relating to the Indian village seem to indicate a pattern at variance with the pattern reported as holding in many other parts of the world where the middle peasants, squeezed from both sides, are said to be the major force behind the peasant organisation. Indeed, in village India, major areas where organisations of this type have developed are those with a large agricultural labour class. An additional variable in those areas has been the existence of considerable political activity by the Communist Party. But even with Communist Party activity, strong organisations have developed only where there was sharp polarisation. It is true, as Wolf points out, that many such movements have occurred in areas distant from the centre of political control, such as Kuttanad in Kerala, or Tanjore in Tamil Nadu. But, as we shall see, very little permanent peasant organising has taken root in Chingleput District which is only slightly closer to the centre of power than Tanjore.

I hope to show that, although 43 per cent of the male workers in the rural parts of Chingleput were recorded as agricultural labourers in 1971, a few of these in any given year may become share-croppers (on a 50/50 basis if they have bullocks; if not, on a 1-to-6 basis). Thus, competition for share-cropping has been one factor inhibiting unity among the landless. Similar competition for land, which can be share-cropped along with cultivation of their own plots, operates among the next two social classes also which I have designated as the poor and middle peasants. Though some of the juggling of tenancies is the result of attempts by the well-to-do and the temples to prepare for the eventuality of a permanent record of tenancy rights (a man who has been a tenant for only one year not being able to claim customary rights), large landowners are not totally unaware of the additional benefit to be derived from such juggling — namely, keeping the poor divided. Thus, one way of handling a potential organiser of the landless or of the small peasants has consistently been to threaten that he might not get any share-cropping land for the next season or for the next year.

I would suggest that in many parts of India, the manipulation of the small landed by the better-off has been a successful strategy for keeping the small landed from being more seriously involved in the formation of tenants' associations or from joining with the landless — such as where the landless are also occasionally given land as share-croppers. Anthropologists who have worked in India have spent much time on the analysis of caste and how it functions in the village context, but they have not spent nearly enough time on the ways in which caste has been used by people in the system, as well as by outside observers, to mask class differences. Thus, in social class analysis and in development of class consciousness, while it may be clear that well-to-do members of middle-ranking castes have sometimes given preference to their own caste mates when it comes to giving land for share-cropping, they have done thus also because it served to keep the poor from uniting. The analysis of caste can be overdone. One finds for example that, when land is not given for share-cropping (as in the case of the Kuttanad in Kerala), the landless of different

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

MAKUM TEA CO. (INDIA) LIMITED

Registered Office : **Margherita P.O., Dist. Dibrugarh, Assam.**

Announcement Regarding Issue of 1,70,000 Equity Shares of Rs. 10 each for Cash at par.

Persons interested in full details may obtain copies of the Prospectus dated 27th June, 1974 and Application Forms from the Underwriters, Brokers and Bankers to the Issue mentioned below and also from the main branches or offices of the Bankers to the Issue mentioned opposite their respective names.

The Subscription List for the Shares Issued will open at the commencement of Banking Hours on 9th September 1974 and will close at the close of Banking Hours on 19th September, 1974 or earlier at the discretion of the Board of Directors of the Company but not before the close of Banking Hours on 12th September, 1974.

ACTIVITIES OF THE COMPANY

The company was incorporated on 17th December, 1971 in the State of Assam as a public limited company under the Companies Act, 1956 with the main objects of acquiring the assets, liabilities and undertaking in India of The Makum (Assam) Tea Company Limited of U. K. ('Makum') and to grow, manufacture, buy, sell and deal in tea and to carry on the business of planters in all its branches. Pursuant to an Agreement dated 28th December, 1972 made between the Company and Makum, the Company acquired with effect from 1st January 1973 the whole of the assets, liabilities and undertaking in India of Makum as a going concern and the Company is carrying on its business in tea as aforesaid. The Company's tea estates, namely, Margherita Tea Estate, Dehing Tea Estate and Dirok Tea Estate are situated in the District of Dibrugarh, Upper Assam.

APPLICATION TO THE STOCK EXCHANGE

Application has since been made to the Calcutta Stock Exchange for permission to deal in and for an official quotation of the Equity Shares of the Company.

castes somehow manage to get together in support of strikes. Indeed, in such a context, even religious lines may be crossed, with Christian and Hindu joining together.

The present paper is part of a study dealing with the relationship between agrarian relations and social structure in Tamil Nadu. It is based on three types of data: (1) computer analysis of five villages studied intensively in 1966-67, (2) some of the materials from a computer analysis of materials for 8 villages studied between 1970 and 1971 in this region (3 villages are the same as in the 1967 study), and (3) detailed analysis of material from three of the villages where the author has personally worked. The villages studied are all in the four southern-most taluks of the District. The conclusions are based on data about: actual household ownership of land (within the village and outside of the village), effects of unwritten or masked tenancy, overall household resources, etc. This paper also shows what kind of insight can be gained from the intensive work of the cultural anthropologist, as opposed to the exclusive use of large-scale surveys (though census and survey materials are also mentioned here).

Much material on class in India is based on census and survey data. Because of the nature of these data, such studies tend to describe classes in simply statistical, rather than sociological, terms. (For the few pieces of work that differ, see: Beteille, 1970, 1972a, 1972 b), Indian School of Social Sciences 1973, and Djurfeldt and Linberg 1973.) Beteille notes that statistical conventions often do not reflect the realities of the situation, so that five acres of, say, double-crop paddy land (especially if records list it as 'dry land') are more productive than even 15 acres of unirrigated land in a dry region (1972).

In his paper on West Bengal (1971), Beteille points to some of the ways in which local people divide up the universe. He mentions a number of terms used by people to refer to classifications of people, such as *jotedar* 'landlord'. In the Tamil instance, some of the local terms, such as *coolie* (day labourer), *al-vara-karan* (a man who works as a permanent servant, being paid 1/7th of the harvest), *al-karan* (worker), or *varakaran* (tenant), may be of some use. However, apart from such terms, there is little in the language to distinguish between a *pattadar* (anyone who holds a *patta* or title to land) of half an acre and one with 50 acres. True, words like *periya* (big) might be used, but there is no clear-cut categorisation: only for the few villages where *zamindars* still persist, that term is meaningful. Thus, for the purpose of understanding classes in rural Chingleput, just "the terms used by villagers to define a significant part of their social universe, to identify themselves and others, and to act in a variety of contexts on the basis of these identities" (p 138) are not enough. Relations in the village are very different, depending on whether one is involved with a small, middle, or large landowner. Furthermore, there is no commonly-used term for 'poor' or 'lower class', though unquestionably such a class exists. For the purpose of this presentation. I shall therefore look not at how people define things for themselves, but how the data actually look on the ground.

Before describing the present class components in the agrarian field in Chingleput, one or two other facts of the organisation of productive relations in this region should be noted. We can not, in this paper, go into the history of the region; but it is clear that by the early part of the 20th century, the system of land tenure was considerably different from village to village. The land tenure situation has become even more complicated in recent times, with the introduction of tube-well irrigation. The various types of land arrangements currently in use in the area include the following: (1) Owner-cultivation (with or without *coolies*). (2) Owner-cultivation with the help of one or more permanent male servants paid a regular monthly salary. (3) Owner-cultivation with the help of one or two men on *al-varam* (who received 1/7 of the harvest). (4) Regular *varam* (50/50 share-cropping) — sometimes called *per-padivaram* (most common on land irrigated by an irrigation channel, river, or tank, or on rain-fed land). (5) Share-cropping on 1/3-2/3 or 40-60 basis where the share-cropper gets the smaller amount and the landowner the larger (1/3-2/3 is most common nowadays on land watered by a pump-set, the extra 1/3 being officially said to go to the pump-set; the 40-60 was common before also, on some especially well-endowed irrigated land, or where the landowner could get away with it). (6) *Kuttagai*, under which a tenant pays the landowner a fixed amount, regardless of the yield; this works out better for the tenant when the yield is good, but not so well when it is bad: the practice is quite common in Tanjore, but relatively rare in Chingleput; some of the temple land, and a few other small pieces of land in Pacciyur (one of our sample villages), is given on *kuttagai;* only 2 out of the 8 villages in the 1970-71 sample had any land given on *kuttagai,* however. (7) *Otti,* under which the landowner obtains cash from a tenant in return for letting him cultivate the land; when he pays back the mortgage, the landowner recovers his land; this is one way in which a middle class man, or rarely a poor man who has saved up some money, can get land away from the rich landowners who might need money in a hurry: this form is not common, and in any given year, in some eight villages, one might find only 6 or 7 cases of *otti*, though, over a period of time, at least in some communities, we find considerable transfer of land *via* these mortgages.

There is marked variation in the amount and type of tenure from village to village. In part, this relates to the caste of the dominant landlords. (In a survey of 94 villages in 1967, 48 per cent of the villages had one caste owning 75 per cent of the holdings of over 4 acres, and an additional 24 per cent of the villages had only two castes owning 75 per cent or more of holdings of 4 acres or more.) On the whole, we found Brahmans preferring *per-padivaram*, or *al-varam*, whereas ordinary *varam* is uncommon among Reddiars though they do go in for *al-varam* and *otti*. Among Mudaliars, there is preference for *al-varam* over ordinary *varam* where possible. This is partly due to the preference of the Reddiars and the Mudaliars for active supervision of their own lands.

Socio-Economic Classes in Chingleput

First of all, I shall present a very rough socio-economic classification of the rural population of Chingleput District. At the same time, I shall discuss and analyse some of the factors which tend to blur the picture and make exceedingly difficult the organisation of people and household on class lines. Roughly speaking, the population which derives its main subsistence from land, in one way or another, may be classified into six groups.

(1) *The Landless*: This group is relatively easy to categorise. At present in this category I include only those who *primarily* derive their livelihood from working in agriculture, either as day labourers, as attached permanent labourers for particular landlords, or as *al-vara-karan* (i e, men who work as a

kind of share-cropper, receiving one portion for every six retained by the landowner). Occasionally, one even finds a landless family who happens to own a pair of bullocks, working as share-croppers.[2] According to the provisional tables of the 1971 census, 43 per cent of working males in the rural area are classified as agricultural labourers. Thus, this group is significant in size.

Though it is true that the vast majority of the landless work as day labourers year after year, there is enough movement between the category of landless and *al-varam* (sharecropper) to keep the landless somewhat divided. If tenancy or even *al-varam* positions are scarce, then this breeds competition, which keeps people on the look-out for their own self-interest rather than their collective interest. Furthermore, the category of landless is cross-cut by caste. Though caste, and caste loyalties, have certainly been overplayed in anthropological literature, caste does provide a mechanism which can be manipulated to keep those with common economic needs divided. In five villages surveyed in 1967, of the two largest caste groups, 56 per cent of all the households of Vanniyars (Naicker, Gounder group) owned less than one acre of land; of the Paraiyans (untouchables) 85 per cent owned less than one acre of land. This included 343 Vanniyar households and 209 Paraiyan households. In our 1970-71 study, 243 of the 446 Vanniyars owned one acre or less of land, whereas 459 of the 495 Paraiyans owned one acre or less land. Furthermore, no Paraiyan owned over 10 acres of land, whereas 26 Vanniyar families did. The landless in this area have occasionally joined together for strikes (Mencher, 1971), but on the whole the well-to-do Vanniyars have managed to keep the Vanniyar poor politically isolated and segregated from the untouchable poor. Populist appeals have helped to keep the landless group among the Vanniyars occupied and distracted.

(2) *Poor Peasants*: The second group consists of those who own small pieces of land ,between 1 and 2.5 acres),[3] small enough to require that on occasion some of the members of a household do day-labour. The extent to which this group is required to 'go for coolie' is related to a large number of variables, among them: (1) the size of the household, especially the number of adults over the age of 16 or 17; (2) the type of land owned (whether it is dry or wet land, and if wet the number of crops that can be cultivated on it per year); (3) the ability of the household to add to its operational holding by leasing in land, on either 50/50 or one of the other forms of *varam* — which in turn is related to other variables, such as (a) the number and health of bullocks, (b) the number of well-to-do in the village or outside who give land for rent, as opposed to cultivating their land under their own supervision or under the supervision of a hired manager (we find in general more people giving land for rent to tenants if the land is irrigated by a natural source, e g. a river, or tank, than if it is irrigated by a tube-well), (c) the kind of relationship existing between the household in question (especially the head of the house) and the well-to-do and the local temple authorities. (Often the temple is a significant renter of land.) (4) Other variables that affect the status of households in this category include whether anyone in the house or from the household (e g, a son or brother) has any other source of income (e g. peon, school-teacher, cleaner on a bus, seller of milk, mason, etc). (5) Another factor which influences whether or not members of a household in this category have to go out for day labour is seasonal rainfall. In a good year, many families with two acres have enough work tending their own land and may not need outside employment, whereas in a bad year, especially when natural irrigation sources fail, they might have to depend on day labour to provide for their food in the lean months. (Only a few people owning less than 2.5 acres own tube-well water or have it available for purchase.)

This category could be called 'poor peasant', in contradiction to category one, for which the term 'peasant' is no more relevant than the term 'rural proletariat'. Category two differs somewhat from category one in caste composition. There are proportionally fewer untouchables in this category than in category one, though there still are some untouchable families in most villages who have over one acre of land. Indeed, in some villages, there are several untouchable families in this category. Furthermore, there usually are households of more than one of the other castes who could be considered poor peasants. It must be pointed out in this connection that, the exigencies of rice cultivation require even owners of tiny plots of land to hire people at last for help in transplanting and harvesting. Thus, even the smallest owners are employers. This is true regardless of caste, though among the Naickers, exchange of labour seems to be preferred to wage labour. In this connection, it has been pointed out that rice cultivation thus appears to require either a vast army of landless or semi-landless labourers or else organisation of farming on a co-operative basis. In the Indian context, the former has always dominated, though there is no intrinsic reason why co-operative farming could not work in the future.

(3) *Middle Peasants*: The third category consists of those who are clearly self-sufficient, and able to sustain themselves without ever doing coolie-work. For some families, especially if they are large, two-and-a-half acres is is not enough. For others, anything over three acres, especially if some of it is double-cropped paddy land, is enough to permit a modest degree of security. As in the other two categories, there are other factors operative here too, such as whether or not a family adds to its holding by renting, whether or not any of the family members have any non-agricultural income, and the extent to which the family aspires to a semblance of urban middle-class life. Thus,two-and-a-half acres of double crop paddy land would adequately feed a family of two adults and three or four children (even in a bad year), but would not be sufficient for college expenses (without a loan) or for costly marriages especially in communities that give dowry. It is clear, however, that in general families in category 3, and even many in category 2, do not see a commonality of interest with the landless — not even with their own landless relatives. Households with over 2.5 acres of land are employers of labour, and rarely go out as manual labourers themselves. In wage disputes with agricultural labourers, they tend to side with the rich farmers and landlords rather than with the landless. (This is generally valid, though I know personally a few notable exceptions, some of whom own 15-odd acres of land. But those individuals who are exceptions clearly see themselves as unusual. Some are people who hope to become political leaders, and do not have or expect the support of the wealthy. Thus, they are dependent on the landless for votes.)

(4) *Rich Farmers*: The real break-off point between the third group and the fourth is about 7.5 acres, at least in the paddy-producing parts of Chingleput. I would like to classify those having between about 7.5 and 15 as rich farmers. It is clear that people with 7 or more acres of land are not only self-sufficient, they are also able to store surplus for a bad year, and still have enough grain to sell to ob-

tain cash for the purchase of consumer goods. (Most have a transistor set or a regular radio, and if possible electricity.) It is in this category, that one finds many landowners with pump-sets (at least where it seems feasible for them to sink a tube-well for their dryland). Indeed, as I have shown in another paper (1974), it is especially the landowners in this and in the higher categories who have benefited most from the expansion of irrigation under the new agricultural strategy of the 1960s.

For Kerala, a study conducted by the Indian School of Social Sciences (1973) has classified all those persons or families who do not physically participate in the major agricultural operations as 'landlords'. They were further divided into the categories, 'feudal landlord' and 'capitalist landlord', on the basis of the source of their income; i e, the feudal landlords are those who lease out land and who derive at least 50 per cent of their total agricultural income from rent. Thus, for feudal landlords, "income from rent is greater than income from wage exploitation". The study distinguishes the capitalist landlord from the rich farmer on the basis of whether the head of the family participates, physically or manually, in the major cultivation activities — instead of merely supervising. On this basis, we find that our land categories become quite mixed, since even some people in the 7.5 to 15 acres category could be classified as either feudal or capitalist landlords. This is especially true of higher-caste *pattadars*, who rarely work in the fields, and it is invariably true when it comes to Brahmans. Even among the so-called agriculturalist castes such as Reddiars and Mudaliars, there are households, with as little as 4 acres, without any other source of income, and of which the head will not soil himself with manual labour. This is particularly true among families who at one time owned a lot of land, but have now come down in life though they are still concerned about their prestige.

(5) *Rich Farmers, Capitalist Farmers, and Traditional Landlords*: The fifth category consists of households owning between 15 acres and approximately 30 acres of land. In this category there are three types of agriculturalists — though the lines of distinction are not always as sharp as theory would have it. There are some rich farmers who, apart from giving small parcels of land to sharecroppers, cultivate most of the land themselves with the help of coolies, and actually go into the fields and do some of their manual work — especially ploughing and levelling. On the other hand, some of these men are clearly capitalist farmers. They see agriculture as a way of earning a living and as a source of investment. There is considerable concern about the maximisation of profits, and a resentment about the 'continual complaining' by the coolies about their wages. The pure capitalist farmers (who do not do physical labour themselves), and the rich farmers with over 15 acres of land, tend to view agrarian relations in very similar ways. For the most part, their decisions about agricultural strategy are strongly affected by their perception of a variety of physical factors (rain, water, land fertility, etc), and economic and factors (wages *vs* prices for different commodities, expectations of change in what is available, etc). One also finds in this category, as in category four above, traditional landlords of the old school. I hesitate to call them 'feudal', because this is an area that has been subjected to capitalist penetration for a long period. Furthermore, not all of the landlords who fit into this category have necessarily owned land for a long time. Mostly this category consists of landowners who give their land on various kinds of tenancy to labourers who look after their land for them. In some cases they have permanent tenants. This is especially true of the absentee landowners, or of those landowners who are elderly, or of households with no males. If the landowners are resident in the village and are physically fit, they tend (this is true at least for the past 15 years) to change tenants frequently, so that no tenant will be able to have any claim to the land if and when a record of rights is drawn up by the government. And this appears to be what has happened to the vast majority of the people in the villages studied by our project. Actually, the amount of land owned by landowners in very distant places is quite small, and need not be considered here. (One does find, especially on or near the Madras-Madurai main road, large plots of land bought up by people from Madras City, especially people in the film industry, which are given out to tenants. This is usually considered a safe way to invest money, and also a way to reduce one's tax liability.)

(6) *Indeterminate Class of Large Land-Holders*: There are also a few households in the over-30-acre category. In a survey of 93 villages in four Community Development Blocks, I found considerable difference in caste for this category, with 4 per cent of the untouchable households owning over 30 acres, 2.3 per cent of the Vanniyars (the large caste Hindu labouring-class community), and 35 per cent, 35 per cent, and 22 per cent, respectively, among the Brahmans, Reddiars, and Mudaliars.[4] If anything, I suspect that the figures for the latter three communities may be understatements, since we only considered land owned in one village, and most of the well-to-do high-caste people own land in more than one village. It would be hard to decide how to classify these landowners, and I frankly question whether it would even be useful to bother to decide if they are 'capitalist farmers' or 'feudal landlords'. Incidentally, this survey was done when the land ceiling was 30 acres. I suspect that, by now, most of these people have concealed their holdings and appear on paper as holding only 15 standard acres, or whatever their particular household is entitled to (see footnote 6). When we tried to collect detailed data on landholdings on a house-to-house basis in 1967, and again in 1970-71, it was remarkably difficult to obtain accurate figures; indeed, we were struck by just how easy it is to conceal landholdings.

Looking at the agrarian situation in this part of Tamil Nadu, then, it is clear that there are striking inequalities in the distribution of wealth. Taking the rural population of the district, as noted above, the provisional tables of the 1971 census shows that 43 per cent of all working males are agricultural labourers (though a few might own a few cents of land, the definition of 'agricultural labourer' meaning those who earn their primary livelihood from such labour). In addition (p 143) 32 per cent of the working male population are listed as 'cultivators' and another 25 per cent as 'other'.[5] Of the 32 per cent who are classified as cultivators, we have reason to believe on the basis of our project data that, by far the vast majority, fit into categories 2 and 3 above. Those owning more than 7.5 acres, even of dry land, are quite rare, though together they tend to control a considerable proportion of the agricultural land. In a survey of five villages in 1967, I found that 6 per cent of the households controlled 48 per cent of the land, and the 1970-71 data show a similar trend. Furthermore, a considerable number of the better-off agricultural households own land in other neighbouring villages. In addition, if we look at the better-off households in the village, we find other useful information. In a significant number of these households, along with income from the land, we also find more members of the family who are employed outside or have additional sources of income which add to the households resource base and serve to raise them further in the socio-economic sphere.

TABLE 1: DISTRIBUTION OF LAND OWNERSHIP FOR FIVE VILLAGES SURVEYED IN 1967

Land Category (acres)	Number of Households	Total Land (acres)
Under 1	782	138.79
1-3	250	445.96
3-6	157	685.71
6-10	78	622.91
10-15	38	472.76
15-25	33	603.23
25-40	9	268.15
40+	5	273.13

ANALYSIS

The question then remains: What are the contradictions within the present agrarian system, and to what extent do outside economic and political forces affect it? It seems to be a clear system of economic inequality, but what are its weak spots? It is clear that the poor do not like being poor, but then why has there been so little organisation among them? There are a number of reasons. First of all, it is not true that there has not been any agitation at all. As I have shown elsewhere (1971), in one sub-region in Kanchipuram taluk, a successful strike for higher wages occurred just prior to the panchayat elections in August 1970, and less than a year before the national and state elections. But the organising that culminated in this strike had become non-existent when we worked in the region in September and October 1970. In other words once the aims were secured, the organisation broke up.

In describing each of the social classes, I have tried to show how the moving from one category to another has also served to confuse the picture. This is especially true when movement between categories, especially between 1 and 2 or 2 and 3, is temporary, and there is competition among people to get share-cropping agreements for a given year. Yet, the fact remains that, everyone in the village knows who is rich and who is poor. While there might be confusion between categories 2 and 3, for example, no one is uncertain as to who belongs in the upper categories (4, 5 or 6), though the exact amount of land owned is often hidden. To some extent, caste has been exploited to keep the poor divided; but that is not the whole story. Perhaps one of the additional factors which has been successful in keeping the poor from uniting has been the rhetoric, associating the DMK party as being for the common man; this may have served to channel political energy away from class-based concerns.

In addition, there has been a fair amount of official propaganda which gave the impression of the State helping the poor. First, a land law was passed restricting land ownership to 30 standard acres.[6] (This in itself is a bit of a misnomer, because most of the tube-well irrigated land comes in the category of dry land, hence an acre is much less than a standard acre. The same is true of a lot of wet land which is watered by sources which are not 100 per cent reliable). Later, this was limited to 15 standard acres. But, not surprisingly, very few households were found to have land in excess of the ceiling.

What are the problems associated with classifying groups purely on the basis of land holdings? It is clear that if one tries to classify households into social classes simply on the basis of large-scale surveys, there are many difficulties that remain simply unsolved. Indeed, much of the dynamics which one can see on the ground is hard to capture even in running house-to-house detailed censuses, which we did in our project in 1970-71, and which I had also done earlier. To begin with, we found that it was exceedingly difficult to get accurate figures on the larger landowners, especially where the household itself controls much more than the ceiling (even if no single person has too much land listed in his own name). There were a variety of reasons for this, but the main one was the fear of changes in land legislation that might require greater covering up. We did manage to get fairly accurate statistics for some of these villages, but it was exceedingly difficult to do. Secondly, obtaining data on tenancy was even more difficult. People were very much aware that at some point the government would draw up a record of rights, listing specific tenants as being attached to particular pieces of land. For this reason, I found that, from the late 1950s on, most farmers who let their land out to tenants had made it a practice to shift around the tenants as much as was feasible — sometimes retaining the same man for two or three years, sometimes letting him go after one year, sometimes shifting him to a different plot of land owned by the same landlord. Yet, even my own study does not provide me with any kind of statistical information on the frequency of this. There are two reasons for this lack. The first is that I had not realised just how prevalent it was until I started to look at some of the intensive interview materials from two of the villages. Secondly, it is hard to obtain tenancy histories from every household. However, there are enough data to suggest that this shifting of tenants is quite common, especially for resident landlords. Most of the tenancies are unwritten. Many are masked, especially when the tenant is a poor relative who can be controlled in a variety of ways, or is in debt to the landowner. Thus some landlords, when asked about tenants, denied having any. And some of the tenants were hesitant to mention who they did *varam* for. They were afraid that might get into trouble with their landlord, and might not be given land on *varam* the following year. This was particularly notice-

TABLE 2: DISTRIBUTION OF LAND OWNERSHIP FOR EIGHT VILLAGES SURVEYED IN 1970-71

Land Category (acres)	Number of Households	Percentage	Cumulative Percentage
No land or less [illegible] 10 cents	813	49.51	49.51
0.1-1.0	227	13.82	63.34
1.1-2.5	217	13.22	76.55
2.55-5	191	11.63	88.19
5.1-7.50	72	4.38	92.57
7.50-10.0	45	2.74	95.32
10.1-15.0	33	2.01	97.32
15.1-30.0	39	2.38	99.70
30+	5	0.30	100.00

Note: This distribution is based on reported land holdings and not actual land holdings in village. Thus, the number of households in the last two categories is actually slightly higher. Still, the general picture is quite correct.

able when people were interviewed in situations where their answers could be heard by anyone else (a difficult situation to avoid in crowded poor neighbourhoods).

Labour and Tenant Organisations

I have dealt with landless labour organisations in detail in another paper (1971), and cannot discuss them here in detail. It is clear, however, that a number of factors have operated to keep them from developing as consistently in Chingleput as in the eastern part of the old Delta of Tanjore, reported on by Beteille. One factor has been the exploitation of caste by the castes; a second has been the competition developed among the landless for well-to-do of a variety of low-ranking the benefits handed out by the landed. Thus, even though only a fraction of the landless in any one year might be doing *al-varam* or *varam*, the possibility of such employment keeps them at competing with one another. Further, as Beteille noted for the parts of Tanjore where labour movements are less prevalent,

> When, on the other hand, we consider large, medium, and small landowners, we find the differences between them to be fewer and less clear ... the lines we draw between them are found to be subjective and to that extent arbitrary less ... minor differences in the size of holding may be mutigated by a variety of other factors such as family size. (pp 136-7)

It is striking that in the two southern peasant agricultural regions (as opposed to tribal areas where other factors intrude in the picture), those most successful in organisation of landless labourers have been the two regions (the eastern part of the old Delta in Thanjavur, and Kuttanad in Kerala) where there appears to be the sharpest cleavage between landless labourers and tenants or small peasants. In the Indian context, the small or middle peasants have not been the ones to organise or lead revolts of any kind. This is sharply opposed to the situation described by Wolf, (see above).

In the south Indian peasant context, it has been the landless labourers, unconstrained by possible ties to the land, who have been the main agitators or strikers. True, there is a correlation between political party activity (especially CPM activity) and the organisation of active *kisan sabhas* (agriculturalist societies). Thus Beteille notes that the class conflict reported on for the eastern part of the old Delta of Tanjore has had its ups and downs, and that this is closely correlated with the "political fortunes of the Communist Party in the state as a whole" (1949). This has not been a problem in Kuttanad where the Communist Party and later the CPM has had a solid following among the landless since the 1940s, though they have clearly been more active in augmenting strikes when the government was headed by the CPM, or even their rival CPI. It is striking that, in Chingleput District, the party which has claimed the allegiance of the landless has been the DMK. The DMK have organised and helped the landless more when they were worried about losing elections and have been quite negligent of the poor in areas where they have been strong. Being a party that is ridden by class interests, but which derives considerable support for their populist platform from the poor, the landless, or the small farmers, the DMK have moved to some extent against traditional landowners, especially former *zamindars*, but not against capitalist landlords or rich farmers, some of whom help the party financially.

It is certainly clear that caste has been utilised to keep the poor divided, but that alone is not enough. The blurring of class lines among the lower categories has also been significant. In Kuttanad, it is true that there has been a long history of politicisation, but it is also true that the landowners, from the 1 to 2 acre owner up, have been opposed to the agricultural labour unions. Furthermore, the agricultural labourers are rarely made tenants, since tenancy is too dangerous in the context of the land legislation in Kerala. In this area, while it is true that the bulk of labourers are untouchables, one also finds caste-Hindu landless labourers joining in with the untouchables for the purpose of protecting themselves from exploitation. The blurring of class lines, and the lack of adequate political organisation, is the main reason for this not happening in Chingleput.

In Tamil Nadu, the land ceiling has been reduced, and the government has been in the process of creating what is called a record of rights for tenants in each district. Yet, when one of the student assistants from our project rechecked in a number of villages in September 1972, he found that none of the villages was aware of any change in the land ceiling, nor was any one aware of anything going on relating to a record of rights. In discussing tenancy reform, and whether there is any hope for it becoming anything meaningful, the Jacobys point out :

> Upto now a neglected aspect of the landlord-tenant relationship is the psychological readiness of the tenants to submit to the landlord's will...this kind of reform ... can only be successfully implemented if strong, independent peasant organisations encourage the tenants to demand collectively that which they are too weak to claim individually. The extent to which governments encourage active tenants' organisations, therefore, is major proof of their sincerity with regard to the implementation of tenancy reforms. The publicity given to the content and ultimate objective of the tenancy reform is equally important proof of this since only widespread information can prevent misinterpretation and circumvention. (pp 263-4).

It is clear in the case of Tamil Nadu, that there has only been official discouragement of tenant organisations (they barely exist), and that it is only in government offices or from people directly involved in doing a record of rights in a particular region that one hears about tenancy reform. It is all very hush-hush otherwise. On the whole, one gets the feeling that the government is much afraid of tenants learning about it, since it might lead some of them to unite against the owners.

If the tenants were to unite, it is anyhow doubtful that it would benefit the landless or the small tenants much, because in this area there are too many well-to-do tenants. This is especially true of temple lands, which tend to be given to a number of small peasants and then a few rich farmers or capitalist farmers. (In one village we studied, we knew of one man who cultivated 20 acres of his own land, another 15 for his father-in-law who lived in Madras City, and rented 30 acres from the temple. This 70-acre holding yielded him considerable profit, and enabled him and his family to have quite a high standard of living which included trips to North India by car.) I suspect that, if any kind of tenant organisation were formed in this region, it would end up being dominated by these rich tenants. Even more important, the time for such an organisation is now past. It might have done good before the landlords started to move tenants around so much. But now it would be very easy for most landlords to switch over to 'self-cultivation' (i e, cultivation with permanent or casual labourers).

Conclusion

It is clearly important to learn, in detail, about the workings of social class in each sub-region. In this case, my attempt to establish a classification led to the recognition of factors involving the blurring of class boundaries, which on the one hand represented a methodological difficulty, but on the other led to an understanding of some of the reasons for the lack of a sustained peasant organisation in this area as compared to other such as those described by Beteille in Tanjore. Similar studies of other areas will be needed to determine the general validity of this point.

Such information is important, particularly for the light it sheds on the sources of internal pressure to implement official government policies. It is clear that most of the talk about land reform during the past 25 years, and especially since the 1971 elections, has been viewed as mere rhetoric by most villagers — at least, by those who know about it. Here and there we get protests. Why here and not there? Why has there been more success with the development of labour and tenant organisations in some places than in others? Since many government agencies and many policy-makers as well are concerned with mainly lip-service and votes, it is important to know what internal forces exist that may propel people to exert pressure for implementation. Detailed analyses of social and economic relations on the ground may help to provide some of the important clues.

Notes

[This paper is based on research in Chingleput District of Tamil Nadu at three points of time, 1963, 1966-67, and 1970-71. The research in 1963 was supported by a fellowship from the National Science Foundation, in 1966-67, by a NIMH grant to Columbia University, and in 1970-71 by a NSF grant for a joint Columbia University and Delhi School of Planning and Architecture research project. The views expressed here are solely those of the author.]

1 The other traditional form of land tenure is *zamindari*. It is not discussed here since it only occurred in a few villages in the region under consideration. Furthermore, it is pretty much on the way out now though a few local *zamindars* have managed to keep bringing cases to the Supreme Court in order to postpone the inevitable. Actually, most of the former *zamindars* have not been seriously affected by land reform since they were quick to put land in the names of relatives far and wide, as well as the names of former tenants and servants who are in heavy debt to them.

2 Occasionally a landless family might happen to own a pair of bullocks and a plough. Such a family will command a higher wage when its male members go for ploughing, since they are providing the animals as well as labour. In addition, such a family has a greater chance of obtaining land as on *al-varam* tenant than a family without bullocks.

3 It should be noted that the amounts of land given for this or any other succeeding class are only approximate. Obviously one cannot equate 1 acre of triple-cropped paddy land with 1 acre of dry land used only for groundnuts once a year. For the purpose of the present discussion, I consider the holdings to be about average — neither all dry lands, nor much of triple-cropped land or even double-cropped land.

4 There are usually two to four community development blocks in each taluk. We selected every fourth village for our survey. We actually sent students to 96 villages, but were only able to obtain the land/caste information for 93 villages, since three village accountants were unavailable during the period of the study.

5 It should be noted that 'other' includes a variety of occupations such as: working in a rice mill, making rice cakes for sale, working as an assistant on a bus, commuting to the nearby town, etc. These groups are not discussed in this paper. However, the percentage in this grouping would be lower if we only looked at the four southern taluks which are further from Madras City. One finds in the tract between Chingleput town and Madras that many people commute to Madras City on the electric train, and would be listed as 'other' in the census.

6 The whole question of land ceilings in Chingleput, what they mean, and how people get around them is discussed in detail in the book I am now working on. A brief paper, dealing with this, will also be completed for publication shortly. The original ceiling was 30 standard acres. This was reduced to 15 standard acres in 1972. A standard acre is defined in such a way that it is possible to own up to 60 actual acres and still be within the 15 acre ceiling, even if the household only consists of 5 people.

ANNOUNCEMENT REGARDING OFFER FOR THE SALE OF 10,00,000 ORDINARY SHARES OF RS. 10/- EACH (fully paid-up) AT PAR ●

Persons interested in full details may obtain copies of the Offer for Sale and application forms from brokers and bankers mentioned below

THE APPLICATION LIST WILL OPEN AT COMMENCEMENT OF BANKING HOURS ON WEDNESDAY, 4TH SEPTEMBER, 1974 AND CLOSE AT THE CLOSE OF BANKING HOURS ON SATURDAY, 21ST SEPTEMBER, 1974 OR EARLIER AT THE DISCRETION OF THE OFFERERS, BUT NOT BEFORE THE CLOSE OF BANKING HOURS ON FRIDAY 6TH SEPTEMBER,1974.

I.T.C. LIMITED

(INCORPORATED IN INDIA WITH LIMITED LIABILITY ON 24TH AUGUST, 1910 UNDER THE INDIAN COMPANIES ACT, 1882)

Registered Office : Virginia House, 37 Chowringhee, Calcutta-700016.

EXISTING AND PROPOSED ACTIVITIES

The Company was incorporated in India on 24th August, 1910 under the name of The Imperial Tobacco Company of India Limited and has since been carrying on business. The Company was converted into a Public Limited Company in 1954. In the same year the Company shares were listed on the Calcutta Stock Exchange and 10,00,000 Ordinary Shares were acquired by the Indian public. In January, 1970 a further issue of 37,90,000 Ordinary Shares was made bringing Indian public participation to about 25% of the equity capital of the Company.

The Company changed its name in May, 1970 to India Tobacco Company Limited and again in March, 1974 to I.T.C. Limited.

The main business of the Company is the manufacture and sale of cigarettes and smoking tobaccos. The Company is also engaged in the manufacture and sale of printed and packaging materials.

The Company has recently diversified its activities into Marine Products and Hotels. These activities will assist the twin Government objectives of earning foreign exchange and generating additional employment.

The Marine Products Division has had remarkable success in the development of an export market. Exports rose from Rs. 70 lakhs in 1971/72 to Rs. 4.30 crores in 1973/74. The Company has obtained all the necessary Government clearances for the establishment of hotels at AGRA, MADRAS and DELHI. The hotel at Madras is nearing completion under the name and style of "HOTEL CHOLA".

The Company has also entered the field of General Exports and has had considerable success in the export of a wide variety of goods such as paper/board products, myrobalan, leather goods, bicycles and bicycle parts, garments as also cigarettes and manufactured and blended cut tobaccos. The Company is recognised as an eligible Export House.

FUTURE PROSPECTS

The Company has paid an interim dividend of 7% (subject to tax) on Ordinary Shares for the year ended 31st March, 1974. The Directors of the Company had recommended a final dividend of 8% (subject to tax) making a total dividend for the year ended 31st March, 1974 of 15%. In view, however, of the Companies (Temporary Restrictions on Dividends) Ordinance 1974, and the Companies (Temporary Restrictions on Dividends) Amendment Ordinance 1974, the recommendation in respect of a final dividend was withdrawn. The Directors of the Company consider that in the absence of unforeseeable circumstances the turnover and profit of the Company should increase in future years.

SHARE CAPITAL

A. Authorised	
2,50,00,000 Ordinary Shares of Rs. 10/- each	Rs. 25,00,00,000
B. Issued, subscribed and fully paid up	
1,89,50,000 Ordinary Shares of Rs. 10/- each for cash	Rs. 18,95,00,000
C. Present Offer	
28,04,775 Ordinary Shares of Rs. 10/- each (fully paid up)	Rs. 2,80,47,750
D. Out of the Present Offer	
i) 10,08,904 Ordinary Shares of Rs. 10/- each (fully paid up) have been reserved for offer to the employees, Directors, associates and the Life Insurance Corporation of India and the Unit Trust of India.	Rs. 1,00,89,040
ii) 7,95,871 Ordinary Shares of Rs. 10/- each (fully paid up) have been reserved for offer to the shareholders of the Company whose names appeared on the Company's Register of Members at the close of business on 1st August, 1974 in the proportion of one Ordinary Share for every six Ordinary Shares held on that date.	Rs. 79,58,710
E. Now offered for sale for cash and at par to the Indian public 10,00,000 Ordinary Shares of Rs. 10/- each (fully paid up)	**Rs. 1,00,00,000**

TERMS OF THE OFFER

The entire amount of Rs. 10/- per share is payable on application.

OBJECTS OF THE OFFER FOR SALE

With a view to increasing Indian participation in the share capital of I.T.C. Limited from 25% to 40% three overseas shareholders of the Company i.e Tobacco Manufacturers (India) Ltd., 7, Millbank, London, S.W. 1, U.K., Tobacco Investments Ltd., 2, Dean Stanley Street, London, S.W. 1, U.K. and Rothmans International Ltd., Christopher Martin Road, Basildon, Essex, U.K., are disinvesting a part of their respective holdings in the capital of I.T.C. Limited aggregating to 28,04,775 Ordinary Shares of Rs. 10/- each (fully paid up) to the Indian public and others in the manner and to the extent herein mentioned. They have irrevocably constituted and appointed Mr. Ajit Narain Haksar, Mr. Santanu Ray, Mr. Sorab Barjor Aibara and Mr. Ronald Carleton Burns, all of 37 Chowringhee, Calcutta-700016 (any two of them jointly or any one of them severally) as their Attorneys for the sale thereof.

On the successful completion of this Offer for Sale I.T.C. Limited will cease to be a Subsidiary Company of Tobacco Manufacturers (India) Ltd., U.K.

FROM THE CHAIR

INDIAN SUGAR MILLS ASSOCIATION

Problems and Prospects of the Sugar Industry

THE following has been adapted from the *Presidential Address of Shri* Pradeep Narang, delivered at the Forty-first Annual General *Meeting of* the Indian Sugar Mills Association held on August 16, 1974:

Besides being an agro-based industry of vital bearing to the millions of cane growers, the sugar industry has now emerged as a large-scale foreign exchange earner for the country. Even if we are able to export 6 lakh tonnes of sugar this year, the industry would be *contributing foreign exchange* of the order of Rs 300 crores, which, perhaps is the highest for any *single commodity*. Besides, the rupee profit to the exchequer is *expected to be of* the order of Rs 170 crores. In the years to come it should be *possible to programme* for an annual export of 10 lakh tonnes. *In this context, there is need* for pragmatic solutions to the problems of *this industry which inhibit production*.

EXCISE REBATE — Due to the unrealistic scheme of excise rebates *announced for the early part* of the season 1973-74, we lost as much as 2 lakh tonnes *output since factories could* not start early. The sugar output in earlier *months of October and November* this season was only 3.20 lakh tonnes as *against 5.10 lakh tonnes achieved* during the preceding season. It is *unfortunate that the Government's* approach in this matter has been purely statistical. *They seem to formulate* their policy based on the previous year's per*formance disregarding completely* the actual conditions obtaining during the season *for which* the scheme is actually formulated. The policy has to be formulated *taking into account* the factor of additional costs incurred both during the *earlier part* of the season and the later hot summer months. If such relevant considerations are ignored, the resultant policy would be only self-defeating and would not yield the desired results.

CREDIT SQUEEZE — *The severe* credit squeeze measures imposed by the banks *under directions* of the Finance Ministry and the Reserve Bank of *India further aggravated the difficulty* of the factories. The credit limits of the factories were pegged at the previous season's drawings disregarding *the higher output* and also the higher costs. Simultaneously, the margins were also increased steeply, on levy sugar from *10 per cent to 15 per cent* and on free sugar from 15 per cent to 25 per *cent. As a result of the* aforesaid measures, there has been a *clear resource gap of about 75 crores* between the actual requirements of the industry and *bank credit allowed* to it. The Reserve Bank of India must realise that the *credit squeeze* has to be selective and not general like the present one, if industries producing essential commodities such as *sugar* are expected to maximise production. Due to the *policy of the Reserve Bank of India*, the factories were unable to maintain prompt cane payments as a result of which there was a heavy diversion of cane to gur and *khandsari and sugar* production suffered.

While planning for increased production it would be *necessary to relax the credit squeeze* measures now imposed on this industry in *common with others*. Here the production is confined to a short period of 4/5 *months while deliveries are staggered* by the Government over a period of 12/14 *months*. *Considering this* peculiar feature of the industry and *the interests of the* cane growers, it is necessary that the present credit curbs *are relaxed in* the interest of increased production as otherwise all our efforts *at augmenting* production *may* prove abortive.

KHANDSARI SPURT — As a direct consequence of *unrealistic and inadequate excise rebates* and severe credit squeeze measures, *there was large-scale* diversion of cane to khandsari and power crushers and *an abnormal increase in khandsari* output has resulted. During the last season *its output, as reported, has suddenly* spurted to over 10 lakh tonnes *representing a 100 per cent increase during* one single year. With proper *policies in regard to crystal sugar and* khandsari sugar, such large-scale diversion *of cane to khandsari could* be checked. For producing additional 5 *lakh tonnes as much* as 70 lakh tonnes of extra sugarcane has been crushed *in khandsari plants*. *If we could* save this cane for sugar factories, the country *would have achieved* an additional sugar output of about 6.30 lakh tonnes. *It is common knowledge that* the process losses in khandsari production are *much higher and as* much as 40 *per cent of the recoverable* sugar is lost in the process itself.

In order to minimise such diversion of cane the present tax disparity between sugar and khandsari should be narrowed down. Even after the last hike in the *compounded* rate of excise duty on khandsari, the effective duty is not *more than* Rs 15/- per quintal on sulphur khandsari and *Rs 11/- per quintal on* ordinary khandsari as against Rs 109/- per quintal of *free sugar. At no time* the disparity was so great. Normally the disparity *should be of the* order of about Rs 50 per quintal only taking the *normal parity in their prices* as against about Rs 100 per quintal existing today.

CANE PRICE — The Government have *yet to announce* the *statutory minimum* cane price for the ensuing season. The present *price of* Rs 8 per quintal linked to a base recovery of 8.5 per *cent was fixed during* 1972. Since then, the prices of agricultural commodities *have* gone up all *round. So is* the case with various inputs specially fertiliser whose price has been *almost* doubled recently. To ensure a steady level *of* cane acreage in factory areas it is essential that the minimum cane price is fixed at a level which assures to growers parity in realisations from *other commodities*. The Sugarcane (Control) Order, 1966, *in* fact, *inter alia* provides that *Government* would fix the statutory minimum cane price keeping in view *the returns to* "the returns to the growers from alternative crops and *the general* trend of prices of agricultural commodities".

LEVY SUGAR PRICES — Closely related to this is the question of de*termination of* a fair levy price for the industry in the absence of which the cane payments are effected which *in* turn impairs the cane supplies to factories. The *experience of* the last season establishes this point beyond any doubt. Taking the actual duration of the season and sugar recoveries and employing the Tariff Commission schedules with permissible cost escalations, the zonal levy prices on an average would compute to be higher by Rs 10/- per *quintal* than what has been actually fixed by Government. In certain regions the *difference would* be as high as Rs 15/- per quintal. The industry which *is provided with a gross* margin of Rs 5.60 per quintal, will not

be able to sustain such heavy losses, specially when all the cost escalations are not taken into account. In effect the entire margin would be completely wiped out and a majority of units would be in the red.

It was hoped that the revised levy prices based on the actual results of the factories and providing for the cost escalations would be announced soon. Within less than 45 days this season would come to a close and hardly any stocks would be left with the mills. Still there is no firm indication when the revised levy prices would be announced. Factories, meanwhile, continue to deliver levy sugar at economical provisional rates.

CANE DEVELOPMENT — No doubt, lasting stability in the industry can be achieved only by accelerating cane development work. It is a happy augury that during the 5th Plan period, Government of India are proposing to give special attention to the development of sugarcane crop. Hitherto, sugarcane has remained a state subject but its development has not made much headway due to paucity of resources. The working group of the Agriculture Ministry has prepared a paper for cane development during the 5th Plan period involving a total outlay of Rs 26.92 crores, which is under active consideration of the Government. While this is a welcome development, the total outlay seems to be low having regard to the magnitude of the problem and the need for developing vast areas and it should be suitably raised.

NEW CAPACITY — The other matter which has a bearing on the lasting stability in the industry is about the creation of new capacity. For the Fifth Plan period, the Planning Commission has fixed the capacity target of 60 lakh tonnes for achieving the sugar output of 57 lakh tonnes. It is doubtful if such an ambitious target could be achieved within the Plan period and there may be a sizeable spill-over to the next Plan. In the present licensing policy, there is undue emphasis on installation of new units while expansions in the existing units have been relegated to a secondary position. A new plant of 1250 tonnes capacity currently cost about Rs 7 crores. The indications are that very soon it will go up to 8 crores. Taking the whole Plan period, it will be safer to assume an average figure of Rs 9 crores. This would amount to a significant strain on the country's resources. Expansions in the existing units admittedly are much less costly and less time consuming. It may therefore be desirable to reverse the apportionment of new capacity between expansions and new units as 60 per cent for expansions and 40 per cent for new units. In fact, expansions should be permitted freely without any licence or restrictions whatsoever. This would render the Plan less costly and capable of speedier implementation.

Further, in the selection of sites for new units adequate consideration should be given to cane requirements of the existing factories as otherwise the capacity utilisation of both the new units and the neighbouring old units suffers. The utilisation of capacity in new units during the past few years has been continuously going down and it was only 60 per cent in 1973-74 season. Half a dozen new units did not work at all. For ensuring optimum capacity utilisation, Government should, before issuing any new licence, give adequate opportunity to the existing neighbouring units to represent their case. There should be a central independent authority to look into this matter.

With a little attention to existing units the sugar output can go up substantially. Larger interests of cane growers also demand that the old units should be helped to expand and modernise. It is, therefore, urged that a revolving fund as recommended by various expert bodies to provide finance to the old units on easy terms for rehabilitation, modernisation and expansion should be created as early as possible.

Poysha Industrial Company Limited

Report for the Year Ending March 1974 and Review by the Chairman, Mr M R Ruia

"INFLATIONARY trend rather than real growth has been the main factor explaining the sales growth from Rs 77.4 million in 1972-73 to Rs 93.3 million in 1973-74" observes Shri M R Ruia, Chairman of Poysha Industrial Company Limited, in his review. This position has dramatically changed in the current year so far. In the first four months (ending July 1974) the sales value has improved by about 70 per cent and the area of tinplate processed (a measure of real growth) by about 25 per cent compared to the corresponding period last year. This pace is likely to be maintained and at the end of the current financial year Poysha expects to reach a sales value of over Rs 135 million.

The Chairman reaffirms the company's confidence in the metal can having to play a key role in the packaging field in India. The technological superiority of tinplate, the experience of the advanced countries establishing the pronounced reliability on tinplate and the vast potential in our country (per capita consumption is 0.3 kg in India as compared to 27.3 kg in the USA and 15.0 kg in the UK) seem to support this belief. It is this philosophy that has promoted the Company to provide to the country the best available can technology through the technical collaboration with American Can Company, USA and plan substantial expansion of operations at Madras and Calcutta in the field of metal cans.

On relative comparison, the tinplate price in India is high (about 128 per cent above the level in the UK) and the level of utilisation of tinplate production capacity is low (about 39 per cent as compared to 80-90 per cent in other major countries). The government also seems to treat metal can as a luxury item. The Chairman feels the need for the government and industry to effect a concerted effort to develop this vital packaging medium.

The metal can is an unusual product, requiring a very high degree of precision and sophisticated technology for mass production. The technical competence demanded is very high and not many can meet this. The potential market for us in India is large with possibilities of exports in beer and beverages packing, processed foods packing and the like where even a fringe of the market has not been exploited so far. Poysha with its technical skill and ability will meet this challenge. Significant increase in sea-food exports during 1973-74 and the performance so far in the current year appear to be the beginning of such a phase.

SUMMARY OF RESULTS FOR

(Rs million)

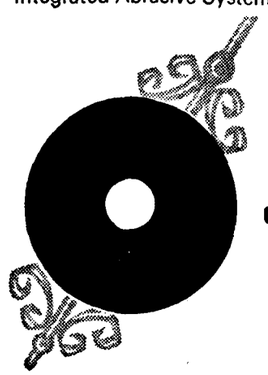
	1972-73	1973-74
Turnover (Excluding Excise Duty)	77.4	93.3
Gross Profits	5.4	7.7
Net Profits (After Taxes)	1.9	2.8
As a percentage of share capital	11.4	16.8

Note: This does not purport to be a record of the proceedings of the 17th Annual General Meeting of the Company.

The same principle applies in abrasive application.

There are two sides to it and you are entitled to both: Top quality abrasives. And expert advice and service to help you get the best results from them.

Carborundum Universal offer you both.



Our abrasives are among the best manufactured in India today. Impeccable in quality. Widest in range. (Not even our competitors would dispute this.)

Add to this our service — and you have a 'System' to work with. We call it the Integrated Abrasive System. Something that takes into account all the factors, from choice of raw materials to use of the right tools and techniques — to give you predictable and profitable results every time.

Call the man from Carborundum Universal. It costs you nothing to let him study your problems; give advice on latest tools and techniques; suggest methods to cut down costs and improve productivity.

This is the service part of our system. And as service-conscious suppliers of basic tools for industry, we feel every single customer of ours is entitled to it.

Why settle for less?

one crore exports in one month

June 1974 was a memorable month
for Gujarat Steel Tubes.
Our exports reached a new high.
We earned Rupees one crore F.O.B. in a single month. We are naturally proud of this achievement.
Proud because it proves that our product competes with the best in the world.
Proud also because our efforts benefit the whole nation.
We have set ourselves a challenge—
to break our own record.
It is a tough challenge.
But we are determined.

NUCLEAR POWER: HEAVY WATER CONSTRAINT

LOIN CLOTH ON TOO HIGH A PEG

MISA: PLEASURE OF INDEFINITE DETENTION

Ours is a magnificent Land-1

I sleep in the sewers of my homeless cities. But I have builded a marbled Taj Mahal.

I hunger when famine stalks the land. But I have saved it from plague and pox.

I taught my child the arts of Science. But I have seen him forsake my shores.

I befoul my cities because I will not plan. But I have looked up and discovered Quasars.

I see food hoarded while my poor go hungry. But I have made the green revolution happen.

I never taught my children to read nor write nor count. But I have fathered Nobel laureates.

I see my brother outraged by my prejudice But I have elevated him to the highest office.

I flee from the farms to the despair of my cities. But I have held to the hope of a hundred million jobs.

I was born to subsist on a half-Rupee daily. But I have died so my ashes can enrich my loved India.

I am sad. But I am glad. I am.

Ours is a magnificent land. We must build a magnificent future. Think Ahead.

Muddied Waters

THE Indo-Bangladesh Joint Rivers Commission keeps meeting and adjourning, but the Farakka issue is no nearer solution. True, by itself the dispute over the sharing of the Ganga waters at the point of the Farakka barrage need not be a major disruptor of relations between Bangladesh and this country. The existing arrangements, though not altogether satisfactory from the point of view of either nation, are not altogether intolerable either. They could, therefore, be continued for some more time. But events could take a different turn too. If, for example, as a consequence of Sikkim and other developments, including domestic pressures on Sheikh Mujibur Rahman's government, the Bangladesh government were forced to serve on India notice of dispensation of services, Farakka might provide it with an excellent alibi.

The last time the Prime Ministers of the two countries discussed the issue was in May, in New Delhi. The operative part of their discussions was summed up in the following two paragraphs incorporated in the joint statement issued at the end of the Bangladesh leader's visit:

> "The two Prime Ministers took note of the fact that the Farakka Barrage project would be commissioned before the end of 1974. They recognised that, during the period of minimum flow in the Ganga, there might not be enough water to meet the needs of the Calcutta Port and the full requirements of the two countries ... It was accordingly decided that the best Ganga in the lean months would have to be augmented to meet the requirements of the countries ... It was accordingly decided that the best means of such augmentation through optimum utilisation of the two countries should be studied by the Joint Rivers Commission. The Commission should make suitable recommendations to meet the requirements of both the countries.
>
> "It was recognised that it would take some years to give effect to the recommendations of the Commission as accepted by the two governments. In the meantime, the two sides expressed their determination that *before the Farakka project is commissioned*, they would arrive at a mutually acceptable allocation of the water available during the periods of minimum flow in the Ganga" (italics added).

It may be useful to have a brief resume of what the trouble in Farakka is about. In the lean season, the Hooghly — which is the nomenclature for the Ganga downstream in West Bengal — dries up and the port at Calcutta gets immobilised. The Rs 116-crore barrage at Farakka was intended to ensure that the Hooghly received, even at the worst of the dry period, at least 40,000 cusecs of water. At the point of Farakka, the availability of water in the lean season was assumed to be around 55,000 cusecs. After the needs of the Calcutta port were satisfied, 15,000 cusecs would thus have been left for East Bengal. Bangladesh (then East Pakistan) considered this to be scandalously inadequate. The technical aspects of arriving at a modicum of agreement on the equitable sharing of the Ganga waters were discussed in at least eleven official meetings, spread over more than five years when Bangladesh was yet a part of Pakistan. The Joint Rivers Commission, which is really a new format for the continuation of these technical discussions, has in its turn met six times between January 1972 and May of this year. Since the joint declaration of the two Prime Ministers referred to above, it has again met on four different occasions.

The imbroglio, however, remains. If anything, the situation has become still more complicated over the years. Contrary to earlier assessments, the lean season flow instead of being 55,000 cusecs at Farakka — it now transpires — would be 40,000 cusecs, or even less. Thus the available flow of water might not be adequate to meet the needs of even Calcutta port; the task of meeting the full requirements of Bangladesh would, therefore, have to be given up as a hopeless job. Further, this reduced estimate of 40,000 cusecs is itself stated to be on the assumption 'of fair weather'; if the weather turns out to be not so fair, there would be a proportionate shrinkage in availability.

Officials of the JRC adjourned once more about 10 days ago, without reaching any agreement. We are now barely two months away from December, when the Farakka barrage is scheduled to be commissioned and Calcutta port gushingly restored to life. But since the JRC has been unable to agree on the means to augment the supply of shareable water, Bangladesh could quote the operational paragraphs of the joint statement and urge a moratorium on the commissioning of the barrage.

Meanwhile, in their search for ways of augmenting the flow, the eyes of Indian officials might rivet on the Brahmaputra. A suggestion could be obliquely made that a link canal be dug to bring the surplus waters from

that river into the Ganga. The citizenry of Bangladesh — already in no mood to concede Indian *bona fides* — might well be outraged at the suggestion. They could question, in return, Indian doings in the upper reaches of the Ganga. Bangladesh newspapers are currently full of stories about the quantum of water allegedly drained away by the Kosi, Gandak, and Sone projects, and by 34 other major and 107 medium-sized projects further up the same river basin. K L Rao's grandiose dream of linking the Ganga with the Cauvery is, in addition, being frequently referred to as evidence of India's extravagant intentions.

Whether satisfying 'the needs of Calcutta port' should take precedence over meeting 'the full requirements of Bangladesh', or whether it should be the other way round, is hardly a technical issue. Whether the flow of Ganga water is to be augmented by slashing down the claims of the upper riparian projects or by excavating a feeder canal to join with the Brahmaputra, is again a matter not to be decided on the basis of technical considerations alone. These are essentially political questions requiring clearance. 'Donating' Kachchativu and 'placating' Sheikh Abdullah could, from New Delhi's point of view, be good trade-offs for the coup in Gangtok. But Bangladesh's proximity to Sikkim might induce it to hold a different view on the matter. A wrong move on Farakka could thus be taken as evidence of the compounding of a felony. And there will be repercussions. In any case, whatever else might or might not happen, the port of Calcutta is likely to continue to have a lean time.

Monetary Policy

False Alibis

WHEN there is total drift in economic management — and indeed in the general governance of the country — institutions which are a part of the system, however independent these may be supposed to be, are bound to share in the lack of purpose and direction. This is the uppermost impression left by the Reserve Bank's Annual Report for 1973-74, just released. Its assessment of the economic situation and prospects is entirely along the beaten path: the all-too-obvious failure in procurement and distribution of food articles, the shortages of power and transport and the disturbed state of industrial relations are listed; what it has to suggest by way of policies is equally banal — demand curbs, output increases, stern measures to deal with unaccounted incomes and illegal transactions, and limiting future additions to money supply. Interest in the Report is thus reduced to the Reserve Bank's laboured defence of its credit policies.

The Annual Report claims that the setting of a ceiling for credit expansion in the 1973-74 busy season at Rs 600-650 crores was something of an innovation. This is not true; it has been quite common for the Reserve Bank to indicate the probable or desirable level of credit expansion. And, as in the past, the so-called ceiling set for the 1973-74 busy season was no more than a pious hope in that the Reserve Bank had not cared to work out in detail how the actual credit expansion by the commercial banks was to be limited to the prescribed level. Now the Reserve Bank laments that "the internal operational system obtaining in banks had not yet been fully geared to work out a technique of this nature". If this is true — as it is, of course — five years after the nationalisation of the major banks, whose fault is it except the Reserve Bank's? The Annual Report has a further excuse for the failure to restrain credit expansion. It says: "the task was made infinitely more difficult by the extensive list of 'priorities' which the banks, individually or collectively, were required to subserve". But is it not a part of the Reserve Bank's function to set priorities for the banks consistent with its ideas on the permissible level of credit expansion? Or is there a suggestion here that priorities have been foisted on the banks by agencies other than itself — the Ministry of Finance, for instance? But since there is no evidence whatsoever that the Reserve Bank has at all applied itself to the question of priorities in credit dispensation or, if it had any differences on this question, taken up the matter with the government, the reference to the "extensive list" of priorities is simply an attempt to evade responsibility for the runaway credit expansion.

Against the ceiling of Rs 600-650 crores, the actual credit expansion in the 1973-74 busy season was Rs 1,271 crores. According to the Annual Report, the major portion of this expansion arose out of "the requirements of food procurement, exports, public sector undertakings and the priority sector". Only a relatively small part of the credit, it is claimed, went to large industry and trade in the private sector. The Reserve Bank's defence of its credit policy, particularly during the 1973-74 busy season, rests on this questionable claim. The data presented in the Annual Report, possibly specially obtained from the head offices of commercial banks, appear to be unreliable. Credit extended to private large-scale industry and trade by 61 banks, accounting for 98.6 per cent of the total bank credit, was Rs 427 crores. During the same period bills rediscounted with the Reserve Bank was Rs 244 crores, most of which would be for the large industry and trade sector. If this was so, then it is most unlikely that during the entire busy season this sector got only about Rs 183 crores or so of direct credit — or, including the other banks, around Rs 200 crores — compared with over Rs 600 crores in the previous busy season. There are thus strong reasons for suspecting that the head offices of banks are over-reporting credit for the priority sectors. That apart, a substantial part of the credit given to small-scale units and almost the entire credit for exports benefits the large-scale sector of industry.

The Reserve Bank's attempt to explain the expansion of bank credit to large-scale industry and trade in the private sector in the force of virtual stagnation in industrial production is similarly unconvincing. First, most of the increase in output in the capital goods sector, in iron and steel and in fertilisers was on account of the public sector credit to which has been shown separately. Private sector industrial output, on the other hand, was not only stagnant but very likely declined. Likewise, the alleged decline in the ratio of short-term bank borrowings to inventories from 50.6 per cent in 1971-72 to 46.2 per cent in 1972-73 is misleading. First, the Reserve Bank's company finance data have a serious limitation in that companies have different accounting years. In 1972-73, the demand for bank credit was slack upto January 1973 (see "Economic Survey, 1973-74", p 33) and so only those companies which closed their accounts in March 1973 would have shown some increase in credit in that year. Secondly, balance-sheet figures of inventories are in any case largely fictitious. If the Reserve Bank were serious, it would not be difficult for it to gather more reliable data on the inventory build-up in different sectors of the economy. As things are, it is intriguing how the Reserve Bank operates its credit policies and its Credit Authorisation Scheme without detailed studies of inventory levels on at least a quarterly basis.

Significantly, there is no section on credit planning in this year's Annual Report and only a cursory reference to the Credit Authorisation Scheme. We are told by way of clarification of "certain points regarding the Credit Authorisation Schemes" that "the primary credit appraisal of the proposals . . . [is] done by the lending banks". Of course, it is; what one wants to know is what the Reserve Bank is supposed to do. Does it merely duplicate the banks' efforts?

The Annual Report, incidentally, has no data to present on the balance of payments — which is truly shocking considering that the Reserve Bank is the custodian of the country's foreign exchange reserves and is responsible for implementing the new Foreign Exchange Regulation Act!

Nuclear Power

Heavy Water Constraint

IN addition to uranium resources, the availability of heavy water has become an immediate constraint on India's nuclear power programme. Our nuclear power programme for the seventies and early eighties is based on heavy water moderated and cooled natural uranium fuelled reactors. Heavy water, a molecular variant of natural water, occurs in very small quantities in sea water and its recovery is very expensive. It is usually produced synthetically from the byproducts of fertiliser plants. As a moderator in a power reactor, it slows down the neutrons, encouraging nuclear fission; and as a coolant, it is circulated to prevent the fuel from overheating. Without adequate quantities of heavy water for the initial charge and annual replacement, the reactors cannot be operated to full capacity.

When the present reactor technology was chosen in the early sixties, planning was initiated for the heavy water plants at various locations. A plant at Nangal has been operating for quite some time and produces about 11 tonnes of heavy water a year. This plant is, however, expected to close down completely by 1975. The Bhabha Atomic Research Centre has developed the technology of producing heavy water through the hydrogen sulphide-water exchange process. The Kota heavy water plant, based on the BARC technology, was started in 1969 and the original estimate of construction time was four years. However, five years later, the plant is still only half-complete and the commissioning date has now been shifted to 1977. Several technical problems have cropped up in upgrading the laboratory level technology to the commercial scale, causing cost escalation and postponement of the completion date. It is even feared that the plant may never come up finally.

Probably anticipating the Kota plant's failure, all subsequent heavy water plants have been planned almost on a turnkey basis, with substantial foreign technical collaboration. A plant is being put up at Baroda with French collaboration, another at Tuticorin with Japanese collaboration and a third at Talcher with West German collaboration. All these plants are based on the ammonia-hydrogen exchange process and the BARC technology and R and D have been all but forgotten. The Indian participation in these plants is restricted to civil engineering, electrical works, construction of employees' colonies, etc. However, considerable R and D on heavy water still goes on in BARC, even though the possibility of its being used in the next decade is remote.

Even the construction of the imported plants is not going according to schedule. The Baroda plant, started in 1969, was scheduled to be ready in 1973, whereas it is now expected to be completed only by early 1975. The original cost estimates have been exceeded. The Tuticorin and Talcher plants are also behind schedule and are experiencing sharp cost overruns. The investment in these plants, it is currently estimated, will be of the order of Rs 100 crores. All of them taken together are expected to produce 280 tonnes of heavy water a year (around 1978). No other heavy water plant is planned for commissioning till 1984.

Heavy water is required for the Rajasthan, Madras and Narora atomic power plants now being built. All these plants are expected to be in operation by 1982. Each plant consists of two reactors. Each reactor requires about 230 tonnes of heavy water as an initial charge and about 18 tonnes annually to replenish operating losses. The Rajasthan-I reactor which has been commissioned is, however, losing heavy water at a much higher rate.

The estimated requirements of heavy water till 1980 are about 1,000 tonnes. A demand/supply analysis would indicate that in the late seventies there would be a severe shortage of heavy water for 3-4 years, necessitating postponement of construction of power stations. A similar problem was faced in the early seventies when the Soviet Union came to our rescue. Currently negotiations are under way with the USSR and West Germany for the supply of heavy water to tide over the expected shortage. However, in the current international climate, foreign assistance to the Indian nuclear programme is likely to be tardy. Canada has already withdrawn its commitment to supply heavy water to us. The USA is thinking of imposing some restrictions on the supply of enriched uranium for the Tarapur power station. The International Atomic Energy Agency is convening a multinational meeting to ban export of nuclear materials/equipment to countries like India which have not signed the non-proliferation treaty. Besides, the recent British interest in heavy water reactors is likely to push up the price and restrict the availability of heavy water to India even from countries like the USSR. The cost of Indian produced heavy water is around Rs 1,000/kg whereas the import price is around Rs 800/kg. Even this Indian price is full of hidden subsidies, such as in the form of low interest capital.

The heavy water story is yet another instance of unco-ordinated planning and inefficient project management, as a result of which the nuclear plants might well have to pay more for and/or get less than the required quantities of heavy water. The failure of indigenous technology and reliance on imported equipment and plant also reveals the large gaps in our research and development effort in yet another vital area.

Chile

Torture and Economic Anarchy

LAST Wednesday marked a year of military rule in Chile. The year witnessed the limitless obscenities and depravities to which a neo-facist military regime can stoop — all in the name of obliterating the defenceless, non-violent, left-wing idealists who had sought some measure of equity for their society. Even conservative sources within Chile are appalled at the unprovoked extent and intensity of terror and torture which has been used on thousands of Chileans, not to extract information or confessions, but to break any possible whisper of dissent. Torture has become the main instrument of rule in Chile. An International Commission of Jurists mission to Chile reported that "Methods employed have included electric shock, blows, beatings, burning with acid or cigarettes, prolonged standing, prolonged hooding and isolation in solitary confinement, extraction of nails, crushing of testicles, sexual assaults, immersion in water, hanging, simulated executions, insults, threats and compelling attendance at the torture of others." Amnesty International reports

that even little children have been terrorised in order to intimidate their families. In one instance that came to light a nine-year-old girl and a four-year-old boy were tortured to death in front of their parents.

This climate of terror is all that has been achieved during the year of military rule. Even by their own narrow standards, the military rulers have not been able to 'improve' economic conditions. The investment rate is low. And despite frantic attempts to attract foreign investment at any cost, the past year has seen very little investment coming in from abroad. Moreover, the regime has been totally unable or unwilling to conbeen totally unable or unwilling to control inflation which rose by 678.1 per cent during the 12 months till the end of July 1974 — during five weeks of Allende and 47 weeks of General Pinochet. In the 12 months till the end of July 1973, all under Allende, prices had risen by 704.5 per cent. But the difference in those faraway days was that the workers and other poor sections of society were compensated for increased prices by a continuous process of increasing wages and a public distribution system which supplied them essentials like foodstuffs at controlled prices. But now wages are tightly controlled while prices continue to go haywire. Workers who — for the first time in their lives — had got used to eating meat, fruit and other nutritious foods during the Allende years, are now existing on near-starvation diets of bread and beans and tea without sugar.

These are the lucky ones as 12 per cent of the workforce is now unemployed. Many are unemployed due to the economic chaos created by the military regime but about 160,000 have been thrown out of employment for no other reason than that they were suspected to have been vaguely sympathetic to the Popular Unity government. From what has happened in Chile during the past year it becomes apparent that even the worst forms of symbolic socialism — and the Allende government did implement significant measures which were not merely symbolic — are distinguishable from the prolonged brutality and economic chaos let loose by some military regimes.

Stock Market

Great Crash?

THE shadow of 'black July' — the month of dividend control and the hike in the Bank rate — still hangs over the share markets. Share prices are estimated to have declined by 24 per cent on average in July-August. The fall in the prices of what are known as 'popular counters' has been of the order of 20 per cent and, as will be seen from the accompanying Table, their current prices are way below the highs touched earlier in the year. If one goes by the drop in prices, it would appear that there has been a great crash. But has there been one?

For a crash, there has to be an avalanche of selling. Nothing of the sort has happened. First, despite dividend control and the raising of interest rates, there is unlikely to be any large-scale movement from shares to deposits, with banks or companies. After all, one-year deposits with banks fetch just 8 per cent and clean loans to companies for a year 9 to 11 per cent. The loss of liquidity as a result of shifting from shares to deposits would not be worth it at these rates of interest. Any movement away from shares will be checked, additionally, by hopes that once shares hit the bottom prices would improve.

Second, few individual shareholders are likely to be in a hurry to sell. Those with annual incomes of Rs 20,000 and over account for roughly two-thirds of the declared (that is, excluding benami) individual shareholding. Clearly, these shareholders can absorb a temporary decline in dividend income and hold out for better times. Those who hold sizeable chunks of the controlling blocks of companies are even less likely to sell out. Finally, 18 to 20 per cent of the shares of companies are held by financial institutions and 30 to 35 per cent by joint stock companies and these holdings too will not be unloaded.

Why then have share prices crashed? Why have stock exchanges found it necessary to fix floor prices? And why has it not been possible to hold these floors? Clearly, the narrow markets, which are the plaything of two dozen-odd operators, were caught on the wrong foot. There were heavy forward sales in a bull market by the knowledgeable — as was noted in Parliament — just before dividend control. And selling by speculators following the announcement of dividend control gathered momentum with the announcement of the Bank rate hike. Advances against shares are not as small as is made out by the commercial banks, judging from the moans and groans following the rise in the lending rates of banks to around 17 per cent.

The fiscal monetary measures caught market-men on the wrong foot. Maladjustments in accounts and overtrading came into the open. Settlement, initiated by the stock exchange authorities, will take time but will not prove impossible. The system supporting the money-game must go on; therefore, those who have made a killing realise the need to forgo a part of their gains. And there is enough money around for the continuance of the system, including the funds accruing to companies because of the reduction in dividends. These funds are at the disposal of the controlling interests and will undoubtedly be put to good use.

The share markets are a barometer of nothing. In recent years, share prices have risen, not because there was any reason for jubilation over the performance of the economy, but because floating stocks of shares in the market have been limited. Demand for shares has exceeded supply. Just now the markets are down, but the disequilibrium will be corrected as the blessed of this country commence picking up shares at rock bottom prices — Tata Steel is already quoting below face value. This will reduce the floating stock, temporarily bloated by mis-speculation. The present noises of distress merely divert attention from such facts as that the shares of most companies would become pregnant with bonus issues because of dividend control and that the top operators in the market are consolidating their position. This last factor points to a further decline in share prices. By pushing prices further down the operators hope to make a dent into the hard-cover, non-speculative share-holding into the market.

TABLE: PRICES OF SELECTED SHARES

	Sept 4	July 4	1974 High
Bombay Dyeing	49.50	58.50	70
National Rayon	298	368	428
Century	468.50	600.50	648

Voltas	209	253	257
Scindia	28.60	33.45	35.50
Tata Chemicals	36	44.25	45
NOCIL	295	377	392

Education

Going Under with Nonchalance

IF anything is more ominous than the progressive encroachment by government on individual and collective freedoms, it is the willing — and mindless — acquiescence of the victims of such encroachment. What, for instance, is one to make of the total nonchalance with which the Pro Vice-Chancellor of Delhi University — who is currently acting Chancellor of the University — told a meeting of students on September 2: *viz*, that the Ministry of Education had some time back issued a circular to universities requiring them to obtain government's permission before inviting Indian scholars residing abroad to their institutions? The acting chancellor seemed to imply that what was important was the fact of the circular having been issued some six months ago, so that in a sense no 'fresh' restrictions had been imposed by the Government. All that the Registrar of the Delhi University had done, he went on to explain, was to issue letters to heads of departments asking them to conform to the circular of the Ministry of Education. It evidently did not occur to the acting Chancellor of Delhi University that the Ministry of Education's assumption of power to screen Indian scholars from abroad who were sought to be invited by Indian universities might constitute a highly improper and dangerous exercise of political authority.

The Education Ministry's circular is comprehensive. According to a newspaper report, the circular applies to Indian scholars invited by any university "for a considerable period of time". Thus it could apply not only to scholars invited to give lectures or attend seminars but also, conceivably, to scholars invited to take up short-term or permanent appointments in the universities. The only exceptions that the circular allows for are scholars who are ex-students of a university and who are visiting the university to meet their teachers or colleagues or "just out of a sense of belonging". A diabolic application of the circular therefore could make it possible for the government to virtually prevent the return to the country of any individual scholar who during his stay abroad, has incurred the displeasure of the government here — unless, presumably, that person is prepared to face a span of unemployment on his return and, only after such a span so as to get over his "Indian scholar resident abroad" status, seeks employment in an Indian university.

Quite apart from the very considerable potential for mischief in the Education Ministry's circular, it is preposterous by even liberal standards that the Ministry should seek to control — and that, so surreptitiously, through a letter sent out quietly to the universities — the presence of Indian scholars from abroad at Indian universities. However, what finally puts the lid on this regime's pretensions to liberal practice is the fact that the universities — the so-called strongholds of intellectual independence — should have accepted such imposition without so much as a murmur of protest. Indeed, but for sheer chance, even the existence of the Education Ministry's circular would not have come to light. Obviously, for most of those who control our universities, 'academic independence' and other such high-sounding phrases are to be invoked only when their own individual positions or perquisites are at stake.

The episode of the Education Ministry's circular is significant for another reason. The circular is said to be the government's response to complaints in Parliament that an Indian physicist who had been invited by the Delhi University in October last year to deliver a lecture at the university had allegedly expressed pro-Israeli views. Considering the nature of the complaint, it is very likely that it emanated from so-called 'progressive' quarters in Parliament. But the result has been to provide the government with an excuse to assume powers which should never have been available to it. Thus it is that our parliamentary democracy, ostensibly intended to promote a 'liberal welfare State', provides its rulers with the institutional — and constitutional — wherewithal for snuffing out any such intent.

Calcutta Diary

A M

PLEASE do not lend thy ears to canards: it simply is not true that India can arrange to have her Constitution amended in even less time than it takes to buckle one's shoe. It is not yet quite as good as that. But things have certainly started to look up. You could serve notice of an amendment the previous night; have a quick first reading at 11 o'clock in the morning; then, by dusk, the Constitution amendment bill would have been passed by the Lok Sabha; since the Rajya Sabha would have been kept waiting by a considerate Chairman, within a bare half hour the bill could be sent across; and All-India Radio would be in a position to beam in its evening broadcast the happy tidings of the nation adorning its Constitution with a new amendment.

A love feast is a love feast, and one scarcely needs to go into the substantive matter which occasioned the Thirty-fifth Amendment. When the Minister for External Affairs asserts that the Amendment reflects the inner urgings of the great Indian people and of the equally great people of Sikkim, for God's sake, hold your tongue, and let them love. There must be deeply felt reasons for the decision finalised at breakneck speed on Sikkim, just as there must be reasons for the sudden anxiety to patch up with Sheikh Abdullah in Kashmir. One might in fact have to go a few weeks back and read an integrated meaning in the Government's unusual keenness to hand over Kachchativu to Madame Bandaranaike on a platter. A certain policy of neighbourliness is being put to shape — a policy, the ramifications of which the amiable Sardar from Jullundar is presumably discussing this week with the powers that be in Moscow.

Sikkim is thus part of a whole, and those who have not been told of the whole are in no particular position to pass judgment on the operational significance of the Thirty-fifth Amendment. The dwellers of South Block, it could be argued, are not so foolish as to have not anticipated the reactions of China, or the outbursts of student wrath in Kathmandu, or the Chogyal's last discreet attempts to revive an international interest in his fading fiefdom. If the Government of India has nonetheless ventured to fare forward, the heart, we will be told, has its reasons. Since outsiders are unable to guess what these reasons are, they might as well suspend their prejudices and give the authorities the benefit of the doubt.

But what about the modality of it? Must even minimum norms of decorum be discarded because certain ideas have suddenly bubbled over in some minds about how the country's border could be further secured against would-be conspirators and trouble-makers? Article 338 of the Constitution has, of

course, made the business of amending the Constitution fairly simple. A bill for amending the Constitution can be introduced in either House of Parliament; it has to be passed in each House by a majority of the total membership of the House and by a majority of not less than two-thirds of the members of that House present and voting. Where Centre-state relations are not involved, nothing further needs to be done, and the Constitution stands amended. Given the present docile climate in Parliament — particularly on issues where at one end the Jan Sangh (to tickle its sense of chauvinism) and at the other the CPI (to serve the needs of Soviet policy) would willingly go along with the authorities — passing a Constitution amendment is the easiest of affairs.

Still, there is such a thing as a sense of proportion. To see beyond one's nose may not be a legal requirement, but it has its longer-term uses. The miracle-makers in New Delhi would of course claim that, while hustling the Thirty-fifth Amendment through, they have not breached any of the forms of the Constitution. Is that enough? In a set-up expected to resemble the quintessence of democracy, a Constitution is a sacred body of laws and doctrines; it is not to be treated as a plaything. To amend it ought not to be taken as a casual process. You are not supposed to spring a constitutional amendment upon a tired parliament at the fag end of a long session, ask it to vote its docile two-thirds majority, and quietly go home. The moment you start such a game, you confirm that the democratic procedures are a mere veil. After all, the Constitution — which by itself is inert — can be violated in so many different ways: it can be violated by passing amendments six times during a week, it can be violated by keeping Article 352 permanently in operation, it can also be violated by throwing a copy of it into the fireplace. Once the practice of violating the Constitution catches on others might more consciously perceive that more honest and direct means exist for debauching it, they might simply go outside its ambit and decide to wage a war against the Government establishment under its authority.

Ask no questions and you will get your Padmabhusan. But you cannot always prevent people from asking questions. It had to hurry, the Union Government says, because the Sikkim Assembly had unanimously passed a resolution, which could be ignored. Imagine the recurrence of a situation as in 1967, when the DMK came to a majority in the Tamil Nadu Assembly comparable to what the Sikkim National Congress has now in Gangtok. It was given to the DMK to pass a near-unanimous resolution seeking a dissolution of the state's ties with New Delhi; and the resolution could have been forwarded by the State Chief Minister to either the Home Minister or the Prime Minister. Rest assured, nobody in New Delhi would have rushed an amendment to the Constitution in a fading afternoon of a fading session of Parliament. But it is the context that makes all the difference: For, were the Sikkim Assembly to change its mind and pass another unanimous resolution asking for the repeal of the Thirty-fifth Amendment, it would no longer receive satisfaction.

The point has thus been established that the Indian Constitution is not a scarament, but a convenience, to be deployed in the manner ruling politicians consider best. In the light of this, what 'moral' or 'constitutional' edifice could be built against those who take recourse to gunpower to alter this Constitution?

But to whom should one address these words of admonition? Since you control the media and have the necessary votes in Parliament, you can proclaim sickness as benediction. How you deal with the Constitution also harmonises with the other aspects of your behaviour. The attitude of mind betrayed in the rushing through of the Thirty-fifth Amendment is substantively different from what is reflected in the stonewalling of the proposals that there should be a parliamentary probe into the import licence scandal. It is not the Piloo Modys and the Jotirmoy Bosus and the Madhu Limayes who are lowering parliamentary standards by constantly raking the muck. The lowering is being done by those who are providing the opportunity to these people to rake the muck. By its conduct in Parliament, the Government has convinced each and all that it has lengths and lengths of dirty linen concealed, which it would not like ever to be washed in the open. One can call the Government the filthiest of names; it could not care less. All it is seemingly interested in is that the details of the unsavoury practices it indulges in must not be constitutionally and publicly revealed.

Must one simply say, cry the beloved country? Or at least may a citizen, seeking to behave more responsibly, demand that since extra-constitutional processes may not be espoused there is need among other things to amend the constitutional process itself — beginning with the amendment of Article 368, so that the procedure for changing the articles of the Constitution could be made more onerous? In order to be able to do so, however, a two-thirds majority in each House of Parliament has to be forthcoming, a condition impossible to fulfil in the present political circumstances. In the face of this *reductio ad absurdum*, what word of solace would you offer to our conscience-smitten citizen?

Accent on Diversification

Hansavivek

MUKAND IRON is diversifying its activities by establishing a boat-building yard to make deep sea fishing trawlers, which are now mainly imported, in technical collaboration with Artillerous Imesa of Mexico. It has also secured government approval for substantially expanding its capacity to manufacture converters for copper and other non-ferrous metals, scrap processing plants, rolling mill equipment, and spares, components and replacements for steel and metallurgical plants. The company's machine building division has also been diversifying its product-range by making many items of complex industrial machinery from its own designs. Under an agreement with the Fertilizer Corporation of India, designs and knowhow will be available to the company for manufacturing heat exchangers, pressure vessels and related equipment. The division will also make hot rolling mills under a protocol signed with Metallurgical and Engineering Consultants (India), a government of India undertaking, which in turn has technical collaboration with Wean-United of US.

Meanwhile, Mukand continues to render technical assistance to other units in India and abroad in setting up and operating plants for steel making and processing. With agreements signed last year with five companies in India and three abroad, the number of such agreements has risen to 10 in India and five abroad. The company is also entering into agreements with Steel Rolling Mills of Tanzania for providing not only technical assistance and knowhow, but also engineering services to set up and operate a steel plant for manufacture of steel ingots and billets. Mukand will participate in the new equity capital of the Tanzanian company to the tune of about Rs 18 lakhs by capitalisation of a portion of the fee for engineering services (Rs 12 lakhs) and the payment for export of plant and machinery (Rs 6 lakhs). With the change in the government's export policy and increased production of steel bars and rods in the country on account of emergence of a large number of electric furnaces, Mukand is looking forward to benefiting from the increased demand and favourable prices in the world market. As one of the leading exporters of steel when export of bulk quantities was permitted, the company has retained its contacts with the international market through token exports. The company regrets that the long delay in evolving a policy and spelling out the procedures for export have resulted in loss of many

months of a favourable international situation.

During 1973-74, Mukand's steel foundry produced 9,429 tonnes against 8,265 tonnes produced during the previous year and the installed capacity of 12,000 tonnes. The foundry now produces heavy castings weighing upto 30 tonnes a piece. The company has in hand an export order worth Rs 36 lakhs for the supply of 220 cast steel bogies to Malaysia. Additional steel making facilities and necessary auxiliary facilities have been set up at the steel plant. Power shortage, shut-down of one of the furnaces for three months and the reduced availability of billets from the main producers notwithstanding, output of bars, rods and wires increased from 102,050 tonnes to 106,593 tonnes. The installed capacity is, however, 212,400 tonnes. Although net sales advanced by about 20 per cent, gross profit lagged behind and rose by less than 12 per cent. Net profit, however, turned out to be about 50 per cent higher than last year's owing to the reduced tax liability. The unchanged 10 per cent distribution, therefore, found a higher earnings cover.

THE TATA HYDEL GROUP's chairman, Naval H Tata, has advocated a crash programme of power generation not only to commission the projects which have spilled over from the Fourth Five-Year Plan, but also to take timely action with regard to those included in the Fifth Plan. Since the target for the Fifth Plan would involve creation of additional generating capacity of about 3,300 MW per annum, he suggests introduction of thermal units of 500 MW. He has commended the Maharashtra government for thinking in terms of units of this size for some of its own plants and also in recommending to the Central government that the Tata electric companies' thermal station at Trombay should have an additional multi-fuel unit. Tata is glad that the Union Ministry of Shipping and Transport has decided to provide bulk transport of coal from the eastern region to the southern and western coasts of India, but points out that the Tata companies' thermal station received only a meagre 70,000 tonnes of coal last year against a promised supply of 1,75,000 tonnes. He, therefore, emphasises the need for a second line of defence in the form of alternate refinery residual fuels. Tata observes that the financial provisions and norms provided in the Electricity Act, 1948, are restrictive in terms of growing demand for electricity. He suggests that there should be ample provisions for servicing of loans and borrowings, ploughing back of earnings for rehabilitation, modernisation and expansion and deferred tax liability arising on modernisation and expansion.

All the three companies, namely, Andhra Valley, Tata Power and Tata Hydro-Electric, have already paid the usual dividends on preference shares and at 5 per cent on equity shares by way of interim distribution. The balance available for further distribution in accordance with the government restrictions on dividends would not be sufficient to pay final dividends at the same rates as last year. Representations have been made through the Federation of Electricity Undertakings of India for suitable relaxation from these restrictions and the managements hope that suitable reliefs would be forthcoming expeditiously so as to remove the hardship caused to shareholders of electricity companies. What has prompted the managements of these companies to expect relief even at such a late stage is the fact that the earnings and profitability of electricity undertakings are already regulated and severely restricted in terms of the provisions of the Electricity (Supply) Act, 1948 and the logic that further restriction of dividends would be "discriminatory" and more onerous for electricity companies than for companies engaged in other industries, which probably could not have been intended by government. With a view to enabling the declaration and payment of such dividends as may be permissible under the law in force at the time of the annual general meetings of these companies, should some relaxation be announced by government before the meetings are held, the directors have recommended final dividends at the same rates as last year. They have clarified, however, that in the event of there being no change in the law relating to restrictions on dividends, only preference shareholders would be entitled to the dividends at the rates specified by them.

ANDHRA VALLEY'S final dividends at last year's rates would require payment of Rs 31 lakhs out of the general reserve, while payment of final dividends at the stipulated rates only on two classes of preference shares would demand less than Rs 5 lakhs. The board has also recommended issue of bonus shares on a one-for-nine basis.

TATA POWER will require an amount of over Rs 53 lakhs to pay final dividend on equity and preference shares at last year's rates. But in case there is no relaxation in the dividend restriction, shareholders would be entitled to final dividend at the stipulated rate on the 7.5 per cent preference shares and at only 3.01 per cent on the 9.25 per cent cumulative redeemable 'A' preference shares which, with the interim already paid, would make a total of 7.63 per cent for the year, leaving a balance of 1.62 per cent remaining unpaid. The directors have also proposed issue of bonus shares on a one-for-five basis.

TATA HYDRO'S final dividends on preference and equity shares at the previous year's rates will require over Rs 24 lakhs. In case, however, there is no change in the law, only preference shareholders would get 2.97 per cent on the 7 per cent preference shares. This would make a total of 6.47 per cent for the year and leave a balance of 0.53 per cent as unpaid. In addition, a bonus issue in the proportion 1.12 has been proposed by the board.

In all the three cases, revenue from power supply increased due to higher fuel adjustment charge and revision of tariffs from January 26 last. The total generation from the companies' resources, both thermal and hydro, was less by 674 MUs due to major repairs being carried out at the Trombay thermal power station. This shortfall was made up by increased purchases from the grid. The cost of power purchased increased due to higher purchases from MSEB and upward revision in tariffs from February last. Although thermal generation was less by 682 MUs, the cost of fuel increased owing to the sharp increase in prices of fuel oil. Both clear profits and distributable profits were lower compared to the previous year. The companies issued new debentures to the public aggregating Rs 4 crores at 8.5 per cent per annum. They propose to place privately with financial institutions further new debentures of Rs 5 crores during the current year. The financial resources raised through these issues will enable them to undertake their programme of rehabilitation and modernisation during the next two years.

Thoughtless Thought, Powerless Power

Romesh Thapar

THE moral conscience, if it can be so described of the Congress party has been roused in a most peculiar manner. Whether the assault is on gold and diamond "hoards" in Bombay, on fake medicines in Uttar Pradesh, or adulteration in the Capital, either the wrong persons are being cornered or almost deliberately the "small fish" are being harassed. There must be some subtle scheming in this careful emphasis of the attack. Petty corruption by petty officials? A cover-up for the operations of the Council of Ministers now surfacing solidly in Parliament? Or could it be just plain stupidity of which we seem to possess an unnecessarily large share?

It is difficult to say. Surely, our Intelligence Bureau, under the benign direction of the Prime Minister's Secretariat, knows of more startling gold and diamond hoards than those which have been uncovered so far? Has the righteous passion of the Health Minister abated now that he knows that large numbers of MPs and MLAs are "sleeping partners" of spurious drug firms — and with the blessings of so many Congress Health Ministers, past and present, in the states? And what's going to happen to catering in this country if everything a hotel or restaurant manager buys is adulterated, and he is arrested for buying it?

Whether it is gold or chilli sauce, the real culprits are going free. Somewhere along the line of power, there is a lunatic on the loose. Or are there regiments of them carefully placed at every level?

I have only mentioned a few of the "stories" that are being splashed in the newspapers. We don't really get the dope on businessmen-donors of the Congress party grabbing government land with impunity, or on the ramifications of thousands of steel licences given to non-existent firms, or on famine and flood relief which never reaches the starving and uprooted. It would be unkind to record the present-day comments on "Garibi Hatao". Whose garibi? The administrative system and the ideological style we have given ourselves are spawning a society which carries the seeds of national destruction. It is here that the attack must be launched.

In other words, the obsession of the ruling elite, and those who contend for its power, with the mess of daily scandals has to end. We must move beyond the wretched people who are fattening themselves at the expense of the State and cut off the sources of their nourishment. It is an operation which calls for real courage and perspective, particularly from those honest elements committed to socialistic theories which have not worked, or which have to be worked differently. The apparent paralysis of thought in India actually marks a slow crystallisation of the alternatives which will be advanced to shatter the corrupt superstructure of a mixed-up socialism built up over the last twenty-five years.

Those inane publicists who imagine that the salvation for India is unchecked free enterprise can only be fought in these days of mounting scarcities by a flexible, intelligent handling of each specific challenge. We are far, very far, from this intelligent state. All manner of extraneous arguments continue to be used to justify non-performance. Not a day passes without this mockery of serious decision-making — and by persons who should be throttled when they hide behind ill-digested socialist theorems. If the ministerial hierarchy is developed in the philosophical state of thoughtless thought, then the Prime Minister and her teeny-weeny, glassy-eyed, overworked, overstretching Secretariat (described now as an "Insect"!) are in the whirlpool of powerless power.

Who will cut the knot that holds this *status quo* together? It has to be a non-*statusquoist*. That is why Jayaprakash Narayan became the focal point of a simmering revolt. The hopes which gathered around him began dissolving as the politicians of the *status quo* flocked to him. JP might still cut the knot, but it doesn't look likely. He is toying with parallel, competitive systems. But where is the time for this slow experimentation. He must confront the administrative and political system frontally. It is from there that the cancer is spreading.

Ironic, isn't it, that when George Fernandes launches his abusive attack on Parliament and the MPs through an article in a weekly, the repository of all power decides not to take notice, for fear that notice will give dear George a chance to perform, unrepentant, within Parliament! Yet, almost the same analysis of Parliament and the MPs was presented by several Opposition speakers even as they denounced the ruling party and the attack in the weekly. Now, I suppose we should prepare for withering attacks on MPs and Parliament. The savage truth is that those who make these attacks are hailed as heroes by the public. Everyone needs to digest this fact, particularly MPs who are intoxicated by absurd notions about their importance.

No one defends the administrative and political system. Yes, no one — except, maybe, some cranks inspired by Anglo-Saxonisms. Inevitably, in such a situation, the system will be broken. Naturally, it is better that someone in power does the breaking. To invite the assault from the unorganised masses is to invite chaos and anarchy. This is the essence of the tragedy facing India. No one from within the system is prepared to begin on the business of breaking it up and restructuring it on a more realistic basis. Indira Gandhi, who once appeared to be so motivated, has lost heart or is caught in a trap of her own making.

In this connection, it is pertinent to note that the outsiders who were brought into the system, even at points of considerable power, failed to assert the need for a fundamental restructuring. They avoided being controversial, and continue to do so. Unless, a commitment to restructuring is made mandatory on those specialists and theoreticians who wish to wield power, we will give birth to little else other than inexperienced *statusquoists*, enjoying the thrill of cynically manipulating a nation of 575 millions. Who is going to forge the mandate ("forge" is an unfortunate word these days, but. . .)?

While all this is in the melting pot, is it possible to get hotted up about the messy handling of the 2 lakh population of Sikkim or the future of Sheikh Abdullah or Bhutto's mercurial moods? The sweep of thoughtless thought and powerless power is widespread. We can only hope that somehow the price spiral will be halted in time to give us one more chance to take considered decisions. We don't deserve it, but then somewhere deep down I know our federal polity can only hold if we impose a firm grip over developing events . . .

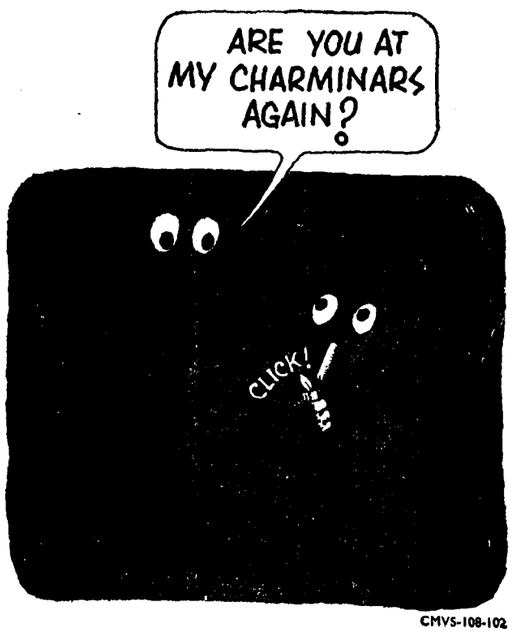
September 9

FROM OUR CORRESPONDENTS

MISA

Pleasure of Indefinite Detention

Mohan Ram



IN its latest judgment involving the Maintenance of Internal Security Act (MISA) the Supreme Court (in Hardhan Saha vs the State of West Bengal and others and Madan Lal Agrawala vs the State of West Bengal and others) held on August 21 that none of the provisions of the MISA violated the Constitution. Individual cases in which authority given to officials under the Act had not been properly exercised or the procedures prescribed had not been correctly followed could, however, be brought to the notice of the courts. The limited parameters of court intervention have thus been defined in the judgment.

Ironically, the petitioners in this case were allegedly involved in economic offences. One of them had been detained under the MISA on the day he was released from prison — to prevent him from hoarding foodgrains. The other, charged with smuggling rice, had been detained within a few days of his release. It is seldom that economic offenders have attracted action under MISA. On the other hand, political prisoners acquitted on one set of charges have all-too-often been rearrested on other charges or under MISA; sometimes those ordered to be released from detention under MISA have been rearrested under MISA just outside the prison or court premises. No risk of contempt of court has attended such actions because it is all within the 'law'.

The two petitioners in the above case had contended that the law of preventive detention was unreasonable and that it, therefore, violated Article 19 of the Constitution; that the law also violated Article 21 because the guarantee of the right to be heard was infringed; that it did not lay down the just procedure or provide the machinery for giving effect to Article 22 (5) which covers liberty and making of representations; and that it violated Article 14 because it permitted discrimination. The petitioners' argument was that MISA did not provide for an objective determination of the facts which were the foundation of a decision to detain a person. The opportunity to make a representation could not be considered reasonable if the order did not disclose the material on which the authority had reached the conclusion that grounds of detention existed. Similarly, the representation could not be reasonable if the detenu had no opportunity to test the truth of the materials relied upon for detention. The act did not define or lay down the standards for the objective assessment of the grounds of detention. Nor did it oblige the government to consider the representation against detention and decide every case of detention on facts and on law against grounds communicated to the detenu.

True, MISA provides for advisory boards to examine cases of detention and all material relating to the detention is to be placed before the boards and the detenus have the opportunity to make representations. But the advisory boards are not obliged to give the grounds for rejecting the representation, which the detenu needs to know to be able to go to court for judicial review in aid of his right of liberty. The order of detention can be passed on acts sought to be prevented and mentioned as grounds of detention but the acts themselves are not defined. The power is so unguided that acts forbidden and acts not forbidden by law are treated alike to be the basis of detention. The detenu is not given the right to be heard on all facts and circumstances and the act does not provide for impartial and judicial consideration of the representation by the government. Finally, it was contended that the act was discriminatory, as under the same set of circumstances some persons were detained, others were prosecuted and still others were both detained and prosecuted.

The Supreme Court has rejected all these contentions. The government has thus received the court's benediction for uninhibited and unfettered use of MISA against those it chooses to detain; merely on the basis of its subjective satisfaction of the need to prevent something real or imaginary from happening. All that the government has to worry about is a few forms and niceties to keep the courts out of the picture. The essential concept of preventive detention, as seen by the Supreme Court, is that of a law the objective of which is not to punish a person for something he has done but to prevent him from doing it. As for the right to be heard, the Supreme Court has held that the representation of a detenu has to be considered by the advisory board which has powers to examine the entire material or call for more material. The board might also call the detenu at his request. The composition of the board (three high court judges or those of similar qualification) is supposed to ensure observance of the fair-play principles of natural justice. But an opportunity of making a representation is not to be equated with an opportunity of oral hearing or hearing before a court and the procedure of judicial trial.

The Supreme Court's philosophy flows from the assumption that preventive detention and prosecution are not synonymous. This is also the philosophy of MISA. The purposes are claimed to be different; the authorities are different; and the nature of the proceedings are different. And so, the argument goes, preventive detention at the pleasure of the executive is perfectly justified. In prosecution an accused is sought to be punished for a past act while in preventive detention the past act (real or imaginary) is merely the material for inference about the future possible conduct.

From the Supreme Court's judgment of August 21, it is clear that

(1) the fact that a detenu is liable to be tried in a criminal court or to be proceeded against for preventing him for committing offences covered under Chapter VIII of CrPC would not by itself bar the government from detaining him under MISA.

(2) the fact that the police arrests a person and later releases him on bail and takes steps to prosecute him under the CrPC and even lodges a First Information Report may not be a bar to an order for detention under the MISA;

(3) where the person is already in prison and is unlikely to be released for a fair length of time, it may be possible to contend that there could be no satisfaction on the part of the detaining authority as to the person acting in a prejudicial manner; however, in the court's view, this again could be a matter of subjective judgment by the advisory board;

(4) the mere circumstance that a detention order is passed while prosecution is pending does not vitiate the order; and

(5) the order of detention is a precautionary measure, based on a reasonable prognosis of the future behaviour of a person based on his past conduct in the light of surrounding circumstances.

The implications are truly frightening. State governments are known to have tried a combination of prosecution and preventive detention to hold its political opponents in continued custody. One is not a bar to the other. One neatly dovetails into the other. Political prisoner A might be prosecuted for alleged prejudicial activities but not detained under the MISA; B may not be prosecuted but may be held under MISA; and C might be prosecuted first and detained under MISA later. Or political prisoner A could be brought under MISA even while the prosecution is on or at the end of it. Similarly, B, while under detention, could be covered by specific criminal charges. This is what has been happening in West Bengal.

The life of MISA being linked to that of the State of Emergency proclaimed in December 1971, each seems to provide the alibi for the other and political opponents of the government and the opponents of the government and the ruling party can be coerced and harassed for indefinite periods by ruthless permutations and combinations of the MISA, the DIR and the normal criminal laws.

India, they say, is the world's largest democracy.

TEXTILES

Loin Cloth on Too High a Peg

THE government has extracted enormous propaganda-mileage out of the so-called controlled cloth scheme. The scheme was designed to ensure that a part of the total output of cotton cloth would be of varieties that are used by the relatively poor and would be sold at prices which they can afford. The scheme has been in existence for almost ten years now. However, considering the scant attention paid to its operational details, it is evident that the government has never been really serious about the scheme.

The proportion of the total production of textiles which is expected to be of the controlled varieties has been progressively reduced by the government. What is worse, the actual production of controlled cloth has been consistently below the levels stipulated under the scheme. These facts are brought out in the 61st Report of the Estimates Committee (1973-74) on the Civil Supplies Organisation of the Ministry of Commerce. When the controlled cloth scheme was first introduced in October 1964, it covered about 50 per cent of total production and the obligations of individual mills were statutorily fixed. However, with effect from January 1, 1967, the proportion of controlled cloth was reduced from 50 to 40 per cent. The scheme was modified again in May 1968, and the controlled proportion of total cloth output was further reduced to about 25 per cent. Actual production of controlled cloth has been consistently far below even these statutory requirements. It declined from 200 mn square metres in the November 1968-January 1969 quarter to as low as 9 mn sq metres in the quarter February-April 1971, or less than 1 per cent of cotton cloth production.

Till June 1971, the obligation on the mills to produce controlled cloth was statutory. However, having allowed the mills to flout the statutory obligation with impunity, the government then agreed to switch to a scheme of voluntary control, under which the industry agreed to produce 100 mn sq metres of controlled cloth per quarter — or less than 10 per cent of total production (compared to 25 per cent under the 1968 scheme, 40 per cent under the 1967 scheme, and 50 per cent under the 1964 scheme). However, except in 1971-72, actual production was far below the voluntary obligation accepted by the industry. In the last quarter of 1973, for instance, it was around 67 mn sq metres against the 100 mn sq metres agreed to under the voluntary control scheme.

Voluntary control having fared no better than the earlier statutory arrangement, the government reverted to statutory control in March this year. With a flourish it announced in Parliament that the obligation on the industry to produce controlled varieties was being stepped up from 400 mn sq metres to 800 mn sq metres. At the same time, the controlled prices were raised by a steep 30 per cent and the retailer's margin was increased from 12.5 per cent to 20 per cent. Also, the penalty for non-fulfilment of the controlled cloth quota was raised from Re 1 to Rs 2.50 per sq metre. However, neither the substitution of statutory for voluntary control nor the steep increase in prices nor the higher penalty for non-production appears to have had an impact on the production and availability of controlled cloth. Against the required production of 200 mn sq metres in the

trolled cloth. Against the required production of 200 mn sq metres in the quarter April-June 1974, actual production is estimated to have been 80-90 mn sq metres.

Under-production of controlled cloth is not the only way in which industry has tried to sabotage the scheme — of course, with the connivance of the government. It has adjustered the variety-wise pattern of production towards similar ends. Thus, of the different varieties of cloth covered by the scheme, the mills have been producing negligible quantities of sarees, dhoties, shirting and drills, and boosting their total outturn of controlled cloth by producing large quantities of longcloth. The objective is very clear: to protect the market for the more expensive, uncontrolled varieties of sarees, shirting, dhoties, and drills, by keeping to the minimum the production of these varities of controlled cloth. According to the National Co-operative Consumers' Federation — one of the agencies charged with the distribution of controlled cloth — the total production of controlled cloth is currently distributed among the different varieties roughly as follows: dhoties 5.8 per cent, sarees 1.4 per cent, shirting 12 per cent, drill 0.2 per cent — and longcloth 80.5 per cent. The powers which the Textile Commissioner has under the new scheme of control to regulate the variety-wise production of controlled cloth have apparently remained on paper.

Adequate arrangements for distribution are crucial to the success of any scheme designed to make available a basic necessity such as cloth at controlled prices. But one finds that the distribution aspect of the controlled cloth scheme has been completely neglected by the government. This is evident from the casual answers given by the officials of the Ministry of Commerce, which is responsible for administering the scheme, to the questions put by the Estimates Committee.

Asked whether any control was being exercised by his Ministry on the distribution machinery to ensure that the controlled cloth was properly distributed, the official's reply was: "I do admit there is responsibility on us. But what I wish to say is that we have entrusted this to fully recognised institutions which are formed under the law and they have got legal status". Further, "The National Co-operative Federation and other co-operative societies should also take it that it is their responsibility to see that proper price is charged. If they also over-charge, what can we do? If such a thing is done, I won't even know of the transaction. It is largely their responsibility. We cannot have a police (*sic*) on every co-operative." The Commerce Mniistry's spokesman also took recourse to the plea that it was the responsibility of the concerned state governments to keep a check on the distribution of controlled cloth and that, if any malpractices were noticed, it was for those governments to take suitable action under the Essential Commodities Act.

The choice of distribution arrangements for controlled cloth appears to have been influenced by the fear that, since the prices of controlled cloth have been fixed relatively low, if it is sold through normal trade channels prices higher than the controlled ones would be charged; in other words, that there would be black-marketing. This has persuaded the government to restrict the distribution of controlled cloth to the following channels: mills' own retail shops, super bazars in the co-operative sector, the National Co-operative Consumer Federation and the chain of co-operative institutions affiliated to it and fair price shops run under the aegis of state governments.

This restriction of the distribution channels has, on the other hand, provided the mills with the occasion to complain that these distributors — whose resources in terms of finances and the number and spread of retail outlets are admittedly limited — are not lifting the controlled cloth produced by the mills. This, in turn, has given the mills the grounds for arguing against larger production of controlled cloth. The government has admitted to the Estimates Committee that the existing channels of distribution "do not have adequate retail outlets to replace the traditional channels and reach the cloth to the weaker sections of society both in the urban and in the remote rural areas". Yet in all the numerous official statements on the scheme, there is no hint that the government is proposing to make the distribution arrangements more effective.

In sum, without the co-operation of the mills, with the government either unable or unwilling to enforce the scheme on them and with distribution arrangements which are wholly unequal to the task of taking the controlled cloth, even if it were available in sufficient quantities and in the required varieties — which it is not — to those for whom it is intended, the much-touted controlled cloth scheme has been a total wash-out.

BIHAR

A Flood of Doubt and Hope

Arvind Narayan Das

THE zest has gone out of JP's programme of "total revolution". The vision which he gave to his young followers that it would be completed within a year has been smashed by reality. The agitation in Bihar is entering its ninth month and JP himself has been at its helm for nearly half a year. Scores of young men have laid down their lives, hundreds are rotting in jail, thousands have sacrificed their careers by boycotting classes and examinations. But price rise, unemployment, corruption — the essential issues they believed they were fighting on — remain. JP carries on and on, but the youth of Bihar have started asking questions.

Till July, when JP addressed a meeting in the Gandhi Maidan in Patna, in spite of torrential rain, thousands flocked there and listened with patience and even reverence. The fact that under his leadership the movement had strayed from its essential objectives to futile demands for Assembly dissolution and self-defeating efforts at *"kaksha-pariksha bahishkar"* ('boycott of classes and examinations'), was forgotten. There was magic still in the sight of the old man, drenched to his skin, thundering against police brutality, calling on the people to unitedly fight against corruption. So the people listened.

Doubts began creeping in when JP started announcing his programmes. After having impressed upon the audience that the people were incapable of putting up positive resistance to police brutality and that they should therefore convince themselves that the only thing they could do was to turn the other cheek, he proceeded to outline a series of 'Days' to be observed: Anti-Repression Day, Revolution Day, People's Independence Day, etc. This is a repetition of the sort of thing that has been going on ever since JP entered the movement: programme after programme of propaganda, but no programme of agitation. Having inspired thousands of students to give up studies, JP called for five thousand amongst them to become "total revolutionaries" by enrolling their names in his Sangharsha Karyalaya. Followed a panegyric about various obscure Sarvodayists, whose role in the movement is known perhaps to JP alone. The militant students who would have volunteered started wondering if the whole movement had not become a recruiting campaign for Sarvodaya. Since they were ony willing to co-operate with the Sarvodayists in a united struggle against the government and its brutal repressive machinery, and could not understand the ideology of Sarvodaya most of them ignored JP's call for volunteers. And since then he has been largely ignored.

Though the large majority of the student-youth section has ignored JP's programmes, piteously small bands of devoted Sarvodayists and even some students who are eager to do something and cannot find another line and leadership, are hoisting flags, holding meetings, observing one 'Day' after another. The most pathetic of these Days was the 'People's Independence Day' on August 15, when the official celebrations were boycotted and little clusters of nationalists bravely tried to wrest the credit for Independence from Congressmen by bravely hoisting the national flag.

And JP has also tried to revive memories of the Independence struggle by trying to stage dharnas on liquor shops. For good measure, he has also added cinema halls to his list of places to be boycotted. Thus, today in a way, the choice in front of the 'lumpenised' students of Bihar is between two national heroes, Jayaprakash Narayan and Shatrughan Sinha. A difficult choice indeed!

However, 'JP's Movement' is only a part of the story of Bihar. Although large numbers of activists have got demoralised, although many have given up, although the leftist forces are badly disorganised, still in several pockets, students and youth, uniting with the broad masses, are carrying on the struggle. In spite of police repression and the administration's blatant siding with the profiteers and black-marketeers, anti-hoarding campaigns are going on. Whenever the students have gone to the countryside, demands of "Land to the Tiller" are being initiated. The slogans are also changing. In many places today the students are shouting, *'jaise jaise hamlaa hoga, waise waise haath uthega*! ('the nature of the repression will determine the nature of resistance).

It would be very wrong to think that the Bihar agitation is finished. What has happened is only that the initial, somewhat unthinking outburst is over. The activists have now finally got down to thinking about what they were fighting for and the manner of their struggle. The plethora of new youth magazines, which are more reflective, self-examining and educative than directly agitational, is evidence of the fact that the struggle continues. For the root causes of the agitation are still present in semi-feudal, non-developing, backward Bihar. All the waters of the flooded Ganga cannot wash those causes away.

THE NORTH-EAST

Report from a Khasi Village

M S Prabhakar

IT rains very heavily on the southern slopes of the Khasi Hills. Mawkyrwat — the village where this correspondent recently spent fifty days — is on these slopes and about fifty miles from Shillong, roughly south-west of it. During my initial days in Mawkyrwat, some people — the educated elite of the village — entertained a suspicion that I was connected with some investigative agency of the state or Central government. After fifty days in the village, I could not fathom why any government agency should want to 'investigate' that place. Nevertheless, the fact that my presence did initially stir such anxieties suggests that 'investigation' of the sort that villagers feel anxious about is not uncommon in this region. I, however, found Mawkyrwat an exceptionally placid, peaceful place; the only unruly element was the heavy rainfall and the weather.

Mawkyrwat is easily accessible by road; private buses ply regularly twice a day, to and from Shillong. The journey takes about four hours. When the rains are very heavy, there are frequent landslides and 'slips', and huge boulders occasionally come hurtling down the hillside and block the way. Traffic tends to be delayed and even disrupted, but the disruption does not last long: I once watched the blasting of a couple of boulders which had rolled down and were blocking the road and lent a hand to clear the debris. The PWD has little to do with these inputs of labour. On the narrow hill road from Shillong there are three 'gates' regulating the inward and outward flow of traffic — one at Mawphlang, about 14 miles south of Shillong, the second at Weiloi, another 16 miles south, and the third at Mawkyrwat itself. Mawkyrwat's altitude is less than that of Shillong; no one was able to tell me precisely what it is, but I should guess it to be over 4,000 feet above sea level. A few miles to the south and west are the peaks of L Sohlamat (5,000 ft) and L Kyllilong (5,127 ft). Though it is lower than Shillong, Mawkyrwat, I am told, has much more severe winters due to harsh winds that blow from all directions in the open hills. The village is not yet electrified, though poles have been planted. The nearest telephone is at Shillong. There is a post office, from where the mail may be collected once or twice a week when the mail is brought in by the runner from Laitmawsiang, about 15 miles away.

Goldsmiths, but No Tea Shops

But Mawkyrwat is not a tiny village by the norms in these areas. It is, in fact, the capital of one of the small states of the Khasi Hills — Maharam Syiemship — and as such is the residence of the Syiem or the chief of the state. (Formerly, the Syiem used to reside in Jakrem, about five miles away.) There are altogether 96 'households' in Mawkyrwat. According to the 1971 Census, the population is 659. There are five modest shops which could pass as grocers and general merchants shops. Prices here are invariably higher than in Shillong from where all the supplies have to be brought. There is no other retail business, though there are many wholesale dealers in potatoes, but they are active only on the bi-weekly bazaar days. There are no regular teashops; but one can get a cup of tea in the kitchen of a couple of houses at 25 p or 30 p per cup, and the tea is specially made for the guest. These are cosy, homely, untidy kitchens, the hosts are very hospitable, and for all the jumble of a home lying around you the china is spotlessly sparkling. Only on bazaar days do the tea shops proper open. There are, surprisingly enough, two goldsmiths — plainsmen from East Bengal — who have small shops; and, I understand, business is brisk. They serve the needs of a larger community than that of Mawkyrwat.

There are in Mawkyrwat about half-a-dozen government or semi-government establishments — the Block Development Office, the PWD, the dispensary, the police outpost, the ME School, and

the little village post office. The total number of salaried employees in the village is a little over 70: about a dozen of these are plainsmen, the rest are all hills people though not all of them are from Mawkyrwat or the neighbouring villages.

The Churches

The composite ME school and high school has about 250 students and 11 teachers. There are also three LP schools — run by the Presbyterians, the Church of God, and the Roman Catholic Mission. In fact, the majority of the residents of the village are Scottish Presbyterians, and a small minority belongs to the Church of God, both of whom have churches in village. Though the Roman Catholic Mission in Mawkyrwat has ambitious plans for expansion of its activities, there are as yet only a very small number of Roman Catholics — less than a dozen households, according to the priest in charge of the Mission. They do not even have a church; a small chapel attached to the Mission ministers to the adherents. There are also a handful of non-Christian Khasis, whose sole mark of separate identity is the fact that they may be seen working on Sundays, whereas the Christians observe the Sabbath most strictly. In fact, the Bazaar, which sits every four days, is put back to a Saturday and put forward to a Monday every seventh and ninth week when it would otherwise fall on a Sunday. Indeed, despite the few non-Christian Khasis in the village, practically all public activity ceases on Sundays and even the bus from Shillong arrives only once and late in the evening.

The residents of Mawkyrwat — like the residents of any other village in India — are primarily agriculturists. But agriculture is a much harder way of life in the hills than on the plains. Even the most prosperous of farmers, with the largest holding of land, can only be described as moderately well-to-do; his lands are in very small plots and are dispersed over a wide area. In and around Mawkyrwat, there is no extended plain surface and the hills have to be constantly cut, terraced, and levelled to get a patch of cultivable land. And this strenuous process is a constant, unending one. No wonder, the people have traditionally never acknowledged the right of any government to levy taxes on the land which generations of them have toiled to claim for cultivation from the hills. Even today it is not clear how the new state is going to raise resources from taxes on land. The soil too is harsh and poor in and around Mawkyrwat, and there is limited scope for multiple cropping. There is no *jhumming;* but neither have the people taken to the plough. The main crops are potatoes (harvested in May-June) and paddy (harvested in November); maize is grown along with the potatoes; and, in the cold season, some sweet potato too is harvested. It is almost impossible to collect any reliable data on the average land holding and the area under different crops.

Apart from the crops grown in Mawkyrwat, everything else has to be brought in from Shillong. Even the rice grown here is not adequate to feed the population. The local rice is a rather coarse, red variety. Much of it is made into the fiery local brew 'kakyat'. Those who can afford it, buy the 'imported' rice — whose price, during my 50-day stay, rose from about Rs 5 a 'kriah' (i e, eight measures of an empty condensed milk tin, or a little over 2 kg) to about Rs 8 a kriah. It was asserted that the price of rice would rise even higher. In fact, during the lean season (August-October), most people would not dream of eating rice every day; they make do with maize and potatoes; and those who cannot afford even these will consume roots and tubers such as colocasia. Fortunately for the people here, beef is easily available. It is considerably cheaper than pork and fowl, which are considered luxury foods. Meat is sold by the portions; it works out to roughly Rs 3 or 4 per kg of beef and Rs 8 to Rs 10 per kg of pork, varying with the quality of beast slaughtered, quality of cut, etc.

On the bazaar days, brisk dealings take place in potatoes — the main crop of this area. One can see people carrying loads of potatoes on their backs from neighbouring villages for sale to the wholesalers in Mawkyrwat. Lorryloads of the crop are constantly carried to Shillong.

Tailoring and 'PWD contracting' are two ancillary occupations of the residents of Mawkyrwat. A considerable quantity of ready-made clothes sold in the bazaar are stitched in the houses of Mawkyrwat. There are a host of contractors and sub-contractors — far in excess of the available 'works' on the roads and culverts maintained by the PWD. But evidently there is money in it. But be they shopkeepers, agriculturists or contractors, the people exhibit a total absence of servility. Not only are there no beggars; but the poorest and the humblest in the village does not behave nor is treated as if he were socially inferior. I witnessed too many incidents, came across too many situations, for this to be merely a romantic 'impression'.

The Bazaars

The Khasi week consists of eight days. The two bazaar days in the week are known as Bada Bazaar and Chota Bazaar. On Bada Bazaar day, all the 400 or so 'stalls' are occupied and many others set out their wares by the side of the narrow mud lanes that criss-cross the bazaar area — perhaps 'illegally', for there is a rent to be paid to a family syndicate which owns the bazaar area. Business is almost as widespread an occupation as is agriculture, but 'business' here is of a very humble kind and often consists of sellers sitting patiently behind their goods whose total value might be less than Rs 10. Most of these 'traders' are from villages nearby; a smaller number is from Mawkyrwat itself. Some of these bring goods from Shillong and sell them at the bazaar: biscuits and bread, textiles and toilet goods, medicines, and other provisions. Betelnut comes from Mawsynram. Pigs and cattle are slaughtered locally; dried fish is imported. Fresh fruits are brought from the 'war' area, about 10 miles southwards. The Mawkyrwat bazaar is at the very core of the village, not merely in that its location is in the heart of the village, but that it constitutes the centre of social, cultural and economic activity. Buying and selling are, undoubtedly, the most important activities during the bazaar day, but hardly less important are the visiting and the fraternising, the watching of a football game in the school field (about a dozen teams from nearby villages have been playing a 'round robin league' for many months now), the convivial drinking and gossiping, and the boy-girl watching. Yet, behind all the merry bustle of the bazaar lies an accepted routine of extreme hardship.

I arrived at Mawkyrwat on a Bada Bazaar day. The bus at Shillong was already loaded far beyond its capacity with people and goods; on the way, we picked up more people as the bus wheezed and creaked along. Of course, the majority of the more than 5,000 visitors to the bazaar had not travelled to Mawkyrwat in overcrowded buses and jeeps. They had walked, as always. Many of them walk for five to six hours from early morning to reach the bazaar around 10 a m. Here is a

Maize starch plays a vital role in our lives.
Maize Products discovered its versatility in India... a quarter century ago!

Leading industries now depend on us for a regular supply.
To manufacture textiles, paper, dry cell batteries, confectionery, pharmaceuticals, life-saving injections...and more.

For us at Maize Products, starch still holds endless promises.
That's why our research experts are always on the job.
Constantly adding new chapters to the story of starch.

fairly typical portrait of Esther, a woman whose routine on such a day I have pieced together after several conversations with her.

Esther is about 45 years old. She looks older today, though a decade ago, I was told, she looked far younger than her age. She walks barefoot, though otherwise heavily clad in skirt, mantle and cloak. She lives in a village seven miles from Mawkyrwat. On her way to the bazaar in Mawkyrwat she has to climb up and down the path which most times leads up several small summits and is crossed by two streams with no bridges on them so that when the rains are heavy she has to make long detours to find a safe place to cross them. (Last month, on such a day when the rains were heavy, an elderly man on his way back to his village from the bazaar, slipped and fell into one stream and was washed away.) Esther leaves her home at about five in the morning, after a meal of a little rice, smoked beef, a chutney of dry fish, and tea. She carries on her back a long conical basket full of potatoes (about 30 kg), and two bags slung across her shoulder consisting of odds and ends. She also carries an umbrella and the long scoop-like bamboo 'knup' (covering) which offers protection during the heavy rains.

More than a dozen people — all, save two, women — make the trip to the bazaar from that village. With two other women for company Esther leaves ahead of the rest. She is married and has six children; she is already twice grandmother. Her husband is a bit of an idler perhaps — given to drinking and archery and spending whole days fishing without catch — but he is nonetheless quite affectionate and has never deserted her. And when he does work, he works very hard. They have two small plots of land on which they labour, and they are planting sweet potato shoots now in one of them; the other plot already has healthy paddy seedlings on it. None of Esther's children have studied beyond the LP School. None in the family speaks or understands any language but Khasi, though the children constantly hum and whistle Hindi film songs. She will sell the potatoes in the bazaar for between Rs 25 and 27 and she will buy some rice, meat, salt, some small dried fish, a roll of sewing thread, tambool, some tobacco for her husband, and some tea. After her tasks at the bazaar are over, and after she has eaten a plate of rice and meat later in the afternoon, she might be left with Rs 11. At about four, she will start the trek back and hope to reach home before nightfall. The way back is comparatively easy and will take less than three hours as it is more downhill this time. She has to take care, however, not to slip and twist her ankle.

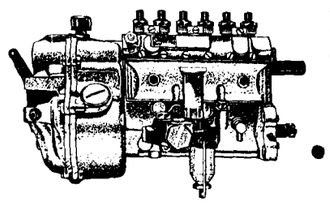
Beyond the Tourist Posters

Hundreds of people like Esther visit the Mawkyrwat bazaar every fourth day. Many travel longer distances, carry heavier loads, and are altogether much worse off than Esther. To visitors they look 'picturesque' as they trudge up and down the paths — especially when, on their way back, they have to carry lighted bamboo staves to guide them along narrow slippery paths, and so appear as little specks of flickering light in the dark distances. Such picturesqueness to others notwithstanding, theirs is a life of unimaginable hardship. Three years ago, this correspondent spent a similar summer in a plains village; life was hard there too; but people did not have to struggle with the same forbidding landscape which the people of the hills have to face all their lives. Of course, most hills people are spared the terrible floods, though. Bitterly cold winters, wet monsoons when the sheets of rain seem to assault you personally from all directions, and winds whose screams are enough to drive the unaccustomed crazy — such are the elements in the hills. For months on end, one seldom sees a patch of blue in the sky; sunlight is only a memory. Most men learn to live with trousers perennially wet from the knee down. All the diseases associated with cold and damp are accepted as facts of life.

The tourist posters about the huntin' and the fishin' and the ridin' and the boatin' and golfin' tell you nothing about the facts of life in these parts. While in Mawkyrwat, I went on a day's outing to a place called Kynoing, about 10 miles south of Mawkyrwat, in the old track to Balat. Before 1947, Kynoing was the traditional exit for the people and goods of this as well as of the 'war' area, as also the traditional hinterland of the Balat and regions to the south and west. It is a rough journey, the roads and paths are especially severe on bare feet, and city men cannot walk even a hundred yards on these paths with the sharp slivers of brittle rock and pebbles strewn all over the roads. The experience has nothing in common with the image of ecstatically running barefoot admist the dew-covered pine needles in the 'woods' of Shillong!

I did not discover any strongly held political views in Mawkyrwat. But the whole area is an opposition stronghold — lost irrevocably to the APHLC, which probably explains the suspicions which my appearance roused among some people. During my stay, people were more interested anyway in a local political fight — the election to the office of the Syiem of the Maharam Syiemship. Two young men of Mawkyrwat were the candidates, and the election — by an electoral college consisting of 63 'Myntris' from the villages under the Maharam Syiemship — was due on July 24. I did not discover much about the functions and powers of the Syiem. The Syiem is regarded highly, but he is very much one of the village. There were no signs of the feudal lord.

There cannot be varieties of poverty; in Mawkyrwat there is harsh poverty. Sharp practice and cunning is undoubtedly there — as abundantly as anywhere else. It is more or less taken for granted that government and public funds are there for milking; but, in individual relationships, there is a peculiar integrity and dignity.



One often hears the complaint that the 'tribals' are lacking in a pan-Indian awareness; that they are not part of the 'mainstream' of national life; that the more educated among them are more aware of events in England and the US than in the rest of India. Let me conclude this personal report with a little incident. During the fifty-day stay I was completely cut off from all news of the world outside of Mawkyrwat. I could have listened to a news broadcast by walking a hundred yards, but somehow I never made the effort. Nobody gave me any news either. But I was fully posted on the progress of the three cricket tests between England and India, despite my repeated assurances that I was not at all interested in the game! At the same time I never seemed far away from Hindi filmi geet, played over ubiquitous transistors or sung and whistled by cowherds. My informants were inconsolable over the results of the Tests; Vividh Bharati was the only restorative. Perhaps, the 'mainstreams' may indeed see in this a hopeful sign: what was lost in the playfields of England is going to be gained in the wonderland of Bombay filmi geet. Surely a most dependable medium of National Integration!

INJECT
FUEL ECONOMY
INTO YOUR
DIESEL ENGINE

How to be MICO-nomical and save fuel

MICO fuel injection equipment is precision-engineered to give fuel economy. Periodic maintenance is essential for continued fuel savings.

- Insist on genuine MICO spares and service. At MICO Service Centres you get expert attention from trained personnel. They ensure that worn-out elements and delivery valves are replaced, the pump is calibrated correctly and the injectors work smoothly, with the right opening pressure.
- Replace fuel filter inserts at recommended intervals.
- Beware of spurious or reconditioned parts. They can cause excessive fuel consumption and damage the system.

Labour Value of the Housewife's Work

Wandana Sonalkar

SEVERAL welfare states in the West pay out family allowances. Among them is Britain where since 1949 a weekly sum has been payable by the state to every mother towards the maintenance of her children. This sum is to be collected by the mother and is expected to provide security against irresponsible husbands, especially in low-income families. In 1972, the Conservative government, in the course of a series of measures attacking the income of the low-paid worker, proposed to transform this allowance payable to the mother into a tax credit for the wage-earning member of the family. The proposal was withdrawn following women's demonstrations of protest. The campaign for the continuance of the family allowance was greeted with abuse by many liberal men: "hysterical", they don't undertand the nature of the welfare state", etc. However, the campaign did succeeded in protecting the right to a measure of security for many women in a society where the family structure is slowly disintegrating and leaving them and their children most vulnerable.

This campaign is mentioned because it serves to introduce the attempt, at about this time, to develop an economic analysis of the function of housework in capitalist society. This analysis led to a most invigorating debate within the women's movement and eventually to the first steps towards an extension of the Marxist method to the problems of women. Selma James in Britain and Mariarosa della Costa in Italy examined the working class family and asked the question: what contribution does work done in the home of a worker make to the creation of value in the capitalist economy? Their question is relevant and important. We have seen that the investigation of the contradictions within the bourgeois family had led feminist theorists to a dead end. Also, many women in the movement were beginning to be guiltily aware that working class women had not hitherto played any part in it.

Why was this so? Some tried to do away with the problem by quoting Engels: ... among the proletariat ... all the foundations of classical monogamy are removed. Here, there is a complete absence of all property, for the safeguarding of which, monogamy and male domination were established. Therefore, there is no stimulus whatever here to assert male domination". The quotation is not quite satisfactory as it is clearly observable that there is male domination in the working class family as well as in other families. The wives of many workers do not go out to work and even those who do still bear the major responsibility for housework and child-rearing. These household functions do not bring them into direct confrontation with the capitalist class. The nature of their labour remains private and isolated. And so their political awareness tends to lag behind that of their husbands and their attitudes are prone to the same kind of mystifications as those of their bourgeois sisters.

Unpaid Labour at Home

Proceeding from these bases, James and della Costa set out to define the economic function of housework in the proletarian family. Housework, they argued, is unpaid labour which contributes to the subsistence and productivity of the labourer. Hence, it contributes to the formation of surplus value. Traditional economic theory, serving as it does to obscure the actual social relations between people, does not recognise that value is created in housework. Therefore, in order to make women and the working class aware of the true nature of these relations, the women's movement must put forward the slogan: "Wages for Housework". It must use the method of strikes, i e, the withdrawal of women's labour in the home, in order to press for wages. Such strike action would hit not only at the men who act as agents in propagating the mystifying ideology, but at the capitalist system also.

The argument was a seductive on But attempts to organise the proposed strike action failed. And shortly afterwards, a criticism of this theory was most fully presented in a paper by Jean Gardiner at the Conference of Socialist Economists in London last year. Gardiner argues that in addition to being merely economist the wage demand is based on an incorrect interpretation of the economic role of women's household work. And even if it were possible to organise such a struggle, it would not hit at the capitalist class but at the man in the home.

The work done in the home by the wife of the worker certainly contributes to his standard of living; this becomes clear through comparing the life of the married and the unmarried wage worker. But how exactly does it benefit the man's employer? Merely to assert that it is unpaid labour and therefore contributes to the formation of surplus value does not contribute to understanding the situation. Gardiner uses the analogy of the urban labour force in some West African economies where the labourer employed in capitalist enterprises in the towns, commutes daily from his rural family homestead which provides him with food and his basic necessities. (This may also be the case in some parts of India.) Thus his wage can remain very low. And even that meagre wage is spent mainly on the purchase of manufactured goods. The pre-capitalist sector of the economy thus looks after the subsistence and reproductive needs of the worker and the wage he earns goes back into providing a market for the capitalist sector. This relationship between the capitalist and pre-capitalist sectors helps to keep wages low and s contributes to increasing the rate of exploitation and surplus value.

The West African analogy is instructive in exposing the household as a pre-capitalist 'sector' within the capitalist mode of production. Capitalist laws of value do not operate in this sector. The housewife is not paid a wage. Underemployment in the household manifests itself not only in the fact that much of the housewife's labour is spent on 'unnecessary' tasks, but also in that during periods of near-full employment such as the Western economies have experienced since the Second World War, extra labour is obtained by drawing more women into the working force. But even then female wage labour is usually employed in the most repetitive types of work or work requiring some manual dexterity. These are the lowest-paid jobs and even where legislation for equal pay for equal work has been passed, this division of labour has preserved the role of women's earnings as merely an addition to the housekeeping budget. Thus even where women are employed as wage labour they are relegated to a secondary, 'housekeeping' role. That this division of labour is not the outcome of any biological limitation in women's capacity to work is proved by the fact that during both the World Wars large numbers of women worked perfectly efficiently in traditionally 'male' jobs, including supervisory work. At the end of the Wars, the men's trades unions protested in order to ensure that they would not have to face female competition in their jobs.

To carry the analysis further, the economic basis of sexual discrimination within the family is similar to the contradiction between the urban proletariat and the poor peasant. But to understand this contradiction within the working class family, much more work must be done on the effect of the existence of the reserve army of unemployed female labour on the wages of male workers, on the pattern of employment of women in the labour force, on the special problems of organisation of female workers in industry. Then, perhaps, the women's movement will be able to awaken the working class housewife to her role in the system — a system which exploits both her and her husband. That these problems have been stated and are being faced as the outcome of activity within the women's movement affirms the movement's historical importance.

Ulster's Workers Show the Way

Farrukh Dhondy

CRISES don't hang fire. Like firecrackers, once the fuse is lit they fizzle or explode. Northern Ireland is unique in that for five years its crisis has been daily news in Britain. The settlement of the crisis of Ulster will be the settlement of the long-term political problem. It is a war and it isn't. It is a class war and it isn't. Governments have changed hands, a thousand civilians have been killed, almost three hundred soldiers of the British army have been killed, British cities have suffered bombings and this year the Houses of Parliament were bombed for the first time (apart from a stray German bomb during the Second World War) since Guy Fawkes' unsuccessful plot, and the historic Tower of London, a sort of innocuous symbol of tyranny has been damaged by explosion.

More important in political terms than the explosions, the unrest in Ulster has caused the first situation of dual power to exist in Europe since May 1968 in France, and in the British isles since the 1926 General Strike or even perhaps since the days of Cromwell. For two weeks in May and June this year, glorious or not depending on your standpoint, the Ulster Workers' Council took the government and the day-to-day running of the province into its control. It forced the resignation of the power-sharing assembly which was presided over by Brian Faulkner's Unionist Party and forced the British government to take the province under direct control. In Indian terms it would mean something akin to the toppling of a state government by industrial agitation and the declaration of Presidential Rule from Delhi *after* the troops had been sent in and had been found impotent. More than that, the Ulster Workers' Council established it could run by the province by delegating duties to its own networks. It took over the supply of everything — food, power, fuel, orders. It set up barricades and made decisions about who went where and moved an armed wing onto the streets. Apart from withdrawing its labour, it conceived and executed the functions of power. The Protestant housewives ran the distribution and information centres during the strike. The Catholic areas were left to the jurisdiction of the Irish Republican Army (IRA) which organised the movement of fuel and supplies in these areas.

The strike added a new dimension to the politics of Northern Ireland. The least it did was split the bi-partisan front on British policy towards Ulster, and posed for the first time in potent terms the real probability of an independent Ulster. Since 1916, the independence of Northern Ireland has been a theoretical possibility, but has always been opposed by the 'loyalist' and 'Unionist' leadership of the Orange Protestant Order whose interests coincided with those of British capital in the province. Today the question of independence is being posed by an active working class. If the strike proved anything, it proved that workers withdrawing their labour and forming alternative structures of control in support of a political demand are finally in the strongest bargaining position that a state like Britain is susceptible to.

For over 60 years the Irish question has been presented as a dispute between a Protestant majority and a Catholic minority with the Catholic state of (southern) Ireland waiting in the wings. These have been real bargaining divides and have by and large left the working class of Britain apathetic to the question. The bi-partisan policy of co-operation between Labour and Conservative has been facilitated in this climate of opinion. And yet over the last year things have changed. The bi-partisan front has been able to get away with murder, literally. British soldiers have been killed in return and the pain of this the British working class feels acutely. Increasingly there have been desertions from the British forces stationed in Northern Ireland. The troops don't believe in the colonial role they are playing and the withdrawal lobby has gained strength.

In early June when the strike threatened to close the file on the worked out plans of the joint parties, the Conservative opposition was fearful that Harold Wilson's Labour government would succumb to pressure and withdraw the British troops from Ulster. The Labour Left began to voice the view that Ireland must be left to settle the Irish question. What could that mean in real terms? It could have meant a standard manoeuvre of decolonisation: the setting of a firm date for the withdrawal of troops, the release of internees and the creation of representative assembly to make a constitution which would guarantee minority rights, parliamentary rule and capitalism. Classical solutions can come too late. The Tories feared that the solution would not only initially cause a civil war and invite the intervention through Catholic solidarity of the Dublin government, but could later also pose the possibility of class unity between the Protestants and Catholic of the North.

Signs of Unity

Though signs of this potential unity have already emerged, it is by no means certain that the prejudices and fears of hundreds of years will melt away. In the history of Ulster there has been an alliance across class lines between the Protestant working class and the Protestant bourgeoisie which leads the Orange Order and for which the so-called leaders, Ian Paisley and William Craig, speak. The alliance has been partly based on the ownership of Northern Irish textiles by joint local and British capital and the provision of employment, livelihood and preferential treatment for the Protestant population. The post-War expansion of international capital has steadily eroded the material base of this tenuous alliance. The influx of this 'new' capital has brought in the cartels and alternative industry. It has also led to the

search for higher productivity. The British government has promoted the influx of international capital and the passing away of control from the local capitalists and landlords. Southern Ireland has been affected in a parallel way. At the same time, both Northern and Southern Ireland have provided Britain with agricultural products and with immigrant labour for those sectors of the British economy which experience an indigenous labour shortage.

William Whitelaw's White Paper published at the end of 1972 for the Tory government stated that "the economy and the security of Northern and Southern Ireland are interdependent". So far, the two only share road and rail lines and a hydro-electric project. Obviously the White Paper was sketching a future in which capital would create political unity. But it did not mention that it is these same material conditions that may make possible unity between Catholic and Protestant workers and also bring to the forefront the idea of a break from Britain.

No one can claim that this is how the issue is presently seen. For the Protestants, the prospect of independence has so far meant the threat of a takeover by the Pope *via* the Papist South. For the Catholics, their cherished programme has been one of Irish unity based on religion, on race and on culture. Since the partition of Ireland in 1920, the IRA has carried on the battle with the British government and the rule of the Northern Protestants, relying on outlawed Republican organisations in the South to ensure an operational base.

The Protestants have had a rabidly right-wing leadership which has based its public perspective on loyalty to the monarchs of Britain, Union Jack waving, parades and practical discrimination — ingredients of a negatively defined programme. Their forces of terror and control have been largely the forces of their sub-state, the Royal Ulster Constabulary and their own brand of blackshirts, the B Specials. It was only after the awakening of the Catholic civil rights movement with a programme of equality in housing, employment and parliamentary representation, that the Specials were suspended and the various Protestant underground organisations took their place.

Of these the Ulster Volunteer Force (UVF) is the oldest and was responsible this year for bombing cars in the heart of Dublin as a warning to Republican opinion. The Ulster Defence Association (UDA), the larger organisation of the two, has a combination of roles. As well as bombing Catholic pubs and precincts, it has street-by-street organisations with a vaguely defined political platform of Protestant supremacy. Its contact with the rank-and-file Protestant worker gives it the courage of fairly radical convictions which horrify the traditional definers of Protestant supremacy.

The British army offensive has been against the IRA, leaving the terrorists of the Protestant community largely alone. With the proliferation of organisations, political and military, the policy of British governments has been that of the pony soldiers of the wild West towards the Red Indians: "Wait till the dust settles and negotiate with the one who is left standing". Publicly the British governments have championed those formations they choose to call the "moderates". Amongst the Protestants, the Unionist Party of Brian Faulkner was entrusted with the leadership of the power-sharing coalition which the Tory government dreamt up. It shared power with the Catholic Social Democratic and Labour Party (SDLP), known in Catholic areas as "Stoop Down Lower Please".

Ineffective Formula

The coalition's overall brief was to work out the procedures of power-sharing, and it was to be given executive powers after it had formulated a mutually acceptable way of including itself and the Dublin government in a Council of Ireland. The formula was supposed to satisfy the Catholic demand for unity with the South and give the Protestants an executive majority in the North at the same time. This eventually ineffective compromise was worked out at Sunningdale and came to be known by that name.

The very process which made politicians acceptable around the Sunningdale table, began their process of alienation from those they were supposed to represent. The IRA came out firmly against any such agreement and so did the UVF and the UDA. In the subsequent election to Westminster in February this year, the Sunningdale formation of parties suffered severe defeat — warning enough of the mood of the population.

Resistance to Sunningdale finally came to a head in May. The Ulster Workers' Council was the full-grown child of this resistance. It came into being through the so-called 'spontaneous' process which theoreticians are so sceptical about. It was totally independent of the trade union leadership of Northern Ireland even though many of its leaders had experience of championing the cause of labour. The newly aligned shop-floor and community forces found their way to new possibilities. The workers of Ulster in the power stations, in the docks, in transport and in the mills, stopped work. Each county community provided three members to an executive which came together on an *ad hoc* basis to run the strike. As a gesture to the old Orange Order, the traditional leaders were given representation but not control on the Council as they scrambled to jump onto the fast moving band-wagon.

The province was paralysed. Harold Wilson declined to use his troops in Ulster to break the strike and risk the armed conflict that was bound to follow. Instead, he appeared on nation-wide television to challenge the strikers and their authority. Earlier he had sent in Len Murray, boss of the British Trades Union Council, to lead a march to call off the strike. Murray was stoned by women and children on the streets of Belfast. Wilson then gave in and Brian Faulkner's coalition resigned.

The strikers had won and their leaders spelt out what they had won. "We used to be so predictable", said Andy Tyrie, a UDA politician, "We could see ourselves coming — the big parade, beat the drum, knock a few people about and then back again. Now I have introduced new tactics, avoiding conflict and shifting the barricades about till the army is exhausted. We've made a bloodless revolution, the types who want to kill everyone and burn everything are out". That is the voice of confidence, a new voice in Ulster. It speaks of *detente* with the IRA, of a new party of the labouring classes in Ulster which could unite the Catholics and Protestants as a class against the old style Unionist politicians. It has been said that the Algerian *pieds noirs* spoke in the same tones, but the Ulster workers make up a majority in their province and have an acute awareness of how much blood the 'religious' leadership has cost them. More than that, the IRA has been the strike for what it is — a manifestation of real power, and one it is willing to make an alliance with.

At a stroke the Ulster workers have given a rebuff to years of domination by the British state and have given birth to the tactics of workers' power and snatched the initiative from the dead-end politics of the Protestant right. The British government and pundits say they are still looking for a recipe for the future of Ireland. They had best look now, as do the people of Ulster, to the soup-kitchens of community power.

By Privilege Possessed

Nireekshak

UNDER the rules of the game as laid down in Erskine May's "Parliamentary Practice," privilege like truth is a matter to be established by sheer weight of numbers — if the ruling party so wills. Call it a one-time exception, but George Fernandes, the Chairman of the Socialist Party and a former MP himself, could get away with that article in his Hindi weekly *Pratipaksh*. The tabloid, published from New Delhi, had insinuated that the Lok Sabha consisted of "thieves, dalals and frauds" and the House had been converted into "something like a brothel". It had also said that the Congress MPs who had denied the genuineness of their alleged signatures on a memorandum which touched off the Pondicherry import licence scandal were liars; that these signatures had been manipulated by the then Foreign Trade Minister, L N Mishra; and that the Prime Minister was the prime source of all corruption in the government.

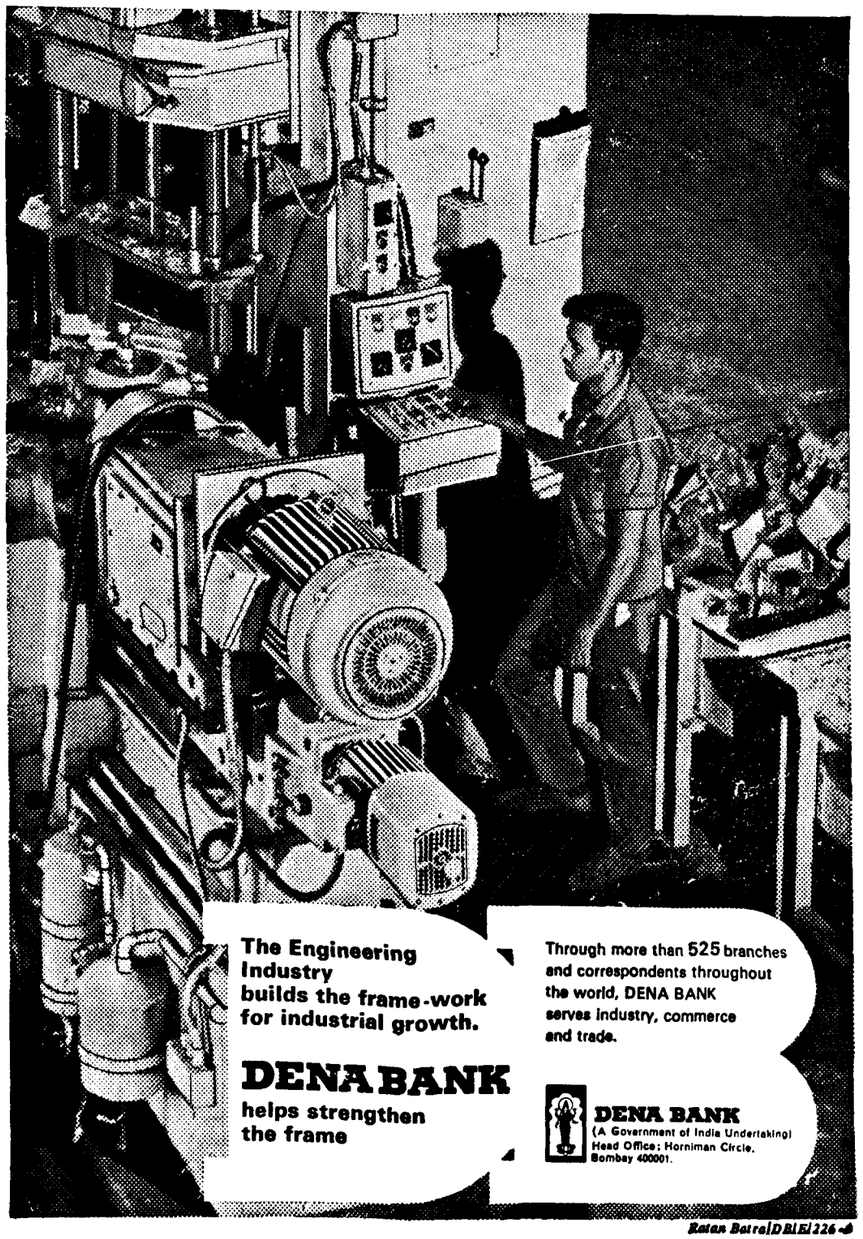
One does not know if George Fernandes would consider himself lucky because the ruling party opposed reference of the issue to the Privileges Committee. In the Rajya Sabha the Congress party took the peculiar position that while *Pratipaksh* had committed gross contempt of parliament, MPs should content themselves with a resolution censuring the weekly. In the Lok Sabha, Piloo Mody succeeded in forcing a full-fledged discussion on his privilege motion. At the earlier stages, Congress members supported it but when the Parliamentary Affairs Minister, K Raghuramiah, said the government was opposing it, the situation changed abruptly.

In the past, there has been only one instance of an editor being summoned to be censured at the bar of the House and for far less objectionable writing. About 14 years ago, a story in *Blitz* had deliberately distorted the spelling of J B Kripalani's name as "Kripaloony" and had described his attack on the then Defence Minister, V K Krishna Menon, as the performance of a "bazar buffoon". For the first time a 'bar' was set up so that editor R K Karanjia could be admonished by the Speaker following the verdict of the Privileges Committee and the editor's refusal to apologise. Parliament has been very zealous of its privileges, especially *vis-a-vis* the press and though many issues involving the press have gone to the Committee or have been raised in the House, the Karanjia episode has not been re-enacted.

It would be a healthy convention not to raise privilege issues with regard to the veracity of reports on parliament's proceedings. Often the misreporting is unintentional. And moreover, no serious journalist would like to misreport proceedings intentionally because that would cost him his professional credibility. The usual practice has been for the Speaker to write to the editor about an inaccurate report and normally the editor expresses regret the moment the inaccuracy is brought to his notice. Almost always, the editor owns up responsibility for the inaccuracy originating in the reporter's copy or at the desk when it is being translated or edited. But there was one instance of questionable professional conduct by the then Delhi editor of *Indian Express* who said in a letter to the Speaker that the sub-editor concerned had been "pulled up" for his lapse. What happens inside a newspaper office is not a matter to be reported to the Speaker because professional ethics demand that the editor should bear the responsibility for what has appeared in the paper.

Privilege issues arising out of comment are undoubtedly of a more serious nature and are often justified. But then how did George Fernandes emerge unscathed in spite of what many members in both the Houses described as scurrilous writing? When Piloo Mody raised the privilege issue, the opposition was building up a case for enlarging any Privileges Committee investigation into a larger probe into the licence scandal. The opposition had failed to find an opening though it had tried all possible means including a motion of privilege against the Prime Minister for alleged coercion of party MPs not to press for a parliamentary probe into the scandal. Since the *Pratipaksh* article related to the scandal, the Opposition wanted the Privileges Committee to go into the entire gamut of the scandal in the process of examining the privilege issue against the weekly. Madhu Limaye's amendment to the motion suggested that all papers relating to the scandal should be brought under the custody of the House. This would mean that the CBI would be barred from going ahead with the investigation which the government seemed to have ordered surreptitiously when the Speaker had not yet given his ruling on the demand for an inquiry by a House committee. Hiren Mukherji of the CPI even suggested two parallel inquiries — one by the Privileges Committee against the weekly and another by a House committee into the licence scandal.

While many Congress members were enthusiastic in their demand for referring the *Pratipaksh* issue to the Privileges Committee, the party leadership seemed to have realised rather belatedly that such a course would mean virtual acceptance of a parliamentary probe into the scandal. After the initial confusion and hesitation the government decided to oppose the demand. In the course of the discussion, Congress spokesmen alleged that the *Pratipaksh* writing was part of a conspiracy between Piloo Mody and George Fernandes to exploit the licence scandal for political ends. The charge of "political motivation" frequently made by the Congress members in parliament sticks ill because all politics is motivated and "political motivation", if anything, is a redundant phrase. It was pathetic to watch the Congress members swallow all those choice epithets hurled at them in the course of the debate; loyalty to the party and the leader was supreme and such things had to be put up with. An inquiry into the scandal in any form had to be thwarted and this the Congress members did, though rather inelegantly.



What the Congress lacked in moral strength could easily be made up with the party's numerical strength. Righteous denunciation of the "scurrilous writing", together with the lofty counsel that it should be ignored with the contempt it deserved, rendered the whole issue innocuous. That was what became of parliamentary privilege so zealously guarded in the past. What *Pratipaksh* wrote will remain in parliament's records forever and be quoted with immunity in the future while similar things if said again by anyone outside might attract privilege. Strange are the ways of the parliamentary system with the Congress in power.

The Congress party which chose to be soft on *Pratipaksh* is no particular friend of the press that is critical of its ways. It is not mere coincidence

that the three state governments — Haryana, Bihar and Punjab — which have been waging a relentless guerilla war on the "unfriendly" press happen to be run by the Congress party. The Haryana government has ignored the Press Council's censure and did not so much as appear before it in the *Tribune* case. The Bihar government has not only de-listed *Searchlight* and *Pradeep*, but has now ordered that bills for advertisements in the pre-delisting period should not be paid. By withholding payment of bills adding up to Rs 10 lakhs the Ghafoor government is playing off its political vendetta against the papers.

In Punjab, *Hind Samachar* and *Punjab Kesari* continue to be delisted despite the government's debacle in court over its crude attempt to cut off electricity supplies for their presses and to put pressure on other printers not to print the two dailies. The Punjab government's wrath can be traced to the exposure by these papers of pressure and patronage used by it to make the notorious August 9 Youth Congress rally in Delhi a dubious success.

On the eve of the debate in parliament to ratify the ordinance extending the life of the Press Council pending modification of the procedure for its reconstitution, Information Minister Inder Gujral inspired a panel discussion on Delhi TV, featuring among others, N Rajagopala Ayyangar, the Chairman of the Press Council. From what Ayyangar said, the Council was helpless when the state governments chose to defy it and refused to recognise its moral authority. In most cases, the problem is the decision of a state government to stop advertisement patronage to unfriendly papers. Yet Inder Gujral would not like to give 'teeth' to the Press Council and would like it to be a decorative piece owing its existence to government funds.

History and Sociology: A Successless Intercourse

C S

History and Social Development; Vol I: Elites in Modern India by B M Bhatia; Vikas Publishing House, Delhi, 1973; pp xiii + 384; Rs 45.

CONSIDERING the amount of painstaking research that has obviously gone into this work, one feels a certain compassionate constraint in describing it as confused and unduly ambitious. 'Know thy mind' — put in a variety of jargon — continues to be one of the fashionable dicta of historiography. It is intriguing, therefore, that the author, who set out on a theoretical interpretation of modern Indian history, did not pause to ask himself whether he possessed the requisite subtlety perception and logical rigour.

Bhatia is unhappy with historical materialism as a framework for explaining historical development. He finds it monocausal. He also thinks that, since historical materialism is informed with a specific philosophy of history, it tends to result in the fitting of facts into a pre-fabricated mould. And yet, on both these counts, the kind of exercise he is undertaking can be *mutatis mutandis* found wanting: Thus, not only is the theory of power elite incapable of permitting multi-causal explanations, it can easily induce the fitting of facts into a given mould.

Bhatia also says that history is not one long continuum; it is a series of continua, each continuum having its own special features. But explanations emanating from the theory of power elite hold for the entire course of human history. Mosca is approvingly and unquestioningly quoted. Then, in almost the same breath, we are told: "A general covering law of history for the entire period of evolution of human society on earth, in the very nature of things, is simply inconceivable". What does Bhatia actually believe? Only if one had the power to divine!

Before coming to Bhatia's actual 'interpretation' of Indian social development during the 190 years between 1757 and 1947, it may be pointed out that, while applying the power elite theory to modern Indian history, he has used terms without clarity. He does not, for instance, distinguish between 'power' and 'pre-eminence'; for him they are synonymous. Nor does he care to distinguish between 'power' and 'authority'; yet this distinction could have exposed the serious limitations of the theory of power for explaining the dynamics of a traditional society such as India's with its strong sense of community. The result has been that, while Bhatia has been able to put forward a partial — and often defective — explanation of change during the 190 years under study, he has completely ignored the continuity in the same period.

Bhatia's Position

The position taken by Bhatia may be best stated in his own words: "Indian history is studied more realistically and meaningfully in the conceptual framework of the elite approach and power theory of history rather than in that of the historical materialism of Karl Marx. In fact, the Indian experience, if anything, provides a refutation of the Marxian formulation on history as a doctrine of universal validity". But approach is obviously different from theory. Elite approach simply implies that study of elite action and role provides a vantage point for looking at the march of history; but it does not constitute an *explanation* of what happens in history. It is for theory to perform that function. (And this theory, one may add, is provided by power.)

Unless one is to take a dogmatic, Adlerian, position — which, incidentally, Bhatia is not doing since he has not once mentioned Adler's name in his text though he does go back to Hobbes and Mandeville in the 17th century — it is difficult to see how material self-interest can be ignored as a motivating force, at least during the early phases of social development in a colonial situation. For material self-interest not only provides the initial impetus for the formation of groups — call them elite groups, political groups, pressure groups, or what you like — but it also brings in the gradual discovery of the basic irreconcilability between the interests of the rulers and the ruled. But the further fact to be discovered is that even the interests of the ruled are often not homogeneous, and they generate internal tensions and rivalries. This, together with the slow pace of realisation about the basic irreconcilability between interests of rulers and ruled, explains the existence of groups whose support the colonial rulers are almost always able to enlist. Herein lies the validity of the competition/collaboration model.

Now, all these developments cannot be explained exclusively within the framework of the power theory. What appears on the surface is only a fragment of the historical reality. The tussle for power among groups may be seen by a historian only at the obvious level of a tussle for power.

But another historian may also decide to discern the roots of what, on surface, appears to be a mere tussle for power. And that might take him to the conclusion that the tussle for power is but a means to achieve a particular end. In other words, pursuit of self-interest may be — and often is — an end in itself. Having been successfully pursued, it may create an urge for power. More often than not, direct pursuit of power or indirect manipulation of it are only the means to facilitate promotion of self-interest. It is, however, possible for people to pursue power *per se*.

That Bhatia is too obsessed with the universality of the power theory, is clear from his insistence on presenting the anti-Brahmin movement in the South merely as the result of the pursuit of power by a non-Brahmin elite. And this he does in spite of his own admission that, "the whole non-Brahmin movement was built on the foundation of the prevailing widespread anti-Brahmin sentiment in the presidency resulting from the social oppression of lower castes by high caste Brahmins". The manifestation of certain forces is more important to him than the complex working of the forces themselves. Thus, what remains significant in the anti-Brahmin movement, according to him, is that "behind the communal facade lay in this case, as in similar others, the striving for its own power on the part of the non-Brahmin elite".

The trouble with Bhatia is that he

is neither consistent nor clear. He accepts Mosca's division of society into the ruling class and the rest, and looks only upon the ruling class as constituting the elite. If this is so, it is absurd to talk of an Indian elite during the 190 years of British rule. Or, does this also need elaboration? In fact, there are Marxian historians who have argued that it is indeed unhistorical to talk of an indigenous elite in a colonial society. This assertion stems from the theoretically unjustifiable restriction of the concept of 'elite' to the 'government elite'.

Be that as it may, if Bhatia wants to apply the elite approach to the study of 'British Indian' history, he has to move away from this simplistic dichotomy between the ruling class and the rest. For, as any sociologist will readily agree, to conceive of the ruling class as a homogeneous unit and the rest as an undifferentiated single mass, is functionally of doubtful value. And, any historian will readily concede that, this is historically suspect. The French society on the eve of the 1789 Revolution offers an instructive illustration. So far as Indian society is concerned, with its strong traditions of almost autonomous communal life which political authority could only rarely and marginally affect, the ruling-class-and-rest dichotomy neither corresponds to actual reality nor provides a theoretical model to explain it.

From Bhatia's use of the term 'elite' one learns nothing about the sense in which it is being used. But it is revealing that most of the time he is talking of *an elite* and not of *elites*. This, in conjunction with his acceptance of two unities in society, goes pretty far to explain how he could make the wild statement that the modern Indian elite performed a modernising role in the country's development. He cannot see the simple fact that *elites* in modern India have not been *necessarily* modernist in outlook and that they have also performed other than modernist roles. Whatever the facts of modern Indian history may have been, they do not justify Bhatia's comment: "The modern elite also lent active support to the British administration in the enactment of social reform measures — such as prohibition of the inhuman practices of *sati* and female infanticide that had come down from medieval times... Later, social reform was made a part of the national freedom movement itself...."

How simple and easily explicable modern Indian history is, has been amply demonstrated by Bhatia. Unfortunately, the tragedy of a less ambitious scholar, who may want to understand what actually happened before aspiring to provide a reliable framework, is that Bhatia's own credentials — indisputably established in the volume under review — and the universally known facts of modern Indian history (such as the controversies between the orthodox and the progressive sections about the best way of dealing with their contemporary situation in its varied complexity) make him wary of Bhatia's conclusions.

Bhatia ends his elaborate theorisation on the note: Modern India is what its elites made it. Yes, very largely so. But they did not make modern India what it is the way Bhatia has described.

INDIAN INSTITUTE OF MANAGEMENT, CALCUTTA

Applications are invited for posts of Research Fellows and Teaching Assistants in the following areas:

1. *Behavioural Sciences*:
   Minimum Qualifications — Second Class Master's Degree in Social Psychology or Sociology or Social Anthropology or Statistics.
2. *Economics*:
   Minimum Qualifications — Second Class Master's Degree in Economics or, in Statistics/Mathematics with some knowledge of Economics.
3. *Environment*:
   (a) *Law* — Min. Qualifications: Graduate with 1st Class Law Degree or Master's Degree in Law with Second Class Honours in the fields of Economics, Political Science or Sociology.
   (b) *History* — Min. Qualifications: Second Class Master's Degree in History with interest in Modern Indian History, preferably in Economic History.
   (c) *Political Science* — Min. Qualifications: Second Class Master's Degree in Political Science preferably with an interest in the area of Political Sociology.
   (d) *Sociology* — Min. Qualifications: Second Class Master's Degree preferably with an interest in the area of Macro Sociology of India.
4. *Finance*:
   Min. Qualifications: Second Class Master's Degree in Commerce or Economics with Statistics; or should have passed the final examination of the Institute of Chartered Accountants of India or Institute of Cost and Works Accountants of India.
5. *Management Information System*:
   Min. Qualifications: Master's Degree in Engineering or Economics or Statistics or Mathematics or Management, with some knowledge of Computer Programming and Analysis.
6. *Marketing*:
   Min. Qualifications: Second Class Master's Degree in Economics or Statistics or Commerce or Applied Psychology.
7. *Operations Management*:
   Min. Qualifications: Second Class Master's Degree in Mathematics or Statistics or Engineering.

Candidates should mention the areas of interest from amongst those mentioned above. Preference will be given to persons having relevant research or work experience. For the positions in Research Fellow Cadre a minimum experience of three years will ordinarily be required.

Scale of Pay:
(a) Research Fellows: Rs 400-40-800-(E.B.)-50-950. (to be revised as per Central Government).
(b) Teaching Assistant: Rs 550-25-750-(E.B.)-30-900. (revised).

Candidates must apply to the Director, Indian Institute of Management Calcutta, 56A, B. T. Road, Calcutta-50, within a month from the date of this advertisement in prescribed form obtainable from Director's Office by sending a self-addressed stamped envelope (9" x 4"). A passport size photograph is to be enclosed with the application. A crossed postal order of Rs 10.00 for Research Fellow position and Rs 7.50 for Teaching Assistant position is to be enclosed along with the application payable to the Director, Indian Institute of Management, Calcutta.

Resource Mobilisation through Indirect Taxes

Some Aspects of Fifth Plan Strategy

N J Jhaveri

This article examines critically the effects of additional indirect taxes in the context of certain expectations and assumptions of the Draft Fifth Plan —particularly, (a) the assumption of overall price stability; (b) the assumption of reduction in the per capita consumption of the 'well-off strata' of the population; and (c) the expectation of generating surpluses of public enterprises.

THE Draft Fifth Five-Year Plan, 1974-79, envisages additional resource mobilisation of Rs 6,850 crores during the the Plan period. The break-down of this amount into different categories of taxes, *viz*, taxes on income, taxes on commodities, etc, is not known. However, on the basis of the pattern of additional resource mobilisation envisaged in the 'Approach to the Fifth Plan, 1974-79' (published in January 1973 and referred to as Approach document henceforth) it would appear that a sizeable portion of the fresh tax effort during the Fifth Plan period would be in the sphere of indirect taxes. Consistent with the fresh tax measures adopted during the earlier Five-Year Plans it may be reasonably assumed that excise duties and sales taxes will account for a major portion of the additional indirect tax effort.[1] The purpose of this article is to examine critically the effects of additional indirect taxes in the context of certain expectations and assumptions of the Draft Fifth Plan — particularly, (a) the assumption of overall price stability; (b) the assumption of reduction during the Fifth Plan in the amount of per capita consumption of the "well-off strata" of the population; and (c) expectation of generating surpluses of public enterprises (indicated at Rs 400 crores in the Approach document).

Indirect Taxes and Price Level

It is generally held that indirect taxes are shifted forward and so push up prices through cost increases. This increase in the price level however, "is a once-and-for-all increase, to be distinguished from the continuous increase that results if the inflationary gap is not closed" ("The Theory of Public Finance", Richard Musgrave, p 447). While the Draft Plan does not spell out in detail the relationship between indirect taxes and the price level, the Approach document had observed, "The market price of a commodity is built up of three components: cost of material inputs, wage and non-wage factor costs, and indirect taxes. An increase in the direct tax component trends to raise the market price". While a rise in the market price on account of an increase in indirect tax is a generally observed phenomenon, the extent of rise would depend upon a number of factors. Assuming 'forward shifting' of indirect taxes through price rise, it can be easily demonstrated that the extent of the rise in market price for the final consumer would be greater than that warranted by the increase in indirect levies. The degree of deviation in the actual rise in market price from that required by the increase in levy would generally tend to vary directly with the number of stages existing between the point(s) of increase in levy and the final consumption.

Extent of Price Rise

Let $i_1, i_2 \ldots i_n$ denote units of different inputs;

and $j_1, j_2 \ldots j_n$ denote units of different outputs.

Assuming that each product (output) uses a single input, *viz*, i the input-output ratio for produce j_1 can be expressed by $a_1 = \frac{Xi_1}{Yj_1}$ where X and Y represent units of input and output, respectively. Thus, if for producing 10 units of j_1 20 units of input i_1 are required, the input-output ratio will be 2:1. Assuming no other costs (including those of other factors), price (p) of a unit of input i_1 in this case will be one-half of the price of unit of j_1.

Now let it be assumed that an indirect *ad valorem* tax (ti_1) is levied on input i_1. Let the price on which the tax is computed be denoted by pfi_1. Let it also be assumed that the suppliers (manufacturers) of input charge profit at the rate of ri_1 per cent on pfi_1.

Assuming forward shifting of indirect tax the market price (pmi_1) of input i_1 will be $p_m i_1$

$$= pfi_1 \left\{ (1+ti_1)(1+ri_1) \right\} \ldots (I)$$

If the producers of j_1, j_2, etc, purchase input i_1 directly from the manufacturers, per unit market price of j_1 after the imposition of tax is given by $p_m{}^t j_1$

$$= a_1 \cdot p_m i_1 (1+rj_1) \ldots \quad (II)$$

where rj_1 represents margin (profit) charged by the supplier (producer) of j_1.

However, if there are intermediaries between manufacturers of i_1 and users of this input (i e, manufacturers of product j_1, j_2, j_3, etc) then the market price of j_1 will be

$$p_m{}^t j_1 = a_1 \cdot p_m j_1 \left(1 + \sum_{=1}^{m} rdi_1 \right) (1+rj_1) \ldots \quad (III)$$

where $\sum_{=i}^{m} rdi_1$ represents the margin of the intermediaries in the supply channel of input, i e,

$rd_1 i_1, rd_2 i_2 \ldots . rd_m i_2$.

If there are, as will usually be the case, intermediaries between the manufacturer of j_1 and its final consumer then the market price of j_1 will be

$$p_m{}^t j_1{}^2 = a_1 \cdot p_m i_1 \left(1 + \sum_{=1}^{m} rdi_1 \right) \left(1 + \sum_{=1}^{m} rdj_1 \right) \ldots . \quad (IV)$$

Integral Coach Factory asked HMT to get its head examined

In HMT's original Pre-Selector Turret Lathe L22TP, the turret head had to be moved to the extreme position of the bed for the power indexing mechanism to operate.

ICF felt that this meant avoidable time wastage and operator fatigue.

The solution? Fitting a limit switch to get the desired indexing position.

They also felt that the operation would be made simpler, quicker, and safer by incorporating a single lever clamping and indexing provision for square Turret Tool post, increased cross traverse and higher rapid traverse for slides.

As usual, HMT responded.

Responded not only by making these modifications but many others, which made it among the most advanced machines of its kind the world over.

It's this kind of customer participation which leads to successful developments.

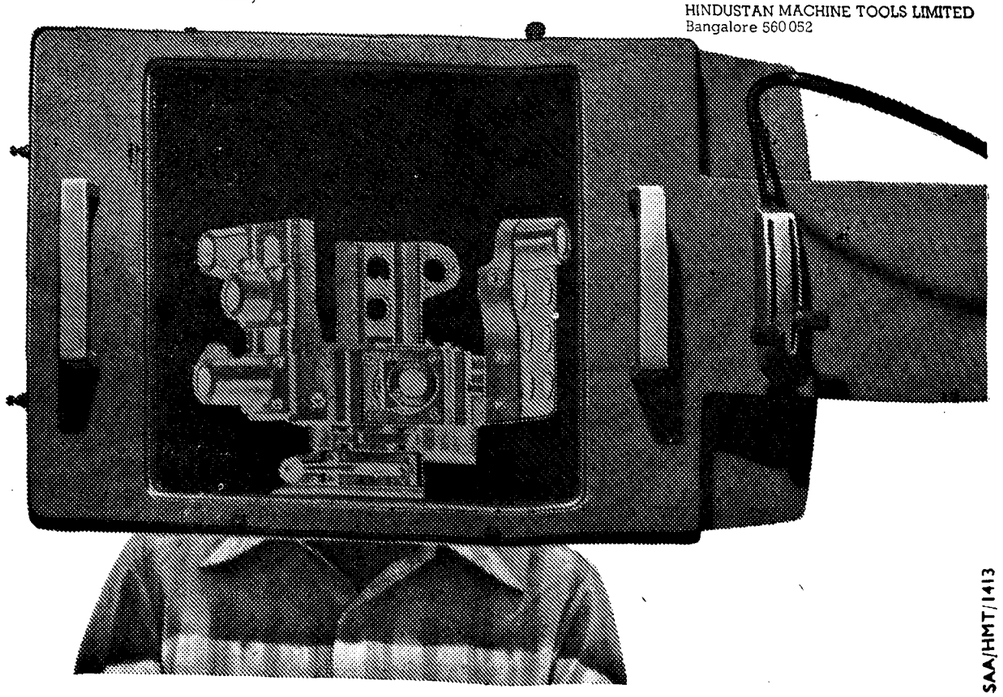
Because nobody can judge an HMT machine tool better than an HMT customer. (After all, they work together—year after year!)

So, HMT talked to the Railways, Lucas-TVS, Bajaj Auto, Ordnance Factories, Divgi Metalwares, Gajra Gears, Premier Automobiles, Escorts, BEML, American Tool Inc. and Wickman of UK.

The suggestions, advice and participation of both big and small-scale industries resulted in improving existing machines as also developing new ones.

This, in turn, resulted in HMT machine tools becoming more effective and versatile. And also more acceptable to potential customers.

Yes, it certainly takes two to match skills to needs.



You and HMT.

That's the HMT way to self-reliance.

We make the machine tools. You help us make them better.

hmt

SAA/HMT/1413

where $\sum_{=i}^{m} rdi_1$ represents the margin of the intermediaries in respect of j_1, i e, rd_1j_1, rd_2j_1 .... rd_mj_1.

Thus the percentage increase in the price to the final consumer after the imposition of tax will be given by

$$\frac{p_mtj_1 - p_mj_1}{p_mj_1} \times 100 \quad \text{where} \quad p_mj_1$$

denotes $p_mj_1 = pfi_1 (1+ri_1) (1+rj_1)$

or $pfi_1 \left(1 + \sum_{=1}^{m} ri_1\right) \left(1 + \sum_{=1}^{m} dj_1\right)$

as the case may be.

The analysis can easily be extended to the case of an increase in the tax rate, i e, $\triangle t = t_1 - t$ by substituting $\triangle ti_1$ in place of ti_1 in (I) above and $p_m t_1 j_1$ in place of $p_m tj_1$ at appropiate places.

Multiple Indirect Levies

So far we have considered the effect on prices of a revision in tax rate on *one* input item. In reality, a product uses more than one input and hence revisions in tax rates on several inputs will have to be taken into account for arriving at the cumulative price effect of these changes. Apart from the multiplicity of tax inputs, if a particular product j_1 (e g, steel products) uses a taxed input (e g, i_1 pig iron) and is itself used as an input for manufacturing another product j_6 (e g, automobiles, tractors), account will have to be taken of revision in tax rates at different stages, i e, i_1, j_1 and j_6; as a result of these two factors, the final product prices will rise substantially. Moreover, in addition to excise duties levied by the Central government, sales taxes are levied by the state governments at *ad valorem* rates.[3] In the above equations allowance can easily be made for all these factors, but their net effect would be to push up the price further.

Still retaining the assumption that a tax increase is shifted forward, the absolute price of a product subjected to tax revision or using such product (denoted by A) would rise *vis-a-vis* prices of products not subjected to such revision or not using them (denoted by B). It follows from this that the value of the ratio of absolute prices of two products, which indicates their relative prices, would rise, i e, $\frac{p_mt_1\ A}{p_mt_1\ B} > \frac{p_mt\ A}{p_mt\ B}$. This would happen even if (i) the tax revision is made for both the products provided $\triangle t$ in respect of A is higher than that for B or/and (ii) the tax revision is uniform (say $\triangle t = 10$ per cent of t) but the proportion of the amount of tax to market price is higher for product A than for product B.

Existing Structure of Indirect Levies

With the available information regarding the market prices of taxed items, it is not possible to segregate the component of market price attributable to the imposition of indirect levies. However, such levies would appear to play an important part in determining market prices of a number of industrial products. The rates of import duties range between 20 per cent and 100 per cent exclusive of auxiliary duties. The relative price (inclusive of duties) of items subjected to heavy import duties would be higher than those either taxed lightly or exempted. The basic rates of sales tax, with a few exceptions, vary between 0.5 per cent and 3 per cent in multipoint sales-tax systems, and are 5 per cent in double-point systems and 5 to 7 per cent in single-point systems. In all the states, however, consumption luxuries attract tax rates of 10 to 15 per cent (see p 46, "Commodity Taxation in India", Lakdawala and Nambiar). To the extent items covered under sales tax have already paid excise duties, there are multiple indirect levies. Union excise duties are levied at specific rates on some items and at *ad valorem* rates on others. The rates of *ad valorem* excise duties vary from 10 per cent on medicines, vegetable oils, etc, to 300 per cent on superior varieties of cigarettes. Again, the excise levies are not confined to final consumer products — whether essentials or luxuries — but are also levied on intermediate and basic products as also on certain types of capital goods. From the point of view of price impact, as would be seen from the formulations above, the increase in market price following a given percentage rise in tax rate will be less if such revision is made at the stage nearest to the final consumption than at the earlier stages. It would be useful, therefore, to identify indirect levies on items of private consumption.

Information relating to sales tax collections is not available. With the available item-wise Union excise collection data it is not possible to segregate the extent to which demand for any excisable item is for direct private consumption, capital formation or inter-industry uses. Electric bulbs and lamps, electric fans, paper products, motor vehicles (including commercial vehicles), refrigeration and air-conditioning equipment are some of the many items listed under the excise schedule which are used for private consumption as well as used by commercial and industrial establishments. In the absence of relevant information, the entire amount of collections from such items is treated as derived from consumer products (including durables). Even with this favourable interpretation, revenue collections from such products work out to around 46 to 47 per cent of the total in 1974-75 (BE).

Cascading Effect

However, excise levies on particular

products do not by themselves indicate the total of excise (and other) duties paid on inputs at different stages in the process of production. Due to the imposition of such levies at multiple points, the proportion of indirect levies to market price would vary from commodity to commodity. For instance, while there is no excise levy (or a sales tax) on items like railway wagons, locomotives, industrial machinery, etc, the indirect levy component in their market price is bound to be quite high on account of the high import and excise duties on steel and other metals. The requirement of mild steel (in tonnes) for manufacturing a diesel locomotive, an electric locomotive and a railway wagon was estimated at 55 tonnes, 95 tonnes and 12 tonnes in that order.[4] At purchasers' prices, the co-efficient of iron and steel (metal) used by railway locomotives and railway rolling stock industry was estimated at 0.33238312 and 0.26104815 respectively, for 1963.[5]

In respect of other items, in addition to indirect levies on inputs like steel, chemicals, cement, etc, such taxes are imposed at the final product stage. For instance, iron and steel (basic metal) is used for producing iron and steel products; these in turn are used by the automobile, refrigeration and other industries. Excise duties and (sales taxes in some cases) are levied separately at each of these stages. Likewise, soda ash is taxed (under excise duty) at the rate of 10 per cent; caustic soda which uses 1.6 tonnes[6] of soda ash per tonne is taxed at the rate of 10 per cent separately. Viscose and rayon staple fibre using caustic soda in the ratio of 1:1[6] is taxed again as a separate excisable item. Fabrics made out of these fibres are again subjected to excise duties separately.

In fact, in the process of widening the excise net, a number of intermediate and basic products have been subjected to excise duties resulting in the well known cascading effect of such duties. Under the assumption of forward shifting, such imposts, irrespective of the stage at which they are levied, are passed on to the final consumers and are ultimately reflected in the market price of one product or the other. In theory, therefore, it may be argued that instead of levying indirect taxes at different stages, the government could levy indirect tax at a composite rate at the final stage. The levy of indirect taxes in such a manner may result in a reduction in the market price of a taxed commodity without any loss in revenue from indirect taxes to the government. In practice, however, there may be two types of difficulties. First, to raise a given amount of revenue, the composite rate at the final stage will have to be higher than the rates of taxes levied at different stages taken individually. 'Announcement effect' of a composite rate, therefore, may be adverse. Secondly, if the size of units producing (or distributing as in the case of retail outlets) is small and there are a number of such units, efficient collection of indirect taxes would be difficult.[7] The convenience of collecting presumably explains relatively heavy imposts on petroleum products, manmade fibres and other intermediate products.[8] While these practical difficulties come in the way of confining indirect taxes to the final stages, the fact remains that multi-point indirect levies, assuming forward shifting, push up the market price of a commodity more than the amount of tax collected by the government, depending upon the number of intermediaries at different stages and the extent of their profit margins.

TABLE 2

		Weightage in Wholesale Price Index	Union Excise Collections, (before transfer of states' share)	
			1974-75 (BE) (Rs crores)	Percentage to Total Excise Collections
1	Mineral oils	3.02	986	32.4
	of which (a) Motor spirit (Petrol)	0.92	414	13.6
	(b) Kerosene	0.85	130	4.3

Total excise collections/weight		100.00	3044	100.0

Note: Excise collections include the revenue effects of fresh proposals in the 1974-75 Budget.

TAX CHANGE AND GENERAL PRICE LEVEL

The full impact of tax-induced price rise will be reflected in an index which records prices as paid by final consumers. If such an index is compiled and if it is assumed that there are no changes in the cost of wage and non-wage material inputs and in middlemens' margins, the movement in the price index would give an idea of the impact of a tax change on the relative price of the concerned products and on the general level of prices. Such an index is not available. But to get an idea of the price impact of a tax change in a simplified case let it be assumed (i) that there are no intermediaries between the producer and the consumer of a product, and (ii) there are no changes in any other cost components and in tax rates on all other products.

Let (i) t and t_1 stand, respectively, for the existing and the revised ($t_1 = t + \triangle t$) rates of tax, (ii) pf denote price used for computing tax liability, (iii) pmt = pf (1 + t) (1 + r) and pmt_1 = pf (1 + t_1) (1 + r) represent respectively, market prices before and after the tax change and (iv) w_1 be the weight of the concerned product in the total weight W (= 100) of the price index.

The overall price index (= 100 before tax change) after tax revision will be given by the following formulae.

$$\frac{pmt_1}{pmt} \cdot w_1 + (W - w_1)$$

SKYLAND EXPRESS
& ALPINE ADVERTISER

74SR3

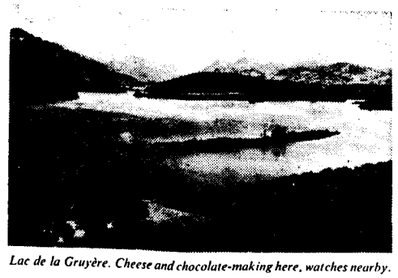
IN THIS ISSUE

- Fans' Corner
- Last Notes of Music
- Can one afford to stay at home?

MUSICAL P.S.

BERN—In the last **Skyland Express** we covered Alpine music alphabetically from A to Y (Alpenhorn to Yodelling), and said if there was a composer beginning with Z we didn't care to know it yet.

We haven't heard of one. There is, however, a **Zytgloggeturm** in Bern, the



12th-century Time Bell Tower, whose 16th-century clock animates a bell-ringing fool, a lion, Father Time, a bear and a cock every hour four minutes before the hour strikes.

(Bern is one of 18 European cities for which inexpensive package arrangements are listed in a set of colour brochures called "Alpine Highlife", an indispensable guide to anyone travelling to Europe.

EARTHBOUND NOTE

SPINDLERMÜHLE, Czechoslovakia—At a recent Tourist Film Festival here, *Wings and Wheels*, a film on bicycling in the Styrian province of Austria, took first prize. It was produced by Zupan Films in cooperation with Swissair.

Lac de la Gruyère. Cheese and chocolate-making here, watches nearby.

Tick-tock, chug-chug through the Alps

ZURICH—Anyone who wants a couple of days of carefree motoring through this chocolate, cheese and watch-making countryside without the bother of making detailed plans can book an "Alpine Hideaway" package from Geneva, Zurich, or Basel, the Airline of the Alps * reports.

The two-day basic package includes a rental car with 200 km free, lodging and breakfast, and for two people travelling together the cost is very reasonable indeed.

Chug-chug, choo-choo through Switzerland, etc.

ALL OVER Switzerland there are special rates for public transportation; the **Swiss Holiday Pass**, a new bargain for non-residents only (unlimited rail, boat and bus travel in Switzerland plus up to half off on mountain railways and cableways); **Swiss Holiday Ticket** (half rates by rail, boat, and bus to all important Swiss vacation centres); the **Swiss Half-Rate Subscription** (applies to unlimited rail, boat and PTT bus ticket purchases).

Students under 26 and from outside of Europe can buy a special low-cost **Student Railpass** that provides two months unlimited train travel in 13 different European countries.

Overseas visitors of any age may, of course, use the tried-and-true **Eurailpass.** (Swissair or your IATA travel agent will get you one.)

AIRCRAFT FANS' CORNER

The Mystery of the Invisible Footprints

Conventional jet

Shhh! DC-10-30

IN TRYING TO determine how much the takeoff of a particular aircraft model will disturb the neighbours, the engineers have hit on a device that makes the whole problem look deceptively simple.

They measure the volume of the roar at different points along the takeoff path, and chart it as a "footprint".

Above are shown the trails of a conventional four-engine jet aircraft and a DC-10-30.

From them we see that the footprint of the new General Electric power plants on the DC-10 is about one tenth of what we have grown accustomed to; the sound itself is only about half as loud.

Noise suppression within the plane is in keeping with that outside. Engine smoke has virtually disappeared.

That all-important question

BOMBAY—By now, many an airline enthusiast has come to know that Swissair DC-10s afford an opportunity of flying aboard one of the latest, most comfortable commercial jets, combined with all the enjoyments of Swisscare. But the question that still remains on a few lips is "All very well—but where do they fly to?" In the public interest, we print hereunder the DC-10 flight schedule.

Departure From Bombay	Destination
(Westbound)	
Friday night:	Zurich (non-stop)
Tuesday, Saturday:	Zurich, with Athens stopover
(Eastbound)	
Saturday night:	Tokyo (non-stop)
Thursday:	Tokyo, with Bangkok and Hong Kong stopovers
Saturday:	Hong Kong, with Bangkok stopover

As for Swissair's tried-and-true DC-8s, they too fly thrice a week to the West and thrice a week to the East, from Bombay. Complete particulars may be obtained from your IATA travel agent or by calling any of the below-given numbers*

* SWISSAIR

Bombay 293535

The increase in the overall price index following tax revision will directly vary with the values of $\frac{t.pf}{pm}$, t, Δt and $\frac{w_i}{W}$. Table 1 furnishes hypothetical illustrations.

Thus the extent of the rise in the overall price index would depend upon the choice of commodities. If additional indirect taxes are imposed on items like foodgrains, which have very high weightage in the wholesale price index, the impact on the overall price level may be quite significant. Under the existing indirect tax structure, consumption luxuries, particularly the superior varieties of cigarettes, synthetic and cotton yarn and fabrics, motor spirit, refrigerators, automobiles, etc, are taxed at relatively high rates. Available data in regard to excise collections show that petroleum products, tobacco (including cigarettes), textiles (including yarn and man-made fibres), food articles (mainly sugar and tea) and metal products (including metals) each account for a significant portion of the estimated excise collections in 1974-75 and together explain nearly four-fifths of the collections.

Excise collections from some items and the weights assigned to these in the wholesale price index are shown in Table 2.

It will be observed that in most cases the percentage proportion of an item in excise collections is higher — in some cases substantially higher — than its corresponding weightage in the wholesale price index. Does it follow that if the additional resources are mobilised from items with high weightage in excise collections (and generally high rates of excise duties) there will be only a nominal rise in the general price level despite a substantial increase in the tax rates? A simple answer is not possible; the final consumer's price would depend upon several other factors.

Actual Price Rise Exceeds Additional Tax Amount

For the purpose of computations in Table 1 it was assumed that there are no intermediaries. Once this simplifying assumption is removed the actual increase in the market price as paid by the consumer would be considerably higher than indicated in those computations; the rise would depend upon the number of intermediaries and their profit margin. An idea of the extent of the rise can be obtained from the hypothetical illustrations in Table 3.

It will be noticed that (a) with the introduction of intermediaries, increase in the market price exceeds the additional taxation, and (b) the excess over the amount of additional tax tends to rise with (i) the number of intermediaries, (ii) the proportion of tax to the price used for computation of tax liability (pf) and (iii) the percentage of tax change.

It was also assumed that there are no changes in the cost of other wage and non-wage inputs. Apart from an exogenous rise in such costs, the increase in tax on a product (and more so if, as generally happens, tax revisions for a few products are introduced simultaneously) may itself raise the purchase price of another product. This can happen in two ways. First, the prices of products using the products subjected to additional levy may go up and this might raise the general price index depending upon the weightage of the former in the price index. For instance, the tax induced increase in prices of cement and metal products may push up the cost of industrial construction and plant and machinery and thereby raise the per unit fixed cost. This in turn may raise the market price of a wide variety of products. Likewise, additional imports on iron and steel and petroleum products, in particular diesel, may raise the operating cost of rail and road transport industries forcing them to revise the freight charges. These in turn would be reflected in the market prices of a wide range of commodities depending upon the input co-efficient of transport services. Secondly, to the extent some allowances (e g, dearness allowance) are linked to the increase in price index, rise in the latter would raise wage payments and thereby cost of production. Therefore, if all these factors are taken into account, the extent of rise in the general price level which records price increase in respect of each product separately as a result of the chain reaction may not be insignificant, consequent upon sizeable additional indirect levies on certain selected items which are not themselves 'wage goods'.

Forward Shifting Assumption

The assumption that the entire imposition or increase in indirect tax is shifted forward may not always be valid. This assumption can easily be removed. In the foregoing formulae, this can be done by substituting for value of t or Δ t only that portion of tax which is assumed to be shifted for-

TABLE 3

pf = Rs 100

t/Δ t=	t=10 Per Cent	Δ t=10 Per Cent of t		Δ t=50 Per Cent of t		t=50 Per Cent	Δ t=10 Per Cent of t		Δ t=10 Per Cent of t

(ii) Inclusive of producer's + wholesaler's margin*	121.28	122.38	+1.10	126.79	+5.51	165.38	170.89	+5.15	192.94	+27.56
(iii) Inclusive of producer's + wholesaler's and retailer's margin*	127.34	128.50	+1.16	133.13	+5.79	173.64	179.43	+5.79	202.58	+28.94

* For the sake of simplification margins at all the stages are assumed to be 5 per cent and are computed on price inclusive of tax paid.

ward. It is possible that the income and price elasticities of demand for final product and price elasticities of inter-industry demand for increased tax products may not permit mark up of the market price by the full amount of increased tax and thereby avoid resultant changes in cost at various stages. The Draft Fifth Plan in this context refers to situations in which "if the consumers are already being charged the maximum price that they would be willing to pay, an increase in the the excise or import duty is likely to cut into the distributive margin which is a component of factor cost, rather than raise the price to the consumer", (para 4.21, page 45, Draft Fifth Plan). According to the Draft Plan document, "Considerable opportunities of this sort exist at present in the economy". It may be interesting to note in this context that despite the imposition of additional excise duties on certain items (e g, iron and steel) in recent years on the ground of a wide divergence between the actual domestic price (i e, not the controlled price) and the landed cost, there does not appear to have been either any reduction in the domestic price or squeezing of the "distributive margins". Apart from the operation of market forces (of supply and demand), statutory price controls, wherever they operate, may be another factor which does not permit any automatic increase in the final product prices following an upward revision in the rates of indirect taxes.

Despite these possibilities, forward shifting of indirect taxes, either partially or totally cannot be ruled out at least in some cases. The Draft Fifth Plan document concedes this possibility and states that "Additional indirect taxes mean that while the real quantum of gross domestic product remains unaffected, its market value is raised by the amount of total yield from these taxes" (para 4.22, page 45). In its projections of GDP, "indirect taxes by themselves are thus estimated to raise the general price level by only 3 per cent over the entire Fifth Plan period" (*ibid*).

Cost Reducing Innovations

Although, unlike the Approach document, the Draft Fifth Plan does not go on to explain in detail the consistency between upward adjustments in relative prices and the objective of overall price stability, the latter does not consider the envisaged additional taxes as "incompatible with growth with stability". The major component of strategy which can ensure growth with price stability is a reduction (offsetting the increase in indirect levy) in other components of cost. The Approach document anticipates such reductions. It states that "The only way to offset the price impact of indirect taxes is through reduction in material and factor costs. Cost reducing technical, managerial and other innovations have a vital bearing on price stability". The document assumes that "measures will be taken to overcome factors and rigidities that inhibit this [cost reduction]" (para 10, chapter IX, Approach Document).

Presenting more or less the same line of argument the Draft Fifth Plan expects neutralisation of the price-raising effect of indirect taxes by "economies in factor costs" so that the rise in the market value of GDP is less than the yield from these taxes. According to the Draft, it would "be a failure of public policy if the needed curb on private consumption proposed to be applied, *inter alia*, through indirect taxes and reduction in subsidies is allowed to be thwarted by increases in money factor incomes, more so when some of these, lie profit margins in several fields, do admit of considerable reduction". Thus the success of the strategy of raising indirect taxes without adverse effects on price level hinges upon avoidance of "factor cost inflation, generated as a reaction to additional indirect taxes or otherwise, and if there are no serious shortfalls in the realisation of production targets" (*ibid*).

The realisation of production targets depends upon several factors. It is not proposed to examine this aspect in the present paper. However, in regard to reduction in the cost of production the following points may be noted. It is not clear in what way imposition of indirect taxes by itself would induce the manufacturers/suppliers to reduce the costs. Given the objective of profit maximisation, practices which result in cost reduction (and thereby raise profits) would have already been introduced. Unless the profit maximisation behaviour is questioned, failure on the part of manufacturers/suppliers to take steps to increase profits may be attributable to factors like ignorance. It is possible that price rise due to additional indirect taxes may raise consumer resistance and make it difficult to pass on the additional imposts through appropriate change in market prices. Thereby profits may be reduced. If such additional levies are shifted, however, profits would remain unchanged and there are unlikely to be motivations to introduce cost-reducing innovations. An urge to protect profits by reducing costs would arise generally only if the market price of an item is not allowed to rise to the full extent of the tax-induced increase in costs.

Reduction in Consumption by Rich

Apart from the fact that cost-reducing innovations may not always be possible and that their benefit may not be necessarily passed on to the consumers through reduction in market price, a policy-oriented increase in the market prices of consumption luxuries so as to discourage their consumption would be a reasonable assumption consistent with the Fifth Plan strategy (para 4.19, page 45 of the Draft Plan). Relatively high level of market prices of consumption luxuries is presumably calculated to discourage their consumption. While the Draft Plan does not give an idea of the magnitude of reduction in consumption envisaged during the Fifth Plan, according to the Approach document, the monthly per capita consumption of the richest 30 per cent of the urban population is proposed to be reduced from Rs 113.21 in 1973-74 to Rs 108.07 in 1978-79. The Draft Fifth Plan indicates that while the share of private sector consumption is to be reduced from 75.9 per cent of GNP in 1973-74 to 72.1 per cent in 1978-79, the relative share of the bottom 30 per cent of the population is to be raised from 13.46 per cent of the total private consumption in 1973-74 to 18.85 per cent in 1978-79 consistent with the objective of removal of poverty (the private consumption norm for this group being defined as per capita consumption of Rs 487 per annum in 1978-79 at 1972-73 prices).

While the Approach document stated the objective in terms of reduction in consumption of the richest 30 per cent of the population, the Draft Plan envisages, as mentioned earlier, a reduction in the overall share of private consumption in gross national expenditure. This is to be attained through the modality of "curbs on consumption outlays of the well-off strata and on inessential, non-functional consumption" (para 1.61, Draft Fifth Plan). However, neither the Approach document nor the Draft Fifth Plan spells out the assumptions regarding behaviour of the richest 30 per cent of the population as consumers. Assuming no increase in the propensity to consume of the 'well-offs' during the Fifth Plan period, i e, assuming constant average propensity to consume of the richest 30 per cent, the absolute amount of consumption expenditures will remain unchanged if there is no change in prices or in disposable income (Yd). An increase in indirect tax would, let us assume, raise the market price. If there is no increase in income the amount of consumption expenditure cYd will remain the same as before the tax increase if money illusion is assumed on the part of consumers, but consumption in real terms, i e, cYd (1—t) will decline. On the other hand, if consumers do not have money illusion, they will try to maintain their consumption in real terms. In view of the increase in price due to tax revision, consumption expenditure in money terms will have to rise, thus raising the value of the fraction c if Yd remains unchanged. If the incomes of the richest 30 per cent increase as anticipated in the Approach strategy (para 10 chapter VI) and implicit in the Draft Fifth Plan projections, normally one would have expected an increase in the absolute amount of expenditure on consumption luxuries unless one considers these as 'inferior goods'.[10] What the Fifth Plan strategy envisages is a decline in the absolute amount of consumption expenditure of the richest 30 per cent or well-off strata of the population notwithstanding a rise in their incomes and in the prices of consumption luxuries.[11] For this relationship to obtain, the marginal propensity to consume will have to decline so that the average propensity comes down to an extent which results in reduction in the absolute amount of consumption out of increased incomes.

Incentives to Save and Equity

What factors would motivate the consumers in the high income groups to undergo a cut in their real consumption even though their money incomes are rising is something which is not clearly spelt out in the Approach document. Statements like "inducements must be given to potential savers to invest their savings in socially productive assets where possibilities of direct investment exist as in the case of agriculture and unincorporated enterprises" and that "the incentives offered to potential savers must be attractive enough to make them invest in financial assets" (para 11, chapter VI, Approach Document) would suggest that through fiscal or other incentives, the return on savings (i e, abstaining from current consumption) should be made sufficiently attractive so as to discourage current consumption. The rates of return required to make future consumption (i e, saving) more attractive than current consumption will have to steeply rise at the margin if consumers are to be induced to undergo a cut in real consumption in the face of rising money incomes. To attain this objective the Draft Fifth Plan would also appear to lay great stress on fiscal policy (para 2.45, page 20). It might be useful to note that, according to the Draft Plan, "Sharp increases in interest rates" are neither desirable nor feasible" for channelling savings into the hands of public intermediaries because of "the effect of such a policy on the aggregate volume of savings being much weaker" (para 2.44 page 20).

Increase in the marginal savings-income ratio in respect of the well-off strata of the population would increase wealth (physical plus financial assets) in their possession. Would this not be inconsistent with the objective of redistribution? At any rate, the Fifth Plan strategy of allowing a rise in the incomes of the richest 30 per cent and then expecting them to reduce their consumption in real terms raises several doubts.

Increased Production of Consumption Luxuries: A Paradox?

Again, nothwithstanding a decline in per capita consumption envisaged for the rich, the production of consumption luxuries is expected to rise. Leaving aside the financial aspects, an increase in total consumption of such items would be determined by (i) the level of per capita consumption of such products, (ii) the increase in this level and (iii) the increase in population. Since the Fifth Plan strategy envisages reduction in per capita consumption of such products (i e, (i) and (ii) are negative values), the possible increase in per capita consumption values may be explained by the projected rate of growth of population. Rates of growth in value of output (figures in bracket represent rates of growth as envisaged in the Approach strategy) of 5.12 per cent in textiles (5.23 per cent), 7.65 per cent (8.52 per cent) in leather and rubber products, 5.09 per cent (5.28 per cent) in cosmetics and drugs, 7.08 per cent (7.27 per cent) in electrical household goods, 7.27 per cent (9.49 per cent) in transport equipment, etc, cannot be easily explained by population growth amongst the rich adjusted for postulated decline in their per capita consumption even after allowing for the reduction in the growth rates postulated in the Draft Fifth Plan compared to the Approach document. To some extent, of course, increased output may be a result of fuller utilisation of capacity created prior to the Fifth Plan. This, however, cannot explain the anticipated growth rates in all the cases. Although the Approach document mentions the need for reorienting fiscal and industrial licensing policy to discourage expansion of output of luxury goods, additional capacity creation in some cases would appear to have been built into the targets of production during the Fifth Plan. This may appear paradoxical juxtaposed with the objective of reducing inessential consumption. However, there are at least two possible explanations for this apparent contrast.

First, an increasing proportion of production of such products may be exported. In respect of 'luxury products' the Draft Fifth Plan endorses the strategy (mentioned in the Approach document) of finding ways to use the existing capacity "as far as possible, for purposes of promoting exports" since "scrapping of existing capacity in these industries would not be a practical proposition" (para 14, Chapter V of the Approach document; para 2.21, page 18 of the Draft Fifth Plan). Secondly, increase in per capita consumption of the bottom 30 per cent as well as the consumption pattern of the middle 40 per cent may require increased production in some of these industries. Since, as stated in the Approach document, the variation between the output growth rates of the preferred (i e, one which allows for a rise in the per capita consumption of the bottom 30 per cent) and the other variant is of a small order — much less than 1.0 percentage point in most of the cases — such a hypothesis is sustained. However, it is possible that the commodity composition may shift in favour of the consumption pattern of the poor and the middle strata of population. For instance, additional production of the textile industry may predominantly be in the coarse variety of cloth; the motor vehicles industry may produce vehicles to cater to the requirements of the public transport system and so on. While the Draft Fifth Plan envisages substitution of "more superior varieties of different commodities by more common varieties" only the detailed commodity-wise exercises carried out by the Planning Commission may throw light on the extent of the substitution assumed.

Revenue Implications

But if alteration in the commodity composition in favour of the consumption pattern of the poor and the middle

classes is built into the Fifth Plan projections there arise certain problems from the point of financial resources. If output of luxury goods for the domestic market is to be reduced either by using the existing capacity for producing for the export market or for producing relatively low-priced products, the revenue from indirect taxes will decline. Even if additional subsidies to promote exports of non-traditional items are not taken into account, the rebate at the existing rates allowed on exports in respect of excise duties paid at earlier stages, would result in a decline in revenue from excise (and other indirect taxes). Further, relatively low-priced products (e g, inferior varieties of textiles, cigarettes, etc), mainly consumed by the poor and the low-middle classes, are subjected to excise and other indirect taxes at low rates. The change in the composition of products sold in the domestic market against the consumption pattern of the rich would thus tend to reduce the indirect tax revenue.

In the absence of knowledge of the assumptions underlying the estimates of financial resources, it cannot be ascertained whether the projected revenue from indirect taxes for the Fifth Plan makes allowance for these factors. Consistent with the assumption of stable prices (exclusive of tax changes), the Approach strategy with its stress on discouraging production of luxuries should bring about some reduction in normal (i e, without changes in the tax rate) growth rates in revenue from indirect levies. While details are not available, anticipated revenue from excise duties and sales taxes during the Fifth Plan at 1972-73 rates of taxes shows a compound rate of growth of over 8 per cent and over 7 per cent, respectively, as per the Approach document. The expectation of an increase of this order at unchanged tax rates would appear to be inconsistent with the assumption of price stability and the objective of reducing per capita consumption of high-taxed luxury products in real terms.

Additional Resources Mobilisation: Double Counting

Another point which has generally been overlooked in the resource computation exercises for the plans is the intra-public sector transactions arising from tax revision. It is a moot question whether the entire additional collections consequent upon an upward revision in tax rates could be considered additional resource mobilisation. An increase in indirect levy on iron and steel, for instance, would raise the material input cost for the railways by pushing up the price of railway wagons, locomotives, etc. An additional impost on petroleum products may push up the operating cost for rail and road transport as well as the aviation industry all of which are almost wholly in the public sector. No doubt the indirect tax collections of the government would rise through imposts on steel and petroleum products, thus resulting in 'additional resource mobilisation'. But the resultant increase in the investment and operating cost of public sector enterprises would reduce their surpluses, unless the increased costs are passed on to the users. The revisions in tariffs by such enterprises, unless they exceed the tax-induced increase in cost, would merely absorb such cost increases. The question is to what extent it is proper to consider tariff adjustments to absorb the increased tax as constituting additional resource mobilisation.

If additional resource mobilisation is defined, as it should be, as the increase in the withdrawal of financial resources from their private use then additional indirect levies (concealed in their input costs) paid by public sector undertakings cannot be necessarily considered additional resource mobilisation. Thus, out of the increased indirect tax collections following a tax revision, the tax element in the increased input cost of the public sector undertakings will have to be taken out in order to arrive at the real magnitude of additional resource mobilisation. In that case, collections by public sector enterprises from private users, through revision in their tariffs in addition to the incremental tax paid by them on account of tax rate revision, would alone constitute additional resource mobilisation in the true sense. To put it differently, failure on the part of public sector enterprises to pass on the tax-induced price rise to the private users of taxed products is akin to the grant of a subsidy (because it cuts into their profits) and should be set off against the additional resources collected through revision in tax rates. Simple addition of additional collections through tax and tariff revisions at all the stages thus overstates the magnitude of purchasing power withdrawn from private use.

Notes

I The measures of additional taxation taken by the Central and the state governments during 1974-75, the first year of the Fifth Five-Year Plan, confirm this pattern.

2 The actual price to the purchaser may be still higher if cognisance is taken of insurance and freight charges to the extent these are linked to suppliers' prices.

3 It may be noted that revision of tax rate at the initial stages in the chain of production process would raise automatically the yield from *ad valorem* taxes levied at subsequent stages.

5 Gokhale Institute of Politics and Economics, *Artha Vijnana*, March 1972, Vol XIV, Input-Output Table for India 1963.

6 Planning Commission, PPD, Material and Financial Balances.

7 Value-added-tax is a multi-point levy and hence to raise a given amount of revenue it requires a much lower rate than the composite rate; it also avoids cascading effect. There are, however, two types of problems in regard to VAT, if considered as a substitute for excise duties. With a wide divergence in the rates of excise duty a uniform rate VAT (or with rates varying within a narrow range) as a substitute for Union excise duties may considerably reduce the tax 'incidence' in respect of some of the highly-taxed items. Secondly, there may be administrative difficulties of assessing VAT in respect of a number of small units.

8 It may also be argued that if indirect taxes are imposed only at one stage there will be a strong incentive for evasion through collusion between the seller and the buyer. If, however, indirect taxes are imposed at various stages there will have to be a collusion at different points of impact of indirect levies; this may not be very easy. Besides, since the rates of tax at each point of impact will be lower than the composite rate, the incentive for evasion, which is generally believed to be a direct function of the level of tax rates (see Wanchoo Committee Report) will be lower.

9 If no reduction in equality of consumption expenditure is assured the monthly per capita consumption expenditure of the richest 30 per cent of the urban population would have increased from Rs 113.21 in 1973-74 to Rs 128.45 in 1978-79.

10 An inferior good is defined as one less of which is purchased when there is a rise in income.

11 Some of the consumption luxuries have a "snob appeal" and can more appropriately be categorised as 'Giffen goods' more of which might be purchased when their prices go up (see Paul Samuelson, "Economics", Asian Student's (fifth) Edition, p 484).

Educational Inequalities among Rajasthan's Scheduled Castes

K L Sharma

Analysis of three crucial factors — enrolment, hostels and scholarships — which are related to the education of the Scheduled Castes reveals that their alarmingly backward condition is connected to the deprivation they suffer in relation to the higher status groups and to the differential treatment they receive from the power elites among themselves.

Broadly, the distributive disparities affecting the Scheduled Castes are at three levels: between the Scheduled Castes and the general population; between the various Scheduled Castes; and among Scheduled Castes in a particular district or area.

THE Scheduled Castes suffer today not only because of imposed social and cultural disabilities but perhaps much more because of the imbalances created by the emergence of structural differentiation within them which is a consequence of the policies and plans undertaken ostensibly for their uplift and welfare. The differential treatment given to the politically weaker and sometimes to the numerically non-preponderant groups within the Scheduled Castes is a major reason for these continuing inequalities.

Analysis of three crucial factors — enrolment, hostels and scholarships — which are related to the education of the Scheduled Castes reveals that their alarmingly backward condition is connected to the deprivation they suffer in relation to the higher status groups and to the differential treatment they receive from the power elites among themselves. Broadly, the distributive disparities affecting the Scheduled Castes are at three levels: between the Scheduled Castes and the general population; between the various Scheduled Castes; and among the Scheduled Castes in a particular district or place.

On examining enrolment figures the disparities between caste Hindus and the Scheduled Castes become clear. For an understanding of intra-Scheduled Castes disparities, an analysis of the pattern of hostels and scholarships is necessary.

According to the 1971 census the Scheduled Caste population in India makes up 14.6 per cent of the total population, whereas the Scheduled Caste population in Rajasthan amounts to 15.8 per cent of the total population of the state. The percentage of literates in the state as a whole is 15.2, but among the Scheduled Castes of Rajasthan the percentage of literacy is only 6.2. And among the various districts of Rajasthan, the level of literacy of their Scheduled Caste populations varies widely — the highest being 13.7 per cent in one district and the lowest being 2.1 per cent in another district. The literacy level also varies between one Scheduled Caste and another — the most literate Scheduled Caste has a literacy rate of 11.6 per cent, while the least literate has a rate of 3.2 per cent.

Enrolment

Table 1 shows the enrolment rates of the Scheduled Castes at different levels of education. The higher the educational level, the lower is the enrolment rate of the Scheduled Castes. This clearly reflects the inability of most Scheduled Caste parents to send their children to school and college particularly because crucial family earnings are supplemented by working children. Therefore, even the available facilities for higher secondary and college/university education cannot be availed of by the weaker sections among the Scheduled Castes. This indicates that it is not the quantum of available educational facilities which determines the educational attainments of various groups but it is the differential background of social networks, status, power, etc, of these groups which determines their level of education. Therefore, an increase in the educational facilities for the Scheduled Castes may not result in the lessening of the gaps between caste Hindus and the Scheduled Castes or between the different Scheduled Castes themselves. Unless a fair distribution of the use of educational facilities is ensured, the present educational system will continue to accentuate the distinctions among the Scheduled Castes. Another dangerous consequence of this trend would be the continuance and further increase of inequalities between caste Hindus and the majority of Scheduled Castes. As is well known, this has already led to a situation where the jobs and positions earmarked for candidates belonging to the Scheduled Castes remain unfilled for some time and are then filled by recruiting non-Scheduled Caste candidates.

This paucity of suitably qualified Scheduled Caste candidates is partly explained by the lack of Scheduled Caste students enrolled in science faculties. The predominance of non-Scheduled Caste students continues in the science subjects, including medicine and engineering. This predominance is even greater than indicated in Table 2, because Scheduled Tribe students have been lumped together with caste Hindu students.

Hostels

There are also marked disparities in the provision of hostel facilities for Scheduled Caste students. Upto 1966-67 there were exclusive hostels for Scheduled Caste students, including at college level. At present the exclusive hostels are only upto the higher secondary stage. Since 1967-68, five per cent of the places in all college hostels are reserved for Scheduled Caste students. To break the isolation of Mehtar (sweeper) students and to integrate them with other students, five places are kept reserved in every hostel for them. Also, twenty per cent of the places in the hostels for Scheduled Tribe students are reserved for the Scheduled Castes.

The sketchy and inadequate data on hostel facilities for the Scheduled Castes in Rajasthan show that the hostels for Scheduled Caste students are not distributed in proportion to the ratio of Scheduled Castes in each district as related to the entire population of Scheduled Castes in the state. Though hostels are a key mechanism through which a number of other facilites like scholarships and special coaching are extended to Scheduled Caste students, information about the actual utilisation of these facilities by students, both Scheduled Caste and non-Scheduled Caste, in each district is meagre and unreliable.

what inspires
confidence
in a trademark?

Take fabrics, for instance.

CHAITRA-CAFI-250

In all there are Scheduled Caste hostels with 4,474 residents in Rajasthan as counted in July 1972. Of these hostels, seven are for girls with a total of 275 residents. Table 3 shows the uneven distribution of hostels, with a concentration of them, not surprisingly in the districts with the bigger urban centres and larger universities such as Jaipur, Udaipur and Jodhpur. There is no correlation between the number of Scheduled Caste hostels and the number of Scheduled Caste students in a district. For instance, some districts like Alwar and Ganganagar have many hundreds of Scheduled Caste students but accommodate only a few of them in a small number of hostels. There is also no proportional relationship between the number of students of a particular Scheduled Caste and the total population of that caste.

However, many of the numerically small Scheduled Castes are not represented at all in the hostels. Of the 27 Scheduled Castes that have no hostel residents, about half have populations of between 1,000 to 10,000, with the remainder having populations of less than 1,000. But there are other Scheduled Castes in the range of 1,000 to 10,000 and 10,000 to 25,000 that have benefited from hostel facilities. However, no caste having a population of less than 1,000 has any hostel residents. In the range of 10,000 to 25,000 only three castes have not benefited from hostel facilities and all the castes with populations of 25,000 or more have been using hostel facilities.

For a fuller understanding of the place of the Scheduled Castes in hostels, a series of micro-studies are needed with particular reference to the composition of hostel admission, managing, mess and purchase committees, student participation and involvement in these bodies, extra-curricular activities, and academic performance of the students living in these hostels. Other factors like intervention by political leaders, politicalisation of students, hostels as political arenas, and the role of caste distinctions, could also be studied.

Scholarships

A major factor in the education of the Scheduled Castes is scholarships. Both the state and the Central governments give scholarships to Scheduled Caste students in Rajasthan. There are three types of scholarships — pre-matric, post-matric and for technical education. The amount paid as pre-matric scholarship in Rajasthan is meagre but is more than that given in some other states. There are no scholarships for students studying in classes one to five. They are given some nominal financial assistance once a year. Students in classes six to eight are paid five rupees per month for a period of 10 months a year. Twenty rupees per month are paid to students of classes nine to eleven, also for 10 months a year. Post-matric and technical education students are eligible for receiving both state and Central government scholarships simultaneously. Students receiving education in some special institutions and public schools are given special scholarships. Scheduled Caste students are also given some other concessions, such as exemption from fees, reservation of seats, concession in marks, etc.

But again, these scholarships are not equitably distributed. Table 4 shows that 19 Scheduled Castes constituting 9.22 per cent of the total Scheduled Caste population of Rajasthan, received 24.44 per cent of the total scholarships. From among these 19 Scheduled Castes, four — Bairwa, Chanuk, Khatik, Koli — received maximum benefits. 13 Scheduled Castes received less than their proportionate share of awards. 36 Scheduled Castes, constituting about seven per cent of the total Scheduled Caste population, did not receive even a single scholarship. But each of these 36 castes invariably accounted for less than one per cent of the total Scheduled Caste population. It is interesting to note that the Scheduled Castes who were lesser beneficiaries of hostel facilities received more of the scholarships — such as the Khatiks, Koiris and Mehtars.

Thus, a multiplicity of factors operates in a very complex fashion in the distribution of benefits to the Scheduled Castes. As a result of this, one finds inter-district disparities, intra-district

TABLE 1: ENROLMENT OF SCHEDULED CASTE STUDENTS IN 1965-66

Educational Levels	Total Enrolment	Enrolment of SC Students	Percentage of SC Enrolment to Total Enrolment
Primary	15,18,364	2,20,573	13.6
Middle	3,29,910	29,301	8.8
High/Higher Secondary	1,39,156	6,915	5.0
Total	20,87,430	2,56,789	9.1

intra-caste disparities, etc, and also disparities because of numerical preponderance, political representation of a particular Scheduled Caste in the Lok Sabha or the State Assembly and sometimes because of certain political and election strategies.

In addition, a combination of other factors, such as past socio-cultural background and present power position in the state and local hierarchies, are also responsible for the disparities and discrepancies. These gaps have not only persisted between the general population and the Scheduled Castes but the availability of certain facilities has also accentuated class distinctions within the Scheduled Castes. The frequent increases in the extent of facilities have increased inequalities primarily because of the differential and unfair distribution of these facilities.

The lack of political mobilisation and the prevalence of social isolation and extreme poverty among the Scheduled Castes have also frustrated the egalitarian programmes meant for their welfare. Conversion to other faiths and change of occupation, without substantial economic gain, are pointless in achieving status mobility. The institution of an increase in the financial rewards for the so-called menial and polluting occupations, and conversely, a decrease in the remunerations of the so-called clean and pure-occupations, would help towards exposing the false notions of 'functionality' and 'differential necessity'. Such a step could help to break through the tendency of monopolising power and status through educational attainment.

Further, children of Scheduled Caste elite families should not be given such facilities as scholarships, hostel admissions and other assistance. These families are better off than the elite families of caste Hindus in a number of cases. These scholarships and other facilities should, therefore, be given to other needy students belonging to the Scheduled Castes. At present, those Scheduled Caste students who receive financial awards at the post-matric level generally come from an upper class background and their successful completion of studies further strengthens their class position. This leads to a vicious circle of increasing intra-Scheduled Caste inequalities. The Scheduled Caste elites become, in fact, 'caste Hindus' to other members of their own communities.

ITC

ITC, formerly India Tobacco Company, is increasing Indian participation in its share capital from 25 per cent to 40 per cent by making the foreign shareholders to agree to offer 28,04,775 shares out of their holdings to the Indian public at par. Of these shares, 10 lakh shares are being offered to the general public through a prospectus and 7,95,871 to the existing shareholders as 'rights' shares in the proportion 1 : 6. The remaining shares are reserved for financial institutions, employees, etc. LIC and UTI propose to acquire 3,79,452 shares each. A leader in the cigarette industry, the 64-year-old ITC also fabricates printed packing material. It is now diversifying into marine products and tourist hotels. According to the management, all necessary government permissions have been obtained for the acquisition of trawlers, the setting up of fish processing plants and the establishment of hotels at Madras, Agra and Delhi. A beginning has already been made in the export of marine products; exports for the year ended March last were of the order of Rs 4.30 crores. The company's hotel at Madras is nearing completion, and land has been acquired at Agra and Delhi and construction is about to commence. One of the main reasons for entering these new fields of activities is the potential for earning foreign exchange. ITC's sales have risen from Rs 145 crores in 1969-70 to Rs 264 crores in 1973-74 and profit after tax from Rs 3.56 crores to Rs 4.46 crores. A total dividend of 15 per cent was recommended by the directors for 1973-74, but in view of the government restriction on payment of dividends, the payment was limited to the 7 per cent already paid by way of interim dividend. As at the end of March last, ITC's net worth was Rs 39 crores and its gross assets were of the order of Rs 75 crores. The shares being offered for sale will participate in the dividend from the current financial year. The entire amount of Rs 10 per share is payable on application. The subscription list will open on September 4 and close on September 21 or earlier, but not earlier than September 6.

Ever seen this mark on the fabrics you buy?

If you haven't, not to worry. You won't find the SKF name on fabrics. Even though more fabrics are woven from yarn spun on machinery equipped with SKF components than any other. Because over 50% of India's mills—the leading ones, rely on SKF textile machinery components. And for some very good reasons: They get the world's most advanced systems, backed by incomparable service.

Is death staring you in your face?

Good lighting makes streets and highways safer. It improves vision, turns off those blinding headlights and reduces the accident rate. Philips have a range of reliable, high-efficiency long-lasting lamps and luminaires for highways and streets. Each specially designed to save on ENERGY to meet Indian conditions.

Philips indigenously manufacture the widest range of incandescent, fluorescent and mercury vapour lamps and luminaires to the highest international standards.

Philips lamps and luminaires—
So that you can see better

Dying on Roots and Grass

THE US administration will not on its own offer foodgrain to India. New Delhi is finding it embarrassing to make an overt request for such supplies. It is perhaps the Government of India which sooner or later would have to give in. An inward-looking administration in Washington could not care less whether Indira Gandhi faces domestic embarrassment in explicitly seeking food aid from the Americans. It might even conclude that the experience of such an embarrassment would make her more amenable to American advice in subsequent seasons. Before giving in, New Delhi, in its turn, might await the outcome of the exchanges with Moscow and the follow-up discussions of the External Affairs Minister in the USSR.

Following these moves and counter-moves, an additional quantity of foodgrains might be imported, and the necessary finances taken care of. These imported grains are, however, unlikely to be available before another four to five months. Even when available, they are unlikely to penetrate the rural areas. And meanwhile, with the nadir of the lean season fast approaching, grim events are unfolding in the countryside. Official prevarication notwithstanding, deaths from starvation are taking place in the interior villages of several regions — particularly in villages in the deficit states. As is to be expected, the landless labourers and their families are the primary victims. They do not have enough work during this period; indeed, they never did have. Further, even where they are able to find some work, the paltry sum they receive as wages is woefully inadequate in the face of the spiralling prices of foodgrains.

Provided official food statistics are not to be scoffed at, despite poor procurement — or because of it —, there would be stocks of foodgrains in the villages to be disposed of. But the nation's majority do not have the wherewithal to obtain any of that. According to reports streaming in every day, thousands have been reduced to subsisting on vegetable roots and wild grass. Those among the poor who had some durable capital, such as corrugated iron sheets over their hutments or one or two brass vessels, are selling them off and buying a temporary respite from hunger. But this is a futile race against time. Labourers on daily wages, who are too weak to work, can earn little at the end of the day; and since they earn so little, they have little to eat and sustain their energy for work, so that, on subsequent days, they are able to work still less and, therefore, earn still less. Finally, comes a day when they are physically incapable of venturing out in search of work; they and their families must therefore perish.

What has been described above is not an academic model of hunger. The scenario is being enacted and re-enacted, right at this juncture, all over the country. The nation's Parliament, however, was not unduly exercised. It discussed the National Cadet Corps bill, it got worked up over the insolence of Sikkim's Chogyal, it congratulated its Member who had done modestly well in the rifle-shooting contest in the Asian Olympics. Occasionally, references were made to urban shortages, such as the scarcity of salt and sugar, or of kerosene and vanaspati. Very few MPs bothered about the approaching tragedy in the countryside. If questions are asked about starvation deaths in remote rural areas, Ministers are known to sulk and ask for notice. There could be reason for their complacence; their Intelligence apparatus might have informed them that the gathering turbulence will end not in thunder, but in a whimper.

Through the courtesy of a visiting American Senator, who had confidential exchanges with ministers and officials, the people of this country have meanwhile been told that the kharif crop of 1974-75 will be at least seven million tonnes less than it was in 1973-74. Because of unsatisfactory rains, a shortage of water is also likely in the catchment areas and so the rabi crop too, it is apprehended, will be down. Which means that, the plight of the unfortunate millions in the countryside would be even harsher about this time next year. The modality of dealing with the problem of their empty bellies will be no different, however. No famine is going to be declared, there will be no public distribution of grains for them at cheap rates. They will continue to die unsung. But, officially, the country will continue its 'progress'. This year it was first the nuclear implosion, now followed by Sikkim. Next year, perhaps, it will be an Indian version of the sputnik, and we will have arrived in space. Once you have attained such heights, people and their need for food must indeed seem remote and trivial.

Government Housing

To Those That Have...

IN New Delhi's stratified society, the allotment of government accommodations, it is well known, is made on a highly selective basis. Type I quarters — the lowest species of official accommodation — are allotted to government servants who draw emoluments of less than Rs 175 per month; that is, those who belong to the Class IV category. As one goes up the scale of emoluments, naturally the quality of accommodation one is entitled to improves: at the level of Secretary, the availability is of Type VIII — that is to say, posh bungalows with two or three acres of lawn and lush vegetation thrown in.

A sample study was conducted to find out what percentage of their emoluments were paid as rent by the allottees of Type V to VII residences in New Delhi in 1972. The spectrum of employees covered by the study included relatively junior officers, at one end, to Secretaries and Additional Secretaries, at the other. The results, incorporated in a recent report of the Comptroller and Auditor-General, are presented in the accompanying Table (position as on June 1, 1972).

Thus 75 per cent of the allottees of Type VII quarters — drawing anywhere between Rs 3,000 and Rs 4,000 per month — paid less than 6 per cent of their emoluments as rent. On the other hand, nearly 95 per cent of the employees allotted Type V quarters were forking out more than 6 per cent of their pay as rent. To be even more specific, while roughly 40 per cent of the allottees of Type V quarters paid as rent more than 8 per cent of their emoluments, not one of the allottees of Type VII houses was called upon to pay that high a proportion of their earnings as rent. Those occupying Type I and Type II accommodations—usually the vast army of class IV employees — were charged 7.5 per cent of their emoluments. The structure of rents was hence so arranged as to make it uniformly regressive: the higher the pay received, the lower the proportion of it paid out as rent.

The sample study reveals something else as well. The rate of return on government accommodations — that is to say, the rent actually recovered net of expenses on account of maintenance and repairs as a proportion of capital cost — was also consistently regressive. In 1970-71, the rate of return was 4.13 per cent for Type II quarters, but only 2.24 per cent for Type VII ones. Next year, the rate of return for Type II accommodations was 3.43 per cent; it was 2.46 per cent for Type VI, and 2.29 per cent for Type VII quarters.

Expenditure incurred for maintenance and repairs in 1970-71 was Rs 31.25 lakhs for 21,202 quarters belonging to Types II to IV. In contrast, as much as Rs 24.52 lakhs were spent for only 3,226 accommodations of Types V to VIII. In 1971-72, repairs of the two respective groups of quarters cost Rs 26.49 and Rs 39.61 lakhs; in 1972-73, the respective figures were Rs 23.83 lakhs and Rs 33.36 lakhs. If the expenditure on repair and maintenance of Types V to VIII quarters were further analysed, the bulk of it could have been shown, to have been on account of houses belonging to Types VII and VIII.

Apart from ordinary repairs and maintenance, special expenditure is also incurred from time to time on 'additions and alterations' to quarters. Such expenditure on Types I to VIII quarters during the period 1968-69 to 1972-73 aggregated to Rs 34.13 lakhs; of this amount, as much as Rs 13.52 lakhs were spent on improving Type VIII accommodations occupied by Ministers and Secretaries.

Quarters are supposed to be made available against as much as 90 per cent of the sanctioned posts in the Class I category; but, it is understood, as against sanctioned Class IV posts, the sanctioned availability of quarters is only around 30 per cent. Thus, for each Secretary to the Government of India who enjoys a luxurious bungalow and pays for it perhaps 4 per cent of his salary as rent, there are at least one thousand or more government officials who, denied official accommodation, are shelling out no less than 25 to 30 per cent of their monthly emoluments for a one-room tenement.

TABLE

	Type of Quarters		
	V	VI	VII
Number of quarters selected	147	48	12

Paying above 9 per cent and up to 10 per cent of pay	21	4	—
Total	147	48	12

IMF

Back in Business

FOR the International Monetary Fund (IMF) the fiscal year ended April 1974 was a hectic one. The floating exchange rates regime, initiated in March 1973, got fully entrenched during the year. To the surprise of many, floating rates soon came to be seen as the only generally acceptable solution to the problems that were plaguing the world monetary system after the collapse of the Bretton Woods arrangements in August 1971. The oil crisis, which brought about a structural change in the payments system, further confirmed that fixed exchange rates, such as had ruled for two and a half decades till mid-1971, were a thing of the past.

A regime of floating exchange rates was initially anathema to the IMF as it virtually questioned the very basis of the IMF. If markets could be relied upon to tackle problems of payments deficits on a day-to-day basis through exchange rate variations and thus render obsolete official judgment about the 'appropriate' exchange rate of any currency, there was no little reason why an elaborate apparatus like that of the IMF should continue to be maintained. The oil crisis, however, changed the situation dramatically in favour of the IMF.

It has become clear by now that floating rates cannot solve most of the problems which at first sight they were thought capable of solving. Both the UK and Italy, ardent supporters of floating rates, have failed to rectify their non-oil-induced trade deficits. It is slowly dawning on the advocates of floating that floating exchange rates have proved a reliable mechanism of transmitting inflationary forces across national borders. More important, floating rates have not dispensed with need for short or medium term financing of deficits by the IMF. The IMF has already worked out an oil facility scheme with around $ 3.5 billion initially, obtained through credits from the oil exporting countries. Countries in need can draw on this facility and be subjected to the usual IMF surveillance. The IMF has also decided to create a new scheme called Extended Fund Facility under which developing countries can obtain medium-term finance for balance of payments purposes.

Now that the ill-fated Committee of Twenty has been wound up, the IMF would also be entrusted with greater responsibilities and powers through its new Super-Board which is to be designated as the Interim Committee of the Board of Governors. The Committee will be subsequently designated the Council of the Board of Governors after an amendment to the IMF's Articles of Agreement.

What are the problems of the world payments system in tackling which the IMF can hope to play a useful role through its Super-Board? Last year saw very wide fluctuations in exchange rates which in the past would have been regarded as highly de-stabilising and harmful. The expectation that speculators would be deterred by the two-way option involved in floating exchange rates has not been borne out entirely. That a number of them were able to play the markets extremely profitably, at the cost of the banking community, is indicated by bank failures on account of losses incurred purely in foreign exchange transactions. Maybe the banks will learn from their mistakes. But the IMF can play a more effective role in keeping a check on speculation than the Bank of International Settlements because of its more representative character.

World trade, reckoned in dollars, increased by a phenomenal 37 per cent in 1973 as against an average rise of 10 per cent during the decade 1960-70, 14.5 per cent in 1970, 12 per cent in 1971 and 18 per cent in 1972. In volume terms the rise was 12.5 per cent in 1973 as against about 9 per cent on average during 1960-72. The steep increase in the value of trade in 1973 was thus largely due to a spurt in unit values. The rise in unit values was 1 per cent in the decade 1960-70, 5 per cent in 1970, 5.5 per cent in 1971 and 22 per cent in 1973 as against barely 8 per cent in 1972. It is true that the unusual spurt in industrial activity all over the world was partly responsible for the spurt in unit values of trade. But it cannot be denied that floating rates also contributed to the unusual rise in unit values in 1973. Along with the spurt in units values, the rates of inflation are also accelerating the world over. And the phenomenon of worldwide inflation cannot be tackled except through co-operative effort under the aegis of a body like the IMF.

The IMF's annual report draws attention to the enormous disequilibrium in the world payments system, wholly unprecedented in size and character. It suggests that this needs a particular type of policy response on the part of the oil-importing countries as a group. The oil-induced deficit is a problem of a long-term nature as the oil exporting countries cannot in the foreseeable future increase their imports from the rest of the world so as to reduce their payments surplus. Some of the relatively sparsely populated countries like Kuwait or Saudi Arabia are unlikely in the next ten years or more to step up their imports to levels that would absorb their payments surpluses. Thus the surpluses of several oil exporting countries will remain undiminished for years to come and correspondingly the oil importing countries incurring payments deficits cannot hope to do away with these deficits except by passing them on to others. In this situation the recycling of funds from the surplus areas to the deficit ones assumes overwhelming importance. A failure in this regard would damage not only the relatively weak among the developed countries, like Italy, but also all the developing countries. This situation is a challenge to the IMF to prove its worth in a vastly changed world in which the relatively safe role which it played from its birth until 1971 has very limited scope.

Smugglers and MISA

Diversionary Operation

IT has been a rather well-orchestrated operation. First, the Minister of State for Finance took the rather unusual step of naming in Parliament the country's alleged three biggest smugglers. The Minister sketched an awesome picture of the power and influence of these persons which supposedly made it difficult for the government to take action against them and their activities under the existing laws. This set the stage for the amendment of MISA to bring smuggling within its ambit and helped to create the impression, when a handful of alleged leading smugglers were arrested under the amended MISA, that the government had performed a near-miraculous feat.

It is as if at one stroke two major criticisms of the government have been silenced. First, it could no longer be maintained that the government used the preventive detention laws only against its political opponents and not against those guilty of even the gravest economic crimes. Second, it may be suggested that the wind has also been taken out of the charge that the government, when it does act against economic offences, concentrates on the small fry — such ts retail traders or urchins 'smuggling' foodgrains into cities and towns in small bundlefuls — while letting the acknowledged pillars of the economic underworld go scot-free.

The timing of the government's supposed crack-down on smuggling is worth noting. About the scale of organised smuggling into the country there has never been any doubt, nor about the damage caused by it to the economy. All the same, at this juncture the most critical problem facing the government is a different one. It is that of the acute shortage of food and the prevalence of famine conditions over large parts of the country. Reports of starvation deaths and grim tales of the most precious possessions and even children being given away in exchange for food for a few days can be heard from all over the country. In many cases the sources of these reports are members of the ruling party themselves, including chief ministers and ministers.

It is also acknowledged that the present food situation is not the result primarily of any shortfall in output, but has arisen because the larger producers and traders are holding back stocks of foodgrains from the market to keep prices high and raise them further if possible. The government's preoccupation just now ought to be with forcing out these hoarded stocks. In fact, however, the government is acting like a helpless by-stander. In the circumstances, the suspicion is entirely permissible that the highly publicised operation against smuggling is intended to divert attention from the government's failure to alleviate famine and starvation and its unwillingness to bring to book those who have brought the country to this pass.

The action against smugglers, its diversionary character notwithstanding, may still have had some merit, if some impact were likely to be made on smuggling as a result. Unfortunately, there is nothing in the government's actions so far to suggest that this is likely to happen. All attention has been focused on the arrest of a few alleged smugglers under MISA. But unless the operation is extended to breaking up the organisations and networks that the alleged smugglers rely on for conduct-

ing their activities, their detention for even relatively long periods may leave their smuggling operations unaffected.

Ironically, what the operations against the smugglers have brought out is the influence that these persons enjoy in the highest political and police quarters. Thus, there has been the case of a non-bailable warrrant of arrest issued against one of them being mysteriously transformed into a bailable warrant and the person concerned being promptly released on bail. There is the other alleged smuggler who was arrested in Surat and released by the Baroda police on no more than a personal bond. Or, again, there is the case of the one who has so far, MISA notwithstanding, evaded being removed to jail or even to a government hospital on grounds of delicate health. After much cogitation, police officials are said to have decided against moving him to jail for fear that he might not be able to withstand the strain of the journey. It may be recalled that no such consideration was shown to the CPI(ML) leader, Charu Mazumdar, a known heart patient, who was allowed to die in police custody — not to mention the scores of cases in which so-called 'Naxalite' suspects and detenus have been deliberately left to bleed to death from injuries inflicted by the police.

Besides diverting attention from the countrywide famine, the government may have achieved something else as well by arresting a few alleged smugglers under MISA. Now it can plead that it cannot dispense with the DIR because if it did its efforts to combat an anti-social activity like smuggling would be set at nought.

Groundnut Export

No Thanks to GEEDA!

EXPORTS of groundnut extractions, at Rs 116.11 crores in the calendar year 1973, were the highest ever — 112 per cent higher than in 1972. Exports to the free foreign exchange areas accounted for 61 per cent of total exports in value and 59 per cent in volume, as against 43 and 42 per cent, respectively, in 1972. Also, apart from Japan where India already enjoys a 'monopolistic' position, the direction of exports was much more diversified in 1973, with the UK and West Europe absorbing nearly a third of the exports. The average unit value realisation for 1973 worked out to Rs 1,409 per tonne fob as compared to Rs 639 per tonne in 1972. But all this was by no means the result of "the organised and well disciplined efforts of the members" of the Groundnut Extractions Export Development Association (GEEDA), as the latest annual report of GEEDA claims.

In fact, India's export performance in groundnut extractions in 1973 was nothing short of a 'windfall', arising from the worldwide protein shortage. All oilcake exporting countries in the world gained from this shortage and India was no exception. Thus exports of the other extractions, such as cottonseed meal, linseed meal, etc, also improved. Indeed, the improvement in export performance was more impressive in oil meals other than groundnut. Thus in quantity terms, exports of cottonseed extractions doubled, and those of linseed extractions increased over five times, while exports of groundnut extractions declined — albeit marginally. GEEDA ascribes this decline to a smaller 'exportable surplus'.

That the export promotion 'efforts' have really had a negligible impact is evident from this year's export of groundnut extractions. Despite the larger exportable surplus out of the 1973-74 crop, exports during January-June 1974 totalled just 4.54 lakh tonnes — as against 4.84 lakh tonnes in the corresponding period last year. At the same time, exports to free currency areas have dropped in the first half of the current year to one-third of the total. In the so-called 'monopoly' market of Japan, exports dwindled to 78,500 tonnes from 1.40 lakh tonnes during the corresponding six months of the last year. And the Rupee Payment areas absorbed almost two-thirds of GEEDA's exports in the first half of this year.

The achievement in raising the unit value realisation too have been negligible since GEEDA was formed in 1969. Before 1969, groundnut meal almost invariably averaged a higher price than soyabean meal. Soyabean meal from the US (44 per cent) averaged $ 89 cif Rotterdam between 1966 and 1968, while groundnut meal (50 per cent) averaged $ 95 cif during the same period. Since then, despite the higher protein content of groundnut meal, their prices ran almost neck-to-neck till 1972. And in 1973 groundnut meal averaged $ 35 less than soyabean. Clearly, in achieving some diversification of the direction of exports, the unit value realisation on groundnut meal was made a casualty.

The protein crisis of 1973 may not be repeated this year. In the long run, it is essential to safeguard the unit values of exports, if export earnings are to be sustained without starving the domestic market. It should also be remembered that the processing margins of the solvent extraction industry are usually large and it is necessary to mobilise this 'surplus'. A state export agency could fix lower domestic prices for purchase of groundnut extractions from the industry, so that the prices of groundnut and groundnut oil in the country are held in check.

Hybrid Seeds

The Gold Rush

DURING the past few weeks there have been a number of reports about the poor quality of hybrid seeds in Maharashtra. There are three types of hybrid seeds widely used in Maharashtra, namely, hybrid bajra, hybrid jowar and hybrid cotton. Growing of hybrid seeds has become a valuable avenue of political largess.

Foundation seed is distributed by the zilla parishad at the district level to influential personages and the government guarantees the repurchase of the seed that is grown. The seed is certified by the State Seed Certification Authorities, processed by the zilla parishad and bought by the District Marketing Officer who is an employee of the Maharashtra State Co-operative Marketing Federation. The seed is usually purchased with zilla parishad money. It is stored on government account and then sold through the Block Development Officer and village level co-operative societies.

A grower of cereal seeds usually earns two or three times as much as the grain grower. He also gets a guaranteed supply of fertiliser. There is hardly any difference in the cost of cultivation of a seed crop and a regular crop. A grain crop yields on average 15 quintals per acre and a seed plot 5 quintals of seed and 3 quintals of grain. The price of seed is more than 10 times that of grain.

According to the Seeds Act, every bag of seed is required to bear the name of the producer so that in case of poor performance the source can be traced. In fact only the name of the zilla parishad is put on the bag. Last year, when there was a shortage of seed, empty bags were sold for as much as Rs 10 each and refilled with ordinary grain which was then sold as hybrid seed. There have been many complaints, but the police have not taken much note of them. The provision for guaranteed repurchase of seeds is again likely to land the government in a mess this year similar to the one that occurred in 1968 when over Rs 2 crores worth of seed had to be destroyed at great loss to the public exchequer.

The situation is worse with regard to hybrid cotton seed production. There are two hybrid cottons on the market at present: Gujarat Hybrid-4 also known as Sankar-4 and Varlakshmi. Hybrid-4 is the older variety and has been grown for the past few years. The government has guaranteed a price of Rs 60 per kg for the repurchase of this seed. Last year the guaranteed price was Rs 100. One acre under seed produces 300 to 500 kgs of seed on the average. The cost of production is Rs 25 per kg, leaving a margin of profit of between Rs 10,000 and Rs 20,000 per acre. Every important politician of the ruling party in Marathwada and Vidarbha has a seed plot. The Minister for Agriculture and the Chief Minister have been growing H-4 seed over large areas for the past few years. Last year 1.30 lakh kgs of seed was purchased on government account. Of this only 70,000 to 80,000 kgs have been used, despite the Department of Agriculture's all-out efforts to dispose of the seed. The carried-over stock of seed is kept in a MAFCO cold storage at high cost. This seed will be revalidated again and efforts made to sell it next year. The incentives offered by the government for purchasing H-4 seed this year included liberal fertiliser quotas. Many bought the seed only to get fertiliser for other crops. This year a further 2 lakh kgs of seed costing Rs 1.20 crores will be bought at government expense, ensuring attractive returns to the government's supporters.

The government has seen to it that H-4 is protected and encouraged under the monopoly procurement scheme. The guarantee (floor) price paid to the H-4 grower is Rs 410 per quintal for kapas, while the lint sells at between Rs 5,100 and Rs 5,700 per candy. By comparison, the floor price for Baramati Laxmi and Nimkar is Rs 350 per quintal for kapas, while the lint sells at between Rs 5,300 and Rs 5,400 per candy, according to current market quotations. Thus the final price for both cottons is about the same, but the H-4 grower gets more money at the time of delivery of the crop to the marketing federation.

A new source of patronage and profit for the political bigwigs is the new hybrid cotton variety, Varlakshmi, developed in Karnataka. The cost of seed production is the same as for H-4, but the Karnataka government last year purchased the seed on a guaranteed basis at Rs 400 per kg. This year many Maharashtra ministers, including the Chief Minister, are growing Varlakshmi seed. The government of Maharashtra is yet to declare a guaranteed repurchase price for Varlakshmi, but, needless to say, the price will be higher than that of H-4 since Varlakshmi is a superior variety of cotton. In Karnataka the distribution of seed plots was given over to the MLAs. Every Congress MLA is said to have been given 75 seed plots which he sold to farmers in his constituency at a premium of Rs 1,000 to as much as Rs 3,000 per plot. The quality of Varlakshmi cotton has deteriorated due to the poor quality of seed produced. This has resulted in a drop in price of the lint from around Rs 7,000-9,000 per candy to Rs 5,000-6,000. This is bound to affect the demand for the seed. So, to prevent an uproar from the grower's lobby, the government may once again have to buy up all the seed produced.

State Violence

No Law and Order Problem This

SUCH news tends to get lost in the melee these days. Earlier this month, there was some unrest among the wretched refugees huddling in the camp at Mana in Madhya Pradesh. A 'law and order' situation ensued; the police were 'compelled' to open fire on the refugees; and according to reports, four persons were killed in the firing — two of them, women. Readers of newspapers by now tend to cast a cursory glance at news of this kind, and pass on to more meaty matters.

The refugees from East Bengal, who had continued to come till 1964, have become an irritant. There has been a tendency to describe them as unrehabitable, and leave it at that. Some doles go their direction; too bad if they are not satisfied with these. A number of these refugees, sent to far-out places in Madhya Pradesh, Rajasthan, and Gujarat, have nurtured grievances about the niggardliness of the arrangements, and the complaints have increasingly received short shrift from the government. Following the emergence of Bangladesh, the East Pakistan refugees have become an even greater embarrassment to New Delhi. Official quarters indeed look forward to a situation where these people would simply make themselves scarce. New Delhi would claim that, within the limits of its capability, it has done enough for the non-Muslims who came away from East Bengal between 1947 and 1964; the nation's precious resources cannot be indefinitely frittered away on them.

And yet, something must be terribly wrong with administrative arrangements if physically emaciated women, women whose daily living is a grim nightmare, women uprooted from their soil for no particular fault of theirs except perhaps reposing an abiding faith in the rhetoric of Indian leaders of those days, can be restrained only by killing them off with police bullets. A certain pattern has by now emerged, a pattern which keeps repeating with exhausting monotony. Women prisoners lodge complaints about unspeakable tortures by the police in jails and lock-ups; the police deny the allegations; as far as the government is concerned, the matter ends there. At Mana, women are shot dead by the police; a few almost ritualistic protests are voiced by this or that politician; the police had to fire in self-defence say the government spokesmen; and, once more, the matter seemingly ends there. In Nagaland, armed sentries fire in the darkness against alleged 'intruders': a woman is subsequently discovered dead from gunshot wounds. So what, pass on to the next news item.

Even when the government has made up its mind that popular discontent must be met headlong, it should not be impossible in these days of galloping technological progress to improve upon the methodology of quelling civil disturbances. Tear gas might have had its day; but, in quite a number of foreign countries, water jets have been found to be substantially effective for restraining unruly mobs. There is absolutely no reason — unless it be that somebody might argue that this would mean a diversion of scarce water from irrigational use — for not trying out similar experiments in this country. Shooting to kill has to be the last resort of the police, not the first.

In this season particularly, this matter has an acute relevance. The unquiet months are upon us. With the developing shortage of food in the market, mass agitations are likely to itensify in the coming weeks. The Centre is unable to allot food to the states; but it is more than liberal in the allotment of CRP battalions. There could be more episodes, therefore, such as that at Mana, or in that Bihar township where a former minister, leading a crowd protesting against rising prices, was gunned down.

Tourist Pickings

Hansavivek

ITC, formerly India Tobacco, is diversifying its activities into the hotel and marine products businesses. It has obtained necessary government clearance for the establishment of hotels at Agra, Madras and Delhi. The hotel at Madras is at an advanced stage of completion and should be ready by the end of 1974. Land for the Agra hotel has been acquired and construction will commence soon. In Delhi, a good site has been located and design plans, etc, are in hand. The company expects to earn considerable foreign exchange and assist the growth of tourism by setting up these hotels. From a small beginning of Rs 73 lakhs in 1971-72, ITC raised its exports of marine products to Rs 430 lakhs in 1973-74. The company's plans for this business envisage the operation of a trawler fleet, the setting up of processing factories and cold storage facilities and exporting the finished products to sophisticated international markets like the USA, Japan, Western Europe and Australia. The company has received the licensing committee's approval for the setting up of three processing plants and has also been given an allotment of trawlers which are expected to be imported in the near future. ITC's general exports cover a wide variety of products such as paper/board products, myrobalam, leather goods, bicycles and bicycle parts, garments as also cigarettes and manufactured and blended cut tobaccos. The company is recognised as an 'eligible export house'. The sister concern, India Leaf Tobacco Development, is the principal supplier of unmanufactured tobacco and has a substantial business in exports. During 1973-74, its exports amounted to about Rs 20 crores.

During 1973-74, ITC showed good results with higher sales, margins and net earnings. The board recommended a total equity dividend of 15 per cent, against 14.5 per cent paid last year, but the final payment of 8 per cent had to be withdrawn owing to the restrictions on dividends. Over the year, production of cigarettes increased from 29,747 million to 34,583 million against the installed capacity of 40,839 million. Smoking tobacco production, however, was lower at 113,000 kgs against 185,000 kgs. The foreign shareholders have offered a part of their shareholding to the Indian public at par to enable the company to increase its Indian shareholding from 25.3 per cent to 40 per cent. Proposals have also been placed with the authorities to further increase the Indian shareholding to 60 per cent in the foreseeable future. Auditors were paid, apart from the usual audit fee of Rs 1,05,000, Rs 27,500 for taxation matters, Rs 15,245 for management services, Rs 9,225 for special certification, Rs 3,368 for provident fund audit and Rs 39,400 for reimbursement of expenses.

POLYCHEM, after several years' effort, has obtained a letter of intent for annual manufacture of 2,000 tonnes of acrylonitrile butadiene styrene resins with *indigenous technology*. A pilot plant, based on laboratory scale know-how developed by the Sri Ram Institute and purchased through National Research and Development Corporation, is expected to be commissioned shortly. The company's production capacity of polystyrene has been increased from 10,000 tonnes to 16,000 tonnes per annum. A letter of intent for manufacture of vinyl acetate monomer and other related products is also being sought to further diversify the company's activities. As a result of research efforts, the company has developed new high-impact polystyrene formulations based on polybutadiene rubber. Plans have been announced for making polybutadiene rubber in the petrochemical complex at Koyali. The chairman, Ramdas Kilachand, however, feels that it will have to be imported till indigenous production commences. In June last, the company commissioned separate facilities for manufacture of country liquor at the alcohol distillery. This will ensure increased production of both Indian made foreign liquors and country liquors during the current year. During 1973-74, the company recorded satisfactory growth in sales of new products like divinyl benzene, neutral spirit and potable liquor. Net sales increased by about 19 per cent, but margins shrank and gross profit was only 5 per cent higher. This outcome occurred following the steep increase in all items of cost of production. The price of naphtha was increased thrice during the year, leading to a very high increase in prices of the main raw materials, benzene and ethylene. The company revised the sale prices of its polystyrene and styrene monomer products from April last. Direct exports of polystyrene have been banned since October 1973. Under the current import trade control policy for 1974-75, it has been stipulated that import licences for raw materials and components will be issued subject to the condition that 10 per cent of production of polystyrene for which the import licences are intended shall be set apart for distribution against release orders based on export performance.

GENERAL ELECTRIC COMPANY OF INDIA has marketed a new range of air circuit breakers and has also delivered higher capacity furnaces. Its erection department has entered new fields and secured an order for the electrification of a textile mill abroad. The inflow of export orders has been showing an upward trend and the current year is expected to scale a new peak in export orders. The merchanting division witnessed some deterioration in trading conditions last year, especially in lamp products, due to widespread power-cuts throughout the country. Also severe competition prevented the full recovery of higher manufacturing costs in this division. There was also a four-month strike in the two main factories. Even so, the company's financial results for the year ended March last have been quite encouraging, as reflected in a sharp rise in margins despite only a modest rise in net sales. The ratio of wages to sales were fractionally lower, while that of inventories to sales increased sharply though total borrowings remained unchanged and the amount of interest showed an appreciable decline over the year. The company has made several applications for manufacturing new products and expansion of output of the present range of products and soon expects decisions on them. The directors are also studying the implications for the company of the new Foreign Exchange Regulation Act, which came into force from January last. Meanwhile, applications have been made to obtain permission from RBI to continue its existing activities in India.

FIRTH (INDIA) STEEL experienced delay in the supply of major plant and machinery required for the alloy steel billet project being set up for making high speed and alloy steel billets. The arc furnace is now expected to be commissioned in November. Since the company had placed firm orders for most of the plant and machinery before December 1973, it will be able to claim the benefit of development rebate on a substantial portion of the plant and equipment. The major financial institutions have sanctioned term loans to the extent of Rs 230 lakhs for the project. The company also issued 9.8 per cent redeemable cumulative preference shares for Rs 30 lakhs and equity shares of Rs 50 lakhs at par to the existing shareholders. The company produced good results for the year to March last, with increased sales and earnings. In terms of tonnage of high speed and alloy steel processed in the works, there was an increase of about 100 per cent over the year. However, the availability of high speed billets continued to be difficult resulting in only 23 per cent utilisation of capacity. Production was greatly affected by the inadequate supply of furnace oil and power restrictions. In view of the restrictions on payment of dividends, the board has recommended a seven per cent distribution, the whole of which is expected to be exempt from tax. The ratio of inventories to sales showed considerable decline during the year.

THE TATA HYDEL GROUP, comprising Tata Power, Andhra Valley and Tata Hydro, is not paying any final dividend to equity shareholders, who have to be content this year with only 5 per cent interim distribution against a total of 13 per cent received by them last year. In the case of Tata Power and Tata Hydro, moreover, a small balance of preference dividends will also remain unpaid, since the Companies (Temporary Restrictions on Dividends) Ordinance has been replaced by an Act without providing any relief to the shareholders of electricity companies. The earnings and profitability of electricity undertakings have been regulated and restricted in terms of the provisions of the Electricity (Supply) Act, 1948. The managements of electricity companies, therefore, felt that further restrictions on the distribution of dividends to shareholders would be discriminatory and more onerous for electricity companies than for companies engaged in other industries. Representations were made through the Federation of Electricity Undertakings of India to government for suitable relaxation from the provisions of the fresh restrictions. In the hope that government would show some consideration to the difficulties of the shareholders of electricity companies when framing the Act to replace the Ordinance by the date of the annual general meetings of the three companies, the directors decided to recommend final dividends at the same rate as last year. But there was no response from the government and, accordingly, dividends have to be paid in accordance with the provisions of Act. The Act also prohibits payment of any interim dividends, which shareholders of electricity companies have been accustomed to for a long time, except with the approval of the Central government.

Calcutta Diary

A M

REMEMBER that title of the cheap American thriller, "Darling, It's Death"? It was a catchy, haunting title; and, suddenly, it is no more a title. As one looks around, it is death. To whom, in such sweet endearment, should one be conveying these tidings?

People are dying in the countryside, dying for lack of food, dying in their hundreds. Many who are not yet dead will be, in the course of the next few days or the next few weeks. Meanwhile, they put up a kind of whining resistance. They scrounge around, and eat whatever they can lay their hands on: grass, leaves, roots, stems, shrubbery. They collect a few dry branches and have a little fire, they collect a little water in an earthenware pot, they boil the roots or the grass. Call it gruel, call it glue, those who are starving will not quarrel over nomenclature. The glue may well be poison, but the poison works slowly; along with the poison, there is a little intake of calories. Man's urge to survive dies hard. There is no dignity in the manner people are collapsing in the villages, on railway platforms, on the way to the towns, in the towns. They do not stand upon dignity, they merely want to live. But, it is an unequal battle, they die. Calories are not for ever, certainly not for the poor.

True, it is not quite 1943, not yet. The scale of the tragedy is not a fraction of what it was three decades ago; again, not yet. But the pattern has a sharp resemblance: helpless people trekking townward, helpless people selling off their ration cards to the sharks for a morsel of food, helpless people disposing of their children — children whose swollen bellies and vacuous eyes are fearsome evidence of the calamity concocted in our times.

It is — or so it seems — all part of an arrangement; people are dying hardly because there is no food in the countryside. Going by records of production, there should be ample food lying around, but nobody sees the food; it is safely tucked away in godowns, away from the reach of the hungry. The food is not reachable to the poor, they cannot afford to pay the price for it. Even in the so-called 'surplus districts' of West Bengal — such as Birbhum — a kilo of rice will now fetch more than Rs 3 in a village; and wheat, only a little less. In a normal season, a daily worker, who has on the average four others to feed besides himself, is unable to earn more than Rs two a day — which today will not get him even two-thirds of a kilo of rice! Between the five of them, two-thirds of a kilo of cereals is grossly inadequate; but still, they would have managed to survive. In this lean season, between the sowing and the harvest, opportunities for work too are few and far between. This year, because of the waywardness of the rains, the scope for finding work has shrunk even further.

That inexorable auto-regression has hence set in motion. An able-bodied worker, who puts in a full day's work, may still earn two rupees at the end of the day. But those who are semi-starved are in no position to put in a full day's work. The economics of wage payments now takes over. A destitute farm labourer lands a job, but his output turns out to be less than satisfactory: the wages are hence cut back *pro rata*. The less he is able to work, the less he earns, and the less food there is for him and his family; the less food there is for him and his family, the less still is his capacity to work. Mercifully, the agony is soon ended; for, within a fortnight or thereabouts, of declining intakes and attempts to work, the moment comes when he is took weak to stir out in search of work. The family begins to starve, wholesale. After a while, the children are sold off, sometimes killed by the parents themselves — a lesser number of bodies to feed, a lesser number of bodies to starve.

It is a 'natural law' at work. When the avarice of the rich is beyond containment, and State power backs this avarice to the hilt, the poor have to die. In West Bengal alone, they are dying, as of this moment, in at least five thousand and odd villages of the fifteen districts of this state. This same great pantomine of death is being enacted and re-enacted, on a greater or smaller scale, in several villages in Assam, Orissa, Madhya Pradesh and Maharashtra too.

Those who are dying belong to the great Indian democracy; the adults amongst them each has a vote at election time; newspapers are full of hints that another such election is going to be ordered soon.

It is a nice, cosy, well-ordered society this. One is not supposed to use swear words in the neighbourhood; expressions such as 'murder in cold blood' are for expunction. And yet, deaths such as these are no normal deaths : landless labourers and their kith and kin are dying in their hundreds for the specific reason that they are unable to purchase food at the going market price. Prices have sky-rocketed in the course of a single year. Even official statistics, which are often fudged, will show that grain prices in many areas have leapt up by as much as 65 to 70 per cent over the year. This rise in prices is not reconcilable with the known facts about output.

West Bengal, for example, is in the heart of the kharif belt and, going by the gushing data released by the government, there has been a record production of kharif grains in the 1973-74 season. Since, very considerately, the authorities have desisted from procuring more than a negligible part of this output, the grains are all there — and in much greater quantity than about this time last year. But, there is the crux of it: the food is there, but not for those who do not have the purchasing power. The money incomes of the poor are not to be allowed to increase; but there is no such embargo on the price of food.

During all these months, grain prices have been raised, all the way, under the sponsorship of the government itself; inflation has been stoked by the kinds of things the government has done, as well as by the other kinds of things it has not done. It has raised support and procurement prices; it has winked at the banks merrily expanding their lines of credit to traders and rich farmers; it has wasted funds on programmes which are just so much alibi for handing over money to the same set of greedy people. It has been reluctant to procure. It has been reluctant to distribute food at cheap rates in the rural areas. This has been one grand strategy to annihilate the poor.

Starving people do not necessarily rise in revolt. They do not have the calorific strength for it. They are a decrepit lot, afraid to die, gripped by panic at the thought that, come tomorrow, they will be no longer alive. It is absurd to think of them as insurrectionary material. Others, who could have organised them, driven them to a fearful crescendo of righteous wrath, are equally dispirited. From the demure sidelines, or from prison, the watch, brooding over their past errors.

Meanwhile, chief ministers meet once more in New Delhi. As far as they and their friends are concerned, no holds are barred. Charge what the market will bear continues to be accepted law. The chief ministers, therefore meet and decide to raise prices of kharif grains some more. By this decision, they are ensuring that some more of this country's 'citizens' will die. In this so-called planned economy, everybody is for himself or herself; the ruling politicians are also for their near and dear ones — who make fortunes out of the deaths of ordinary people. It is all a matter of self-preservation and self-advancement. Thus those who are dying are dying because of an open conspiracy on the part of the rich who rule this land. Those who are dying have every right to bestir themselves against their murderers. It is the luck of the rulers — ministers included — that this prerogative is not being exercised by default.

CAPITAL VIEW

The Cut on Luck

Romesh Thapar

THE current situation is more bizarre than you think. Someone summed it up: plenty of gobar, but no gas. Probably, it is the cut on luck. On the one side, there is a steady reportage of famine signs at widely scattered points. On the other, the daily dose of ununderstandable economic and political analysis from the Prime Minister. I will not add the inevitable spice to the traditional kidgeree: a recent ministerial statement has it that we will be exporting foodgrains next year or by 1976! The gulf between reality and make-belief is so vast that the entire ruling elite needs the relaxation of meditation. As for commentators, they should, I suppose, attempt levitation.

At this moment of writing, a fairly reliable non-official estimate of the foodgrains shortfall is around 10 million tonnes — as against the official figure of four million tonnes. This colossal quantity will have to be imported. The Soviet Union, the guessing goes, will be persuaded to offer some four million tonnes as a grain loan. Kissinger will bring two million tonnes with him. A million tonnes has been contracted in Europe. And three million tonnes more will have to be bought, loaned, received as aid, demanded, etc, etc. Yes, the perspective is pretty grim when one adds to this picture the propensity of the trader to hoard, blackmarket and to deal in death.

What will be, will be. We have been blessed with incompetence and corruption at every level of food management. Now, we can only hope that there will be some rain to relieve the drought and some efficiency in handling relief, an efficiency at least comparable to earlier famine fighting operations. It is imperative that these operations be kept in readiness. It is necessary to say this because official chatter betrays a lack of crisis thinking. The people, in whose name the politician swears, are not being taken into confidence.

A passing check in the Capital reveals that on the free market good quality wheat is selling at Rs 5 per kilo and sugar at over Rs 8 per kilo. Sugar, of course, will disappear as it is a great earner of foreign exchange this year. We can do without it. But cereals cannot be left to the cynical play of traders and the like. Today, the situation is notable for its lack of campaigns to halt waste, to develop alternative food habits, to cut rice consumption in wheat-eating areas and wheat consumption in rice-eating areas, and to motivate the country for a long battle on food.

We have been living from year to year, hoping that the shortage will lift with a series of good monsoons. This criminal drift, a drift which affects all categories of thinking, has to be ended. It is time that the truth was drilled home that we are going to be living with shortages for the next decade, what with population booming and productivity declining. Let us not imagine that discipline and patriotism will suddenly descend from the heavens on this benighted subcontinent. In other words, a sensible plan for austere living, for rewarding the productive and sacking the inefficient the incompetent and corrupt, will have to be hammered out — that is, if the ruling elite remains democratic.

Indira Gandhi's invocations and meditations, together with warnings about the conspiracies being hatched against her, must be read against this background of a sharply deteriorating economic situation. Nothing can divert attention from it. Even atomic implosions turn into damp squibs. It is becoming embarrassingly clear to a bankrupt power hierarchy that India's future is now more than ever at the mercy of the "generosity" of the USSR and the USA, that relations with both will have to be carefully nurtured. And succour will be sought from every other giver: Iran? Iraq? Kuwait? Abu Dhabi? In fact, everyone on the scene.

It is a sad situation to be in but it throws up the most astonishing sideshows. Witness US Ambassador Moynihan's carefully worded cable to Kissinger about Indira Gandhi's fears of Chile-like intervention in India. Unless Ambassador Moynihan is playing for a recall from the political desert that is India, it appears that the cable is a skilful ploy to provide the excuse for elaborating a new Indo-US relationship. We'll know very soon.

As every nation in this crisis-ridden world begins to take a long look at itself, India that is Bharat is content to wallow in the cliches of the *status quo*. This frightening faith in *mantrams* will exact a terrible debt. It is said that there is no alternative to the present leadership. Then how does one compel this leadership to act? This the central question, even as Indira Gandhi publicly mentions the 1976 general elections and appoints the now well known Yashpal Kapoor as the teacher and guide of party ranks!

Tailpiece: A published, alleged quote from Haji Mastan : "I know many political beggars who shower abuse on me in the light of the day and call me the vilest names but come with a begging-bowl to me in the darkness of the night clandestinely. They beg me to give them money for elections. At that time their faces are worth seeing and the facade of their moral loftiness, gentlemanliness and honesty is shattered. I smile at their cunningness in the heart of my heart after filling their bowls with alms. Among those who come to me in the dark, there are some big leaders and respected elders and there will be a political explosion if I reveal their names. They include Congressmen, Communists, Socialists and Muslim Leaguers. Some people fight and win elections at my expense and become Ministers. But they start abusing me the very next day in order to make a show of their gentlemanliness and integrity to the world. God knows, I have no complaint against them as I know this is the way of the world and the business of the world goes on like that ...".

Who is Haji Mastan? If you don't know, it's about time you found out.

September 16

FROM OUR CORRESPONDENTS

NEW DELHI

No Money for Development Projects

B M

THE Secretary in the Ministry of Petroleum and Chemicals, heading the Department of Chemicals, last week called journalists to a special briefing to take the Press into confidence on the snags that have developed in the implementation of the high priority fertiliser programme. The stunning disclosure that he made on the occasion was that it was no longer the availability of foreign credits which now stood in the way of launching fertiliser projects. The real hurdle was the paucity of rupee resources. The Finance Ministry had made it clear that it was unable to provide funds for the Paradip fertiliser project for which French credits to cover the foreign exchange cost had already been arranged. The beginning of work on the project will, therefore, have to be postponed till April next. The mention of April in this case, as also in several other cases, is a camouflage; it merely means that the question will be considered when the next year's budget is framed.

The Secretary in the Ministry of Petroleum and Chemicals made the further extraordinary suggestion that some way would have to be found to persuade foreign sources to finance not only the foreign exchange expenditure on these projects but also their local costs. He hinted that the oil producing countries might be approached for this purpose. One used to hear of extremely backward countries, like Nepal, making similar pleas way back in the sixties when foreign credits were offered to them — that they were unable to raise matching domestic resources to take advantage of the foreign aid. The aid-givers, therefore, sent them all kinds of fancy consumer goods — from fountain pens to cars — for sale in their home markets to help raise internal resources. After 25 years of planned economic development we seem to be sliding down to a similar position.

The situation is not an entirely new one. The prolonged dependence on PL 480 foodgrain imports, after all, not only gave foodgrains for current consumption but also provided sizeable budgetary support. Though PL 480 aid in its original form has been ended, new forms of similar assistance have been received in the last two years. The two million tonne Soviet Wheat loan and Rs 190 crores worth of crude oil credits serve the same purpose of providing budgetary crutches. The idea evidently is to extend the range and expand the quantum of such assistance. Great hopes are pinned on an additional wheat loan from the Soviet Union, on foodgrain imports on deferred payment basis from the US and other Western countries and on additional accommodation from the oil producing countries.

While all development is thus halted and a desperate search is on for foreign support to keep the country afloat, the foreign exchange situation is far from easy. The propaganda about the successes on the export front notwithstanding, the balance of payments position is becoming desperate. The latest exercises show that as against the estimate of Rs 3,100 crores made earlier in the year, imports this year will be around Rs 4,000 crores. Export earnings, on the other hand, are expected to touch Rs 2,600 crores at the very most, leaving a trade gap of Rs 1,400 crores. The primary reason for the higher imports is the larger requirement of foodgrain imports which are now estimated to be of the order of Rs 700 crores. An additional Rs 100 crores each is required for fertiliser and crude oil imports. The total import bill for crude oil, fertilisers and foodgrains adds up to Rs 2,400 crores and this is considered inflexible. The figure of all other imports is placed at about Rs 1,550 crores. Here some economies are contemplated. But nothing definite has yet emerged.

Foreign aid in sight is expected to fill the gap between imports and exports earnings to the extent of Rs 800 crores. This includes Rs 190 crores of oil credits, Rs 250 crores of net aid flow from the Western countries and drawals of Rs 350 crores already made from the IMF in three instalments. For the rest, hopes are placed on the US relenting and releasing sizeable aid. The IMF may have to be approached for additional accommodation, if overtures to the US do not succeed. The Planning Minister's current visit to Moscow — to prepare the ground for which no less a person than the Foreign Minister had earlier made a dash to the Soviet Union — is also regarded as crucial in this respect. If the Soviet Union comes forward with another wheat loan of 2 to 3 million tonnes, the need to import foodgrains from other sources will be correspondingly reduced. A long shopping list of other requirements, including fertilisers and ferrous and non-ferrous metals, has also been carried to Moscow. To the extent to which the Russians meet these requirements the strain on foreign exchange for financing imports from Western sources will be eased; but to the extent the gap still remains, after all efforts to fill it by soliciting more aid from every quarter has been made, the figure of Rs 1,550 crores of imports other than crude, fertilisers and foodgrains will have to be slashed. Here again the idea is not to cut maintenance imports as far as possible. The axe will fall on new projects which will have to be postponed to save on imports. The logic is the same here as has been in the use of domestic resources: new investment can be dispensed with till happier days are here again.

Development is thus being strangulated by paucity of both rupee resources as well as foreign exchange. The effects of this are beginning to show. Heavy engineering industries have been doing well for the last two years or so. This was probably the only bright spot in the otherwise gloomy economic picture. These industries are now going to be hit hard by lack of demand. With the steel expansion programme virtually at a standstill, the Heavy Engineering Corporation is confronted with a situation where it has nothing on its order books beyond 1975. And even if the steel programme is revived next year or the year after next, the HEC will then be criticised for its inability to meet the demand for equipment and machinery and new pressures will be mounted for allowing imports of these. It is not only the steel programme which has been slowed down. Several other projects, including the Mathura refinery, are being put in cold storage. The Planning Commission's long awaited exercise of updating the Fifth Plan has become an exercise in pruning Plan targets on a wide front. Recessionary tendencies are, therefore, beginning to affect the working of many engineering units, among them those taken over by the Heavy Industry Ministry in the past two years. These units had been nursed back to health with efficient management and use of resources. They are now facing the prospect of sinking back into sickness. The situation is indeed getting to be far more grim than during the three years of Plan holiday in the sixties.

NORTH

Culmination of a Set Drama

THE traders have again successfully and indirectly pressed the Punjab government into abject surrender. In the last week of August, grocers and other retailers in most Punjab towns closed down their shops in protest against the Centre's bill for checking adulteration and the state government's independent measures to seize samples for checking on impurities. Things came to a head when two Ferozepur retailers were arrested for having obstructed the Health Department staff's attempts to seize samples as part of the anti-adulteration campaign. Grocers started 'dharnas' and 'hartals', demanding the release of the arrested and the withdrawal of cases against them. The state government buckled under, on the pretext that the hartal was causing great inconvenience to consumers. On August 29, it decided to drop the cases against the arrested traders. Thus the government's anti-adulteration campaign lost much of its force as it was clear that no action was to be taken against the offenders.

Partly in response to the threat posed earlier by the anti-adulteration campaign, and partly in an attempt to publicly establish their own *bona fides*, a deputation of the Uttar Bharat Kiryana merchants assured full co-operation to the government in its anti-adulteration drive. They contended that the arrest of the two Ferozepur traders was the result of 'misunderstanding'. Indeed, the Retail Kiryana Ration Committee of Jammu went so far as to suggest the death penalty for those found "really guilty of adulteration after scientific investigation". The committee also suggested several other measures. Finally, it demanded protection against unscrupulous producers!

There are, of course, clearly contrived loopholes in the retailers' list of suggestions. First, the retail shopkeepers of edible commodities are demanding from government a warranty to be arranged from the producers and wholesalers for all the goods they supply them. They further demand an end to all raids on shops by the Police and Food Department squads: these raids on them, they claim, are 'unjustified' in the absence of any warranty of the purity of goods supplied to them by wholesalers and distributors. Moreover, the shopkeepers insist that 'sub-standard' goods should not be considered 'adulterated' because "sub-standard quality is caused by several factors — such as seed, manure, soil, weather conditions, etc". They also demand mobile laboratories to conduct on-the-spot tests of commodities, since at present the retailers have "no ready means to ascertain the purity or impurity of the articles they agree to sell".

While the retailers are thus apparently passing the buck onto the wholesalers and producers — though the public seems not too convinced by the retailers' postures of innocence — the success of the retailers *vis-a-vis* the government has also afforded protection to the wholesalers and producers. In sum, the Punjab government has hurriedly climbed down from its high horse of 'anxiety for the consuming people' in order not to offend another important and more powerful section of the electorate.

Meanwhile, Jan Sangh leader Baldev Parkash — MLA and convenor of the Punjab non-CPI Opposition Front — has appointed district convenors for a signature-collecting campaign against the Zail Singh government. The Front proposes to collect about 40 lakh signatures on a giant petition to be presented to the Governor for dismissal of Zail Singh and his ministry. While the signature campaign is known to be a futile gesture in the context of the comfortable majority that Zail Singh commands in the Assembly, it will certainly aggravate some of the administrative hurdles which have complicated his task and will further slow down the tempo of economic development. Officials and inter-departmental wrangles have created awkward situations; the Finance Ministry has been trying lately to discipline the other Departments by insisting on prescribed procedures. It was the Planning Commission that initiated the process by sanctioning only Rs 2 crores in place of the Rs 10 crores sought by the state government for sinking about 1,000 tubewells near the Indian embankments of the Sutlej and Ravi rivers which border on Pakistan as part of the effort to bring an additional 1,60,000 hectares under cultivation during the next rabi season. What made matters worse was that half the sanctioned sum was diverted by the Punjab State Planning Board to other purposes. Finally, a few days ago, the state government imposed an-across-the-board cut of 10 per cent on all expenditures.

In Haryana, on the other hand, Chief Minister Bansi Lal's tenure was further underwritten by the Prime Minister when, during her visit to Ambala, she complimented him on the constructive work he had done to put the state on its feet. District officials had taken good care during the visit to see that village functionaries who had arrived in Ambala from the neighbouring areas and other spokesmen of the aggrieved public did not get anywhere near the Prime Minister. Consequently, no voice of dissent or complaint was heard; the Prime Minister apparently went away with the impression that Haryana is a happy, contented state, with Bansi Lal in full command of the situation.

The publicised purpose of Indira Gandhi's visit — to boost food production — remained largely unfulfilled, however. The monsoons have failed in Haryana this year, the distressing power cuts continue, and there is a shortage of fertilisers. The state authorities, therefore, are worried over the bleak prospects of the kharif ouptut. The irrigation sources too being meagre, this year's crop shortfalls may be unusually large.

While many cases of nepotism and irregularities at various levels have been successfully hushed up in Haryana, the recent wheat scandal has not remained a secret. The illicit gains, estimated at Rs 30-50 lakhs, seem to have been rationed among Food Corporation and Haryana Food Department officials, secretaries of marketing committees, rich farmers, and of course wheat traders. No doubt, the lack of proper supervision and the inefficiency of the Food Ministry itself created the opportunities for such misappropriation. But as always, the consumer will have to pay, in terms of even higher prices for the wheat.

BIHAR

Politicisation of Middle Class Youth

Narendra Panjwani

BIHAR is among the poorest states in the country. It has half the country's mineral resources, two big steel plants and several engineering and cement factories. Yet its per capita income is Rs 402 (1969-70 figure), the lowest in the country. Two-thirds of the state's 60 million people live below the poverty line. The stranglehold of feudalism on Bihar's people is revealed by the fact that even though 90 per cent of them subsist on agriculture, Bihar is deficit in foodgrains.

The communist parties, CPI and CPM, have for long been a strong force in Bihar politics. Two districts, Purnea and Mushahari, have been and continue to be the scene of 'Naxalite' struggles against landlords and the government. Bihar also has a tradition of middle class radicalism due to the work done by the Socialist party, which had reached the height of its influence under the late Ram Manohar Lohia, and the CPI.

Food Crisis

The food situation in Bihar had assumed crisis proportions by the last week of December 1973 and newspapers were filled with reports of starvation deaths, looting of grain shops and hoarding and smuggling of large quantities of foodgrains out of the state. The Madhubani bye-election to the assembly, in which the Congress candidate was the Chief Minister, Abdul Ghafoor, was fast approaching. Ghafoor, therefore, became especially vociferous in his condemnation of hoarders and blackmarketeers. Meanwhile large numbers of students were finding it difficult to continue their studies due to the shortage of food in their hostel messes and canteens.

The CPM, along with some Marxist-Leninist groups, organised a militant demonstration on the night of January 1 and a Patna Bandh the next day which, according to reports, was partially successful. Sensing the popular mood and perhaps afraid that the initiative might pass out of their hands, the CPI and the Jan Sangh speeded up their preparations for a campaign against rising prices and the food shortage.

On January 13, the *Indian Nation* published an article titled 'Onward to People's Democracy' by Jayaprakash Narayan. After invoking M N Roy, Gandhi, Annie Besant and Chittaranjan Das, JP came to his plan: "I urge that we turn our attention more and more to the people including the intellectual elite and youth and suggest programmes of action, both of constructive and self-help nature as well as of combative, coercive and non-cooperation nature ... I wish to issue a call to build an alternative type of democracy ... My call to the country's youth is to seize this favourable opportunity and play the revolutionary role that the present age demands of them. Young men and women pick up this torch and march on. Destiny beckons you. Success awaits you."

On January 19, a local newspaper carried the following report: "The Patna University Students' Union at its cabinet meeting on January 16 decided to gherao the District Magistrate on January 23, if adequate supply of foodgrains, oil, etc, was not restored by January 22. They expressed anxiety over the closure of many messes of the university due to the non-supply of foodgrains. It was also decided that Smt Chandra Panday, a cabinet member of the PUSU, would launch a fast unto death from January 23 to press the union's demands."

A large meeting of students was organised by some "local enthusiasts" in the Patna University campus, under the joint auspices of the Tarun Shanti Sena (Sarvodaya youth front) and PUSU on January 22. It was addressed by JP who saw "dangers to democracy" all around him and strongly criticised the present system of government for having failed to deliver the goods. A second such meeting on February 1 heard JP deliver his blueprint for action, containing suggestions for a massive campaign aimed at changing everything, including the government, to usher in "total revolution" and calling upon students to give up their studies for a year if necessary.

Meanwhile the CPI had given a call for a Bihar Bandh on January 21. The pro-CPI federation of University Teachers, at an emergency meeting on January 16, called upon its members to make the bandh a success. Significantly, the pro-CPI All-India Students' Federation elected a student leader from Bihar as its President at the end of a conference in Cochin on January 18. A Samyukta Sangharsha Samiti, consisting of CPI, Jan Sangh, SSP, Congress(O) and CPM elements was formed around this time. The basis of its formation was a broad agreement on demands and on joint efforts to make the Bihar Bandh a success.

In Muzaffarpur, dissident Congress declared that a government which was unable to supply foodgrains to the people did not deserve to remain in office. On January 20 the Bharatiya Krantikari Yuvak Sangh (an RSS youth front) passed the following resolution: "We urge the President of India to immediately dismiss the Bihar ministry and impose President's Rule ... unless this is done the whole state would soon be engulfed in food riots as in some other states ...". The reference was obviously to Gujarat where the agitation in which the Jan Sangh had been active was beginning to spread. On the same day, Ramnandan Singh, the Sarvodaya leader, expressed support to the bandh.

After reporting the "complete success" of Bihar Bandh, the *Indian Nation* of January 22 said in its editorial: "The Samyukta Sangharsh Samiti will do a great service to the state by rousing peacefully the political will to stem the crisis ... drawing lessons from the anti-price rise stir in Gujarat ... the sponsors of the Bandh should see to that it does not create more difficulties for the people."

Two United Fronts

Young activists of the various parties comprising the Samyukta Sangharsh Samiti organised a convention of more than 300 student leaders from colleges all over the state. In the course of discussions, violent disagreements arose over the formulation of demands and strategy, resulting in the formation of two united fronts: one led by CPI, CPM, and groups of the CPM and called the Chhatra Navjawan Sangharsh Morcha and another called the Chhatra Sangharsh Samiti led by students from the remaining parties plus some unattached students. Both decided to campaign broadly for the same demands, but separately.

Chief Minister Ghafoor was reported to have said on March 17 that Anandmargis had come to Bihar from outside the state to create trouble. The Collector of Patna stated in a press statement that in a raid on an office of the Anandmargis on March 26, six Anandmargis who had come to Patna from Calcutta on March 14 had been arrested. Some arms had also been recovered from the office. On March 16 Atal Behari Vajpayee accompanied by three Jan Sangh MLAs met Prabhat Ranjan Sarkar, Anandmarg chief, in Patna jail. CPI reports claimed that an official of the American Embassy had also arrived in Patna on that day.

This was how the clouds had gathered, and when they burst over Patna on March 18 the section most bewildered were those who were apparently in the forefront of it all — the students. "I just can't understand how it all happened. None of us had planned to burn or loot anything", said one student from Patna. Mahesh Tiwari, a student from Ranchi who had also participated in the March 18 incident, was convinced that "it was the work of hired professionals and goondas. Later on when we were running away from the bullets I did see some students also throwing stones and looting shops but never setting fire to anything. You can't just burn any place — you need to have made extensive preparations. There were so many strange things which happened that day. In the following days I spoke to many students from different parts and we have all come to the conclusion that it was initiated and done mainly by the goondas."

S K Singh, a young doctor added: "There was something very professional in the way they burnt things. At one point I saw three bearded men — not looking like students at all — got off a rickshaw, turn a corner, enter a shop or something and in less than two minutes there were flames leaping all around and they were nowhere to be seen! Near the Assembly I saw similar oldish looking people who deliberately threw stones in spite of being told not to by the student leaders who were in front. Having succeeded in causing confusion and provoking the police to open fire, they disappeared."

Between 30 and 40 persons were killed and many more injured in the melee that ensued. This incident served to inflame the people of Patna and generate mass sympathy for the students. The first procession to be taken out a few days after this incident was that of some 5,000 women from Patna and the neighbouring towns. That women should lead the way in political activity in one of our most feudal states was remarkable. Dr Veena Shrivastava, wife of a prominent Jan Sangh member and herself an active sympathiser, is the secretary of the Nari Mandal which had organised this process. She explained: "Well you see, we had begun organising the women some weeks prior to the March 18 incident ... Why? Because it was planned this way. There are some forces who had planned so that the spark would be provided by the students, the women would be next, then another section and so on ...".

JP's Entry

Not surprisingly, soon after this some of the student leaders turned to Jayaprakash Narayan for guidance and leadership. After much hesitation and reluctance, he agreed. The BSF and CRP massacre at Gaya on April 12, in which more than 100 persons are said to have been killed was, in the words of some eye-witnesses, "reminiscent of Bangladesh". More people had been killed in Bihar in three weeks than had been killed in the whole three-month Gujarat movement. Blood and anger, JP's non-violent crusader image, the backstage manipulations of political parties, and the students' energy combined to mobilise most sections of the middle class and Chhatra Sangharsh Samitis, Nari Mandals and Jan Sangharsh Samitis sprang up in many parts of Bihar.

This torrent of energy spontaneously released overflowed the channels created by the political parties and Jayaprakash at many points, but never breached them. Painters, poets, playwrights, politicians, intellectuals and teachers came out on the streets with the intention of making their distinctive contribution to 'rousing the masses' along with participating as common citizens. Teachers organised open-air classes, attended by hundreds of students and others. They spoke of the distorted and partial history taught in our classrooms — particularly the history of our Independence struggle of the exclusion of many important truths from textbooks and of what was wrong with the present education system. Five teachers have so far been arrested under MISA. One of Bihar's leading Leftist poets, Nagarjun, is on the run and the police are looking for him. A large number of persons have been arrested under MISA for making speeches at street corners.

The agitational programmes put forward from Patna — the political centre of the movement — were acted upon with much vigour and effectiveness in the mofussil towns. Regarding the future, there was one answer this writer got from almost every student however critical he or she might be of the present state of the movement: "whatever may happen, even if all the political parties ask us to call it off, even if JP asks us to call it off, we shall continue and the movement will continue until our demands are met".

Student opinion and consciousness could roughly be classified into four categories: those whose agreement with JP's programmes is based on idol worship rather than on critical understanding; those who profess total agreement in the hope of material gains through political power; those who are critical of JP's authoritarian methods, vague programmes and deceptive promises, but agree with the need for a mass movement to politicise the middle class; and those who belong to the CPI camp and disagree with the present objectives of the movement and consider JP a representative of reactionary, fascist forces. The largest number of students belong to the first category. The next largest number belongs to the third category.

Criticism of JP and the top leaders is now increasingly heard. The teachers' grievance is that he has not considered their problems while formulating his programme for the one-year boycott of colleges. If there are no students, no tuition fees will be collected by the colleges, and that means they will not get any salaries. As it is, payment of salary to teachers is very irregular. "And now he has called upon school students to also boycott all classes", exclaimed Vinod Kumar, a college lecturer.

Questionable Leadership

Students from outside Patna complain that in spite of repeated requests, there is still no district-wise representation on the Bihar Rajya Chhatra Sangharsh Samiti — the main decision-making body. "The programmes and instructions come from the top and we have to act according to them irrespective of whether they are feasible or not, whether we agree with them or not", said Manohar Prasad from Monghyr.

"These student leaders of ours are themselves corrupt — how then can they weed out corruption?" Two of the top leaders have criminal cases pending against them involving murder and rape. The father of another student leader is alleged to be one of Bihar's biggest landlords and blackmarketeers. These people extorted large sums of money from shopkeepers and hoteliers as 'contributions' to the Chhatra Sangharsh Samitis. "And such is their reputation that most students do not even dare to ask for accounts", added a young teacher.

Wishing to confirm these charges, I asked Arun Tapasvi, a member of the Patna Town Action Committee. His reply: "Yes, that is so. But most students outside Patna don't know them so well. When some of us informally

pointed out to JP that he is surrounded by goondas in his Samiti and three persons were named in particular, he asked us not to worry since none of them could force a decision upon him and that he was exerting himself to bring about a change of heart in them through daily association with him. Well, if that is the case then why are we bothering with a mass movement at all? JP could induct Ghafoor and Indira Gandhi into the Samiti and change their hearts!"

The nature of the relationship between the Chhatra Sangharsh Samiti and JP provides an important clue to the direction in which the Bihar movement is heading and the kind of changes it is likely to bring in the event of success. Arun Tapasvi, who has met JP a few times with other student leaders, had this to say: "He is usually too busy to meet most of us. Only the selected few have free access to him. And I have seen that everytime these leaders enter his room they first go and touch his feet, and address him as 'Babuji' whenever they work up the courage to say something to him. Though he has sometimes taken our suggestions, I must say that most of these meetings consist of monologues by the Great Leader."

According to a cabinet member of the PUSU, "During a conversation in jail with one of our leaders, I remarked that he had now become a big man, that he had been arrested under nothing less than MISA and that too had been done by the Superintendent of Police — not an ordinary constable. He replied: 'Don't worry, when I become a minister you shall be well looked after too.' As if to confirm my worst fears they announced a few days ago that the Chhatra Sangharsh Samiti would be fielding candidates for election after the present Assembly was dissolved."

Workers and peasants have played very little part in the Bihar movement, apart from the January 21 Bihar Bandh, in which nearly 500 trade unions and associations participated, plus a few scattered solidarity processions. Most rickshaw-pullers in Patna and Ranchi did not seem to know what all this turmoil was about. Those who did wanted to know what was in it for them. While addressing the factory workers of Ranchi and Jamshedpur, JP explicitly asked them *not* to join actively in the movement as it would jeopardise their jobs and their families. He asked them instead to give financial and moral support to the youth who were participating.

When the Patna Town Action Committee decided to organise a Patna Bandh on May 8 to support the Railwaymen's strike on their own initiative, they were severely rebuffed by the Sarvodaya leaders whom JP had left in charge of the movement during his absence. They argued that the strike was unjustified and harmful to the nation. Not deterred, the Committee went ahead and organised a bandh which was successful. The leadership retaliated by de-recognising the Committee and relations between the two have been strained ever since.

Different Objectives

The success of the movement means different things to the different sections involved. And this is where the purpose of the groundwork done by political parties like the Jan Sangh, the Congress(O), SSP, and others becomes clear. For them success means a re-election and yet another attempt at grabbing political power. The Jan Sangh President, L K Advani, has already declared that students should boycott their classes only until the Assembly is dissolved. If the move for dissolving the Bihar Assembly succeeds, we can expect that parliamentary opposition parties (particularly those of the Right) would intensify their efforts to build up more such mass movements in other states.

Success to JP and the Sarvodayists would mean more youths joining the Tarun Shanti Sena or any of their other organisations whose number increases every year. The purpose of these organisations is to maintain 'peace' between destitute peasants and those who have plundered them, to postpone a social revolution, to prevent small peasants and agricultural workers from uniting and wresting back their land as a matter of right.

For the majority of students, success means change to a nebulous new social order in which corruption would be a little less rampant, where ministers and MLAs would be a little more honest, where prices would not soar so high, where education would not be such a burden and would be more related to the country's problems and where the educated would not be unemployed. They are prepared to follow anyone who promised them these reforms in a short time and without too much sacrifice of their careers or lives.

There is, however, a small section whose aim is to radicalise middle class youth through the process of struggling against the government and coming to realise whom it serves and protects most and whom it fears most. Success to them would mean the largest possible number of youth coming to view the present movement as a lesson in politics.

FOOD SITUATION

Despair and Desperation

(From a Special Correspondent)

THE food situation has become desperate. The management of the food economy is in a shambles. The concurrence of the Union Government with the Maharashtra Government's decision to lift the ceiling price on wheat has sharply underlined this. The elaborate price controls and restrictions on movement of foodgrains have become irrelevant. The stocks with the government are altogether inadequate to meet the demands of the public distribution system in the lean period before the kharif harvest. In spite of slashing the monthly releases from Central stocks to the states to around five lakh tonnes, the Centre had a stock of hardly four million tonnes at the beginning of July. A part of this has since been exhausted and there has been hardly any replenishment either by domestic procurement or imports. Total stocks with the Centre and states together add up to only about 3.3 million tonnes at present. Meanwhile, the drought and floods in many parts of the country have aggravated the situation of general scarcity and spiralling prices. Reports of mass destitution and starvation deaths are coming in from different areas. But the government appears to be a helpless onlooker, unable to do anything to mitigate the sufferings of large masses of the people.

The conference of chief ministers on September 14 and 15 to consider the kharif procurement policy and prices was thus meeting in far more difficult and critical circumstances than at any time in the past. The position of the state chief ministers is fairly clear. They all want a steep increase in the procurement price of paddy, comparable to what they secured for the last rabi crop. In their discussions with the Agricultural Prices Commission, Punjab and Haryana government officials had asked for a price of Rs 100 per quintal of paddy, or an increase of Rs 30 per quintal over last year's price. Besides the usual argument about increased costs of inputs, the demand for such a steep rise in procurement prices is justified on the ground that sufficient procurement will not be possible without use of the price incentive. The Central government is placed in an awkward position by this stand of the state governments. There is even a move among Central officials to put off taking any decision on price and procurement policies for the kharif cereals for the time being — on the ground that the crop position is still uncertain.

The Agricultural Prices Commission must, however, be complimented for having shown courage in this difficult situation. Its report on kharif procurement and price policy is forthright. The Commission probably realised that giving in to the pressure of the rich farmer lobby, as it had done last year in respect of rabi prices and procurement, does not anyhow work. While the Commission had then agreed to a sizeable increase in procurement prices of wheat and had refrained from suggesting any target of procurement, the chief ministers used its report as the starting point for finally securing double the increase in wheat procurement prices recommended by the APC. The same thing had happened in the kharif season last year. The panicky decision to abandon the wheat trade take-over and to permit wholesalers to re-enter the markets was also used to bring about the virtual collapse of procurement by the public agencies. The APC, therefore, decided to put the position with regard to procurement and prices squarely before the government. The onus is now on the Central and state governments for any decisions that they may take in disregard of the APC's recommendations.

The basic proposition that the APC has advanced in its report is that there should be the utmost restraint in raising administered prices if inflation in the economy is to be checked at all. This proposition has a more general validity than only in respect of prices of paddy and other kharif foodgrains. According to the APC, an important part of the rise in the general level of prices is the direct result of upward revision of administered prices all round. In advancing this important proposition, the APC has examined the question of foodgrain prices in a forthright and convincing manner.

The APC points out that the increase in foodgrain prices during the 1973-74 agricultural year was double that in the previous year, being 35.6 per cent compared to 18.8 per cent. This could not be blamed on the vagaries of nature alone. Nor is the expansion of money supply an adequate explanation for the steep rise in foodgrain prices. According to the APC, the successive increases in the procurement price for last year's kharif crop and the rabi crop this year, followed by the sharp increase in the issue prices of foodgrains from the public distribution system, gave the main push to the price spiral. These measures also encouraged hoarding by private trade and holding back of stocks by surplus farmers. The APC has, therefore, firmly rejected the demand for a further increase in the kharif procurement price for paddy to Rs 100 per quintal. Were this demand to be accepted, the APC warns, the increase in the procurement price of paddy would be as much as 85 per cent in just 24 months — from Rs 54 to Rs 100.

The APC has also sharply debunked the propaganda about the higher cost of production. It points out that the increase of Rs 7 per quintal in the procurement price of paddy last year granted by the government over what it had recommended (Rs 63 per quintal) more than compensated for the increase in the prices of inputs such as fertilisers. The APC, therefore, feels that only a modest increase of Rs 4, from Rs 70 per quintal to Rs 74, is all that needs to be allowed in the procurement price of paddy in the coming kharif season. It has also proposed a target of procurement of 5 mn tonnes of paddy and 1.5 mn tonnes of kharif coarse cereals. The APC evidently holds that organisational effort is far more important for getting results in procurement than higher and higher incentive prices for the surplus producers. In this context, its observation that a radical change in the entire agricultural strategy has become necessary is of much significance. The APC is evidently questioning the soundness of the 'new agricultural strategy' launched in 1966, which has failed to solve the problems of either production or marketing of foodgrains.

But here lies the rub. C Subramaniam, who now holds temporary charge of the Food and Agriculture portfolio, is expected to be confirmed in this office in the coming Cabinet reshuffle. And Subramaniam is the proud father of the strategy of relying on rich farmers to secure marketable surpluses through provision of subsidised inputs and incentive prices. It is not to be expected that he will change this strategy in any way. It is not without significance that probably the first important initiative he took after assuming temporary charge of the ministry was to hold a conference of representatives of rich farmers — most of them holding 300 acres and more, ceiling laws notwithstanding — to assure them the government's full support and to plead with them that they should ensure sufficient marketed surpluses for the urban consumer. The entire thrust of Subramaniam's policy is likely to be to increase the supply of inputs for these "viable farmers", even though there may be a general shortage of fertilisers and other inputs.

The other aspect of the government's policy is to rely on massive imports till the rich farmers oblige the government. The air is thick with talk of concessional imports of foodgrains. There is no official request to any country in particular to this effect, but that does not mean that intense lobbying is not going on with the USA as well as other countries for foodgrain supplies on soft terms. An important part of Planning Minister D P Dhar's brief for the session of the Indo-Soviet Joint Commission in Moscow was to take up with the Soviet leaders the question of another wheat loan. The effort in this direction is wide-ranging and even the EEC countries are being sounded. Wheat imports on deferred payment terms are being vigorously canvassed and are being defended as being entirely commercial and not at all comparable to the erstwhile PL 480 imports.

According to the demands for grants submitted in connection with the supplementary budget, the Finance Ministry estimated that public distribution during the current year would be of the order of about 8.8 mn tonnes. Of this, the import component would be as much as 5.6 mn tonnes, the contribution of domestic production being only 3.2 mn tonnes. Of the imported foodgrains, 1.7 mn tonnes would be out of the Russian wheat loan of 2 mn tonnes arranged last year. In addition, there was some carryover of imports from last year and another 1.9 mn tonnes of imports have been contracted for during this year. On this reckoning, an additional import of 2 mn tonnes is considered the bare minimum needed to run the public distribution system. However, the Finance Ministry's estimate of 8.8 mn tonnes of public distribution is grossly inadequate. The demands on the public distribution system are running at a far higher level and an additional import of about 5 mn tonnes, and not just 2 mn tonnes, appears to be unavoidable. But there is not enough foreign exchange with the government to arrange imports of this order on commercial terms. Hence, semantics apart, the government has no choice but to look for charity imports of food in one form or another.

INTERNATIONAL AFFAIRS

Unreal Contradictions

G P D

KISSINGER is in the news, as always. This time he is interested in India's political system — not as a Harvard Professor, but as Gerald Ford's Secretary of State. In any case Ambassador Moynihan thinks so. It seems Indira Gandhi is worried about Kissinger's views on the "acceptability" of her government. Ambassador Moynihan, like a good democrat, shared a fellow democrat's apprehension and promptly cabled Washington to say that Indira Gandhi sees herself as another Allende. What happened to the Chilean Marxist, she apparently fears, could well happen to an Indian you-know-who. Moynihan has, therefore, asked Washington to put all its cards on the table.

It is indeed a pity that Allende did not know some simple things which Indira Gandhi seems to know. Any time you are worried about American designs all that you need to do is to send for the American ambassador and put the matter straight to him. He would do the needful. In short, contact "the man on the spot" and you have nothing to worry about. The Americans can be so obliging that they can, for your benefits, even organise a leak of the cable. This leak helps those in your country who may be looking for anti-imperialist heroes. And the socialists in Moscow may be depended on to co-operate by publicising the very image that our ruling elite has of itself.

It is beyond the comprehension of ordinary mortals how Indira Gandhi and her colleagues see such pointed resemblance between themselves and the late President of Chile and his colleagues. This will probably remain a well-guarded secret unless some socialists either here or abroad decide to enlighten us on the question. Meanwhile the commercialisation of Allende's death will continue. Almost everyone in the developing world who wants to play the anti--American game according to the American rules can liken himself to President Allende and instruct his Ambassador in Washington to make an appointment with Kissinger.

It's a perfect case of the Theatre of the Absurd. It would have been a normal comic experience but for the fact that poor Allende's name is being so vulgarly bandied about. It is a reflection on the international system today that this can happen at all. It would have been unthinkable in the early fifties, for example, for somebody in power in a developing country to liken himself to a Marxist to secure more American attention and money. Even if anybody had done so, the Americans would not have played the game. The careful leaks of anxious cables and the injured innocence of State Department officials are of one piece indeed. The lady protests too much indeed!

If all this appears to be rather well-rehearsed it is because never since 1945 has the international system been so stable and sure of itself as it is today. The two super-powers in their near-complete unanimity that they shall jointly rule the world — their differences notwithstanding — are indeed setting a very elaborate system of dos and dont's in international behaviour. If Kissinger appears to be the most successful American statesman of the post-war world it is not because he has clues to some mysterious ways of conflict-resolution, but rather because he has the clear perception that the appearances of cold-war and contradictions should not be allowed to cloud the realities of detente and deals.

Once this is grasped, the appearances can be managed. If the Soviets want their allies to make anti-American noises periodically, and *vice versa,* nothing could contribute better to the health of the system. Those, like Allende, who make the mistake of not seeing the distinction — between postures of contradiction and actions of accommodation — will be mercilessly punished. As for the rest who see the distinction clearly and cleverly, they need not worry. Kissinger would even consider putting their country on his next itinerary. He would be naturally a little softer on those who prefer him to Gromyko in much the same manner as Gromyko would be.

The stability of this system is really remarkable. For the first time the Americans seem to have hit upon a formula which permits them to penetrate any part of the world they like without causing much domestic trouble to their hosts. The domestic troublemakers in India, for example, can always see the Soviet side of the Indian foreign policy coin! Equally the 'democrats' of the Indian system can see the American side of the coin. Everybody is happy. The bi-alignment grows stronger.

Unlike in the 'cold-war' years, the people of different alignments now talk to each other. Thus the Foreign Minister of India with a treaty of friendship with the Soviet Union can fly to Seoul which has an alignment with the United States. In other words, the system has so much resilience now that one aligned state is on speaking terms with a state belonging to a supposedly antagonistic alliance system without causing any damage. Local Kissingers can interpret these little preferences in the right perspective and sort out the problems.

The Chinese are shouting from the housetops that there 'is great disorder under heaven'. One wonders exactly where they see it. Little do they seem to realise or care that even 'disorders' can sometimes be well-rehearsed. We are living in a world of 'unreal contradictions'. The Chinese choose to ignore them for the simple reason, perhaps, that Mao Tse-tung has not provided for this category of contradictions!

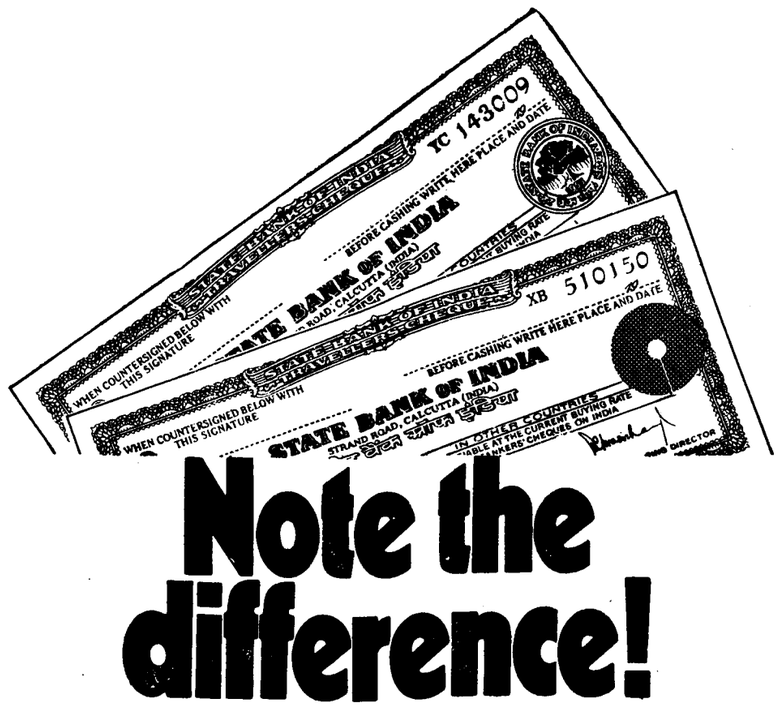
Nixon Goes, Presidential Absolutism Remains

Swadesh Rana

NIXON's decision to resign may prove disappointing to those who thought that the entire Watergate affair was not really about Nixon but about a more fundamental issue in the American political system, i e, the centralisation of executive power in the White House. The willingness of a number of Democrats and Republicans to consider offering immunity from prosecution to Nixon if he decided to resign dramatised their unwillingness to question seriously the absolutist powers of the American presidency. Impeachment would have certainly involved a critical examination of presidential power — a prospect equally unattractive to presidential hopefuls both in the Democratic and Republican parties. The Democrats' position would have been particularly embarrassing because the two greatest centralisers in recent times, John Kennedy and Franklin Roosevelt, were Democrats. Both Kennedy and Roosevelt believed that centralisation of authority was a necessary means to achieve reform. Nixon, on the other hand, started by advocating the return of power to the states and the promulgation of a new federalism..

But in the actual exercise of authority he carried presidential power to such extremes that some of his chief aides in the White House tended to overshadow his cabinet officials. It was an arrangement tacitly accepted by many, if not actually approved by all, Republicans. With the gradual unfolding of the impeachment process many of Nixon's former aides and confidants were convicted on grounds of perjury and conspiracy to obstruct justice — the latest two being John Connally, Nixon's former Treasury Secretary, and John Ehrlichman, a former presidential assistant. While a long drawn process of impeachment would have generously served the interests of the Democrats and critics of the Nixon administration, it was in the interests of the Republican party to shorten that process and reduce the number of people who would go down with Nixon. It was to attain this purpose that Republican Senator Edward Brooke took the initiative to introduce a 'Consensus of the Congress' resolution offering Nixon the choice of quitting voluntarily or facing the "tortuous and disastrous" but almost certain prospect of impeachment. Viewed in this context, the new president, Gerald Ford, was not being merely polite when he told newsmen on August 9 that he viewed Nixon's decision to resign as "the greatest personal sacrifice" and "saddest incident" of his political career.

The Republican party's decision to persuade Nixon to 'sacrifice' himself was implicit in its approval of Ford as the Vice-President in 1973 after Spiro Agnew resigned on being implicated in alleged felony and abuse of power. Ford, the leader of the minority Republican party in the House of Representatives, was acceptable to a Democratic Congress in a year when the charisma of the landslide Republican winner of the presidential election of 1972 was wearing off. With one of their own designated as the legitimate constitutional successor to the presidency, the Republicans felt comfortable in pressing Nixon to step aside. Even while confirming Ford for the vice-presidential position, the Republicans highlighted only those aspects of his 25 years of inoffensive and mediocre political career which portrayed him as a conservative Republican reputed "precisely for the kind of political civility and institutional deference most needed to redeem" the Nixonian exercise of presidential power. As Ford was the first candidate to be considered for the vice-presidency without facing a national election, his political, personal and financial background were subjected to a thorough inquiry by the Federal Bureau of Investigation. A voluminous 1,600-page report revealed no skeletons and was greeted with relief by the Republicans, many of whom were worried that if Nixon were ousted before yielding the presidency to an impeccable Republican, the Democrats would reach the White House in 1976 even "with the Boston strangler as their candidate".



Besides his thoroughly investigated record, Ford had an additional merit which fitted the Republican search for a probable successor to Nixon like a glove. Despite his disclaimers to presidential ambition, Ford had expressed some opinions about the presidency which were relevant to the consideration of his presidential candidature. Speaking about executive privilege, Ford had said in April 1963: "To maintain that the executive has the right to keep to itself information specifically sought by the very people the executive is supposed to serve is to espouse some power akin to the divine right of kings . . . Congress cannot help but conclude that executive privilege is most often used in opposition to public interest". About presidential power, he had said in October 1966: "I believe the power of the Presidency has become so intoxicating for Lyndon Johnson that he believes he can accomplish anything he sets his mind to. The result of this presidential arrogance, this mistaken exercise of excessive power, is a crisis in our economy," About impeachment, while supporting the unsuccessful move to impeach liberal Supreme Court Justice William Douglas, he had said in April 1970: "What, then, is an impeachable offence? The only honest answer is that an impeachable offence is whatever a majority of the House of Representatives considers it to be at a given moment in history".

All these pertinently quotable statements were made by Ford in the pre-Nixon era and there is no way of ascertaining whether these were actually considered by the Republicans in their support for Ford. Nor is it possible to maintain that Ford would like his presidential behaviour to be judged against his opinions about the presidency expressed at a time when he had no presidential ambitions or prospects. However, what is quite certain and needs being mentioned is that the American mass media which played a crucial role in Nixon's resignation did not seem adequately concerned with the fundamental issues involved in the Watergate affair. In their massive concern not to miss a single erasure, disclosure, rebuttal or expletive in the never-ending footage of presidential tapes, the American mass media gave scant coverage to the central issue of presidential absolutism. Inumerable journalists, humour columnists, telecasters and broadcasters vied with each other to present the most exciting way of saying the simple fact that Nixon is not to be trusted. And among the academic community, some enterprising analysts decided to establish political linkages between the domestic and international environment of the American political system by talking about issues like Watergate and the energy

crisis, Watergate and China, Watergate and the Atlantic alliance.

While the mass media relished their role of providing what they considered to be 'hot' and troubling news to the American public, the American public — recovering from the trauma of the Vietnam involvement and facing soaring inflation — easily slipped into the reassuring belief that what was wrong with America was Nixon.

With Nixon's departure from the political scene, the Republicans may feel relieved that the 1976 presidential election will not be lost before it is polled, the American mass media may devote themselves to projecting Ford as the man America needs most and the American public may feel reassured that the nightmare of Watergate is over. If this happens — and it is most likely to happen — the American political system will have missed a rare chance to utilise a harrowing experience to evolve constitutional procedures which would subject the American presidency to sustained restraints.

Note the difference!

A new look for State Bank Rupee Travellers Cheques.

State Bank Rupee Travellers Cheques now come to you in brighter, more colourful designs, in new series bearing the Bank's emblem. The new cheques also are available in denominations of Rs. 50, Rs. 100 and Rs. 500.

Of course, the old cheques are good until used—there is no time limit on spending them. In fact, these will continue to be issued for some time at our offices and selling agencies. Both the old and new Travellers Cheques can be encashed at over 10,000 points all over India.

Detention Conditions in West Bengal

Text of Report by Amnesty International

Introduction to the Report

WHEN Jawaharlal Nehru published his autobiography in 1936, he could write that "political imprisonment had become a frequent enough occurrence in India".* Nehru himself, like many other prominent Indian leaders, suffered from political detention on several occasions under the Defence of India Rules (DIR) and the Indian Penal Code, both introduced by the then British Government. Both these laws are still in force in India and being used to detain people with different opinions from the Government in power. Observations once made by Nehru while in prison are now relevant to many of the prisoners held in India today.

The Indian constitution has laid down detailed safeguards to protect human rights and the record of the judiciary in enforcing these safeguards has been impressive. The Indian prison system is unusual in the sense that it allows for special and better treatment for political prisoners (Class A, or Division I); this classification is, however, now given to only a small proportion of such prisoners. The majority live in prison conditions which not only fall far short of such preferential treatment, but also of the minimum prison conditions as laid down in the United Nations Standard Minimum Rules for the Treatment of Prisoners. Amnesty International estimates that between 15,000-20,000 prisoners are now held for political reasons in one Indian state alone, West Bengal. A large number of these prisoners have spent periods of up to three years without trial as "Under Trial" prisoners.

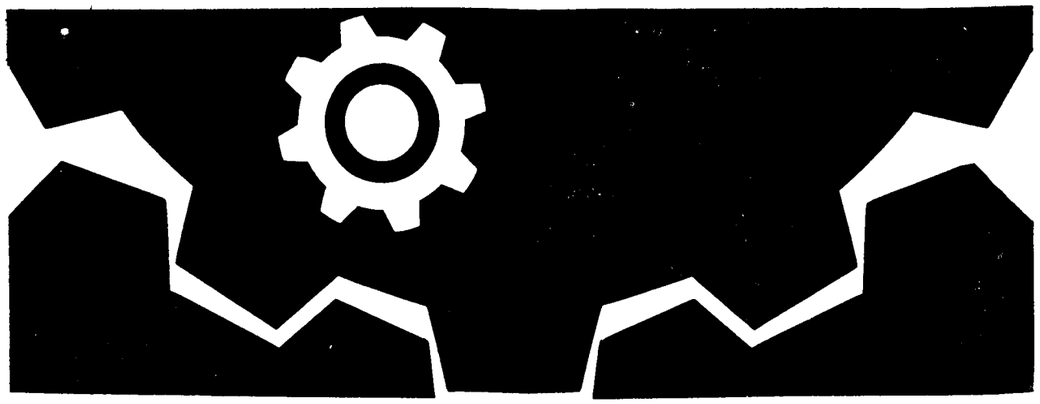
Amnesty recognises that its concern about this policy of large-scale untried detention is shared in the highest legal forum in the country. Lately, the Supreme Court of India observed that "the new jurisdiction of the 'jejune' judicial protection was an erosion of citizens' fundamental right of personal liberty against arbitrary deprivation".† In its judgment, the Supreme Court observed that "the final cure for prejudicial activities threatening the survival of the community is not the executive shut-up of all suspects in prison for how long one is guessing. Such a strategy may alienate and embitter men".

Amnesty International has raised the issue of political imprisonment in West Bengal (where most of the political prisoners are being held) both with the Central and with the provincial Governments on several occasions (on March 15, 1973, October 19, 1973 and February 1, 1974). When 46 political prisoners went on a hunger strike on May 17, Amnesty prepared a report on the conditions and the treatment of political prisoners in West Bengal. The report, making specific recommendations for policy (which are attached) was sent to the Indian Prime Minister and the Chief Minister of West Bengal on June 14, 1974. Since the prisoners have called off their strike, the West Bengal Jail Minister has conceded to some of the basic demands made by the prisoners (i e, that prisoners can be visited by their relatives; that some non-proscribed newspapers and periodicals be allowed; and that clothes be supplied to Under Trial prisoners whose relatives are not in a position to do so).

However, on none of these four occasions has Amnesty received any response from the Government, and has therefore decided to publish the updated report on detention conditions in West Bengal jails.

Short Report on Detention Conditions in West Bengal Jails

(1) Numbers

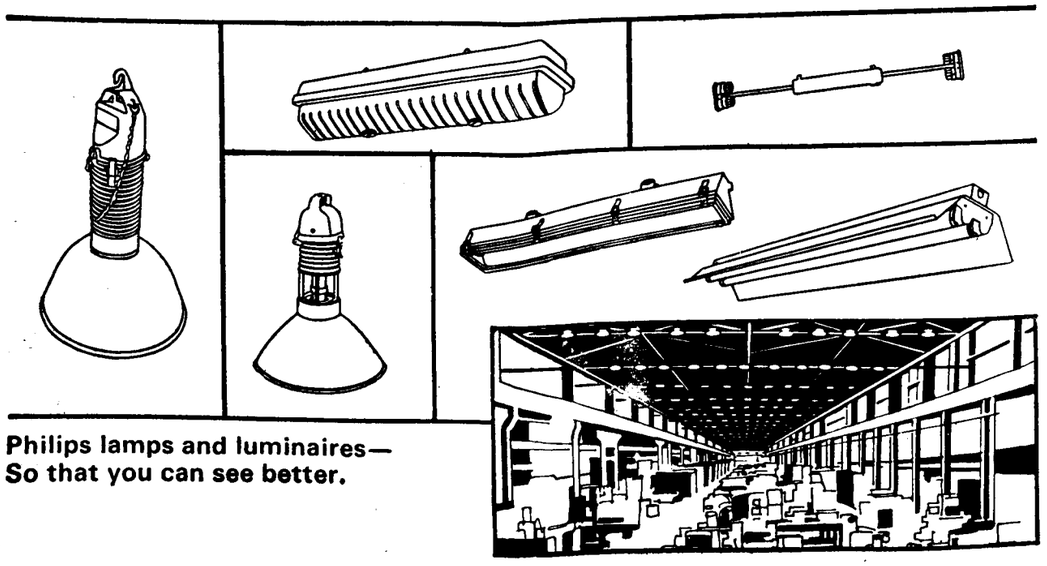


Amnesty estimates that at the moment between 15,000 and 20,000 prisoners are being held in West Bengal for their alleged involvement in extremist left-wing political activities. Last year the West Bengal Home Minister stated in the state Assembly that the total number of "prisoners arrested for being Naxalites was 17,787" (*Ananda Bazar Patrika*, March 17, 1973). On January 1 this year, the *Statesman* reported that 2,000 are held under the Defence of India Rules (DIR) and the Maintenance of Internal Security Act (MISA); these are preventive detention laws introduced after the declaration of a state of emergency on December 3, 1971 at the time of the war with Pakistan. According to this report, more than 17,800 are, in addition, held as "Under Trial" prisoners, but the majority have now been detained for two or more years without trial. Some of them have been so detained for nearly five years. On their release, prisoners held under preventive detention laws are often reported to be rearrested, either under different clauses of the same laws or charged with specific criminal offences. Thus, although the Supreme Court of India ruled on April 19, 1973 that the special detention powers under Article 17A of the MISA (extending the period of preventive detention to 21 months) were illegal, and ordererd the release of 1,760 prisoners who had been detained under this provision, nearly all of these prisoners remained in detention, either under different sections of the same act or on criminal charges (*Economic and Political Weekly*, Bombay, May 12, 1973 and *Le Monde*, Paris, May 15, 1973).

Most political prisoners are described as sympathisers with or members of the CPI(ML) (Communist Party of India Marxist-Leninst) commonly known as "Naxalites". A smaller number are members of the main parliamentary opposition party in Bengal, the CPI(M) (Communist Party of India — Marxist). Apart from being held under preventive detention laws, prisoners are also detained on a variety of serious criminal charges, but often released before actually having been tried. Such was the case, for example, with Dr Gholam Yazdani, physician and former member of the United Front Government of Bengal, arrsted in 1971. He was released in December 1973 without having been tried. Prisoners tried and not found guilty on one charge are often immediately rearrested on different charges. Thus, it was reported to Amnesty that Karune Mukerjee, Gour Banerjee and Nag, all Naxalite suspects, had been arrested in 1970-71 and were since detained charged with murder and illegally carrying arms and explosives. In October 1973 the Calcutta magistrate pronounced a verdict of not guilty on their case, but the prisoners were rearrested within the court premises and taken into police custody on charges of robbery. After their release, prisoners, even if cleared of all charges brought against them, are often put under "restrictions", i e, have to report regularly to the police, whereas according to a number of statements made to Amnesty, restrictions are being imposed on their movements and political activities.

(2) Prison Conditions

Many jails are grossly overcrowded; at the moment Alipore Special Jail,



* Jawaharlal Nehru, "An Autobiography", London, 1947, p 90.
† *The Times of India*, March 15, 1974.

What's keeping up his production efficiency?

Good lighting helps the worker's vision, reduces the accident rate and increases production-efficiency. Philips have a range of reliable, high-efficiency, long-lasting lamps and luminaires for factories. Each specially designed to save on ENERGY to meet Indian conditions.

Philips indigenously manufacture the widest range of incandescent, fluorescent and mercury vapour lamps and luminaires to the highest international standards.

PHILIPS INDIA LIMITED

Presidency Jail in Calcutta and Jamshedpur Jail in Bihar are among the prisons containing more than the official capacity. This has made it difficult for the prisoners to obtain certain essential facilities. Accounts from ex-prisoners received by Amnesty indicate that hygiene conditions in most jails are bad. According to a recent report in the *Economic and Political Weekly* (December 22, 1973), in Calcutta Presidency Jail, only one watertap is available for 150-200 prisoners, and in the dry season it is often difficult to obtain drinking water for the inmates. In Alipore Special Jail, there is only one watertap for 700 prisoners. In some other jails, prisoners reportedly have to take drinking water from ponds where other prisoners bathe and wash their clothes. Under Trial prisoners are kept in wards of 80-100 inmates which are dark and airless, and prisoners are locked up from 5:30 in the evening until 6:00 a m without any sanitary facilities. In the morning, prisoners are allowed out for two hours to have meals, wash and use lavatory facilities.

Although Presidency Jail is one of the few prisons with a sick ward, very few prisoners are admitted to the ward. According to the same report, medical facilities are scarce, and skin diseases particularly scabies, widespread. Amnesty has been told that in some cases, despite recommendations from jail doctors, no permission was given for prisoners to be treated in outside hospitals. Of the cases reported to Amnesty, one was of Ramal Roy Chowdhury, arrested in October 1970, who allegedly had been tortured and whom the jail doctors had recommended for outside treatment, which was never given. The prisoner is said to have died in April 1972 on the day of his "Special Release" from jail. Another prisoner, Azizul Haque, is said to be seriously ill following alleged torture during police interrogation which left him partly paralysed. Despite doctors' recommendations for outside treatment, he remains in jail.

Visits, according to the *Economic and Political Weekly* report, are officially allowed twice a month. In the case of Under Trial prisoners, such visits last usually 3-5 minutes, except in the case of the few prisoners classified as Grade II, who are allowed 20-minute visits. However, on occasion, families are refused permission to visit the prisoners at all, as has happened with the prisoners on hunger strike in May. Most of the Under Trial prisoners and prisoners held under the MISA — who form the vast majority of the prison population — have no access to the library, and reading material is restricted to a few officially allowed newspapers.

(3) Discipline and Punishment in Prison

Amnesty has been particularly concerned about the use of bar fetters ("dandaberri" and "shikliberri") on prisoners regarded as dangerous or as security risks. While such fetters seem to be used in West Bengal jails, reports of this have reached Amnesty also from Bihar, especially. Fifty-one alleged Naxalite prisoners are kept in chains in Hazaribagh Jail, some of them for periods of more than two years. The fetters are kept on day and night, according to the jailer of Hazaribagh Jail "to avoid further trouble". They consist of an iron ring on each ankle, each of which is attached to an iron bar some 20 inches long, the bar being connected to another one connected to the waist. One of the prisoners recently on hunger strike, Ashim Chatterjee, was chained for a period of two years. It was also reported to Amnesty that the same prisoner had spent two years in solitary confinement. Another case known to Amnesty is that of Shibal Roy, detained in the same jail, who contracted tuberculosis during imprisonment. After having received hospital treatment, he returned to jail and was put in irons again. Prisoners held in this condition in Hazaribagh Jail spend 24 hours locked with four or five in a cell, which they may only leave to use the lavatory. The use of bar fetters is also reported from other jails: in Calcutta Presidency Jail, prisoners are allegedly kept in fetters for periods of three to six months or even longer. Such treatment is contrary to Rule 33 of the United Nations Standard Minimum Rules for the Treatment of Prisoners — even for those who are convicted (see Appendix II).

(4) Correctional Institutions for Political Prisoners

The Jail Minister of West Bengal, Mr Gyan Singh Sohonpal, announced on February 21, 1974 that "The West Bengal Government will convert Barasat subjail in 24 Parganas district into a correctional institution to bring about a psychological change in the behaviour of the 'misguided youths', mainly Naxalite prisoners" (*The Indian Express*, February 22, 1974). According to the Jail Minister's statement, the Naxalites are regarded as "psychopaths and in need of psychotherapy to get rid of the extremity of mind".

Amnesty International understands the term "Naxalite" to describe a particular political orientation of a group of young men and women who sympathise with the Maoist oriented peasant uprising which occurred in 1967 in West Bengal. Their ideology advocates armed struggle to bring about a change in the social and political structure. Numerous acts of violence have been committed by members of the movement in Bengal and its neighbouring provinces, particularly in the period 1970-71. As such, the term describes a particular ideology rather than a pathological state. Amnesty therefore wrote to the West Bengal Jail Ministry early this year to enquire about the evidence in existence to qualify these prisoners as psychopaths. Its request for an assurance that any psychotherapeutic treatment administered to, or carried out upon these prisoners be with their voluntary consent, has so far remained unconfirmed.

(5) Torture Allegations

Over the past three years, a number of torture allegations have reached Amnesty from legal sources in Calcutta. According to these reports, torture is frequently applied during police interrogation, both in the Special Police Office (14, Lord Sinha Road, Calcutta), and in the Lal Bazar Police Station in Calcutta. Allegations of torture include severe beatings — to the extent of fractured limbs —, prisoners being hung upside-down and pins and nails being inserted into their nails and other sensitive organs of the body, including the genitals. In a number of cases the use of modern electric shock methods is reported, and prisoners are also allegedly burned with cigarettes, extinguished on their skin. According to the same reports, appropriate medical treatment was denied to prisoners who had suffered such treatment, which resulted in their being partly paralysed (as in the case of Azizul Haque and Megharanjan Sen Gupta, detained in Presidency Jail). In the case of Ramal Roy Chowdhury (mentioned in Paragraph 2) who died after his release, it was reported that his death was due to inadequate medical treatment following police torture.

Allegations of torture of women have most recently been made in a report* by the "Akhil Banga Mahila Samiti" (All Bengal Women's Association). Members of the Association were detained in May this year, together with some 25 female Naxalite suspects,

* Extracts from which appeared in the *Economic and Political Weekly* of July 27, 1974. This report mistakenly mentions the All-India Women's Association.

With Best Compliments

of

BRAKES INDIA LIMITED

Padi, Madras 50

whom Amnesty estimates now to be detained in Calcutta's Presidency Jail. According to members of the Association, these women were taken to Lal Bazar Police Station one month after their original arrest. When failing to supply the wanted information they were stripped naked, burned with cigarettes on all parts of the body, and in some cases, iron rulers were inserted into the rectum and vagina. When recovered, these women would, according to this report, be taken to Lal Bazar for the same treatment after 20-22 days.

Although Amnesty has not been able to make an investigation of the majority of these allegations, Amnesty representatives have talked to a small number of ex-prisoners who allege they have been tortured. In at least one case, the Amnesty representative was able to establish that the right hand of an ex-prisoner was paralysed and could find no reason to question his statement that this was caused by severe beating during police interrogation: this prisoner was a lawyer who had been detained in January 1970 on three criminal charges, and, after he had been acquitted of all the charges, was released in June 1973 on the condition that he report regularly to the police and not engage in political activities.

(6) Jail Incidents

According to official figures which appeared in the *Statesman*, *The Times of India* and the *Jugantar*, 88 prisoners were killed in 12 jail incidents during the period December 1970 to June 1972 in West Bengal alone (see Appendix I). Unofficial reports from ex-prisoners which have reached Amnesty put the number of prisoners who died in these encounters between prisoners and the jail staff and police at three times that figure. Only in a limited number of these incidents was an official enquiry ordered to take place, i e, as in the case of the July 26, 1971 Hazaribagh incident in which 16 people died. While no official report on these incidents has ever been published, as far as we know, *The Times of India* and the *Statesman* of August 4, 1971 stated that "The Preliminary enquiry held by the Commissioner of the Chotanagpur Division and the Deputy Commissioner for Hazaribagh also shows that the remaining 12 inmates died of injuries caused by convict officers". Regarding the incident at Asansol Jail which took place on August 7, 1971, the *Statesman* also reported: "about Thursday's incident in Asansol Jail, it was learnt that all the nine killed had been beaten to death."

Such reports cast serious doubts on one common official explanation: that the prisoners were shot while trying to escape from prison.

(7) Legal Aid

While Article 22 (*i*) of the Indian Constitution confers the right to every citizen to be informed as soon as possible about the grounds for his arrest, and the right to consult a lawyer, the main complaint of the Legal Aid Committee in Calcutta — a committee of lawyers whose aim is to extend legal aid to political prisoners — is that members of the Committee are often denied access to their clients in prison. Letters written by prisoners to the Committee have, in a number of cases, not reached their destination; while prisoners, when they have a lawyer, often complain that they cannot meet their counsel in jail and can only see him for the first time when they are actually brought to court. Whereas the work of the Legal Aid Committee in the High Court has been fairly successful, a report from the Committee issued in November 1973 mentions that "The Committee moved 200 bail petitions in different courts in West Bengal (in 135 Under Trial cases and 52 MISA cases). Bail was granted to six Under Trial prisoners and 46 prisoners held under the MISA. Till now, only six prisoners have been released". Like many of the political prisoners in West Bengal, they were rearrested under different charges immediately after their release had been ordered by the Court.*

Research Department
September 1974

Recommendations Arising from a Short Report on Detention Conditions in West Bengal Jails, Submitted to the Prime Minister of India and the Chief Minister of West Bengal†

Amnesty International, while concerned about the policy of large-scale detention without trial, would like to draw Your Excellency's attention to the detention conditions of political prisoners, many of whom are held in West Bengal jails. One the basis of a report on detention conditions of such prisoners, prepared by Amnesty's Research Department, and guided by the principles of the Universal Declaration of Human Rights, which states in Article 9 that

"No one shall be subjected to arbitrary arrest, detention or exile"

and also led by the principles laid down in Article 22 of the Indian Constitution, which provides safeguards against such arrests, we would now like respectfully to submit to you the following recommendations:

(1a) That your Government confines itself to prosecuting only those against whom evidence exists that they have committed offences punishable under the Indian Penal Code.

(1b) That all prisoners held under criminal charges either be brought to trial without further delay, or that in the absence of such, that prisoners likely to be held for more than three months in prison without trial be instead at least released on bail.

We feel that a prosecution policy along these lines, resulting in the release of considerable numbers of prisoners held without trial, would solve to some extent problems created by overcrowding as outlined in the attached report under Paragraph 2. But until such a policy is declared, we would, moved by humanitarian considerations, respectfully suggest that Your Excellency considers the following steps for immediate consideration: in so doing, we are guided by the United Nations Standard Minimum Rules for the Treatment of Prisoners (SMR).

(2) That, on the basis of the principle that all unconvicted prisoners are presumed to be innocent and be treated as such [Rule 84(2) of the SMR]:

(a) That no instruments of restraint, such as bar fetters and irons, be used in prison, in accordance with Rule 33 of the SMR. (For information on the use of these, see Paragraph 3 of the attached report.)

(b) That adequate facilities for accommodation, personal hygiene and food, as well as medical facilities, be supplied to the prisoners in accordance with Rules 10, 11, 12, 20 and 22 of the SMR

* This report is available in Hindi and Bengali as well as English and can be obtained from the Publications Department of Amnesty International, International Secretariat, 53 Theobald's Road, London WC1X 8SP.

† These recommendations were submitted to the Indian Prime Minister and the West Bengal Chief Minister in letters dated June 14, 1974 from Martin Ennals, Secretary General of Amnesty International.

(see Paragraph 2 of the report).

(c) That family visits, reading material and all other conditions applicable to persons held on remand awaiting trial be supplied in accordance with Rules 90 and 92 of the SMR (see Paragraph 2 of the report).

(d) That investigations be made into allegations of torture whenever they reach the Government, and that all possible steps be taken to prohibit such use in the future, including the punishment of any persons found guilty of such acts (see Paragraph 5 of the report).

(e) While seriously disturbed about the various incidents, resulting in the death of prisoners as described in Paragraph 6 of the report, Amnesty urges that an official investigation be made into the nature of these incidents and the resulting deaths of prisoners, and that adequate measures be taken to prevent the recurrence of similar excesses in the future.

(f) Finally, that prisoners, in accordance with the provisions of Rule 93 of the SMR be allowed to apply for legal aid and to receive visits from their legal advisers, and that such visits be in sight, but not in hearing distance of the police or institutional officer (see Paragraph 7 of the report).

Appendix II: Relevant Rules of the United Nations Standard Minimum Rules for the Treatment of Prisoners (Resolution Adopted on August 30, 1955)

(10) All accommodation provided for the use of prisoners and in particular all sleeping accommodation shall meet all requirements of health, due regard being paid to climatic conditions and particularly to cubic content of air, minimum floor space, lighting heating and ventilation.

(11) In all places where prisoners are required to live or work,
(a) The windows shall be large enough to enable the prisoners to read or work by natural light, and shall be so constructed that they can allow the entrance of fresh air whether or not there is artificial ventilation;
(b) Artificial light shall be provided sufficient for the prisoners to read or work without injury to eyesight.

(12) The sanitary installations shall be adequate to enable every prisoner to comply with the needs of nature when necessary and in a clean and decent manner.

(20) (1) Every prisoner shall be provided by the administration at the usual hours with food of nutritional value adequate for health and strength, of wholesome quality and well-prepared and served.
(2) Drinking water shall be available to every prisoner whenever he needs it.

(22) (1) At every institution there shall be available the services of at least one qualified medical officer who should have some knowledge of psychiatry. The medical services should be organised in close relationship to the general health administration of the community or nation. They shall include a psychiatric service for the diagnosis and, in proper cases, the treatment of states of mental abnormality.
(2) Sick prisoners who require specialist treatment shall be transferred to specialised institutions or to civic hospitals. Where hospital facilities are provided in an institution, their equipment, furnishings and pharmaceutical supplies shall be proper for the medical care and treatment of sick prisoners and there shall be a staff of suitably trained officers.
(3) The services of a qualified dental officer shall be available to every prisoner.

(33) Instruments of restraint such as handcuffs, chains, irons and straitjackets shall never be applied as a punishment. Furthermore, chains or irons shall not be used as restraints. Other instruments of restraint shall not be used except in the following circumstances:
(a) As a precaution against escape during a transfer, provided that they shall be removed when the prisoner appears before a judicial or administrative authority;
(b) On medical grounds by direction of the medical officer;
(c) By order of the director if other methods of control fail, in order to prevent the prisoner from injuring himself or others or from damaging property; in such instances, the director shall at once consult the medical officer and report to the higher administrative authority.

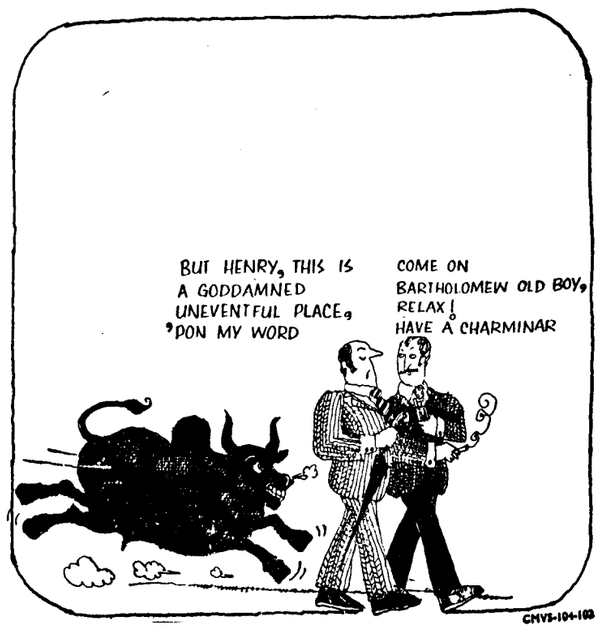
(82 [2]) Unconvicted prisoners are presumed to be innocent and shall be treated as such.

(90) An untried prisoner shall be allowed to procure at his own expense or at the expense of a third party such books, newspapers, writing materials and other means of occupation as are compatible with the interests of the administration of justice and the security and good order of the institution.

(92) An untried prisoner shall be allowed to inform immediately his family of his detention and shall be given all reasonable facilities for communicating with his family and friends, and for receiving visits from them subject only to such restrictions and supervision as are necessary in the interests of the administration and justice and of the security and good order of the institution.

(93) For the purposes of his defence, an untried prisoner shall be allowed to apply for free legal aid where such aid is available, and to receive visits from his legal adviser with a view to his defence and to

prepare and to hand to him confidential instructions. For these purposes he shall if he so desires be supplied with writing material. Interviews between the prisoner and his legal adviser may be within sight but not within the hearing of a police or institutional official.



Background to the Release of Amnesty International's Report on Prison Conditions in West Bengal

Over the last two years Amnesty International has been increasingly concerned about the large numbers of political prisoners held without trial, particularly in the Indian state of West Bengal. Between 15,000 and 20,000 prisoners are detained for what are usually described as "extremist activities". Most of the prisoners are said to be members of the Communist Party of India (Marxist-Leninist), commonly known as "Naxalites". Their name is derived from a Maoist-oriented peasant uprising which occurred in 1967 in the village of Naxalbari, north Bengal. The ideology of the CPI(ML) advocates armed struggle as a means of bringing about changes in India's social and political structure. Acts of violence have been committed in its name in Bihar, Orissa and Andhra Pradesh; in Bengal, and specifically in Calcutta, indiscriminate violence was intense during 1969 and 1970; it was in this period, and in this context, that many of those now in detention were arrested. However, many prisoners are still held without trial as members or sympathisers, rather than convicted for specific criminal offences. While Amnesty has not adopted any of them as "Prisoners of Conscience", it feels that immediate steps should now be taken to ensure that these prisoners are given a fair trial at an early date or be immediately released on bail.

Some political prisoners are detained under preventive detention laws such as the Maintenance of Internal Security Act and the Defence of India Rules — in force since the outbreak of the Bangladesh War in 1971 — but the majority are held as "Under Trial" prisoners, charged with specific criminal offences. Prisoners, when released, are in many cases reported to be rearrested, either under different clauses of the preventive detention laws, or under other clauses of the Indian Penal Code. They live in overcrowded conditions which fall far short of the minimum as laid down in the United Nations Standard Minimum Rules for the Treatment of Prisoners. Such conditions may well have contributed to the occurrence of a number of serious jail incidents which have resulted in the deaths of at least 88 prisoners between the period December 1970-June 1972 alone. In view of the nature of the circumstances in which some of the prisoners have reportedly died, Amnesty is unable to accept unconditionally the common official explanation: that the prisoners were shot while trying to escape from prison.

On June 14, 1974 Martin Ennals, Secretary General of Amnesty International wrote to the Indian Prime Minister and the West Bengal Chief Minister, repeating his concern about the continued detention without trial of such large numbers of prisoners. Attached to the letter was a report prepared by Amnesty's Research Department in May of this year, when 46 prisoners staged a hunger strike in West Bengal, demanding the improvement of detention conditions. The allegations which the report specifies are: the overcrowded conditions, the large number of prisoners who have died in prison allegedly while trying to escape, the use of bar fetters on prisoners, in some cases reportedly for more than two years, the use of torture during police interrogation, the insufficient hygiene and medical facilities and allowance for legal aid. In his letter, Amnesty's Secretary General submitted that the Indian Government should confine itself to prosecuting only those against whom there is evidence that they have committed criminal offences. All such prisoners should be brought to trial immediately, or at least released on bail if their trial cannot be held within three months. Mr Ennals urged the Government to make official investigations into the various jail incidents which have occurred between December 1970 and June 1972 and that adequate steps be taken to prevent the recurrence of similar excesses in the future. On the basis of allegations of torture which had reached Amnesty both from legal sources in Calcutta and from personal statements made to Amnesty, Mr Ennals requested the Indian Government to investigate any allegations of torture whenever they reach the Government, and that all possible steps be taken to improve the prisoners' detention conditions, specifically the abolition of the use of bar fetters, better material and medical facilities, and that adequate arrangements be made for prisoners to receive visits and to apply for legal aid.

On several occasions since early 1973 Amnesty has raised the policy of large-scale detention without trial of political prisoners both with the central and with the provincial governments of West Bengal and India. Amnesty recognises that its concern about such a policy is shared by the highest legal forum in the country, since the Supreme Court of India, in its judgment of March 15, 1974 (*Times of India*, March 15, 1974) expressed serious reservations about detention on suspicion. However, Amnesty has so far not received any response from the Indian Government and has, therefore, decided to publish the up-dated report on detention conditions in West Bengal.

An Approach to the Historiography of Economics

Isher J Ahluwalia

IS the development of science through time a piecemeal process, or, can one observe a systematic pattern underlying the evolution and accumulation of scientific knowledge? This question which is central to the historiography of any science, is particularly relevant at times when a new push seems necessary. Thomas Kuhn in his book, "Structure of Scientific Revolutions" puts forth a theory of scientific development based on the experience of the physical sciences, which presents very useful and interesting possibilities of application to Economics. There has been an increasing concern with the "limits" of Economics in dealing with problems of economic development. How do we view this in terms of the historiography of Economics?

Section I below summarises Kuhn's theory, and points out some major differences between physical sciences and social sciences. The basic applicability of this theory to the development of ideas in Economics is shown in Section II in the specific context of the Keynesian Revolution. Section III considers the current state of "development economics" in the light of Kuhn's theory and shows that a borrowed framework of analysis from the developed economies may be responsible for much of the so-called failures of the subject.

I

In analysing the historical process of scientific development, Kuhn proceeds from the hypothesis that a definite identifiable structure can be observed in the development of any science. In the first or pre-history stage of science, there are competing schools of scientific activity confronting the same range of natural phenomena, attempting to explain and interpret them in different ways. In course of time, such initial divergences disappear, and a "paradigm" emerges, constituting the beginning of history. A paradigm is defined as a scientific achievement which is sufficiently unprecedented to attract an enduring group of adherents away from competing models of scientific activity, and is sufficiently open-ended to leave problems for the redefined group to resolve. It is this open-endedness that gives a particular paradigm the ability to endure. At the time of its appearance, a paradigm is limited in its scope and precision, but once accepted, it becomes an object for further articulation under new conditions. Research activity based upon a certain conceptual and instrumental framework provided by one or more paradigms is called "Normal Science". The next stage in scientific evolution is reached when observed phenomena cannot be explained in the limits of the "paradigm". "... Novelty emerges only with difficulty, manifested by resistance, against a background provided by expectation. Initially, only the anticipated and usual are experienced even under circumstances where anomaly is later to be observed." The revolution occurs, and this leads to the acceptance of a new paradigm.[1]

This approach has obvious limitations in the development of a social science such as Economics.

To begin with, we have to bear in mind some basic differences between the social sciences and the physical sciences. The first and most obvious is that there can be no controlled experiments to test economic theory. As a result, economists have to rely on indirect methods, *viz*, examine the assumptions for their degree of approximation to reality or test the implications of the theory. Econometrics has an important contribution to make in this respect but it is far from empirical experimentation as understood in natural sciences. Econometricians face important problems in passing from the reduced form in which the system is observable to the true structural form which may not be observable at all. The transition involves certain assumptions, and the structure derived depends on what assumptions are made. In the nature of the case, it is more difficult to weed out poor theory. Furthermore, it provides ample ground for the existence of more than one paradigm providing competing "schools of thought". The difference between such competitive paradigm situations and pre-history may appear tenuous to an outsider, but is endemic to the specific nature of Economics. Hence the co-existence of the Keynesians and the monetarists, and at an even more fundamental plane of difference, that of the neo-classicists and the marxists.

In the face of very limited scope for empirical verifiability, the commitment to "the accepted paradigm" limits research with crucial consequences in the case of Economics than would be true in the case of physical sciences.

Secondly, owing to the interdependence of the system as a whole, the recognition of a new paradigm involves more confusion and debate in the process. Thus, classical economists, brought up in the traditional thinking of the economic system in terms of certain behavioural relationships, had a hard time understanding and accepting an alternative approach of Keynes which emphasised a causal chain different from theirs.

Lastly, since socially significant policy implications are frequently drawn from economic theory, the paradigm has an important role to play and a greater burden to bear than in the case of physical sciences.

II

The evolution of macro-economic theory provides a classic illustration of the applicability of Kuhn's theory to Economics.

The classical macro-economic theory as understood by a contemporary student of Economics would be: real output is determined by the production function given the real wage which is determined by the labour market equilibrium through price flexibility. The rate of interest is determined by the Saving and Investment functions, once the output is given, while the price level is determined by the money market equilibrium. Expectations are assumed away, and the system can be solved explicitly.

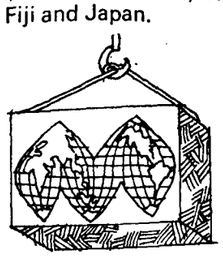
A MOMENT IN TIME

Apa Pant Pp. 190 Cloth with jacket Rs. 40.00

In these autobiographical reflections, the veteran diplomat offers the fruits of his search for a meaningful life.

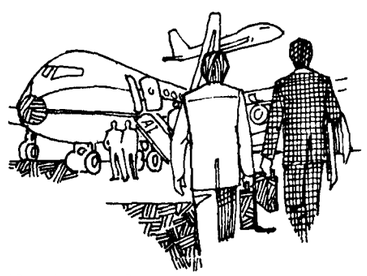
ORIENT LONGMAN LTD.
Bombay, Calcutta, New Delhi, Madras, Bangalore, Hyderabad.

Achievements and Aspirations



The vigorous and result-oriented activities of the Silk and Rayon Textiles Export Promotion Council have achieved spectacular increase in exports during 1973-74. The future holds good promise. The export potential is high.

Growth of Exports



Exports have risen from Rs. 3.9 crores in 1968-69 to about Rs. 32 crores in 1973-74. The exports include Rayon and Synthetic Fabrics, Garments and Made-ups, Hosiery and Knitwear, Rayon Tyre Cord/Yarn and miscellaneous items.

The major countries to which India exports are Poland, Bangla Desh, Iran, Afghanistan, Saudi Arabia, Singapore, Indonesia, Canada, U.S.A., the U.K., Nigeria, Dubai, Fiji and Japan.

Scope for Expansion

Encouraged by this record performance, the Council has set the export target at Rs. 40 crores for the current year. This was announced by Shri Bhogilal (Manubhai) N. Kothary, Chairman, at the 20th Annual General Meeting. In his view, it may be even possible to touch Rs. 50 crores, if certain additional facilities are available. The Rayon and Synthetic Industry offers scope for achieving a very high rate of expansion. It is one of those industries which is responsible for the present day prosperity of advanced countries. If due recognition is given to its role in the Indian economy and if it is provided with necessary inputs at proper prices, it can utilise its production capacity at an optimum level and offer the goods for exports at competitive prices.

Business Tours

To encourage more and more manufacturers and exporters to undertake business tours abroad and expand export activity, the Council plans to extend financial assistance in such cases where it is satisfied about the size of business as well as the commitment involved. Such business tours will help realise better unit values and open up new avenues for trade expansion.

Export Service

To ensure effective assistance to exporters, the Council provides an integrated export service, which includes dissemination of information concerning overseas demand, market surveys that act as useful indicators, assistance in negotiating business, arranging meetings between foreign buyers and Indian exporters and encouraging adoption of quality control methods.

Through its varied services to the trade at home and importers abroad, the Council has built up an infra-structure for the growing international trade of Indian Rayon and Synthetic Textiles.

THE SILK & RAYON TEXTILES EXPORT PROMOTION COUNCIL

Adept-SRT-174

The classical economists adopted a paradigm of price flexibility and perfect competition, and the facts seemed to correspond pretty well with this paradigm. In this accepted framework, Economics developed in Kuhn's "normal science" terms. A great deal of emphasis was placed on micro-economic analysis and macro implications were deduced generally on the basis of aggregation. For example, Marshall was mostly concerned with the partial equilibrium approach in the study of micro-economic problems. Thus, the demand for labour by a firm is the marginal productivity of labour (MPL) curve. Labour is employed by the firm until real wage equals MPL. The MPL curve slopes downward due to the law of diminishing returns. Therefore, a cut in real wage leads to an increase in employment of labour by the firm. On aggregation, we get the macro rule that a fall in real wage leads to an increase in employment.

The classical paradigm with its causal behavioural relationships could not explain why a fall in real wage would not lead to greater employment. Any existing unemployment in the economic system was therefore voluntary because if these workers were only willing to accept a lower wage, they would be employed. Keynes, however, gave an alternative definition of involuntary unemployment. A person is involuntarily unemployed if he/she would be willing to work at a lower real wage than the current real wage, whether or not he/she is willing to accept a lower money wage. Keynes attempted to explain the existence of this unemployment in theoretical terms, and analyse measures which should be taken to correct this.

The limitations of paradigm-oriented research are clearly seen when the above process is analysed in its historical context. In the Great Depression of the 1930s, unemployment soared high in the capitalist economies. The volume of unemployment in the United States and Germany, both highly industrialised economies which had experienced high levels of employment in the 1920s, amounted to about one-third of the total labour force in each country.

Various diagnoses of the depression problem within the classical paradigm were put forth. Hawtrey had his purely monetary theory of the business cycles which said that changes in the "flow of money" are the only causes of business fluctuations. An easy-money policy can stimulate any revival by inducing the merchants to invest in liquid and working capital. This theory is hardly convincing in view of the failure of the monetary policies to combat the Great Depression. The monetary over-investment theorists (Hayek and Mises) derived their business cycle theory from Wicksell's interest theory. Whenever market rate is pushed below the natural rate, the cumulative process begins. Downturn occurs when the banking system fails to supply sufficient credit. If only the market rate can be pushed below the natural rate, the cumulative process begins. But if the natural rate is very low, then what? These theories implicitly assumed that the natural rate is always so high that it is possible to find market rate of interest low enough to stimulate investment. Again, the non-monetary over-investment theorists explained the depression in terms of too little saving, and the under-consumptionists in terms of too much saving, irrespective of whether investment offsets for these savings are provided for or not. Schumpeter with his innovations theory of business cycles, explained the depression in terms of agrarian crises, protection, high taxes, high wages, high interest rates and therefore due to failure of the assumptions of price flexibility.

Awareness of Anomaly

As Kuhn says, "Discovery commences with the awareness of anomaly, i e, with the recognition that nature has somehow violated the paradigm — induced expectations that govern normal science". In Economics, again, the awareness of the anomaly itself may take a long time. One would go through a whole process of repeated diagnoses of the problem and the corresponding policy prescriptions; the ineffectiveness of the same would however direct attention towards a different diagnosis of the problem.

Keynes *felt* the effective demand problem in his Treatise which he published in 1930. He realised that all the savings were not being transformed into investment automatically. Yet his diagnosis was in terms of the classical paradigm. He considered Saving and Investment both to be functions of the rate of interest. According to the classical paradigm, the rate of interest should adjust freely till it comes to the level where the *ex-ante* Saving is equal to the *ex-ante* Investment. Thus, if for some reason, the rate of interest does not move, monetary policy should be directed to this end. He advocated monetary policies to affect the rate of interest to bring about the equality. He had to live through the depression and see the failures of the monetary policies to recognise the anomaly that the classical paradigm could not explain correctly.

Kuhn's piece of research on the multiplier came in 1971. Keynes was beginning to see the flaws in the classical paradigm for the analysis of the unemployment problem. There are two major economic problems: the problem of achieving full employment and the problem of allocating resources in a full employment economy. The classical paradigm had an automatic full employment solution. In the face of unemployment in the real situations, and the necessity to move towards full employment through policy measures, Keynes gave a meaningful theory with which to attack the first problem. The availability of the multiplier theory and Keynes' recognition of the effective demand problem came around the same time which leads one to suspect that the missing link was provided by the consumption function which Keynes put forward as a psychological postulate. Thus, Saving is a function of income and is relatively insensitive to the rate of interest. Similarly, Keynes argued that investment expenditures are insensitive to changes in the rate of interest. The interest rate enters the demand relation for investment through its influence on the discount rate applied to expected future earnings. In a world full of risk and uncertainties, the non-interest components of the discount variable may far outweigh the interest component. The calculation of the depreciation allowances over a period shorter than the actual life time of the machine is one example. Thus, Keynes said, investment can be taken as autonomous for practical purposes. He thus derived the Saving-Investment theory of output. The interest rate was determined by the liquidity preference theory.

To recapitulate, Keynes observed some price rigidities in economic systems (wage rigidity due to the Trade Union pressure, money illusion of the labourers, interest rigidity due to dynamic expectations) and held that the classical paradigm would not give an automatic solution of full employment. He realised that savings do not get channelled automatically into investment, and looked for measures in the classical paradigm to equate the two only to discover that the determinants of the classical theory of interest were to determine the level of output in his system. In his efforts to build a substitute theory of interest, Keynes developed the concept of a liquidity preference function. He analysed the role of expectations, although he was carried away by this to some extent so

that he ignored the thrift-productivity considerations in the determination of the rate of interest. Thus Keynes stepped out of the classical paradigm to give an alternative analysis of the interdependent economic system.

III

Notwithstanding a general belief that problems of economic development require special consideration as issues of economic research, most research in this field has been within a framework borrowed from the neo-classical growth theory. The latter is essentially based on some simplifying assumptions, *viz*, substitutability in production, maximisation in behaviour and perfect competition in institutions. In developing economies, with their fragmented markets, lack of factor mobility, pervasiveness of uncertainty in the agricultural sector and dependence on borrowed technology, these assumptions are far from the "truth". In fact, a second order of research has therefore concentrated on how to approximate this assumption through institutional reforms as witness the attention devoted in this respect to land and capital market reforms.

When analysed in the context of the neo-classical paradigm, certain specific features of developing economies are characterised as "distortions", which once identified permit application of the extended paradigm. The co-existence of surplus labour with positive wage rates reflects one such distortion. Other examples are the regulated prices of capital and foreign exchange which do not reflect their true scarcity value. This opens up another area of research, i e, determining the true "shadow" prices of the various factors.

The standard point of departure in analysing problems of economic development is the specification of an explicit objective function. Some examples are the maximisation of present output, maximisation of empolyment or the maximisation of the rate of growth of output. On assumptions similar to that of the neo-classical growth theory, the pursuit of the specified objectives implies alternative strategies of economic development, e g, maximise the use of labour through adoption of labour-intensive techniques, maximise savings and/or exports for an open economy. When different objectives are not mutually consistent, suitable constraints are used to modify a simple objective function. Once the objective function is specified, the planning process consists in mobilising and allocating reserves to maximise the same.

If a paradigm may be rendered ineffective over time as observed reality changes, there is no reason that it may not be equally ineffective when observed reality differs between countries. A cross-sectional approach has its limitations. When a paradigm fails to take account of the differences, it needs to be suitably amended or rejected.

Note

1 It may be noted that Kuhn's theory presents a structure of scientific development based on empirical observation. As observed reality changes through time, the old paradigm is either widened or rejected to accommodate the changing reality. What explains the changing reality and the character of change is a different and more fundamental question. An answer is provided in terms of the notion of dialectics. Everything is in continual process of becoming and ceasing to be; nothing is permanent but everything changes and is eventually superseded.

INDUSTRIAL FINANCE CORPORATION OF INDIA 6 PER CENT BONDS 1984

PAYMENT OF INTEREST AND REPAYMENT OF PRINCIPAL GUARANTEED BY THE GOVERNMENT OF INDIA

AMOUNT OF ISSUE : Rs. 10,00,00,000.

ISSUE PRICE : Rs. 99/- per cent

REDEEMABLE AT PAR ON THE 28TH SEPTEMBER 1984.

The Bonds are approved securities under the Indian Trusts Act, the Insurance Act and the Banking Regulation Act, and are also eligible for grant of advances to scheduled banks by the Reserve Bank of India. These are on the approved list of securities of the State Bank of India and are also eligible for investment of the accumulations of the Provident Funds exempted as well as non-exempted.

Subscription will be received in cash/cheque or 4½% IFC Bonds 1974 due for redemption on the 28th September 1974 at the Branches of the Reserve Bank of India at Ahmedabad, Bangalore, Bombay, Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi and Patna from Saturday, the 28th September, 1974. The list will be closed without notice as soon as the total subscriptions amount to Rs. 10.00 crores, and in any case, not later than the close of business on Friday, the 4th October, 1974 The Corporation reserves the right to retain subscriptions received upto 10% in excess of the sum of Rs. 10.00 crores.

The Bonds will have a currency of 10 years, and will be repaid at par on the 28th September, 1984. These will bear interest at the rate of 6% per annum from the 28th September, 1974. Interest will be payable half-yearly on the 28th March and 28th September and will be subject to tax under the Income Tax Act 1961.

CONVERSION TERMS

4½% IFC Bonds 1974, due for redemption on the 28th September, 1974, will be accepted at par in payment of subscription to 6% IFC Bonds 1984. If the cash value of 4½% Bonds 1974 tendered for conversion is not an exact multiple of the issue price per cent of the 6% IFC Bonds 1984, applied for, the tenderer will receive in cash at the time of issue of new Bonds the amount by which the value of the Bonds tendered exceeds the nearest lower multiple of the issue price. Interest on 4½% Bonds 1974 will be paid at the stipulated rate of 4½% p.a. upto and inclusive of 27th September, 1974 at the time of issue of the Bonds.

Copies of the prospectus and application forms can be had from the offices of the Reserve Bank of India as also from the Head Office of the Corporation at Bank of Baroda Building, 16-Parliament Street, P.B. No. 363, New Delhi-1, its Regional/Branches/other offices at (i) Mehta Mahal, 5th Floor 15-Mathew Road, Post Box No. 3928, Bombay-400004, (ii) 4-Mangoe Lane, 2nd Floor, Post Box No. 2483, Calcutta-700001, (iii) Raji Building, 3rd Floor, 147-Mount Road, Post Box No. 1080, Madras-600006, (iv) Near Lal Bunglow, Chimanlal Girdharilal Road. Ellis Bridge, Ahmedabad-6, (v) 3-6-15, Shayeedyarjung Lane, P.B. No. 1037, Himayatnagar, Hyderabad-500029, (vi) 22, Mahatma Gandhi Road, Post Box No. 5091, Bangalore-560001, (vii) Jeevan Tara Building, 1st Floor, Gate No. 3, 5-Parliament Street, Post Box No. 182, New Delhi-110001, (viii) Kaliram Medhi Road, (Ranibari Lane), Post Box No. 30, Panbazar, Gauhati-781001, (ix) 'Karuna' (2nd Floor) XXIII/1311-D, Mahatma Gandhi Road, Ernakulam, Cochin-682011, (x) E-1/23, Arera Colony, Bhopal, (xi) Bunglow No. 216, Sector 11-A, Chandigarh-160011, (xii) 20, Forest Park, Bhubaneswar-9, (xiii) Aggarwal Building (1st Floor), Canal Crossing, The Mall, Post Box No. 319, Kanpur-4, (xiv) 43, Patalputra Colony, Patna-13, (xv) SB 38/A Bhawani Singh Marg, Bapunagar, Jaipur, (xvi) 9, Galaxy, 353A Boat Club Road, Poona-1.

Arrangements will be made for listing of these Bonds at the Bombay, Calcutta and Madras Stock Exchanges.

Brokerage will be paid at the rate of six paise per Rs. 100/- to recognised banks and brokers on allotments made in respect of applications for the Bonds tendered by them and bearing their stamps.

NEW DELHI,
DATED THE 2ND SEPTEMBER, 1974.

Reducing Growth Rate of Population through Declines in Mortality

A Note

S K Rao

The purpose of this note is to demonstrate how fertility rates may fall more than proportionately as mortality rates decline given certain rationalistic premises.

In the first section a model is set up to demonstrate the above; in the second section the realism of the assumptions underlying the model is discussed; and in the last section the implications of the model to population policy are mentioned.

I

SUPPOSE that:

(a) Every couple wish that at least one child survives them and that they *control* their fertility behaviour such that they have a minimum number of children to ensure that at least one child survives them.

(b) A couple feel *confident* that at least one child will survive them if the probability of death of all the children they have is not greater than ten per cent.

In short the aim of a couple is to have the minimum of babies necessary to ensure that at least one child survives them with ninety per cent confidence.

Given these assumptions how would fertility rate behave as mortality rates fall?

Denote that:
s=survival rate, and
x=number of births.

Assumptions (a) and (b) above give us the condition,

$$(1-s)^x \leqslant e^{-1} \qquad (1)$$

$$x \log (1-s) \leqslant -1$$

$$x \geqslant \frac{-1}{\log (1-s)}$$

Define that $g = x.s$ (2)

$$g = \frac{-s}{\log (1-s)}$$

$\log (1-s) \searrow -s$ as $s \to 0$

Therefore, $g \to 1$ as $s \to 0$

$$\frac{dg}{ds} = -\frac{1}{\log (1-s)} - \frac{s}{[\log (1-s)]^2} \cdot \frac{1}{1-s}$$

$$= -\frac{1}{\log (1-s)}\left[1 + \frac{s}{1-s} \cdot \frac{1}{\log (1-s)}\right]$$

as $s \to 0$, $\left[\log (1-s) \searrow -s - \frac{s}{2}\right]$

$$\frac{dg}{ds} \searrow -\frac{1}{-s}\left[1 + \frac{s}{1-s} \cdot \frac{1}{-s\left(1+\frac{s}{2}\right)}\right]$$

$$= \frac{1}{s}\left[1 - \frac{1}{(1-s)\left(1+\frac{s}{2}\right)}\right]$$

$$\searrow \frac{1}{s}\left[1 - \frac{1}{\left(1-\frac{s}{2}\right)}\right]$$

$$= \frac{1}{s} \cdot \frac{-\frac{s}{2}}{1-\frac{s}{2}}$$

$$= -\frac{1}{2} \cdot \frac{1}{1-\frac{s}{2}} \to -\frac{1}{2} \text{ as } s \to 0$$

as $s \searrow 1$, $(1-s)\log(1-s) \to 0$

$$(1-s)\left[\log (1-s)\right]^2 \to 0$$

$$\frac{dg}{ds} \searrow -\frac{s}{1-s} \cdot \frac{1}{\left[\log (1-s)\right]^2} - \frac{1}{\log (1-s)}$$

Therefore, $\frac{dg}{ds} \to -\infty$ as $s \to 1$

It could be verified that $\frac{d^2g}{ds^2} \leqslant 0$

for all $0 \leqslant s \leqslant 1$

If $\left[\frac{-1}{\log (1-s)}\right]$ denotes the least integer greater than $\frac{-1}{\log (1-s)}$, then

$$g = s\left[\frac{-1}{\log (1-s)}\right].$$

Further, given that $x \leqslant x^*$, where x^* is the fecund limit,[1] the behaviour of x and g as s increases is shown in Diagrams 1 and 2.

Diagram 1 shows how the birth rate x and the growth rate of population g would behave as survival rates improve assuming that x can be a continuous number; Diagram 2 shows the same where x is discrete. It is more convenient to refer to Diagram 1 where the relationships are more naked to the eye than in Diagram 2 even though the basic relationships are identical.[2]

What emerges is that: (a) as survival rates improve birth rates might remain flat and growth rates rise upto a point; after that birth rates fall more than proportionately and growth rates decline. The initial unresponsiveness of birth rates to improvements in mortality is due to the fact that at very low survival rates the minimum children required to ensure the survival of at least one child with some confidence may be so large that it might exceed either the fecund capacity of the mother or the economic capacity of the family to support so many children to start with. (b) Curiously, the number of children a couple might end up with on average (x.s) might be larger than the desired number which in our example is assumed to be one. That is to say, a couple in an attempt to hedge against the risk of losing all the children have so many extra babies that in general the actual number of surviving children exceed the desired number of children. Such a discrepancy is larger the smaller is the survival rate confronting an individual couple.

II

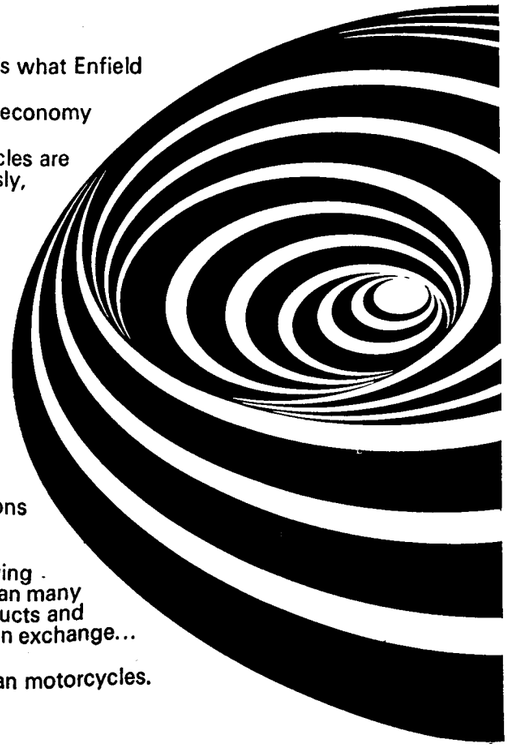
That the growth rate of population tends to decline in response to improvements in survival after a critical point

at ENFIELD progress is a continuous process

Continuous, sustained progress—that's what Enfield India is all about.

Enfield's contribution to the country's economy is varied...

Enfield's Bullet and Crusader motorcycles are the pride of the roads—serving tirelessly, faithfully over long periods.



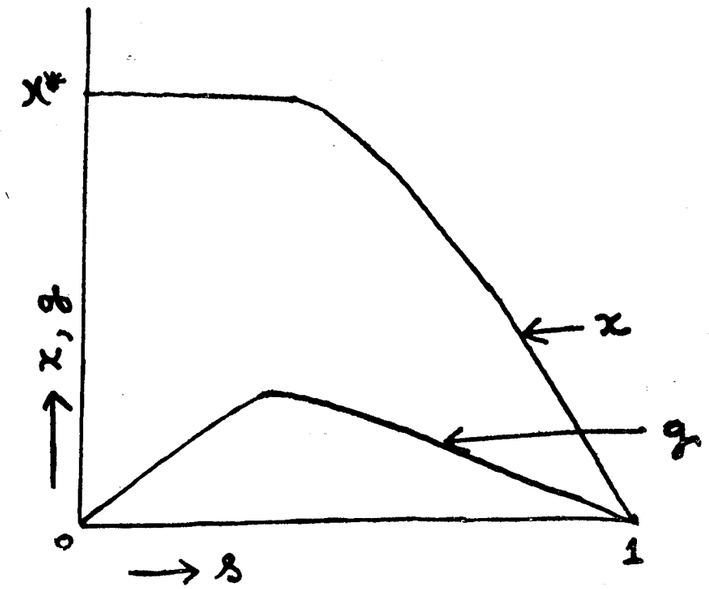
And Villiers Engines are the good companions of many a farmer in the country for plant protection and irrigation purposes, apart from being useful for a wide range of industrial applications, and for generating sets for Defence Forces.

And Enfield's second factory for motorcycles is at Anaikaraipatti—a backward area in Tamil Nadu.

Enfield's role in promoting ancillary industries is well known. The groups of ancillaries sponsored by Enfield at Madras and Anaikaraipatti are indications of its involvement in the growth of small-scale units.

All these efforts, plus the rapidly growing export markets for Enfield products mean many things—more employment, more products and services, savings and earnings of foreign exchange... and a boost to the economy.

In short, Enfield means much more than motorcycles.



FDS EI 1959

Enfield: progress in many directions—always.

DIAGRAM 1: CONTINUOUS CASE

x = number of births per woman; x* = the fecund limit;
s = survival rate; g = x.s

DIAGRAM 2: THE DISCRETE CASE

. x
——— g
x = number of births per woman; x* = the fecund limit;
s = survival rate; g = x.s

is demonstrated on the basis of some assumptions. How realistic are they?

First, it should be pointed out that it is not crucial whether we assume that the desired survivals is one; it can be any number. The larger the minimum of survivals desired, the later would be the point after which the growth rate starts declining; the basic relationships would remain unchanged. For example a couple might not think in terms of the survival of one child at least but that it has to be a male child;[3] such a behaviour would have the effect of increasing the minimum number of births necessary for there is only half the probability that any child born is male.

The crucial assumption in the model is really that parents worry about the possibility of losing all their children and plan the number of births to hedge against such a risk.

This is an assumption which is not easy to test by looking at the statistics of births and deaths. What one could say in favour of the assumption is that it presumes rationality on the part of the parents and therefore ought not to be ignored in a population policy which relies on rational persuasion. Further, from what one could gather from various social surveys there seems to be some evidence in favour of such an assumption. For example, a study conducted by the United Nations in Karnataka, records that, "the fear of losing children as a motive for having more of them was poignantly stated by a woman aged 20 years, having one daughter, five years old and expecting another child, in the following terms: 'If this daughter dies then what will happen to my home? Another child will certainly make my home happier.' A rural mother who had lost one of her daughters and had another six years old wanted two boys because, 'out of the two I had, one is already gone. I would like to have more to be sure of at least some child surviving me.' A villager whose wife was pregnant said, 'I have only one son. I lost two and I am really anxious to have more'" [United Nations (1961) p 146-7].

It is not easy to indicate the level of confidence people aim at when they are hedging against the risk of losing all the children. However, some of the motives stated by parents for having children — 'to be taken care of in old age', 'to increase family income'[4] — make one suspect that the confidence limit must be fairly high. Again the basic relationships suggested in the model would remain valid whatever the ac-

6 Per Cent State Government Loans, 1984

	State	Amount of Loan (In crores of Rs.)
* 1	Andhra Pradesh	12.75
* 2	Gujarat	1.00
3	Himachal Pradesh	1.25
* 4	Karnataka	6.75
* 5	Kerala	1.00
* 6	Maharashtra	9.75
7	Manipur	3.25
8	Meghalaya	3.50
9	Nagaland	5.25
*10	Rajasthan	2.25
*11	Tamil Nadu	8.75
12	Tripura	1.50
*13	Uttar Pradesh	18.25
	Total	75.25

* Second Issue

All the above loans will be issued at Rs 99.00 per cent and will open for subscriptions on Friday, 27th September 1974 and close on Monday, 30th September 1974 or earlier without notice as soon as subscriptions approximate to the amount of each issue. All the State Governments reserve their right to retain subscriptions upto ten per cent in excess of the notified amounts.

The loans will be redeemable at par on 27th August 1984. Interest on the above loans for the period 27th September 1974 to 26th February 1975 inclusive will be paid on 27th February 1975 and thereafter payment of interest will be made half-yearly on 27th August and 27th February each year. Interest in respect of all loans will be liable to tax under the Income-tax Act 1961. Interest on Government securities along with income in the form of interest or dividends on other approved investments will be exempt from Income-tax subject to a limit of Rs 3,000/- per annum and subject to other provisions of Section 80L of the Income-tax Act, 1961.

The value of investments in the Loans now issued together with the value of other previous investments in Government securities and the other investments specified in Section 5 of the Wealth Tax Act, 1957 will also be exempt from the Wealth Tax upto Rs 1,50,000/-.

Subscriptions may be in the form of CASH/CHEQUE.

Applications *for all the loans* will be received at the offices of the Reserve Bank of India at Ahmedabad, Bangalore, Bombay (Fort and Byculla), Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi and Patna and the State Bank of Bikaner and Jaipur at Jaipur.

Applications will also be received *at other places within the* respective States as follows:

(i) Branches of the Subsidiary Banks of the State Bank of India conducting Government treasury work except at Hyderabad; and

(ii) Branches of the State Bank of India at places where there is no branch of its Subsidiary Banks conducting Government treasury work;

Applications for Himachal Pradesh, Kerala, Meghalaya and Nagaland State Loans will also be received at treasuries and Sub-treasuries in the State of Himachal Pradesh, Kerala, Meghalaya and Nagaland respectively at places where there is no branch of the State Bank of India or its subsidiaries conducting Government treasury work. Applications for Uttar Pradesh State Loan will also be received at the District Treasury, Chamoli.

Copies of the Notifications and Application Forms may be obtained from any of the Receiving Offices mentioned above.

In the event of over-subscription to the loan applied for, applicants tendering applications at the offices of the Reserve Bank of India at Ahmedabad, Bangalore, Bombay (Fort and Byculla), Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi and Patna will be given the option of transferring their cash refunds to any other State Government loan which may still be open for subscription. To avail themselves of this facility, applicants should complete the "Special Option Form", copies of which can be obtained at any of the offices of the Reserve Bank of India mentioned above and tender the form along with their applications.

tual confidence limit is. What is important is that people *do* aim at some confidence limit.

What is disputable among our assumptions is whether people do limit the births after they have had the minimum number of children necessary to ensure a stated number of survivals. At the worst what can be claimed in favour of the model is that it demonstrates the limits to a birth control programme. It emphasises how the motivation to adopt birth control practices may be linked to improvements in survival chances — so that expenditures on family planning and mortality reducing activities need not be looked upon as competing but complementary to each other.

But perhaps it is not altogether unrealistic to think that, provided there is motivation, parents do search for various means of birth control and adopt them so that one may expect some spontaneous declines in birth rates following declines in mortality. The fact that most of the declines in birth rates in Europe during 19th Century followed earlier declines in mortality — albeit with a lag — and in an atmosphere of great religious taboo against artificial methods of contraception — not that there were many available[5] — suggests that in the less developed countries today the sluggish response to the intensive birth control propaganda may be due to lack of motivation because of high mortality rates.

Various empirical studies on fertility behaviour published recently support the point of view embodied in our model. Gosta Carlsson (1966) argued that the persistent regional differentials in fertility in Sweden during 19th Century cannot be explained in terms of a lagged response to an innovation, *viz*, the idea of limiting family size, for they existed before the great decline in fertility began. He argued that Swedish couples practised birth control before the start of the great decline and that the persistent differentials can only be explained in terms of mortality differentials. Coming to contemporary times, Harald Frederiksen (1961), (1966), (1966A), found, on the basis of a study of inter-district changes in Sri Lanka and from a cross-section study of 21 countries which differ widely in their levels of living, that changes in birth rates are inversely related to the excess of births over deaths in the initial period.

Most of the cross-section studies on fertility behaviour in India started on the *premise that the cultural aspects are important in explaining fertility* differentials;[6] yet the general finding of these studies seems to be that 'fertility is not significantly related to income, literacy, education, occupation or caste, except in the topmost ranks' [Myrdal, (1968), p 1446].

We suggest that the differentials in fertility can be better understood if one relates them to survival rates. A great deal of the information available in the case studies is not readily usable to test our hypothesis as it has been tabulated from a different point of view. Still, with this proviso, we quote statistics on fertility and survival from two case studies in India in Table 1.

Rele's data in Table 1 are based on a survey of a rural area in Banares Tehsil, UP, and the Mysore Population Study refers to Karnataka state. In both cases the data on fertility and mortality are tabulated from a different point of view. Rele's "Class I includes higher castes such as Brahmins and Kshatriyas; Class II embraces Hindu castes of intermediate social status and Class III has both lower Hindu castes and scheduled castes. All non-Hindus, virtually all of whom are Muslims make up Class IV." [Rele (1963)]. The Mysore Population Study on the other hand groups the data according to the degree of urbanisation. In spite of these statistical problems of grouping it is interesting that in both the case studies fertility (Column 1) is generally inversely related to survival chances (Column 2) so that the differences in the average number of surviving children per woman (Column 3) are not so large as in fertility. In both the cases the group which enjoyed the best survival chances for it's children had the lowest fertility and the groups which faced the worst survival conditions tended to have higher fertility rates.

A comparison of inter-regional changes in survival conditions and birth rates in India over the first half of the Century (see Table 2) seems to support the view that mortality conditions have an important bearing on fertility behaviour. It supports the expectation that declines in birth rates tend to be greater where the survival conditions improved most. The South and the Central parts which had the least improvement in survival conditions had the least declines in birth rates. The Northern and the Western parts which had experienced much better improvements in survival conditions have also had greater declines in birth rates. The East is an exception to this broad trend.

What little evidence we can gather, then, suggests that the assumptions underlying the model are perhaps not unrealistic; indeed the empirical findings are consistent with the behavioural relationships derived in the model.

III

That reductions in mortality could be followed by decreases in growth rates of population has some interesting implications to population policy. First, the lament that the quick reductions in mortality rates have led to an explosion in growth of population making it difficult to achieve economic growth is, apart from being a very bankrupt kind of thing to say, perhaps posing the problem wrongly — for according to our logic rapid and far-reaching reductions in mortality may bring about reductions in *growth rate* of population. This task might be successfully accomplished if rapid reductions in mortality are coupled with accessible service and

TABLE 1: FERTILITY RATES AND SURVIVAL RATIOS FROM TWO CASE STUDIES IN INDIA

	Children Born Per Woman (1)	Survival Rate* (2)	Number of Children Surviving Per Woman (3)
Rele's Data			
Class I	6.81	64.2	4.4
Class II	7.66	56.7	4.3
Class III	7.20	58.1	4.2
Class IV	7.86	57.3	4.5
Mysore Population Study			
Rural Hills (1)	7.2	56	4.0

means of birth control. What should be emphasised is that there may be a limit to the success of birth control propaganda without further declines in mortality rates.

How can the mortality rates be further reduced? No doubt there is still some scope for declines in mortality through purely public health measures. But ultimately it is the improvements in nutrition and housing, etc, which will have a telling effect on survival chances. Paradoxically, then, it is vital to allow essential consumption to rise to trigger off declines in fertility which could in turn *release* a lot of resources which *could be* used for investment.[7]

TABLE 2: CHANGES IN BIRTH AND SURVIVAL RATES BY BROAD REGIONS, INDIA 1901-11 TO 1951

Zone	Per Cent Change in Expectation of Life at Birth (1)	Per Cent Change in Birth Rate (2)
North	+114	—33
East	+ 67	—30
South	+ 29	—15
West	+202	—35
Central	+ 54	—13
N-West	+221	—26

Note: Both Columns (1) and (2) show changes in rates standardised for age composition.

Notes

[In writing this note I have greatly benefited from discussions with K Dayanithy and N Panchapagesan who have helped me in constructing the mathematical proof contained in this paper. I am also grateful to M V Posner, Luigi Pasinetti and Amit Bhaduri who have given me comments on an earlier version of this paper. Of course, none of the people mentioned are responsible for any errors that remain.]

1 x^* can also be interpreted as the economic limit, i e, the limit beyond which a couple consider it too burdensome to have children for economic reasons even though there is still a risk of losing all of them. Such a limit would, of course, vary from individual to individual.

2 These results are similar to those obtained by May and Heer (1968) based on a computer simulation exercise. Their assumptions as well as the aim of their exercise are similar to our's and credit is due to them for the pioneering research they have done. We may, however, claim a modest advance over their research in three respects: first, we provide the proof, the *rationale* for the results which is missing in their paper. Second, we go more deeply into the realism of the assumptions underlying the model. Third, our reading of the implications of these results to economic policy are slightly different from theirs.

3 See May and Heer (1968). They find that nearly 25 per cent of the mothers in India do *not bear* enough children to ensure the survival of at least *one son* given the mortality conditions prevailing in India during the mid-fifties.

4 See United Nations (1961), and and also Agarwala (1962), United Nations (1967).

5 For a review of the historical experience of Europe, see Coontz (1961); also United Nations (1967).

6 For a review of some of these studies, see Myrdal (1968) and Agarwala (1962).

7 We wish to emphasise that a lower growth rate of population does not necessarily *lead to* economic growth. It helps in augmenting the surplus available for investment; whether it does in fact materialise into investment or not depends upon the existence of an institutional framework which is capable of transforming such a surplus into investment.

Joint Sector and 'Control' of Indian Monopoly

A Comment

H K Paranjape

IN his article "Joint Sector and 'Control' of Indian Monopoly",[1] Aurobindo Ghose has attempted to examine the whole problem in a particular context. My own views about what the joint sector can and should be — and should not be — and why have been already stated in my various articles on the subject.[2] It is not necessary therefore to go into details. However, as Ghose has made certain comments about my views, it will perhaps be useful if I clarify the position.

Ghose is quite right when he states that there is "little uniformity and even less agreement on what constitutes the joint sector". The term has been used by various persons in their own way and this certainly causes much confusion. But this is a difficulty that we have to face in social sciences. After all, when even a much more important term like Socialism means different things to different men, what can we expect of an obviously contrived term like the 'joint sector'. May be that the Dutt Committee would have done well to avoid a term which, as Ghose rightly points out, has already been used by others to mean something different from what the Committee had in mind. This does not, however, necessarily mean that had the Committee used some other term, it would not have been twisted later to support something different.

NATURE OF JOINT SECTOR

As Ghose states, one can conceive of a middle zone of mixed ownership enterprises in India in addition to pure public and pure private enterprises. He makes a further distinction between (a) the mixed public enterprise and (b) the mixed private enterprise. The former according to Ghose, is "characterised by (i) majority equity ownership by the government and its different agencies, (ii) financial supervision and audit control in the hands of the government even when management is with the private collaborator, and (iii) statutory accountability to the government as well as the Parliament." The latter has opposite characteristics such as "(i) minority equity participation by the government and its different agencies, (ii) day to day management, financial supervision and audit control in the hands of the private promoter, and (iii) its functioning not being statutorily accountable to the government or Parliament." But Ghose also states that the distinction between the two types "turns round the character of 'effective control' of the enterprise". He appears to overlook the possibility that majority ownership of equity may not be necessary for effective control; that in most large enterprises, control over 20 per cent of equity can provide effective control, if the remaining equity is widely dispersed. His first characteristic may thus be seen to be not an essential one. From this it also follows that enterprises like TISCO, CIMMCO, Premier Tyres or ACC need not be automatically ruled out from the first category merely on the ground of minority ownership, as long as no private group controls a large proportion of equity than public financial institutions. Ghose is right in pointing out that in so-called joint sector companies formed under the 26 (State Government): 25 (private sector): 46 (general public) formula, it may well happen that the government will not be in effective control even if it is the largest single owner of equity. But the important factor is effective control — not majority ownership.

I agree with Ghose that if the approach is to be a government nominee as Chairman and a nominee of the private collaborator as Managing Director, it is likely that effective control will be with the latter. My emphasis however has been that it is not necessary; it would be dangerous in any case, to accept the joint sector as a kind of partnership between government and a private business group. That was the main emphasis of my article in *Mainstream*. Unfortunately government appears to have fallen prey to this use of the term joint sector.

Ghose however appears to place too much emphasis on statutory control and accountability. He overlooks the fact that public enterprises have proved in the past neither enterprising nor adequately oriented to public purpose in spite of full statutory accountability by the Comptroller and Auditor General. As a matter of fact, it is well known that legislative accountability wrongly interpreted has been an important factor leading to Secretariat control and overcentralisation in public sector enterprises; and CAG audit has many times tended to create a 'procedures first' rather than 'performance first' approach in them. Our public enterprises have surely not been shining examples of success so as to suggest that these aspects of their organisation must be reproduced in the joint sector-mixed public enterprise category.

MISREPRESENTING DUTT COMMITTEE?

This brings me to Ghose's conclusion that I am a proponent of the approach "arguing for the enlargement of the role of the private sector but of course with public funds and some semblance of public control" and that, in effect, my approach is essentially the same as that proposed in the Tata Memorandum. It is even suggested that I am misrepresenting the recommendations of the Dutt Committee. While "the Dutt Committee recommended the joint sector *only* as an intermediate measure, a second-best alternative to the mixed public sector which was in fact advocated as the first-best instrument", I am said to be making out, "as if the Dutt Committee recommended the joint sector as the optimum instrument of development of Indian industry". In making this statement, Ghose is relying on my *Mainstream* article.

It is always difficult even to argue about what an individual author really meant; it is far more difficult to argue about what a Committee really meant, even though perhaps as one of its three members it may not be considered presumptuous of me if I attempt to indicate what the Dutt Committee's Report implied.

But my task has been made easier by Ghose who has quoted from the Report and stated that "the Committee recommended the mixed public enterprise as the most suitable form of development of Indian industry without increasing private concentration. Such mixed public enterprises would be regarded as belonging to the public sector. For the time being, however, the Committee felt that the joint sector should be resorted to. The joint sector would include units in which both public and private investment has taken place and where the State takes an active part in direction and control. How the State would play this active part was left unspecified, except for the possibility of conversion of public loans into equity and the necessity of creation of a cadre of trained full-time Public Directors".

Ghose sees red at my emphasising the important potential role of the joint sector because he assumes that the joint sector of the Dutt Committee — and which I also have in mind — is what he has called the 'mixed private enterprise'. But he has no reason to make

any such assumption. The idea of the joint sector has been spelt out by the Dutt Committee in its Main Report in paras 8.15 to 8.18. Para 8.15 deals with what may fall under what Ghose has called Mixed Public Sector — majority equity held by government but with some equity held by private individuals. Paras 8.16 to 8.18 deal with the other type — where government may not own or control majority equity but it is made certain that "the State takes an active part in direction and control". Effective control is envisaged — and for that purpose it is suggested that the idea that the equity held by public financial institutions should not be normally used for appropriate participation in private sector concerns should be "firmly set aside". "This would ensure that the management of industry is conducted according to the overall policies laid down by government, and that public interest and not merely

On our 25th Anniversary, we're paying a lot of people in our own coin.

ate profit would guide the operations of large industrial undertakings in the private sector. This would also be an important means of curbing the increasing concentration of economic power. Thus the development of the 'Joint Sector' on these lines is, in our view, an important instrument for the attainment of this objective", i e, to curb the increasing concentration of economic power. It should be noted that all this is written in relation to the joint sector — not government companies. This should suggest that Ghose should not have at least alleged that I am misrepresenting the Dutt Committee. This is not to say that the Dutt Committee's ideas need to be treated as sacrosanct!

It is important to note why the Dutt Committee had thought of convertibility of loans into equity as an important part of the joint sector development. "This purpose [of proper representation for the State in management] may be achieved", it was stated, "by the Financial Institutions insisting on the whole or part of their assistance in the form of loans and debentures being convertible into equity at their option and, if necessary the law should be amended to provide for this". Whether the convertibility was to be only for future loans or also for past ones was left vague — deliberately in my view as to give government an opportunity to announce retrospective convertibility at an appropriate time; but the reference to the law being amended could have no further implication. What was contemplated was that, in the cases of key companies, such retrospective conversion should take place so that the financial institutions should have a substantial chunk of equity in them. This was combined with the other suggestion that the equity of all the institutions should be used to obtain appropriate representation for the State in the management of these concerns and that a body of full-time Public Directors should be created for that purpose. The implication was that, in a large number of key companies, such conversion to the joint sector would bring those concerns under the effective control of the state. They would not formally be public sector concerns, the majority equity may not be with government or financial institutions; but in effect they would be operating under State control.

Extension of Dutt Committee Approach

It is necessary to emphasise that in my recent writings I have gone further than the Dutt Committee though I do think that my suggestions are in keeping with the logic of the Committee's policy recommendations. The Dutt Committee had specifically decided not to spell out the organisational details regarding the joint sector. While pointing out that the joint sector would be an instrument for curbing the concentration of economic power in private hands, it had not specifically pointed out how the joint sector could be effectively used for the purpose. In this connection, it needs to be recalled that the MRTP Act was put on the Statute book some months after the submission of the Dutt Committee's Report. What I am now suggesting goes beyond the Dutt Committee. I may mention that my main pleas have been as follows:

(1) Many of the key companies in the private sector can be converted into joint sector companies by retrospective conversion of public loans into equity, effective and purposeful use of the provisions of Chapter III of the MRTP Act and the proper and purposeful use of the shareholdings as well as other inherent powers enjoyed by financial institutions in the public sector such as term-lending institutions, the LIC, general insurance companies, the Unit Trust and nationalised banks.

(2) The break-up of the so-called Larger Houses as well as conglomerate companies can be effectively brought about through the use of Section 27 of the MRTP Act — if necessary, with certain amendments — so that continuing concentration of economic power to the common detriment can be brought to an end speedily and effectively.

(3) The convertibility of term loans into equity can be so organised that it becomes a built-in device for automatic conversion of every private sector concern that grows beyond a certain size into a joint sector concern.

(4) The joint sector concerns can then be looked upon not as private sector concerns but as national enterprises whose further growth need not be hindered as far as what the MIC has called "country-wise monopoly" is concerned. Scrutiny from the angle of product monopoly may of course continue to be necessary.

(5) Nationalisation can be largely discarded with increasing use of the joint sector as a more economical instrument to bring large and key concerns in the private sector under effective public control. Ownership of such concerns would increasingly vest in public sector financial institutions, but much before majority control is obtained, the concerns can be under the effective control of public sector financial institutions who would be able to make sure that a good management is appointed and to supervise the results that are achieved.

(6) It is necessary that the public financial institutions' role in this matter should be properly co-ordinated and streamlined so that they should be in a position to carry out these new and vastly expanding responsibilities in an effective manner. It should be noted that this was already hinted in the Dutt Committee Report where it was said that it would be necessary to create a suitable, well-trained cadre of full-time Public Directors who will represent the State on the joint sector industrial concerns and that probably the best agency to do this work would be the IDBI.[3]

(7) The actual organisation of joint sector concerns may take many forms. Two possibilities are:

(i) a holding company like the SAIL for a particular sector; and

(ii) an industrial holdings corporation which would obtain the proxies for all the equity holdings of the public financial institutions in concerns other than those for which joint sector holding companies like SAIL are set up. As I had pointed out, "such an agency may also undertake investments on policy grounds where increasing the equity portfolio in a particular company is desirable on considerations of public interest, but the investment institutions do not find it worthwhile to do so in terms of their special objectives. This agency can build up an expert techno-economic set-up so that it becomes capable of keeping a watch over the operations of the major joint sector companies and stepping in to bring about changes in management personnel or policies where necessary."[4]

Why Joint Sector?

The main advantages that I claim for the joint sector are: (i) The question of Larger Industrial Houses can be solved "by means of a swift surgical operation" and this can help create a situation where basic changes in economic and administrative policies may be possible. When very large units would all be increasingly in the joint sector, there need be no inhibition regarding permitting them to grow. The economies of scale and the necessity to promote competition where possible will then become the main considerations governing decisions regarding the size of the units. Disortions such as encouraging uneconomically small units,

or not utilising the technical and economic growth potentialities of existing large units, which mar the present industrial policy will then obviously become irrelevant and unnecessary".[5] It may be noted that this is very much in keeping with the Dutt Committee's point that the joint sector approach would be of importance because "the objections raised to permitting large projects to be developed, even though such a size might be necessary on techno-economic grounds because of the fear that this would help build up a private industrial empire would become irrelevant".[6]

(ii) At the same time this would obviate the difficulties faced in organising large public sector enterprises from scratch. The joint sector units would provide the nuclei for healthy growth of certain important industries, making the best possible use of available technical and managerial experience in existing enterprises, while not permitting such growth to add to private concentration of economic power. Joint sector enterprises through proper use of professional managers already existing in the erstwhile private concerns would also help to avoid the undue dependence on elitist bureaucrats which is one of the features which has marred the healthy and efficient growth of the public sector.

Ghose concedes that I have suggested the extension of the joint sector concept to existing large private companies and break-up of dys-functional interconnections together with the professionalisation of management. But he is not sure that professionalisation of management is enough. What is the meaning of State supervision, he asks, and points out that I do not support public audit and parliamentary accountability. "Nowhere does Paranjape specify the mechanism of resolving public/private conflict in decision-making within a joint sector enterprise", he points out

While it may be true that I have not spelt out this matter in my writings — partly because details cannot be dealt with in occasional articles — I have indicated that:

(i) in the joint sector of my conception, there is normally no question of any partnership between the government and a private concern as such; and

(ii) the management will be nominated by the financial institutions who may operate through some kind of a holding company.

Normally, therefore, there would be no question of dual management or public/private conflict in decision-making. I have specifically pointed out that the joint sector concept in which there is a partnership between a Large House and the government is not desirable and that this might well lead to extension of private industrial empires on the one hand and the enhanced possibility of corruption and subversion of the whole concept on the other.[7] It was for this reason that I likened the acceptance of the joint sector concept by spokesmen of big business to the embrace of the boa-constrictor.

It is surprising that in spite of all this, Ghose comes to the conclusion that essentially my approach to the joint sector is no different from that of the spokesmen of private business such as J R D Tata. Of course, I do not think there is anything wrong if one finds occasional areas of agreement with business spokesmen. Thus I certainly agree with the point made in the Tata Memorandum that joint sector enterprises should not be burdened with the cumbersome and time-consuming procedures enforced in the public sector. On the other hand, I have made it very clear that the idea of joint sector as a partnership between the private sector company and the government, with the day-to-day management remaining in the hands of the private sector party, cannot be accepted without subverting the very basis of the concept as supported by the Dutt Committee.

Majority Ownership Not Necessary
