## SEASON AND CROP REPORT

FOR

FASLI 1316 (1906-1907).

*Character of the seasons.*—The south-west monsoon usually commences in the second fortnight of June. During the year under report light rains set in in the first week of June in all districts except Vizagapatam, Salem, the West Coast and the Nilgiris. In the second and following weeks of the month there were copious rains which enabled the ryots to commence generally the sowing of early crops. The rainfall in July and August was timely and well-distributed and was above normal in all districts. The fall in September was less than the normal everywhere except Bellary, Anantapur, Cuddapah and Chingleput where that limit was slightly exceeded, while in Trichinopoly, Tanjore and Tinnevely the rainfall was less than half the quantity due. Up to the end of September the rainfall was normal in Tanjore, slightly deficient in South Canara and considerably so in Malabar. The yield of the cocoanut palms was seriously affected in Malabar in consequence of which the price of cocoanuts rose above normal. On the whole the south-west monsoon may be characterized as having been plentiful and well-distributed, because the total extent cultivated up to the end of September under dry (first crop) exceeded the average of five years in all districts except Ganjam, the Carnatic, Trichinopoly, South Canara and the Nilgiris while under wet (first crop) that limit was not reached only in Trichinopoly, the South and the Nilgiris.

2. During the second week of October, the opening month of the north-east monsoon, there was good rain in all districts except Nellore, Chingleput, South Arcot and Tanjore in which the monsoon burst in the following week. In the third week the fall was also particularly good in the Central, Southern, West Coast districts and the Nilgiris. In Cuddapah the rainfall especially in October and November was markedly deficient. The falls in November were disappointing in the Circars and Deccan generally and were considerably below normal in Nellore and Madras. In Trichinopoly and Tanjore there, was, on the other hand unusually heavy rain in November which caused a few tanks to breach and resulted in the case of the former district in some loss of grain stocks and houses. In Coimbatore and Madura the rainfall in November was heavy and proved of much benefit to the crops. In December abnormally heavy rains fell in Kistna, Guntur, Kurnool, Anantapur, Nellore and Chingleput and did considerable damage to wet and dry crops. In Guntur several tanks breached causing loss of cattle and damage to property. Copious rains fell everywhere else in December and while much damage was done as noted above, the rain, following a dry November, helped to save crops over a considerable extent in Kurnool, Anantapur, Cuddapah and Nellore. On the whole the fall during the north-east monsoon exceeded the normal in a dozen districts while in eight more the deficiency was only slight. As regards distribution, the north-east monsoon was unfavourable in comparison with a remarkably well-distributed south-west monsoon and in consequence the late crops did not fare so well as the early ones.

3. Light and scattered showers fell in the first two weeks of January 1907 followed by fine weather which lasted up to the first week of March. In the second week of that month small amounts were received in parts of the Central and Southern districts and in the remaining weeks of the month the rainfall was general, and brought the receipts up to normal in several districts. A good deal of rain was received in April and May which enabled the ryots to prepare the ground for sowings in the following year.

4. *Area under cultivation.*—As compared with the normal, there was an increase in the area under cultivation to the extent of 80,000 acres—the result of an increase of 206,000 acres under first, and a decrease of 126,000 acres under second crop.

The favourable season caused an increase of 860,000 acres as compared with the previous year.

5. *Cropped area of the year.*—The total crop area of 1906–1907 (29,247,767 acres) exceeded the normal area (29,172,545 acres) by 75,222 acres. The increase was due not so much to the extension of cultivation as to the preparation of *puccants* on the basis of settlement areas in the districts of Malabar and South Canara. Particulars of the area under the chief food-grains and industrial crops during the year 1906–1907 are compared below with the normal areas and explanations are furnished for important variations:—

| Crops.            | Normal area. | Area in 1906–1907. | Difference. |
|-------------------|--------------|--------------------|-------------|
| 1                 | 2            | 3                  | 4           |
|                   | ACS.         | ACS.               | ACS.        |
| Paddy .. .. .     | 7,338,325    | 7,409,424          | + 71,099    |
| Cholam .. .. .    | 4,525,951    | 4,479,193          | — 46,758    |
| Cumbu .. .. .     | 2,930,067    | 3,050,532          | + 120,465   |
| Ragi .. .. .      | 1,664,384    | 1,591,919          | — 72,465    |
| Gingelly .. .. .  | 806,173      | 593,158            | — 213,015   |
| Groundnut .. .. . | 451,611      | 634,514            | + 182,903   |
| Castor .. .. .    | 654,271      | 572,486            | — 81,785    |
| Sugarcane .. .. . | 53,972       | 58,586             | + 4,614     |
| Cotton .. .. .    | 1,535,979    | 1,742,416          | + 206,437   |
| Indigo .. .. .    | 230,185      | 180,700            | — 49,485    |
| Tobacco .. .. .   | 123,660      | 146,836            | + 23,176    |

Cholam, ragi, gingelly, castor and indigo showed a decrease and the other crops an increase. The increase under paddy and sugarcane was small and calls for no remark. The decrease under cholam and increase under cumbu in the Coimbatore district showed a marked preference on the part of the ryots for the latter crop. Decrease under ragi occurred chiefly in the districts of Coimbatore and Trichinopoly and is attributable in the latter district to the want of timely rains during the months of May and June for unirrigated ragi and in the former district to the unfavourable nature of the season for that particular crop as compared with the years 1902–1903 and 1903–1904. Among oil-seeds, the areas sown with gingelly and castors showed a falling off. In the districts of Coimbatore, Salem, Gódvári, South Arcot, Madura and Tinnevely there was a noteworthy diminution under gingelly, due partly to want of timely rains for the crop and partly to the preference of groundnut as a more paying crop. The decrease under castors was large in the Bellary district and was due to the cultivation of better paying crops, such as cereals and pulses. On the whole there was a steady growth in the area cultivated with groundnut on account of the increasing commercial importance of the crop. Increases under cotton occurred chiefly in the districts of Coimbatore, Bellary and Tinnevely and must be ascribed to higher prices. The cultivation of indigo has fallen considerably owing to the introduction of the synthetic dye and that of tobacco has gradually increased in the Guntur district.

6. *Outturn of crops.*—The outturn of crops was in no case above the normal. The outturn of paddy in Chingleput and Cuddapah was 67 and 72 per cent. respectively of the normal, while in the other districts it ranged from 75 to 92 per cent. Indigo in Bellary, castors in South Canara and

groundnut in Gódvári yielded a normal outturn; while in the remaining districts except Vizagapatam the outturn ranged between 53 and 92 per cent. The outturn of the other crops with a few exceptions ranged between 56 and 92 per cent. of the normal.

7. *Prices, trade and stocks.*—The harvest prices of rice in Vizagapatam, Bellary, Cuddapah, Salem, Trichinopoly, Madura and Tinnevely districts, of ragi in Gódvári, Kistna, Madura and Tinnevely districts, of cholam in Bellary, Madura and Tinnevely districts, and of cumbu in Guntur, Salem, Madura and Tinnevely districts were either at or slightly below the level of the previous year, while in all other cases they were above that level. The prices of all grains were everywhere above the normal rates, as given in the Madras Famine Code of 1905, and while the “season and crop” report for the year shows it to have been distinctly good, the so-called “scarcity” rates were either reached or exceeded in the case of rice in Ganjam, Gódvári, Kistna, Guntur, Madras and Salem; in the case of ragi in Cuddapah, Nellore, South Arcot, North Arcot, Salem, Trichinopoly and Tanjore; in the case of cholam in Kistna and Salem; and in the case of cumbu in Coimbatore. It is obvious from such facts that the “normal” and “scarcity” rates here referred to which were fixed in 1896 can no longer be regarded as fulfilling those characters. The question of revising the normal and scarcity rates is under the consideration of Government.

Little or no information has been furnished in the district reports in regard to the course of trade. Collectors will be requested to supply the omission in their future reports, obtaining the necessary statistics from the Railway and Customs authorities. The stocks of grain in the several districts are reported to be generally sufficient.

8. *Cattle disease.*—The total loss of cattle from disease was 113,539 against 90,293 in the previous year. This increase is probably only apparent and not real and due to more accurate record of deaths. Deaths from rinderpest (including diarrhoea and dysentery), malignant sore-throat and unspecified diseases showed an increase while there was a decline under other heads. Inoculation against rinderpest, anthrax and malignant sore throat continued, but the number of animals inoculated was 42 per cent. less than in the previous year. More satisfactory results may be expected when the veterinary staff is strengthened and more expert assistance is made available throughout the Presidency.

9. *Agricultural deterioration.*—On this subject the Director of Agriculture reports as follows:—

“As regards agricultural deterioration, no facts indicating deterioration have been observed in any part of the Presidency. It is well known that the classes which own or have any interest in the land are very prosperous at the present time, owing to the high level of the prices of all agricultural produce. It is not only the industrial crops such as cotton, jute, ground-nut, etc., which have risen in value, but the prices of paddy and other chief food-grains of the country have risen, in spite of good harvests, to what were formerly considered scarcity rates, and show no signs of falling to their former level. In consequence of this, the ryots who are usually slow to change their old economical ways of living are making large profits.”

“In the Pattukkóttai taluk of the Tanjore district, the rapid spread of the new so-called ‘Mauritius’ ground-nut has brought prosperity to the cultivators of the poor sandy dry lands which prevail in that part of the district. Requiring as it does only five or at most six months for the full period of its growth, it is in less danger of failing for want of rain than the old variety, which needed seven months or more. This is a point of great importance when it is understood that in this part of the district ground-nut is purely a rainfed crop. Its other advantages, viz., greater yield and better outturn of oil are too well-known to require emphasizing here. The consequence of this is that it is largely displacing (except as rotation crops) the cumbu (*Pennisetum typhoides*) and varagu (*Paspalum scrobiculatum*), the comparatively unremunerative crops which alone were suited for the poor soil and uncertain rainfall of the taluk before the advent of the groundnut. This has caused a well-marked improvement in the position of the cultivators. They pay their assessment without difficulty. They can borrow, when borrowing is necessary, at more favourable rates than before. The poorer classes, who formerly lived on dry grains such as cumbu and varagu, can now afford rice as their usual food. It is, therefore, satisfactory to notice that this crop is likely to be grown much more widely in future. Considerable areas are already reported from Madura and Tinnevely, and it is being tentatively introduced into several other districts.”

"The area under some other important industrial crops, viz., cotton, sugarcane and Bimlipatam jute (*Hibiscus cannabinus*) is also increasing. In the case of cotton and Bimlipatam jute, this is due to the rise in prices; in the case of sugar, the increase of the area under cane, in the absence of any marked improvement (till very lately) in the price of sugar, must be put down to the general improvement in the position of the ryots who can now command the capital necessary for the large outlay which this crop demands."

10. *Condition of the agricultural population.*—On this point also the Director of Agriculture reports thus:—

"The position of the agricultural labourers is more difficult to ascertain. Inasmuch as they are still usually paid in kind, they also are benefited by the rise in prices in respect of the surplus which remains, after satisfying their daily needs, for exchange for other commodities. On the Government agricultural stations, the tale is usually one of demands for higher wages. This is especially the case at Samalkota and Palur which are situated in the districts of Godavari and South Arcot, respectively. As much as As. 6 a day is demanded from ryots who are in urgent need of coolies for planting their sugarcane in Godavari, and at Palur so many labourers now cultivate small patches of ground-nut on their own account that it is found very difficult to obtain labour for the picotas during the season of the irrigated ground-nut. In the Tanjore delta, many complaints are heard from landowners of the growing scarcity and independence of the day labourers in consequence of emigration. The extra labour needed for transplanting and harvest has now to be paid for more liberally, or else great delay is incurred when the ryot tries to get this work done by the families of the ancestral labourers attached to the land. It is well-known that many of the emigrants return to India with sufficient money to purchase land on which to maintain themselves by their own labour for the rest of their lives. There are, therefore, signs that the labouring classes are asserting their claims to a share in the increased prosperity of the ryot."

# APPENDIX A (paragraphs 1, 2 and 3 of the report).

STATEMENT showing the rainfall in each district during the agricultural year 1906-1907 in comparison with the average of 35 years ending 1904.
