ANNUAL RETURNS

TRICENNIAL REPORT

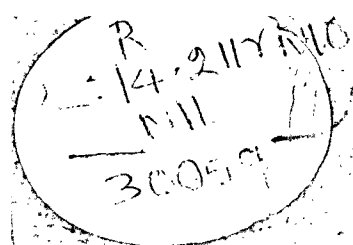

ON THE CIVIL HOSPITALS
AND DISPENSARIES

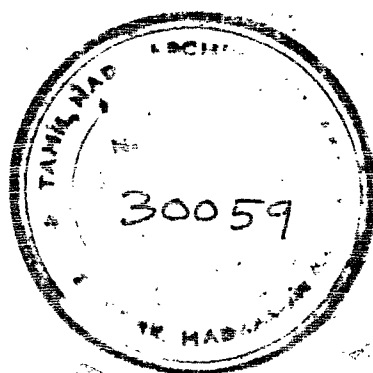

IN THE

MADRAS PRESIDENCY 1910

IN THE

MADRAS PRES.

treated; but from the figures of 1908 and 1909 it is calculated that females form 25 per cent. of the number, and are, with rare exceptions, treated as out-patients only. The in-patients numbered 23,489 and of these 23,129 belonged to the Police force.

7. The private non-aided institutions gave relief to 350,312 males and 368,428 females whose ailments were classified according to Statement E, and others for whom no proper statistics were furnished. The average *per mille* on the total was for 1908, 144 males and 139 females; for 1909, 161 males and 168 females; and for 1910, 182 males and 205 females. The rise is progressive in both sexes; and that among females indicates the growing repute of the class B dispensaries in this group.

8. The attendance at the general institutions (classes I, III and IV) is steadily increasing. There were treated 17,066,054 patients as contrasted with 15,826,475 in the preceding triennium; males numbered 11,196,718 and females 5,869,336. Assuming the total of 1907 to be 1,000 for each sex the numbers for the three years under report are, of males 1,014, 1,056 and 1,147 respectively, while the female patients have risen through 1,044 and 1,061 to 1,166.

9. The ratio of females to males in the total has not apparently improved in this simultaneous increase; but as the number of class B institutions continues the same, although 22 new dispensaries were established, the improvement does certainly exist. There is however considerable scope for improvement. In the census of 1911 the percentage of females in the population was found to be 50.8 for the Presidency, and over 51 for the districts of Ganjam, Ramnad, Tanjore, Tinnevely, South Canara and Trichinopoly. Among patients in 1910 the female percentage was 35.22 for the Presidency; in the districts of Tinnevely, Salem, Trichinopoly, Coimbatore and Chingleput it exceeded the average within 40 per cent.; in the districts of Bellary and North Arcot it exceeded 41 and in Madras it rose to 43.3 per cent. The 'patients' include the sex as treated in all the Civil Hospitals and Dispensaries reported upon excluding those in classes II and VI.

10. The in-patients aggregated 227,339. Among these the increase is well marked and proportionate to the general increase.

11. The mean daily average sick comprised 24,642 males and 13,581 females, of whom 2,131 and 1,231 respectively were in-patients. The total is an advance of 91 males and 103 females *per mille* on the mean of the preceding triennium; among in-patients the advance was 53 and 109 *per mille* respectively.

12. *Madras Institutions*—The hospitals and dispensaries in Madras account for 471,668 male and 364,486 female patients; the proportion of the City total to that of the group was 4.87, 5.02 and 4.87 percentage respectively in the three years. The progressive advance among females was through 1,005 and 1,057 to 1,128; among males a fall of 7 in the first year (at the Georgetown and Bahiah Naidu Dispensaries) was succeeded by a rise to 1,066 and to 1,136. There were admitted to the wards 31,139 males and 37,219 females. The mean daily average sick comprised of male patients, 623 in-door and 1,094 out-door; and of female patients 527 in-door and 739 out-door. Of the provincial sex-totals the percentage that sought relief at the City institutions was 6.97 males and 9.33 females, the variation being accounted for by the special arrangements for female medical relief.

13. *Classes*.—The figures in Statement F for 1910 (hereto annexed) differ from the same in previous years, owing to the inclusion of labour cases conducted by the midwives in the disease returns (Statement C) instead of, as heretofore, dealing with them in a separate paragraph of the district Administration Reports. The change produces an increase under females of each class in the Statement F for 1908 and 1909. Allowing for this increase it is calculated that every 10,000 patients may be held to include, of Europeans and Eurasians 40 men, 39 women and 33 children; of Hindus, 3,808 men, 1,546 women and 1,975 children; of Muhammadans, 635 men, 279 women and 385 children, and of others (mostly Indian Christians) 525 men, 345 women and 385 children. The unequal division of sexes in the adult population is present among children also. The proportion of each class in the total varies very slightly from the same for 1907, the Hindus and Muhammadans sharing in the increase.

14. *Diseases treated*.—During 1908-10 the registration of disease among those treated has been elaborated by the introduction of (1) cases of normal and abnormal labour in the disease statement; (2) separate disease statements for in and out-patients among institutions other than those of class V; and (3) separate columns to register the mortality under each disease-heading among all patients treated in class V, and among in-patients in other classes of institutions.

A further improvement was secured by the order to include in the appropriate columns of the in-patient return the out-door labour cases with the mortality noted among them. There is therefore now a complete record of all deaths within the districts, which the Civil Medical Department may be held to be professionally cognisant of.

General diseases are in the new statements differentiated into 'infective' and 'other general' diseases, but for comparison with previous statistics the group name is retained.

15. Excluding labour cases the clientele during the triennium included those seeking relief for general diseases 4,795,324; for local diseases 12,317,581; for injuries 1,091,262; and for poisons 32,322. These items formed respectively 26.30, 67.54, 5.98 and 0.18 per cent. of their total. In the previous triennium the proportions noted were 28.36, 65.88, 5.59 and 0.17 respectively. The variations in the disease proportions is due (1) to the fact that prior to the introduction of a separate column in 1908 for 'Labour' the abnormal cases of that heading were included under general diseases; and (2) to the subsequent instructions from this office to omit cases of 'no appreciable' disease, etc., which were similarly included.

16. In 1908 and 1909 labour cases numbered 8,232 and 10,160 respectively which had come under medical treatment, together with 32,640 and 32,286 respectively which were credited to the midwives employed by local bodies. The system of registration clearly permitted of some cases being duplicated by separate entry in the hospital and the midwife's registers. In 1910 the District Medical officers were instructed to include in the hospital registers and, consequently, in the hospital returns, every case of labour, whether conducted by the Medical staff or the midwives; and to return the out-door cases among them as 'represented by friends.' The consequence of the order was a fall of 5,405 in the number returned for the Presidency; but that this fall has had no bearing on the outturn of obstetric surgery will be shown further on.

In this branch of medical relief the private non-aided institutions are doing admirably: their record has progressed from 474 labours in 1908 to 854 in 1910.

17. *Mortality* statistics were not furnished for Classes II, V and VI prior to 1910. In the other classes the deaths during the triennium numbered 13,028 among in-patients; and 128 were recorded among out-door labour cases during 1910. Of the former group 2,389 had been admitted moribund; the apparent death-rate of 5.73 per cent. must therefore be taken as 4.68. In the preceding triennium 13,585 deaths occurred, and of these 2,230 had been admitted moribund; the death-rate was 6.64, or 5.55 per cent. after deducting the moribund cases.

18. *Infective diseases*.—(1) Cholera. Of this 21,847 cases were treated, over 64 per cent. having occurred in 1908. Of cases treated during 1910 several were admitted in the last stage, but the mortality was less than 4 per cent.

(2) Dysentery formed, on an average, 1.64 per cent.—a decrease of 0.12 of the annual total. Every district contributes its share to this record. The worst cases are generally admitted as in-patients, and among these the mortality was over 15 per cent. for 1910.

(3) Kala-Azar, only recently recognised, and separately tabulated since 1910. Two hundred and fifty-eight cases were treated in Madras, and the mortality recorded among in-patients was 18 per cent.

(4) Koyarogam, as occurring in Vizagapatam Agency, has been investigated during the past two years, and was separately reported upon.

(5) Leprosy. Some effort has been made to improve the special accommodation for patients under this heading. The Criminal Lepers from the Leper Hospital, Madras, were transferred to the Salem Jail, from 1st September 1910, and the space

REPORT ON THE ANNUAL RETURNS

occupied by them has been made available for Civil patients. At the request of the Mission to Lepers in India and the East the Government (G.O., No. 485, Public, dated 9th June 1908) sanctioned building grants to Calicut, Salur (Vizagapatam) and Bapatla (Guntur) Loper Asylums; together with annual grants of maintenance to the same, and to the Mangalore Asylum, conditional on submission of annual reports and statements of work done. The Calicut and Mangalore Asylums show a satisfactory outturn of work regarding treatment of lepers for leprosy, and appear in the official returns as 'Private-aided' institutions; from Salur a statement (E) is received to show that 62 lepers were treated, while from Bapatla a statement was received showing that 214 patients were treated for various diseases other than leprosy. To maintain the intention of the Government, instructions will be issued for these two institutions being brought under class IV.

(6) Malaria. A considerable fall occurred in the number for 1908, but the increase in attendance during the subsequent years was marked. The average percentage on the annual total was 7.03 instead of 7.19. The use of quinine as a prophylactic is increasing among the population. I am informed that the sale of the drug at Post offices in the Presidency realised Rs. 21,417 in 1910, as contrasted with Rs. 13,567 and Rs. 12,372 in the years 1909 and 1908. The Government were further pleased to sanction the distribution of quinine in the malarial tracts of the Gódvári district by means of itinerating dispensaries (G.O., No. 1595 L., Mis., 21st December 1909); and revised instructions have been issued for self-treatment with quinine on the new ten-grain packets.

(7) Pneumonia, now separately classified, seems important enough for such consideration. In Classes I, III and IV, there were treated 829 in- and 2,934 out-patients suffering from this disease; of the former 191 proved fatal. The cases were most frequent in Madras, the Nilgiris and Malabar; and the mortality was greatest on the hills.

(8) Rheumatism and rheumatic affections rank next to malaria in order of frequency. The cases are generally chronic and are treated as out-patients.

(9) Septic intoxication. During 1910 in Classes I, III and IV there were admitted 168 cases of septicæmia; 3 occurred in hospital after operation, and 36 were otherwise acquired. The deaths in the groups numbered 41, 2 and 2 respectively.

(10) Small-pox. In the public dispensaries there were treated 2,954 cases, as contrasted with 2,907 in the preceding triennium. Of the former 801 were treated, during 1910, in Classes I, III and IV; among these 374 were admitted as in-patients and 88 died. Effort was made to secure the information called for in G.O., No. 992, Public, 21st October 1910; but the items had not up to then been recorded, and the matter will be dealt with in future reports.

(11) Tuberculosis formed the cause of admission in 9,949 cases during 1908; in the following years the numbers were 10,738 and 13,990 respectively. The increase might be attributed, to some extent, to the more careful discrimination of the cause in the affections heretofore classified as 'of the respiratory system.' The largest numbers occur in Madras and Malabar; but all districts contribute to the total. Certain special arrangements for combating the disease by the establishment of sanatoria were sanctioned in G.O., No. 1017, Public, dated 1st November 1910.

19. Among 'other general diseases' cases of anæmia due to causes other than malarial formed, on an average, 1.11 of the annual total; but the rise from 62,927 in 1907 to 69,765 in 1910 can only be explained on the prevailing financial depression of the agricultural and labouring classes.

Of 'malignant new growths' there were treated during 1910 in Classes I, III and IV, 761 in-patients and 685 out-patients; of these 334 and 104 respectively sought relief at the city hospitals; but only 21 cases in Madras and 106 cases in the mufassal were reported under the terms of G.O., No. 101, Public, dated 6th February 1904.

20. Among 'systemic diseases'—which were formerly returned as local diseases—those deserving mention are:—

(1) Diseases of the eye. In 1908 and 1910 epidemic conjunctivitis increased the attendance under this head very largely; but the increase is marked in all eye affections as well, and the heading claims nearly 10 per cent. of the total treated.

OF THE CIVIL HOSPITALS AND DISPENSARIES.

(2) Diseases of the digestive system are shown under six headings in the statements. As a group these cases formed 12.75 per cent. of the total number of patients treated excluding cases of labour. The most common among them were disorders of digestion, diarrhoea and passive congestion of the liver. Abscess of the liver is generally in evidence at Madras; and in 1910, of 51 cases treated in the city hospitals 13 proved fatal.

(3) 'Ulcers and diseases of the skin' formed 20.54 per cent. of the total; and this proportion may be held to apply to each centre of relief among general institutions.

21. Injuries led to 6,862 admissions among in-patients (Statement C (1)) with a mortality of 5.3 per cent. In Madras alone 1,066 were registered with a mortality of 6.5 per cent. The number seeking relief for injury has risen steadily through the triennium, there being a difference of more than 50,000 between the figures for 1907 and 1910. Improved methods of surgery account for this; and it is hoped that better surgical equipment will lead to further advance.

22. Poisoning by opium was reported in 377 cases. The heading 'other poisons' includes snake-bite, which will be dealt with in a separate report later in the year, and several cases of wounds described as poisonous because of the history given by the patients.

23. Operations.—The institutions in classes I, III and IV only supply tabulated statistics of operations. During the triennium under report 621,869 operations were performed on 616,439 patients, as contrasted with 536,137 on 531,100 patients during 1905-1907. The proportion of cases operated on was 3.63 per cent. of all those who were under treatment, 10.36 among injured persons and 7.18 of the labour cases; it varies but slightly from the average record.

24. Operations may be conveniently considered under three heads: (1) those necessitated by injuries; (2) those performed for disease or deformity; and (3) obstetric operations. Among the first and second groups a large number of small value occur frequently, and must be excluded in considering the comparative mortality; in the last group about one-fourth, intended to facilitate the commencement or completion of labour, are safe and seldom fatal.

25. Injuries gave rise to 106,344 operations. Of these 66,829 were undertaken for the removal of foreign bodies, and 11,961 for repair of wounds in various parts of the body; the deaths herein numbered 1 and 32 respectively. The most important among the rest were: amputations, 1,256; setting of fractures, 13,371; reduction of dislocations, 5,123; and hæmatocele, 261. The mortality was 0.13 per cent. for the group; but in the above selections amounted to 3.72, 0.42, 0.06 and 1.14 respectively. The number treated under each item of the group was higher than that of the previous triennium; the fall in mortality was general, and under amputations was 1.96 per cent.

26. Operations undertaken for disease or deformity numbered 507,054. The most frequent were those performed for abscesses (195,569), linear scarification of the skin for boils, carbuncles, sinuses, etc. (46,772), and dental operations—mainly extraction of teeth—(171,433). The increase under each of these items yielded 75 per cent. on the group total, and the mortality among them was less than 1 per cent. Those of surgical interest in this group included—

(1) Extraction of lens, 3,675. The number is less by 180 than the previous record, the reduction being due to the change of Superintendent at the Government Ophthalmic Hospital, and the smaller number of cases returned from the mufassal; 96.68 per cent. were cured and relieved.

(2) Amputations, 784 or 87 less than before. The death-rate was 5.75 per cent. or 2.34 higher; the increase occurred almost entirely among amputations of the lower extremities.

(3) Operations on the skull, spine and nerve-centres, 90, or one-tenth as much again as the last record. These resulted in 70 per cent. of successful cases and 22.58 of deaths.

(4) Abdominal sections—294 for diseases of the abdomen, and 393 for diseases of the female generative organs. This is an advance of 50 per cent.

39. *Invested Capital*.—This was increased in Madras by Rs. 12,299 and in mufassal by Rs. 10,966.

40. *Establishment*.—Surgeon-General Browne retired from the service on 1st April 1908. The Hon'ble Surgeon-General Benson controlled the department during the rest of the triennium.

41. The formation of the Ramnad district has thrown open a district appointment for the Civil Assistant Surgeon class, and the charge is now held by a Civil Assistant Surgeon.

42. Among medical subordinates the changes made in the city hospital establishment have been noticed. No special changes were made in the mufassal.

43. At the end of 1910, there were in independent charge 25 third-grade Civil Sub-Assistant Surgeons, including 6 who had undergone the post-collegiate course, and 16 fourth-grade Civil Sub-Assistant Surgeons, together with 22 and 3 of the same grades respectively maintained by Local Boards. The Government subordinates of these grades are, in compliance with G.O., No. 633, Public, dated 28th July 1904, appointed to independent charges when men of senior grades are not available.

44. There were 363 *midwives* employed in the mufassal throughout the triennium with a temporary increase of 1 at the end of 1909. The number of cases in which these took part fell from 32,640 in 1908 to 32,286 in 1909 and 31,622 in 1910; and the decline is the outcome of the popularity being achieved by private non-aided institutions. The midwives employed in Vizagapatam and South Canara districts show the best outturn and severally average over 128 cases in each year; those in Anantapur, South Arcot and (omitting Nilgiris) Coimbatore districts successively came last with averages per midwife of 55.7, 57.3 and 63.3 cases. The average for the entire Presidency was 89.9, 88.7 and 87.1. It is hoped that the increased rates of pay recently sanctioned for midwives will secure the services of women better qualified to extend this form of medical relief.

45. *Inspection*.—The city institutions and the district head-quarters as well as the stations in charge of Civil Surgeons have been regularly inspected by the Surgeon-General. Inspections of out-lying stations have been made by the District Medical and Sanitary Officers; stock and service registers were duly verified at such inspections.

46. *Lending Libraries*.—The lending libraries established under G.O., No. 436-L., dated 20th March 1908, continue to progress favourably. The income realised during 1910 was Rs. 10,223-9-2. The number of books was increased by 522 at an outlay of Rs. 3,953-2-8; and the closing balance at the end of the year was Rs. 5,789-3-0.

I have the honour to be,

Sir,

Your most obedient servant,

W. B. BANNERMAN, M.D., Colonel, I.M.S.,
Offg. Surgeon-General with the Government of Madras.

ANNUAL RETURNS.

STATEMENTS A—J.

on the previous triennium. The operation was attempted more frequently in mufassal hospitals; and, in view of the comparatively inadequate surgical equipment and nursing facilities of those hospitals, the slight increase of death-rate (5.81 per cent.) in the first set is excusable. The second variety, mostly performed in the special City hospitals, yielded satisfactory results, and the mortality was 6.48 per cent. less than the previous record.

(5) Operations for stone in the bladder, 181. This was less frequently performed but with decidedly better results.

27. Among obstetric operations—

(1) *Those not necessarily involving injury to mother or foetus* numbered 4,816 or 400 more than in the last triennium. The percentage of success was 93.38 and that of mortality was 4.62.

(2) *Operations involving destruction of the foetus* were performed in 1,185 instances, as compared with 1,063 previously recorded; 86.04 proved successful on behalf of the mothers and the mortality among them was 8.07. The increase in this class of operations is not satisfactory. It is hoped that when the districts are more freely supplied with competent and carefully trained midwives cases of prolonged labour will be less frequent, difficult cases will be sooner recognized and brought to the notice of the medical man, and the lives of many unborn children be saved.

(3) *Of those involving surgical injury to the mother* were performed 54, or three times as many as before. Success attended 72.73 per cent. and the mortality was 25.45. The advance here is satisfactory as showing that women do come forward more readily than before for such severe operations in order to have living children.

(4) *Other obstetric operations* became necessary in 2,416 cases or 746 more than in the last triennium; the death-rate among these was 2.81.

The improvement in obstetric surgery is very marked and the results are satisfactory; for in 1905 to 1907 the mortality in the above four divisions stood at 5.73, 13.48, 61.11 and 2.27 respectively in comparison with the present rates of 4.62, 8.07, 25.45 and 2.81 respectively.

28. *Finance.*—The remarks apply only to classes I, III and IV which supply financial statements. The subject will be considered under two sections: (1) the institutions in the City of Madras, and (2) the mufassal institutions.

29. The City hospitals comprise six institutions of class I and four each of classes III and IV. During the triennium the support of these cost Rs. 21,08,753 as contrasted with Rs. 16,27,913 for the last period. The rise in expenditure was due to—

(1) Increase of *establishment* in State hospitals. In the General Hospital, with effect from 1st April 1909, the pay of four medical officers is debited against the hospital instead of, as heretofore, against the Medical College; an additional Civil Assistant Surgeon was appointed in 1909 for pathological work, and another in 1910 for the X-ray department. In the Maternity Hospital an extra Military Assistant Surgeon was appointed in 1908 to take charge of the new out-patients' dispensary; and in the same year an allowance of Rs. 50 per mensem was sanctioned for the Military Assistant Surgeon who teaches midwifery to European and Eurasian pupil midwives; two trained European surgical nurses were sanctioned at the end of 1909. In the Government Ophthalmic Hospital a special local allowance was granted to the Military Assistant Surgeon in lieu of private practice; and since November 1909 two European nurses have been appointed. In the Leper Hospital an increase of local allowance was granted to the Sub-Assistant Surgeon in September 1909. In the hospitals generally certain additions were also made to the establishments of "inferior servants," and the pay of Sub-Assistant Surgeons has been increased in accordance with the new scheme.

(2) The increased value of *drugs and medical stores* due in large part to the outfit required in 1908 for the Egmore out-patients' dispensary attached to the Government Maternity Hospital, and for the Chintadripet Dispensary in 1910.

(3) The daily rate for *diets* was increased (G.O., No. 271, Public, dated 23rd April 1909) from eight to ten annas for European and from four to five annas for native patients; the expenditure on this item was increased by 30 per cent.

(4) The increases under "miscellaneous charges" and "buildings or repairs" aggregated respectively Rs. 1,30,718 and Rs. 86,222; these were due, in the former case, to electric and scientific equipment purchased for the State hospitals, and in the latter case to the extension of the buildings now in progress; the latter charge was partly enhanced by the Municipal Hospital at Royapettah being located in rented buildings pending the completion of the new buildings.

30. Towards the income of city hospitals the Government contributed 84.22 per cent.; 1.35 and 6.80, respectively, were borne by the Monegar Choultry Committee and the Municipal Corporation; subscriptions realised 1.17, of which 1.11 was obtained from the Indian community; interest on investments brought in 1.71 per cent. and miscellaneous receipts amounted to 4.75. An increase of 1.24 in the Government share was due to the increased expenditure on State hospitals.

31. The mufassal institutions were maintained during the triennium at a cost of Rs. 41,00,648 or Rs. 6,04,526 more than in 1905-07; in these figures the sums invested have no share. The increase was distributed among various items of expenditure.

32. Under "Salaries" the rise occurred from (1) the increased rates of pay sanctioned to Sub-Assistant Surgeons, already alluded to; (2) the permission granted from time to time to certain local bodies to increase existing establishments; and (3) the opening of new dispensaries and provision for their staff; nevertheless the entire cost of establishment was only 53.35 per cent. of the total expenditure, or nearly 3.08 less than in the preceding triennium.

33. "Medicines" and surgical appliances cost 18.53 per cent. of the total instead of 16.49 as before. The increase was due to the more liberal scale of equipment now permitted for Civil Hospitals generally; to the special allowances made on behalf of head-quarter institutions, and to the outfit supplied for new dispensaries.

34. Under "Diet" the increased expenditure was proportional to the increase in the number treated; but proportionately the item is resolved into 0.03 per cent. less than the item in the preceding triennium.

35. The actual expenditure on "Miscellaneous charges" was an increase of Rs. 35,371, but the outlay, proportionate to the total cost, was only 8.3 instead of 8.7 per cent.; the increment is due to the need for supplying the wants of an increased number of patients.

36. "Buildings and Repairs" cost Rs. 5,27,396 in contrast with Rs. 4,00,209 in the preceding triennium. With the help of large Government contributions during 1909 and 1910 various new dispensaries and additions to existing hospitals have been constructed. The details appear as foot-notes to statement H yearly in so far as the contributions are utilised and the buildings made over to the medical department for use.

37. Summarising the above results to show the relative cost of medical relief in the City of Madras and the mufassal the results are as follows:—

In the Madras hospitals the daily expenditure on *diet* was Rs. 379-6-4 and on all *other charges* Rs. 1,544-10-6. With a mean daily attendance of 1,150 in- and 1,833 out-patients this gives the daily cost per patient of As. 5-3 for diet and of As. 8-3 for other charges.

In the rest of the Presidency the daily expenditure on *diet* was Rs. 344-7-7 and on all *other charges* Rs. 3,700-11-5. The mean daily attendance was 3,362 in- and 34,861 out-patients. The daily cost per patient was As. 1-6 for diet and As. 1-6½ for other charges.

38. Towards the maintenance of the mufassal hospitals the Government contributed Rs. 1,94,802 as salary, and Rs. 2,31,510 for other purposes, of which over Rs. 1,50,000 were intended for buildings. The two items formed 9.7 per cent. of the total income (excluding cash balances) or 2.6 per cent. more than in 1905-07. Local Fund Boards and Municipalities contributed respectively 62.42 and 22.50 instead of 63.21 and 22.67. The relative proportion under other items was practically unchanged.

STATEMENT A.

Showing the Number of Dispensaries in the Madras Presidency during the year 1910.

Population of the Province—41,396,267.

Class of dispensary.	Number open on 31st December 1909.	Number opened during the year 1910.	Number closed during the year 1910.	Number open on the last day of the year 1910.	Remarks.

Total	630	12	5	637	

CLASSES I AND II.—These include all institutions maintained by Provincial funds and under Government management. The fact that an institution possesses endowments or receives contributions from Local funds or private subscriptions should not be regarded as a reason for not classing it as 'State' so long as Provincial and Imperial funds are practically responsible for all the charges connected with it. Class I.—Public are State dispensaries which are open to the poorer classes of the public. Class II are State dispensaries which serve only a special section of the public as indicated in the sub-classification attached.

CLASS III.—Local Fund dispensaries include all institutions which are vested in Local Boards or Municipalities or guaranteed or maintained by Local or Municipal funds. The fact that such an institution is aided by private subscriptions, or receives assistance from Government in the shape of part of the salary of the medical officer, grants of medicine, or otherwise, should not be regarded as a reason for not classing it as a Local Fund dispensary so long as its existence is practically dependent upon Local funds.

CLASS IV.—Comprises institutions supported by private subscriptions or guarantee, but receiving aid from Government or Local funds.

CLASS V.—Comprises institutions maintained entirely at the cost of private individuals or associations. The fact that Government supplies superior inspection or registers should not be regarded as a reason for not treating it as a private non-aided dispensary.

CLASS VI.—Comprises all railway dispensaries whether maintained by State railways or others.

STATEMENT B.

Showing the Number of In-door and Out-door Patients treated in the State-public, Local Fund and Private-aided Dispensaries of the Madras Presidency during the year 1910.

No. 933, PUBLIC, 25TH AUGUST 1911.

GOVERNMENT OF MADRAS.

PUBLIC DEPARTMENT.

READ—the following paper :—

Letter—from the Hon'ble Surgeon-General P. H. BENSON, M.B., V.H.S., I.M.S.,
Surgeon-General with the Government of Madras.

To—the Chief Secretary to Government.

Dated—the 24th June 1911.

No.—63/468.

ABSTRACT.—Submitting the annual returns of the Civil Hospitals and Dispensaries in the Madras Presidency for the year 1910.

Order—No. 933, Public, dated 25th August 1911.

Recorded.

2. *Number of institutions.*—The total number of institutions in all classes rose during the triennium from 609 to 637. There was, at the end of 1910, one institution to every 64,986 persons. The Government are glad to note that there was a marked increase in the number of private non-aided institutions, due principally to missionary enterprise. Neither the slight increase in the total number of institutions nor the ratio of institutions to population can be regarded as satisfactory. Until the area of private medical relief, whether by hospitals or private practitioners, is considerably extended, the provision of hospitals and dispensaries by the State and local bodies must be continued on a scale sufficient to meet the needs of the people.

3. *Accommodation.*—The number of beds available for in-patients in public and private (aided and non-aided) institutions was 5,527 at the beginning of the triennium and 5,881 at its close. Here again, it is observed that the principal increase occurred in the number of beds provided in private non-aided institutions. The total accommodation even now available, however, can only be regarded as seriously inadequate for the needs of a population of forty-one millions.

4. *Number of patients treated.*—There was a steady increase in the number of both in- and out- patients treated in the different classes of institutions, and the total treated rose from 5,594,940 in 1907 to 6,537,045 in 1910.

5. *Hospitals for women.*—The Government regret to observe that there was no increase during the triennium in the number of institutions intended exclusively for women. The number of patients treated in the institutions, however, showed an increase of 50,000 over the figures for the previous three years, and serves to emphasize the need for additional institutions of this kind.

6. *Principal diseases treated.*—In 1909-1910, the Presidency was happily affected but little by cholera. There was a progressive increase during the triennium in the number of patients treated for small-pox, malarial fevers, tuberculosis, injuries, diseases of the eye and for poisons. Under diseases of the eye (chiefly epidemic conjunctivitis), the total was higher than even that under malaria. The increase under the head of poisons is probably due to the extended treatment of cases of snake-bite in hospitals. Small-pox and enteric were in the mufassal most prevalent in Malabar and South Canara and the figures in the returns show that tuberculosis was on the increase to a marked extent in the former district.

7. *Operations.*—There was a very noticeable increase in the number of operations performed, the average for the triennium being approximately 17 per cent. higher than the corresponding figures for 1905—1907.

8. *Expenditure on medical institutions.*—The expenditure on the maintenance of the public and private aided institutions rose from Rs. 18,97,859 in 1907 to Rs. 23,70,637 in 1910; while subscriptions from private individuals towards their support continued in the period under review to be lamentably small.
