1870

Jan - Jun

year, it is only necessary to observe that the decrease of tonnage is in the quantity of Government stores only. This will of course vary from year to year with the requirements of the works in progress.

7. Of private boats carrying private goods, the numbers were in 1867-68, 128 boats with 489 tons, against 563 boats with 1,179 tons in the following year, showing an increase in the traffic connected with private trade of 690 tons, or 122 per cent., that is to say, that the private boat traffic on the river which is that of principal interest, increased nearly two and a quarter-fold in the year. This was chiefly owing to the final suppression of the Government Agency by which the food of the work-people was formerly supplied. The trade in rice and all other provisions having been thrown into the hands of private parties, a proportionate extension of this description of traffic took place.

8. With regard to the light which these returns may throw on the question of the navigability of the river at the different times of year, the following is a comparison of the arrivals of boats at the 1st Barrier in each quarter for each of the two years :—

		Arrivals in 1867-68.		Arrivals in 1868-69.	
		Boats.	Tons.	Boats.	Tons.
Monsoon.	1st Quarter, June to August ...	41	707	52	290
Monsoon.	2nd „ September to November...	42	238	166	352
Dry Weather.	3rd Quarter, December to February	162	1,265	382	754
Dry Weather.	4th „ March to May ...	56	252	274	578
	Total ...	301	2,462	874	1,974

This, however, includes Government boats, which being towed by steamers form no part of the ordinary sailing boat traffic. Excluding these, the return for the private boat traffic only is as follows :—

	Arrivals in 1867-68		Arrivals in 1868-69.	
	Boats.	Tons.	Boats.	Tons.
1st Quarter ...	9	42	21	112
2nd „ ...	29	76	118	109
3rd „ ...	47	210	225	482
4th „ ...	30	90	199	476
Total ...	128	489	563	1,179

In the first year the dry-weather traffic is three times, in the last year four times that in the monsoon. It will be observed also that in the last year, 1868-69, the traffic on the last quarter, when the river had fallen lower than had ever been known before, was almost equal to that in the preceding quarter, and much greater than in any quarter of the previous

9. It is satisfactory to notice in connexion with this increase of traffic, that freights have not risen. It might have been supposed that in a year of such very bad navigation, the charges for transport would have been higher. They remained, however, about the same, or slightly less than in the previous year, *viz.*, 14 annas per bag from the Coast to Badrachellum, 105 miles, and Rs. 1-1 to Rs. 1-2 to Dumagoodium, 120 miles, being at the rate of 1 anna 11 pie to 2 annas per ton per mile. Since the freshes have set in, and the improved chan-

between Badrachellum and Dumagoodium has been opened, freights have fallen to 15 annas per bag to Dumagoodium, which is now the ruling rate, equivalent to 1 anna 8 pie per ton per mile. This is for carriage up-stream without return loads.

10. The *number of boats that entered* the canal at the Tail Locks, whether to unload at the Dumagoodium Wharf, or to proceed further up river, was—

Government boats	420
Private „	615
Total ...	1,035

of these, the number that passed through the Canal was—

Upwards.

	No.	Tons.
Governments boats	102	268
Private „	75	234
Total ...	177	502

Downwards.

Government boats	75	226
Private „	78	55
Total ...	153	281

Total traffic through the Canal ... Boats 330, Tons 783

11. Statement No. 3 gives an abstract of the traffic with its estimated value. From this it appears that the Imports to the 1st Barrier from the Coast were—

	At 1st Barrier.		At 2nd Barrier.		Total.	
	Tons.	Value.	Tons	Value.	Tons.	Value.
		Rs.		Rs.		Rs.
[illegible] 1867-68 ...	...	...	...	...	2,462	2,43,540
In 1868-69 ...	1,974	2,48,058	502	78,321	2,476	3,26,379

[illegible]e Ex

	1st Barrier.		2nd		Timber from above 1st Barrier.		Total.	
	Tons.	Value.	Tons.	Value.	Logs		Tons	Logs tim- [illegible]
		Rs.		Rs.		Rs.		
1867-68 ...	28	7,600	...	...	19,162	77,292	28	19,
1868-69 ...	137	18,225	55	2,829	14,021	84,126	192	14,

The Exports consisted chiefly of country produce, as hides, horns, wax, whe[illegible]. The Imports consisted chiefly of rice and salt, with a large variety of other articles. A go[illegible] many passengers were carried in the Native boats, the charge being very small, only 8 annas to a Rupee per head from Dumagoodium to Dowlaishwarum, a distance of 120 miles; 1,305 pa[illegible]ngers are returned as arriving at, and departing from, the 1st Barrier in this way, and about a fifth of that number from 2nd Barrier. I herewith enclose a specimen of a Traffic Register Form used at the Tail Locks.

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Friday, the 7th January 1870.

PRESENT:

His Excellency the Viceroy and Governor General of India, K. P., G. C. S. I., *presiding*.
His Excellency the Commander-in-Chief, K. C. B., G. C. S. I.
The Hon'ble G. Noble Taylor.
Major General the Hon'ble Sir H. M. Durand, C. B., K. C. S. I.
The Hon'ble John Strachey.
The Hon'ble Sir Richard Temple, K. C. S. I.
The Hon'ble J. Fitzjames Stephen, Q. C.
The Hon'ble Gordon S. Forbes.
The Hon'ble D. Cowie.
Colonel the Hon'ble R. Strachey, C. S. I.
The Hon'ble Francis Steuart Chapman.
His Highness Saramadé Rájáhée Hindústán Ráj Rájendra Srí Mahárájá Dhiráj Sivái Rám Singh Bahádur, of Jaypúr, G. C. S. I.
The Hon'ble F. R. Cockerell.

The Hon'ble MR. COCKERELL took the oath of allegiance, and the oath that he would faithfully discharge the duties of his office.

AGROR VALLEY BILL.

The Hon'ble MR. STEPHEN introduced the Bill to remove the Agror Valley from the jurisdiction of the tribunals established under the general Regulation-

and Acts. He said he did not think he need say more than a very few words on the subject, because the object of the Bill was simply to confirm an Ordinance which was fully considered some months ago by His Excellency the Governor General. The Ordinance was rendered necessary by the condition of the Valley at that time, and that condition still remained unaltered. It was hoped that the Bill introduced during the last session of Parliament would have invested the Governor General in Council with power to make laws, executively, for those parts of the empire which were in a wild and unsettled condition, and for which, practically, before 1862, the Governor General legislated. This would have superseded the necessity of legislation by the Council. That Bill, however, as passed, did not make the anticipated provision. In fact, the Bill was hardly discussed at all: it was introduced at the very end of the session, and was reduced to the narrowest limits. The consequence was that it was necessary to legislate on the subject now before the Council in respect of the measures to be taken for the government of the Agror Valley. The territory was in an unsettled state, and it was necessary, for various reasons, to invest the authorities with unusual powers. The Bill was little but a transcript of the Ordinance, which had been carefully settled with the Government of the Panjáb, and had worked satisfactorily since its promulgation. There was therefore every presumption in favour of the policy of continuing the existing powers.

SUBORDINATE JUDGES AND MUNSIFS' BILL.

The Hon'ble MR. COCKERELL presented the Report of the Select Committee on the Bill to provide for the appointment of additional Subordinate Judges and Munsifs in the Presidency of Fort William.

QUARANTINE RULES' BILL.

The Hon'ble MR. CHAPMAN presented the Report of the Select Committee on the Bill to provide rules relating to quarantine.

The Council adjourned to Friday, the 14th January 1870.

WHITLEY STOKES,
Secy. to the Council of the Governor General for making Laws and Regulations.

CALCUTTA,
The 7th January 1870.

GOVERNMENT OF INDIA.

HOME DEPARTMENT.

COTTON CULTIVATION IN THE N. W. PROVINCES DURING 1868-69.

No. 321, dated 30th March 1869.

From—W. C. PLOWDEN, Esq., *Secy. to the Board of Revenue,*

To—*The Secretary to the Government of the N. W. Provinces.*

I am desired by the Board of Revenue to submit, for the information of the Hon'ble the Lieutenant Governor, a statement of the area and estimated out-turn of the cotton crop in the Districts of the North-Western Provinces for the year 1868-69 as compared with 1867-68.

2. On reference to the details given in the statement, it will be observed that the extent of land brought under cultivation, and the aggregate produce in the several divisions of the North-Western Provinces during 1868-69, fall considerably below that of the preceding year. The large decrease is, without doubt, entirely attributable to the drought, which has injuriously affected [illegible] culture generally.

3. In every District in the Meerut Division, except Boolundshuhur, the estimated yield and the land cultivated are much less this year than in the previous year. In Boolundshuhur, however, the area cultivated is almost double that of last year, and the out-turn is, comparatively speaking, equally as good. This is very remarkable, and it is to be regretted that the Collector has not explained the cause of it.

4. Kumaon is not a cotton-growing district, and consequently no remarks on the part of the Board appear to be called for. A small quantity has been grown for private consumption, but none for sale or export.

5. The area sown in the Rohilcund Division is less than in the previous year by 15,984 acres, and the out-turn is less by 31,287 maunds. The decrease is entirely owing to want of rain.

6. The land devoted to cotton in the Agra Division is less by one-sixth than in the previous year, but there is great falling off in the out-turn, which in 1867-68 was to 2,50,743 maunds, and in 1868-69 1,46,389 maunds, or almost two-fifths less.

7. In the Jhansie Division much cotton was sown, but very little germinated. The area brought under cultivation was almost equal in extent to that of the previous year, but the yield was considerably less, *viz.*:—

In 1867-68	... ...	23,747 maunds.
„ 1868-69	... ...	9,550 „

8. There has been no material variation in the Allahabad and Benares Divisions. The season in these divisions was more favourable than in other parts of these Provinces, and the crops have yielded a fair out-turn.

9. In Ajmere the crop is very scanty.

10. Extracts from the reports of the District Officers, who have given an opinion on the condition of the cotton trade, as also the ruling prices of cotton during 1868-69, are attached as an appendix to this report.

11. A copy of this letter has been sent direct to the Chamber of Commerce, and the table appended will be published in the Gazette.

COMPARATIVE STATEMENT of the area and estimated out-turn of the Cotton Crops in the Districts of the North-Western Provinces during the years 1867-68 *and* 1868-69.

DISTRICTS.	ESTIMATED OUT-TURN IN CLEANED COTTON, 1867-68.		ESTIMATED OUT-TURN IN CLEANED COTTON, 1868-69.		REMARKS.
	Acres.	Maunds.	Acres.	Maunds.	
Saharunpore	28,417	26,133	21,265	15,764	* The produce is described by the Tehseeldars to be about half of that of last year, but even this estimate is supposed to be excessive.
Mozuffernuggur ...	28,532	41,096	15,879	18,803	
Meerut*	54,171	74,707	37,282	37,871	
Boolundshuhur ...	21,168	26,441	59,969	79,129	Return of 1867-68 believed to be erroneously low. Crop good and productive.
Allygurh	55,515	54,586	37,539	50,000	The area was less than in the preceding year; but from the market returns, it is clear that, in proportion to area, the produce of the present year has been greatly in excess of that of the previous year. The amount estimated is therefore probably near the truth.
TOTAL MEERUT DIVISION	487,803	222,963	171,934	199,567*	

COMPARATIVE STATEMENT of the area and estimated out-turn of the Cotton Crops in the Districts of the North-Western Provinces during the years 1867-68 *and* 1868-69—continued.

Meerut.—Mr. W. A Forbes, Collector, says:—"There have been no marked changes in the ruling prices of cotton during the year, notwithstanding the scarcity of the article. The rates have varied from Rs. 13-5-4 to Rs. 20 per maund, and the average price between October 1867 and November 1868, both inclusive, was Rs. 16-10-3 per maund. The very difficulty of procuring cotton in any large quantities has probably prevented purchasers from entering the field."

The following extract of a letter from Messrs. Middleton, Cohen and Co., who are large purchasers for the English market in the Meerut District, is given by Mr. Forbes:—

"In further reply to your letter of the 16th ultimo, the following are the rates on which we purchased cotton from August 1867 to December 1868:—

"August 1867 ... ... Rs. 13 8 0
"September 1867 ... ... „ 12 0 0
"April 1868 ... Rs. 16-4-0, 16-2-0, 16-0-0, 15-8-0, 15-4-0, 14-8-0 and 14-0-0.
"May 1868 ... „ 15-8-0, 15-12-0, 16-0-0, 16-4-0, 16-8-0, 17-0-0, 17-4-0, 17-8-0 and 18-0-0.
"December 1868 ... Rs. 17-8-0, 18-0-0, 18-4-0, 18-8-0 and 18-12-0.

"The highest price paid this year was in last month, *viz.*, Rs. 19-4-0

"*Quality.*—The cotton last year was better than that of the preceding year, but the quality of this year's crop is far better than any I have ever seen at Meerut. It possessed very little seed, and scarcely any discoloration; whilst the cotton I see at Cawnpore, or the largest portion thereof, is very seedy.

"I do not think the price is likely to rise; the mofussil price is too high now to execute orders for this market or for England. I presume the price is maintained owing to the scarcity of the crop, but the shipments from Calcutta have been very light."

Allygurh.—Mr. G. H. Lawrence, Collector, says:—"Owing to the present scarcity, there is no great demand for cloth."

Moradabad.—Mr. R. Manderson, Collector, says:—"The price of cotton is, however, still very little higher than in the plentiful year, and far lower than in 1866.

"This is due (1), to diminished exports; and (2), to the flooding of the market with English cloths at low prices, which, re-acting on the price of native manufactured cloths, keep down the price of the raw material.

"Weavers are still employed on their looms, but if scarcity continues, it must be anticipated that many of them will be thrown out of work.

"The cotton drought of former years has taught them to betake themselves to other modes of subsistence, and no doubt they will act accordingly, should the necessity arise."

Bareilly.—Mr. H. D. Willock, Officiating Collector, says:—"There is now no perceptible demand for country cotton in the English markets; we have not exported any worth mentioning, and the prices have, as was to be expected, gone down.

"Good cotton can now be had at Rs. 21 to Rs 22 per maund of the local seer, or for one rupee less than what it commanded at the beginning of the season.

"The cultivation has also fallen off, and has reverted to the normal standard previous to the breaking out of the American civil war.

"The manufacture of country cloth has revived, but there is not the most distant apprehension of its ever being able to compete successfully with English piece-goods. They are very coarse, and, though durable, are never preferred by the rich and middle classes."

Muttra.—Mr. B. Hardinge, Collector, says:—"The native cloth trade is very slack, and the demand very small; the distress has affected the sale, as the poorer classes have enough to do to keep their families in food without spending their customary amount in clothes. English cloth has become much cheaper, as the stock in the country is large, and was imported when cotton was neither so scarce nor so dear as at present, and is under-selling the country products. For instance, the better-to-do classes can now buy common *markin* at 2½ annas a yard, while *guzzie* costs 1½ annas a yard; the English cloth is nearly double the breadth, and of much superior quality, wear, and appearance.

"The average price of cotton in Muttra, during the last twelve months, ranges from Rs. 15 to Rs. 20 per maund."

Agra.—Mr. H. W. Dashwood, Collector, says:—"I give in the margin the price of cotton in the Agra market for the last six months of 1867 and 1868.

Month.	1867.			1868.			Remarks.
	Rs.	A.	P.	Rs.	A.	P.	
July ...	16	0	0	20	8	0	Wholesale per maund.
August ...	14	0	0	20	8	0	
September ...	14	0	0	22	0	0	
October ..	13	8	0	18	0	0	
November ...	13	0	0	19	0	0	
December ...	13	0	0	19	8	0	
January 1869...	0	0	0	18	0	0	
Average ...	13	11	8	13	14	8	

"The Secretary of the Agra Municipality informs me that the importation of English cloth into Agra during eight months of 1868-69 shows a falling off equal to one-fourth as compared with the import of the preceding year. This, however, may be partly accounted for by the fact that four of the eight months were those of the rainy season, when trade always falls off. With regard to native cloth, it does not appear from the records of this (Octroi) office that there is any import or export trade beyond a very trifling extent, and that the native cloth used in Agra is manufactured here."

Furruckabad.—Mr. E. Montague, Deputy Collector, says:—"For the last nine months of 1867, the average price of cotton was Rs. 13-5-0 per maund, and for a similar period in 1868, the average was Rs. 17-12-0.

"Little or no foreign cotton is cultivated in this district; three years ago some was sown, but the cultivators unanimously declare that, when a foot or two high, the plant is burnt up by the heat of the soil.

"From the want of rain and high prices of grain, the demand for country cloth has greatly fallen off, and the market being glutted, the price has consequently fallen. Several weavers, it is reported, have left the trade for other more remunerative work.

"The ultimate effect of the scarcity will, no doubt, be a stimulus to the sale of native cloth, for people being poorer will not be able to afford English cloth, and will have to put up with the coarser and stronger article. *Dosuti* in any case holds its ground, as there is a constant demand for it for tent-making, and no similar European fabric to compete with it. It is made in Rujeepore and Guddunpore in the Mohumdabad Tehseel.

"The coarse country cloths are (except a few special manufactures, such as fine *pugrees*) the only native fabrics which have not been beaten out of the field by English goods,—*garrah, guzzie, adhotar* and *charkhana* (the latter being merely striped *garrah*) have the market to themselves until some coarse, strong, cheap English-manufactured article may appear. In the towns, the sale of country cloth is inconsiderable. The Superintendent of Octroi reckons that 50 men in Furruckabad buy English cloth to one who buys country; but the cultivators and the poor, who find that *garrah* lasts well, and who do not care about appearance, go to the country cloth market. An excellent *garrah* is made near Goorsuhaigunj and sold at the Terah Jakut bazars. It is nearly equal in fineness to *markin* (or English unbleached calico), and of twice the strength.

"A *pugree* of fine thread is made in the Kaimgunj Tehseel at Shumsabad. *Susie* (for women's pyjamas) of fine thread is made in the Mohumdabad Tehseel. A figured muslin, called *dodami*, used to be made five or six years ago in the Kaimgunj Tehseel, but like all native cloth, except of the coarsest kind, it vanished before the fine and cheap muslins of England."

Etawah.—Mr. H. M. Chase, Collector, says:—"The general dearness of food has affected the sale of country cloth, and the manufacturers are depressed in consequence. The price of the staple is higher than last year, the rate being during the year from Rs. 18 to Rs. 26 against Rs. 15 to Rs. 21 for the maund during the previous year.

"The local demand is so small that it must rather be the rates in the English market which have raised the price in this country than the increased use of the staple here."

Etah.—Mr. H. C. Barstow, Deputy Collector, says:—"Cleaned cotton is now selling at Rs. 19½ per maund in Kasgunj, the only considerable market of this district."

Jaloun.—Lieutenant-Colonel A. Ternan, Deputy Commissioner, says:—"Cotton is now selling at Rs. 24 per maund."

Jhansie.—Mr. G. L. Lang, Deputy Commissioner, says:—"The manufacture of native cloth has been very limited this year. Many families of Korees have altogether deserted their villages, owing to the poverty of the people and want of a market for their *ikree*, which is commonly called and sold as *kharrooa*.

"English manufactures are, however, rapidly replacing native cloths; they are cheaper and better, and Natives appreciate the fact."

Banda.—The Collector says:—"The prices of cloth, both of English and native manufacture, have declined, the latter in consequence of the fall in the former, and also as neither the khurreef nor rubbee harvests were good.

Jounpore.—Mr. W. R. Benson, Officiating Collector, says:—The price of English cloth is the same as it was at this time last year. The native manufacture of cloth has been inconsiderable, the demand for this article having decreased in consequence of the high price of grain, and a greater quantity of it having been worked up than the demand for the article required."

Mirzapore.—Mr. F. S. Wigram, Collector, says:—The price of cotton in the town of Mirzapore fluctuates in proportion to the demand in the London and Liverpool markets.

"As Natives for the most part give preference to English-manufactured cloth, the country stuff is not much in demand; the poorer classes of people only like to make use of it, as it is obtained somewhat cheaper than the other."

Dated 10th April 1869.

From—C. A. DANIELL, Esq., *Officiating Collector of Boolundshuhur,*

To—*The Secretary to the Government, North-Western Provinces.*

Offers remarks on the cotton crop for 1868-69 as an addenda to the figured statement which was submitted through the Board on the 2nd of February.

MEMORANDUM OF COTTON REPORT FOR 1868-69.

Boolundshuhur.—I am glad of this opportunity of adding the following remarks to the figured statement which was submitted on the 2nd of February.

2. In that statement the details were as follows:—

Area in acres	39,189
Out-turn in maunds	48,641

These figures show what was estimated to be the case, and although these are higher than the figures of the three preceding years, I find them to be far below the actual results.

3. I have now got my crop returns (Jinswar Statements) completed for this past khurreef, in which the following are the details of "cotton":—

Area in acres	59,969
Out-turn in maunds	9,129

I believe these figures to represent the facts of the case as correctly as can be expected from returns which are made up by so many hands.

4. These are the first returns of the sort which have been prepared in this District. The Putwarees and Kanoongoes have been well instructed in their work by myself and my Settlement Assistant, Mr. J. G. Robertson, and the papers have gone through a very careful and thorough office scrutiny. Until, therefore, I can find that any grave error has crept into these statements, I must consider the present actual returns of this cotton crop to show an area of close upon 60,000 acres and an out-turn of 79,000 maunds.

5. I have furthermore the following statement of figures to bear out my crop returns. This statement will show the comparative annual returns for the past six years with approximate sales at Khoorja, which I believe fairly represent the probable annual out-turn of cotton:—

Estimated Cotton Return.

	Area in acres.	Out-turn in maunds.	Sales at Khoorja in maunds.
1863	89,566	199,132	120,000
1864	83,627	140,656	110,000
1865	24,817	36,716	95,000
1866	22,679	31,158	90,000
1867	23,299	33,168	80,000
1868	59,969	79,129	80,000

The third column gives an approximate amount which is reported to me by seven of the chief dealers to be about the amount of sales each year.

6. It can easily be understood that the *area* for 1863 and 1864 are not too highly entered. It may, however, be possible that the *out-turn* for 1863 is too highly put down, as from the returns of other districts I think an average of two maunds one seer per acre is doubtful. The out-turn for 1864 is probably nearly correct, but I am afraid the returns for the three next years must be condemned as being very far from the truth.

7. In 1863 and 1864, the out-turn of the district, according to the returns, exceeded the sales at Khoorja.

In 1865,	the out-turn was	367,950	of	sales
„ 1866,	„	„ 312,900		„
„ 1867,	„	„ 332,800		„
„ 1868,	„	„ 791,800		„

Now I believe that the sales at Khoorja very fairly represent the out-turn of the district.

Khoorja is now the only market for cotton; and as regards the comparison between the amount of sales at Khoorja and the district out-turn, I believe that the amount of cotton grown in this district which does not reach Khoorja is made up as nearly as possible at Khoorja by the cotton which comes in from the neighbouring pergunnahs of Allygurh, Goorgaon, &c.

8. Assuming 80,000 maunds to be the district out-turn, one-fourth may be consumed in the district and one-eighth may find its way out of the district without going to Khoorja, *i. e.*, in all 30,000 maunds. It is, as far as I can learn, probable that about this average of cotton comes in to Khoorja from other districts, *i. e.*, to every 50,000 maunds of cotton of this district's growth sent to Khoorja, 25,000 to 30,000 maunds come in from outside. I write this under correction when I can secure accurate information; but whether it is a matter of 10,000 maunds more or less, the result as far as the returns for the past three years (1865-67) stands the same.

9. Believing, then, that the Khoorja sales fairly represent the district out-turn, it must, I think, be presumed that the estimates sent in for 1865, 1866, and 1867 are very far below the truth.

It is true that the sales only partially consume the cotton grown in each year, as the cotton is plucked towards the close of the year; but taking the demand or rather consumption for the three years (1865-67) to average 88,000 maunds per annum, it is very unlikely that the out-turn only averaged 84,000 maunds per annum.

10. I am at a loss how to account for the low returns of those three years, beyond the probability that the Putwarees prepared mere estimates instead of furnishing actual facts. I confess myself to have been taken aback when I saw the result of the papers of this last khurreef; but I have no reason to think that there can be any remarkable error in the present actual returns.

BOOLUNDSHUHUR; *The 10th April 1869.*

C. A. DANIELL,

TERAI SUPERINTENDENT'S OFFICE;
The 29th March 1869.

E. COLVIN.
Superintendent.

No. 994, dated 30th April 1869.

RESOLUTION—By the Govt. of the N. W. Provinces, Revenue Department.

Read a letter No. 321, dated the 30th ultimo, from the Secretary to the Board of Revenue, North-Western Provinces, submitting a statement of the area and estimated out-turn of the cotton crop in the Districts of the North-Western Provinces for the year 1868-69 as compared with 1867-68.

OBSERVATIONS.—The tabular statement of the area under cotton during the past season, and its estimated out-turn, submitted by the Board and now completed and corrected, is subjoined* to this Resolution.

* Printed with Board's letter No. 321, dated 30th March 1869, with this Proceeding.

It shows that while in 1867-68 nearly 1,300,000 acres were sown with cotton, only 890,000 acres were sown in the past season; and whereas in 1867-68, 727,026 maunds were produced, last year only 552,516 were obtained. Reduced to lbs. the produce of 1867-68 was 58,162,080, and of 1868-69, 44,201,280 lbs.; and even this estimate is probably too favorable, as in the past year there was considerable loss not only from drought, but from severe frost in December.

The crop of the former year (1867-68) was very short, there having been extensive and heavy losses in consequence of the prolonged and untimely rain, which injured the plant and destroyed the pods. In the present year, the deficiency is of course due to the directly opposite cause of the long-continued drought.

Taken by divisions, the area and estimated out-turn are as follows :—

Divisions.	1867-68. Area.	1867-68. Maunds.	1868-69. Area.	1868-69. Maunds.
Meerut	487,803	222,963	171,934	199,567
Rohilcund	143,154	99,758	126,261	68,677
Agra	312,732	261,923	260,271	161,661
Jhansie	54,497	23,747	49,387	9,550
Allahabad	253,219	87,012	256,752	96,993
Benares	23,529	6,755	19,910	5,928
Ajmere	12,792	24,868	5,868	10,140
Total ...	1,287,726	727,026	891,444	552,516

Thus in almost every Division there is a falling off from last year; and in all a very heavy falling off from the normal crop, which is shown in the margin in lbs. for the last six years.

1861-62	95,980,000
1862-63	114,000,000
1863-64	81,493,200
1864-65	132,257,280
1865-66	62,663,280
1866-67	85,684,920
1867-68	58,162,080
1868-69	44,201,280

The causes of this deficiency were various in different localities. Everywhere there was a very sufficient inducement for the cultivator to sow cotton largely, for the average price throughout the Provinces steadily rose by about one rupee every month from Rs. 17 per maund in April to Rs. 22 in September.

In the lower cotton districts, as Banda, an unusually large area was sown in consequence of the apparent early setting in of the rains; but then followed their long suspension, and it seemed as if the crop would entirely perish from the drought. Much was lost, but "the heavy showers in September restored to life the withered crops, and the out-turn (as compared with the area sown) will be more than last year." This is the case generally throughout the greater part of the Allahabad Division.

Elsewhere the setting in of the rains was so long deferred that the ordinary season for cotton sowing passed away. But nevertheless when rain fell in the latter half of July, sowings did take place, though to a less extent than in ordinary years. Then supervened the drought of August, which was broken only by occasional and partial showers, and not relieved as in the eastern districts by a general fall in September. Hence the area which was sown produced but a scant return. There is an exception to some extent in the districts of Boolundshuhur and Allygurh, where, partly from the help of the canal and partly from better seasonal conditions, the out-turn has greatly exceeded expectation.

As regards Boolundshuhur, Mr. Cairns Daniell is satisfied that his estimate is close to the truth. He has ascertained that the sales for the year in the Khoorja bazar have been about 80,000 maunds, and the sales at Khoorja represent nearly the total amount grown, for about one-fourth of the crop is consumed in the district, and about an equal quantity is imported from other districts into Khoorja. In this view the statement in the margin, which shows the sales at Khoorja from 1863 to 1868, is of interest; the quantity has gradually decreased from 120,000 maunds to 80,000.

	Maunds.
1863	120,000
1864	110,000
1865	95,000
1866	90,000
1867	80,000
1868	80,000

The growth of cotton as an article of commerce continues practically unknown in the Benares Division and in the hills.

The same causes which affected the fertility of the indigenous crop prevented the Hingunghât seed from having a fair trial. The supply of seed also reached Collectors at a very late period. There seems some doubt whether it is suited to the soil and climate of these Provinces; but Collectors should every where be enjoined to give it a full and complete trial in the coming season, carefully to watch the results, and duly to report them in their annual cotton return. A report on the subject is shortly expected from the Board.

Appended to the Board's letter are some extracts of interest relating to the price of cotton, the injurious effect of the scarcity on the cloth market, and the comparative demand for English and country manufactures. With the upper and middle classes the preference is no doubt for the English manufacture; but the lower classes, it appears, still hold to the cheap and strong country cloth. The remark of Mr. Montague, Deputy Collector of Furruckabad, is of importance in this respect:—"The coarse country cloths are (except a few special manufactures, such as fine *pugrees*) the only native fabrics which have not been beaten out of the fields by English goods,—*garrah, guzee, adhotar, and charkhana* (the latter being merely striped *garrah*) have the market to themselves, until some coarse, strong, cheap English-manufactured article may appear."

The Elgin Cotton Mills at C[illegible] find a good demand for their thread, but the Lieutenant Governor was informed on lately visiting them that there was little demand for the[illegible] if the Hingunghât staple could be successfully cultivated in the Doab and Bundelcund, it would prove a great assistance to this spirited undertaking, and the subject demands the attention of the Commissioner of Allahabad.

In future the Lieutenant Governor would wish any information of collateral interest or importance to be embodied by Collectors in their annual cotton reports. For example—

The quantity of cotton which comes into the local market from other districts or foreign territory, the probable amount of local consumption, and the balance exported. In 1862 it was estimated that, of 96,000,000 of lbs., one quarter was used in the districts which grew it; one quarter was taken for consumption in the eastern districts which grew no cotton; and one half found its way for eventual exportation by sea. The yield being less in the present year, the proportion locally consumed is probably the greater, and the proportion exported less.

The Lieutenant Governor was given to understand that a great portion of the cotton purchased by our merchants in the Agra market comes from the Rajpootana and Central India States.

Any information regarding the quality of the cotton crop of the year will be of interest, and also any particulars as to the extent to which it is screwed. Both at Agra and Cawnpore progress is being made in this direction. The number of screws and the estimated work done by them should, as far as possible, be stated. Complaints were made to His Honor at Agra by the European merchants of their liability to frauds in purchase; and it was said that a modification of the Cotton Frauds Bill would be useful if it only afforded facilities of effective prosecution. It was admitted, however, that there were great practical difficulties in fixing the blame upon the guilty parties, as the person who comes into the market is generally a middle-man who is unable to guarantee the quality of the bales throughout. The subject is one of great importance, and deserves the attention of those Collectors who have large cotton marts within their jurisdiction.

The progress of the Elgin Mills should be noticed by the Collector of Cawnpore, with any particulars bearing on the manufacture and sale both of English and native pieces and thread.

ORDERED, that copy of the foregoing be forwarded to the Secretary to the Board of Revenue, North-Western Provinces, for the information and guidance of the Board, with reference to his letter No. 321, dated 30th ultimo.

GOVERNMENT OF INDIA.

PUBLIC WORRS DEPARTMENT.

PROPOSED BRANCH RAILWAY FROM THE GREAT INDIAN PENINSULA LINE TO CHANDA AND THENCE TO SOME POINT BELOW THE 3RD BARRIER OF THE GODAVERY.

No. 29, dated 6th December 1869.

From—T. W. ARMSTRONG, ESQ., M. I. C. E., *Offg. Secy. to the Chief Commr., Central Provinces, in the P. W. Dept.*,

To—*The Secretary to the Government of India*, P. W. DEPT.

I am directed to forward, for the consideration and orders of the Government of India, a Minute by the Officiating Chief Commissioner on a branch Railway from the Great Indian Peninsula Line to Chanda, and thence on to some point below the 3rd Barrier of the Godavery, and to solicit early instructions regarding the carrying out and completion of the surveys for the line, as proposed in the last paragraph of the same.

Dated 4th December 1869.

Minute by J. H. MORRIS, ESQ., *Officiating Chief Commissioner, Central Provinces, on a Branch Railway from the Great Indian Peninsula Line to Chanda, and thence on to some point below the 3rd Barrier of the Godavery.*

The importance of this Railway has long engaged my attention, and as this line was mentioned in the recent State papers on Railway extension as one of the Great Indian Peninsula Railway branches which ought soon to be constructed, I propose in this Minute to set forth shortly the considerations which make the early commencement of the branch line desirable.

2. I will *first* describe the country through which the branch Railway will pass; *secondly*, I will advert to the special advantages to be secured by the early opening of this branch line; and *thirdly*, I will notice a few points connected with the direction, cost, and possible future extension of the Chanda Railway.

3. The section of the Great Indian Peninsula Line known as the Nagpoor extension leaves the main line at Bhosawul, a station 276 miles from Bombay. Thence it runs through the vertile valley of Berar, and onwards through the Wurdah District into Nagpoor. One hundred and ninety-four miles from Bhosawul and 49 short of Nagpoor is the station of Wurdah, the head quarters of the Wurdah District. From Wurdah a road, metalled and bridged for the most part, leads to Hingunghât, the well-known cotton mart. This road runs for 21 miles through the best cotton-growing country of these parts; and at Hingunghât are centred the cotton, piece-goods, salt, and other trades of at least 1,500 square miles of country. This tract bears a population of about 130 souls to the square mile; it grows cotton, wheat, millet, linseed, and other oilseeds and pulses. According to the trade returns of the year 1867-68, the total value of the registered trade of Hingunghât was £250,445

sterling. Last season (1868-69) there were about 24,000 bales (400 lbs. each) of cotton sent from Hingunghât to Bombay, and at Hingunghât during the cotton season are effected the largest cotton transactions in these Provinces.

4. From Hingunghât a short (metalled and bridged) branch road, 6 miles in length, leads into the southern road, which connects Chanda with Nagpoor and with the Railway stations of Sindhee and Boree. The Hingunghât branch strikes into this southern road at the village of Jam, and from Jam runs a partially metalled and bridged road straight to Chanda, a distance of 55 miles. This road skirts the great strip of broken and wooded country which forms the water-shed of the Wurdah and Wynegunga Rivers. The road runs nearly parallel to the line of the Wurdah River. Between the road and the river stretches a belt of well cultivated country, over which the staple products are cotton, wheat, and millet. The average breadth of this belt of open plain is about 6 miles, and its population is about 120 to the square mile. The only place of any commercial importance between Hingunghât and Chanda is Wurrora, where a steady, though not an increasing, trade in cotton goes on.

5. Across the Wurdah, opposite to Hingunghât and Wurrora, is situate the East Berar District of Yeotmahal (or Woon), and behind or south of Woon lies the fine cotton-producing country of Edulabad in the Nizam's territory Hingunghât is the market to which the cotton growers of Woon and Edulabad take their produce, and whence they draw their supplies of piece-goods, hardware, and other European manufactures. The river Wurdah is easily fordable for eight months of the year; and there are scores of fords by which the traffic of the country crosses into Chanda, and takes the road to Hingunghât.

6. Although the country to the north-east of the southern road is wooded and thinly peopled, still this tract contributes largely to the road traffic. The open country of Wurdah and Central Berar has no jungles near at hand, and it draws a great part of its petty timber, grass, bamboos, baskets, fuel, and other forest produce from the wooded country of Chanda. No statistics of this trade have yet been registered, but the right to collect forest dues on exported jungle produce is annually farmed out. This lease fetches from Rs. 10,000 to Rs. 12,000 per annum; the rates of duty range from four annas to one rupee per cart-load for the different kinds of forest produce. It is therefore tolerably safe to assume that from ten to fifteen thousand cart-loads of forest produce pass annually from the north-eastern corner of the Chanda District into the Wurdah country. The quarries of excellent building stones (sandstones) which exist along the southern road are as yet unworked, save by the Government departments and the villagers of the neighbourhood. Some good sandstone is, however, taken yearly to Hingunghât, and the trade will increase as the people grow richer and communications become better.

7. The present terminus of the southern road is the town of Chanda, which contains a population of neary 19,000 souls. Chanda is the head quarters of a district. It was in past years the seat of a dynasty of Gond kings, and it possesses some important industries, among which weaving and leather working are the most conspicuous. It stands at the mouth of the outlet by which the whole trade of the lower valley of the Wynegunga, of Aheree and the great forest uplands between the Wynegunga and the Indrawuttee, threads its way through a thirty-five mile belt of jungle and reaches the markets of Wurdah and Berar. According to the trade returns of 1867-68 the total commerce of the town of Chanda amounted to £304,897.

8. The whole trade of the country is, however, not done inside the towns of Chanda and Wurrora. The people of those parts are very fond of making their petty purchases for a year or six months at one of the two great fairs which are held annually at Chanda and at Bhanduk,—a place midway between Chanda and Wurrora, which enjoys a high repute on account of the sanctity and antiquity of its temples. From the statistics for 1866, I extract a few

figures illustrative of the business done at the Chanda and Bhanduk fairs. In that year 229,000 persons came to these fairs; Rs. 30,80,555 (£308,055) of goods were brought, and Rs. 20,55,843 (£205,584) of goods were sold. Nearly all of this traffic would either be brought or be taken away by any branch Railway which might be constructed between Chanda and the Great Indian Peninsula Railway.

9. It is difficult to offer any reliable statistics regarding the miscellaneous forest products of the Chanda District. All these products find their way to the open country in the west either by the southern road, or by rugged tracks through the central jungles, or by circuitous route on the northern confines of the forest. It would occupy too much space to describe at length all the staples of this important commerce, and it will suffice to extract a short paragraph from the Settlement Officer's report, in which the forest produce of Chanda is thus described:—"Forest and jungle cover three-fifths of the district, and supply in immense profusion almost every thing necessary for life. Thus they yield timber for building, furniture, implements, carts, and boats; wood for warmth and light; bamboo and grasses for thatching, fencing, matting, basket-work, and vessels; fruits, leaves, roots, and barks for food and medicine; and fibres, oils, resins, gums, tanning substances, and dyes. From the labour of the insect world of the woods, honey, wax, tussa silk and lac are obtained, and the larger animals furnish flesh and horns and skins."

10. The mineral products of Chanda and their value can best be noticed under the *second* head to which I referred, *viz.*:—

The special advantages to be gained by the early construction of the Chanda Branch Railway.

11. The first and great advantage will be the opening of the Chanda coal-field to the Great Indian Peninsula Railway and to Central and Western India. At present all the Railways, all the factories for cleaning, pressing, and spinning cotton, all the saw-mills and other industries which employ steam power, are obliged to use English coal all over Central and Western India. The price of this coal ranges from Rs. 20 and Rs. 25 a ton in Bombay to Rs. 35, Rs. 50, and even Rs. 70 a ton in Berar. In Bengal, where the use of Indian coal is almost universal, and where Indian coal does form one-half to two-thirds the duty per ton which English coal yields, the price of coal varies from Rs. 5 a ton at the pit's mouth to Rs. 12 and 14 a ton at Calcutta, or places 150 miles distant from the coal-fields. The gain in economy of Railway working, the benefit to manufactures of all kinds, would be immense, if Chanda coal could be put on the Great Indian Peninsula Line at the same rates as Bengal coal reaches the main line of the East Indian Railway. It is quite clear that Chanda coal cannot come into practical use on the Great Indian Peninsula Railway, or in the Berar and Khandeish factories unless the Chanda coal-field be connected with the Great Indian Peninsula Line by a branch Railway. It is 60 miles from the coal-field at Googoose (a village some 14 miles due west of Chanda) to Wurdah in a straight line, and the length of a road or railway might be about 65 miles between these two points. Even if a good road metalled and bridged were made between these two points, the cost of carting the coal would be at least Rs. 12 a ton; while the cost of a really good road would come to about half the cost of a branch Railway. It seems then that a branch Railway from Wurdah to Chanda or thereabouts is absolutely required, if the Chanda coal-field is to be opened out.

12. The question then naturally arises:—Is the Chanda coal worth opening out? Our present information is not sufficiently full and precise to enable me to say definitely that the Chanda coal-field is worth opening out by a special branch Railway. The position at present stands thus: Coal was discovered on the Wurdah within a few miles of Chanda by Major Lucie Smith in 1867.

Since then coal has been found at four places in a small field (containing about three square miles) at Googoose, 14 miles west of Chanda. Coal has also been found at Chanda itself, at Bullarpoor, four miles south of Chanda, at another place 30 miles down the river Wurdah, south-east from Chanda. Rocks belonging to the Indian coal-bearing series have been found, if not continuously, at intervals over some hundreds of square miles of country above and below Chanda. These rocks extend into, and coal has been found in, both Berar and the Nizam's territory across the Wurdah opposite the Chanda coal-field.

13. During the last ten months continuous and persistent effort has been made to prove or test the coal and ascertain its thickness by putting down bore holes at several points on the supposed coal-bearing area. The appliances and skilled labour required for successful boring operations were not at first available, and our borings have gone on more slowly than I could have wished. The bore holes put down at and near Chanda itself and at Bullarpoor, though not altogether favourable as far as they go, are as yet inconclusive. A bore hole was also put down on the left bank of the Pranheita about half a mile from Bullarpoor, and six and a half feet of coal were proved at a depth of some 120 feet from the surface. The bore hole was carried on through a hundred more feet of rock, and no further seams of coal were met.

14. The only portion of the coal-field which has been so far examined as to warrant our drawing any inference, is the small (three square miles) field near Googoose. In this field a pit, sunk last season in the bed of the river Wurdah, reached good workable coal 28 or 29 feet thick. A bore hole put down 330 yards away from this pit has gone through 34 feet of good workable coal. Of the two other bore holes put down in this field, one has been stopped, owing to a breakage in the machinery, after it had gone through 11 feet of fair coal; but before it had gone down through the beds where all the thick seams of coal ought to be, the other owing to a similar accident has been stopped before it reached the beds where we expect to find coal. A steam boring machine and three more sets of hand boring tools are close to, if they have not already reached, Chanda, and fresh bore holes will be put down at the points C. and D. These borings will be done, and the proving of the Googoose field will probably be complete in another four weeks' time.

15. Dr. Oldham, Superintendent of the Geological Survey, the Deputy Superintendent, Mr. Blanford, two Assistants, and the Mining Engineer, Mr. Mark Fryar, are all at this moment in the Chanda District, examining and proving the supposed coal-bearing areas. Now that efficient machinery has reached Chanda, I have no doubt that not only the Googoose field, but a considerable area of the coal-bearing rocks will be proved by the end of this open season.

16. While the existence and thickness of the coal was being proved by borings, the quality of the Googoose field has been tested in locomotives on the Great Indian Peninsula and East Indian Railways, and in a stationary engine at Kamptee. The coal was taken from the out-crop in the bed of the river Wurdah, and so was not a fair specimen of what the seam will produce. Still it did about half the duty of English coal, and about three-quarters the duty done by Raniguj coal. Dr. Oldham, Superintendent of the Geological Survey, writes that the Chanda "coal, however, did the work required of it, and in a satisfactory manner." And he adds that the different tests to which the coal has been put "prove that good useful fuel exists near Googoose in considrable quantity." Moreover, during the present month, the pit at point B. on the sketch map has reached the uppermost coal seam which is four feet thick. The coal from this seam is pronounced to be much superior to what was sent to the Railway for

trial from the river bed pit marked A. Dr. Oldham saw some of this coal stacked on the surface, and pronounced it to be "good Indian coal." A sufficient sample of this B. pit coal will shortly be sent for trial on the Great Indian Peninsula Railway.

17. Thus though our information is as yet imperfect, it may be safely said that a large supply of good useful coal exists in the Chanda coal-fields; and that the borings of the next six months will fully prove whether or no the Chanda coal-field is very large and practically inexhaustible.

18. The next advantage to be gained by the opening of the branch Railway to Chanda would be the connection of the largest cotton field in Central India (Berar only excepted) with the Great Indian Peninsula Railway. It seems quite unnecessary to dwell here on the advantages which 60 or 70 extra miles of Railway would confer upon the Indian producers; upon the English manufacturers and mill hands; and upon consumers of Hingunghât cotton all over the world. Mr. Rivett-Carnac's picturesque and yet faithful reports have set forth the difference between the carriage of unpacked cotton in clumsy bundles on little country carts along dusty roads, and the transport of clean cotton, well packed and pressed into bales in the closed waggons of a Railway line. The cotton produce of Hingunghât and the cotton-fields to its south and east will never be properly packed, nor will it reach the home market in the cleanest possible state, until pressing and packing establishments grow up in different parts of the cotton field. Such establishments will never be supplied in sufficient numbers until a Railway runs through the field. The Government of India recognised the need which the cotton traffic had for Railway facilities, when it ordered the construction of the branch Railways to Khamgaon and Oomrawuttee. It is of course difficult to set a money value upon the benefit which a Railway from Wurdah through Hingunghât to Chanda would confer upon the Wurdah River cotton field; but it is at any rate safe to predict that the construction of such a Railway would result in the cheapening of the Hingunghât cotton at Liverpool, without reducing the price which reaches the producer, and that it would be a powerful, perhaps the only effectual, means of securing the introduction of packing and cleaning machinery over the Hingunghât cotton field.

19. There is one feature about the Chanda grown cotton which makes it more particularly in need of Railway carriage. Cotton grown round Hingunghât is picked in November and December, and most of it is cleaned, pressed and put on the Railway by the following March or April. But the cotton grown south and east of Wurrora is picked in the month of April, and it rarely happens that the whole crop is cleaned and carried to the Railway before the rainy season begins. Only last season just as the rainy season began, long strings of cotton carts from Wurrora, Chanda and the Woon country were seen making their way to Hingunghât, and it appeared on enquiry that much cotton was still left behind. When once the rain falls cotton carts cannot get along the country roads, and a good deal of the Chanda spring (or "jhirree" as it is locally called) cotton crop is kept back every year, and does not reach the market till the ensuing open season. In this way the farmers lose six months' interest on their money, and the cotton is late in reaching the Lancashire looms. If a branch Railway ran to Chanda, this cotton could all be put upon the waggons, and carried off to Bombay as soon as it might be ready for export.

20. Among the many indirect advantages which the Railway would confer upon cotton growers, would be the certainty that no farmer, even if he gave up all his land to cotton, would ever be in difficulties for food so long as there were good harvests along any part of the Great Indian Peninsula Railway. I will offer just one instance of the way in which the present imperfection of our communications acts upon the price of food during the rainy season, and so compels farmers to grow food grains when their lands might be more profitably occupied in the production of cotton. The town of Wurrora is, as I have mentioned

the chief market of the country between Hingunghât and Chanda. At this place the price of millet, the staple food of the country, ranged during the whole of the rainy season from 10 to 12 seers the rupee. This price had shown scarcely any symptoms of falling even by the middle of October, although there was absolute certainty that a bumper rice crop and a full millet crop would be garnered in a few weeks' time. Prices continued to hold up because the stocks were very low, and there was no possible way of replenishing them until the cross roads had become passable. During the last week of October and first week of November several convoys of pack bullocks reached Wurrora with millet which they had brought from the nearest Railway station. The price of millet at once went down to 17 seers the rupee at Wurrora and in all the country round. This is only an instance of what may happen, and generally does happen, every year during the rainy season in the Chanda country. Where people may fall into straits like this, they are obliged to grow a certain proportion of food grains, whether it pays as well as cotton or not.

21. The advantages then which the branch Railway would bring to the cotton trade of the Wurdah valley, would be that it would take the cleaner cotton more swiftly and more safely to Europe; that it would ensure its reaching markets before the fall of the next rains, and that it would enable the farmer to grow as much cotton as he could without fear of starvation or want.

22. The next special object which the Chanda branch would subserve is the opening out of the Aheree timber forests. About 60 miles east of Chanda are the forests of Aheree, 32 square miles of which the Government Forest Department is now working. There appear to be broad forests of fine timber for many miles north of Aheree; but the two richest and best situated patches of teak and sheshum forests are being worked by the Government Forest Department. These two forests can, it appears, easily yield 4,000 first class logs per annum, besides an abundance of petty timber. Each of these logs will yield an average of 30 cubic feet, and first class timber has for some years averaged from 2¼ to 3 rupees a cubic foot in the Nagpoor market. Notwithstanding the great store of Aheree timber which is past its prime, and absolutely wants to be cut, and notwithstanding the great demand for, and the high price of, teak at Nagpoor and in Berar, still the Forest Department has hardly been able to bring a single Aheree log into the Nagpoor market during the last two years. The obstacle has been not the difficulty of working the forest, but the absolute impossibility of carrying large logs from Aheree to the Railway. In 1867 some Native carriers undertook to haul Aheree timber to Nagpoor at a very high rate. They brought some 30 logs or so, none of which contained much more than 30 cubic feet; some magnificent pieces of timber had actually to be cut into three lengths before they could be got along at all! Since 1868 no contractors have come forward, and the Aheree forests are at present virtually closed to the Nagpoor markets.

23. The Inspector General of Forests in a recent note on the Aheree forest question, recorded his opinion that a tramway or a good road would have to be made from Aheree to the Railway, before the Aheree timber could come into the market. Aheree is 60 miles beyond Chanda, and the Aheree timber trade alone would not suffice to support a branch Railway between Chanda and Aheree. Still this timber trade would benefit enormously, if it found the Railway at Chanda instead of at Wurdah; and the Aheree timber route, whether by river, or by road, or by a light tramway, would be a very valuable feeder to the Chanda Branch Railway. When the Aheree forests are really opened, a net annual revenue of nearly one lakh of rupees will accrue to the Forest Department; a good and sure supply of fairly cheap timber will be assured to the woodless countries of Nagpoor and Berar, and a market will be opened for the products of the Aheree and Bustar forests.

24. *Fourthly.*—The Chanda Railway would, if produced 60 miles to Dewulmurree, or some other place close to the Aheree Government forests,

connect the Godavery river navigation with Western India. Dewulmurree and Moogeylee are at the foot of the 3rd (the highest and the most insuperable) Barrier of the Godavery. After an outlay of about 60 lakhs (£600,000), and after more than ten years of designing, estimating, working and writing, and after the expenditure of several valuable lives, the Godavery will probably, in the course of two or three years, be in some shape navigable from the sea to the foot of the 3rd Barrier. The navigation will indeed be far from perfect, and it will be practicable for only seven or eight months of the year. But still the river will in some sort be open, and the navigation will be improvable. But when the Godavery navigation reaches Dewulmurree, the scheme will still be quite incomplete. The navigable head of the river will still be 60 miles from the nearest town, 60 miles from the nearest stretch of cultivated British territory, and 130 miles from the Railway, or from the fertile cotton fields of the Wurdah and Poornah valleys.

25. It is quite clear that the Godavery navigation scheme, if it is to take effect at all, can never stop at Dewulmurree. The trade between the sea and the foot of the 3rd Barrier could not pay the cost of maintaining the navigation, much less meet the cost of interest on the capital outlay. The problem will then be, what is the best mode of connecting Dewulmurree with the Railway system of Western India and with the countries whence the Godavery must draw its trade? The Godavery officers advocate a canal across the chord of the arc of the river where the 3rd Barrier occurs, and they contemplate the canalisation of the Wurdah and Wynegunga above the 3rd Barrier. No precise designs and estimates have yet been submitted for the works at the 3rd Barrier. The canalisation of the Wynegunga has been pronounced impossible, save at an enormous expense: that of the Wurdah as far as Hingunghât would probably cost much less, and the Wurdah might perhaps be made navigable on to Poolgaon (where there is a Great Indian Peninsula Railway station) at a fairly moderate outlay. Although no precise estimate has yet been framed of the expense of the 3rd Barrier works, yet it was stated some years ago on the best authority that they would cost about 30 lakhs (£300,000). During the last year or so 50 lakhs (£500,000) have been taken as the sum to which the 3rd Barrier works' estimates would probably reach. Considering how the Godavery estimates have grown as the work went on, we should probably be quite safe in taking 75 lakhs (£750,000) as the ultimate cost of the 3rd Barrier works and the canalisation of the Wurdah. Now the distance from Chanda, in a direct line to Moogeylee (a place situated on the right bank of the Pranheita, just opposite Dewulmurree) at the foot of the 3rd Barrier, is about 50 miles. Probably a Railway between these points would be 60 miles long: the line would cross the Pranheita at or near Kirmirree on the rocks which form the head of the 3rd Barrier. Sixty miles of Railway at £7,000 a mile would cost 42 lakhs (£420,000). And a Railway from Wurdah on the Great Indian Peninsula Railway *viâ* Hingunghât and Chanda to Moogeylee, would connect the two lower reaches of the Godavery with the cotton lands of Central and Western India; it would give means of transit all the year round, instead of for only seven months, and it would secure to the public treasury and to the people of Berar and Nagpoor the valuable timber of the Aheree forests.

26. It seems unnecessary to speculate here on what the Godavery trade will be. A full exposition of the sources from which this trade will come has been set forth in Sir R. Temple's Godavery Minute and in other papers. But it may suffice to state that the Godavery scheme and its huge outlay will be quite unfruitful of results, if the navigation stops at the foot of the 3rd Barrier, and if the river is not by some means linked in with the Great Indian Peninsula Railway system. Of the two schemes for bridging the gap between the railway and the river, the plan of a Railway from Chanda to Moogeylee would be the more secure, the more effective, the more speedily executed, and the more economical.

27. I have now enumerated the four special objects which will be gained by a branch Railway from the Great Indian Peninsula Line to a point below the 3rd Barrier of the Godavery. They are briefly—

1.—The opening up of the Chanda coal-field.

2.—The opening out of the Hingunghât cotton country.

3.—The utilisation of the great timber forest of Aheree.

4.—The completion of the Godavery scheme, and the connection of the Godavery navigation with Central and Western India.

28. But there are a number of other incidental advantages which would flow from the establishment of the Railway. When the coal-field shall be opened and regularly worked, the rich iron ores of Chanda would before long be smelted at foundries near the coal-field. Then again the coal will be carried to the Gadavery, used in its steamers, and carried to the coast, and thence on to Madras and Southern India in exchange for salt and rice. Then again the Hyderabad and Madras lines of Railway may some day be linked with the Central Indian. If such were the case—and the day when we shall see this is not, I trust, very distant—then the Chanda coal would compete at an advantage with English coal on the Hyderabad and Southern Indian lines of Railway. Possibilities and probabilities such as these do not of course deserve much weight, when the expediency of commencing the Chanda branch line is being considered, but the existence of such possibilities merits incidental mention in a note of this kind.

29. I will now advert briefly to a few points connected with the direction, the gauge, and the possible cost and earnings of the Chanda branch line.

30. It has been proposed that the Chanda Railway should start from the Boree Station (18 miles west of the Nagpoor terminus), and take the same line as the southern road. But the preferable route seems to be for the branch line to leave the main line at Wurdah, and thence to make for Hingunghât. From Hingunghât, where the Wunna River would be crossed at such point as the surveys might dictate, the Railway should take the best line for Kanbarra, crossing the Pothru Nuddee at some place where the foundations might be favourable. From Kanbarra it would naturally take a direction very nearly, if not quite the same, as the southern road. If the Googoose field turns out to be the main coal-field, then the line would go either from Wurrora to Googoose, or *viâ* Bhanduk and Goorpete to Googoose. If the branch Railway is carried on to Chanda and Moogeylee, then there would, supposing Googoose to be the main coal-field, have to be either a branch from Goorpete to Googoose, or the line would go from Wurrora round *viâ* Googoose to Chanda. The total distance from Wurdah to Chanda, including a branch nine miles long to Googoose, would be something less than 80 miles. If the branch to Googoose were not undertaken, or if the line were taken to Googoose only and not to Chanda, the total length would be less than 70 miles, and the gradients throughout the whole distance would be exceedingly easy. Until the completion of the surveys, the exact direction of this Railway must remain more or less conjectural, nor is it possible at present to make any reliable estimate of the bridge work necessary on the line. But I think it would be safe to say there are only five streams between Wurdah and Chanda which would require more than 60 feet of waterway. The only really considerable bridge out of the five would be the viaduct over the Eraee in the neighbourhood of Chanda. There would be scarcely any outlay for taking up land; the roadway of the Hingunghât and the southern road would be available for rails for a considerable portion of the whole distance; and sleepers of excellent teak could be delivered from the Aheree forests at an average cost of about 1 rupee to 1¼ rupee per cubic foot. Throughout the whole length of the line excellent building stone is very abundant close at hand; and lime also is at most points easily collected. Any estimate for such a line must, of course, be more or less conjectural; but it seems to me that a State Railway with light rails, but of the full Indian gauge, could be constructed from Wurdah to Chanda at a cost of not more than £5,000 a mile, including rolling-stock.

31. As this Minute discusses the extension of the Chanda Railway to Moogeylee, at the foot of the 3rd Barrier of the Godavery, that portion of the proposed line must not be left unnoticed. The country through which this line would have to pass is crossed by no metalled road, and comparatively little information exists regarding its gradients and its drainage. Still the Civil Officers and the Godavery Engineers have repeatedly been over the ground, and the following information regarding the distances may be relied on:—

Chanda to Kirmirree	...	...	... 34 *miles.*
Kirmirree to *Moogeylee*	...	...	... 23 „

The drainage to be crossed would be greater than in the case of the other section of the line; the Pranheita bridge, though the foundations would stand on the solid gneiss dyke which forms the river barrier, would be a heavy work; population is more scanty and labour would be dearer along this length, and I would therefore put down the cost of this section of the line at not less than £7,000 per mile.

32. The total cost of the line from Wurdah *viâ* Hingunghat and the Chanda coal-field to the navigable reaches of the Godavery would thus be—

	£
Wurdah to Chanda with branch to Googoose, 80 miles at £5,000 per mile	400,000
Chanda to Moogeylee with bridge over Pranheita, 57 miles at £7,000 per mile	399,000
or about £800,000 in all.	

This total, it will be observed, is very little more than would be required to construct the navigation works at the 3rd Barrier of the Godavery, and to canalise the Wurdah up to Poolgaon.

33. Now if the branch Railway were completed at the above cost, then it would require £80,000 of gross earnings to cover working charges, and pay 5 per cent. on the capital outlay. Any estimate of what the traffic may hereafter reach must of course be somewhat conjectural; but it may be pretty safe to assume that in any one year 10,000 bales of cotton would want to be carried 50 miles to Hingunghât; 5,000 more bales would go 120 to Moogeylee for the supply of Calcutta and the East Coast; 30,000 tons of coal would want to be carried 70 miles to the Great Indian Peninsula Railway; 10,000 tons of coal would go 80 miles to the Godavery navigation; 4,000 tons (4,000 logs averaging a ton each) of Aheree timber would want to be carried 120 miles from Moogeylee to Wurdah; 20,000 tons of miscellaneous goods, such as forest produce, piece-goods, country cloth, hardware, salt, grain, cocoanuts, hides, &c., would have to be carried 120 miles. The above estimates must, I think, be regarded as low, when the resources of the tract are considered. The money out-turn of such a traffic would probably stand thus:—

		Rupees.
Cotton receipts at 3 annas per ton per mile	...	41,250
Coal „ at ¾ anna „ „	...	1,36,000
Timber „ at 1 anna „ „	...	30,000
Miscellaneous at 2 annas „ „	...	3,00,000
Total	...	5,07,250

This would give 5 lakhs (£50,000) out of the desired 8 lakhs (£80,000), without taking credit for any passenger traffic, or for any fresh trade between the Godavery River and the Great Indian Peninsula Railway. There would certainly be more coaching earnings, and there can be no doubt whatever but that a very considerable traffic would arise between the East Coast and Central India as soon as the Godavery navigation and its connection with the Great Indian Peninsula Railway system are completed. I offer a low estimate of the Chanda Railway trade in coal and cotton and miscellaneous goods, becaus-

it seems best always to under-estimate than to over-estimate the anticipated receipts in a proposal of this kind. But if the Chanda coal should ever come into use on any part of the Great Indian Peninsula Railway beyond Bhosawul, or on the Hyderabad and Southern India lines, or on any other line (as for instance a Chuteesgurh line), the coal traffic would increase indefinitely. And it has often been stated in papers on the Godavery that the trade between the East Coast and Central India is certain to expand enormously.

34. I have in the foregoing paragraphs taken for granted that the Chanda Branch Railway should be of the same gauge as the Great Indian Peninsula main line. I have done this because I understand that a branch, which is to bring coal on to the main line, ought never to break gauge. Breaking gauge would, it is acknowledged, involve the shifting of every ton of coal from one truck into another at Wurdah, and it would also involve a good deal of breakage and wastage. I am unwilling to pronounce an opinion on this question of breaking gauge, for I have no access to any reliable estimates of the saving which a reduction of gauge would secure; but it strikes me that any mechanical difficulty in shifting the coal once at Wurdah from the narrow gauge trucks into the main line trucks should not be insurmountable; and if the Chanda coal is worth anything, and I believe it to be good sound coal, it ought to bear shifting once at Wurdah, without involving very great loss by wastage and breakage. The question of the gauges has doubtless been under the consideration of the Government of India. I confess that I am myself greatly in favour of cheap Railways, with a narrow gauge or light rails, for this country; and if it should be deemed desirable to try a narrow gauge branch Railway in any part of India, then it would seem that the Chanda Railway might not be unsuited for such an experiment. For there is not I fear much probability that the eastern terminus of this branch Railway will be linked, at any very early date, into the Madras and Hyderabad Railway system.

35. In conclusion I would say that from time to time further information shall be promptly submitted to Government regarding the progress of the coal borings and coal testings. Fresh facts are being discovered every day; while this paper was being written, more coal indications have been brought to light, and it is more than probable that by the time this Minute has reached the Government, Dr. Oldham will be in a position to pronounce favourably regarding the quantity of the coal in the Chanda field. Meanwhile I solicit that the Supreme Government be pleased to allow us to take advantage of the present open season, and complete the surveys for the line as far as Chanda and Googoose, if not to the foot of the 3rd Barrier. The Officers required for the work could be spared without difficulty from some of the divisions where work is at present slack, and the surveys could be finished this season without asking the Government for a single extra Officer, and without costing more than Rs. 5,000 or Rs. 6,000 for contingencies. In this way the surveys and the estimates could be submitted to Government during next rains, as soon as full information regarding the coal-field and its capabilities are available.

No. 8 R, dated 3rd January 1870.

From—COLONEL R. STRACHEY, R. E., *Offg. Secy. to the Govt. of India*, P. W. DEPT.,

To—*The Chief Commissioner of the Central Provinces.*

I am directed to acknowledge the receipt of your Officiating Secretary's No. 29, dated 6th December 1869, submitting a Minute by yourself, proposing to undertake the survey of a line of Railway from the Great Indian Peninsula Railway to Chanda, and thence to some point on the Godavery below the 3rd Barrier; the construction of such a line being advocated in the special interests of the coal of Chanda, the cotton of Hingunghât, and the forests of Aheree, as well as with a view to the connection of the Godavery navigation with Central and Western India.

2. The importance of these several objects is fully recognized by the Government of India, and although the available information as to the extent of the Chanda coal-fields, and their probable yield, is still imperfect, there appears to be good ground for the expectation that the construction of a cheap Railway in this direction, at least as far as the coal-fields, will be justified. The Governor General in Council is therefore pleased to sanction the employment of the Officers whose services are stated to be available, for surveying and investigating this project, and drawing up an estimate of the probable cost of carrying it out. The first object of the survey should be a line of Railway as far as the coal-fields, but if the time will admit of it, and you have Officers available, the Governor General in Council will not object to your extending the surveys as far as the 3rd Barrier of the Godavery.

3. The information which is at present before the Government of India is not sufficiently complete to enable the course of the line to be indicated with any precision, but it is evident that Hingunghât, as a great cotton mart, and the chief collieries of the Chanda District, are obligatory points. And since Hingunghât is to be on the line, the map shows that Wurdah, as recommended by you, should probably be the point of junction with the Great Indian Peninsula Railway, in order that the cotton may have as direct a route to Bombay as is consistent with keeping down to the lowest the total mileage of new Railway to be constructed.

4. The precise point where the coal-field should be entered cannot be named, until more certain knowledge has been attained of the extent and locality of the coal measures of the district. If the coal found near the town of Chanda is sufficient in quality and quantity to meet all demands on it, the line might go there: if Googoose is the more favourable locality for coal working, the line should go to this place. Again, if works at the three sites where coal has been found, *viz.*, Chanda, Googoose and Bullarpoor, are likely to find simultaneous employment, it will become matter for consideration how the main line should be carried so as to serve all the localities in the most convenient manner, and whether branches would be needed or not. Possibly the coal from the Googoose pits might be brought down the river to Bullarpoor, if an extension of the line to that place was desirable.

5. Beyond the coal-fields the main object of the line would be to give a connection with the navigable portion of the Godavery, and thus open out a route for the export of coal and the produce of the Central Provinces, to the sea and to the Madras Presidency.

6. The possibility of an eventual junction with Hyderabad should be also kept in view in considering the general direction of the line near Chanda. When the line from the Great Indian Peninsula Railway to Hyderabad is constructed, a junction from Chanda to Hyderabad would give the means of distributing coal all over the southern part of the Deccan and the northern portion of the Madras lines, a matter of the greatest economical importance. Such a junction, if crossing the Pranheita River near Chanda, might, it is believed, be carried through some of the best cotton districts in the Nizam's territories, and from it the communication to the Godavery might, perhaps, be made on the right bank of the river. These points call for careful consideration.

7. In any event, it may be concluded that Wurdah, Hingunghât, and the neighbourhood of Chanda will be on the line. Between Wurdah and Hingunghât there exists a road 21 miles long, and for the most part bridged and metalled. A line drawn south-east from Hingunghât strikes at a distance of 12 miles the southern road to Chanda, which is partially metalled and bridged. If then the levels and curves of these roads can be adapted to any suitable kind of Railway, and if they possess sufficient width for a single cart-way, and a single Railway track, the expense of the embankment, of the land, and possibly of some of the bridges will be saved. Nor is this the only advantage to be gained by utilising the road, for all materials can be carted to

the works at less cost, and existing branch roads will act as feeders to the Railway, while such commerce as the construction of the present road has created in the villages in its neighbourhood, will form the nucleus of an expanding trade. So far, therefore, as present information extends, there seems ground for enquiry whether the line of the road should not be followed where practicable.

8. It is possible that this condition might necessitate the adoption of a narrow gauge, and it is almost certain that the bridges would, if utilised, not bear the weight of a broad gauge locomotive. Considering the absolute necessity for economy of first cost in the construction of Railways by the State, the question of the gauge cannot be finally decided without reference to the comparative cost of different gauges. But it is so certain that the economy in the use of a gauge of say 3 feet 6 inches over that of the Great Indian Peninsula Railway will be very great, that the Governor General in Council has little doubt of its superiority in this case, whether the width and circumstances of the existing road render such a limit necessary or not. The line, therefore, where it deviates from the road, might be located with sharp curves, and the whole designed for a 3 feet 6 inches gauge, but an alternative estimate for a 5 feet 6 inches gauge Railway for low speed on the same location should be also framed. In the estimate for the narrow gauge, the special arrangements proposed for the transfer of coal and other goods at Wurdah should be included, and their details explained. On this subject the Governor General in Council will only further remark that the cost of shifting goods at a junction is an absolute amount which may be determined for each article, and balanced against the saving which might result from the use of a narrow instead of a broad gauge for a given number of miles, and that mechanical means can be adopted for reducing the cost of transhipment of any particular kind of traffic to a minimum.

9. It may be added that the coal traffic on the Great Indian Peninsula Railway will probably be mainly to supply the wants of the eastern portions of the Great Indian Peninsula system of lines, and can hardly develop into a very large business. The main demand on the Chanda coal will, so far as an opinion can now be formed, eventually be for the Railways of the central and southern portions of the Deccan and Madras, and attention should from the outset be given to this feature of the question.

10. It should be impressed on the Officers entrusted with the investigation of this scheme, that the greatest economy must be studied in designing this Railway for the special wants that it is desired to supply. The expected traffic is not a highly organized one, comprising passengers of many grades in society, but that of a few staple articles of produce requiring little special accommodation, and the principles embodied in the general instructions* to Officers employed in drawing up projects for State Railways are entirely applicable to this line. The road and sub-way must be good and substantial, while all elaborate buildings and expensive works may be postponed until the development of the country and of its trade has made their construction desirable.

* See Memo. appended.

ALLAHABAD;
The 21st December 1869.

PAPER BY MR. MEADOWS RENDEL ON STEAM FERRIES.

If a fixed bridge over the Hooghly is not to be constructed on account of its cost, and the question for the best substitute for it is brought under discussion, a good system of ferries will deserve consideration, beside the other proposition, which has met with favor in India, of a floating pontoon bridge.

For the purposes of their present ferry, the East Indian Railway Company has lately completed, at a cost of upwards of £ 70,000, the erection of two large pontoons, 350 feet long and from 60 to 80 feet broad,—the one at Howrah in front of their station, the other at Armenian Ghaut on the Calcutta side. These pontoons have comparatively deep water alongside them at low water, and the distance between them is a bare quarter of a mile.

For the last fifteen years, the Company has worked a steam ferry boat between the sloping jetties which these pontoons have replaced, but the jetties were of so inconvenient a nature, and the steam boat plied at such long intervals, that practically the ferry was useless, except to persons going to meet or coming from trains, and indeed such were the delays of this steamer that very many of even these persons,—myself frequently among the number,—crossed in the native row boats, or on a native steamer which ran in competition with the Company's boat and beat it.

The jetties being removed, I believe that the present Railway ferry may be made on the whole more satisfactory than a pontoon bridge, at a fourth part of its cost, and free from all its risks and interference with the river.

For passengers nothing can be better than the present boats, if only like the Liverpool boats they would run from bank to bank as quickly as they could, making the double run in say 15 minutes as they might easily do; and I do not think foot-passengers would care to exchange such a conveyance for a walk over a pontoon bridge exposed to the sun and rain.

But the present boats are quite unfit for wheeled carriages and animals, though they do occasionally carry them, the decks being encumbered with deck-houses, paddle-boxes and hatchways.

For such traffic new boats are required of a different build; suitable boats might be placed on the river for a sum certainly not exceeding £15,000 each. They should have great breadth of unencumbered deck, and be divided transversely by barriers into a series of pens to receive carriages and horses.

Steam-boats cross the River Hooghly in a course which forms the figure of the letter S, starting and bringing up with their heads against stream. Carriages would, therefore, always arrive with the horses' heads in the right position for disembarking.

The ends of the boats and perhaps, as in the present boats, an upper deck might be set apart for passengers.

There are occasional fogs on the river, but I satisfied myself, when in Calcutta, that they need be no serious inconvenience if proper lights were provided.

I am therefore of opinion that if such boats as I describe were supplied, the pontoons being also partially roofed and provided with seats, &c., a ferry would be as good a substitute for a fixed bridge as a pontoon bridge, and a much cheaper one. Indeed, I am sure it would be preferred by the native passengers, the mass of whom go of course on foot, because they would be saved a walk, and would be under shelter during the transit.

There is another system of ferry which might be adopted. It requires, however, the use of chains laid along the bed of the river which might be said to be inconvenient to vessels dropping up and down the river, as they do, dragging their anchors, though this does not seem a real objection. I mean the so-called "floating bridges" introduced by the late Mr. Rendel, 40 years ago, and still in use across Portsmouth and Saltash, the Ftchen at Southampton, and on the Clyde.

These bridges, which are merely pontoons, hauling themselves by steam power across the stream on chains, and, therefore, not subject to the influence of the tide, receive and discharge carriage and cart traffic with the greatest ease, by means of flaps or bridges hinged to each end, and but for the introduction of railways they would have been brought very largely into use.

The cost of a new boat of this class of very large dimensions lately supplied to Portsmouth was about £11,000. The working expenses of this ferry are about £2,200 a year, exclusive of Directors' fees, and the revenue is now approaching £6,000 a year. It is freely used for carriage and horse traffic of all kinds, and I never heard of difficulty in regard to it.

I have no doubt that two of these boats could be set to work between the Company's pontoons or anywhere in Calcutta for the sum of £40,000, and that their working expenses would not exceed £3,000 a year. The lowness of their working expenses is due to their requiring very little skilled labor, and that of the cheapest kind, for their management, and to the power they consume being of a more economical description than an ordinary steam boat. A single European in each boat would be enough for India. I should state that two of these boats were sent out to Calcutta some 30 years ago, but from a series of fatalities they were never put together. I should have proposed them some years ago to the Railway Company, but for a fear that the chains laid along the bed of the river would sink. I now believe this to be improbable. The only risk would be during the rains when the boats would probably require to be worked occasionally at night to lift the chains, or to be hooked and suspended at say two points to small boats.

However, on the whole, I believe that a suitable boat of the ordinary kind would in this case suffice, and I am quite certain that one such boat running at short intervals between the existing pontoons, with a second boat in reserve for accidents, would, on the whole, be more satisfactory to the traffic, would certainly be cheaper both to work and maintain, and would be free not only from the risks to which a pontoon bridge must be exposed, but from the inconvenience to the river traffic generally, which that kind of bridge must occasion.

The 9th October 1869. A. M. RENDEL.

REPORT ON RECENT INSPECTION OF THE UNOPEN PORTION OF THE GREAT INDIAN PENINSULA RAILWAY TO JUBBULPOOR.

No. 2336, dated 20th December, 1869.

From—The Secretary to the Government of Bombay, Railway Dept.,

To—The Secretary to the Government of India, P. W. DEPT.

In continuation of my letter No. 1891, dated 5th October 1869, I am directed to forward copy of a report by the Consulting Engineer on his recent inspection of the unopen portion of the Great Indian Peninsula Railway to Jubbulpoor, and to state that the portion of the Railway from Jubbulpoor to Gurrawara is not likely to be in a fit state to open for traffic much before the date fixed for the through opening from Bombay. A large number of sleepers have to be put in, and a considerable quantity of ballast must be spread before the line can be pronounced safe for passenger traffic.

The sleepers have all been procured, but have to be conveyed where they are wanted, and some girder tops have also to be fixed. An engine is runni[illegible]

through to Gurrawara now with materials for the line west of that place, but this engine will have to be stopped soon to permit of the bridges being completed.

No. 3578, dated 15th December, 1869.

From—LIEUT. COLONEL J. S. TREVOR, R. E., *Consg. Engr. to the Govt. of Bombay,*

To—The Secretary to the Government of Bombay, Railway Dept.

I have the honor to report that, in company with the Agent, Traffic Manager, and Chief Engineer of the Great Indian Peninsula Railway, I have just completed an inspection of the unopen portion of the Great Indian Peninsula Railway between Bheer and Jubbulpoor.

2. The line from Bhosawul to Jubbulpoor, distance of 339 miles, was originally let out in three contracts. The first from Bhosawul to Hurda, 138 miles 50 chains, was let to Messrs. Wythes and Company in 1861. The first 98 miles of this contract have been open for some time for traffic; on the remaining 40 miles, a bridge across the Kalee Machun River, a small bridge of three spans of 60 feet, a bridge across the Bringee River, two small bridges at Palusnair, and two others at Moodgul, remain to be completed.

3. The Kalee Machun is a bridge of 5 spans of 100 feet each. The masonry is well advanced, the piers are to be completed with cylindrical iron tops purchased from the Sindh Railway Company, and the girders are to be the old girders sent out for the Chinnee Creek Bridge at Kurrachee. These girders are different to those in use on the Great Indian Peninsula Railway. They require to be laid for a double line, and the pieces are not interchangeable. Considerable difficulty has arisen from the intermixture of the several parts and from the obliteration of marks. The difficulties have now been nearly overcome, but the bridge will not be completed before 1st June 1870. A diversion has been laid in, over which trains can work at low speed till the bridge is finished. This diversion is now ready and in use.

4. The small bridge beyond the Kalee Machun has had a diversion laid alongside of it through the river bed, and traffic can be carried on without interruption. The bridge can, however, easily be completed by 1st March 1870. The bridge of 4 spans of 30 feet at Beringher may be said to be finished, and as also may the three bridges consisting of 15-feet girders at Palusnair; only a little wood-work was required at these bridges to complete them when I passed over.

5. A diversion has been laid in alongside the two bridges each of 30-feet span at Moodgul. These bridges have their foundations laid, and can be completed as soon as stone is available from the other works.

6. Sleepers are required for relaying the road from the Buringhee to the Machuk River, a distance of about four miles. The sleepers in the other portions of the line are in fair order. Ballasting with broken stone is in progress, and the stations are well advanced, the buildings at Hursode, Kukraun and Mandwa being finished; but the water arrangements are still defective.

7. Engines will run through to Hurda by the 1st of January 1870 at latest, and the line will be ready for passenger traffic by 1st March 1870 with only one diversion at the Kalee Machun River.

8. The second contract, a length of 82 miles, was let to Messrs. Hood, Winter and Mills in 1861. With the exception of the Towa River, and a few sleepers north of that stream, the line is complete. But one bridge at Sewnee has been condemned, and is being rebuilt at the expense of the contractors. A diversion is laid in at this place, and engines and trains can pass over it with safety. The new bridge will be completed by 1st June 1870. Another bridge at Hurda, about which there was doubt, has been opened out. The work under ground has been found not to be as well put together as it ought to have been, but as the upper work is good, it has been decided not to rebuild the bridge, but to strengthen the parts below ground by short piling and concrete filling round the masonry. The masonry for the bridge over the Towa, 4 spans of 202 feet and 2 spans of 132 feet, has been complete for some time, and three of the larger spans were put in place before last monsoon. The other three spans will be in place by the 15th of January 1870, and trains will run through to Sohagpoor by the 1st of February 1870 at latest. Up to the Towa River, engines can run as soon as they can reach Hurda, but the sleepers along the whole of Messrs. Hood, Winter and Mills' contract are very bad, and extensive renewals are necessary before the line can be safely opened for passenger traffic. These renewals will, however, easily be effected to an extent sufficient to ensure safety by 1st March 1870.

9. The third contract, 119 miles in length, extended to Jubbulpoor, and was let to Messrs. Norris and Weller in 1861. These gentlemen were relieved from the work some time back, and the works are carried on partly departmentally and partly by small contractors. A great deal of work still remains to be completed on this length. The most backward section is the first 20 miles to Bunkerry Station. On this length there are incomplete at present three viaducts, the Machyee, Rampore and Bunkerry; one bridge of 2 spans of 60 feet, two bridges of 100-feet span each, four bridges of from 15 to 20-feet span, and six of about 10-feet span.

10. The Machyee viaduct, two spans of 78 feet each, is the most backward work on the section; one abutment is about 10 feet above ground line. At the other the wells are in, but no masonry has yet been put over them. At the pier work is just commenced. The girders are on the ground; great exertions must be made to get this bridge complete by 1st March 1870. There is a diversion alongside, but this diversion is not fit for passenger traffic.

11. The masonry of the Rampore viaduct of 5 spans of 60 feet is well advanced, only one pier and one abutment not being complete. The girders are on the ground, and are being put together.

12. The Bunkerry viaduct of 8 spans of 30 feet each is nearly ready for girders, there being only one abutment not complete; six pairs of girders of this bridge are not on the ground, but are lying some 40 miles on the Jubbulpoor side.

13. The masonry of the bridge of 2 spans of 60 feet, and also of the two bridges of 100-feet span each, is complete. The girder for the former are ready to hoist, but for the two latter, pieces are still deficient, and the same difficulty has arisen as at the Kalee Machun. The pieces, however, I was given to understand, have now been all found, and the work will be pushed on rapidly in future.

14. The smaller bridges and culverts are in different stages of progress, but no delay in opening need be apprehended on their account; rails are laid over the whole diversion, but the sleepers are bad as a rule, and the ballast deficient.

15. Between Bunkerry and Gurrawara, a distance of 19 miles, the unfinished works are, a bridge of 100-feet span, two bridges one of 30 and the other of 2-spans of 34 feet each, and six culverts and drains of less than 10-feet openings. The masonry, except in the case of two or three of the smaller openings, is complete. But there are no girders on the ground except for the 100-feet opening, and all the pieces of this have not yet been collected, as it is one of the Chinnee Creek girders. Sleepers are required for the last eight miles to Gurrawara, and a considerable quantity of ballast has yet to be spread, but the rails are laid, and there is no doubt of the line being fit for passenger traffic by 1st March 1870.

16. The Sukkur Bridge at Gurrawara of 4-spans of 150 each is being pushed on with remarkable vigor; the abutments and one pier are complete,

one other pier will be finished by the middle of January, and the last by the beginning of February. The girders are on the ground, and are now about to be put together. There is much to be done, but the energy that is being displayed in this neighbourhood will, I believe, ensure the completion of the bridge by the time appointed for the opening.

17. Engines can run in from Gurrawara to Jubbulpore, a distance of 79 miles, but there are several bridges to complete. The masonry of all these but the Baloo Rewa, and a few small 10-feet openings, is finished. But the iron girders are not put over the openings. These girders are now nearly all on the ground, and the bridges as well as the small culverts will soon be completed. At the Baloo Rewa a diversion has been laid in, and over this the traffic will have to be conducted till the bridge can be completed. It consisted of one span of 132 feet, and this portion of the bridge is complete. But the waterway was considered insufficient, and Mr. Brereton recommended the addition of a span of 78 feet on each side of the 132-feet opening. The design he submitted was not sanctioned on account of the heavy expense and delay its adoption would occasion, and a suggestion was made for obtaining the additional waterway by means of screw piles. Unfortunately, before the orders of Government could reach him, Mr. Brereton had dug out the foundations and cleared the river bed for a bridge on his own design. The work done rendered it impossible to carry out the suggestion of Government without filling up again a great part of the river bed that had been dug out. Under these circumstances, it has become necessary to allow the work to proceed as first proposed by Mr. Brereton. The necessity is much to be regretted, both on the ground of the increased expenditure that has had to be incurred, and also on account of the line having to be opened with a diversion at this point. But Mr. Brereton acted solely with a desire to push the work on as fast as possible.

18. Ballast is required all along the line from Gurrawara to Jubbulpoor, and a large proportion of the sleepers will have to be renewed. The station buildings are well advanced and the fences are being erected.

19. The joint station at Jubbulpoor is to be built by the East Indian Railway Company. The running engine-shed and the houses for the drivers, &c., are in progress.

SECOND SUPPLEMENT TO

The Gazette of India.

CALCUTTA, SATURDAY, JANUARY 15, 1870.

GOVERNMENT OF INDIA.

FOREIGN DEPARTMENT.

THE PUNJAB TENANCY ACT.

No. 20 R, dated 14th January 1870.

From—C. U. AITCHISON, ESQ., *Offg. Secy. to the Govt. of India*, FOREIGN DEPT.,

To—*The Secretary to the Government of the Punjab.*

With reference to your letter to the Secretary to Government in the Home Department, No. 616, dated 29th April 1869, with which you submitted a memorial from certain of the chiefs and landholders of the Punjab, regarding Act XXVIII of 1868 (The Punjab Tenancy Act), and a memorandum thereon by the Hon'ble the Lieutenant Governor, I am directed to forward, for the information of His Honor, the enclosed copy of a despatch from the Secretary of State, dated 28th October, No. 80.

2. The Lieutenant Governor will perceive that, after a very careful consideration of the provisions of the Act, and all the information collected during the protracted discussions which preceded its enactment, as well as of the memorial above referred to, the Secretary of State in Council has determined that the Act should not be disallowed. It is the wish of Her Majesty's Government, however, that the operation of the Act should be most carefully watched, and that cheap and ample means should be provided by which all classes whose rights in the land may be affected, may, if dissatisfied, prove by a regular suit that those rights are more correctly recorded in the revised settlement than in first.

3. I am therefore to draw the attention of the Lieutenant Governor to the general review of the Act contained in the Secretary of State's despatch, and more particularly to paragraphs 25, 26, and 27 thereof, and to request that His Honor will inform the Viceroy and Governor General in Council whether, in his opinion, any further measures are necessary to provide every possible facility to all classes, whose rights are affected, to prove in a regular suit cheaply and easily any errors which the first settlement may have involved.

4. His Excellency in Council further desires that His Honor the Lieutenant Governor will carefully watch the effect of the Act on the rights and interests of individuals, and will from time to time bring to the notice of the Government of India any symptoms, either of public satisfaction or of dis-

content with its operation which may come under notice, and will report, if necessary, after experience of its working, whether, in the opinion of His Honor, any of the provisions of the Act will require to be revised and amended.

REVENUE.
No. 80.

INDIA OFFICE;
London, 28th October 1869.

To His Excellency the Right Hon'ble the Governor General of India in Council.

MY LORD,—*Para.* 1.—I have had under my consideration in Council your despatch of the 25th May last, No. 37, transmitting a memorial from certain of the chiefs, gentry and landholders of the Punjab, regarding Act XXVIII of 1868 (The Punjab Tenancy Act), and a Minute on the subject of the memorial by the Hon'ble the Lieutenant Governor of the Punjab.

2. You do not yourself express any opinion on that memorial, nor do you give me any indication of the course which you would wish to be taken by me upon the important and very difficult subject to which it refers.

3. Under these circumstances, I have to determine on that course, guided by the information which had already been supplied in previous papers, and by any further light which may be cast upon the subject by the memorial itself. That information appears to be very full. All the proceedings of the Government of India on the Act, all the debates in Council, as well as all the Minutes of the Lieutenant Governor of the Punjab, and of his Officers, are before me. I gather from your silence that no change has occurred in the view finally taken of the matter by the Government of India, a view which was embodied in the Act now appealed against.

4. In considering the very grave question, whether it be expedient to disallow the Punjab Tenancy Act, there are three preliminary questions which naturally arise. The first of these is the question whether legislation was or was not imperatively required to settle the difficulties which had arisen in respect to land tenures in the Punjab. The second question is, whether the Government of India proceeded to such legislation with full knowledge of all the circumstances of the case. And the third question is, whether there is any prospect of your Government being prepared to pass another Act materially different from that which was passed in October 1868.

5. As regards the first of these questions, I find the strongest evidence in the papers that by all parties concerned in the controversies which had arisen on the land tenures of the Punjab, a legislative solution was considered necessary.

6. So long ago as August 1865, a Draft Bill had been prepared by the Supreme Government, and remitted for consideration to the authorities in the Punjab. From that time forward no doubt seems ever to have been expressed as regards the necessity for some legislative measure. Attempts even earlier than this had been made to avoid the evils which were arising from disputed principles of settlement. So long ago as October 1860, the Officiating Financial Commissioner, Mr. Cust, had drawn up a "Draft Code to define the rights of landlords and tenants," and in reference to this attempt, the Lieutenant Governor observes that "the subject appeared too vast and intricate for the Punjab Government to deal with authoritatively."

Para. 8, Minute of Lieutenant Governor, dated 10th February 1868.

Para. 6, same Minute.

7. But, indeed, if any doubt existed on this question of the necessity for legislation, it seems to be settled by the 35th and other paragraphs of the Minute by the Chief Court of the Punjab:—"Coming now to the second of

the two heads into which this reply is divided, the Judges have at once to express their opinion that legislation is absolutely required. The confusion into which this subject has been thrown cannot be remedied in any other way."

8. As regards the second question, whether the Government of India proceeded to legislation on this subject with full information on all the facts of the case, I must observe that, although the memorial you have forwarded contains many allegations of fact, and many arguments which are well worthy of careful consideration, none of these can be new to the Government of India, because I find that all of them are to be found in one or other of the papers which that Government has transmitted to the Government at home.

9. It appears from these papers that not only the subject generally, but successive Draft Bills in regard to it, had been referred during a period of three years to four successive Committees consisting of local officers, and had been submitted in one edition to ample discussion in the Supreme Legislative Council.

10. It is unfortunately true that, notwithstanding all this long preparation, no general agreement had been arrived at on some of the principles, and on many of the most important details, of the proposed measure. But there is no evidence that longer delay or more discussion would have resulted in any such agreement. There is indeed much evidence in favour of an opposite conclusion. The Lieutenant Governor of the Punjab, in his Minute already quoted, which is dated eight months before the passing of the Bill, observes:—"On particular points a closer scrutiny of Native opinion may be deemed desirable, but I do not think it is possible, under existing circumstances, or practically necessary, to collect more reliable information than has now been supplied to guide the Legislature in determining the general course which legislation should follow." The Lieutenant Governor also, in the same paragraph of his Minute, refers to, and quotes approvingly, a passage from Mr. Prinsep, in which that distinguished officer says, "if a new Commission (of inquiry) be appointed, nothing will result from it except confusion and diversity of opinion."

Para. 14.

11. And this conclusion I find to be farther confirmed by the very nature of the dispute which had arisen on the land tenures of the Punjab. That dispute involved a radical difference between two schools of theoretical opinion, who regard from two opposite points of view the slender basis of fact which alone appears to be ascertainable. These differences of theoretical opinion were not inoperative in practice. The proceedings of the Settlement Officers were coming into collision with the legal principles which ruled the decisions of the Civil Courts, and there could be no prospect of peace in the Province without the action of the Legislature. Under these circumstances, I am of opinion that the Government of India did not proceed to legislation without being urged to that course by very powerful arguments of policy, and that it was in full possession of all the facts and arguments by which its legislative action should be guided.

12. As regards the third question, whether, if this Act were disallowed, there is any prospect of your Government being prepared to pass another materially different, or more likely to reconcile opposite opinions, you have given me no indication of such a probability, and I see none in the nature of the case.

13. Having disposed of these preliminary questions, I have only farther to consider whether there is anything in the Punjab Tenancy Act itself so violent or so inexpedient as to call for its disallowance by the Crown.

14. After a very careful consideration of its provisions, and of the objections urged against them, I am of opinion that, whilst some of these pro-

visions appear to require in their operation very careful watching, none of them are of such a nature as to call for a sweeping condemnation of the Act.

15. The first great leading feature of the measure is that it sets up, as presumably correct, the first regular settlement of the Province, thereby setting aside, as of authority, the records of right contained in the revised settlement which was being conducted by Mr. Prinsep and his officers. It appears to be well established that this first settlement contained many errors. It could not be otherwise, conducted as it was soon after our acquisition of the Province, and when the people hardly understood the nature of the questions which we asked, or the effect of our record upon questions of land tenure. But as that settlement had lasted about 15 years, and as rights of occupancy had been roughly recorded on the basis of a previous holding for 12 years, it follows that the existing condition of the tenures had lasted somewhere about 25 or 27 years, and presumably, therefore, it must be held as affording a safer basis for legislative action than a later settlement, which had become the subject of violent controversy.

16. I find, indeed, in these papers abundant evidence of the ability, care, and desire to ascertain the truth, which have distinguished the proceedings of Mr. Prinsep. Nor can I entertain any doubt whatever that in very many cases his settlement would have rectified real errors in the settlement which had been first recorded. But neither can I doubt that the changes he would have effected had these two characteristics, first, that they were very sweeping and extensive, and secondly, that their legal force was more than doubtful. That the changes he sought to effect were very sweeping is admitted on all hands, and this fact is not the less important that these changes were recommended as a mere correction of previous mistakes. The Lieutenant Governor of the Punjab says expressly, that "among our Settlement Officers none had more keenly felt the necessity for *a radical change in the relations between landlord and tenant*, and the correction of what had been erroneously laid down at the previous settlement, than Mr. Edward Prinsep." (Paragraph 7, Sir D. M'Leod's Minute.)

17. Rough as may have been the process of inquiry by which the first settlement was established, it must be very full of errors indeed to render it expedient for the Legislature to assume as a safer basis of recognition another settlement which is new, and which is admitted to effect a "radical change" in the relations between landlord and tenant as they were recognized at the first settlement and so recorded, having thus been in force for a period of about 25 years over a populous and extensive Province.

18. If, indeed, the Punjab Tenancy Act had the effect of absolutely stereotyping the first settlement, and rendering all its mistakes permanent and irreversible, I should entertain very strong objections to it. But this is not its effect. The Act provides for the rectification of all errors through the means of a "regular suit," which may be prosecuted by all who may think themselves aggrieved. And by a "regular suit" is meant, as I am led to understand, not necessarily an expensive law plea before the ordinary Civil Courts, but a suit prosecuted before a Court of Revenue Officers, which may be, and I trust will be, rendered cheap and easily accessible to all classes of the people.

19. This view of the object or effect of the Act I find to be clearly indicated in the language held by Mr. Brandreth, when, in January 1868, he was advocating a former edition of the same measure in the Supreme Legislative Council. He spoke of the Bill as "not so much an attempt to settle anything definitively, as to open a way for the claims of the landowners being dealt with by the Settlement Officers or by the Civil Courts." Again, he said:—"Those landowners who clearly had rights of ejectment, and complained of having been deprived of them under

British rule, would, he hoped, have no great difficulty in re-establishing their rights in the way that would be open to them if this Bill became "law; . . . . two or three suits here and there would settle the matter." Nor does it seem to have been contemplated that Mr. Prinsep's revision of the old settlement should be ignored, or his labours considered as thrown away. Mr. Brandreth, on that occasion, proceeded to say that "the general inquiries that had recently been made by the present Settlement Officers ought to make it sufficiently clear in most cases what classes of tenants had, and what classes of tenants had not, rights of occupancy in those districts that were under settlement. There was nothing in the Bill to prevent the Government, if it should think it worth while, making such inquiries in every district."

20. This language applies equally to the Act as it was finally passed in October 1868, and it appears to me that, if your Government conducts its operation in this spirit, a satisfactory solution of all difficulties may be attained.

21. I have already referred to some of the causes which in the nature of things must have imported many errors into the record of rights established by the first settlement of the Punjab. There is one other cause, the operation of which seems to be admitted on all hands. That cause is this,—that the rights of landowners, whatever they were before, have acquired altogether a new value under our rule. Formerly the necessities of a military government, and the arbitrary character of its administration, subjected all classes to a scale of taxes and to exactions which depressed agricultural industry, and rendered all property in land, beyond the most ordinary profits of cultivation, altogether uncertain and precarious. Under our rule, on the contrary, a system of fixed and moderate assessment has stimulated agricultural prosperity, and has given a new value to all rights, whether of occupancy or of ownership, which are connected with the soil. Inquiries into the respective rights of these classes, even if such inquiries had been otherwise complete, instituted at a time when those rights were of little value, cannot itself be regarded as giving a satisfactory result. A record of rights so important to the welfare of the people ought to be founded, not only on the fullest inquiry, but on the fullest inquiry conducted at such a time, and under such conditions, as shall assure the Government that the people are awake to the value of those rights which we are engaged in recording.

22. I observe, indeed, that the fact here adverted to has been used as the basis of an argument in favour of the Government exercising a very large and free discretionary power over the rights of the landowning classes. It is said that the value which has arisen out of our system of government is a value which we are free to deal with and regulate as we like. It appears to me that this reasoning is of a very doubtful character, and may be used to justify the most sweeping confiscations. It would not be just towards any class interested in the soil to call upon them to give up well known and long established rights in return for our promise not to be oppressive and unjust in the amount of our assessments. There is no right belonging to any class of society which does not acquire a new value under a Government which is good as compared with the value attaching to it under a Government which is bad. The doctrine which, on this account, would assert a power of free dealing with those rights is a doctrine which requires very cautious application. We must not put a price upon our abstinence from one kind of injustice by taking leave to inflict another.

23. I rejoice, therefore, to see that, although such arguments as these have been used in the course of the discussion, all parties profess to be bound by one principle, which ought to render all such reasoning irrelevant. That principle is the very simple one, that it is our duty to ascertain, as nearly as we can, what the relative rights and relations of landowners and land-occupiers actually were before we took the country, to give to those rights and relations a new sanction, and not to upset or to interfere with them.

24. Here, however, we are encountered by another of the main facts of the whole case, namely, that the pre-existing rights and relations of the agricultural classes were complex, and are to us obscure;—that in no case do they rest, as in Europe, on written documents, or on a long course of judicial decisions, or, in fact, on any thing but local customs. These customs are of infinite diversity, they have been handed down by tradition only, and they have long been liable to such invasion by the agents of arbitrary Governments, and have consequently been so broken and disturbed that the widest differences of opinion may arise on the ultimate principles of tenure which they involve.

25. Under those circumstances, I am well aware that it is almost impossible to prevent pre-conceived ideas of what the relative rights of land-owners and land-occupiers ought to be from intruding into the inquiry as to what those rights actually are. But in setting up the record of rights founded on the first settlement as presumably correct, no permanent injustice will be done, provided cheap and ample means be given whereby the two great classes, whose rights in lands are affected, may prove that those rights are more correctly recorded in the revised settlement than in the first. Whatever objections may be taken to Mr. Prinsep's method of operation, in so grave a matter as the final adjudication of legal rights, that method appears to me to have been at least carefully and conscientiously devised in order to arrive at facts in so far as they could be ascertained, and I cannot doubt that many of the results arrived at by him will, on judicial investigation, be found to be correct.

26. I will not enter upon those details of the Punjab Tenancy Act the exact effect of which is not very easily intelligible without minute local knowledge, and which cannot perhaps be certainly known until the provisions of the Act have been made the subject of judicial interpretation. I am glad to observe that the Clauses providing for augmentation of rent during the period of the settlement are such as materially to mitigate the hardship of any mistakes which may have occurred in granting rights of occupancy as against the landowner, when none such really existed. But in this, as in all similar provisions, the whole value will depend on the facilities which are given for bringing the remedies of the Act into operation, and for meeting the conditions of proof which it imposes.

27. I have already intimated to you that Her Majesty's Government do not contemplate resorting to a disallowance of the Act. But I have to request that the operation of it be watched by your Government with the closest care, and especially that you will devise measures for affording every possible facility to all classes, whose rights are affected, to prove "in a regular suit," but cheaply and easily, any errors which the first settlement may have involved. I desire to be informed of the steps you may take for the purpose of securing this most essential object, and I cannot doubt that in any matter in which you see cause to think that the provisions of the Act, as they become more generally understood, are exciting discontent, or otherwise require revision, you will not hesitate to pass an amending Act.

I have, &c.,

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Friday, the 14th January 1870.

PRESENT:

His Excellency the Viceroy and Governor General of India, K. P., G. C. S. I., *presiding.*
His Excellency the Commander-in-Chief, K. C. B., G. C. S. I.
The Hon'ble G. Noble Taylor.
Major General the Hon'ble Sir H. M. Durand, C. B., K. C. S. I.
The Hon'ble John Strachey.
The Hon'ble Sir Richard Temple, K. C. S. I.
The Hon'ble J. Fitzjames Stephen, Q. C.
The Hon'ble Gordon S. Forbes.
The Hon'ble D. Cowie.
Colonel the Hon'ble R. Strachey, C. S. I.
The Hon'ble Francis Steuart Chapman.
The Hon'ble J. R. Bullen Smith.
His Highness Sarámade Rájáháe Hindústán Ráj Rájendra Srí Mahárájá Dhiráj Sivái Rám Singh Bahádur, of Jaypúr, G. C. S. I.
The Hon'ble F. R. Cockerell.

QUARANTINE RULES BILL.

The Hon'ble MR. CHAPMAN moved that the Report of the Select Committee on the Bill to provide Rules relating to Quarantine be taken into consi-

deration. He said that, when he introduced the Bill, he stated that it would provide for both inland and maritime quarantine. On further consideration, however, it had been found that, in order to secure effectual sanitary rules for the multitudes resorting to fairs and sacred places, it would be necessary to pass a far more comprehensive measure. Thus, it would not only be necessary to meet the case of places where infectious diseases prevailed, but also the case of places where there were grounds for apprehending an outbreak of such diseases. Above all, it would be necessary to authorize the levy of taxation to cover the expenditure on account of the medical and other arrangements that would have to be made. On these grounds, the Select Committee had come to the conclusion that it would be advisable to limit the Bill to seaports, leaving for further consideration, either by this Council or the Councils of the several Local Governments, the question of inland quarantine. He believed that a law to regulate inland quarantine was greatly needed, and that it would be found to interpose an effectual barrier against the inroads of cholera. It was with extreme regret that the Select Committee found themselves obliged to confine the operation of the Bill to the establishment of a system of quarantine in the seaport towns ; but the subject of inland quarantine would not be lost sight of.

The Motion was put and agreed to.

The Hon'ble MR. CHAPMAN then moved that the Bill as amended be passed.

The Motion was put and agreed to.

SUBORDINATE JUDGES AND MUNSIFS BILL.

The Hon'ble MR. COCKERELL moved that the Report of the Select Committee on the Bill to provide for the appointment of additional Subordinate Judges and Munsifs in the Presidency of Fort William be taken into consideration. In doing so he said that, in the opinion of the Select Committee, the provisions of the Bill as introduced were sufficient to attain its objects, and no alteration had therefore been recommended.

The Motion was put and agreed to.

The Hon'ble MR. COCKERELL then moved that the Bill be passed.

The Motion was put and agreed to.

COURT FEES BILL.

The Hon'ble MR. COCKERELL also presented the Report of the Select Committee on the Bill to provide for the better regulation of Court fees.

AGROR VALLEY BILL.

The Hon'ble MR. STEPHEN moved that the Bill to remove the Agror Valley from the jurisdiction of the tribunals established under the general Regulations and Acts be passed.

The Motion was put and agreed to.

HINDU WILLS BILL.

The Hon'ble MR. STEPHEN also presented the Report of the Select Committee on the Bill to regulate the Wills of Hindús and Buddhists in the Presidency Towns.

HIGH COURTS (COSTS OF PETITIONS) BILL.

The Hon'ble MR. CHAPMAN introduced the Bill to enable the High Courts at the presidency towns to deal with costs of petitions for certain monies transferred to Government, and moved that it be referred to a Select Committee with instructions to report in a fortnight. He said that the Bill would deter parties from making idle and unfounded applications, as it would enable the Courts at their discretion to saddle such parties with costs.

The Motion was put and agreed to.

FEMALE INFANTICIDE BILL.

The Hon'ble MR. STRACHEY, in moving for leave to introduce a Bill for the prevention of female infanticide, said that the prevalence of female infanticide in many parts of India had long been a matter of unhappy notoriety. From time immemorial, this crime had been practised in many parts of India, and especially in the North of India, by many tribes of Rájputs. Although, speaking generally, it might be said that the crime was peculiar to the Rájputs, still this was not, strictly speaking, true ; for there were other tribes of Hindús with whom the practice was common, and in some parts of the country female infanticide was practised even by some classes of Muhammadans. The first Englishman, he believed, who, he might say, discovered the existence of this horrible system of crime, was the well known Jonathan Duncan, who, after eighty years, was still remembered with respect and affection in the Benares District. In 1789, when he was Resident at Benares, he first made known the wide-spread prevalence of this crime among the Rájputs of the Benares Division, and he exerted his influence to the utmost to induce the people who practised it to abandon the commission of the crime. Two Regulations were passed not long afterwards specially directed against this crime, Regulation XXI of 1795 and Regulation III of 1804; but the measures taken under those Regulations practically had very little effect, and they certainly had led to no permanent result. For some forty years after those Regulations had been passed, almost nothing seemed to have been done on this side of India with the object of repressing the practice of infanticide. It was not till the year 1836, when Mr. Thomason was making a settlement of Azimgarh, that he discovered the prevalence of the crime in that district. This admirable man and wise statesman, to whom India owed, on many grounds, a deep debt of gratitude, was the first, in modern times, on this side of India, who directed his mind to the prevention of this crime. He found that it was commonly practised in the Azimgarh District by Rájputs on the borders of the Oudh territories, and he stated that, among a body of Rájputs numbering some 10,000, "not a single daughter was forthcoming." MR. STRACHEY was quoting from the excellent account of Indian Infanticide by the Revd. Cave Browne :—

> "I do not think," Mr. Thomason wrote, "it is generally known that the horrible practice so extensively prevails even at our own doors. I myself discovered it accidently whilst engaged in revising the settlement of the pargana. In conversation with some of the zamíndárs, I happened to mention one of them as the son-in-law of another. The mistake raised a sarcastic laugh, which was explained by the brief exclamation of a bystander:—'Where will you find a daughter in Kooha?' Inquiry once roused, the truth was palpable. They freely admitted the practice themselves, and it was a matter of notoriety. These Rájputs," Mr. Thomason went on to say, "are a fine, manly, independent race of men. There are few whom I have seen of more prepossessing address. Their tribe have formed of old high alliances, and they have served on regal establishments. * * They pride themselves on giving their daughters in marriage only to the members of certain tribes on an equality with themselves or their superiors. Matches are difficult to be obtained, and attended with great expense, which they can ill bear, and are almost certain to cause the alienation of the whole, or a great part, of their hereditary lands. Hence the birth of a daughter is considered a most serious calamity, and the unfortunate infant is very seldom spared."

Mr. Montgomery, now Sir Robert Montgomery, was then an Assistant to Mr. Thomason. Shortly afterwards he became Magistrate of Allahabad, and he

found that the crime prevailed also in that district to a terrible extent. Soon after similar investigation showed the extreme prevalence of the crime in the Northern parts of the Doáb. Mr. Unwin, the Magistrate and Collector of Mainpuri, was the first to bring the fact to light in that part of the country: he found in that district that, among the Chohán Rájputs, who were very numerous, there was hardly a single female child, young or old, forthcoming. In Etáwa, Mr. Monckton soon afterwards found the same, and Mr. Gubbins made the same discovery in Agra. The higher the rank of the family, the more commonly and the more systematically was the crime practised. Thus, Mr. Raikes, who was Magistrate and Collector of Mainpuri and who devoted himself most energetically and successfully to the suppression of the crime, in his work called "Notes on the North-Western-Provinces," wrote as follows:—

"There is at Mainpuri an old fortress, which looks far over the valley of the Eesun River. This has been for centuries the stronghold of the Rájá of Mainpuri Chohans, whose ancient blood, descending from the great Pirthá Ráj and the regal stem of Ním-rána, represents *la crême de la crême* of Rájput aristocracy. Here, when a son, a nephew, a grandson, was born to the reigning chief, the event was announced to the neighbouring city by the loud discharge of wall-pieces and matchlocks; but centuries had passed away, and no infant daughter had been known to smile within those walls."

Shortly afterwards the first Panjáb war occurred, and in 1846 the Jalandhar Doáb was annexed to the British territories. Lord Lawrence was Commissioner of the new Division, and he found this practice equally prevalent there. It was found, subsequently, that there were other tribes besides the Rájputs in the Panjáb, who commonly practised the same crime, especially the Bédis, a numerous and very influential class of Sikhs of a sacerdotal character, said to be descended from Guru Nának, the founder of the Sikh faith. From that time, the more enquiries were made, the more was the prevalence of this crime in Northern India established. In 1856 an officer was appointed to make special investigations into the facts in the Benares Division, and MR. STRACHEY would quote to the Council some of the facts discovered by Mr. Moore during his enquiries carried on at Benares. Similar facts were quite as true in many other parts of the North-Western Provinces, of Oudh and of the Panjáb. In the Benares Division, Mr. Moore personally visited and made most minute investigations into the facts in three hundred and eight villages in which he found reason to suspect that the crime prevailed. In sixty-two of these villages he found that there were no female children under the age of six years. In one sub-division of the district he visited thirty-eight villages, and in ten of them he found no girls at all. He found that marriages of girls were of very rare occurrence; in some villages there had not been any within the recollection of the present generation. In one village, in which there was not a single girl under six years and only two above that age, the Rájputs could give no account whatever with what tribes they intermarried, nor of the expenses attending marriages. In another village there, no girl had been married for twenty-five years. In another part of the Division, Mr. Moore found a community of Hárá Rájputs, inhabiting villages on the borders of Oudh, regarding whom he said—

"Not only are there no girls to be found in their houses now, but there never have been any, nor has such an event as the marriage of a daughter taken place for more than two hundred years. This is their own confession, nor have they the remotest idea as to what tribes their daughters would be married with, nor how much such a marriage would cost."

Whenever Mr. Moore went amongst these particular classes, he found the same results. In another group of thirty villages he found that, in twenty, the total number of female children under six years of age was only thirty-seven, while there were three hundred and thirty-nine boys of the same age: in eleven villages there were no girls at all, and no marriage of a girl had taken place within the recollection of the oldest inhabitant.

Shortly after these enquiries occurred the mutinies of 1857, and, as might have been expected, the whole subject was then for some time lost sight of. But

after the re-establishment of order the subject again attracted the attention of Government. In Oudh, in particular, it was found that the custom was terribly prevalent, and active measures were taken by Sir Charles Wingfield with the help of the taluqdárs to put a stop to the practice.

Although in many parts of the country, a great deal had undoubtedly been done to check the crime, MR. STRACHEY feared that there could be no question that it was really at the present time almost as prevalent as ever. Only a year ago a minute investigation was made by the orders of the Lieutenant Governor of the North-Western Provinces in the District of Basti by Mr. Hobart. He conducted his investigation with great care and judgment, and the conclusions to which he came were the same as those arrived at ten years previously by Mr. Moore, of which MR. STRACHEY had just given some account to the Council. For example, Mr. Hobart examined a group of ten villages inhabited by Rájputs, and in seven of them he found one hundred and four boys and only one girl, and the people admitted that, for the previous ten years, only one girl had been married. In another group of twenty-seven villages, he found, in twenty-three villages, two hundred and eighty-four boys, but only twenty-three girls, and in ten other villages he found that the marriage of a girl was an unknown ceremony. Again, there was another group of sixteen villages, in four of which no girls existed, and in nine other villages there were seventy-one boys and seven girls.

But MR. STRACHEY need not continue these terrible illustrations of the prevalence of this crime. The accounts that were given would seem absolutely incredible if they were vouched for on less unimpeachable authority.

The causes which had led to this terrible prevalence of female infanticide had already been generally indicated in the passage from Mr. Thomason's Report which MR. STRACHEY had read to the Council; but he would also read a passage from Mr. Raikes' book, which stated very plainly what the real causes of the crime were. Mr. Raikes, than whom there could be no higher authority, for he was one of the first and most successful of the officers who had endeavoured to contend against this crime, wrote as follows:—

"At the very root of the evil stands this principle—The Hindú disbelieves the purity of the sex; a daughter arrived at puberty *must*, he thinks, be married or be disgraced. When he seeks a husband for her, it *must* be in his own caste; but it *must* also be in a sub-division of that caste, higher, if possible, but at all events differing from, his own. To marry in one's own sub-division is impossible; such an union would be set down as incestuous. Disgrace is attached to marriages with men of inferior relative rank. 'The owner of a hyde of land, whether Sisodia, Ráhtor, or Chohán, would scorn the hand of a Járejá princess.' What then is a Rájput father to do with his marriageable daughters? He must, it is clear, seek a husband for them in a rank equal to his own, or in a higher rank. But if his own sub-division be high, if he be a Chohán or a Ráhtor, he will not easily find such a son-in-law; or, if he do find him, will have to pay high in hard coin for blood and rank. And this is why a Rájput mourns when a daughter is born to him, and rejoices when he has a son. The one brings disgrace, anxiety, or at least heavy expense upon his house; the other increases his wealth and his dignity."

Thus this necessity of getting his daughter married to a man of at least the same class as himself, and if possible of a higher rank than himself, brought on the high caste Rájput something of personal degradation. The father of a married daughter came to be looked upon as inferior to her husband, and the very name of "father-in-law" had become one of the commonest terms of insult and reproach.

"A Rájput, of the present day," writes Mr. Raikes, "is subject to his son-in-law hand and foot, can refuse him nothing, and, without disgrace, cannot accept so much as a meal at his hands."

Although all this was not strictly true, except of some classes of Rájputs, still there could be no doubt that these feelings of family pride had been at the root of this great evil. It had followed as a natural consequence that the most extravagant and ruinous expenditure had been incurred by these people in

the marriages of their daughters, and this had been admitted on all hands to be one of the greatest immediate causes of the crime. Marriage-expenses were frequently so enormous that the marriage of a daughter literally proved the permanent ruin of the family, and under these circumstances a Rájput preferred that his daughter should perish rather than that he should be placed under the necessity of incurring expense for her dower to an amount, than which if he gave less he would consider himself disgraced. But after all, the real great reason for the crime at the present moment might be considered to be custom—immemorial custom—which Manu declared must be looked upon "as transcendent law and the root of all piety." There could be no doubt that these people murdered their children from generation to generation mainly because their forefathers had done so before them, with hardly an idea that there was anything criminal in the practice.

As to the remedies to be applied to this great evil, there was fortunately no reason to doubt, because we had ample actual experience to show us how the crime could be dealt with. The measures that had been taken had been of two kinds. The first class of measures had been those which aimed at the removal of the causes which led to the commission of the crime, and especially to the prevention of extravagant expenditure on marriages. The second class of measures had been of a coercive and directly preventive character. The first sort of measures evidently must mainly depend on the action taken by the people themselves; the other class of measures on the action of the Government. There had been considerable success in some parts of the country in inducing the Rájputs themselves to agree to limit their marriage-expenses. Mr. Raikes was the first to initiate measures of this kind at Mainpuri; they were afterwards followed up on a great scale, and with very great success, in the Panjáb, under the orders of Lord Lawrence, Sir Robert Montgomery, Sir Donald Macleod and others, and also in Oudh and elsewhere, and, there could be no doubt, had been very useful. There was a strong sense among the people themselves of the extreme folly of spending all this money on marriages, and it had been proved by experience that, with a little help and pressure put on them by the officers of Government, they were often glad to limit these expenses. While MR. STRACHEY believed that measures of this character, which struck at the very root and causes of the evil, were of the utmost value and importance, he thought there could be no doubt that the measures which had been practically the most successful had been those of active though judicious prevention and coercion. The measures of this character on this side of India were, MR. STRACHEY believed, first adopted by Sir Robert Montgomery. They were followed up afterwards very actively by Mr. Unwin, Mr. Gubbins and others, in the North-Western Provinces, in the Panjáb, and in Oudh, and MR. STRACHEY might give illustrations of the great success of those measures by a few facts. In 1842, Mr. Raikes found that there was hardly a Rájput girl living in the District of Mainpuri. Nine years afterwards, in 1851, there were one thousand four hundred and eighty-eight girls found alive, and, in 1855, the number had risen to two thousand five hundred and thirty. Similar results had been observed in the Agra District. The measures taken by Mr. Gubbins led, in a very few years, to the doubling of the number of female Rájput children; the same had happened in the Panjáb and Oudh, and indeed everywhere where preventive measures had been taken. These measures had been of a very simple character. They had consisted mainly, in the first place, in the introduction of an effective system of registration of births and deaths in suspected localities, and in a constant system of periodical inspection and enumeration of children. It had been found, in practice, that these measures had the effect of saving the lives of a large number of children when they were born. If a child was not killed immediately after birth, it might be considered safe; and it might be confidently said that experience had proved in a most unmistakeable way, that it was quite in the power of the Government of India to eradicate, or at any rate enormously to diminish, this crime. But the authorities in all parts of the country where the crime was practised had come to the most decided conclusion that it was necessary that measures for the prevention of the crime should be taken much more systematically and continuously than any that had hitherto been attempted, and to enable them to carry out completely the measures that were necessary, legislation was absolutely required. It had been acknowledged on all hands that the existing law was altogether insufficient.

MR. STRACHEY said that he could not now enter into details regarding the Bill which he proposed to introduce; that would be done more properly hereafter. It was sufficient now to say that the Bill proposed little more than to give to the Local Governments legal authority to do, completely and systematically, that which had already been imperfectly done in many parts of the country. There was no real novelty in what was now proposed. The Bill had been already sent to the several Local Governments and Administrations and in all substantial respects it had been entirely approved by them. He thought that the Council would agree with him when he said that a stronger case for legislation could hardly be imagined. The British Government had borne too long with this abomination, and he hoped that the time had come in which the Government would show to the world that it had finally and firmly resolved that these things should cease. He could not, for his part, doubt that it was in the power of the Government to bring about this end. Some people had talked of the political danger of rudely interfering with these atrocious practices. For his own part, MR. STRACHEY was quite confident that there was no danger of the kind. We were told the same thing when suttee was prohibited, and there were not wanting people to tell us the same at every such step that was made for the moral improvement and enlightenment of the people of this country. This talk of political danger was baseless and foolish, but he would say, for his part, that even if it were true that such danger existed, that was no reason for allowing such abominations as this to continue. Whatever might be the consequences, it was the duty of the British Government to declare that it would not suffer any longer the continuance of these horrible practices in any part of its dominions, and that it would put forth the whole of its power for their repression.

The Motion was put and agreed to.

The following Select Committee was named:—

On the Bill to enable the High Courts at the Presidency Towns to deal with costs of petitions for certain monies transferred to Government—The Hon'ble Messrs. Stephen, Gordon Forbes and Cockerell and the Mover.

The Council adjourned to Friday, the 21st January 1870.

WHITLEY STOKES,
Secy. to the Council of the Govr. Genl. for making Laws and Regulations.

CALCUTTA,
The 14th January 1870.

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

LATE TRAINS ON THE PUNJAB AND DELHI RAILWAYS.

No. 72 R, dated 12th January 1870.

From—The Government of India, PUBLIC WORKS DEPT.,

To—The Joint Secy. to the Govt. of the Punjab, P. W. Dept., Railway Branch.

I am directed to acknowledge the receipt of your letters noted in the margin, submitting late train reports of the Punjab and Delhi Railways for the months of September and October 1869.

Nos. 2391 and 2561, dated 13th and 22nd December 1869.

2. I am desired by the Governor General in Council to point out that the object of the Government of India in calling for these returns was to draw the attention of the local authorities to the unsatisfactory working of the lines, in view to their taking such steps as would insure better management; but that though the returns have now been submitted for seven months, and have received repeated comment in the letters noted in the margin, the results are still as follows:—

P. W. D., No. 1122 R, dated 12th August 1869.
" " 1589 R, " 11th October 1869.
" " 1822 R, " 4th December 1869.

	Percentage late.		
	Ghazeeabad to Umballa.	Lahore to Mooltan.	Lahore to Beas.
April	83	30	36
May	37	22·6	12
June	57	47	46
July	62	23	46
August	16	22	32
September	14	23	16
October	39*	12	

These figures show that some improvement has been made, but that vigorous measures of reform are still required.

3. I am again to call your attention to the request contained in Public Works Department No. 1122 R, dated 12th August 1869, for a report on the steps which have been taken to remedy these serious and constantly recurring delays in the train service, and to beg that it may be submitted without further delay.

* Ghazeeabad to Loodiana.

GOVERNMENT OF INDIA.

FOREIGN DEPARTMENT.

OPERATIONS AT BAHREIN.

No. 12, dated 8th January 1870.

From—E. H. PERCIVAL, ESQ., *Acting Under Secy. to the Govt. of Bombay, Political Dept.,*

To—The Secretary to the Government of India, FOREIGN DEPT.

I am directed to forward to you, for submission to His Excellency the Governor General in Council, copy of a despatch from Lieutenant-Colonel Pelly, C. S. I., with accompanying plan, reporting on the recent operations at Bahrein.

No. 207, dated the 9th December 1869 (received in Bombay on the 7th January 1870).

The pirate Chiefs, five in number, arrived here in Her Majesty' Ship *Daphne* on the 31st ultimo, and have been forwarded to Asseerghur for detention there as prisoners of war.

No. 207, dated 9th December 1869.

From—LIEUT. COLONEL L. PELLY, C. S. I., *H. B. M.'s Political Resident, Persian Gulf,*

To—The Secretary to the Government of Bombay, Political Dept.

In continuation of my letter as per margin, and of previous correspondence, I have now the honor to report proceedings at Bahrein in punishment of the recent piracy. And as these proceedings have been conducted by Commander G. A. Douglas, Senior Naval Officer of Her Majesty's ships present, and myself in complete concert and harmony, I propose, in this report, whenever I refer to matters arranged in common by us, to use the plural we, instead of reiterating Captain Douglas' and my own names.

No. 204, dated 14th November 1869.

2. On the 14th November we had the honor of receiving at Angaum His Excellency's telegram, instructing us as to the mode of procedure to be followed at Bahrein, and directing me to intimate our orders to Her Majesty's Chargé dé Affairés at Tehran for the information of the Persian Government. A copy of the telegram sent to Tehran is appended.

3. As regards the mode of procedure, His Excellency's instructions were based on four recommendations submitted in my letter No. 184 of the 5th of October 1869.

4. Of these four recommendations, one related to the blockade of the Wahabee ports; but, as the fulfilment of this recommendation was postponed by His Excellency, pending a reference to the Viceroy, and as the question of the Wahabee Ameer's complicity in the Bahrein piracy has since formed the subject of a separate report, we do not propose further alluding in the present letter to this particular recommendation.

Vide my report sent by this opportunity, No. 209, dated 9th December 1869.

5. The three remaining recommendations which we were directed to carry into effect were as follows:—

"*Firstly*, to blockade and otherwise use force against Bahrein, until the leaders of the piracy, *viz.*, Mahomed bin Abdullah, Nauser bin Mubarek, also Mahomed bin Khalifeh himself, supposing him to be still alive, should be surrendered.

"*Secondly*, and supposing the choice to be eligible on general considerations, to recognize the son Esau, of the late Chief Alee bin Khalifeh, as Chief.

"*Thirdly*, to come to an understanding with whatever Chief might be recognized, to the effect that the estates and other available property of the pirates and traitors,' Mahomed bin Khalifeh, Mahomed bin Abdullah, and Nauser bin Mobarek, should be considered as forfeited, and that the produce or value of such property should be applied, in the first instance, towards the reimbursement of persons plundered. But I would exclude from claimants to such compensation such persons as may have implicated themselves in the purchase of plundered property at nominal rates."

6. In conformity with His Excellency's instructions, we left the Angaum station with Her Majesty's Ship *Daphne* and Gunboat *Clyde* on the morning of the 15th November, leaving Her Majesty's Ship *Nymphe* and Gunboat *Hugh Rose* to await the further instructions of Government.

7. On the afternoon of the 17th we arrived at Bahrein, and on the following morning sent ashore several copies of a circular letter addressed to the Chiefs and Heads of tribes.

8. We accorded personal interviews under safe conduct to the head and some of the minor pirate Chiefs, and also to the heads of some of the peaceful Bahrein tribes. It soon appeared—

1*st*, that the tribes and people of Bahrein in general earnestly desired the restoration of the late Chief's family in the person of his son Esau bin Alee bin Khalifeh; and

2*nd*, that the pirate Chiefs in possession were disliked, but held power with a firm grasp; and that the Bahrein inhabitants were neither sufficiently organized nor warlike to expel the usurpers.

9. It appeared, indeed, at this point of the proceedings almost more than doubtful whether we ourselves should be able to seize or expel the pirate Chiefs and restore the succession.

10. At the same time it seemed our duty to use every effort and devote full time towards the realization of the above objects, and, failing their attainment, to make the next best arrangement possible, in preference to injuring the islands by bombardment or other severely destructive measures.

11. Accordingly, having ascertained that Esau bin Alee was a refugee on the Guttur Coast, we invited him over with an armed escort, and cautioned the Guttur Chief to refrain from hindering him.

* * * * * * *

13. As it was in the afternoon of the 19th that we commenced a series of manœuvres and operations which have resulted in the successful fulfilment of the Government instructions, we would beg at this point to solicit a glance on the part of His Excellency in Council at the annexed sketch map, which has been obligingly prepared for us by Navigating Lieutenant White, Her Majesty's Ship *Daphne*.

14. The immediate objects in view were—

1*stly*, to watch the Menameh Fort which was held by Nauser bin Mobarek; and

2*ndly*, to threaten the Moharrag Fort, where we supposed it possible that Mahomed bin Khalifeh, if not already dead, was imprisoned.

15. Accordingly *Daphne* was left at her anchorage, while Gunboat *Clyde* in command of Mr. Elton was sent round to the head of the creek directly opposite the Moharrag Fort. Towards sunset we took the boats (under command of Lieutenant Acklom, Her Majesty's Ship *Daphne*) across the reefs to the spit of sand which connects the Moharrag Island with its fort. We ran

the boats close in with intention of isolating the fort by a line of small armsmen across the spit. Some men from the fort then came down and parleyed. They strenuously denied the existence of Mahomed bin Khalifeh, but after being suitably reminded of consequences agreed to surrender him, if only we would permit them to communicate with the garrison. A few minutes afterwards some of the garrison brought Mahomed bin Khalifeh down to the boats in irons, and thus fell into our hands by a short manœuvre this fierce old Chief, who has for a generation past shown himself an incorrigible tyrant and pirate, and a standing annoyance to successive Residents. It is characteristic of the man that immediately his irons were removed, he first set to praying, then drank vigorously of coffee, and finally requesting a private interview, explained to me that if I were really an able man, I should replace him in power, or, failing this, that the next best course would be to let him rouse the whole coast line against every body else.

16. On the morning of the 20th we learnt that the Bedouins of Nauser bin Mobarek had assembled in large numbers on the shore line below the Menameh Fort, and threatened a night attack on the vessels. We further learnt that the tribes and inhabitants in general were in terror of violence from the pirate Chiefs and their followers.

17. To meet these circumstances, a letter was addressed to the head Chief, informing him that if injury occurred, the ships would open fire. Meantime *Clyde* was brought back to the anchorage opposite Menameh.

18. During the 21st a further letter was addressed to Mahomed bin Abdullah, informing him that the proceedings and movements of Nauser bin Mobarek had compelled us to resolve on dislodging him from the Menameh Fort, and we simultaneously addressed a letter to the head of the tribes on the coast line, requesting that neither men nor animals might be allowed to embark.

19. On the 22nd *Clyde* was run in to the inner anchorage immediately opposite the Menameh Fort, while the boats in charge of Lieutenant Acklom took up a flank position commanding one of the gates. Nauser and his Bedouins were speedily shelled out of the fort with loss, and received the fire of the small arms on emerging.

20. Nauser bin Mobarek then fled to a private house further inland. A spy indicated the building, and a shall bursting in Nauser's room again compelled him to fly with loss.

21. During the nights of the 22nd and 23rd information was brought to us of Nauser bin Mobarek being lodged in a musjid close to the shore line of the Bahrein Island. We therefore took the boats with intent to a night surprise, but the Pilot mistaking the channel in the dark, the boats grounded and had to return. Nauser, however, discovered our movement at daybreak, and retreated inland to the hill fort Ruffah.

22. On the 24th the winter set in and suspended all operations during three days.

23. On the 27th three craft attempting to run the blockade were fired on. Two of them then desisted, but one ran on and was burnt.

24. At sunset of the 27th intelligence reached us that Shaik Nusser, a sort of treasurer and general minister to the pirate Chiefs, had sailed across to Moharrag in view to an interview with his master, and that he would probably return after dark to Menameh. He was surprised accordingly in his boat while returning, and was brought on board *Clyde*. This is the man alluded to in former reports as having been the recipient of a large portion of the plunder, and without whose aid the pirate Chiefs and Bedouins could not have subsisted.

25. Learning on the 28th that Ahmed bin Abdullah, brother to the head pirate Chief, had been appointed to the charge of the Menameh Fort, firing was re-opened on it; and *Nymphe* with *Hugh Rose* in tow arriving

during the afternoon, their boats joined us, and at midnight we landed, entered the fort, and rendered it untenable; the boats were on this occasion in charge of Commander Meara, Her Majesty's Ship *Nymphe*.

26. On the 29th we landed again with the boats in view to searching the town premises of Shaik Nauser and to completing our work at the fort. I regret to say that during this operation, Captain Douglas received a severe shock while exploding a mine, and from which he is still suffering.

27. On the morning of the 30th we learnt the following important items of intelligence:—

1*stly*, that Esau bin Alee, whom we had invited over from Guttur, had been seen *en-route* at Zebairah, and that 30 craft had been observed making for that point;

2*ndly*, that Nauser bin Mobarek had left the Ruffah fort and taken up a position at Jow, where he had seized some craft, in view to intercepting Esau at sea, or to making good his own retreat in case of need;

3*rdly*, that the head Chief Mahomed bin Abdullah was still on the island of Moharrag prepared to be joined by Nauser bin Mobarek, or to escape himself by sea if necessary.

28. It now became advisable forthwith to make a move which should be calculated to meet all the above contingencies. Accordingly we took both the gunboats with all the ship's boats in tow and marines and small arms-men on board, and steamed round from the inner anchorage of Menameh to a point to the southward of Moharrag Island.

29. We thus placed ourselves in a position—

1*st*, to threaten Nauser bin Mobarek at Jow;

2*nd*, to aid Esau with his fleet on its passage from Zebairah to Moharrag Island; and

3*rd*, to cut off sea communication between Nauser bin Mobarek at Jow and Mahomed bin Abdullah at Moharrag.

30. The demonstration proved successful, and Nauser bin Mobarek, after committing some further cruelties, embarked with his Bedouins and fled to the Wahabee Coast.

31. On the following morning, 1st December, we again weighed anchor, and still accompanied by all the boats pushed up the Moharrag creek to a point a little way above the Moharrag Fort, which we thus commanded at a distance of 700 yards, while we commanded Mahomed bin Abdullah's fortified house and the town of Moharrag generally within a distance of 1,000 yards. We were further in a position for laying out the boats and so preventing Mahomed bin Abdullah escaping by sea.

32. We then prepared to land on the spit already described, and isolate the Moharrag Fort, which we proposed to occupy and afterwards to make over to Esau bin Alee as a point of appui.

33. While preparing this operation, the pirate Chief Mahomed bin Abdullah came on board in hope of arranging matters, and almost simultaneously Esau's fleet hove in sight.

34. We then informed the pirate Chief of the general situation, and called on him to elect between surrendering at discretion or proceeding at once on shore to take his own course. He surrendered, and his nephew Alee bin Nauser and his secretary named Jassim declared to surrender also, since they were committed to their Chief's cause. They sent on shore for their swords and made them over to me.

35. Meantime the landing took place (the marines and small arms-men under Commander Meara), and the garrison of the fort of Moharrag surrendered.

We occupied the fort, hoisted the British flag for an hour or so, and then made over the fort to a detachment of Esau's friends that had been previously prepared to garrison it.

36. On the following morning, 2nd December, Esau bin Alee with his fleet sailed up the creek, but before landing he visited us on board, when we received him publicly, recapitulated to him the circumstances of the past year, and then informing him that the rulership of these islands was vacant, and added that he could assume the government of them if it suited his convenience; but that in so doing he must clearly understand that he acted on his own account and not as our protegé; that he should organize his tribes and means of defence for himself, and that although in the case of his late father Her Majesty's Indian Government had deemed well to punish those who had slain him and seized his possessions to the injury of British subjects, yet that it must not be expected that Her Majesty's Indian Government would incur similar outlay and trouble for the future.

37. Esau bin Alee accepted the government with this knowledge, and further signed and sealed a document binding him to fulfil the conditions specified in the 3rd recommendation of my letter No. 184 of 5th of October. A copy of this document is appended.

38. We then gave the new Chief some good advice, permitted him to use every precaution against aggression from the Wahabee coast line, and swore the surrounding Chiefs upon the only oath which they consider really binding (*viz.*, "Telauk") to be faithful to Esau bin Alee as their ruler.

39. The new Chief then went ashore, and nearly the whole of the Moharrag population turned out to welcome him, while the native craft and houses hoisted flags.

40. Esau bin Alee visited us on two subsequent occasions, and on each occasion we marked our recognition by the salute usually accorded to the Chiefs of Bahrein.

41. Thus concluded our proceedings, and I trust that His Excellency in Council may consider that we have completely fulfilled his instructions.

42. As for myself I would add my deep satisfaction that no loss of life has occurred on our side. The result might very readily have been otherwise had our information been less accurate, or our own manœuvres less successful.

43. At the same time success has not been attained without considerable hardship and exposure to all hands. Both men and officers were detached from their ships for some 17 days, during which period they were nearly constantly in the boats, and called on for severe work both by night and day.

44. To Commander G. A. Douglas, Senior Naval Officer, I cannot too earnestly express my thanks for his most cordial and efficient support during the period he has co-operated with me in this delicate naval affair. Had our unity in action been less complete, or had he been impatient of detaining his squadron until proceedings were brought to a conclusion, it would have been impossible for me now to report full success.

45. Commander Meara, Her Majesty's Ship *Nymphe*, who commanded the boats on several occasions, and who has more recently been of much service in visiting the Pirate Coast, has my sincere acknowledgment of his courteous and valuable aid.

46. I would beg permission also to mention the name of Lieutenant Acklom, of Her Majesty's Ship *Daphne*. This old and experienced officer has performed unceasing and responsible duty during the whole period of the expedition, and had charge of the boats on the night of the capture of Mahomed bin Khalifeh.

47. Navigating Lieutenant White, Her Majesty's Ship *Daphne*, has placed me under obligation by his care and trouble in sounding, and by favoring me

with sketches of intricate navigation; and I may add that all the naval officers with whom I have had the honor of co-operating during the past seven years have been unanimous in opinion that they had never seen more treacherous and pirate-like ground than that which envelopes the reef-bound coasts of Bahrein and the Wahabee ports.

48. I have already brought the claim of Captain Elton, commanding Gunboat *Clyde*, under the notice of His Excellency, and it is unnecessary therefore for me now to do more than renew an expression of my satisfaction with him during the three and half years he has served in these waters.

49. Finally, I would desire, in concluding this inadequate despatch, to record my grateful thanks to all the officers and men of Her Majesty's Ships *Daphne* and *Nymphe* and of the marine Gunboats *Clyde* and *Hugh Rose*. It would be impossible for any men to behave with better order and discipline than did the men of Her Majesty's ships present during this expedition. Their self-restraint when landed in the town of Menameh after it had been abandoned by nearly all its male inhabitants, was remarkable, and defenceless women approached the column without fear of molestation.

50. It is necessary to bear in mind that while I may not venture to do more than mention the names of the officers who have been prominently associated with me, yet the heat and burthen of the day have been equally borne by all hands.

51. In the Political Department my Assistants, Majors Cotton, Way, and Sidney Smith, have been with me on every occasion, and I beg to strongly recommend these meritorious officers to the favorable consideration of His Excellency in Council.

52. It would be unjust if I did not add that my Interpreter, late Acting Uncovenanted Assistant, Mr. George Lucas, has been of essential service to me. During the past seven years he has accompanied me on numerous arduous and delicate duties.

53. The utility of the Angaum Telegraph Station, as shown on the present and previous occasions, will not escape the notice of His Excellency in Council. It is situate on a most convenient point for ordinary work, and during a crisis becomes the centre of communication.

54. Captain Douglas, like other Commanders, has brought to my notice the advisability of causing an accurate survey of the Kateef and Bahrein reef channels to be made.

55. I have remarked in a preceding paragraph *that the officers of Her Majesty's ships were detached for some 17 days in boats and on board the gunboats, when these went into shallow waters. During this period it became necessary to mess these officers at the tables of the Commanders or gun-room messes of the two gunboats. I would respectfully suggest that no claim be made on Her Majesty's officers on this account, and that an allowance at the rate of Rs. 5 per officer per diem be sanctioned to the Commanders and Messes at which the officers referred to were accommodated.

* Paragraph 43.

Dated 14th November 1869.

Telegram from—*Governor of Bombay,*
To—COLONEL L. PELLY.

Notify by telegraph to Mr. Thomson for information of Persian Government that you have received orders from India to proceed to Bahrein with gunboats and vessels of Royal Navy from Bombay, and to call Chief now in possession of island to account for breach of maritime truce and attack on Chief placed in power by British Government. Act on first recommendation in your No. 184 of 5th October; second recommendation approved, if on mature consideration on the spot of all circumstances and feelings of the people found

desirable; third recommendation depends on circumstances and left to your judgment how indemnity enforced blockade of Wahabee ports referred to Viceroy, and further instructions will be given immediately. Telegraph where to be sent and despatch steamer for them when Bahrein affair concluded.

Dated 14th November 1869.

Telegram from—COLONEL L. PELLY,
To—RONALD THOMSON, ESQ., *Tehran.*

I have received orders from India to proceed to Bahrein with vessels of Royal Navy and gunboats, and call on Chief now in possession of island to account for breach of maritime truce and attack on Chief placed in power by British Government. I am to beg you to inform the Persian Government accordingly.

Dated 12th Shaban 1286. / 17th November 1869.

From—LIEUT. COLONEL L. PELLY, *H. B. M.'s Political Resident, Persian Gulf,*
To—The Chief or Chiefs in possession of the Island of Bahrein.

I am instructed by Her Majesty's Indian Government to call on you to account for the signal breach of the maritime truce recently perpetrated on the Island of Bahrein, and in which act of piracy the Chief, Shaik Alee bin Khalifeh, was killed, the town of Menameh plundered, and numerous British subjects, together with those of Shaik Alee bin Khalifeh, grievously injured or ruined.

If any, or all, of you be desirous of coming on board, safe conduct will be afforded you to and from the ship to the shore.

As a precautionary measure, I warn you to clear out all women, children, and other non-combatants from any and all of your forts, whether in Menameh or Moharrag, and also from the neighbourhood of those forts, whether that neighbourhood be in the form of town or suburb; and it is necessary you should do all this within 24 hours from the time of my messenger delivering this letter at the gate of your fort in Menameh.

I trust that your own good sense and knowledge of the British Government may forthwith lead you so to act that it may not be necessary to resort to force.

But should this unhappily not prove the case, the senior officer of Her Majesty's vessels now present, and of those now on the way to Bahrein, will take such measures as to him may seem proper to carry into effect the instructions of the British Government.

Pending further communications, I would beg you to notify publicly in the town that no boat or other craft is to move from its present position; should it do so, it will be at its own risk. In like manner, pending further communications, no vessel of whatever description should attempt to enter the harbour of Bahrein unless at its own risk.

Dated 13th Shaban 1286. / 18th November 1869.

From—LIEUT. COLONEL L. PELLY, *H. B. M.'s Political Resident, Persian Gulf,*
To—ESAU BIN ALEE, *Guttur.*

After compliments,—I have had the pleasure to receive your letter.

I am now at Bahrein, and shall be glad to see you here if you will come quickly. You can bring with you as many of the Naeem tribe as an armed escort as you like. They will not be injured.

The vessels of war are with me.

Dated 13th Shaban 1286.
18th November 1869.

From—LIEUT. COLONEL L. PELLY, *H. B. M.'s Political Resident, Persian Gulf,*
To—SHAIK MAHOMED BIN SANEE, *Chief of Guttur.*

After Compliments,—I have invited Esau bin Alee to visit me here (Bahrein) with an armed escort of the Naeem tribe, and I desire that he may not be interfered with in any way.

Dated 15th Shaban 1286.
20th November 1869.

From—LIEUT. COLONEL L. PELLY, *H. B. M.'s Political Resident, Persian Gulf,*
To—SHAIK MAHOMED BIN ABDULLAH, *Bahrein.*

After Compliments,—Having reason to suppose that some of the inhabitants of these islands are in fear of being molested, whether by yourself, Nauser bin Mobarek or by the Bedouins piratically collected in Bahrein, I must request that, pending further communications, no chief, tribe or inhabitant of the Bahrein or Moharrag Island be injured whether in person or property.

Should injury take place, Her Majesty's ships will open fire.

Dated 16th Shaban 1286.
21st November 1869.

From—LIEUT. COLONEL L. PELLY, *H. B. M.'s Political Resident, Persian Gulf,*
To—SHAIK MAHOMED BIN ABDULLAH.

After Compliments,—Five days ago I addressed, in obedience to the orders of Her Majesty's Indian Government, a circular letter to the Chiefs in possession of Bahrein, informing them of the duty on which I came here with Her Majesty's ships, and inviting them to conform with the Government wishes, failing which it would become my painful duty to use force.

I invited all the Chiefs off to visit me within 24 hours. I repeated my invitation on the following day, and refrained from using force on my own responsibility.

Nauser bin Mobarek, the Chief who is now occupying the fort of the late Chief Alee bin Khalifeh, whom Her Majesty's Indian Government recognized as Chief of Bahrein, has neither acknowledged my letter, nor has he visited me under the safe conduct offered him. On the contrary, he has allowed his piratical Bedouins to assemble in large numbers on the shore line, and utter the insulting threat of attacking Her Majesty's ships. Further, he is every night clandestinely embarking his goods and animals in boats, and sending them close in shore towards the Wahabee coast in defiance of the blockade.

It is time for the Senior Naval Officer of Her Majesty's ships present and myself to convince this pirate and his Bedouins that they cannot with impunity reiteratedly insult Her Majesty's Indian Government and injure or ruin that Government's subjects. We are compelled to act accordingly. But it will be our chief care to avoid injuring the town or towns-people.

Dated 16th Shaban 1286.
21st November 1869.

From—LIEUT. COLONEL L. PELLY, *H. B. M.'s Political Resident, Persian Gulf,*
To—The Chief and Members of the Dowasir Tribe at Bedagabraud Zellag.

After Compliments,—I request you will oblige me by arranging that neither persons, animals or property be allowed to leave the coast of Bahrein.

Should any craft or person attempt to leave, please detain her or him and inform me. Any of the Dowasir tribe coming on board my ship will have safe conduct and be politely received.

Should persons or property be allowed to depart without my consent, the consequences will be on the head of all concerned.

Extract from letter No. 184 of 5th October 1869, from H. B. M.'s Political Resident, Persian Gulf, to the Secretary to the Government of Bombay, Political Department.

Thirdly, to come to an understanding with whatever Chief might be recognized, to the effect that the estates and other available property of the pirates and traitors, Mahomed bin Khalifeh, Mahomed bin Abdullah, and Nauser bin Mobarek, should be considered as forfeited, and that the produce and value of such property should be applied, in the first instance, towards the reimbursement of persons plundered. But I would exclude from claimants to such compensation such persons as may have implicated themselves in the purchase of plundered property at nominal rates.

I, Esau bin Alee bin Khalifeh, Chief of Bahrein, do, of my own free will, agree to the above arrangement.

Signed and Sealed by Esau bin Alee bin Khalifeh.

Signed and Sealed in our presence on the 3rd day of December 1869.

LEWIS PELLY, *Lieut.-Colonel,*
H. B. M.'s Political Resident, Persian Gulf.

G. A. DOUGLAS,
Senior Naval Officer of H. M.'s Ships employed in the Persian Gulf.

No. 154 P, dated 20th January 1870.

From—C. U. AITCHISON, ESQ., *Offg. Secy. to the Govt. of India,* FOREIGN DEPT.,
To—The Secretary to the Government of Bombay, Political Dept.

I have the honor to acknowledge the receipt of your letter No. 12, dated 8th January 1870, giving cover to a report from Colonel Pelly of his proceedings for the punishment of the offenders concerned in the raid upon Bahrein.

2. In reply I am directed to state that the Viceroy and Governor General in Council has perused the report with great interest, and he instructs me to communicate to you his entire approval of Colonel Pelly's proceedings.

3. His Excellency in Council is of opinion that Colonel Pelly has conducted the whole affair with great prudence, discretion, and courage, and he desires that the warm congratulations of the Government of India may be conveyed to that officer on his success.

4. His Excellency in Council likewise requests that the thanks of this Government may be communicated to Captain Douglas and to the other officers associated with Colonel Pelly for their exertions on the occasion.

5. With reference to paragraph 55 of the report, His Excellency in Council sanctions the proposal therein made regarding the messing of the officers for the time they were on detached duty with the gunboats, and requests that Colonel Pelly will state definitely the total expenditure incurred on this account.

6. The Marine Department will be asked to take into consideration the question of the survey of the Kateef and Bahrein reef channels referred to in paragraph 54 of Colonel Pelly's report.

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

MR. TEIGNMOUTH SANDYS' PROPOSAL TO USE MORTAR BLOCKS IN SUPERSESSION OF CHAIRS AND SLEEPERS ON RAILWAYS.

Dated 29th November 1869.

From—TEIGNMOUTH SANDYS, Esq., *Bhaugulpore,*

To—*The Private Secretary to His Excellency the Viceroy and Governor General of India.*

When quite at your leisure, will you kindly favor me with a perusal of the enclosed memorandum, and exercise your own discretion in placing it before His Excellency the Right Hon'ble the Viceroy and Governor General of India for his information, whenever His Excellency may be pleased to consider the subject.

Should any orders follow thereon, my address is Teignmouth Sandys, Bhaugulpore; and oblige.

Memo.—*By* TEIGNMOUTH SANDYS, Esq., *of a system for a cheap and durable Railway, equal to high or low speed, and removable at pleasure,—dated 29th November* 1869.

It retains only any kind of rail in use, abandoning *in toto* the expensive system in vogue of costly and perishable sleepers, chairs, keys, &c., and ever changing ballast.

2. This is realized by accepting in lieu thereof the ground itself, together with all its ordinary or extraordinary gradients in an usual level country, and by raising embankments only in such places as may be requisite to keep the railway above water level.

3. In the ground, as thus naturally existent, or artificially made, the proposed railway works as follows :—

Blocks of ordinary mortar, half lime and half brick-dust, more or less of the former according to its quality, are compressed in moulds together with the rail to be used; and the result is that the block takes the correct impression of the rail as truly as a seal marks its sealing wax.

4. These blocks, when well dried, and subjected to exposure one rainy season before being used, all the better, become as durable as stone, and fit the rail which passes through them as truly as a key does its lock.

5. To each rail a certain number of these blocks is assigned. The number and size of the block of course depends in the character of the rail, and can be increased or diminished at pleasure, and is open to experiment. These blocks also serve the place of chairs, keys, &c., since the ends of each rail lock together in the centre of each block or can occupy two half-blocks placed in juxtaposition together.

6. These blocks are burried in the ground level with its surface, which thereby does the duty of sleeper. Once buried true to its opposite block, they are little likely to get out of gauge, since the size, weight, and thickness of the blocks, together with the great lateral resistance of the ground itself, will keep it in its proper place. In very loose soils, other simple expedients are available to insure adequate artificial lateral resistance for maintenance of the gauge, but the use of which would be exceptional.

7. For the East Indian Railway rail, I made a block of the following dimensions :—

Four feet square, six inches thick on the inner and seven inches thick on the outer side. Four of these blocks (3 entire and 2 halves) were assigned to each rail of 20 feet length.

Shortly after the opening of the railway to Bhaugulpore, I obtained permission to put down seven pairs of rails at the end of a siding, then much used for the conveyance of heavy stores, chiefly rails. Up to this date it is in the same spot. But of late years this siding has become superfluous, and is only occasionally used for spare carriages. A heavy locomotive was once taken over it without injury, but in such a cramped position; of course at no speed.

8. I was also in treaty for a similar experiment with the rail of the Nulhattee Branch Line, but the opportunity was lost, and it was never tried, though I then had, and still have, some 50 to 100 blocks quite enough for any preliminary trial.

9. These Nulhattee blocks were of like size and dimensions to those of the East Indian Railway; the object of both experiments being to ascertain what might be the correct size of block for a heavy and light rail respectively. Some of the East Indian Railway blocks, although all of the same standard size, 4 feet square, differed in thickness above seven inches.

10. The cost of each block, the prices of lime and brick-dust being ordinary, would average twelve annas. This, together with the cost of the rail, and the fixing such railway in the ground, would constitute its outlay in full for construction, as carried through a country in its natural level, and through shallow streams as would amply answer for local purposes in many places.

11. The objection raised by the Railway Engineers to these artificial blocks was "rigidity." Stone blocks had been tried and condemned. But it is self manifest the rail could not have rested in these stone blocks in the way they do within these artificial ones, as the expense of such manufacture, if practicable with stone, would have been prohibitory of any thing of the kind. Moreover, the idea of "rigidity" may or may not arise in prejudice resting on very incomplete experiment. Any one standing close to heavy train in motion cannot help feeling the vibration of the ground under his feet caused thereby. Whence then the rigidity of the ground itself? when everything founded thereon, let the railway system be what it may, thus yields to the violence of a train in motion, and which must necessarily increase in ratio to the speed with which the train is driven.

12. I do not claim for any block success, since, as already explained, this would be premature, but I think they will be found deserving of fair trial. If they cannot be made of sufficient size and thickness to stand the highest rates of speed, still they would undoubtedly answer for tramways and lower speeds, or wherever a cheap railway, rather than none should be desirable. In any case, a railway of this kind and kept in working order would be less expensive than the original cost of a metalled road and its maintenance; whilst the difference between the two systems would represent so much clear profit.

13. But it is quite beyond the capability of one individual to carry out experiments of this kind. Of late years, systems of cheap railway have attracted some attention, but they do not seem to make much progress. The principles so nobly recognised in the Government of India's proceedings of 22nd September last regarding Rheea, would doubtless tend to develop something valuable in this matter also, giving rise to a wider interest in it through the excitement of general competition, which so successfully brought the first real locomotive into existence. The Government of India also, with its now numerous direct railway engagements, in a country more especially like India, becomes the most interested party in such a matter.

14. I do not seek anything of the kind for my own proposition, but that it may give rise to something better. If I have sufficiently interested His Excellency the Right Hon'ble the Viceroy and the Governor General of India in the foregoing particulars, on the slightest expression of his pleasure to such effect, I shall be most happy to despatch per rail, for his inspection, two of the railway blocks above described :—

One for the East Indian Railway, with a portion of its rail locked therein.

One for the Nulhattee ditto ditto ditto.

15. After such inspection, should His Excellency still further express his pleasure, I shall be prepared to seek the removal of all the blocks now on the East Indian Railway siding at this station, and despatch them, together with some 50 to 100 Nulhattee ones, per rail, to Calcutta, to be placed down anywhere for trial His Excellency may be pleased to order. I beg to suggest their being put down, in the first instance, in the Municipal Railway. All that will be wanting is the requisite number of East Indian rails and Nulhattee rails, both of which, I conclude, will be easily procurable in Calcutta.

16. Should such trial turn out favorably, I am ready to place the system at the Government's entire disposal, on the sole condition that its commencement be placed in my hands.

This need to be only on a small scale to secure its future successful working. The expense would be inconsiderable, Rs. 2,000, for which I would supply the

requisite working tools, the moulds, two sets of portable presses, sufficient to work 10 to 20 moulds at one time, and a carriage for placing the blocks and rails in position.

I resign the free use of the system and its tools to the Government, who may cause them to be copied and improved on at their pleasure to suit any amount of work that may be undertaken.

Exclusive of the above amount, it would be as well to have a portable steam engine, so arranged as to work the best kind of soorkee and mortar mill, and, at the same time, serve as a traction engine for carrying on the line itself as constructed the working materials required, *viz.*, engine, mills, presses, blocks, rails, lime and soorkee (brick-dust)—the two latter from places most conveniently situated to the line itself. The blocks should be made on the spot itself, at distances suitably apart. Worked in this manner, the expense of construction ought to be reduced to a minimum.

17. On my travelling expenses being paid, and on a deputation allowance of Rs. 20 per diem during the next two years, I engage to proceed to any place required, and there superintend the commencement of any line of the kind proposed, so that my attendance there does not exceed from one fortnight to one month at any one time. I would undertake to teach a body of ordinary intelligent native workmen, under proper European supervision, to carry on the work, as well in my absence as in my presence, and after the commencement, perhaps any necessity for my deputation might be only occasional, and soon cease altogether.

18. I will not conceal from His Excellency what I look to as my real reward in this matter. I will be honest as I ought to be, whilst taking the liberty to trouble His Excellency the Right Hon'ble the Viceroy and the Governor General of India with the perusal of this memorandum, and which, I trust, the importance of the subject will excuse. I respectfully present it, not altogether through public motives ; I fear selfish ones are predominant. I wish to realize what is the cheapest kind of tram railway practicable and easily removable at pleasure, which would answer for agricultural purposes, more peculiarly invaluable in a country like India; and if at the same time it can combine other general purposes of railway conveyance, all the better. If this can be ascertained, then whether any one else or my own is the successful system, I would apply it, in the event of my eventually pursuing Rheea cultivation, to that cultivation to which, with its extension, which can alone secure its commercial success, it is, from the nature of the plant itself, peculiarly and economically applicable. If this can be ascertained at once, so much valuable time will have been gained beforehand.

Dated 6th December 1869.

Endorsed by the Private Secy. to the Viceroy.

Transferred for disposal to the Secretary to the Government of India in the Public Works Department.

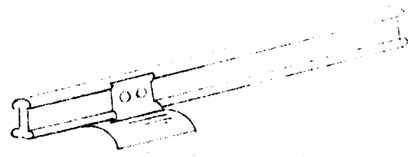
No. 1972 R, dated 31st December 1869.

From—Major E. C. S. Williams, R. E., *Depy. Secy. to the Govt. of India*, P. W. Dept.,

To—Teignmouth Sandys, Esq., *Bhaugulpore.*

Your communication of the 29th November 1869, to the address of the Private Secretary to His Excellency the Viceroy and Governor General, with its enclosed memo. on a system for a cheap railway, having been considered

by the Government of India in this Department, I am directed to forward, for your information, copy of a note on the subject prepared in this Department, and to state that it appears to the Governor General in Council that, without cross ties, the system must fail for anything but slow-speed tramways. It might, however, it is thought, answer for sidings, but the Government of India is unable to make trial of the scheme, and there will always be on railways a quantity of indifferent material of the nature used for the running line, which may be disposed of in sidings where the wear and tear is not important.



Note by the Under Secretary in the Railway Branch on Mr. Teignmouth Sandys' *proposal to use mortar blocks to hold rails in place.*

Mr. Teignmouth Sandys' proposal is apparently to use a block of concrete or mortar in lieu of sleepers, ballast, chairs, keys, and spikes to support an iron rail on which an engine is to run. From the clear description, the under-shown sketch is drawn to represent the position

of one of these blocks which are to set on ordinary ground, except where embankment and bridging are required to keep the rail above water.

There is no doubt but that good mortar may be made so as to fit round the rail, and hold it in its place in dry weather if there be no passing load. Mortar has no special advantages, according to the written description, but cheapness. Iron moulded in the same shape would answer the same purposes, and if iron moulded, then iron wrought to fit the rail tightly by means of bolts or rivets as below :—

Iron has been tried in this way, and it has been found that ballast is required just as much as if a wooden sleeper were used.

As a heavy weight passes over any part of the earth, that part is depressed, and it does not perfectly recover its position after the load is removed. After several of these compressions and partial recoveries, the rail must have the support packed up to prevent the rail from being bent; it is to supply a hard material for this purpose that ballast is used. It would be wanted for the brick blocks as well as for any other kind of support.

Again, the inventor thinks that lateral ties will not be necessary. They have been found to be necessary in every case where the rail has even been supported throughout its entire length, as in the Great Western Railway of

England. The principle of the mortar blocks does not counteract the effect if the side blow of an engine wheel and ties would be wanted, as well as for any other kind of support.

Again, as ballast is necessary for packing, so it is necessary also to use an implement by which to force the ballast firmly up to the support. In this operation, the iron tool or beater is so forcibly struck against the support that even wooden sleepers are beaten to pieces.

Mortar is very brittle compared with wood, and must necessarily suffer much more under repeated blows than wood.

Again mortar, although it may fit fairly against the rail when it first is laid down, must wear, as a load of six tons on each rail strikes sometimes vertically, sometimes sideways, on the rail. When it wears in even the slightest way, there is no means of repairing the block of mortar; the abrasion must increase, and the rail must rattle dangerously in the support, as it is not possible to tighten it.

A rigid support, such as is recommended by the inventor, was probably the first kind of support devised for a rail, and when it was found to fail, other more artificial expedients were resorted to. Notably, a cast-iron chair closely fitted to a rail and resting on a stone block was tried and condemned, as being not expensive in itself, but as being most costly in the destruction it caused to rolling stock. The mortar block could not be better than the stone block; if so good, it would be too expensive, according to past experience, to adopt.

This proposal has been well known for the past ten years in Bengal, and as the principle is defective, I do not recommend that any expense shall be gone to. The good faith of the inventor and the single-minded perseverance which he has shown in the prosecution of this and other experiments, deserve a more remunerative result than can, in my opinion, accrue from the nature of his trial.

Dated 7th January 1870.

From—TEIGNMOUTH SANDYS, Esq., *Bhaugulpoor*,

To—*The Depy. Secy. to the Govt. of India*, P. W. DEPT.

I have the honor to acknowledge your favor No. 1972R, dated 31st ultimo.

May I request the favor of your own and Mr. Vaux's perusal of the enclosed suggestions in reply to that gentleman's opinion, beyond which I will not take the liberty to trouble you further.

I beg to submit my best acknowledgments for the attention bestowed on the subject.

Suggestions in reply to MR. VAUX'S *opinion, dated 13th ultimo, regarding mortar blocks for rails.*

If the experimental proposition does not altogether dispense with the ever-shifting expensive ballast and perishable sleepers as now in vogue, then it is not worth a trial.

The mortar blocks are not set on ordinary ground, but together with the rail are buried therein, just as much as rails on the East Indian Railway are buried almost even with the ballast, leaving only the upper or running rail exposed to view.

For instance, each mortar block being four square feet, and seven or nine inches thick, is firmly fixed in the ground, leaving only one and one-quarter inch thick visible above ground.

In this way, also, the ground itself forms the tie. For such a tie to be weak, the ground itself to the full size of the blocks themselves, including both sides of railway, must first give way; whereas, in solidity, the ground itself may be said to be immoveable, whilst ballast, in its very essence, is moveable. In exceptional cases, where the ground is treacherously weak, a difficulty would arise to be counteracted by other contrivances sufficiently simple in the face of such complexity.

Ballast now used as a hard material to counteract depression of the earth caused by heavy weights passing over it, is self-provided for in the blocks themselves, since each one shows a base of four square feet or sixteen square feet to each rail of twenty feet in length; whereas sleepers and chairs as now in use are restricted to as many inches. These mortar blocks also are capable of being increased in size either by the square or superficial contents, say half as much again, whilst there is no limit to thickness within the given size short of what is convenient. Thus, with a sixteen square feet resistance, the depression of the earth will be reduced to a minimum, and, if any, then these mortar blocks admit of packing easier than is now the case with ballast. Blocks and rail together could be readily raised out of the ground, without recourse to the laborious violence and blows ballast so much delights in, and their foundations mended by simply throwing in a little earth, or any hard material if preferred, which would soon become so solid as to need little repetition, certainly not of the incessant kind and extent to which ballast is now subject.

The Great Western Railway of England never tried principles of this kind.

As regards the wearing of the mortar blocks by abrasion, experiment alone could test this. But the same remarks as above are applicable. Here again, mortar blocks have to deal with feet, instead of, as in the case of chairs, keys and sleepers, with inches. The abrasion, therefore, would be necessarily less in proportion to the wearing surface, most where narrow, less where broad, and the earth itself from each side, or a little sand placed above and shaken by the traffic itself into any vacant place, would serve to keep the rail tight, and prevent rattling. Further, in case of any of the blocks becoming unserviceable, the material itself could be re-used, with the addition of a certain proportion of fresh mortar to make new blocks.

No. 101 R, dated 17th January 1870.

From—Colonel R. STRACHEY, R. E., *Offg. Secy. to the Govt. of India*, P. W. DEPT.,

To—TEIGNMOUTH SANDYS, Esq., *Bhaugulpoor*.

I have the honor to acknowledge receipt of your favor of the 7th instant in further explanation of your proposal to use mortar blocks in supersession of chairs and sleepers on the State Railways, and in reply I am directed to observe that the remarks contained in the Under Secretary's note, forwarded to you on 31st ultimo, in No. 1972R, appeared deserving of some weight, and likely to be of interest to you; but they are not to be understood as representing any conclusions come to by the Governor General in Council, or to have been sent to you as though thought to be conclusive as to the merit of your invention. The Government of India, however, after full consideration, and thanking you for your suggestions, do not consider themselves at present justified in expending money in experiments on mortar blocks to replace sleepers.

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Friday, the 21st January 1870.

PRESENT:

His Excellency the Viceroy and Governor General of India, K. P., G. C. S. I., *presiding*.
His Excellency the Commander-in-Chief, K. C. B., G. C. S. I.
The Hon'ble G. Noble Taylor.
Major General the Hon'ble Sir H. M. Durand, C. B., K. C. S. I.
The Hon'ble John Strachey.
The Hon'ble Sir Richard Temple, K. C. S. I.
The Hon'ble J. Fitzjames Stephen, Q. C.
The Hon'ble Gordon S. Forbes.
The Hon'ble D. Cowie.
Colonel the Hon'ble R. Strachey, C. S. I.
The Hon'ble Francis Steuart Chapman.
The Hon'ble J. R. Bullen Smith.
The Hon'ble F. R. Cockerell.

HINDU WILLS BILL.

The Hon'ble MR. STEPHEN moved that the Report of the Select Committee on the Bill to regulate the Wills of Hindús and Buddhists in the Presidency Towns be taken into consideration. He said—"My Lord, my hon'ble friend Mr. Cockerell proposes to move, as an amendment, that this Bill be referred back to the Select Committee with instructions to report again in six weeks. I shall have no objection whatever to agree to that course, because the Select Committee has made a very important alteration in the draft of the Bill introduced to the Council some time ago, by proposing that that section of the Indian Succession Act, which refers to perpetuities, be extended to the wills affected by the Bill. I understand, also, that the Hon'ble Mr. Cockerell wishes that the Bill should be extended to the wills of the whole Hindú population of Lower Bengal. These two proposed alterations undoubtedly require careful consideration. I have therefore no objection to agree that the Bill should be referred back to the Select Committee, and that they should be instructed to report in six weeks. At the same time, I hope that I shall not be wasting the public time by making a statement in the Council with respect to the character of the Bill in some particulars, and more especially with regard to the alterations now suggested. I do so in the hope that, in the course of the six weeks during which the Bill will undergo further consideration at the hands of the Select Committee, public attention may be directed to the real points at issue; and that the motives which actuated both the original draftsmen and the Committee in bringing the Bill into its present shape, may be properly appreciated. I shall therefore say a few words on the different provisions of the Bill, and enter somewhat more fully into the reasons of the Committee with regard to the clause regarding perpetuities. After the circulation of the Statement of Objects and Reasons, and the statement made by the Hon'ble Mr. Cockerell on a former occasion, I may pass rapidly over the general features of the Bill. I wish, however, to say, that one principle has been recognized throughout every part of this measure. That principle is to combine the utmost possible respect for Native opinions and institutions, with a gradual improvement of those institutions, and their adaptation to changing circumstances.

In the first place, I may say a few words about the history of the measure. A paper was circulated, requesting the opinions of persons well acquainted with the subject, so far back as the year 1865, almost immediately after the passing of the Indian Succession Act. The answers to that paper are most interesting, and peculiar interest attaches to the Native opinions, many of which are very able. One point on which these answers threw light, was the importance of not extending the provisions of the Succession Act to Muhammadans, and this has been recognized in the original draft of the present Bill. The Muhammadans possess an elaborate legal system of their own upon the subject of wills. It is closely connected with all their customs and with their religious belief, and it would be improper to disturb it. An excellent detailed statement of the differences between the Muhammadan law and the Indian Succession Act upon this subject has been supplied by a former Muhammadan Law Officer in the North-West Provinces. It is printed at length at pp. 48—57 of the collection of papers. On the whole, speaking of the contents of the papers generally, I may say that, though the Native gentlemen consulted made some objections to what they supposed to be the purport of the proposed measure, objections which were obviated by the provisoes which have been introduced into it, the papers show that they received the main provisions of the Bill with satisfaction. I will read, as an illustration of this, a few observations made on the Bill by the Rájá of Benares. After quoting some authorities, the Rájá observes—

'At all events, the written will has now come into use, and the reason is that the people have become gradually impressed with the idea that property, whether personal or real, is, without a written will, liable to injury, and that the disputes of relations burden the estate or property with heavy law-expenses, by which it is eventually ruined and lost.

It being, therefore, apparent that the Natives have followed the example of the English in this respect, and that written wills are being generally adopted, it is expedient to prescribe rules for their execution.

The objections to, and defects in, nuncupative wills, alluded to in the confidential letter of Government, are with few exceptions just and valid. No definite limits can be assigned to nuncupative wills, and although the High Courts of Calcutta, Madras and Bombay admit the legality of nuncupative wills by Hindús, yet the times and the condition and character of the people render the execution of written wills preferable.'

I come now to the objections raised against the measure. They can all be brought under the four following heads:—*First*, that the Bill would interfere with the Native Law of Succession; *secondly*, that it would interfere with the Native Law of Marriage; *thirdly*, that it would interfere with the right to leave property for the purpose of a religious endowment; and, *fourthly*, that it would interfere with the supposed right of Hindús to create a perpetuity. Of these four objections, the first is met by the proviso that nothing contained in the Bill shall enable a testator to bequeath anything which he could not have alienated *inter vivos*, or to deprive any persons of any right of maintenance which they would have possessed if he had died intestate, and by the omission of certain Parts of the Succession Act, to which I shall refer in their place. The second is met by the proviso that marriage, in the case of Hindú wills, shall not operate as a revocation. The third is met by the omission from the Bill of the 105th section of the Indian Succession Act. The fourth objection proceeds, as I shall show at length, upon a misconception of the Hindú law.

When the effect of the provisoes referred to is considered in connection with the omission from the present Bill of certain Parts of the Indian Succession Act, it becomes apparent that the result of the whole measure will be to preserve to the Hindús the full benefit of every part of their present Law of Inheritance. In order to set this in a clear light, I will go through the provisions of the Bill, and show how they bear upon the subject when taken in connection with the provisoes.

The general object of the Bill is to apply to the wills of Hindús such Parts of the Indian Succession Act as are adapted to their circumstances. I will now

point out specifically which Parts of that Act are, and which are not, regarded by us in that light. The first six Parts of the Act relate to domicile, consanguinity, intestacy, the distribution of intestate property, and the effect of marriage. No part of these provisions would apply to Hindús : to apply them would be to produce a total revolution in the Hindú Law of Succession and Inheritance, and they have accordingly been omitted. The seventh Part of the Act is general, and begins with the forty-seventh section, which is in these words—'Every person of sound mind and not a minor may dispose of his property by will.' This, standing alone, would no doubt affect considerably the Hindú Law of Inheritance, but it must be taken in connection with the proviso to which I have already referred,—that nothing contained in the Bill shall authorize a testator to bequeath property which he could not have alienated *inter vivos*, or to deprive any persons of any right of maintenance which they would have possessed if he had died intestate. The effect of section 47, qualified by this proviso, will be that Hindús within the local limits of the Bill will be able to dispose by will of such property as Hindú law permits them to dispose of by deed *inter vivos*, and that their testamentary power will be limited by such rights of maintenance as Hindú law confers upon their families at present. Nothing else in the application of this part of the Act requires notice till we come to Part IX, which relates to the wills of soldiers and sailors on active service. By the Indian Succession Act as well as by the Law of England, such wills may be nuncupative. This Part is not applied to Hindú wills, because the wording of section 50 renders it unnecessary to do so. That section runs thus—'every testator, not being a soldier employed in an expedition or engaged in actual warfare, or a mariner at sea, must execute his will in the following manner.' Therefore, if the Hindú testator is a soldier or sailor on active service, section 50 does not apply to him, and he is still at liberty to make a nuncupative will according to the present Hindú law. The tenth Part of the Act, with regard to attestation, revocation, alteration and revival of wills, requires no notice.

The Parts (XI to XXVIII, both inclusive), which relate to the construction of wills, may require a few words. They consist mainly of provisions which can in no way whatever affect any rights of inheritance. They are merely directions for the guidance of the Judges in settling cases, which, as experience shows, constantly arise as to the meaning of a testator's words. They are of universal application, and will be found of great convenience to all persons having to interpret wills, and, as to most of these rules, I cannot conceive how they should be opposed to Native ideas. There are, however, some of them of which this cannot be said. They are contained in sections 78, 79, 80, 81, 84, 86 and 87, and arise principally out of certain technicalities of English law. I need not trouble the Council even with a slight sketch of these, but any one who possesses any acquaintance with English Real Property Law must be aware that such words as 'heir,' 'right heir,' 'children,' 'issue' are dangerous in the extreme, and that, if used without the greatest care and the best possible advice, they are nearly sure to produce litigation. This arises, not from the nature of things, but from peculiarities in the English law, especially in the English Law of Real Property, which have nothing to do with the wills of Hindús. The rules relating to the interpretation of such expressions have accordingly been omitted from the Bill. I pass over, for the present, the section relating to perpetuities, which occurs in this part of the Succession Act, and I come to Part XXVIII, relating to what is called in English law the *Donatio mortis causâ*. We have omitted to extend this Part, first, because it has nothing to do with wills, and, secondly, because we do not wish to interfere with the rules of Hindú law in regard to gifts.

The next part of the Succession Act which is applied to Hindú wills is that which relates to executors and administrators with a will annexed. It consists of Parts XXIX, XXX, XXXI and XXXIII to XXXIX, both inclusive. The matters to which these Parts relate are most important, and the

change which we propose to effect by applying them to Hindú wills will, I hope, be found most beneficial. Speaking generally, the object of the Bill is to give to Hindús the benefit of definite rules with regard to the duties and position of executors and of administrators with a will annexed; but we have been exceedingly cautious to leave out every section the effect of which would be to vary the course of inheritance. We have effected this object in the following manner :—

By section 179 it is provided that the executor or administrator of a deceased person is his legal representative, and all the property of the deceased person vests in him as such. This would have altered the Hindú law, if we had not qualified it by the proviso that nothing shall vest in the executor or administrator with the will annexed of a deceased person which such person could not have alienated *inter vivos*.

Again, sections 200—207 provide in substance that, if a man dies intestate, administration is to be granted to his next of kin in the order stated in other parts of the Succession Act. If these sections had been applied to Hindús, they would have altered the present practice of granting administration. We have accordingly abstained from extending them. On the other hand, by sections 195, 198, 230 and 231 (which are extended to Hindú wills), administration with the will annexed must be granted to the person who would be entitled to administer in case of intestacy, and we have taken care to add words to those sections to show that we mean the person now entitled, without reference to our Bill or to the Succession Act. The Court will have to be guided in such cases by the Hindú law. In the language of our Courts, the grant will follow the interest; that is, the letters will be granted to the person or persons who, according to Hindú, Jaina, Sikh, or Buddhist law (as the case may be) are entitled to succeed to the estate of the deceased, or in the case of an undivided Hindú family, to the managing member of the family. These arrangements in my judgment effectually protect the Native Laws of Inheritance from any alteration by this part of the Act. I hope that, with these precautions, this part of the Act will prove to be highly beneficial. It will for the first time define clearly the position and powers of a Hindú executor or administrator, and provide him with distinct and authoritative guidance in the discharge of his duties. This is highly important; for, as matters stand, the position of a Hindú executor is difficult to comprehend. A Hindú will itself is a matter of comparatively modern growth, and a Hindú executor is in a condition even more embryonic than that of a Hindú will. He is at present rather a manager than an executor; but by these provisions he will be placed in very much the same position as an English executor, though the substance of his duties will be regulated by Hindú law.

One or two other provisions of small importance have been omitted. For instance, we do not apply to Hindú executors the provisions relating to executors of their own wrong.

I now come to a matter in which a substantial alteration has been made in the Bill by the Select Committee,—that is, the question of perpetuities. The section which we propose to introduce is this—

'101. No bequest is valid whereby the vesting of the thing bequeathed may be delayed beyond the lifetime of one or more persons living at the testator's decease, and the minority of some person who shall be in existence at the expiration of that period, and to whom, if he attains full age, the thing bequeathed is to belong.'

That is substantially the rule of the English law, and the Committee propose that it should be applied to Hindú wills. It has been said that this is an alteration in the Hindú Law of Inheritance. I have studied the matter as carefully as I could, and after considerable trouble and consideration I have arrived at the conclusion that it would be difficult to imagine a more total and complete mistake. I am indeed disposed to doubt whether those who make such an objection know what a perpetuity means. If they did, they would see that the power to

create a perpetuity, as we understand it, is diametrically opposed to the whole spirit and character of the Hindú law. It may be necessary for public information to say, in a few words, what I understand by this power. It is, in substance, a power of posthumous legislation for an indefinite period, by which the testator or settlor is enabled to restrain the alienation, and to suspend the possession and enjoyment, of property for such time as he chooses—a power to lock up land and capital for ever, to prevent the free circulation of property, to check the improvement of land, to render its acquisition impossible. The possession of this power has, by a strange peculiarity, by a sort of disease of the human imagination, been ardently desired by a certain number of persons in all countries and at all times. People seem to suppose that they can perpetuate their own enjoyment of property by interfering with other people's enjoyment of it after they are dead and gone. They seem to think that a man can extend his own life by doing something which, hundreds of years after his death, will affect the lives of other people. This delusion invariably springs up in men's minds when the power of making wills is conceded to them. It exists to this day both in England and in India, and has shown, as it is still showing, itself in the most absurd and mischievous testamentary dispositions. The object sometimes is, as in Mr. Thellusson's case, to accumulate enormous sums of money for the benefit of some distant descendant. In other instances testators have attempted to regulate the succession to property in a manner totally unknown to the law, and others have attached childish and ludicrous conditions to the enjoyment of their property. One man provided that certain furniture should never be taken out of his house during the term of several lives in being, and for twenty-one years afterwards, and had he had power to extend these conditions over many centuries, he would no doubt have done so. That a wish of this kind exists, not only in England but also in Bengal, and that it exists at present as strongly as ever, is proved by a case decided lately—the case of *Kumara Asima Krishna Deb* (Appellant) v. *Kumara Kumara Krishna Deb* (Respondent). The testator in that case provided by his will for the accumulation of his property for ninety-nine years at least, and probably for a much longer period. That is an example of what is meant by the system of perpetuities, and I assert that it is sanctioned neither by the Hindú nor by the English Law, nor by any system whatever, which is based upon common sense even in a small degree. I will add that, under every system of law with which I am acquainted, it has been found necessary to devise means to restrain persons from putting into effect these extravagant and mischievous notions of their testamentary powers.

It is by no means easy to see how the opinion that the Hindú law authorizes the creation or existence of perpetuities ever arose. I asked myself this question when I entered upon the consideration of the subject, and the more I studied it the greater became my difficulty; because it was perfectly clear that, if any law could be opposed to the system of perpetuities, that law was the law of the Hindús; and this I will endeavour to show in a few words. There are two modes in which the devolution of property may be regulated. It may be regulated, either by the provisions of the law as to its descent, or by will. So far as it is regulated by law, it cannot be regulated by will, and so far as it can be regulated by will, it is not regulated by law. In proportion, therefore, as the law of any country regulates the devolution of property, to that extent it excludes testamentary power; and the more any given system recognizes the principle of permanence, the more alien to that system would be the principle of testamentary perpetuities as I have described it. In England a very wide latitude is permitted to the testamentary power. In France hardly any latitude at all is permitted. The French law declares that the whole of a man's property shall descend to his children equally, with certain exceptions. It therefore excludes the power of creating perpetuities by will, and consequently the power of creating perpetuities is more alien to the law of France than to the law of England. I now proceed to consider how the law of Hindústán stands with respect to the power of creating perpetuities by will, and I assert that no imaginable system of law could be more fundamentally opposed to them; for it is a system so unfavourable to testamentary power of any kind at all, that wills themselves are unknown, or all but unknown, under it; and that, in the greater part of the country, the owner, or rather the possessor, of property, is not only unable to leave it by will, but is unable to alienate it *inter vivos*, except with the consent of his sons. The Hindú law upon this subject differs in different parts of the country. It is contained, as is well known, in several authoritative works, the authority of which applies to different districts. The Mitákshará is the great authority for all the schools of law except for that of Bengal, and might perhaps be described as the common-law of Hindústán; though the phrase must not be pressed as it is liable to abuse. There is also the Dáyabhága, which prevails in Bengal, the Vyavahára Mayúkha in Bombay, and there are other authorities which prevail in Madras and other parts of the country. The general scheme of the Hindú law is, that a man's property is to descend to his family. It is indeed hardly an exaggeration to say that the family, and not any one living man, owns the property, and that the father is more in the position of a manager than in that of a proprietor, as appears from the whole purport of the law of partition, the distinction between ancestral and self-acquired property, and the rules which pervade the whole subject as to divided and undivided families. Such being the state of the Hindú law, is it possible to imagine anything more diametrically opposed to the testamentary power, and still more to the power to create a perpetuity by will, which must, by the nature of the case, derogate from the most essential provisions of the Hindú law? What can be more opposed to the spirit of the Hindú law than that a man who cannot alienate his ancestral immoveable property without the consent of his sons, grandsons and great grandsons (if he has them), should be able to leave it by will to a stranger for life, and to entail it for ever upon one particular line of that stranger's descendants?

This being the state of things, it is a curious question how the notion that testamentary perpetuities formed a part of Hindú law can ever have grown up? As I am most anxious to vindicate fully the course which the Committee have taken, I will try to answer this question, though it will involve a somewhat technical statement. Whatever the precise origin of Hindú wills may have been, it is an admitted fact that they are of very modern origin. My own opinion is, that they came into use after the establishment of British rule in Hindústán, that they grew up by degrees, and that a certain number of obscure texts in Hindú law-books, which in fact apply to a different subject, were used for the purpose of sanctioning their introduction after the practice had been introduced. My opinion on such a subject is of course of little value; but as far as I can judge I should say that the native texts in question apply, not to the power of making wills, but to the power on the part of a father to make dispositions of his property to take effect after his death, which gifts, when once made, were irrevocable. Now the essence of a will is, that it is ambulatory; that is, that it is revocable until the moment of death, and becomes irrevocable only upon the death of the testator.

The documents which are now described as Hindú wills antecedent to the establishment of the English power were in fact, as I believe, irrevocable gifts made during the lifetime of the testator. I ought however to add that, in Lower Bengal, where the Dáyabhága prevails, the legal right of alienation on the part of the head of a family has been established, though, in the absence of his sons' concurrence, it is reprobated as immoral. The effect of this would no doubt be to suggest the idea of alienation by will, and to dispose people to find authorities for that practice, when once introduced, which in point of fact have nothing to do with it. Be this how it may, there is no doubt that the power of making wills has been well established in Bengal ever since the famous Nuddea case, which was decided early in the present century. What might have been expected followed. When the Natives of Bengal

began to make wills, they soon began to wish to create perpetuities; and inasmuch as wills had been unknown to the early Hindú laws, those laws contained no rules against perpetuities; hence they argued that they had the right to create perpetuities. No argument could be more absurd. It might be stated thus:—because it was till very lately questionable whether we had the power to make a will at all, therefore we have now an amount of testamentary power which no other nation ever possessed. This was fully recognized by the Courts of justice which had to decide upon particular cases; but there is some real and more apparent confusion and indistinctness in the way in which they dealt with the subject; and in order to state precisely the existing state of the law it will be necessary to enter into a certain amount of technical detail. In 1859, a case came before the Privy Council. It was the case of *Sonatun Bysakh* v. *Sreemutty Juggutsoondree Dossee* (8 Moore I. A. C. 66). In that case an attempt was made to create a perpetuity, and the Supreme Court at Fort William had laid down the law upon the subject in the following words, p. 78:—

'If the question were untouched by authority, we should be of opinion that the testamentary power engrafted upon the general Hindú law by the custom of Bengal, which has been recognized and established by repeated decisions, must be taken to exist, subject to those restraints which the general policy of the law imposes on the exercise of testamentary power in general; and in particular, that it cannot enable a Hindú testator to alter, perpetually, the legal course of succession to his property by making it pass for all time to those who, taking not as legal, but as substituted, heirs would, according to our phrase, take, not by descent, but by purchase. But in truth we are bound to hold this, unless we are prepared to overrule the decision of the Court when presided over by the late Chief Justice in *Luckunchunder Seal* v. *Koroonamoney Dossee*, Boulnois' Reports, 210. Therefore, some time before 1859, the Supreme Court ruled against the doctrine of perpetuities. The Privy Council, in their judgment in that case, passed over the subject of perpetuities; but they varied the decision of the Supreme Court on other grounds, and the effect of that was, that it seemed doubtful whether the ruling of the Supreme Court as to perpetuities was correct. That doubt would appear to have been considerable, inasmuch as a case (*Ramdhone Ghose* v. *Annundchunder Ghose*, 2 Hyde, 93) was decided in the year 1864, by Mr. Justice Levinge, in which he not only held that a devise creating a perpetuity was valid, but referred, as the ground of his decision, to certain remarks made by Sir Barnes Peacock in a case (*Goberdhun Bysack* v. *Shamchund Bysack*) decided by him some time before and now reported in Bourke, 282. The effect of this decision, so far as it went, was to prove that perpetuities were valid according to Hindú law. However, the subject again came up for decision in a later case (reported in 2 Bengal Law Reports, O. C. J. 11), and with reference to a will which attempted to create a perpetuity for ninety-nine years. In that case, Sir Barnes Peacock strongly pronounced against the power of creating a perpetuity. I shall not give the very words used by Sir Barnes Peacock on these occasions, because to do so would occupy too much time, and require the statement of too many facts of no general interest; but the substance of his explanation of the apparent inconsistency between his two judgments was, as I understand it, as follows—'I said *then*, and say now, not that by Hindú law perpetuities were good, but that the remedies against perpetuities adopted by English law did not apply to Hindús,' which was quite a different proposition. At all events, in the second case, he expressly laid down, in the clearest way, that perpetuities were not only not valid by the law of the Hindús, but were on the contrary opposed to the whole spirit of the Hindú law. Besides these cases, certain expressions fell from the Judicial Committee of the Privy Council, in giving judgment in another case (*Sreemutty Soorjeemoney Dossee* v. *Denobundoo Mullick*, 9 Moore, I. A. C. 123) which I could imagine might favour the notion that perpetuities were valid by the Hindú law. Lord

Justice Knight Bruce said—'We are to say whether there is anything against *public convenience*, anything generally mischievous, or anything against the general principles of Hindú law, in allowing a testator to give property, whether by way of remainder, or by way of executory bequest (to borrow terms from the law of England) upon an event which is to happen, if at all, immediately on the close of a life in being. Their Lordships think that there is not.'

Now those words 'remainder' and 'executory bequest' are words with regard to which there is a very long history, and a person who reads the judgment quoted carelessly, or with a strong wish in his mind to find in it an authority for perpetuities, might perhaps argue that the Court meant to say that the Law of Remainders and Executory Devises, as it exists in England, is in force in Hindústán without the restrictions to which they are subjected in England, and of which the judgment says nothing. That is not, as I need hardly say, the true construction of the judgment; but it is a construction which might be put upon it by a prejudiced mind. This, however, is more or less speculative; but whatever may have been the particular phrases or cases which gave rise to the notion of the legality of perpetuities, I do not think I can be wrong in saying, in general, that it was due to a want of perception of the leading idea which runs through all these cases, which is this:—The Judges were anxious, from first to last, to condemn perpetuities on the one hand, without introducing, on the other, the remedies against them provided by the English Law of Real Property; and the language which they employed for the second purpose may have appeared, or may even have been, to some extent, inconsistent with that which they used for the first purpose. I do not think, however, they should be blamed for an anxiety which may have led them a little astray in their language in one or two instances; for the introduction of the English Law of Real Property into this country would be a worse remedy than the disease. The difference between the laws of the two countries is this:—In India, wills and perpetuities alike were altogether unknown until quite lately, and the absence of express rules against perpetuities arose from the absence of any law about wills. In England, both wills and perpetuities are comparatively ancient, and the safeguards provided by the judges and the legislature against the abuse of the one, by the introduction of the other, are to the last degree intricate and technical. I need not trouble the Council with a history of them; but by way of giving a faint notion of what India has escaped by the refusal of the Courts to introduce them, I may mention in a very few words the leading points of that history. It begins with the Statute *De donis* (13 Edw. I). It goes on to the invention of fines and common recoveries. Its next stage is the Statute of Uses. Then we come to the rule in Shelley's case; the *Scintilla Juris*; the learning of contingent remainders; shifting and springing uses, and executory devises; the doctrine of powers, which cannot be understood without a full appreciation of the nature of estates and tenures and of the distinction between law and equity; and many other matters which I do not at this moment remember, and of which it would not interest you, My Lord, to hear. The result no doubt is, that the English law has settled down into a definite form. But those who argue that, because these doctrines—intricate, complicated, all but unintelligible as they are—do not apply to the wills of Hindús, therefore perpetuities do exist by the law of Hindústán, argue as absurdly as if they said that a man does not recognize a painful disease as such, because he is not prepared to undergo, for its cure, some strange series of intricate operations which happen to have been inflicted centuries ago on another patient of a totally different constitution. The conclusion from all this is, that the Hindú law does not sanction perpetuities, and that its spirit and temper are entirely alien to them.

As I wish to put this matter beyond dispute, I may add that the same proposition may be collected from the judgments of Chief Justice Scotland in the case of *Arumugam Mudali* v. *Anmi Ammál*, 1 Madras High Court Reports, 400, and of Mr. Justice Macpherson in the recent case of *Sreemutty Kistomoney*

Dossee v. *Anund Krishna Bose*, and that it is assumed on appeal by the Judges in the late case of *Tagore* v. *Tagore* as one of the grounds of their decision, although the case did not expressly turn upon it.

We now come to the question of legislation. The long review of decided cases which I have been obliged to give, proves clearly that legislation is necessary. If we do not legislate, the courts of justice will; and inasmuch as they will have to legislate *ex post facto* on each particular case as it arises, and no further than that case will warrant, it is probable that, if the matter is left to them, we shall get, at an immense expense to litigants, and after the lapse of generations, a system as complicated as that of the English Real Property Law. We must therefore lay down some rules. What are they to be? Our answer is, the 101st section of the Succession Act. Apply those three lines to Hindú wills, and you settle the question. If we do not do that, we must make perpetuities legal by express words, and I think no one would propose so monstrous a system. The reason on which the rules of the Succession Act are founded is obvious enough. They enable a person to provide for all contingencies as to which ordinary human prudence can form reasonable anticipations. The owner for the time being can say to a particular man—'I think you should have a life-estate in my property, and after that it shall go to your son, then living, when he attains his majority.' Such a period is one over which a man's interest in the affairs of the world would naturally extend, and as to which he can form rational anticipations. To enable a man to legislate as to the employment of what once was his, centuries after his death, is to sacrifice the living to the dead for no other purpose than that of gratifying a diseased and mischievous appetite.

I now come to a very important matter, which, however, may be very briefly dismissed. This is the omission from the Bill of section 105 of the Succession Act, which relates to religious endowments. With regard to this, a very strong expression of opinion has been given by many of the Native gentlemen who were consulted. The Committee have thought it best to permit the existing state of things to continue, and not to interfere in a matter which affects native religious feelings, and as to which we are not the best judges. Lastly, there is section 104 of the Act, which it is proposed to leave out of the Bill; it is a section relating to accumulations. It prevents accumulations of income for a longer term than one year. In England, accumulations are permitted for twenty-one years, and I could mention many purposes for which that period is not excessive. I must add that I do not understand on what grounds accumulations were restricted to one year by the Succession Act. Whatever the reason may have been, the Committee have thought it best not to apply this provision to the wills of Hindús, but to leave the matter as it stands.

I have thought it right to make these observations on the Bill, because it is one which has attracted considerable attention amongst the Native community, and because it involves what every one must allow to be a matter of the most essential importance, namely, the charge against Government of having wished to interfere with those Native feelings and institutions which we are bound to respect. I have thought it necessary to refute that charge as strongly and fully as I could, and to show that, on the contrary, the most scrupulous attention has been paid to the opinion of the Natives; that is my excuse for taking up so much of the time of the Council.

With regard to the proposal that the Bill should extend beyond the Presidency Towns, I think that that question can be considered when the Hon'ble Mr. Cockerell brings forward his motion."

The Hon'ble MR. COCKERELL thought that, looking to the important character of the alteration which this Bill had already undergone in Committee, there was certainly some advantage in allowing some further time to elapse ere we proceeded to confirm the measure and render it irrevocable by

passing the Bill in its amended form. For it must be borne in mind that there was this important difference between the Bill as introduced, and as it came up from Committee, that whilst, in the one case, its provisions did not, as so minutely explained by his Hon'ble and learned friend (the mover), overstep in any single matter the limits within which its scope and object had been entirely approved by the many intelligent Native gentlemen who were consulted on the subject, in the other, a certain degree of restraint on the free action of the testator was contemplated, which, in some quarters at least, had been represented to be repugnant to the feelings of the people of this country.

For his own part he entertained no doubt as to the expediency of the addition to the Bill of those sections of the Indian Succession Act which comprised the rule against perpetuities; but after the very forcible justification of the action taken in this matter by the Select Committee, which they had just heard from his Hon'ble and learned friend, he should be unnecessarily taking up the time of the Council if he were to dwell further on this subject. He would merely add that he thought no one who had marked the various decisions of their Courts in Will cases during late years, and more especially the decisions regarding the will of their former colleague, the late Bábu Prasanna Kumár Thákur, could come to any other conclusion than that the time had arrived for the interposition of the legislature for the purpose of placing some restraint on the abuse, by the Hindú testator, of his testamentary powers, and removing the uncertainty which now prevailed as to the extent to which such testator might controul the devolution of his estate: the only point which could be said to have been clearly established hitherto was that the creation of perpetuities was not only supported by no express authority of Hindú law, but was even alien to its principles.

The amendment which he was about to move, however, rested on other grounds. He was strongly of opinion that the proposed local limits of its operation were unnecessarily and even unreasonably restricted. The principle of the Bill was that a Hindú proprietor's legal power of disposing of his property by will being an established fact, it was expedient to secure the effectual exercise of that power by such safeguards as experience had shown to be necessary in countries where the devolution of property was largely influenced by the practice of testation. And the natural corollary to this proposition was that the application of those safeguards should follow the prevalence of the practice. If then it was a fact that the exercise of the testamentary power was confined to persons residing within the Presidency Towns, the Bill, as it stood, would provide all that was desirable in the way of present legislation. But had they any good grounds for the assumption on which the present limitation of the Bill avowedly rested?

It should be remembered that the Courts had established, by a long train of decisions, that the testamentary power of disposition of their property amongst Hindús was co-extensive with their rights of alienation of such property by gift or sale; that this conclusion was now universally accepted, and was, in fact, the basis of the proposed legislation. Such being the case, they would naturally expect to find the prevalence of the practice of testation in proportion to the area of the testamentary power; and, consequently, greater in Lower Bengal—where, under the tenets of the Dáyabhága interpretation of the sástras, the dominion of the Hindú over every description of property vested in him was absolute—than in other parts of India (not excepting the Presidency Towns of Madras and Bombay which were included in the Bill) in which the proprietor's rights were far more limited. This expectation seemed to be justified by such facts as were within their reach. As regarded nuncupative wills, they had the evidence of the Judges of their Courts, and of those Native gentlemen who had been consulted in the matter, that such wills were not unfrequent in Bengal; and, as to written wills, they had the clear evidence of the records of the registration-offices that, in Lower Bengal, the practice of testation was by no means confined to Calcutta. He found from the records of

the registration-offices in Lower Bengal that, in the year 1867-68, about four hundred wills were registered, of which fifty-four only were registered in Calcutta.

In the year 1868-69, out of a total number of five hundred registrations of wills in the Lower Provinces of Bengal, about seventy-nine were effected at the Calcutta office. The registration of wills was not compulsory, and therefore the number of wills registered did not of course represent the number of wills executed; but the statistics which he had just cited might be fairly held to indicate the relative extent to which the testamentary power of disposition of property was exercised by the Hindú owner of property residing within Calcutta and such owner in other parts of Lower Bengal. And the reasonable conclusion was that not only was the practice of testation in Bengal Proper unrestricted to the inhabitants of the Presidency Towns, but that—having regard to the relative numbers of the Mofussil and town population possessing property which could be disposed of by will—the practice of testation was scarcely less common amongst the former than the latter class.

On these grounds, when he had temporary charge of the Bill at the time of its introduction into this Council, he expressed the opinion that the measure was as applicable to Lower Bengal generally as to the Presidency Towns, and again, in Committee, he advocated the extension of the local limits of its operation.

The majority of the Committee, whilst not dissenting from his opinion on this point, considered that the action of the legislature was in a measure fettered by the correspondence which had taken place between the Government of India and the Secretary of State on the subject of the proposed legislation. It was held that, as the Government had expressly drawn attention to the intended narrow limits of the Bill's operation and its consequent experimental character, the sanction of the Secretary of State should be construed as upholding only the application of the provisions of the Bill to its original local area.

He observed that, whereas the only reason assigned in the despatch to the Secretary of State for the proposed confinement of the measure to Presidency Towns was the assumption that in such places only was the testamentary power exercised to any material extent, it was stated in another passage of the same despatch that, *in Bengal* and in the towns of Madras and Bombay, the power of making nuncupative wills was for the last twenty years found to encourage fraud and perjury. The previous assumption was clearly weakened if not absolutely controverted by this last statement. The letter of the Secretary of State in reply to this despatch conveyed a general sanction to the proposals of the Government of India, without any reference to the fact that the proposed legislation was to apply only to the Presidency Towns; and when this was considered in connection with the latest despatch of the Secretary of State on the subject of this Bill, he did not think that the sanction of the Home Government should be held to be conditional on the operation of the Bill being confined to the Presidency Town; for in that last despatch, which was dated 30th November 1869, it was expressly remarked that the "principle of the Act seems applicableto all Natives of India except those Mussulmans who follow the strict law of Muhammad."

That remark was, he thought, undoubtedly correct, and the only consideration by which we should be guided in the determination of the limits within which the provisions of the Bill should be applied was the extent to which the practice of making wills prevailed, and the consequent need of providing securities against its abuse. On these grounds, he begged to move the following amendment on the Motion of his hon'ble and learned friend (Mr. Stephen):—

That this Bill be recommitted with instructions to the Select Committee to take into consideration the propriety of extending its operation to the territories

under the government of the Lieutenant Governor of Bengal and to report again after six weeks.

That the Bill as amended, together with this Motion, be forthwith published in the *Gazette of India* for public information.

The Hon'ble MR. STEPHEN expressed his concurrence in the amendment.

The amendment was put and agreed to.

NORTHERN INDIA CANAL AND DRAINAGE BILL.

Colonel the Hon'ble R. STRACHEY introduced the Bill to regulate the construction and maintenance of Public Works for irrigation, navigation and drainage. He said—"My Lord, the Bill having been published under Your Excellency's order when the Government left Simla, almost three months ago, the Council will have had the means of making themselves fully acquainted with its provisions. It will therefore not be necessary for me to enter at any considerable length into an explanation of its objects.

The Bill is designed to consolidate and amend the law relating to Irrigation Works in the North-West Provinces, the Panjáb, Oudh and the Central Provinces. It deals only with works constructed or maintained by the Government, or with the minor works carried out by private persons in connection with Government works. Its provisions extend to Canals for Navigation as well as to those for Irrigation, and also to Drainage Works, which, as defined in the Bill, include all works having for their object the protection of land from flood or erosion by rivers. It is not the intention that the Bill should apply to town-drainage or sewage, but only to what may be called agricultural drainage.

The existing law on these subjects applicable to the provinces I have just named is contained in two Acts, Act VII of 1845, and Act XII of 1866. The former of these Acts, though originally made applicable only to the North-West Provinces, was, some years ago, extended to the Panjáb under the powers then exercised by the Governor General in Council, and now has the force of law in that province under the provisions of the Indian Councils' Act. In Oudh and the Central Provinces there are still no Government irrigation works, and the necessity for any irrigation law has not yet arisen. The second Act is applicable to the North-West Provinces and Panjáb, but may be extended to any other part of India by order of the Local Government.

Act VII of 1845, which is the essential law on these subjects, is a very short enactment. It professes, in the preamble, to provide for the levy of water-rent, tolls and dues on canals of irrigation and navigation, and for the protection of the canals from injury. It authorizes the Local Government to make rules for the levy of water-rent and supply of water for irrigation, and the payment of tolls, and admission to the benefit of navigation. These rules may be enforced by the temporary deprivation of the benefits of the canal, by fine to the extent of fifty rupees, or imprisonment for fourteen days. The water-rates may be levied as land-revenue, and the tolls for navigation may be realised by the sale of the boat or other floating body. The officers appointed to levy the rates and tolls may be given powers of Deputy Collector and Joint Magistrate to enforce payments and obedience to rules.

Act XII of 1866 exclusively provides for taking land for the construction of private water-courses, it having been doubted whether such land could be taken as for a public purpose. It is a somewhat complicated law, and I am informed has never been put into operation.

It has been generally recognised by all the authorities concerned that the present law, Act VII of 1845, is at present inadequate for the satisfactory administration of the Irrigation and Navigation Canals of Upper India.

That this should be the case is not surprising when consideration is given on the one hand to the circumstances under which that law was framed, and, on the other, to the circumstances of the present time. Still more obvious does it become that reconsideration of the whole subject is necessary when we look forward to the probable future of irrigation works in Upper India.

It is now nearly thirty years ago since my connection with the administration of irrigation works began on the Western Jumna Canal. At that time—I speak of 1840—there was no law whatever relating to irrigation, and among the earliest professional discussions with which I was concerned was the question of providing a law for the purpose. These discussions ended in 1845 by the passing of Act VII. Previously to this period the canal administration had been carried on entirely under rules approved by the Government, the only real coercive power at the disposal of the canal administration having been that of cutting off the water supply of persons who did not comply with the orders of the executive canal officers. The gradual progress from what your Lordship has recently termed discretionary government, to government by law, led in due course to the passing of Act VII of 1845, and the further pressure of the same influence now calls for a reconsideration and large amendment of the first tentative measure, which has carried us on for the last quarter of a century, not without great cause for congratulation at the general results of our canal administration.

To bring more clearly before the Council the relative position of the canal administration of Northern India when this Act came into operation, and that which it now holds, I will briefly state the extent of the transactions conducted by this department as they were in 1840, and as they now are.

In the former year, the whole capital outlay to date was £195,500; the annual income directly realised by the Canal officers was £37,890, and the annual charges for maintenance and management amounted to £22,030. The number of engineers employed was from four to six, and the Canals in operation were the Western Jumna and Eastern Jumna. We had just begun to carry out new Canals on a small scale in the Dehra Doon, and some works of a minor character had also been executed in the vicinity of Delhi. This completes the list of the irrigation works of that period.

In 1869, the statement of our undertakings is as follows: The capital outlay has risen from £195,500 to £4,129,300, the income from £37,890 to £412,600, and the charges from £22,030 to £215,700. The number of engineers employed is not less than 110 to 120. The list of Canals is largely increased, the Ganges Canal and the Bari Doab Canal being the principal new works. The Canals in the Dehra Doon have been much extended. Works have been carried out in Rohilkhund, and a large series of Canals derived from the Sutlej, Chenab and Indus also have to be included. Nor do the figures I have mentioned fully convey the idea of the present importance of the canal administration, for the figures I have just given refer only to the income directly managed by the Canal officers, while a large additional revenue is received under the head of Land Revenue, which is, in fact, dependant on the Canals, and the indirect advantages to the country due to them are difficult to estimate, and cannot be reckoned at all by a money standard.

Looking to the future, we have before us the prospect of an expenditure of not less than sixteen millions sterling, which may even now be anticipated with tolerable accuracy in the North-West Provinces, the Panjáb and Oudh alone. A canal taken from the Jumna below Delhi is estimated at about half a million, and is already well advanced; extensions of the old Ganges Canal, and a second canal for the lower part of the Doáb from the same river, may together cost three millions. The general scheme for this last work has been settled, and the project is now in preparation in detail. A canal on the left bank of the Ganges for Rohilkhund, and another to be derived from the Ramgunga river, and other smaller works in Rohilkhund, will probably exceed one million.

The designs for these works are well advanced, and operations have been partially commenced on them. For Bundelkhund, an outlay of half a million is not unlikely. In all, the North-Western Provinces may readily exhaust five millions. For Oudh and the districts of the North-Western Provinces between the Ganges and Gogra, an outlay, in all, of five millions more may be contemplated for canals to be derived from the Sardah, the projects for which have been generally settled, and preliminary operations set on foot. In the Panjáb, extensions of the Western Jumna Canal are contemplated, likely to cost, say, three-quarters of a million; the Sirhind Canal from the Sutlej has just been begun, which will require two and a quarter millions, of which about one-third will be provided by the state of Patiala, which, in return, will receive a corresponding share of the water; the completion and extension of the Bari Doab Canal is in progress at a probable cost of half a million. Surveys have been made for canals to be taken from the Sutlej below the junction of the Bias River, likely to cost about two and a half millions, to supply, in combination with the old existing works, the whole tract between the Sutlej and Ravi, as far down as Multan on the one side, and on the other bank of the river will be carried through the British territory into the state of Bháwalpur. The aggregate of the sums thus named is six millions. Beyond the Indus important works will be carried out, for which the surveys are not yet sufficiently advanced to admit of any, even the roughest, estimate of outlay to be named. Besides these projects now actually in course of preparation or execution, there remain the magnificent rivers, the Chenab and Jhelam, to which our Engineers may turn their attention when the work actually in hand is sufficiently advanced to give a hope of any practically useful result being derived from the commencement of new schemes, the realization of which must, of course, in a sensible degree, be determined by financial considerations.

Further I need only refer to the Central Provinces as not having been lost sight of, though the difficulties there to be overcome have been found so great as to have prevented any project for irrigation works being yet brought into a shape in which it could be sanctioned. Engineers are still employed in maturing designs, and it may be hoped that the means will eventually be found for meeting the real requirements of the country there also.

But without enlarging more on the prospects of these operations, enough, I am satisfied, has been said to prove that the interests at stake in connection with the construction and management of the irrigation works of Upper India, have already reached a very large developement, and that they must necessarily, day by day, grow, and that, before long, the responsibilities of the Irrigation Department will not be second in importance to those resting on any other branch of the public administration. The time has assuredly come when the law should be placed on a basis which will secure the thoroughly efficient control of the operations of the Irrigation Department, both in relation to the great agricultural community that will be so directly dependent on the satisfactory management of the works, and to the responsibilities that arise from the financial consequences of transactions on so vast a scale as those now in course of realisation or contemplated.

The necessity for a revision of the law relating to irrigation has been felt for many years past, and even as long ago as 1854, the late Colonel Baird Smith was directed by the North-West Provinces Government to frame a new draft. The matter seems to have been lost sight of in the years that followed the mutiny, until it was revived by the Government of the Panjáb in 1867. The present Bill is the consequence of this last movement.

The objects and reasons annexed to the Bill go so fully into its provisions, that it will be hardly necessary for me to explain them at any length. The first object of the Bill has been to place on a satisfactory footing the powers which are now *de facto* more or less commonly exercised under the existing law. It has been the intention to leave such an amount of discretion in the hands of

the Local Government in respect to the class of officers who shall carry out the law, and in respect to the details of management, as experience indicates to be expedient. A great machinery exists, which it would be most unwise summarily to set aside, while it is essential, for future progress, to admit of the introduction of modifications of system which shall be shown to be desirable. The time certainly has not come when any attempt shall be made to stereotype by a rigid code the procedure of the irrigation officers in the details of their duties. The power which it is proposed to continue to the Local Government of making rules for the guidance of the canal officers, will give the necessary means of adapting the system of management to the peculiarities of each locality.

It may be a question to what precise extent the specific provisions of the law should go, and how far a discretion may be properly left to the Government to regulate details. This will be for the special consideration of the Council in each particular case that may arise. In framing the Bill, it has been thought preferable to err on the side of defining proposed powers, rather than on that of leaving a discretion, so that as little doubt as possible shall be left of the intentions of the measure.

The experience of the last few years has shown that, if any effectual measures are to be carried out for improving and extending the means of irrigation generally, it is necessary for the Government to possess a power of re-distributing the water supply of districts where irrigation has been going on without Government control for any length of time. Rohilkhund is a province in which the exercise of such a power has become essential as a preliminary for any improvement. The Bill accordingly provides for dealing with private rights in water in a manner analogous to that in which private rights in land may be dealt with under the existing law, when it is necessary to interfere with them for public purposes. The peculiar character of rights and property in water, of course, calls for a special treatment.

The procedure laid down in the Bill to meet this object is as follows :— The existence of the right is to be first ascertained by the revenue authorities and compensation is to be given for any loss arising from a stoppage or diminution of a water-supply, partly by a revision of the land-revenue, and partly by a cash payment when it is held by the revenue officers that such a payment is proper. The amount to be thus awarded will be settled in the same manner as awards are made when land is taken. These provisions have been generally approved by all the local authorities consulted, but they will, no doubt, receive the careful attention of the Council.

Another part of the measure that is new is that which deals with drainage. Here, again, experience has shown that drainage must go hand in hand with irrigation. If the drainage of irrigated tracts be not carefully attended to, not only serious injury is apt to be done to the land, but the health of the population is often affected in an alarming manner. In dealing with this subject the respective obligations of the proprietors of the land, and of the Government as owner and constructor of the canals, have to be carefully regarded, and provision to be made for giving compensation, on the removal of obstructions to natural drainage-channels cleared for purposes of public utility, to proprietors who suffer loss by being thereby deprived of rights of irrigation or otherwise.

The existing customs, in some places better, and in others less well, defined, under which the Government may require the proprietors and labouring population of estates supplied with water from irrigation works, to assist in the provision of the labour necessary for carrying out urgent operations essential for the safety or efficiency of the works, have been considered, and sections introduced into the Bill for placing requirements of this description on a clearly defined and equitable basis. Powers of a like nature, but more extensive than those contemplated in the Bill, have been given in respect to the Madras Irrigation works by Act I of 1858, and of the absolute necessity of some such

powers in a country dependent on irrigation there can be no room for doubt. It will be for the Council to see that the real requirements of the case are properly met and not exceeded.

The chapter relating to the manner in which charges are to be made for canal-water, is probably the most important of the Bill, and that which offers the greatest difficulties. Under the existing law the power of the Local Government to determine how charges are to be made for irrigation is not limited in any way, and there can be no doubt, I think, that if the form of the present law had been retained, the whole of the proposed sections relating to irrigated land could have been issued as Rules by the Executive Government. But it has been thought better, for the reasons I have already given, to introduce into the substance of the Bill the main principles which the Government desires to have recognised in the administration of irrigation works, and this has accordingly been aimed at. The most prominent features of this part of the Bill are the provisions for charging the proprietor of irrigated land with a water-rate as well as the occupier, and for preventing such a system affecting unfairly the interests of the proprietor in relation to the land-revenue.

The sections which relate to the imposition of a rate on land irrigable from a canal, but not irrigated, contain the substance of the plan thought most suitable for giving that financial security for the payment of the interest on the capital invested in these works, which the Government considers of the greatest importance. The proposal is that if, after a canal has been open for five years, the average nett revenue does not amount to seven per cent. on the capital, a general rate may be charged on all land irrigable from the canal, though it be not actually irrigated, of such an amount as will bring up the whole nett revenue to seven per cent. on the capital. Such a proposal is novel in this country, and therefore at first likely to be viewed with some hesitation. But the Government has thought it to be the most likely method of arriving at a final conclusion which shall be generally satisfactory, to make a definite proposal in the form which, on the whole, seems best suited to meet the requirements of the case, and to endeavour to remove any valid objections that may be taken to the plan, and to adopt any improvements that may be suggested in course of discussion. These parts of the Bill, no doubt, require, and will receive, special attention from the Council ; and so far as such a course may approve itself, simplicity may be secured by leaving to the discretion of the Local Government, to be dealt with under Rules, matters which are specifically dealt with in the Bill as now framed.

Further, I need only direct attention to the preamble of the Bill, with the comment made thereon by Mr. Maine. 'The Bill,' he says, 'lays down a proposition which is believed to be a correct statement, not only of the existing custom of India, but of a fundamental rule universally recognised in Western Europe, and nowhere so distinctly asserted as in those European countries, such as Northern Italy, which resemble India in their dependence on artificial irrigation. This proposition is that the property in the lakes, rivers, and streams of British India is vested in the State, subject, in certain cases, to rights acquired by usage or grant.'

With these remarks, I beg to introduce the Bill."

Major General the Hon'ble SIR HENRY DURAND said that it was not his intention to oppose the introduction of the Bill. His object was to guard himself against its being supposed that, as at present informed, he entirely approved of its principles. One of these was an important one, and with respect to it he wished it to be understood that he reserved to himself the right of rejecting or of accepting it. He adverted to the somewhat arbitrary powers taken by the Bill for the imposition of a water-rate upon irrigable lands, whether water be taken or not, when the revenue return upon irrigation works fell short, within a fixed period, of a certain percentage on the outlay. This was a principle which would demand a careful scrutiny in its application when the Bill had to be considered in Committee, and he suspended his own decision even as to the admission of the principle until he saw how it was applied and

dealt with. For he observed that, under the powers taken, there was no security for the people exposed to the incidence of this water-cess against their being, in fact, made to pay for failures—for projects ill-considered and ill-carried out. At the same time he observed that the Bill was permissive, rather than absolute, on this point. A Lieutenant Governor might levy the water-rate after the prescribed period of short receipts, and the responsibility was thrown upon him of deciding whether or not to impose the cess. The instruction to do so was not positive, but left him a wide discretion. Under these circumstances, he was not disposed to object to the leave asked to introduce the Bill.

He must, however, remark that he should have preferred that the opinions of the Lieutenant Governors upon this point of a water-rate imposable on irrigable land had been before the Council. The Statement of Objects and Reasons informed us "that this proposal had been introduced into the Bill by the Govern-"ment of India since it was submitted to the Local Governments, and that they "have therefore had no opportunity for expressing their opinions on the very "important questions it raised." The foregoing was written on the 21st of last September, and in the interval of four months that the Bill had been before the public, the Local Governments had had the time necessary for the consideration of the provisions of the Bill. He was not aware whether they had communicated their views or not. But as they had had the opportunity of so doing, the fact that the Council was not in possession of their opinions on this principle, which involved such weighty considerations, did not seem to him sufficient to raise an objection to the introduction of the Bill.

He contented himself, therefore, with guarding by these remarks against its being understood that the admission of the Bill pledged him to uphold this principle and the provisions based thereon. He held himself free to accept or reject them uncommitted by the leave to introduce the Bill.

KULLU SUB-DIVISION (PANJAB) BILL.

The Hon'ble MR. STEPHEN introduced the Bill to invest the Assistant Commissioner of the Kullu Sub-division in the Panjáb with certain appellate powers, and moved that it be referred to a Select Committee with instructions to report in a fortnight.

The Motion was put and agreed to.

HIGH COURTS (COSTS OF PETITIONS) BILL.

The Hon'ble MR. CHAPMAN presented the Report of the Select Committee on the Bill to enable the High Courts at the Presidency Towns to deal with costs of petitions for certain monies transferred to Government.

EMIGRATION OF NATIVE LABOURERS BILL.

The Hon'ble MR. CHAPMAN asked leave to withdraw his motion to introduce a Bill to consolidate and amend the law relating to the emigration of Native Labourers.

Leave was granted.

The following Select Committee was named:—

On the Bill to invest the Assistant Commissioner of the Kullu Sub-division in the Panjáb with certain appellate powers—The Hon'ble Mr. Cockerell and the Mover.

The Council adjourned to Friday, the 28th January 1870.

WHITLEY STOKES,

Secy. to ~~the~~ Council of the Governor General for making Laws and Regulations.

CALCUTTA,
The 21st January 1870.

GOVERNMENT OF INDIA.

FOREIGN DEPARTMENT.

EXTRADITION TREATIES WITH THE STATES OF RAJPOOTANA.

I.

Extradition Treaty between the British Government and His Highness RAEESOODDOWLAH SEPADAROOL MOOLK, *Maharaja Dheeraj*, SREE SEWAEE RANA, BHUGWUNT SINGH LOKENDER BAHADOOR, DULER JUNG JEYDEO, *of Dholepore, his heirs and successors, executed on the one part by Captain* CHARLES KENNETH MACKENZIE WALTER, *in Political charge of the Dholepore State, under authority from Colonel* WILLIAM FREDERICK EDEN, *Agent to the Governor General for the States of Rajpootana, in virtue of the full powers vested in him by His Excellency the Right Hon'ble* SIR JOHN LAIRD MAIR LAWRENCE, *Baronet*, G. C. B., G. C. S. I., *Viceroy and Governor General of India, and on the other part by* PIRBHOO LALL, *Nazim Adawlut and a Member of the Dholepore Council, in virtue of the full powers conferred on him by the Maharana aforesaid.*

ARTICLE I.

That any person, whether a British or foreign subject, committing a heinous offence in British territory and seeking shelter within the limits of the Dholepore State, shall be apprehended and delivered up by the latter Government to the former, on requisition, in the usual manner.

ARTICLE II.

That any person, being a subject of Dholepore, committing a heinous offence within the limits of the Dholepore State and seeking asylum in British territory, will be apprehended and delivered up by the latter Government to the former, on requisition, in the usual manner.

ARTICLE III.

That any person, other than a Dholepore subject, committing a heinous offence within the limits of the Dholepore State and seeking asylum in British territory, will be apprehended, and the case investigated by such Court as the British Government may direct. As a general rule, such cases will be tried by the Court of the Political Officer, in whom the political supervision of Dholepore may at the time be vested.

ARTICLE IV.

That in no case shall either Government be bound to surrender any person accused of a heinous offence except upon requisition duly made by, or by the authority of, the Government within whose territories the offence shall be charged to have been committed, and also upon such evidence of criminality as, according to the laws of the country in which the person accused shall be found, would justify his apprehension and sustain the charge if the offence had been there committed.

ARTICLE V.

That the following offences be deemed as coming within the category of heinous offences:—

1. Murder.
2. Attempt to murder.
3. Culpable homicide under aggravating circumstances.
4. Thuggee.
5. Poisoning.
6. Rape.
7. Causing grievous hurt.
8. Child-stealing.
9. Selling females.
10. Dacoity.
11. Robbery.
12. Burglary.
13. Cattle Theft.
14. Arson.
15. Forgery.
16. Counterfeiting coin or uttering base coin.
17. Criminal breach of trust.
18. Criminal misappropriation of property.
19. Abetting the above offences.

ARTICLE VI.

The expenses of any apprehension, detention, or surrender made in virtue of the foregoing stipulations shall be borne and defrayed by the Government making the requisition.

ARTICLE VII.

The above Treaty shall continue in force until either of the high contracting parties shall give notice to the other of its wish to terminate it.

ARTICLE VIII.

Nothing herein contained shall be deemed to affect any Treaty now existing between the high contracting parties except so far as any Treaty may be repugnant thereto.

Signed, sealed, and exchanged at Bhurtpore this fourteenth day of January A. D. eighteen hundred and sixty-eight, corresponding to the fifth day of Magh Buddee Sumbut nineteen hundred and twenty-four.

(Sd.) C. K. M. WALTER,
In Political Charge of Dholepore.

Seal. Signature of PIRBHOO LALL, Nazim Adawlut and a Member of the Dholepore Council.

(Sd.) MAYO.

This Treaty was ratified by His Excellency the Viceroy and Governor General of India at Calcutta on the fifteenth day of February 1869.

II.

Extradition Treaty between the British Government and His Highness TUKHT SINGH, *Maharaja of Joudhpore,* G. C. S. I., *his heirs and successors, executed on the one part by Captain* EUGENE CLUTTERBUCK IMPEY, *Political Agent in Marwar and Political Superintendent, Mullani, under authority from Lieutenant-Colonel* RICHARD HARTE KEATINGE, C. S. I. *and* V. C., *Agent to the Governor General for the States of Rajpootana, in virtue of the full powers vested in him by His Excellency the Right Hon'ble* SIR JOHN LAIRD MAIR LAWRENCE, *Baronet,* G. C. B. *and* G. C. S. I., *Viceroy and Governor General of India, and on the other part by* JOSEE SHEORAJ, *Moosahib of Joudhpore, in virtue of the full powers conferred on him by Maharaja* TUKHT SINGH *aforesaid.*

ARTICLE I.

That any person, whether a British or foreign subject, committing a heinous offence in British territory and seeking shelter within the limits of the Marwar State, shall be apprehended and delivered up by the latter Government to the former, on requisition, in the usual manner.

ARTICLE II.

That any person, being a subject of Marwar, committing a heinous offence within the limits of the Marwar State and seeking asylum in British territory, will be apprehended and delivered up by the latter Government to the former, on requisition, in the usual manner.

ARTICLE III.

That any person, other than a Marwar subject, committing a heinous offence within the limits of the Marwar State and seeking asylum in British territory, will be apprehended, and the case investigated by such Court as the

British Government may direct. As a general rule, such cases will be tried by the Court of the Political Agent, in whom the political supervision of Marwar may at the time be vested.

ARTICLE IV.

That in no case shall either Government be bound to surrender any person accused of a heinous offence, except upon requisition duly made by, or by the authority of, the Government within whose territories the offence shall be charged to have been committed, and also upon such evidence of criminality as, according to the laws of the country in which the person accused shall be found, would justify his apprehension and sustain the charge if the offence had been there committed.

ARTICLE V.

That the following offences be deemed as coming within the category of heinous offences:—

1. Murder.
2. Attempt to murder.
3. Culpable homicide under aggravating circumstances.
4. Thuggee.
5. Poisoning.
6. Rape.
7. Causing grievous hurt.
8. Child-stealing.
9. Selling females.
10. Dacoity.
11. Robbery.
12. Burglary.
13. Cattle Theft.
14. Arson.
15. Forgery.
16. Counterfeiting coin or uttering base coin.
17. Criminal breach of trust.
18. Criminal misappropriation of property.
19. Abetting the above offences.

ARTICLE VI.

The expenses of any apprehension, detention, or surrender made in virtue of the foregoing stipulations shall be borne and defrayed by the Government making the requisition.

ARTICLE VII.

The above Treaty shall continue in force until either of the high contracting parties shall give notice to the other of its wish to terminate it.

ARTICLE VIII.

Nothing herein contained shall be deemed to affect any Treaty now existing between the high contracting parties except so far as any treaty may be repugnant thereto.

Done at Mount Aboo, Rajpootana, this sixth day of August in the year one thousand eight hundred and sixty-eight.

III.

Extradition Treaty between the British Government and His Highness RAM SINGH, BAHADOOR, *Maharao Rajah of Boondee, his heirs and successors, executed on the one part by Captain* ARTHUR NEIL BRUCE, *Political Agent, Harowtee, under authority from Colonel* WILLIAM FREDERICK EDEN, *Governor General's Agent for the States of Rajpootana, in virtue of the full powers vested in him by His Excellency the Right Hon'ble Sir* JOHN LAIRD MAIR LAWRENCE, *Baronet,* G. C. B. *and* G. C. S. I., *Viceroy and Governor General of India, and on the other part by* BOHORA IMRUT LALL, *in virtue of the full powers conferred on him by Maharao Rajah* RAM SINGH, BAHADOOR, *aforesaid.*

ARTICLE I.

That any person, whether a British or foreign subject, committing a heinous offence in British territory and seeking shelter within the limits of the Boondee State, shall be apprehended and delivered up by the latter Government to the former, on requisition, in the usual manner.

ARTICLE II.

That any person, being a subject of Boondee, committing a heinous offence within the limits of the Boondee State and seeking asylum in British territory, will be apprehended and delivered up by the latter Government to the former, on requisition, in the usual manner.

ARTICLE III.

That any person, other than a Boondee subject, committing a heinous offence within the limits of the Boondee State and seeking asylum in British territory, will be apprehended, and the case investigated by such Court as the British Government may direct.

As a general rule, such cases will be tried by the Court of the Political Officer, in whom the political supervision of Boondee may at the time be invested.

ARTICLE IV.

That in no case shall either Government be bound to surrender any person accused of a heinous offence, except on requisition duly made by, or by the authority of, the Government within whose territories the offence shall be charged to have been committed, and also upon such evidence of criminality as, according to the laws of the country in which the person accused shall be found, would justify his apprehension and sustain the charge if the offence had been there committed.

ARTICLE V.

That the following offences be deemed as coming within the category of heinous offences:

1. Murder.
2. Attempt to murder.
3. Culpable homicide under aggravating circumstances.
4. Thuggee.
5. Poisoning.
6. Rape.
7. Causing grievous hurt.
8. Child-stealing.
9. Selling females.
10. Dacoity.
11. Robbery.
12. Burglary.
13. Cattle Theft.
14. Arson.
15. Forgery.
16. Counterfeiting coin or uttering base coin.
17. Criminal breach of trust.
18. Criminal misappropriation of property.
19. Abetting the above offences.

ARTICLE VI.

The expenses of any apprehension, detention, or surrender made in virtue of the foregoing stipulations shall be borne and defrayed by the Government making the requisition.

ARTICLE VII.

The above Treaty shall continue in force until either of the high contracting parties shall give notice to the other of its wish to terminate it.

ARTICLE VIII.

Nothing herein contained shall be deemed to affect any Treaty now existing between the high contracting parties except so far as any Treaty may be repugnant thereto.

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Friday, the 28th January 1870.

PRESENT:

His Excellency the Viceroy and Governor General of India, K. P., G. C. S. I., *presiding*.
His Excellency the Commander-in-Chief, K. C. B., G. C. S. I.
The Hon'ble G. Noble Taylor.
Major General the Hon'ble Sir H. M. Durand, C. B., K. C. S. I.
The Hon'ble John Strachey.
The Hon'ble Sir Richard Temple, K. C. S. I.
The Hon'ble J. Fitzjames Stephen, Q. C.
The Hon'ble Gordon S. Forbes.
The Hon'ble D. Cowie.
Colonel the Hon'ble R. Strachey, C. S. I.
The Hon'ble Francis Steuart Chapman.
The Hon'ble J. R. Bullen Smith.
His Highness Sarámade Rájáháe Hindústán Ráj Rájendra Srí Mahárájá Dhiráj Sivái Rám Singh Bahádur, of Jaypúr, G. C. S. I.
The Hon'ble F. R. Cockerell.

OUDH TALUQDÁRS ESTATES BILL.

The Hon'ble MR. STRACHEY, in moving for leave to introduce a Bill to relieve from incumbrances the estates of taluqdárs in Oudh, said that the

Council was well aware of the peculiar conditions under which the taluqdárs of Oudh held their landed estates. Those conditions had their origin in the arrangements made by Lord Canning in 1858 and 1859, and it would be in the recollection of the Council that those arrangements received finally the sanction of the legislature about a year ago, by the passing of Act I of 1869. In the debate when the Bill was passed, which took place, MR. STRACHEY believed, on the very last occasion on which Lord Lawrence was present as Viceroy in Council, he made a statement which had led to the preparation of the measure which it was now proposed to introduce. Lord Lawrence then said that he trusted that the policy which was about to receive the sanction of the Council that day would be so worked by the taluqdárs and their descendants, that the British Government would never have cause to regret the policy that had been adopted. He said—

"It is in the hands of the taluqdárs themselves to make their privileges a blessing or a misfortune to their relatives, to the subordinate proprietors, and to the cultivators of the soil, and I trust that they and their descendants will so discharge the duties which are bound up with their rights, that the British Government will be satisfied that the policy which is now being declared is sound."

Lord Lawrence then went on to say that it had come to his knowledge that many of the taluqdárs of Oudh were in great pecuniary difficulties, and he said that it was hard that any man placed in the position of a taluqdár should be just and generous to his dependants when he had difficulties of this kind in his own home. He then said that, not many years ago, an Act had been passed in the Presidency of Bombay with the object of relieving the taluqdárs of Guzerat who, MR. STRACHEY believed, formed the aristocracy of that part of the country, and of assisting them to get rid of the heavy incumbrances on their estates. The Act enabled the Government to make advances of money to taluqdárs on the security of their estates. The Bombay Act VI of 1862 appeared to have been worked with the most complete success. In the course of the six years following the passing of the Act, 469 estates came under its operation, and nearly half of those estates had been restored to the taluqdárs in a completely solvent condition and free from all incumbrances. Lord Lawrence proposed to treat the taluqdárs of Oudh in a similar manner, and he stated that it was his intention to direct the Chief Commissioner of Oudh to make enquiries into the actual condition of the taluqdárs, and that he thought it would be right that the Government should then take measures for relieving those taluqdárs who apparently deserved it. He wound up his remarks as follows:—

"I think that, under good management, all those taluqdárs who are really desirous of retrieving their position can do so if they pursue the course it behoves them to follow, and thus prevent their descendants from arbitrarily selling their estates to meet their necessities. If they fail, they will have no one to blame but themselves, and their descendants will be deprived of all means of maintaining their position. The measure I propose appears to me to be justified by sound policy; and I trust that it will also have the effect of showing the taluqdárs of Oudh that the British Government really desires that they should be maintained in prosperity in their present position."

Immediately after that speech of Lord Lawrence, the Chief Commissioner of Oudh was ordered by the Government of India to institute enquiries on the subject. He was informed that it had been brought to the notice of the Governor General in Council that various causes had led to many estates of taluqdárs being greatly incumbered with debts, whilst the legal facilities for the recovery of debts by creditors, and the high interest on loans must tend to the gradual transfer of those estates to bankers and merchants. The Governor General thought that loans might properly be made from the treasury, with a view to "re-establishing the solvency of these estates, in cases in which the assistance of the Government appeared to be deserved, the taluqdár surrendering the management of the estate to an officer appointed by the Government, as security for the re-payment of the loan."

The result of those orders was, that a minute enquiry into the whole matter was instituted under the orders of the Chief Commissioner of Oudh. He found that there were about fifty of the principal taluqdárs of the province, paying an annual revenue of about £135,000, whose debts amounted to about £327,000. The Chief Commissioner sent up the draft of a Bill, taken almost entirely, with slight modifications, from the Bombay Act of which MR. STRACHEY had been speaking; and that was the Bill, with some further modifications, which he now asked leave to introduce. The Bill provided that, on the application of any taluqdár for assistance of this kind, the Chief Commissioner, if on due enquiry he came to the conclusion that the case was one in which interference of this kind was right, might make a declaration vesting the management of the estates of the taluqdár in an officer appointed by the Chief Commissioner. The effect of that declaration would be that the estate would be made over, for a period not exceeding twenty years, to the management of the officer appointed by the Government. While under the management of this officer, the estates and the income derived from them would cease to be liable to attachment or sale by the courts on account of any debts of the taluqdár, and the power of the taluqdár to alienate or incumber his estates in any way would be in abeyance. The taluqdár would receive such allowance for his maintenance and the maintenance of his family as might be considered appropriate. The amount of the debts of the taluqdár would be ascertained, and the officer appointed to manage the estate would adopt systematic measures for paying off the whole of them. It would rest entirely with the Government to say, in each particular case, whether it would advance money from the treasury or not. It was not proposed to say anything in the Bill about this, but to leave the Government absolutely free to act as it pleased. The present intention was, that no such advances should be made unless the Government was quite satisfied that the whole of the advances could, without any doubt, be repaid, with interest at six per cent. per annum, within ten years. MR. STRACHEY was unable to say what sum of money might probably be actually advanced by Government to the taluqdárs if the present measure should become law; but according to the estimate made by the local authorities, supposing that the whole of the estates to which he had referred were to be taken under the management of Government officers, the whole sum to be advanced would be about £[illegible]6,000. But even if the total advances should amount to so much as this, which was not very likely, the whole sum would be little more than one year's income of the estates. Now, as the management of no estate would be undertaken without the Chief Commissioner having satisfied himself that it would be relieved completely in a few years from all embarrassment, the security would be quite complete, and therefore, financially speaking, the Government would run no risk whatever. The taluqdárs themselves were extremely anxious that this measure should be passed. The Financial Commissioner, Colonel Barrow, who was the best possible authority on the subject, said that his belief was that this anxiety on their part was quite real, and that the wish of embarrassed taluqdárs to place their estates under Government management was "to be accounted for by the good opinion they have of Government management as exercised in estates under the Court of Wards in Oudh, and by the fact that our management generally frees them from the incubus of a host of hangers-on, whom they have not themselves the moral courage to get rid of."

MR. STRACHEY hoped that there would be no misunderstanding regarding the measure which he proposed to introduce. It was a measure with which it would not be difficult to find fault on economical grounds; and there would be many people who would say that if these estates had been mismanaged by the taluqdárs and thus became encumbered with debts, the sooner they passed into the hands of solvent proprietors, the better. Not only in Oudh, but in other parts of Northern India with which he had been personally acquainted, he had never believed that that principle was a right one to apply. He had always believed, and he thought the experience of 1857 had shown it to be the

case, that this was a matter in which we could not afford to ignore the feeling of the people of the country. It shocked every feeling of propriety and justice in the Natives of Northern India, that we should allow estates which had been held in the same family for generations to pass into the hands of strangers—generally of the money-lending class—in satisfaction of decrees of civil courts for debt. He thought there could be no doubt that the experience of 1857 showed conclusively the mischief thus done. The transfer, under the operations of our courts, of many ancient estates into the hands of strangers was found, in 1857, to be a great cause of political weakness, by depriving the Government of the support of the Chiefs whom the people themselves looked on as their leaders; and it also became a cause of internal commotions and bloodshed among the people themselves. He did not intend to defend this measure on economical grounds, but even on those grounds much might be said in its favour; for he believed that, if it was certain that a thing was politically inexpedient and wrong in any country, it was impossible that that thing could in that country be at the same time economically right, whatever it might be in some other country under different conditions. But however that might be, this was to be looked on as a purely political measure. It was brought forward with the object of strengthening the policy originally adopted by Lord Canning's Government in Oudh, and which was sanctioned by the legislature by Act I of 1869 a year ago. The merits of that policy were now not a question for discussion. The Government believed it to be its duty, and it was the determination of the Government, to carry out that policy fully and honestly, and to give to the great experiment now being tried in Oudh every fair chance of success which could reasonably be given to it. The Bill which MR. STRACHEY now asked leave to introduce would be a pledge of that determination, and would be at the same time a fulfilment of the promise made by Lord Lawrence a year ago.

The Motion was put and agreed to.

EMIGRANTS' REGISTRATION FEE BILL.

The Hon'ble MR. CHAPMAN, in moving for leave to introduce a Bill to enable the Governor General in Council to increase the fees payable under section 31 of Act No. XIII of 1864 (*to consolidate and amend the law relating to the Emigration of Native Labourers*), said that, under the existing law, the fee for registering an emigrant was, except in the case of the Presidency Towns, limited to one rupee. But the total cost incurred for controlling emigration in India exceeded the revenue derived from fees, and it was not deemed expedient that the Government should bear that loss. The object of the present Bill, therefore, was to empower the Government to increase the fee for the registry of an emigrant to any amount not exceeding double the present amount.

The Motion was put and agreed to.

KULLU SUB-DIVISION (PANJAB) BILL.

The Hon'ble MR. STEPHEN presented the Report of the Select Committee on the Bill for investing the Assistant Commissioner in charge of the Kullu Sub-division of the Kángra District with certain appellate powers.

The Council adjourned to Friday, the 4th February 1870.

WHITLEY STOKES,
Secy. to the Council of the Govr. Genl. for making Laws and Regulations.

CALCUTTA,
The 28th January 1870.

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

REPORT ON THE FLOODS IN LOWER BENGAL IN 1868.

Report by COLONEL F. H. RUNDALL, R. E., *Chief Engineer, Bengal, Irrigation Branch, on the floods in Lower Bengal in* 1868, *dated* 11*th December* 1869.

The year 1868 was marked by disastrous inundations over a large extent of Lower Bengal, comprising the Districts of Cuttack, Burdwan, and the Presidency.

These inundations were produced by the unusually heavy rains in the commencement of the south-west monsoon, which, falling over the entire tract of country lying between the hills and the Bay of Bengal, from Poorce in the extreme south to Jessore in the north, which apparently formed the two limits of the belt of rain, brought down most of the rivers which intersect it in more sudden and violent floods than had ever been known to occur within the memory of living men.

The floods appear to have reached their greatest height everywhere between the 16th and 17th June.

2. The rain-fall in the month of June 1868, as measured at the following stations, is shown opposite to each. The quantity which fell in the first half of that month is also given, from which it will be seen that excessive as the total fall during the month was in several of these stations, more than $\frac{3}{4}$ths of the whole quantity fell between the 1st and 14th; while in 5 out of 8 of them the proportion was much greater. At Contai, in the Hidgelee District, for instance, the whole, with the exception of 2 inches only, fell in the first fortnight. The *normal* rain-fall in June is about 12 inches in Contai.

		1st to 7th.	8th to 14th.	Total.	15th to 30th.	Total per month.
1.	Poorce	5·50	1·90	7·10	3·60	11·00
2.	Cuttack	4·65	8·50	13·15	3·98	17·13
3.	Aquapudda	5·63	9·10	14·73	4·68	19·41
4.	Balasore	11·10	18·70	29·80	6·40	36·20
5.	Midnapoor	3·0	15·90	18·90	3·90	22·80
6.	Contai	6·35	26·48	32·83	2·01	34·84
7.	Calcutta	5·91	15·29	21·20	5·41	26·61
8.	Jessore	2·99	5·97	8·96	7·66	16·62
				146·97		181·61
			Average ...	18·36		23·08

3. The floods which did most harm in 1868 were those of the Byturnee, Brahminee, Soobunreekha, Kaleeaghye, Cossye, Selye, and Dalkissur, the name given to the upper portion of the Roopnarain, and of these the Soobunreekha and Kaleeaghye proved by all accounts the most destructive in their effects on the country. These effects, as gathered from the various reports of the Superintending and Executive Engineers, written immediately after their occurrence, will now be briefly stated.

4. Commencing with the Poorce District in the south, the Superintending Engineer reported that although the flood in the Katjooree and its branches, the Bargovee, Dyah, and Koosbuddra, was not as high as it had been known to

be on previous occasions, still it was 2 feet higher than the "safety mark" on the Cuttack gauge.

Only 9 breaches, aggregating half a mile in length, occurred in the embankments of the Bargovee, which proved that these protective works had been better made and looked after than they were wont to be formerly, when floods of no greater height than the one under notice used to do immense injury to them.

5. The flood in the Mahanuddy Proper was also a moderately high one, and did no damage whatever to the embankments for a considerable distance below Cuttack, or as far as the Civil Station of Juggutsingpoor. Below that, about 25 breaches, aggregating less than half of a mile, occurred. This flood was, if anything, higher than the great flood of 1866 at Juggutsingpoor, owing to the embankments above having stood so well, and it is satisfactory to find that protection was afforded to so large a tract of country which formerly suffered.

6. The flood in the Brahminee and in its branch the Kursooah, was on this occasion higher by 12 inches than the greatest flood on record (that of 1862), but notwithstanding this, the injury done in the upper portions of the embankments was very trifling. From the junction of the Kemereah with the Beropa downwards, however, considerable injury was done, not only to the embankments, but also to the country, chiefly at Ooteekan and Aul, where from a fourth to a half of the standing rice crop was destroyed by the inundation.

7. The embankments which suffered most were in the zemindary estates, which not having yet been taken over by the Government had not been properly repaired. An Assistant Engineer of the late East India Canal Company, who explored the country inundated by the flood of the Brahminee soon after its occurrence, reported that the water rose to a height varying from 5 to 10 feet over the banks, and swept away several villages, large trees, cattle, and much of the standing crop. The people were obliged to take refuge on the tops of houses, on trees and on any high ground they could find. No loss of lives was reported.

8. The Byturnee also rose very much higher than it had ever been known to do. At Aquapudda on the Calcutta road the water stood 11 inches higher than in the highest flood (1866), and although the embankments had been well repaired and raised 2 feet higher than the 1866 flood level, still that of June 1868 proved too much for them, and 168 breaches, aggregating 3·6 miles in length, occurred. The sea dyke at Ankoorah also was heavily breached by the inland floods in the Byturnee. Mr. Sub-Engineer O'Neil, then in the employ of the late East India Canal Company, and who inspected the locality which had suffered from the inundation immediately afterwards, reported that the water had swept over the country with an average depth of 6 feet, and destroyed fully two-thirds of the standing rice crop, and laid in ruins some 60 villages on both banks of the Byturnee and on the Roboo Nullah. Numbers of people took refuge on the Calcutta road, and on the tops of houses, trees, &c.

9. But far more disastrous than the Brahminee and Byturnee floods was that in the Soobunreekha, which came down so rapidly and suddenly, that it is stated to have been comparable to nothing short of a "storm-wave," so stupifying the people that the Executive Engineer of the Hidgellee Division through which it rushed had the greatest difficulty in getting them to assist in cutting the bunds which exist on the tidal rivers in the division, and towards which the "spill-water" of the Soobunreekha found its away, in order to relieve the country of the inundation.

Within the limits of the Orissa Circle, or in the Busta Sub-Division alone, 132 breaches, nearly 6·5 miles in extent, occurred in the embankments. This flood was said to be 3 *feet higher than the highest ever known.*

10. In the Hidgellee District, the floods of the Soobunreekha and Kaleeaghye caused a great deal of mischief. Not only were these floods in themselves far beyond any thing of the kind previously known, but the extremely heavy local rain-fall already noticed, and the strong south-westerly winds which blew at the same time and kept up the low water level at the mouths of the several rivers and creeks, all greatly aggravated the evils of the inundation.

For more than three days the whole of the Contai Sub-Division was covered with water to a depth of from 3 to 8 feet, cutting off all communication with the surrounding districts.

Scarcely a village in the Hidgellee District escaped the flood, which, breaching in innumerable places the embankments which surround the district on three sides, poured over the country, which is in itself naturally low.

Numbers of people took refuge on the "sand-hills" which run along the coast for some distance; others resorted for shelter to the public works bungalows, and others to the tops of houses, trees, &c.

From the Police returns, it appeared that 27,600 houses were utterly demolished. This, allowing only four individuals to one house, represents more than 110,000 people rendered houseless; upwards of 660 head of cattle were drowned; from 25 to 50 per cent. of the stores of grain were washed away, and the entire year's harvest in many parts of the district entirely lost. Providentially not more than 5 or 6 human lives were lost by drowning, or by the falling of the houses.

11. The floods in the rivers Cossye, Selye, and Dalkissur were all extremely high in June 1868, and did considerable damage to the embankments and to the country generally through which they run. A good deal of injury was done in Ghattal, where a large portion of the bazaar was washed away, and another large portion left a heap of ruins. So high was the flood on this occasion that it topped the compound wall of a gentleman's house, which was much above the reach of any previous flood. The school-house also was swept away, and but for the large number of breaches in the embankments which helped to lower the level of the water, the entire place would probably have been destroyed. In the Shampoor circuit the water was 8 feet deep over the fields, and houses, cattle, and crops were swept away, besides a large portion of the Koila road.

In the Midnapoor Zemindary Sub-Division, great injury was done by the floods, which covered the country for days; the people, with their cattle, fled for shelter to the highest parts of the embankments, and no lives were lost.

In the Tumlook Division, the Dalkissur rose on an average 3 feet over the highest land, and swept over a tract of country extending 3 miles on each side; and some 38 villages, all within a radius of 7 miles round Jehanabad, were greatly injured, one-third of the houses in them being demolished.

In the Burdwan Division, the Damoodah was only slightly in flood, showing that the rain had not extended as far as its "catchment-basin."

12. In the Presidency Division, the floods of June 1868 were not so severe, and nothing important was reported from it.

13. In most of the rivers above mentioned, the June flood was followed by tolerably high floods in the middle of August, and again in the middle of September; but as these were not quite so high as the June floods, they passed off without doing much additional damage.

14. In one respect, and only one, were the inundations above described of any benefit to the country over which they poured with such disastrous effect. A layer of "silt" was deposited by them on the land, which was thus greatly improved for agricultural purposes. This was the only compensating advantage which the ryots had for all their other heavy losses, but the silt without water which the ryots had for all their other heavy losses, but the silt without water was of little use, for scarcely six weeks after the heavy flood in the Byturnee, the resident Sub-Engineer of the late East India Canal Company wrote that "unless more rain fell immediately, the rice crops would certainly perish from drought."

GOVERNMENT OF INDIA.

FOREIGN DEPARTMENT.

ARRANGEMENTS MADE BY THE GOVERNMENT OF THE NIZAM FOR THE BETTER GOVERNMENT OF HIS HIGHNESS' TERRITORIES.

Translation of the Gazette of the Government of Nizam-ul-Moolk ASIFF JAH, *Monday, 26th Rajab,* 1286 *Hijree* (*1st November* 1869).

APPENDIX A.

NOTIFICATION.

Whereas it is considered expedient to give every facility to the efficient administration of the affairs of this Government, it has been determined to issue a Government Gazette, and to notify therein, from time to time, all orders emanating from the various Departments under the control of the Minister of State (Madar-ul-Mihamm, or Dewan), and of the Ministers of Departments (Sadr-ul-Mihamm), relating to the dismissals, appointments, changes, transfers, promotions, leave of absence, &c., of the Officers of this Government. By this measure, as already stated, not only will public business be expedited, but it will be made generally known what rules and measures have been, or shall be from time to time adopted for the benefit of the people, and for the government and prosperity of the country; while at the same time the Gazette will serve as the best instrument to ensure the due enforcement of the orders of Government.

2. The Government Gazette will be supplied to all the principal Departments of the State free of cost and postage, and the Officers of such Departments shall keep their copies among the records of Government, and have them bound and secured in quarterly files.

3. Every Officer to whom the orders of the Minister of State, or of the Departmental Ministers, published in the Government Gazette relate, shall be guided thereby, in the same manner as if the orders were issued to them directly and individually, as no separate directions will be issued on the same subject, with the reservation, however, of important and special orders which involved detailed instructions. On weighty subjects, separate orders will be issued.

4. When any orders of the Dewan, or of the Ministers of Departments are inserted in the Government Gazette, it will be incumbent upon every Officer to whom such order relates to give effect to it at once, even if, in the opinion of such Officer, it may appear necessary to solicit any further instructions, or to obtain special orders thereon. In the latter case, after carrying out, in the first instance, the orders received through the Gazette, it will be for the Officer concerned, with a view to clear his doubts, to address the Department from which the orders emanated, and obtain further instructions. Although, as far as possible, such orders as may involve public danger, will never be issued, still, should it happen that, pending receipt of reply to a reference, the carrying out of the orders received through the Gazette would be apt to cause mischief, or disturbance, or any evils entailing loss or injury, then the execution of such orders may be deferred upon the personal responsibility of the Officer concerned, and until further instructions be received, provided there are reasonable grounds for so doing; otherwise the Officer concerned will be liable to be brought to a strict account for it.

5. In the event of an order of the Dewan, or of the Departmental Ministers injuriously affecting any party or persons, the proper authority will most gladly take into due consideration the representations of such party or persons, provided their representations be not disrespectful or frivolous, and that they contain a clear statement of the injury sustained.

GOVERNMENT OFFICE—ORDER OF THE MINISTER.

Dated 21st Rajab, 1286 *Hijree (27th October* 1869).

In conformity with the Proclamation, dated the 6th Rajab, 1286 Hijree (12th October 1869), all the four Ministers of Departments therein named having been appointed to the offices detailed below, have entered upon their respective duties, *viz.*:—

Basheer-ud-Dowlah Bahadur to supervise the Courts of Justice, &c.

Mukarram-ud-Dowlah to superintend Revenue matters, &c.

Shamsheer Jung Bahadur to control the Police Department.

Meer Yawar Alee, son of the late Sazawar Jung, to superintend the Public Works and other Miscellaneous Departments.

Rules for the Conduct of Business connected with the Department of the Chief Minister of Justice (SADR-UL-MIHAMM-I-ADALAT) *in His Highness the Nizam's State.*

For the supervision and improved regulation of the conduct of business in all the Courts of Justice within the territories of this Government, for ensuring the prompt and vigorous administration of justice and equity, and for causing the enforcement, with sufficient strictness and care, of the rules and regulations approved and enacted by this Government, it has been deemed expedient to create the office of a Chief Minister of Justice, in order that he may devote his special attention to these important objects, and watch the working of the several Courts. Such a functionary has accordingly been appointed, and the under-mentioned Courts, &c., are placed under his control:—

1*st.*—All Adalats within the city.

2*nd.*—All Adalats within the (Sarf-i-khass) estates.

3*rd.*—All Adalats in the districts directly under the Dewan.

4*th.*—All jails pertaining to the above Courts over which a General Superintendent of Jails will be appointed.

5*th.*—Department of Judicial Stamps.

6*th.*—The temporary Committee for considering, consolidating, and amending the rules for Courts of Justice.

Inasmuch as the due and efficient discharge of the duties pertaining to this high official is a most desirable and important object, involving the improvement and well-being of the people, as well as the reputation of this State, the Government entertains the full belief that he will, by devoting his full attention, and bringing his entire energy and intelligence to bear upon the duties entrusted to him, conduct them in such a manner as fully to realize the objects above indicated, and the following paragraphs are prescribed by way of rules for his practical guidance:—

1. For the purpose of carrying on the business connected with his office, he shall have a seal engraved with the words—"Seal of the Office of the Sadr-ul-Mihamm of Adalats of the Government of Nizam-ul-Moolk Asiff Jah."

2. For the efficient performance of work, a 1st and 2nd Secretary or Assistant (Motamid) have been attached to the Office of the Chief Minister of Justice, and the former shall hold correspondence with the officials subordinate to that functionary and other Officers, &c., under his own signature.

3. The Secretary of the Chief Minister of Justice shall every day submit to that functionary the official correspondence, &c., and obtain his orders thereon. And notwithstanding that all despatches will be signed by the Secretary, every letter should commence with the words—"Under the orders of the Sadr-ul-Mihamm of Adalats, it is written, &c."

4. Inasmuch as the Chief Minister of Justice is responsible for the work of his Department, he shall not allow any fair letter to issue from his office until he shall have approved and initialed the draft thereof; and on important subjects, the orders passed by him should be written by himself, or caused to be written by his Secretary in his presence, and in either case, the order shall be signed by the Chief Minister of Justice. In ordinary matters, such as calling for the papers of any case, or enjoining the carrying out of any order previously issued, the Secretary may issue orders without the signature of his Chief being obtained on the drafts thereof.

5. Inasmuch as the mode of correspondence in the form and fashion of Proceedings (Roobakarees) is both convenient and obviates controversial writing in a greater degree compared with other modes, therefore it is essential that all the correspondence of the office under notice should be conducted in such mode.

6. Orders will be issued to all the Officers of Government, whether belonging to the Department of Justice or to other Departments, that in all matters connected with the Chief Minister of Justice, the necessary references to that functionary should be addressed to his Secretary, and that the same shall commence with the words—"For the information of," or "for such orders as may be deemed fit by, the Chief Minister of Justice."

7. In the case of Departments to which Secretaries are attached, the Secretary of the Chief Minister of Justice will correspond with, and receive replies from, such Secretaries. Where there are no Secretaries, such as in the offices of Talukdars, &c., the correspondence will be addressed to those functionaries direct.

8. For carrying on the work of the office of the Chief Minister of Justice, an adequate establishment has been fixed.

9. The Chief Minister of Justice will direct that, excepting on Fridays, his office will daily open not later than 10 A. M. and close at 5 P. M., provided the work of the day shall have been completed, otherwise it should remain open a few hours later.

10. Inasmuch as in the exercise of the duties appertaining to this functionary, it will be occasionally necessary to issue orders, &c., to certain persons of consideration in the State, such as Jageerdars, Jemadars, Maktahdars, &c., while delay would be caused if application were in such cases to be addressed first of all to the Minister of State, it is enjoined that in all such cases, the Chief Minister of Justice should cause every means to be used in the form of advice and persuasion in order to induce them to hold themselves amenable to the processes of justice, and that when all such measures have failed, and it appears to the Chief Minister of Justice that the said parties will not listen to

reason, then it will be for him to transmit to Government a clear statement of the whole of the circumstances of the case, with an expression of his own opinion, and he will be guided in the matter by the instructions of the Minister of State.

11. Whenever it may be necessary to obtain the orders of Government on any subject, the Secretary of the Chief Minister of Justice will be directed to address the Dewan's Judicial Secretary, and in doing so will always commence with the words—"Under the orders of the Chief Minister of Justice, it is stated for the information and such orders of the Minister of State as he may deem proper," &c. The Dewan's Secretary also in his turn will begin his reply in similar language, namely, "The letter, &c., dated——month—— having been received and laid before the Minister of State, it is written under his orders that," &c., &c.

12. Although it does not pertain to the Chief Minister of Justice to entertain appeals from the decisions of Talukdars and Sadr Talukdars, still should it appear from an examination of the statements received in any case that there has been some radical defect in any suit, or error in point of law or usage, it is competent for this functionary to remand the case for re-consideration to the Court concerned, accompanied with such plain remarks as may be requisite.

13. The Chief Minister of Justice shall not entertain appeals from the judgments of the Court of Appeal, but if any one petition him on reasonable grounds that his case has not been equitably disposed of, then he is certainly competent to call for from the Court concerned, and scrutinize the proceedings of the case; and in doing so, should it appear that there has been error in law or usage, or in the original character of the suit itself, then the Chief Minister of Justice shall transmit the proceedings in question, with a clear statement of his own opinion through the channel of the Judicial Secretary to Government, for the orders of the Minister of State.

14. When the Minister of State directs that any case disposed of by the Court of Appeal shall be re-investigated in the Court of the Chief Minister of Justice, then the latter will be competent either to investigate it himself, or to do so in conjunction with the head of any of the City Courts, but in either case, before issuing the judgment passed in the case, the proceedings shall be submitted for the perusal and orders of the Minister of State, and such orders shall be considered final.

15. It is competent for the Chief Minister of Justice, with the view of facilitating the conduct of business, and accelerating the administering of justice, to give strict and suitable orders to the heads of Courts under his authority, without reference to the Minister of State; but the making, amending, or altering of any rule or regulation shall not be carried out except with the approval and sanction of the Minister of State.

16. It shall be the duty of the Chief Minister of Justice carefully to provide that every order issued from his office to the heads of the lower Courts shall be promptly and precisely carried out, since disobedience of orders or delay in their execution is most injurious to good order and administrative arrangements. Therefore it is highly necessary that this functionary, whenever he sees defect or laxity in this respect, should apply instant remedy.

17. It is possible that at times differences of opinion may arise between the Appellate and other Courts, whether of the city, or of the districts in the interior. On such occasions, it will be the business of the Chief Minister of

Justice to use his best endeavours to reconcile the Courts at issue by all modes of persuasion, supporting the affronted Court, advising and admonishing the affronter, and pointing out its error. In the event of persuasion and advice proving ineffectual in bringing either or both the contending Courts to the right path, the Chief Minister of Justice will transmit the whole of the papers in the case, together with an expression of his own opinion, to the Minister of State, and seek his advice and counsel and be guided thereby.

18. The public generally complain of the Courts of this country, and consequently do not regard them with the respect which ought to be their due. The inhabitants of the city, the towns, and villages all alike raise the same clamour, and complain that justice is not promptly and impartially administered, especially in cases where Pleaders are retained on both sides, for these Vakeels not only conduce to enhance litigation and prolong suits, but are the cause of numerous complaints, sowing as they do the seeds of discord among communities, and disruption in families, and exciting parties to litigation for their own selfish ends. This is explained by the fact that these Vakeels are usually men of disreputable character, and utterly destitute of sound education, while the inhabitants of the city are as yet totally unacquainted with any rules or regulations. Under these circumstances, it is incumbent on the Chief Minister of Justice to do his best towards securing the improved working of the Courts under his control, so as to ensure suits of every description being enquired into and disposed of with the utmost promptitude and vigour, in order that no one may be inconvenienced by unnecessary delay. It should also be strictly enjoined that, as far as possible, parties shall personally plead their own causes, or shall employ their servants or friends to represent them instead of hired Vakeels.

19. The Chief Minister of Justice shall not exercise any original jurisdiction.

20. As regards jails, the Chief Minister of Justice must pay attention to the following points:—

1*st*.—Dimensions and capacity of the buildings, with a view to the preservation of the health of the prisoners.

2*nd*.—Sanitary condition of the jails and their free ventilation.

3*rd*.—Keeping the prisoners employed in in-door and out-door labour, seeing that work is not exacted from them for the benefit of private persons, and that their labour is strictly confined to works of public utility.

4*th*.—Diet and clothing of prisoners.

21. To enable the Chief Minister of Justice to exercise the functions of his office fully and satisfactorily, he is invested with the powers detailed here below, *viz*.:—

1*st*.—He is competent to suspend from duty the Secretary of his office for repeated disobedience of orders, or for receiving bribes, or for negligence, or incompetence, a report of the same being immediately made to the Dewan. If, in the opinion of the Chief Minister of Justice, the dismissal of the suspended official appear to be called for, the record of the case, with a clear statement of his opinion thereon, shall be forwarded to the Minister of State, and his advice in the matter will be duly attended to.

2*nd*.—The Chief Minister of Justice has authority, without reference to Government, to suspend from duty, to transfer, reduce, or dismiss from the service any member of his establishment for negligence, or misconduct, or incompetence; but the person concerned will be at liberty to appeal to Government.

3*rd*.—The Chief Minister of Justice is authorized, without reference to Government, to accord sanction to the recommendations of the Talukdars, or Sadr Talukdars, or the Judges of Courts for the suspension from duty, or transfer or reduction of the members of their establishments, provided just and reasonable grounds are shown. An appeal shall however lie to the Government by the party concerned.

4*th*.—The Chief Minister of Justice is empowered to appoint Officers to fill vacancies in his own establishment, or in those of other Courts, caused by the dismissal or death of the members thereof, provided such persons be qualified for such posts. It will be necessary, however, in these cases to give due consideration to the recommendations of Officers in favor of persons, based on fitness and long service.

5*th*.—Inasmuch as the Tehseeldars and Talukdars are in a great measure connected with the Revenue Department, the Chief Minister of Justice has no authority to suspend from office any of those Officers for any offence. But he can obtain the orders of Government in such cases, by reporting the circumstances, with an expression of his own opinion, to the Minister of State. The assistants of the Talukdars' Courts can be supended from office by the Chief Minister of Justice.

6*th*.—The Chief Minister of Justice is competent to suspend from office the Judge, or member of any of the City Courts, excepting the President, on grounds of glaring oppression, receiving bribes, or other misconduct, or total incompetence for his post; but a complete and clear report of the circumstances relating to such suspension, with the record of the grounds of conviction, shall be transmitted to the Minister of State, and his advice conformed to.

7*th*.—The Chief Minister of Justice has authority, without reference to Government, to suspend from duty, to transfer, reduce, or dismiss from the service the Darogahs, Jemadars, Policemen, and Clerks attached to the jails, provided their names are not borne on the Police Schedule. He can also appoint candidates in room of Darogahs, or Jemadars, or Clerks dismissed or deceased. In cases of disobedience of orders, or misconduct, or negligence on the part of any member of the Police force, detailed on jail duty, a report of the circumstances, including the name of the individual, his rank, and the charge against him, shall be forwarded for information and issue of orders to the Chief Minister of Police through the channel of the Secretary of that Department.

8*th*.—The Chief Minister of Justice has power to dismiss or re-instate any servant of the Stamp Office (which is connected with the Judicial Department) upon the application of the Superintendent of Stamps. But in the case of dismissal or re-instatement of the Superintendent of Stamps in particular, strong and valid reasons must be shown.

9*th*.—As the Superintendent of Stamps is also connected with the Revenue Department, in the event of any fault being imputed to that Officer, the Chief Minister of Justice should refer the matter for the information of the Minister of State.

10*th*.—Whenever absolutely necessary, or when despite every effort, arrears of cases have accumulated in any Court, the Chief Minister of Justice is authorized, with a view to clearing off such arrears, to entertain, without reference to Government, temporary establishment to the extent of Rs. 300 per mensem for a period of three months. If it be found necessary to incur larger expenditure, and for a longer period than above indicated, the sanction of Government should be sought.

11*th*.—The Chief Minister of Justice is authorized to remit fines awarded by the Judges of Adalats, or Sadr Talukdar, either on the Civil or Criminal side, or as regards stamped paper in petty cases, provided the aggregate amount of remissions on reasonable grounds do not exceed Rs. 500 per annum. For remissions in excess of that amount, the authority of the Minister of State will be requisite.

12*th*.—The Chief Minister of Justice is authorized to pass the abstracts of salaries and contingent bills of his own office, and of the District and City Adalats subordinate to him, provided the items are not disputed by the Examiner's Office, and provided also that they do not exceed the sanctioned scale, and are in all respects legitimate.

13*th*.—The Chief Minister of Justice is empowered to incur expenditure to the extent of Rs. 200 per annum, in each case, for the repairs and improvement of the jail buildings of the districts and the city. In the event of a larger amount being necessary, the sanction of the Minister of State should be obtained.

14*th*.—When it is found necessary to send prisoners on out-door labour, such as the repairs and construction of public works, the Chief Minister of Justice has authority to entertain contingent guards for their custody on the scale of one man on Rs. 6 a month to every four prisoners, and one Duffadar on Rs. 10 a month to every twelve men for a period not exceeding three months. In the event of their employment for a longer period being necessary, the sanction of Government must be obtained.

15*th*.—The Chief Minister of Justice has power to sanction charges on account of diet and clothing of prisoners, according to the regulated scale, as well as to authorize the cost of fetters, &c., for prisoners to the amount of Rs. 1,000 per annum.

22. He shall submit to Government the periodical returns and statements specified below, *viz.*:—

WEEKLY.

1*st*.—Diary of correspondence between his Office and other Courts, &c.

MONTHLY.

2*nd*.—General statement of cases filed in each criminal tribunal of the districts and of the city, showing respectively the number of cases tried, proved, not proved, sentences passed and under execution, the number of persons released on bail, and number of cases and persons pending trial at the close of the month.

3*rd*.—Return showing the amount of cash and value of property stolen or plundered, with details of amounts recovered and likely to be recovered.

4*th*.—General statement of suits filed in each Civil Court of the city and the districts, showing the numbers instituted and disposed of, the number in which execution has issued and is pending, number compromised, number struck out, and the number pending enquiry at the close of the month.

5*th*.—Return showing the total value of suits filed in each Civil Court of the districts and the city, the amounts awarded, realized, paid out, and remaining, and the amount difficult of recovery for reasons stated.

6*th*.—Return showing the number of persons imprisoned for debt, the debt, and term of imprisonment.

7*th*.—Return of prisoners in the district and city jails, showing the number admitted during the month, the number released on expiration of term, number escaped, and number remaining at close of month.

8*th*.—Return of work performed by prisoners of the city and district jails.

9*th*.—Return of stamped paper, showing balance of last month in the office of the Superintendent of Stamps and the District Courts, quantity supplied to the District Courts, &c., within the month, the quantity sold, and the stock remaining in each District and City Court and in the office of the Superintendent of Stamps.

10*th*.—Return showing the names of the Districts or Adalats, the repairs to the jails of which have been sanctioned during the month, with the sums so sanctioned.

QUARTERLY.

11*th*.—Statement showing the value of stamped paper sold in each District and City Court, and the Office of the Superintendent of Stamps.

12*th*.—Statement showing realizations from fines relating to stamped paper on the Civil and Criminal sides in each City and District Court, and in the Office of the Superintendent of Stamps, specifying the sums realized and the number of cases remaining.

HALF-YEARLY.

13*th*.—Statement showing the temporary establishments entertained under the authority given in clause 10 of para. 21 of these rules.

14*th*.—Statement showing the temporary Jail Guards entertained under the authority granted in clause 14 of para. 21 of these rules.

YEARLY.

15*th*.—General report upon the working of the several Departments under the control of the Chief Minister of Justice, noticing the conduct and services of the Officers and of the Judges of the lower Courts, &c.; the report should reach the Minister of State not later than the month of Meher.*

* Begins on 21st March as per present year's Almanac.

23. The Minister of State will on his own part be glad at all times to give his best support and advice to the Chief Minister of Justice in carrying out all important measures connected with his office, and he entertains the hope that this functionary also will on his part exercise his careful discretion and judgment on all occasions of difficulty. On mature consideration, should any measure of reform or improvement appear to him to be called for in any respect, even though no distinct complaint may have reached him in regard to it, he may, either in official form, or by way of consultation, make a reference to the Minister of State, and ascertain his wishes on the subject. In the adoption of any measure which may appear peremptorily called for in the interests of the public, or for the benefit of Government, if delay in applying for Government sanction appear to be productive of evil or loss, he should not hesitate to carry out the requisite measure upon his own responsibility, though it may be beyond the scope of authority vested in him by these rules; but he shall immediately, after carrying out the measure, make a full report of the circumstances thereof to the Dewan, with the grounds for acting upon his own authority in the matter.

Dated 21st Rajab, 1286 *Hijree* (*27th October* 1869).

Rules for the Conduct of Business relating to the Department of the Chief Minister of Revenue (SADR-UL-MIHAMM-I-MALGUZAREE) *of His Highness the Nizam's Government.*

Whereas it has been deemed expedient to facilitate the conduct of business connected with the Department of Revenue, an Officer under the designation of Sadr-ul-Mihamm-i-Malguzaree has been appointed, and the Departments of the State Revenue relating to the Sarf-i-khass lands, and the Khalsa under Dewanee administration enumerated below, have been placed under his supervision and control :—

1*st*.—All the Departments of Land Revenue.

2*nd*.—All the Siwae or extra sources of revenue.

3*rd*.—The Revenue Stamps.

4*th*.—Postage Stamps.

5*th*.—The Karôdgeeree or Customs Department.

6*th*.—The Forest Department.

For carrying out the work connected with the above branches of administration, one 1st and one 2nd Secretary (Motamid) have been attached to this functionary's office.

The following paragraphs are prescribed for this Department :—

1. For giving effect to the transactions of the office of the Revenue Minister, he shall have a seal engraved with the words—"Seal of the Office of Sadr-ul-Mihamm of Malguzaree of the Government of Nizam-ul-Moolk Asiff Jah."

2. His Secretary shall every day submit to him all letters and correspondence, &c., received by him from the Departments mentioned above, and shall obtain his orders on every subject.

3. The Secretary of the Department shall correspond with all the Officers of Government, but every Roobakaree should commence with the words—"Under the orders of the Revenue Minister, information is given," or "it is written," &c., &c.

4. Between the office of the Minister of Revenue and the other Departments and Officers of Government, correspondence shall be conducted in the form of Roobakarees.

5. The Sadr Talukdars, the Talukdars, and other Officers of Government shall address their correspondence to the Secretary of the Revenue Minster, commencing with the words—"For the information (or orders) of the Revenue Minister."

6. In matters beyond the powers of the Revenue Minister, or in cases in which it is necessary to obtain the orders of Government, his Secretary shall address the Revenue Secretary of the Minister of State, prefacing his letters with the words—"Under the orders of the Revenue Minister, it is written." The reply of the Minister of State will likewise be conveyed through the medium of the Secretaries.

7. All the drafts and other papers which are to be placed on record shall bear the signature of the Minister of Revenue, but every order on important subjects should be written in his own handwriting, or caused to be written in his presence by his Secretary. In either case, it shall be signed by the Revenue Minister himself. He will be responsible also for all matters which may be carried out under the signature of his Secretary. In all routine matters, such as calling for papers, or enjoining compliance with orders previously issued, the Secretary himself may issue orders under his own signature, but such orders also should be worded as under the orders of the Minister or Head of the Department.

8. For the efficient performance of the work in this Department of the State, an adequate establishment has been sanctioned.

9. The Revenue Minister is invested with the powers defined here below :—

1*st*.—He is competent, without reference to Government, to suspend from duty, or transfer, or reduce, or dismiss from the service any member of his office establishment on grounds of misconduct, negligence, and incompetence; but the party so dealt with will be at liberty to make an appeal to Government.

2*nd*.—On sufficient and valid grounds shown by the Sadr Talukdars, Superintendent of Forests, &c., the Minister of this Department has power to suspend from duty, transfer, reduce, or dismiss from the service any member of the establishments of the Sadr Talukdars, Talukdars, &c.; but the parties so dismissed may appeal to Government.

3*rd*.—The Minister of Revenue is empowered to suspend from office any Tehseeldar, Talukdar, Sadr Talukdar, and Superintendent of Forests, &c., on the grounds of misconduct, repeated negligence, or incompetence; but after investigation and completion of the case, the Revenue Minister shall submit the same to Government, recording his own opinion thereon in clear and distinct terms, and, pending the orders of Government, shall take no further action beyond suspension.

4*th*.—He is competent to recommend candidates for the appointment of Tehseeldars, Talukdars, Sadr Talukdars, Superintendent of Forests, &c.; but it will be optional with Government to approve or disapprove of such recommendations without assigning grounds for doing so. Moreover, this Minister in every instance in which a candidate may be entertained in

consideration of long service and ability, shall, besides his own opinion, submit a detailed explanation of the claims of such candidate.

5*th*.—He is empowered to hear and determine appeals in the Revenue Department on the decisions of Talukdars and Sadr Talukdars, especially in Revenue matters; such cases being received on stamped papers of the values laid down here below:—

1*st*.—For claims relating to land paying revenue to Government, on stamp paper valued 8 annas.

2*nd*.—For claims relating to land paying no revenue to Government, on stamp paper of values prescribed for Civil suits.

6*th*.—The decisions passed by this Minister in matters relating to Land Revenue, Abkaree and Karôdgeeree (Customs, &c.), shall be held to be final, provided the amount of claim does not exceed Rs. 1,000.

7*th*.—He is authorized to sanction remissions of arrears of revenue in any division to the extent of Rs. 2,000 outstanding for a period exceeding three years, submitting monthly reports thereof to Government.

8*th*.—He has authority to sanction refunds of revenue erroneously realized to any amount not exceeding Rs. 1,000.

9*th*.—He may also sanction expenditure from Government revenue on public works, repairs of buildings and tanks, &c., in all the divisions, to the extent of Rs. 20,000 within the period of one year.

10*th*.—He is empowered to entertain temporary land-measuring establishments in the Revenue Department for a period of six months in each division, the cost thereof not exceeding Rs. 300. In the event of a larger expenditure being required, the sanction of the Minister of State should be applied for.

11*th*.—On emergent occasions, or when required for clearing off arrears of work, &c., provided such arrears shall not be owing to the negligence of Officers, or due to other improper causes, he has authority to sanction temporary establishment for a period of three months, at a cost not exceeding Rs. 300 per mensem. On a greater contingency arising, sanction will be subject to the Minister's order.

12*th*.—He is authorized to sanction travelling allowances on circuit to Sadr Talukdars, Talukdars, and other Officers of Government, who are entitled to such under the rules.

13*th*.—He is authorized to pass the abstracts of salaries and contingent charges of his own office, and those of the Departments subordinate to him in the districts, if no objections are raised in the Examiner's Office, provided that the items charged are not in excess of the scale sanctioned by Government, and are legitimate.

14*th*.—He is competent to reduce or enhance the fines awarded by the Sadr Talukdars or Talukdars for infringement of Stamp Rules, provided the total amount of fine does not exceed Rs. 300; a higher amount will require the sanction of the Minister of State.

15*th*.—With reference to accepting applications for uncultivated and waste lands, he shall be guided by the rules prescribed on that subject. But if any measure not provided for in these rules happen to be called for at any time, he shall not be at liberty to authorize it without special sanction of the Minister of State.

16*th*.—He shall make arrangements for the grant of permits from his office for the cutting of timber.

10. He has no power, without obtaining the permission of Government, to grant fresh "Maktahs" or leases on fixed quit-rent, money allowances and stipends, or in disputed cases to declare such claims valid after enquiring into their titles. When referring such matters to Government, he shall submit a clear statement of his own opinion with that of the Talukdar and Sadr Talukdar thereon.

11. He is competent to transfer from one district or division situated within the same part of the country any Tehseeldar or Talukdar, but he cannot transfer or remove the said Officers from one part of the country to another without the sanction of Government.

12. He has no power, without obtaining the orders of Government, to sanction remission of balances of revenue either of the current year, or of the two previous years.

13. He is not competent, excepting under Government authority, to abolish or reduce any tax or duty fixed by Government, whatever the nature of such tax or duty may be.

14. He is not vested with power to refund any sum of money after it has been credited in the accounts, or paid into the treasury But he can cause the refund of such sums of money by applying for the authority of Government so to do.

15. He has power to suspend from duty the Secretary of his office for receiving bribes, or other misconduct, or for repeated negligence, a full report of the circumstances being made for the information of Government. In the event of his offence being considered by the Minister of Revenue so grave as to call for his dismissal from the service, then the whole of the circumstances of the case shall be laid before Government, with a view to elicit orders thereon.

16. When any dispute or cause in revenue matters arises among the Officers belonging to the Dewanee, Maktahdars, Inamdars, Jageerdars, or Jemadars, the Revenue Minister is authorized, in the first instance, to advise such persons, and use his best endeavours towards bringing their affairs to adjustment. If, after using all efforts and persuasion, it should appear to him that there is no prospect of effecting a reconcilement without recourse to coercion, in that case the whole of the circumstances of the case shall be perspicuously laid before the Minister of State, and his orders obtained thereon.

17. The Revenue Minister shall submit to Government the under-mentioned periodical returns:—

WEEKLY.

1*st*.—Diary of correspondence held between his own and the other Departments.

MONTHLY.

2*nd*.—Return of entertainment and dismissals of district establishments.

3*rd*.—List of permits for cutting timber granted from his office.

4*th*.—Statement of Revenue Stamps, showing balances of last month in the Office of the Superintendent of Stamps and in the District Offices, with the quantity supplied to the districts, &c., during the month, the amount of sale, and the stock remaining in each District and in the Office of the Superintendent of Stamps.

5*th*.—Statement showing the names of the districts in which sanction may have been accorded on account of repairs, and to what amount.

QUARTERLY.

6*th*.—Returns of persons imprisoned for arrears of revenue.

7*th*.—Statement of refunds.

HALF-YEARLY.

8*th*.—Return of the state of crops and agricultural prospects.

9*th*.—Statement of temporary establishment entertained under the provisions of clause 10, para. 9 of these rules.

YEARLY.

General report upon the whole of the Province, the state of trade, arrangements regarding timber and forests, notice of the manner in which the Officers of Government have conducted their duties, and other matters.

17. The Minister of Revenue shall furnish to the Account Department the under-mentioned periodical returns:—

MONTHLY.

1*st*.—Return of permits granted from his office for cutting timber.

QUARTERLY.

2*nd*.—Statement of remissions granted by him and by the Sadr Talukdars.

3*rd*.—Statement of refunds granted by him and by the above Sadr Talukdars respectively.

18. The Government, while on its part it will at all times be happy to give its best support, aid, and advice to the Minister of Revenue in the discharge of the duties entrusted to him, entertains the hope that the latter functionary will, on all necessary occasions, use his own careful discretion and judgment in the transaction of business. On mature consideration, should the adoption of any measure appear to him absolutely demanded for the benefit of the public and in the interests of Government, and that delay would be productive of inconvenience, he shall, under such circumstances, unhesitatingly carry out the requisite measure at once upon his own responsibility, though it may be beyond the powers vested in him; but he shall immediately after doing act upon his own authority on the occasion, for the information of Government.

Rules for the Conduct of Business appertaining to the Department of the Chief Minister of Police (SADR-UL-MIHAMM-I-MAHKAMAH KOTWALEE) *under His Highness the Nizam's Government.*

Whereas the Department of Police has now become a highly important branch of the administration, therefore it has been deemed expedient by Government, with a view to the matters connected with this Department being carried out with promptitude and energy, to appoint a special officer under the above designation, for whose guidance the following paragraphs are laid down:—

1. Under the supervision, care and control of this Minister are placed the Departments mentioned below, *viz.*:—

1*st*.—The Police of the city of Hyderabad.

2*nd*.—The Police of the Sarf-i-khass lands.

3*rd*.—The Police of the suburbs of the city of Hyderabad.

4*th*.—The Police of the Districts.

2. For the efficient performance of the duties of this Department, 1st and 2nd Secretaries (Motamid) have been appointed. The Secretary shall, under the orders of his Chief, hold direct correspondence with other subordinate Departments. He is also at liberty to correspond with other Departments of Government whenever the exigencies of the service require it.

3. Whenever it appears to the Minister of Police necessary to obtain the orders of Government on any subject, his Secretary shall, under his orders, address the Secretary of the Minister of State in the Police Department, and the reply of the Minister of State shall likewise be addressed through the same Secretary to the Secretary of the Minister of Police.

4. Although all communications will be issued under the signature of the Secretary of the Minister of Police, yet the latter functionary will be held responsible for the acts of his Secretary; therefore he should not allow any paper or letter to leave his office before his signature is affixed to the draft of such letter or memorandum. But in important matters, every order emanating from him shall be written with his own hand, or caused to be written in his presence by his Secretary, and in either case such order shall be signed by the Minister of Police himself.

5. For giving effect to the transactions connected with this Department, a seal shall be provided, engraved with the words—"Seal of the Sadr-ul-Mihamm of Police of the Government of Nizam-ul-Moolk Asiff Jah."

6. For carrying on the work of this office, an adequate establishment has been fixed.

7. For guidance in the conduct of business, and the control of Officers and men of the Police force, and for instruction as to the mode in which the work of the Department is to be peformed, a body of Police Rules has been drawn up after mature deliberation, and put in force, which the Minister of Police will conform to in administering the Department. The paragraphs of the rules in question which do not apply, or cannot be made applicable, to the City Police, shall of course be inoperative as regards the city, but if any rule can, with a slight modification, be advantageously applied to the city, it shall be so modified and applied accordingly; in all such cases, it will be necessary to bear in mind that the measures adopted shall not be made to inconvenience any person, or be felt as grievous or oppressive by the people.

8. Between the office of the Minister of Police and the Officers of this and the other Departments, correspondence shall be conducted in the form of Roobakarees, as this mode of communication is calculated to obviate inconvenience in general, and preclude the possibility of giving offence.

9. If between the Officers, &c., under the control of the Minister of Police and persons belonging to the Jageerdar, Inamdar, Maktahdar, and Jemadar classes, any dispute arise as regards the apprehension, or harbouring of any offender, or offering obstruction in Police matters, the Minister of Police shall, in the first instance, employ strong advice and persuasion to bring the parties concerned to the right path and proper behaviour. If, however, such advice and persuasion prove ineffectual, and coercion appear necessary, in that case he shall lay the whole of the circumstances, with the papers in the case, before Government, and obtain the orders of the Minister of State thereon.

10. Although the adoption of stringent measures for the suppression of crime in general is an indispensable part of Police administration, yet amongst the different descriptions of crime that which demands the greatest exertion, and the most serious attention on the part of the Minister of Police is dakaitee, which is the most heinous and atrocious of all crimes. Where it occurs, calamities and sufferings of every description ensue, such as plunder, outrage, and violence of all sorts, rape, murder, &c. Therefore the efficiency and vigilance of the Police, or the contrary will be clearly evidenced by the occurrence or suppression of this crime, or where it occurs, by the apprehension of the perpetrators and plunderers. If this crime does not disappear, or the perpetrators thereof are not apprehended, it will be a conclusive proof of the total inefficiency of the Police force. The second heinous crime is highway robbery. The expenditure of lakhs of rupees by Government on account of the Police is for the security of the lives and property of the people. If, notwithstanding such enormous expenditure, property continue to be plundered, the Police arrangement is simply useless. Therefore the suppression of this crime is also most indispensable. Another point calling for particular attention is the fact that after the occurrence of murder, or dakaitee, or highway robbery, or any other crime, the Police Officers generally prosecute search and pursuit for a few days, and afterwards lose sight of the matter altogether; whereas it is absolutely necessary that search and pursuit should not be abandoned until detection and apprehension of the criminals ensue, and exertions and endeavours of every kind should continue. For adopting the needful and remedial arrangements in all these respects, the Government will certainly look to the Minister of Police.

11. To enable him to exercise the functions of his office with efficiency, the powers defined here below are conferred upon him:—

1*st*.—He is authorized, without reference to Government, on sufficient grounds to suspend from duty, or transfer, or reduce, or dismiss from the service any Policeman, Duffadar (inferior officer), or Jemadar of Police.

2*nd*.—He is authorized to suspend from duty any Officer from the grade of Assistant General Superintendent to the Ameen of Police, &c., on grounds of negligence in the performance of duty, glaring oppression, or other misconduct, or incompetence; but after enquiry into their delinquency, the whole of the proceedings, with a clear statement of his opinion, shall be submitted to Government for orders.

3*rd*.—He is competent to recommend candidates on grounds of long service and ability for the appointments of General Superintendent, Assistant General Superintendent, and Superintendent of Police of the Districts; but Government reserves to itself the option of accepting or rejecting such recommendations without assigning any reason.

4*th*.—The Minister of Police is authorized, without reference to Government, to suspend from duty, or transfer, or reduce, or dismiss from the service any member of the establishment of his office, and to appoint another to fill the vacancy caused thereby.

5*th*.—He has authority, without reference to Government, upon just and sufficient grounds being shown by the superior Officers, to suspend from duty, or transfer, or reduce, or dismiss from the service any individual of their office establishments, and to appoint another instead; but an appeal will lie to Government in all such cases.

6*th*.—He has authority, without reference to the Minister of State, to transfer men, or Officers of Police from one district or division to another, whether such transfers be made by way of punishment, or as considered to be called for in the interests of the public service.

7*th*.—He is competent to hear and determine appeals against the decisions of the Police Courts of the city and its environs. He shall also exercise the said powers as regards the orders of the General Superintendents of Police of the Sarf-i-khass estates, and of the districts, passed in appeal from the decisions of the Assistant District Superintendents of Police. The decisions of the Minister of Police in cases relating to the duties of the Police shall be held to be final.

8*th*.—He is authorized to sanction repairs to Police stations in each district to the extent of Rs. 200 within one year.

9*th*.—If any Policeman, or Jemadar, or Ameen of Police distinguish himself by the display of special zeal and energy in the accomplishment of any difficult work, the Minister of Police is authorized to promote him to the next higher grade at once, though such promotion of an Officer may cause the sanctioned scale of establishment to be exceeded. Till such time, however, as a vacancy occurs in the grade to which the promotion has been made, the Officer so promoted shall be reckoned supernumerary.

10*th*.—When at any time, fixed term prisoners escape from jails, or in serious cases where the capture of any one is highly necessary, the Minister of Police is authorized to issue proclamations offering a reward of Rs. 200 to any person who may apprehend such prisoner or criminal. Even in the absence of such proclamations, if any Policeman or Police Sawar bravely apprehend any criminal, the Minister of Police may grant him a reward up to Rs. 100. Rewards of larger amounts will be subject to the sanction of the Minister of State.

11*th*.—The Minister of Police is authorized to pass the abstracts of salaries and contingencies of all the Police Departments and the expenses of the jails, provided that the items charged are not in excess of the sanctioned limit.

12*th*.—He has power without reference to Government, when required for the protection of any dangerous locality, to entertain temporary additions to the Police force; but the total cost on account of them shall not exceed Rs. 300 per mensem for one district, nor the period of their employment extend beyond two months.

13*th*.—He is authorized to incur expenditure from the Clothing Fund of the Police on account of clothing for the Police force through the Superintendent of Clothing, in conformity with the rules of the service.

14*th*.—The Minister of Police is empowered to investigate the case of any offender of the Police force, which may be beyond the powers of the Officers subordinate to him, provided the offence relates to the discipline and duty of the offender as a Police servant; and, in case of conviction, imprisonment for a term not exceeding two years, or fine up to Rs. 500, or both may be awarded by him. If the offence be of a nature requiring a greater degree of punishment, the case must be referred to the Criminal Court of the city, or of the districts, in conformity with the rules in force.

15*th*.—The Minister of Police is competent to suspend from duty the Secretary of his office in case of bribery, or misconduct, or repeated negligence; but the grounds of such suspension shall be immediately reported for the information of Government, or in the event of the offence charged being established on enquiry, and in the opinion of the Minister of Police being such as to call for the dismissal of the culprit, then the proceedings of the case, with a full expression of the Minister of Police's own opinion thereon, shall be submitted for the orders of Government,

12. It is absolutely necessary that the Sadr-ul-Mihamm of Police should exercise a careful supervision over the Officers and force under his control, and see that the rules of the service are strictly conformed to in every respect, and that the distribution of the Police force and posts is judiciously arranged and carried out. Whenever any plan for the improved administration of the Department occurs to the judgment of the Minister of Police, he shall unhesitatingly represent the same to Government, and act according to the orders he shall receive thereon.

13. He shall submit to Government the under-mentioned periodical returns, *viz.* :—

WEEKLY.

1*st*.—Diary of correspondence.

MONTHLY.

2*nd*.—Statement of crimes committed, with detail of districts, and showing the number of cases in which criminals have been apprehended, the number in which they have not yet been apprehended, and the number brought before the Courts of the districts.

3*rd*.—Statement of fines levied under the powers vested in the Minister of Police or other Police Officers.

4*th*.—Statement showing sums sanctioned for repairs of Police stations.

5*th*.—Statement showing appointments and dismissals made under the authority of the Minister of Police.

YEARLY.

6*th*.—General report upon the Police administration of the city and of the districts, conduct of the Officers, &c.

14. While the Government on its own part will at all times give its best support, aid, and advice to this functionary in carrying out all important measures connected with his office, it desires that he himself will exercise his own prudence and judgment on all occasions of difficulty. On mature consideration should it appear to him that any measure is essential for the benefit of the public, or the interests of the State, and that delay in its adoption would be productive of inconvenience to the public, then even if the matter be beyond the powers vested in him, he shall not hesitate in carrying out the same at once upon his own responsibility, and immediately after doing so shall report the circumstances and the grounds for carrying out the measure upon his own authority for the information of the Minister of State.

Rules for guidance in the transaction of Business pertaining to the Office of Chief Minister of Miscellaneous Departments (SADR-UL-MIHAMM-I-MUTAFARRIKAT) *of His Highness the Nizam's State.*

Besides the Judicial, Revenue, and Police Departments, there are certain other Departments of Government, which, though of a miscellaneous character, demand for their proper administration and supervision great care and attention. Therefore with a view to ensure business connected with these Departments being carried out with correctness and efficiency, it has been deemed expedient by Government to appoint a supervising Officer under the above designation, and to place under his control the Departments mentioned below, *viz.* :—

1*st*.—Public Works Department.

2*nd*.—Educational Department of the city and the districts, with the Hyderabad Engineering College.

3*rd*.—Medical Department, comprising the Native Doctors and Dispensaries of the city and of the districts, and of the Government lands.

4*th*.—Conservancy and Sanitary Department of the city and suburbs, and of the Government lands and Khalsa Districts under the Minister of State.

5*th*.—The Department for the improvement and repair of village roads. Also other Miscellaneous Departments which it may be deemed expedient hereafter to entrust to this functionary.

The Government having thus specially appointed a Minister for the supervision and control of the affairs connected with these Departments, feels every confidence that that official will administer them with the utmost prudence and sagacity, and the following paragraphs are laid down by way of rules for his practical guidance.

1. For giving effect to the transactions connected with his office, a seal shall be provided engraved with the words—"Seal of the Office of Chief Minster of Miscellaneous Departments of the Government of Nizam-ul-Moolk Asiff Jah."

2. For the efficient performance of work under the Minister of Miscellaneous Departments, a Secretary and an Assistant Secretary (Motamid) have been appointed. It shall the duty of the Secretary to conduct under his own signature, pursuant to the instructions of his Chief, the whole of the correspondence in the Departments enumerated above.

3. For the performance of the above work, an adequate establishment will be provided.

4. On all necessary occasions this Minister will through his Secretary correspond with the Officers of other Departments of Government. The correspondence with Departments to which Secretaries are attached shall be carried on through that medium. Departments without Secretaries shall be addressed direct.

5. All heads of Government Departments shall be instructed that whenever it may be necessary to send replies, or make references to the office of this Minister, the correspondence shall be addressed through the Secretary under the formula—"For the information of the Chief Minister of Miscellaneous Departments, it is written," &c., &c.

6. Although all correspondence will issue under the signature of the Secretary of this Department, yet the responsibility will rest with the Minister of the Department himself; therefore all drafts and other documents which are to be placed on record should bear his own signatures, and all orders on important subjects should be written out in his own handwriting, or caused to be written in his presence by his Secretary, and in either case should be signed by the Minister himself.

7. Between this Minister and other Officers, &c., of Government, correspondence shall be conducted in the form of Roobakarees, as this mode obviates inconvenience in official correspondence, and gives no offence to any Officer.

8. Whenever it may be necessary for this Minister to obtain information from, or make communications to, authorities other than those pertaining to the Departments under his control in the city, or in the districts, such as Maktahdars, Jageerdars, Jemadars, &c., as well as other Departments, as regards cleanliness of public thoroughfares, &c., it shall not be necessary to apply for Government Ahkams or Takeeds, &c., to their address, but on such occasions, the Minister of the Department himself is competent through the channel of his Secretary to call on those concerned for the needful information, or to persuade or advise them to accede to any requisite measure. In the event of persuasion and advice, &c., proving ineffectual, or direct refusal being made, and coercion appearing necessary, then the whole matter, with a clear expression of opinion, shall be laid before Government for orders.

9. In matters relating to the conservancy and improvement of the city and towns, &c., the Secretary of the Minister of this Department shall correspond, as regards the city, with the President of the Municipal Committee; and as regards the towns and villages with the Talukdars. The President aforesaid and the Talukdars shall address their replies to the Secretary of the Department.

10. As regards measures relating to the course of instruction and arrangements in schools, this Minister shall be the President of the Educational Committee, and all measures decided on by the Committee referred to shall emanate from the office of this Minister. In connection with the Hyderabad Engineering College also, all business will be conducted under the signature of the Secretary of this Department as *ex-officio* Educational Secretary. The Educational resolutions should bear the signature of the President of the Educational Committee, *i. e.*, the Minister of the Miscellaneous Departments.

11. If, in any case, it becomes necessary to obtain the orders of Government, the Secretary of the Department shall address the Secretary of the Minister of State in the Revenue Department, through whose channel also the reply will be communicated.

12. Rules have been prescribed by Government for the regulation and management of schools in the city of Hyderabad and in the districts, the working of which the Minister of Miscellaneous Departments shall continue to watch, so as to observe whether business is conducted in conformity with rule. He is at liberty also to submit to Government from time to time proposals for new measures, or suggestions for amendment, or modification of the rules in force, which may be desirable and expedient, and shall act in accordance with the advice of the Minister of State in such cases.

13. In matters relating to the Native Doctors and Dispensaries of the districts, the Secretary of the Minister of the Miscellaneous Departments shall hold correspondence with the Assistant to the British Residency Surgeon, under whose supervision the Medical Department referred to is placed. In consultation with, and under the advice of, the British Officer alluded to, he can carry out on his own responsibility whatever may be in conformity with the prescribed rules. Otherwise the orders of Government must be obtained and conformed to.

14. A special code of rules for guidance in the Public Works Department has been already framed and introduced, in conformity with which the Minister of Miscellaneous Departments will regulate the business of that Department.

15. In the transaction of business connected with the Public Works Department, the Chief Engineer shall act as Secretary to the Minister of Miscellaneous Departments, his letters being worded as those of other Secretaries.

16. When the Government shall have sanctioned the annual Budget of charges, and apportioned the sums for expenditure in each Department, the Minister of this Department may pass, upon his own signature, the estimates of charges of each denomination within the sums allotted. It will be necessary that the Budget of charges for each ensuing year shall be prepared with all possible expedition, and submitted to the Minister of State two months before the commencement of the year to which it relates, to enable that authority to make such revision or modification therein as may be reasonable or expedient in the interests of Government.

17. Pending the preparation of the annual Budget of charges, whenever estimates are received, a general statement thereof shall be submitted for Government sanction, and after such sanction has been notified by signature, the district estimates can be passed upon the signature of the Minister of Miscellaneous Departments.

18. The functionary just named is invested by Government with the powers defined below :—

1*st*.—When the Chief Engineer considers necessary and recommends changes among Zillah Engineers and Assistant Engineers, he is authorized after proper enquiry to sanction such changes. But the reduction, appointment, and dismissal of Assistant Engineers and Zillah Engineers will take place under the orders of Government; these Officers can however when necessary be suspended from duty by this Minister.

2nd.—In the Conservancy and Sanitary Department of the city and towns, the Minister of Miscellaneous Departments is authorized to sanction expenditure up to Rs. 2,000 as regards the city, and up to Rs. 1,000 for each district per annum for improvement of a town or a village.

3rd.—In the Educational Department, the Minister of Miscellaneous Departments is authorized to sanction expenditure up to Rs. 500 in each district for miscellaneous purposes and for school buildings.

4th.—In the Department of improvement and repair of village roads, the Minister of Miscellaneous Departments may sanction expenditure up to Rs. 5,000.

5th.—He is also competent to suspend from duty the Secretary of his office on grounds of repeated disobedience of orders, or corruption, or negligence, or incompetence; but a report of the same shall be immediately made to Government. In the event of the dismissal of the Secretary being in the opinion of the Minister of this Department expedient, the proceedings held in the matter, with a clear expression of opinion, shall be submitted to Government, and action taken according to the advice of the Minister of State.

6th.—The Minister of Miscellaneous Departments is competent, on proof of the charge of negligence, or incompetence, to suspend from duty, transfer, reduce, or dismiss from the service persons on the establishments of the Public Works and Conservancy Departments of the city, &c., as well as those on his own office establishment, but such persons will have it in their power to appeal to Government.

7th.—He is competent, without reference to Government, to suspend from duty, transfer, reduce, or dismiss from the service Schoolmasters and Officers in the Conservancy and Sanitary Department, &c., on grounds of unfitness, misconduct, or incompetence, as well as to appoint others in their stead. But in the cases of Headmasters of the Hyderabad School of Sciences, the Engineering College and the Principal thereof, the Chief Engineer in the Public Works Department, the Secretary to the President of the Municipal Committee of the city, it will be necessary to obtain the orders of Government.

8th.—He is competent to authorize expenditure for construction and repairs of hospitals to the extent of Rs. 300 in each district.

19. It is necessary that he should keep a watchful eye upon the conduct of all the Officers subordinate to him, and see that every thing is properly done; that in the Public Works Department, every work is substantially and expeditiously executed; that the business of the department is carried on with zeal and energy, and whether the system prevailing in the various Departments is correct, or change or modification is required. He should represent to the Minister of State whatever measure may appear to him to be expedient, and act according to his advice in such matters.

20. He shall submit to Government the periodical returns specified here below, *viz.*:—

WEEKLY.

1st.—Diary of correspondence.

MONTHLY.

2nd.—Statement of sums sanctioned monthly by him in the several divisions of his Department.

3rd.—Statement of receipts, disbursements, and balances of Local Funds of the city and towns as at present fixed, or hereafter to be fixed.

4th.—Return of sick in hospital to be obtained monthly from the Medical Department.

QUARTERLY.

5th.—Returns of pupils in schools, with detail as to the number of admissions during the current month, number that left the schools, and the total number upon the rolls.

6th.—Statement showing the sums sanctioned for construction of village roads.

7th.—Progress report of construction and repairs of village roads, with particulars as to what remains for completion.

YEARLY.

8th.—Statement of all public works in the several Departments in detail, as per estimates countersigned and sanctioned by him, showing the total amount sanctioned, the quantity of work executed, and that remaining for completion, and in the event of there being any laxity or interruption, the cause and source of it.

9th.—Report upon the administration of the several Departments under him, noticing the services and conduct of the Officers, &c., the increase of schools, the number of pupils who have completed their studies and become qualified for service, and such other matters of interest. The report should be so timed as to reach the Minister of State in the month of Meher.

21. The Government, while it will on its own part always give every support, consideration, and useful advice to this functionary in the execution of all important matters connected with his office, wishes to express the desire that he himself should on all difficult occasions bring his own intelligence to bear upon them. When on mature consideration, the prompt adoption of any measure appears to be imperatively required for the well-being of the public, or the advantage of Government, and delay would cause distress or inconvenience to the public, then even if no provision exists for such an emergency in the powers vested in him, he should, nevertheless, without hesitation, at once carry out the requisite measure on his own responsibility, and immediately after doing so report the whole of the circumstances, with the reasons for acting upon his own authority, for the information of Government.

Extra Assistant Commissioner.

APPENDIX B.

Abstract translation of a Memorandum addressed by the Prime Minister (MADAR-UL-MIHAMM) *of His Highness the Nizam's State to the Chief Minister of Justice.*

1. Rules for the guidance of the Chief Minister of Justice, under the signature of the Minister of State, are herewith enclosed, and are prescribed as the basis of future practice. Due promulgation of the same has been made through the latter's office to the functionaries of the Department of Justice who are concerned. And similarly the Chief Minister of Justice should issue his instructions to the Officers thus placed under his control, directing the reference to him of judicial matters for the future.

2. Although under the new arrangements the Minister of State will not ordinarily correspond with the executive Judicial Officers, nevertheless it may happen that, on emergencies, or when time is an object, orders may be issued direct to the latter from the Minister's office. Copies of such orders will immediately be transmitted to the office of the Chief Minister of Justice. And in like manner all holding judicial offices must be instructed to forward to the head of their own Department copies of any communications which they may have occasion to address direct to the Minister of State.

3. It has been determined to issue weekly, or oftener when necessary, a Gazette of His Highness the Nizam's Government. All dismissals from the service and appointments, with all circular orders and such other subjects as may advantageously be made public, will be published in the Gazette. Whatever orders may be issued by the Minister of State shall appear in it under the signature of the Secretary of the Department to which it appertains; and in the same way orders issued by the Ministers of Departments will be published under the signatures of the Secretary of each of the Departments respectively. The Chief Minister of Justice will instruct his Secretary to forward to the Superintendent of the Printing Office all orders which may be issued by him; and every Officer affected by such order shall consider its publication in the Government Gazette a sufficient voucher for its validity.

4. Saiad Muhammad Mowdoodee Sahib has been appointed Secretary of the Chief Minister of Justice's Office. The Minister of Justice should report if he knows of any one qualified for the post of 2nd or Assistant Secretary. A list of qualified persons amongst those in the service of Government will be forwarded, and the selection of one of their number for the office in question will be left to the discretion of the Minister of the Department.

5. Enclosed is a return of establishments which it will be necessary to transfer to the office of the Minister of Justice consequent upon these reforms. These persons should be appointed to suitable posts, and their numbers supplemented if requisite by others. As far as possible, it is desirable that establishments should be completed by a re-distribution of Officers already in the service, provided these are found qualified, rather than by the introduction of outsiders.

6. Inasmuch as the Chief Minister of Justice has, with the utmost liberality of mind, associated himself with the Minister of State in the work of Government, Sir Salar Jung entertains the strongest hope that in all matters conducing to the welfare of the public, or affecting the prosperity and good name of the State, the Minister of Justice will lend his best endeavours with cheerfulness and zeal, and believing the Minister of State to have the interests of the country sincerely at heart, will not hesitate freely to consult with him when occasion arises.

7. There is another point which must be noted, namely, the Secretary of the Chief Minister of Justice's office must be charged to use the utmost forbearance and prudence in the transaction of business, to temper both personal intercourse and correspondence with all courtesy, to pay to every one the respect he is entitled to, and, as far as possible, to combine the *Sauviter in modo* with the *fortiter in re.*

8. Although the correspondence between the Secretaries of the Minister of State and the Department of Justice will, as a rule, be conducted in the form of Proceedings (Roobakaree), nevertheless Sir Salar Jung hopes that friendly communications between himself and the Minister of Justice will not thus be superseded. Whether such letters be written in the handwriting of the correspondents themselves, or in that of their Secretaries, they will be found an advantageous mode of exchanging sentiments on any point.

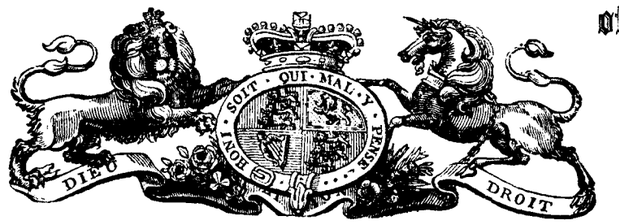
Extra Assistant Commissioner.

No. 179 P, dated 26th January 1870.

From—C. E. R. GIRDLESTONE, ESQ., *Offg. Under Secy. to the Govt. of India,* FOREIGN DEPT.,

To—*The Resident at Hyderabad.*



I have laid before the Viceroy and Governor General in Council your letter No. 45, dated 15th December 1869, reporting certain arrangements which have been made by the Government of the Nizam for the better government of His Highness' territories, and forwarding a copy of a Gazette which has been lately established, together with a translation of the more important portions.

2. In reply I am directed to state that His Excellency in Council cordially approves of the arrangements now reported, and desires that an expression of the satisfaction of the Government of India may be communicated to Sir Salar Jung and the Ameer-i-Kubeer.

3. The translation submitted by you will be published in the Supplement to the *Gazette of India.* It is requested that a copy of the new *Hyderabad Gazette* may be regularly furnished to this Office for the future, and that a translation of anything which may appear to the Resident to be worthy of the notice of the Supreme Government may also be sent as occasion requires.

No. 7 of 1870.

SUPPLEMENT TO

The Gazette of India.

CALCUTTA, SATURDAY, FEBRUARY 12, 1870.

OFFICIAL PAPERS.

A SUPPLEMENT *to the* GAZETTE OF INDIA *will be published from time to time, containing such Official Papers and information as the Government of India may deem to be of interest to the Public, and such as may usefully be made known.*

Non-Subscribers to the GAZETTE *may receive the* SUPPLEMENT *separately on a payment of six Rupees per annum if delivered in Calcutta, or nine Rupees four annas if sent by Post.*

No Official Orders or Notifications, the publication of which in the GAZETTE OF INDIA *is required by Law, or which it has been customary to publish in the* CALCUTTA GAZETTE, *will be included in the* SUPPLEMENT. *For such Orders and Notifications the body of the* GAZETTE *must be looked to.*

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Friday, the 4th February 1870.

PRESENT:

His Excellency the Viceroy and Governor General of India, K. P., G. C. S. I., *presiding.*
His Honour the Lieutenant Governor of Bengal.
His Excellency the Commander-in-Chief, K. C. B., G. C. S. I.
The Hon'ble G. Noble Taylor.
Major General the Hon'ble Sir H. M. Durand, C. B., K. C. S. I.
The Hon'ble John Strachey.
The Hon'ble Sir Richard Temple, K. C. S. I.
The Hon'ble J. Fitzjames Stephen, Q. C.
The Hon'ble D. Cowie.
Colonel the Hon'ble R. Strachey, C. S. I.
The Hon'ble Francis Steuart Chapman.
The Hon'ble J. R. Bullen Smith.
The Hon'ble F. R. Cockerell.

FEMALE INFANTICIDE BILL.

The Hon'ble MR. STRACHEY introduced the Bill for the prevention of female infanticide, and moved that it be referred to a Select Committee with instructions to report in a month. He observed that, when he obtained leave to introduce the Bill, he had said enough to show the Council the terrible prevalence

of the crime of female infanticide in Northern India, and to show the necessity for legislation to enable the Government to carry out its determination that this crime should no longer be borne with, and that it would spare no efforts to eradicate this abominable custom, which had been too long suffered to be a reproach to our administration. Although he would not repeat the facts he had then stated, there were one or two points which he had omitted to notice, and to which he would now briefly refer. One omission which he had made was this—that he had made no reference whatever, as he certainly ought to have done, to the noble efforts taken through a long series of years in the Bombay Presidency to suppress the practice of female infanticide in Katíawár and Katch. Although he was referring specially to the prevalence of this crime in Northern India, he felt that he ought not to have passed over in silence the fact that more had probably been done in the Bombay Presidency for the suppression of this crime than in any other part of India. An excellent account of the measures taken by the Bombay Government for the suppression of female infanticide had been published by the learned and accomplished Missionary of the Free Church of Scotland, Dr. Wilson. MR. STRACHEY might mention his work as containing a mine of information on everything connected with the subject. There was another point to which it had been his full intention to refer, but which he had forgotten. He had been reminded of the omission by more than one person. In consequence of the decrease in the number of female children, brought about by the prevalence of the crime of female infanticide amongst the Rájputs of Northern India, it frequently happened that it was extremely difficult for the Rájputs to find wives of their own caste for their sons. The want thus felt was not uncommonly provided in a very abominable way. There was a system under which persons who made a regular trade of the business kidnapped or purchased girls with the object of selling them as wives to these Rájputs. Children of lower castes were stolen or purchased and passed off as Rájput girls to men who wanted wives, and who were content to accept them with little or no enquiry. As long as it was not publicly known that the statement was certainly false, no objection was made. Besides this custom of kidnapping, which there was reason to fear to be extremely prevalent, there was no doubt that, in very many cases, girls of lower caste were sold voluntarily by their parents, in the belief, which no doubt was usually well-founded, that these girls would be kindly brought up and would ultimately be well married. An interesting account of this practice would be found in the Oudh Police Report for 1866, and he might refer in particular to the report of Captain Sharpe, an excellent Police officer in that Province, who had made careful enquiries into the subject. The Oudh authorities were satisfied that the practice MR. STRACHEY had been describing was extremely common. Girls from three to fourteen years of age were purchased from their parents by people, usually themselves Rájputs, who then gave out that the girls belonged to their own families. They looked out for some family where a wife was wanted, and the purchasers then got paid for the girls by Rájputs who wanted wives. Captain Sharpe referred in his report to one old woman, whose case was under investigation, who had followed this trade all her life, and said that she could not count the number of girls she had thus disposed of. This practice of kidnapping and selling children was one extremely difficult to deal with, but at the same time there was no reason to suppose that any special legislation was necessary for its suppression, and consequently there had been no reference to it in the Bill.

When MR. STRACHEY asked for leave to introduce the Bill, he said that, in regard to the remedies to be applied for the suppression of this great evil, there was fortunately no reason for doubt, because we had ample experience to show how the crime ought to be dealt with. The measures taken had been of two kinds—those which aimed at the removal of the cause which mainly led to the commission of the crime—that was to say, the prevention of extravagant

expenditure on marriages; and, secondly, measures of a coercive and directly preventive character. The present Bill proposed to give to the Local Governments power to carry out measures of both classes.

The Bill would enable the Government to lay down rules for regulating and limiting marriage-expenses amongst the classes who were found addicted to the practice of female infanticide. Although it might seem difficult to make rules on such a subject as this, still, as a matter of fact, it had been found that a great deal might be done in this direction; and this was rendered more easy by the fact that the people themselves were well aware of the folly of spending all this money on marriages, and when a little pressure was put on them by the officers of the Government, they were very glad to find an excuse for limiting their expenditure. The Bill further enabled the Government to order a complete system of registration of births and deaths in suspected places to be carried out, and a constant system of periodical inspection and enumeration of children. It had been found by experience that this had the effect of saving the lives of a great number of children; for, if a child was not killed immediately after its birth, and its life was saved even for a few hours, there was commonly little danger of its being killed afterwards. The Local Governments would have power to institute and maintain a system of registration of births and deaths in suspected places and amongst the persons to whom the proposed Act should have been made applicable; and to order the entertainment of special Police officers, or other officers and servants, for the purpose of making this registration or for carrying out any other of the provisions of the Act. The Bill further enabled the Government to levy from the parties concerned the whole expense incurred in carrying it into effect. The Bill, as MR. STRACHEY had already informed the Council, had been circulated to all the Local Governments and Administrations of Northern India, and it had received the approval of the whole of them.

He had hoped that the Council would have had, in the discussion of this Bill, the assistance of our colleague, His Highness the Mahárájá of Jaypúr. Unfortunately he had been compelled by illness to leave Calcutta; but although His Highness had been unable to take a part in the discussion of this measure in the Council, he had left behind him in writing a statement of his complete approval of the Bill, and of his determination to spare no efforts within his own territory to co-operate with the determination of the British Government to eradicate the practice of female infanticide. MR. STRACHEY was sure that he would do so, and it would be difficult to exaggerate the value of the assistance which the Mahárájá, one of the great Rájput Chiefs of India, would thus be able to afford in the suppression of this abominable crime among the people of his own class. With His Excellency the President's permission, MR. STRACHEY would read to the Council the remarks which the Mahárájá had made upon the Bill. He said—

"Speaking for myself, I fully concur with the spirit of the Bill introduced by my hon'ble colleague, Mr. John Strachey, for the prevention of female infanticide in the North-Western Provinces, the Panjáb and Oudh, and the measure has my hearty support. It shocks my feelings to think of the horrible crime which the Bill contemplates to suppress, and I pity those deluded individuals who, under a misapprehension of a sense of honour, are led, against their natural feelings, to sacrifice their own offspring to the altar of a revolting custom, which has no other authority than that of antiquity to support it. The Hindú *Cástras* are replete with ordinances as to the duties of a father to his daughter, and invoke the tenderest of all feelings for one's own offspring without distinction of sex. The shocking custom, therefore, which necessitates the men of my caste to murder their own infants—a custom which steels their hearts against the feelings of nature, and induces them to commit a crime which is even repugnant to instinct, has nothing to do with the religion of the people; and I for one would carry out the measure in such a vigorous way that the hateful practice may soon die out under the pressure of the law. The regulation of marriage-expenses, I believe, was introduced into my own territories by one of my ancestors, the Mahárájá Sivái Jay Singh, one hundred years ago, and I am still enforcing the same law in a modified form, which has had the effect, perhaps, of making it more rigorous; and I dare say that the introduction of a similar

measure within the British territories will be calculated to do infinite good to the British subjects. It is, therefore, with feelings of no little pleasure that I hail the introduction of the present measure in the Governor General's Council; and I have not the slightest doubt in my mind that the right-thinking and intelligent portion of my caste-men will never fail to appreciate the benefit of the law now contemplated, and will agree with me in looking upon the proposed enactment as a real blessing to them.

I am exceedingly glad to find that my hon'ble colleague has traced out the real causes which lead to the commission of infanticide in India, and I would beseech my own caste-people to co-operate with the Government of India in the suppression of the crime, and in dispelling the false and mistaken sense of honour which at present prevents a high-born Rájput from marrying his daughter to one inferior in rank in his own clan. If some of the Rájput chiefs of the day will take the initiative at the present moment, I dare say that the mistake operating so banefully in its results upon the Rájput community will soon disappear.

The call of humanity loudly demands the enactment of the present Bill, and in the interests of humanity I would heartily support it in all its stages through the Council.

Major General the Hon'ble SIR HENRY DURAND said that he was not at all surprised at hearing the contents of the paper read out by the Hon'ble Mr. Strachey and written by His Highness the Mahárájá of Jaypúr. SIR HENRY DURAND thought that it would have been a matter of very great surprise and regret if one who, he might say, had a hereditary right to take a leading part, had not stepped forward in the manner he had done to support the measure which the Government had brought before the Council. It must be a matter of great satisfaction to His Excellency to have the support of one of the leading Rájputs of India, a man whose family carried back its rise to about the third century of the Christian era, a family which had been ruling where it now ruled for 900 years, and who amongst its line could produce men who certainly, if any men in Indian history deserved to be remembered, were worthy of renown. It would perhaps be out of place for him to notice many of the great men who were ancestors of this very Mahárájá; but he hoped he would be allowed to note two instances: one was Mán Singh, the Commander of the Forces of the Empire, a man who conquered for the Emperor the whole of Orissa and Assam, who was, it might be said, the first Lieutenant Governor of the Emperor, for Bengal, Behar, and Orissa, who also ruled the Deccan, and who took up the armies of the Emperor to Cabul, and governed Afghánistán, maintaining order and tranquillity among the turbulent Afghán tribes. Such was one of the ancestors of the Mahárájá of Jaypúr, whom SIR HENRY DURAND brought forward as a man of note. And perhaps, if SIR HENRY DURAND were to consult his own professional feelings, there would be a tendency to give great weight to the abilities and fame of a man who at that time could maintain such sway in and out of India. But great as were the merits of this man, he could not say that he was inclined to regard him as the greatest of the ancestors of the Mahárájá of Jaypúr. There was another ancestor of his, the renowned Sívái Jay Singh, to whom the Mahárájá adverted as having first set the example of devising measures for the suppression of the crime of female infanticide, and who was known as a great Mathematician, a great Astronomer, and a great Engineer and Architect, but above all, as a most humane and intelligent ruler—one who, for these great qualities, was felt to be more than an ordinary man, and who obtained the name of *Sívái*, which meant in our idiom that he was a man and a half. Under such circumstances, with such an ancestor, SIR HENRY DURAND was not at all surprised to see the Mahárájá coming forward to support these measures. It showed that the old chivalrous spirit of his Rájput ancestors had not died with them, but still lived, when the Mahárájá of Jaypúr came forward in the way he did to uphold what was right, and to promise that he, the head of the Chuchwaha Rájputs, would make applicable to his own territories similar measures. There he had full and entire power to do as he intimated he meant to do; and SIR HENRY DURAND was sure that the Government of India would value extremely the co-operation of one circumstanced as the Mahárájá of Jaypúr was circumstanced. He would add that, some time ago, he observed

in the newspapers the reports of a Social Science Congress at Jaypúr, which was established by the Mahárájá. He (SIR HENRY DURAND) thought that perhaps there could hardly be a subject on which that congress could be employed with greater advantage than in connection with the suppression of female infanticide.

He was quite sure that the Mahárájá's example would have great effect amongst all the Native Chiefs of India; amongst the Rájput chiefs, not only of Rájputána, but of Central India, where the crime was more or less prevalent: there, it had been to a certain extent kept down; but still it prevailed, and there was little doubt that the example of the Mahárájá would tend to check the practice.

He need hardly say that he heard with great satisfaction the Hon'ble Mr. Strachey adverting to the labours of the Bombay Government in the suppression of female infanticide. SIR HENRY DURAND could almost wish that, when his Hon'ble friend quoted the work of Dr. Wilson, he had also quoted a part of the dedication of that work to a man who was one of the ablest, most honest, hard working, intelligent members of the Civil Service; he meant John Pollard Willoughby, who devoted himself to all that was right and good and for the benefit and promotion of the welfare of the Natives of India. With the permission of the Council, SIR HENRY DURAND would read, as the work lay before Mr. Strachey, an extract from Dr. Wilson's preface. After quoting the names of Duncan and Walker, he concluded with Willoughby, and said of him—"Willoughby, who ultimately suggested or adjusted the practical measures of inquiry, registration, review, reward and punishment, which, through the Divine blessing, have effected its extinguishment as a custom."

He (SIR HENRY DURAND) thought that the labours for the suppression of this crime on that side of India had been fully as great, and fully as continuous, as any we had attempted in Northern India. He was far from thinking that, either on that side of India or in Central India and Rájputána, or in Northern India, there had been as yet any adequate success; but he was certain that, with this law which His Excellency the Viceroy intended to pass, and which the Council would no doubt support, and with the support and example of the Mahárájá of Jaypúr and his noble-hearted ancestors, His Excellency might expect that this measure would be one of those which in future years would be looked back to as marking His Excellency's administration with one great commanding act of benevolence.

His Excellency the PRESIDENT said—"I have little to add to what has been so ably and eloquently said by my two hon'ble colleagues.

"The only regret that I have to express with regard to His Highness the Mahárájá of Jaypúr is this, that he is unfortunately not present today in order to declare his sentiments by his own mouth; but I am in a position to state that his absence from Calcutta has been occasioned by untimely illness.

"I hope, however, that this will be only temporary, and that, before long, we shall again have the advantage of his presence at this Council. I can only say with regard to what His Highness has done in this matter, that it is in conformity with the general course of conduct which he has invariably adopted, and more particularly since he has been a member of this Council. During the short time he has been among us, he has been able on more than one occasion to afford this Government valuable and practical assistance. The whole course of his conduct in reference to the treaty with regard to the Sámbhar Salt, which was undertaken by this Government entirely in the nterests of the people, in order to endeavour to provide at a cheaper rate one of the prime necessities of life, has been most praiseworthy. The assistance which he has given to us has been in all respects most cordial, and I believe

that assistance has been given with a sincere desire, not only to assist the British Government to maintain their revenue, but also to confer lasting benefits upon the people.

"It must be gratifying to the Mahárájá to have been able to state, as he has done in his letter today, that one of his distinguished ancestors, who was mentioned with so much feeling by my hon'ble colleague, Sir Henry Durand, was perhaps one of the first of Native Princes who made any endeavours to restrain this frightful practice of the murder of children by their own parents; and it is no shame to the British Government that, many years afterwards, they endeavoured by legislation to follow the same course as that which the Mahárájá's ancestor attempted to carry out more than one hundred years ago. I can only say that the Mahárájá's whole conduct in this matter shows what valuable assistance Native Chiefs and Princes, and rulers of this country, can give, when they are so disposed, to this Government, in their efforts to improve the general, social and material condition of the people; and we may cordially, I think, echo the sentiments expressed in the Mahárájá's letter, when we say that we feel with him that, in the efforts we are making now to abolish this abominable crime, we are conferring real blessings upon the people themselves—blessings which, I believe, the very people who are now engaged in this practice, will before very long be the first to appreciate.

"I believe, with regard to the Bill itself, that the mode in which it is proposed now to deal with this crime is the best and the most efficient that can be devised. It is a mode of dealing which is not calculated in any way to shock or to oppose the prejudices or feelings of the people themselves. It will be to a certain extent a gradual process, but I believe that its being gradual will not in any degree lessen its efficiency.

"I cannot help saying that, if the undertaking which we are engaged in today is successful, it will rank on a par with the abolition of suttee, thuggee, and other practices, in the suppression of which the British Government in India have been always engaged, and which I believe has tended more than anything else to vindicate the justice and wisdom of our rule."

The Motion was put and agreed to.

KULLU SUB-DIVISION (PANJAB) BILL.

The Hon'ble MR. STEPHEN moved that the Report of the Select Committee on the Bill for investing the Assistant Commissioner in charge of the Kullu Sub-division of the Kángrá District with certain appellate powers, be taken into consideration. The Committee had made no alterations and recommended that the Bill should be passed.

The Motion was put and agreed to.

The Hon'ble MR. STEPHEN then moved that the Bill be passed.

The Motion was put and agreed to.

HIGH COURTS (COSTS OF PETITIONS) BILL.

The Hon'ble MR. CHAPMAN moved that the Report of the Select Committee on the Bill to enable the High Courts at the Presidency Towns to deal with costs of petitions for certain monies transferred to Government, be taken into consideration. The Committee had made no alterations and recommended that the Bill should be passed.

The Motion was put and agreed to.

The Hon'ble MR. CHAPMAN then moved that the Bill be passed.

The Motion was put and agreed to.

MILITARY CANTONMENTS BILL.

The Hon'ble MR. COCKERELL asked leave to postpone the Motion which stood next on the List of Business, for leave to introduce a Bill to amend the law relating to Military Cantonments.

Leave was granted.

The following Select Committee was named:—

On the Bill for the prevention of female infanticide—The Hon'ble Messrs. Stephen, Chapman and Cockerell, His Highness the Mahárájá of Jaypúr and the Mover.

The Council adjourned to Friday, the 11th February 1870.

WHITLEY STOKES,
Secy. to the Council of the Governor General for making Laws and Regulations.

CALCUTTA,
The 4th February 1870.

GOVERNMENT OF INDIA.

HOME DEPARTMENT.

EXPLORATIONS FOR COAL IN THE CHANDA DISTRICT.

No. 617, dated 11th January 1870.

From—T. OLDHAM, Esq., LL.D., *Supdt., Geological Survey of India,*
To—*The Secretary to the Government of India,* HOME DEPT.

I have now the honor to report, for the information of His Excellency the Governor General in Council, the progress which has been made in the explorations for coal now in progress in the Chanda District.

In my last report I stated that I had been, with much regret, compelled to send Mr. Longridge, one of the trained borers sent from England, into Nagpore for medical treatment. The medical authorities there entirely agreed with the Doctor at Chanda that he was unfit for work in this country, and that the sooner he went Home the better. Dr. Beatson, Civil Surgeon at Nagpore, had kindly admitted the man into hospital at Nagpore, and had been most attentive to his case. He believed that, in addition to the effects of exposure to the sun, there was some incipient derangement of the brain, probably consequent on a very severe blow on the head which the man had received some three years since. Dr. Beatson subsequently accompanied the man to Bombay, and never lost sight of him until he was safely on board the steamer.

This interruption, I endeavoured, as reported, to remedy as far and as quickly as possible by placing Mr. Smythe in charge of the tools. Mr Smythe, as I expected, very quickly acquired sufficient knowledge of the mode of working, and he has been for nearly three weeks past (he was nominated on the 10th December) in sole charge of one of the bore-holes, and has carried it out very successfully to its conclusion without accident or hinderance, and I have been so much satisfied with his work that I have again placed him in independent charge of a new boring just commenced at Bullarpore.

I have also to report with much satisfaction that both Mr. Smythe and Mr. Heppel, the second trained borer sent from England, have been, for some time past, at my request, working double shift with two gangs of coolies, so that the work is carried on without any cessation for 13½ or 14 hours a day, instead of 7 or 7½. The progress has consequently been increased in the ratio of about 7 or 7½ to 4. This has been done without the smallest difficulty on the part of either the men themselves or those superintending them.

The work, therefore, so far as the amount of progress is concerned, has not suffered by the absence of Mr. Longridge during the past month.

The results of the borings for the month have been most satisfactory, inasmuch as they have gone far to prove the existence of a large supply of fuel, ample to meet the demands likely to be thrown on this field for centuries, and have also proved the correctness of the views as to the structure of the field, which my short stay had enabled me to arrive at, so that coal has been found in the borings, within a few inches of the calculated depth, at places where its existence was entirely unknown and unsuspected.

It is scarcely necessary to give the full details of all the borings at present. I will state briefly the general results. At Googhoos (Ghúghús) a new bore-hole has been commenced, instead of that in which the 'pump' had formerly been stuck. This new hole has been carried down a little more than 130 feet, and has struck and cut into *coal* for some feet in thickness. It is still in progress. A boring at Nokora, about a mile still further to the south, has passed through 45 feet of rock, when the rods entered coal, below which the section gave as follows :—

	Ft.	In.	Ft.	In.
Coal	4	0		
Sandy shale with a tinge of Coal	...		2	10
Coal	3	6		
Dark sandy shale mixed with coal	...		5	4
Coaly shale (bad coal)	...		3	6
Black shale	...		16	10
Coal, inferior	...		4	0
Coal	...		5	0
Sandstone mixed with shale	...		5	0
Very dark shale	...		3	0
Dark sandy shale	...		2	10
Coal	21	8		
Sandstone white sandy shale	...		0	2
Coal	13	0		
White sandstone, very hard in parts	...		7	8

This shows a total thickness of coal, taking all the beds, of 42 feet 2 inches! I do not wish to convey the idea that there are 40 feet of *workable* coal, for a good part of this will have to be rejected from a mixture of earthy matter, but the mass of the coal stated above is quite as good as that already proved from the bank of the Wurdah at Googhoos.

The great source of doubt with regard to the productiveness of this field arose from the fact widely established that the thick coals of these lower beds varied very rapidly and within short distances, not only in amount, but in quality, so that a bed of good coal, many feet thick, would within a few yards, or a few hundreds of yards, pass into a thin bed of perhaps shale or even sandstone with no coal, and would again become productive further on. It was therefore of high importance that the continuity or constancy of the beds should be proved; and with this object, before leaving Calcutta, I had urged that borings should be prepared for at a sufficient distance to the north of the known localities to test this fact of continuity. The rapid visit I paid immediately on my arrival in the field to the localities confirmed this view, and led to the selection of two points in the village grounds of Telwasa, about nine miles to the north

of the other borrings. Being satisfied that the geological evidence was conclusive, and that, whatever variation they might exhibit, the same group of beds as contained the coal to the south must be met, I had the borings put down. The result is, I think, the most important one yet attained. Within a few inches of the calculated depth the coal was struck, and, up to the evening of the 8th instant, 30 feet of coal, with shaly partings, had been cut through. This boring is still in progress.

I consider this the most important result yet attained, because it has not only proved the constancy of the deposit of coal (with variation as was anticipated), but has confirmed the accuracy of our geological views of the structure of the field, and has given great confidence in searching for coal elsewhere on the same horizon.

Another boring was simultaneouly started near this to test the lower beds. No coal was looked for in this; it was put down to ascertain the nature of the beds, which were here covered and unseen. It has been carried down about 140 feet, and will be stopped at 150, if it does not get into another series of rocks before that. No workable coal has been found as was predicted.

Meanwhile, I have carefully fixed on other localities, at which bore-holes will be put down as soon as the rods are disengaged at any of those holes now in progress, and I am at the present carefully examining the country further to the south with the same object in view, so that no time may be lost in moving the boring-tackle whenever ready.

I have great pleasure in reporting that every day's experience, now extending over two months nearly, has increased my confidence in the skill and persevering energy of Mr. Heppel. He is a remarkably steady, quiet, hard-working man, thoroughly up to, and interested in, his work, and willing and anxious to push it on.

Mr. Smythe, as I have said, has already proved a very efficient assistant, and I doubt not will rapidly become more so.

A steam-boring machine has been delivered at Chanda to the Deputy Commissioner, but from want of any one competent to undertake its management and working, it has not as yet been set up. The great difficulty experienced in bringing this machine from Nagpore, in parts and in cases (five days were occupied in getting across one small nullah), along a made-road, has, I think, satisfied the Deputy Commissioner that it will not be practicable to use it at many places in the district which is much covered with jungle, and is without any roads other than the common country cart tracks. In reality, every information that can be obtained by means of this machine can be obtained quite as economically and quite as quickly by the boring tools now in use. I shall see that it is got to work as soon as possible, and trust it may prove more useful than I anticipate.

In connection with these researches, I have again to notice the ready aid we have received from the Deputy Commissioner, Major Lucie Smith, and also the hearty co-operation of Mr. S. H. Hennessy, Extra Assistant Commissioner.

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

SANCTION OF SECRETARY OF STATE REQUIRED TO LOAN IRRIGATION WORKS COSTING OVER £100,000 EACH.

No. 35 A. I., dated 2nd February 1870.

RESOLUTION—By the Govt. of India, P. W. DEPT.

Read the following paper:—

P. W. D. Circular No. 94 of 1867.

Also the following Telegram from Secy. of State, dated 10th August 1869:—

We adhere to our rule that no irrigation works to be met by loan are to be undertaken without detailed plans and estimates previously sanctioned by me, but under this condition we do not object to your making such plans and surveys for work which may cost two millions, twice one million, in the year 1870-71.

Read also despatch:—

No. 115, dated 30th August 1869, from the Govt. of India, to the Secy. of State for India.

Also the following despatch from the Secy. of State, No. 116, dated 25th November 1869:—

I have had before me in Council your Excellency's Despatch No. 115 of 30th August last, requesting reconsideration of the intimation recently conveyed to you that no irrigation works to be met by loan should be undertaken without previous sanction by the Secretary of State of detailed plans and estimates.

2. Your Government seems to me to have misapprehended those expressions in despatches from Lord Cranborne and myself to which you refer, as having caused it to consider that full authority had been delegated to it of determining the works to be carried on by loan. Lord Cranborne's language, in one of the despatches quoted, seems to me to be distinct in a directly opposite sense. "It is not necessary," he says, "to consider the means of providing funds for projected works until propositions, with detailed plans and estimates, shall have been fully considered by you, and have been approved by me." Without, however, dwelling further on this part of the subject, I will state briefly the rules with respect to the sanction of irrigation works designed for construction with borrowed funds which I desire should be observed in future.

3. There does not appear to me to be any sufficient reason for treating such works differently from irrigation works intended to be provided for out of ordinary revenue, and I propose, therefore, that you should be vested, with respect to the former, with the same independent powers of sanctioning estimates not exceeding £100,000 each as you already possess with respect to the latter. All works, however, the estimates for which may exceed £100,000, will continue to require my sanction, and no operations based upon them must on any account, or in any instance, be commenced until that sanction has been obtained. But in order to be enabled to judge of the expediency

of any project, I shall no longer require to be furnished with detailed plans and estimates. One or more general plans, accompanied by reports in such detail as will clearly explain the character, objects, and financial prospects of the projected work, will in most instances suffice, and I apprehend that more elaborate plans will scarcely ever be requisite than the lithographed copies alluded to in your concluding paragraph.

4. Your Excellency will recollect that the necessity for the previous sanction of the Secretary of State, on which I have above insisted, has been distinctly admitted in para. 18 of your Government Resolution of 21st September 1867. The reasons which render it desirable that the Indian Government should reserve to itself the power of deciding on projects orginating with the subordinate Governments are there admitted to apply equally to the Home Government in its relation to the Indian Government.

RESOLUTION.—It will be observed from the papers now read that the Secretary of State has ruled that, as in the case of other works, his sanction is requisite to the commencement of all irrigation works the estimated cost of which may exceed £100,000 each.

2. In publishing this decision, the Governor General in Council desires to impress upon the several Governments and Administrations the necessity laid on all concerned for not allowing any extraordinary irrigation work to be commenced until the project has been regularly approved and sanctioned by proper authority in each case.

ORDER.—Ordered, that this Resolution be communicated to the several Governments and Administrations noted on the margin for information and guidance.

Governments of Madras, Bombay, Bengal, N. W. Provinces and Punjab; Chief Commissioners of Central Provinces, British Burmah, Oudh, and Mysore.

Ordered also, that a copy be published in the Supplement to the *Gazette of India*.

AGRICULTURAL OPERATIONS IN THE CENTRAL PROVINCES DURING 1868-69.

Book Circular No. XLV, dated Nagpore, the 26th November 1869.

From—C. GRANT, Esq., *Secretary to the Chief Commissioner, Central Provinces,*

To—All Commissioners and Deputy Commissioners, Central Provinces.

The attempt for the first time made this year to compile agricultural statistics in the form prescribed in this office Book Circular CIV of 1868, has been on the whole not unsuccessful, though it has been necessary to omit from the calculations the district of Sumbulpoor and the feudatory States, owing to the impossibility of obtaining reliable information from them. It will be impracticable to obtain the necessary statistics from Sumbulpoor until a regular

settlement has been effected, and feudatory States must always be left out of such calculations. The area thus excluded is 32,461 square miles of the total area of 111,121 square miles comprising the Central Provinces. The omission is, however, not so important as at first sight it would appear to be, for of the excluded area, some 20,993 square miles are estimated to be waste, hill, and forest.

2. The tables in the appendix, therefore, refer to 18 of the 19 districts of the Central Provinces, inclusive of all maâfee and quit-rent paying estates, and the following remarks will refer to the sub-divisional headings of the returns as nearly as possible in the order in which they present themselves.

3. Before proceeding further, it will be necessary to notice briefly the rain-fall of the year. In the previous season (1867-68), there was, generally speaking, an excessive rain-fall, and heavy showers late in the spring did some damage to the wheat and cotton crops. In the season under review, the rain-fall was much below the average, and though there were places, like the lower Nerbudda Valley and the southern pergunnahs of Raepoor, which lost little of their usual supply and reaped a full average crop, the country generally experienced a severe drought. In many places the rain was not sufficient to fill or even half fill the tanks, most of which dried up long before the first heats of summer. Many wells, too, that were never known to have failed, completely dried up. Still, on the whole, though garden cultivation suffered considerably, with rice, sugar-cane, opium, and other irrigated field crops, there was but seldom an absolute want of water for drinking, even in the dryest months, though it was not perhaps so readily obtainable and very often at inconvenient distances for herds of cattle.

4. The Table A in the appendix gives the rain-fall for each district for each month of the year, and if the average of ordinary fair seasons be accepted at 45 inches, the falling off has been 17 inches in the year under review. The following extracts will best illustrate the main features of the monsoon of 1868. In the Nerbudda Valley, which suffered least, the Deputy Commissioner of Nimar writes, when accounting for an increase in his rice cultivation, that it was owing "to the copiousness of the early fall of rain, which enabled rice to be sown in many places not available in moderate seasons for that crop. Nimar escaped the effects of the capricious rain-fall of the past season very well. The Nimar soils are peculiarly suited to khureef crops, and nothing but an almost total absence of rain does any excessive mischief." The adjoining district of Hoshungabad is, on the contrary, a rubbee country, and here, "thanks to some heavy showers which fortunately visited it in September, and again in December, an average harvest was reaped; the continued absence of rain in the early part of the monsoon caused the gravest apprehensions, which, but for the opportune fall of rain in the months noted above, would undoubtedly have been verified. As it is, however, the year, if not one exactly of plenty, has not been, as in so many other districts, one of distress." In Chuteesghur, again, the Deputy Commissioner of Raepoor writes that "the drought after all was only partial. Considerable tracts had almost an average harvest, while other tracts reaped nothing. For instance, the Dhumterry or southern pergunnah scarcely suffered at all, while the Droog pergunnah and the western sections of the Raepoor and Simgah tehseels had a fair out-turn, the high lands chiefly suffering. In contrast to this the eastern section of the Raepoor and Simgah tehseels suffered very severely, many villages having no khureef harvest at all." It was much the same in the adjoining Belaspoor district. But capricious as the rain-fall would appear to have been in circumscribed localities generally, it may be said that the autumn rains, deficient everywhere, fell more copiously in those districts where the autumn crops are most plentifully raised, and the spring showers where the rubbee predominates. Had it been the other way, the harvests might have been much worse than they were.

Classification of Land and Crops.

5. Table B. in appendix gives the information under this heading for each district, and may be thus abstracted:—

Total area of the Province			50,865,135 Acres.
Barren			21,032,695 ,,
Cultivable	Jageer or not paying revenue		1,676,189 ,,
	Cultivable not cultivated		14,391,117 ,,
	Fallow of one year		1,413,264 ,,
	Under crop, *viz.*:—		
		Khureef	7,189,080 ,,
		Rubbee	5,162,790 ,,
			29,832,440

or in other words the land under the plough is about one-half of the whole cultivable area, which again is to the total area in the proportion of 3 to 5.

6. It may appear singular that in a year of drought the cultivated area should thus be returned as slightly in excess of that given for the previous season; but the explanation is that the non-completion of settlement operations in Mundla did not admit of the statistics for that district being included in the returns for 1867-68, and similar information for certain large non-feudatory zemindarees was also not then available in the necessary detail; all this has now been added. Another reason is, that the lateness of the monsoons induced farmers to break up as much land as they could before the heavy rains stopped plough operations; and then in the spring, when the rains had mostly failed them, and all hope of recouping themselves lay in the rubbee sowings, the fine open weather again enticed them to sow a larger breadth with wheat, gram, pulses, oilseeds, and the like,—with a result which will be noticed further on.

7. In analysing the figures showing the cultivated area as they stand, it will be seen that the proportions of cultivated to cultivable land for the Province generally differ widely from those for certain districts. Thus in Chanda, Mundla, and the Upper Godavery, cultivated land ranges from a fourth to a sixth only the culturable area. Not far behind are Nimar, Raepoor, and Chindwarra, which have about one-third cultivated;—and the only districts whose cultivated area exceeds, but very slightly exceeds, the proportion deduced for the Province as a whole, are Nagpoor, Bhundara, Wurdah, Seonee, Hoshungabad, and Nursingpoor,—the corn-growing district of Hoshungabad heading the list in this respect.

8. Further examined, this cultivated area will be seen to consist more largely of khureef than of rubbee sowings for the Province as a whole, the proportion being as near as possible as 7 is to 5. In Balaghat and the Upper Godavery the sowings may be said to be almost entirely khureef, but the largest khureef growing district is Belaspoor and the next Raepoor. In other parts of the country the khureef comprises rice and jowar, the latter generally predominating, but here jowar is unknown, and the two million acres under khureef in Raepoor and Belaspoor are mainly sown with rice. After these two districts come Bhundara, Wurdah Chanda, Balaghat, Mundla, and Nimar; jowar, pulse, and cotton here sharing largely with the rice, or, as in Wurdah, almost entirely excluding it. On the other hand, the principal rubbee growing districts are Hoshungabad, Nursingpoor, Saugor, and Dumoh, in which wheat, gram and other pulses are the chief products. In Nagpoor, Jubbulpoor, Seonee, and Baitool the sowings of either kind are pretty equally balanced. But if Raepoor has been above classed with Belaspoor as one of the largest khureef districts, it will be seen that it is also next to Hoshungabad, one of the largest rubbee districts. Statistics thus prove the truth of the popular assertion that Chuteesgurh is the grainary of the Nagpoor and Berar country, while the Nerbudda Valley supplies with food the people of Central India.

9. There appears to be still some misunderstanding by district officers of the details required under letter G of Table I. For instance, the total cultivated land under "bárání," or not irrigated, is given at 12,161,821 acres, and that under "ábpáshí," or irrigated, at only 190,019 acres; from which it may reasonably be concluded that much of the rice cultivation, irrigated from tanks and other artificial means, has been omitted under the latter heading, and irregularly shown as "bárání." This point has been noted by the Commissioner of Nagpoor in the remarks on the Bhundara report, and as in that district a large area is under rice, the defect in the returns is material. The same defect probably exists in the Raepoor and Belaspoor returns. On the other hand, there seems to be more land included in the Balaghat returns as irrigated, than, from the description given by the Deputy Commissioner, would ordinarily be thus classed. He explains the system thus:—"a 'ghatia' is a field surrounded by very high bundies; in it water is allowed to collect during the rains, and is drained off into the neighbouring rice-fields at the end of the rains. After the ghatia becomes dry, it is ordinarily sown with wheat or gram." A similar practice prevails in other districts, and besides the utilisation of the temporarily stored waters, it has the advantage of preventing the growth of the kans grass on the land submerged; but such land is not ordinarily classed as irrigated. It should therefore be generally understood that all land watered, during either the khureef or rubbee seasons, from permanent tanks and wells is to be returned as irrigated, and all else as "bárání" or not irrigated. The Chief Commissioner trusts that the next year's returns will be accurate in this respect.

10. The information regarding the khureef and rubbee area in each district, above remarked on, will be found in fuller detail in the next following Table (C) in appendix, the area under rice, cotton, wheat, oilseeds, jowar, &c., being given for the autumn and spring sowings respectively. It will be seen that in Belaspoor, Raepoor, and Bhundara, rice is most cultivated; kodoo and kootkee in the hill districts of Baitool and Mundla; cotton in Wurdah and Nagpoor; jowar in Nagpoor and Wurdah; wheat in Hoshungabad and Saugor; opium in Baitool and Chindwarra; sugar-cane in Raepoor, Bhundara, and Baitool; and so on. For the whole Province the percentage under each description of crop may be thus stated:—

Khureef	Rice	... ...	24 per cent.
	Kodoo and kootkee	.. ..	9 „
	Cotton	... .	5 „
	Jowar and bajra	... ...	12 „
	Oilseeds	... ...	3 „
	Dal and pulses	... ...	2 „
	Others	... ...	3 „
			—58
Rubbee	Wheat	... ...	25 „
	Gram and pulses	... .	7 „
	Tobacco	... .	0 „
	Oilseeds	... ...	4 „
	Others	... ...	5 „
			—41
Do. fusli crops	Sugar-cane and vegetables	... ...	1 „
			—1
			100

This again may be shown in a more abstract form, thus:—

Land occupied by food grains	... ...	79 per cent.
Cotton	... ...	5 „
Oilseeds	... ...	7 „
Others	... ...	9 „
		—100

11. To turn now to the actual out-turn of the year. The opinions of certain of the district officers themselves will be seen from the following brief extracts from their reports:—

Nursingpoor.—"Long-continued droughts damaged the khureef crops, with the exception of cotton, and later the absence of rain after the sowing time was very detrimental to wheat and all the pulses, except gram."

Jubbulpoor.—"The season has been exceptional in the way of drought all over the district; in the northern tehseels the failure of both khureef and rubbee was most complete." The out-turn of wheat "was very small, only 1 maund and 27 seers per acre; this, calculating the seed at 1 maund 10 seers per acre, may be called a total failure." Kodoo and kootkee "may be called a complete failure;" and rice yielded "under 9 seers per acre." These three crops on which the people "trust for their living have been complete failures during the past year, and in the northern tehseel it may be said during the past three years. The totals of the two Tables II and III, if compared, show that over an acreage of 798,967, a produce of only 1,104,125 maunds have been collected of all kinds of grain."

Bhundara.—"The average produce per acre in maunds for the past and previous years is given below:—

	Maunds.	Seers.
In 1867-68	7	25
„ 1868-69	4	9
Loss ...	3	16

The decrease in production is considerable. This is solely owing to the past unfavorable season."

Nagpoor.—"All things considered, the crops were fair during the past year. The rice and ulsee suffered in many places, but the wheat, jowaree and cotton were good."

Wurdah.—"The season 1868-69 was favorable for cotton, and bad for all spring crops, while the circumstances of 1867-68 were just the reverse. With regard to jowaree, in the rich blacksoils the produce has been unusually good, but these bear a small proportion to those of the lighter kind, and the out-turn of these has been very little. Of wheat people go so far as to say that only $\frac{1}{8}$ of the usual crop was realized; while not agreeing entirely with this statement, I feel convinced from what I have myself seen that the out-turn generally has been far from favorable. * * The linseed crop throughout the district has been an entire failure."

Raepoor.—"The produce is much below the average yield, owing to the failure of the regular monsoon and the consequent drought, from which so considerable a portion of the district suffered. Opinions may differ as to the actual average struck in each case, because, as regards rice, which is to so large an extent the staple crop of the district, there have been great fluctuations in the yield, ranging from an average return in many villages of the Dhumterry pergunnah to no yield at all in parts of Lown. On the high lands every where the yield was nothing or next to nothing, and in the north-eastern section of the district the lowlands also gave no return. The failure seemed at one time so serious as to raise fears whether the people could tide over the difficulty without an extensive importation of grain from other quarters. It is not too much to assert, situated as Chuteesgurh is, with so considerable a population, that the deficiency could not have been met by importation. The surplus grain stock of previous years has saved the people. The annual crop was nearly thirty lakh maunds short of what was actually required by the lowest calculations for local necessities, a half of which it would have been difficult to find carriage for had the necessity for importation arisen. The spring crops suffered less than the khureef sowings, though the failure of the

latter rains diminished the area taken up. In the southern and western pergunnahs the yield was fair, but the return was poor over a considerable portion of the Raepoor and Simgah tehseels." Of gram and other pulses, "the yield on the whole has been fair. Oilseeds too have generally given a fair return. The cotton out-turn was fair."

12. So chequered has been the result everywhere, that any estimate of the total aggregate out-turn must be only very approximate. As such, it may be stated as follows :—

Rice	10,658,800	Maunds.
Kodoo and kootkee	4,305,920	,,
Jowar and bajra	5,361,140	,,
Wheat	13,271,010	,,
Pulses	5,418,400	,,
Sugar (goor)	607,800	,,
Vegetables	526,200	,,
Cotton (kupas)	1,397,550	,,
Oilseeds	2,038,720	,,
Tobacco	48,570	,,
Others	1,732,790	,,

13. The average produce of rice in a good season may be stated at about 7 maunds per acre, but in the season under review it is reported to have averaged in one district 2 maunds, in another 3 maunds, in another 5 maunds, and so on, making the average for the Province about $3\frac{3}{4}$ maunds only,—a loss of some 46 per cent. In kodoo, kootkee, and jowar, the food of the aboriginal tribes and poorer classes generally, the loss has not been so great, averaging only some 26 per cent. of the out-turn of a good season. In wheat it was still less, averaging about 18 per cent. due mainly to the fair yield in Hoshungabad. And thus, taking all food-grains, the loss of the year may on the whole be roughly stated at about 30 per cent.* The falling off in oilseeds has been very slight. And as regards cotton, the out-turn has been as high as in an average good year, notwithstanding the total loss of the crop in districts where it is not much cultivated. The sugar-cane, so dependent as it is on irrigation, suffered severely in the spring, when, approaching maturity, it requires much moisture, and got little. The greatest loss has thus been mainly in food-grains, but the effect of this loss has been different on different sections of the community. To quote the words of the Deputy Commissioner, Raepoor—"The effect on the agriculturists has been in inverse ratio to their means,—the rich having become richer and the poor poorer. The landholders, as a body, and the better class of ryots, have realised large profits from the enhanced prices. The price of cereals has ranged nearly four times as high as in the preceding year, so that those who had a surplus stock or a fair crop have been immense gainers. On the other hand, the poor landholders and the class of struggling ryots with no surplus, little property, and a deficient crop, have been reduced to great straits. Perhaps from 5 to 10 per cent. of the proprietors and 20 to 25 per cent. of the ryots would come under this latter description. As a body, the agricultural laborers suffered most. They are always an impoverished class in this district, having no means, and living with their families from hand to mouth on grain advances. These stopped when the crop failed, and the suddenly dismissed hands have only been kept alive by the relief works started under the orders of the Chief Commissioner." The position was much the same in the district of Belaspoor north, and in Bhundara west of Raepoor, and again in Chanda south of Bhundara—all large rice-growing tracts, supporting an aggregate population of $2\frac{3}{4}$ million inhabitants. It was also much the same, and in circumscribed localities even worse, in the trans-Nerbudda parts of Jubbulpoor, Dumoh, and Saugor, having a population of 1,382,000 souls.

* The area sown, it will be remembered, was a little larger than in the previous year as explained in para. 6.

14. The attention of the Chief Commissioner was directed early in the year, when the prospects of the khureef were growing daily from bad to worse, to the subject of food-supply, and information was collected from all available sources of the extent of reserve food stocks then in the country. Thereafter, weekly and fortnightly reports were received from all districts of the general state of the crops, the harvests, the prices current, imports and exports of grain, from all which not only was the fullest possible information obtained at head quarters of the actual state of affairs, but the executive officers were also enabled to determine where relief measures would be necessary. It would be difficult to present in this report the food resources of each district individually, but it may be possible to do so with some approach to accuracy for groups of districts corresponding with the three geographical divisions into which the Province has been mapped out for the purpose of registering exterior trade imports and exports, *viz.*, the Nagpoor group of five districts, the Chuteesgurh group of four districts, and the Nerbudda group of ten districts.

15. First, then, as regards the reserve stock of grain in hand at the beginning of the year. These figures, arrived at after an examination of the agricultural and trade statistics of the previous two years, supplemented by local enquiry, show that the production of food grains in the year 1866-67 was, for the entire Province, nearly 58 million maunds, or, for the three separate geographical divisions, as follows :—

	Population.	*Maunds—food-grain.*
Nagpoor Circle...	2,299,565	17,373,000
Chuteesgurh Circle	1,706,922	14,798,000
Nerbudda Circle	3,513,591	25,790,000

16. At 1lb. of grain per head, including infants with adults, which would be a fair average daily consumption, this production would leave a surplus in the Nagpore Circle at the close of the year (after adding imports and deducting exterior trade exports, and excluding an additional ninth for seed-grain) of $5\frac{1}{2}$ months' consumption, in the Chuteesgurh Circle of $5\frac{1}{2}$ months', and in the Nerbudda Circle of $5\frac{2}{3}$ months'. In the following year the wheat harvest was slightly injured by late heavy rains, and the total production may be put down at about $52\frac{1}{2}$ million maunds as follows :—

	Maunds—food-grain.
Nagpoor Circle	15,495,000
Chuteesgurh Circle	14,798,000
Nerbudda Circle	22,258,000

which, after deducting trade exports and adding imports, and allowing for seed-grain, should have left a surplus at the close of the year, in the Nagpoor Circle of 4 months' consumption, in the Chuteesgurh Circle of $4\frac{1}{2}$ months,' and in the Nerbudda Circle of $2\frac{1}{2}$ months.'

17. The surplus of these two years thus deduced at the opening of the year under review, would then have been—

	Maunds—food-grain.		
In the Nagpoor Circle ...	7,761,032	= $9\frac{1}{2}$	months' consumption.
,, Chuteesgurh Circle ...	6,400,957	= $9\frac{1}{2}$	,, ,,
,, Nerbudda Circle ...	9,881,974	= 8	,, ,,

or for the Province as a whole, there should have been sufficient for 9 months' consumption in hand when the year opened on 1st April 1868.

18. The total produce of the year 1868-69 in the three circles, after allowing for exports and imports, was—

	Maunds—food-grain.		
Nagpoor Circle	10,510,794	= $12\frac{1}{2}$	months' consumption.
Chuteesgurh Circle ...	9,876,563	= $15\frac{1}{2}$	,, ,,
Nerbudda Circle ...	18,585,120	= 14	,, ,,

19. At first sight there would thus appear to have been ample provision in store at any time during the year under review; but apart from the consideration of the extent to which it was made up by exterior importation in the Nagpoor and Nerbudda Circles, it has to be remembered that the surplus at the beginning of the year (April 1868) and the production of the year, after adding and deducting exterior imports and exports, was not for a twelve months' consumption agreeing with the official year 1868-69, but actually for a consumption of 20 months, or from April 1868 to the ingathering of the khurreef harvest in November and December 1869. How little the food of the country was in excess of its requirements will appear if, keeping in view the number of months for which provision was to be made, we add the surplus and production of the three years together, thus :—

Nagpoor Circle	22	months' consumption.
Chuteesgurh Circle	24½	,, ,,
Nerbudda Circle	22	,, ,,

That such was really the case, there can probably be little doubt. For the two seasons previous to 1866-67 were bad years, and any old surplus then in hand must have been small. The surplus of the two seasons before 1868-69 could hardly have been more or less than that deduced from all the agricultural and trade statistics available. As has been said above, the consumption per head of population has been taken at 1lb. all round. All additions and deductions from the stock by exterior importation and exportation have been made. And the result is a very small surplus in November 1869 over and above the requirements for seed grain. Opinions will probably differ as to the existence of old stocks in the wealthy centres of commerce, but even if allowance were made for these, they would comparatively be so small that the general provincial result would be very slightly improved. The price current lists of the last few months afford strong proof of the exhausted condition of the food-market; and only now when the khureef of the year 1869-70 is being reaped, prices in the Mofussil towns for rice show but slight improvement, while for all rubbee grains the tendency is rather the other way. In short, the preponderance of evidence is in favor of the approximate accuracy of the average results above deduced.

20. But an average result after all proves very little, and is practically of little value, for while it is true that there was grain sufficient in the Nerbudda Circle to feed all its population for even a month or two after the present year's khureef harvests were brought to market, that grain was mostly in the district of Hoshungabad,—many miles from Saugor and Jubbulpoor and other large centres of consumption, with no good roads or means of transport between them. It is notorious that Hoshungabad and Nursingpoor not only fed all the neighbouring populations in our own territories, but sent thousands of maunds to Berar and Bundelcund in foreign territory.

Agri-Horticultural Experiments.

21. Some experiments were made in the Wurdah district, both at Wurdah and at Arvee, with potatoes, but they failed. Some flax grown in the district obtained a reward at the Akola Exhibition, the fibre varying in length from 4 to 5 feet.

22. The potatoe experiment at Chindwarra and Moohtoor also failed; the crop was a short one, and the size of the tuber little greater than that ordinarily grown in the district; but as the peculiarly dry season and late arrival of the seed may have caused the failure, another experiment will be made. Lucerne seed was distributed to the malgoozars, in the hope that its cultivation would become more general, but the grass requires too much watering to be popular. Some arrowroot was introduced into the Lall Bagh at Boorhanpoor, and a small quantity was successfully manufactured.

23. The introduction of Hingunghat cotton into Nimar was not such a failure last year as at first supposed. Improvement in the cotton of the Taptee Valley is already visible, and the landowners have re-sown the seed raised from Hingunghât seed sown in the district. A fresh supply of Hingunghât seed has been sent to all districts in the Nerbudda Valley.

24. In Chindwarra the American cotton trees have so greatly deteriorated that a succession of crops is not to be hoped for, nor was it considered worthwhile to take any more care of them.

25. In Balaghat a series of experiments in potatoe cultivation met with a fair measure of success. The Otaheite sugar-cane came to maturity at the proper season, and answered the most sanguine expectations of the malgoozars to whom it had been given for trial, the cane produced being twice the size of the indigenous sugar-cane. The cane now planted in the garden at Balaghat will be given out for trial to malgoozars and cultivators.

24. In the gardens at Nagpoor, under the management of the Local Committee, 76 seers of Hingunghât and 38 of Dharwar cotton seed were sown, the out-turn being 811 of the former, and 206 of the latter.

25. In the Raepoor garden an experiment with Indigo seed was made, but it failed from want of water. Four seers of Englisl oats gave a yield of 26 seers.

26. In Belaspoor the rice experiments were a failure, but the Otaheite sugar-cane proved a success, and may now be considered as fairly introduced into the district.

27. In Sumbulpoor some excellent potatoes were raised in the small garden near the Cutcherry from seed produced the year before from Nagpoor seed. A good crop of oats was also raised from seed received from Hissar; the best plants were about 3 feet high.

28. The experiments in Mundla with exotic cotton was more successful than in the preceding year; from one seer of cotton planted in the public garden, 16 seers of seed cottor was obtained, which gave 5 seers of ginned cotton. Some experiments with tea and coffee met with no better success than in the previous year.

29. In Seonee the cotton formerly planted has continued to yield a plentiful and good crop; the picking sold for Rs. 10, or at the rate of Rs. 40 per acre. An endeavour is being made to obtain some Rhea, or China grass seed, with which to make experiments.

30. In Chanda some coffee seed received from Mysore was planted in the public garden and was beginning to germinate; but an experiment with potatos received from Bombay was not successful. Some sandal-wood and coffee seed and potatoes were supplied to the zemindars of Panabaras and Jurapapra. Some Carolina rice seed was distributed among some landowners in the Wurdah and Wynegunga Valley, but owing to the failure of rain, the crops were destroyed, except in Koorza, where 3 seers produced 64½ seers of paddy and 62½ seers of straw.

Sheep Breeding.

31. In the Nagpoor Sheep Farm at Telinkheree, on the 1st April 1868, the stock was 4 Patna rams, 3 Punjab rams, 1 English ram and 5 ewes, 272 country ewes and lambs, and 36 half-bred lambs. Twenty Punjab rams were purchased during the year; 211 half-bred lambs were born; and of these, 34 died.

32. Since the close of the year a new system has been introduced, a small breeding stock only, for the production of good rams, being now kept up.

33. In Dumoh, at the close of last year, there remained 69 rams and 253 ewes. Thirty-four sheep were sold; there were 161 births and 51 deaths; of these, 39 were old ewes and rams, and the remaining 12 were lambs, leaving 398 remaining at the end of the year. The expenses of the farm were Rs. 210-7-9, and the receipts Rs. 151-4-0, leaving Rs. 59-3-9 as the actual cost of the farm for the year. Five maunds and a half of wool realized Rs. 106.

34. At Jubbulpoor, out of the 12 rams brought down by Mr. Jones, 11 were made over to different landowners in the district; and of these, 5 have died, as also 3 lambs, their produce. The landowners have taken so little care of the sheep that they have been taken back. The attention of the people has been drawn to the pamphlet on the subject, the instructions in which appear most valuable, if the people would only act up to them.

35. In Saugor the two rams remaining at the end of last year at the Saugor Tehseelee have not been able to serve at all. It is stated that the sheep of the country will not let the rams come near them. The two rams at Khoorye died during the year.

Cattle Breeding.

36. In the Nerbudda Division there are only two Government bulls,—one Nellore and one Hissar. The latter at Nursingpoor is herded with the cattle, and is reported to have served 18 cows.

37. In Baitool there were no results, the people considering the bull too heavy for the cattle of the country.

38. At Nagpoor the Local Committee have come to the conclusion that the Hissar bulls are next to useless for breeding purposes, and their sale has been sanctioned.

39. At Bhundara the two Hissar bulls served 19 cows during the year, but the complaint that they are too large for the indigenous cows of the country is universal.

40. At Sumbulpoor there is a fine Nellore bull, and it is reported that his breed is already showing itself in the cattle about the sudder station. The cows of the district are, however, so small that it is only about 1 in 50 that he can cover.

41. At Dumoh there are five bulls, three of which are kept in the Dumoh Tehseelee and two at Huttah. The services of the former were put into requisition 50 times, the latter 20 times. They are, however, too large for the cows of the district.

42. In Chanda 35 cows were served by the bulls at Chanda, Wurrora, and Berhampoorce.

43. In Jubbulpoor the four Hissar bulls served 18 cows.

44. There are seven bulls in the Saugor district,—three Hissar and four Mysore; they served 193 times. The reasons given for their services not being more sought after, are that there are other bulls in several parts of the district, and that owners of cows do not like going long distances to the tehseelee. Probably the system of herding the bulls with the cattle might be advantageous.

Horse Breeding.

45. Government stallions were only kept in the districts of Hoshungabad, Nursingpoor, Nagpoor, Bhundara, Dumoh, Jubbulpoor, and Saugor.

46. In the Nerbudda Division there are two stallions at Hoshungabad and two at Nursingpoor. The number of mares covered during the last three years may be thus shown:—

	1866-67.	1867-68.	1868-69.
Hoshungabad, mares served ...	19	28	55
Nursingpore, ,, ...	11	68	42

The falling off in Nursingpoor is attributed to one of the stallions being not fit for the purpose, and consequently his services are not so much fancied. The Deputy Commissioner reports that he has seen some of the foals, and that they look very promising. The progressive increase in the number of mares served in the Hoshungabad district is satisfactory.

47. At Nagpoor the services of the stallion were not sought for so much as in the previous year. It is in contemplation, however, to send him now and then to the Wurdah district, where his services may probably be taken advantage off.

48. In Bhundara there is a very good little Arab stallion; the number of mares served was 25 as compared with 13 in the previous year. It is reported that of the mares served last year, 5 have produced promising stock.

49. As reported last year, the stallion at Dumoh was found to be too old, and was consequently sold. He has been replaced by a handsome Arab stallion. Five mares were covered during the year.

50. Both the Deputy Commissioners of Raepoor and of Belaspoor consider that success would attend an attempt to improve the breed of ponies, the number of which in Chuteesgurh is considerable; and that pony breeding would be eagerly taken up by the people if some good pony stallions were placed at their disposal. The subject is now under consideration, and definite orders will shortly issue.

51. As was mentioned last year, the stallion at Jubbulpoor was not fancied by the Natives, and the stallion sent from Mundla, especially selected for small mares, was subsequently transferred to Dumoh. The number of mares severed during the year was 11.

52. There were 2 stallions in the Saugor district during the greater part of the year. The number of mares served was 20. The Deputy Commissioner is of opinion that the fee of one rupee is too high, and proposes that it should be reduced to eight annas; this can hardly be the case, when it is remembered that eight annas is the charge for bulls. It is also stated that the malgoozars do not care to take their mares a long distance, and prefer to have them served by stallions belonging to two or three Natives who travel about the district. This difficulty may be overcome by the Deputy Commissioner and his Assistants taking the Government stallions out with them when on tour, and allowing the malgoozars' mares to be brought to their camp to be served.

Public Gardens.

53. The public gardens in the different districts still remain under the management of the Local Committees, except the Maharaj Bagh at Nagpoor, which is under the charge of the Agri-Horticultural Society of the Central Provinces. The report of the Society's operations for the past year has lately been published. The number of experiments tried during the year was few, owing to the difficulty of getting a sufficient supply of water.

54. In the Nerbudda division public gardens are kept up at the head quarters of each district, besides the Lall Bagh,—a public park with pleasure ground at Boorhanpoor. The garden on the hill plateau of Mohtoor was closed

during the year. The Baitool garden has been improved; some new *parterres* having been laid out, a cistern constructed and graft mango trees planted. In the Hoshungabad garden the well has been improved, and nearly 1,400 feet of masonry water-courses built; this will do much to prevent the waste of water, which is hardly sufficient for the requirements of the garden. This garden is, almost, if not quite, self-supporting. The value of the vegetables supplied to the jail more than repaid the cost of the prison labour supplied to the garden. A vinery has been erected, and a large number of fruit trees, chiefly mango and lime, have been planted out. In the Khundwa garden advantage has been taken of the peculiarly dry season to improve the well; and in the Lall Bagh garden the number of flower and graft fruit trees has been considerably increased, and the garden much improved. At Nursingpoor the garden suffered very much from want of water.

55. In the Nagpoor district there are four public gardens, in which various experiments were tried, which will be noticed further on.

56. In the Wurdah district also there are four public gardens,—at Wurdah, Arvee, Deolee, and Sindhee. In the Wurdah garden, after a great deal of trouble in finding water, a new well has been sunk, as the old one did not supply sufficient for the whole garden, which will now, it is hoped, keep the garden well supplied even during the hot weather. A variety of fruit trees were received from the Agri-Horticultural Society at Nagpoor, which, together with those previously planted, are thriving well. The water in the Arvee garden failed, but during the rains 264 fruit trees of different kinds were planted out, and most of them are doing well. Nurseries are kept up at all the gardens, except Sindhee, which is too small.

57. In Bhundara one of the gardens is exclusively reserved for the cultivation of Nagpoor oranges, from which it is intended to distribute young plants all over the district.

58. At Raepoor the garden has been enclosed with pillars and rails, and a band-stand has been built by public subscription in the centre. Although the wells have been deepened to 60 feet, they do not give a sufficient supply of water for the garden. The trees planted out last year have thriven, and 113 fruit trees, the greater portion of which are graft, were added during the year.

59. In Sumbulpoor the new garden commenced last year has been greatly improved. A tank which is enclosed in the garden has been cleared out, and flowering water plants have been planted in it. A broad walk has been made all round, which it is intended to plant with cocoa and betul-nut trees, of which some 200 have already been imported from Cuttack. European vegetables were produced of all kinds; the surplus, after supplying European residents, being sold to the Natives, who buy them readily. A summer-house has also been erected, and a flower garden laid out and planted.

60. In the Seonee district the garden at Lucknadown has been resuscitated during the year. In the Seonee garden the swamp at the foot of the garden is being gradually filled up with the rich deposit taken from the Dil Saugor Tank, and will probably be finished during the year. The jail garden also supplied a large quantity of vegetables, both European and Native, the surplus finding a ready market. The public garden at Kuttunghee is a good one, and is much resorted to by the townspeople.

61. In Jubbulpoor the Cantonment garden is in good order, and is under the charge of the Cantonment Magistrate. The city garden, which is under management of the Local Committee, has been improved and the well repaired. A very fine well has been completed in the Thuggee garden; it was proposed to use part of this garden as a nursery and for experiments, but owing to the exceptional season of drought, nothing could be done.

62. The Dumoh garden suffered greatly from want of water; both the tank near, and the well in the garden dried up, and water had to be brought in carts from long distances. The plan of the garden has been improved, and the flower and vegetable beds, which were formerly mixed together, have been separated. The tank and well were deepened.

63. At Chanda the appearance of the garden has been improved very much by the growth of various kinds of trees and plants put down in former years. A considerable quantity of vegetables, both English and indigenous, were grown and distributed. Sugar-cane and arrowroot did well, and a large quantity of the former were supplied to some zemindars and malgoozars for plantation in their villages. Some orange trees were grafted during the year, and 115 lime trees, 200 sweet limes, and 28 cocoanut trees, which were planted during the year, are doing well.

64. At Saugor the Local Committee leased a large part of the garden to a Native, as they found that their funds would not admit of their keeping it up as formerly. A good many mango grafts were produced during the year, but Natives have not generally availed themselves of the opportunity of purchasing them.

65. In conclusion, I am to observe that the reports and returns from some districts were not submitted in proper time, and the Saugor returns were not received until three months after they were due. The Chief Commissioner hopes that greater punctuality will in future be observed. Considering the great amount of agricultural distress which prevailed during the year, it might have been expected that the agricultural reports would have been unusually full of information, but, with one or two exceptions, such as the reports from Raepoor, Jubbulpoor, and Nimar, the observations submitted by the Deputy Commissioner have been meagre, and the subjects of cattle breeding and horticulture, important though they are, have in the reports engrossed more than their due share of attention to the exclusion of more important matter. When statistical returns of the kind submitted with the agricultural report are furnished, the figured statements should always be carefully reviewed and commented upon, and the more noticeable facts and results brought into prominence. The Commissioner of the Nerbudda Division is also the only one who has summarised the reports of his district officers, and in forwarding the reports and statements, many thoughtful remarks have been made by him and by the Commissioner of Nagpoor.

UNOPEN LINE OF THE G. I. P. RAILWAY BETWEEN SHOLAPOOR AND RAICHORE.

No. 114, dated 12th January 1870.

From—LIEUT.-COL. J. S. TREVOR, R. E., *Consg. Engr. for Railways, Bombay,*

To—*The Secretary to the Government of Bombay, Railway Dept.*

Referring to my letter of the 13th October last, No. 2917, describing the state of the works on the unopen line between Sholapoor and the Caugnee River, I have the honor to report that I have again inspected the works, and that the progress on the section from the Boree River to Goolburga has been most remarkable.

2. Rails are laid to Goolburga, and engines have been running daily to that place since the 24th of December 1869, when Mr. LeMesurier went through on the first engine that had gone so far south on the Great Indian Peninsula Railway. The ballasting is well advanced, and will be nearly completed by the end of the current month. The fence is being rapidly erected. The stations are well in hand, Kurubgaum is nearly finished, Dordneh will be completed by the middle of March, and the other two by the end of April. The wells are backward, but arrangements of a temporary character for the supply of water have been made. The only work not sufficiently advanced to be used for traffic by the 1st of February is the

bridge over the Beni Sheroor River. This bridge is to consist of 6 spans of 60 feet, in place of 2 bridges of 3 spans of 20 feet each, that had been first erected and afterwards condemned. The new bridge is to be built with screw-piles and Warren girders, of materials procured from the Baroda Railway Company. The piles are now being screwed, the girders are not yet on the ground; but there is no doubt of the bridge being ready for traffic by the monsoon. In the interval a diversion has been laid in, and traffic will be worked over that diversion till the bridge is completed.

3. The progress on No. 18 Contract has been most creditable to all concerned with the works: every officer has worked with the greatest energy, and their efforts have been crowned by the completion of works that, on my last visit, I considered it almost impossible to finish by the time first fixed for opening to Goolburga. The zeal and energy displayed deserves both praise and substantial recognition at the hands of the Company and Government.

4. I regret to have to write in very different terms of the works beyond Goolburga. In my last report I mentioned that, on the first division from Goolburga to Shahbad Station, 16 miles in length, the only works that remained to complete were the Taganore and Shahbad bridges. At the former, a bridge of 5 arches of 30 feet span, the last foundation has just been laid and the arches are now being turned. The work will probably be finished in another two months. At the latter, nothing has been done. This bridge, which is over the same nullah as the Taganore bridge, was to have been built with 6 arches of 30 feet each, but so much difficulty was experienced by the Contractor in getting in the foundations, that the design has been changed to 3 spans of 60 feet and 1 of 30 feet. One abutment and one pier of the bridge were built on the original design. These are to be used for the 30 feet opening. Screw-piles are to be put down for the piers for the 60 feet openings, and the north abutment is the only piece of masonry that has to be built. The foundations of this have not yet been laid.

5. It had been intended by means of diversions laid in at the Taganore and Shahbad bridges to open the section to Shahbad at the same time as the line to Goolburga. The construction of the diversions was commenced, but the Contractor demanded such exorbitant terms for permitting the Company to use the line before the date fixed for completion of the contract, that the idea of opening the section from Goolburga to Shahbad has been abandoned, and the work at the diversions stopped.

6. Between Shahbad and Nulwur Stations, 13½ miles, the only incomplete work of importance is the bridge (12 spans of 30 feet, 16 of 78 feet, and six of 62 feet) over the Caugnee River. This work has not been touched for the last six months. There are four piers and one abutment still to found. The other masonry is, with the exception of girder bed blocks, completed. The cause of the delay at this work, as well as at the Shahbad Viaduct, is want of pump power. The Contractors possess only two steam pumps; one has been in use at the Taganore; and the other had not sufficient power to keep down the water at the Caugnee foundations. The pump from the Taganore has now been taken to the Caugnee River, and work will be commenced. The girders over the bridge are to be erected by the Company, but the materials are to be conveyed to that place by the Contractor from Goolburga. The iron-work is now being delivered to the Contractor for conveyance, and the Company can put up the girders in about four months.

7. There are some gaps in the approach banks on the south of the Caugnee River; these gaps were formerly intended to be crossed by bridges, but are now to be closed. Rails are laid for all but 5 miles between Shahbad and Nulwur. This work is progressing very badly; although the Contractor has complained of want of rails, he has not carted forward more than a mile or two during the last six months, and at the time he complained that the Company had declined to permit him to take more rails from their stores at Goolburga, there were in front of his house stacks that had been in his possession since 1866, and that have not been moved to this date. Ballast is laid over the whole distance from Shahbad to Nulwur. Between Nulwur and Yedagherry, a distance of 16½ miles, besides a few culverts, there are only two bridges incomplete, one of 9 spans of 20 feet, and another of 12 spans of 30 feet. The former is in hand and will be finished in about six weeks. At the latter, one abutment and 5 piers are complete, the others are not founded. The difficulty here also has been the want of pump power. The Company are about to lend the Contractor one of their steam pumps, and this work can then be pushed on. There is one cutting in which some granite has been met with, not quite cleared out. With this exception, the earth-works and also the ballasting may be said to be complete. No rails have been laid, or any permanent-way materials brought on to the ground south of Nulwur. There is one bridge of 4 spans of 10 feet close to Yedagherry not completed, but this it has been decided to close.

8. From Yedagherry to Sholapoor Road Station, 14 miles, all the bridges are founded and up to springing. The arches of one, a bridge of 7 spans of 20 feet, are being turned; but at 11 other bridges, having among them 22 arches of 20 feet, and 10 of 10 feet, no work is in progress for want of centres, although dressed arch stones are on the ground. Mr. Bray obtained an advance in his rates for arch-work in May 1868, from Rs. 20 to Rs. 26½ per cubic yard, on the plea that the work the Engineers made him put in was better than provided for in the specifications attached to his contract. He now claims a further advance on the same grounds, and the arch-work has been kept back purposely to get this advance. It can, however, be finished by the date fixed for the completion of the contract, if a few more centres are provided. One or two cuttings in this section are not cleared out, but with these exceptions, the earth-works and ballasting are nearly completed.

9. The distance between Sholapoor Road Station and the Krishna Station and bridge is 13 miles. As on the preceding sections of the line, the earth-works and ballast are nearly finished, and all the bridges are up to springing. But the arch-work is backward, there being still 6 arches of 20 feet, and 14 of 15 feet, to turn, besides the arches and walls of some drains and culverts. Work is, however, in progress, stone is collected on the ground, and the arches will be finished in a few months.

10. The bridge over the Krishna is to consist of 37 spans of one hundred feet each, and will be about 70 feet in height at the deepest part of the river. The bridge is to be built throughout of iron. The design has been prepared, and the site selected by Mr. Berkley. The bridge was to have been built originally with masonry piers, at the road crossing, about two miles lower down the river. But the site was abandoned after about a lakh of Rupees had been expended on earth-works in approaches, and about Rs. 40,000 on stone for the masonry work. For a bridge to be entirely built of iron, there is, I think, but little to be said in favor of the new site over the old. The new line makes the railway a little longer, and the advantage of better foundations that it offers is of no great importance when the piers are to be formed of iron columns. In both places granite crops out in the bed, but at the new site it stretches regularly and at right angles across the river; while at the old site the lie of the rock is at a considerable angle to the direction of the stream.

11. None of the iron-work has yet been despatched from Home, and unless greater exertions are made in England to get it ready, the bridge may not be commenced before the working season of 1871-72. The bridge will take at least two seasons to construct, and great difficulty will be experienced in working traffic over the river till it is finished. The stream was not fordable when I crossed it in the beginning of January 1870.

12. South of the Krishna Station, the Great Indian Peninsula Railway extends to Raichore, or about 15 miles; there are two bridges of some size, one of 7 spans of 30 feet, and the other of 3 spans of 20 feet. The remainder 1 span of 20, 5 of 15 feet, and 8 of 10 feet are up to springing. But no work is in progress on them, nor is stone for the arch-work on the ground.

13. The first bridge 3 spans of 20 feet is being proceeded with, one abutment is up to ground line, the other work is not yet founded. At the second bridge of 7 spans of 30 feet, two piers have still to be founded, the remainder of the masonry work is up to springing. The delay in getting in the foundations is again attributable to want of pump power, and the want of progress with the arch-work, to disputes with Engineers in regard to the quality of work to be provided under the new specification.

14. There were to have been six stations on the contract. The buildings at Shahbad are completed. Those at Nulwur, Yedagherry, Sholapoor road, and Krishna bridge are well advanced, and are being pushed on; but the station at Raichore has not been commenced. This station was to have been the joint property of the Madras and Great Indian Peninsula Railway Companies, and was to have been built about a mile and a half to the north of the junction line of the two undertakings. The Madras Company are desirous to carry out the work, and they can erect a better building for the same money under their contract rates than the Great Indian Peninsula Railway Company can through the agency of Mr. Bray. It has been decided to let the Madras Company carry out the works. This cannot, however, be done without a change of site, and it is proposed to build the station about a mile and a half south instead of north of the dividing line. The new site is equally convenient for the town of Raichore and for water-supply.

15. In conclusion, I have the honor to state that, with the exception of the Krishna bridge, there is no difficulty in completing all the works south of Goolburga by the 30th of June next, the date to which Mr. Bray's time of completion has been, at his own request, extended, and the date by which Mr. Bray's Agent personally admits that the works can be finished, if pushed on with vigour. But from the method in which the works are being prosecuted, the obstructive spirit displayed by the Contractor's Agent, and the absurd claims put

forward for compensation for every trivial deviation from the plans and designs first sent to the Contractor, I cannot but fear that the present working season will be wasted, and the completion of the works delayed to another year, to the great pecuniary loss, not only of Government and the Railway Company, but also of the Contractor, Mr. Bray.

No. 70, dated 17th January 1870.

RESOLUTION—By the Government of Bombay, Railway Dept.

From the Consulting Engineer for Railways, No 114, *dated* 12*th January* 1870.

Submits a report of his inspection of the unopen line of the Great Indian Peninsula Railway between Sholapoor and Raichore.

RESOLUTION.—The line to Goolburga can be opened for passenger and goods traffic on the 1st February 1870. The speed of passenger trains should be restricted till the fencing is complete, and the line thoroughly boxed up to an average of 15 miles an hour. It has given Government pleasure to note the remarkable progress of the works between Sholapoor and Goolburga during the last three months. The arrangements made by the Agent, and the energy and vigour with which the works were carried out by the Resident and Assistant Engineers, have been most creditable.

* * * * *

2 A copy of the Consulting Engineer's report should be sent to the Secretary of State, whose attention should be drawn to the obstructive spirit displayed by the Contractor's Agent for the works south of Goolburga, and also to the delays in the preparation of the iron-work for the Krishna bridge.

3. Government direct the Agent to take all legal steps in his power to secure the vigorous prosecution of the works on Contract No. 19, and to serve notice on Mr. Bray that if the works are not finished by the date to which his contract has been extended, the works will be carried on at his expense by the Company's Officers, and he will be proceeded against for all losses sustained by reason of his failure to complete his contract within the stipulated period.

4. Copies of these papers should also be forwarded to the Government of India.

W. BROADFOOT, *Lieut., R.E.,*
Asst. Secy. to Govt., Punjab, Irrign. Branch.

LAHORE,
The 18th January 1870.

GOVERNMENT OF INDIA.

FINANCIAL DEPARTMENT.

WORKING OF THE CERTIFICATE TAX ACT IX OF 1868 IN THE DIFFERENT DISTRICTS OF THE NORTH-WESTERN PROVINCES.

No. 53 A, dated 7th December 1869.

From—R. SIMSON, Esq., *Secretary to the Government, North-Western Provinces,*
To—*The Officiating Secretary to the Government of India,* FINANCIAL DEPARTMENT.

I am directed to forward, for the information of His Excellency the Viceroy and Governor General in Council, copy of a letter,* and of its enclosures, from the Secretary to the Board of Revenue, containing a report on the working of the Certificate Tax Act IX of 1868 in the different districts of the North-Western Provinces, together with a copy of the orders of Government thereon, No. 52A of this day's date.

* No. 216, dated 27th November, 1869.

2. It will be observed that the administration of the Act was by far the most successfully carried out in the Meerut district, and that to Mr. Billings, Deputy Collector, fell the largest portion of the work of assessment, and that he performed the duty with great care and ability. The Board recommend that a donation of Rs. 1,000 be granted to Mr. Billings, and the Lieutenant Governor considers that this reward is well deserved, and moreover that the grant of it will have a good effect. His Honor accordingly desires me to submit the proposal for the favorable consideration of His Excellency the Governor General in Council.

No. 52A, dated 7th December 1869.

From—R. SIMSON, Esq., *Secretary to the Government, North-Western Provinces,*
To—*The Secretary to the Board of Revenue, North-Western Provinces.*

I am directed to acknowledge receipt of your letter No. 216 of the 27th ultimo, and to convey to the Board the thanks of the Lieutenant Governor for their full and instructive analysis of the incidence of the Certificate Tax.

2. The Board have very clearly shown, both by comparison with the returns of the Income Tax, and by a numerical examination of the several classes, as also of the average rates of the tax as assessed in the various districts, that (excepting in the Meerut district) the provisions of the Act have not been applied with discrimination and with care.

3. The districts noted in the margin, with the Collectors who have been in charge during the year, are those in which failure has been most conspicuous, and in which consequently it must be concluded that the Collectors failed to discharge efficiently the trust committed to them by the Legislature.

Bareilly	...	Mr. Willock.
Goruckpore	...	,, Clifford.
Ghazeepore	...	,, Pasley.
Jounpore	...	,, Clarmont Daniell.
Shahjehanpore	...	,, R. Saunders.

4. The Lieutenant Governor has already, in the C. O. dated 27th August last, No. 35-20A,* enforced upon Collectors and the controlling authorities

* Circular No. 35-20A of 1869. Dated Nynee Tal, the 27th August 1869.

The Lieutenant Governor desires to impress on you the duty of assessing the Income Tax at a full and sufficient amount, and of omitting no precautions, or sparing yourself any pains or labor, to secure this end.

2. The law has lodged a trust in you which you are bound to fulfil.

3. While every endeavor should be made to avoid over-assessment, it will be remembered equally that every under-assessment is a defrauding of the Exchequer; and that, in the present unfavorable state of the finances, what is short assessed on any one person or class is virtually imposed as a debt which they will have to make good on all other persons and classes.

4. No compunction must therefore be allowed in assessing to the full figure of estimated income. It is a duty owing to the State and to the community at large.

5. The Board of Revenue and the several Commissioners will be required to see that these instructions are fully acted up to, and that any deviations from them are promptly brought to the notice of the Lieutenant Governor.

the obligation that devolves on them to assess the tax at full and adequate rates, and the wrong accruing to the public from any neglect to do so.

5. The operations of the Income Tax in the current year will be carefully watched, and will, in the same manner as the present, be analyzed by the Board; and the merits and demerits of the various officers concerned made public.

6. The remarks by Mr. Tidy as to the weapon for extortion and oppression afforded by proceedings which show a disposition to repose special trust in any of the lower classes of officials deserve the careful attention of all officers engaged in the assessment of the tax. The danger is only to be obviated by active and independent personal enquiry and research.

7. Mr. Forbes and his staff, Messrs. Ward and Billings, deserve much praise for the able discharge of their duties; and the thanks of Government are due to them for the successful results secured by their labors. The Lieutenant Governor will have much pleasure in recommending Mr. Billings for the gratuity proposed by the Board.

No. 216, dated 27th November 1869.

From—W. C. PLOWDEN, Esq., *Secy. to the Board of Revenue, North-Western Provinces,*

To—*The Secretary to the Government of the North-Western Provinces.*

I am desired by the Board to submit the accompanying report reviewing briefly the administration of the Certificate Tax Act IX of 1868 in the different districts of the North-Western Provinces.

2. The tax has been assessed throughout the 36 districts of the Provinces, and the realizations have been £50,835 out of a demand of £51,342. The sum realized was contributed by 34,294 persons (who took out certificates), of whom 332 were Europeans or Eurasians, and the remainder Natives.

3. Statement A shows the realizations, district by district, and Statement B, the classes under which the tax was paid.

4. Turning to the last statement, it will be seen that the 1st class is without a single representative. In the 2nd class, comprising incomes between £20,000 and £40,000, there is one solitary tax-payer, a Native resident of Cawnpore. The great firm of the Muttra Seths is conspicuous by its absence; yet the partners' firm have certainly the repute, if not the enjoyment, of an income exceeding £20,000.

5. In the 3rd class (incomes between £20,000 and £10,000), the 36 districts contribute but five tax-payers, of whom four reside in Allahabad and one in Muttra.

6. In the 4th class, comprising incomes between £5,000 and £10,000, there are 12 contributors to the tax, of whom five are Europeans or Eurasians, and the remainder Natives; four (one European and three Natives) belong to Allahabad, three (two Europeans and one Native) to Mirzapore, one to Agra, one to Muttra, and one to Ajmere.

7. In the 5th class (incomes between £2,500 and £5,000) there are 62 contributors, of whom 26 are Natives, 13 reside in Cawnpore, seven in Allahabad, and six at Muttra; but in 18 districts so large an income as £2,500 does not seem to be known outside of the official and landed classes.

8. It cannot, however, be the fact that the large bankers of Seharunpore, Moradabad, Shahjehanpore, Muttra, Ghazeepore, and elsewhere should have such small incomes as these returns would indicate; and it is only clear that the tax has been evaded by many who should have contributed more largely to it than they have.

9. In the 6th class (incomes between £2,500 and £1,000) there are 245 tax-payers, 23 of whom are Europeans.

10. In eight districts these tables are made to assert that there is not a single individual liable to the Certificate Tax whose income would bring him within this class. These districts are Deyrah, Kumaon, Gurhwal, Bijnour, Jaloun, Lullutpore, Humeerpore, Jounpore, and Turrai; and Moradabad, Etawah, and Etah have each only one individual so favored in the way of income.

11. The 7th class comprises incomes between £500 and £1,000. It includes only 659 tax-payers, of whom 43 are Europeans and Eurasians; 59 belong to Meerut, 42 to Allygurh, 47 to Agra, 75 to Cawnpore, 37 to Allahabad, 29 to Mirzapore, and 33 to Benares; that is to say, nearly half of the entire number will be found in 7 out of the 36 districts.

12. The 8th class is the first which contains over a thousand tax-payers. It comprises incomes between £500 and £250, and embraces 1,733 contributors to the tax, about 5 per cent. of whom are Europeans and Eurasians. About 12 per cent. belong to Meerut (221), half as many to Allygurh (116), and nearly as many to Budaon (104); indeed these three districts contribute 25 per cent. of the persons in this class; Agra adds 89, Cawnpore 139, Allahabad 85, and Azimgurh 66 persons taxed under this class. Bareilly, with its large town population, and with nearly a million and a half of inhabitants in the district, contributes 28 persons; while Goruckpore and Bustee, with their population of three millions and a half, contain 46 persons rated in this class; and Deyrah, Kumaon and Gurhwal add 29 more, of whom 16 are Europeans.

13. In the remaining two classes, where the incomes are below £250, the great bulk of the tax-payers (31,403) is found; of these only 6,851 have incomes above £100 a year.

14. In the first of these last two classes, class 9 (incomes between £100 and £250), out of the 6,851 tax-payers embraced, one-twelfth (578) belong to the Meerut district, and 410 to Cawnpore. Bareilly has three less tax-payers than Budaon, *viz.*, 232 against 235; while Shahjehanpore has only 171. Benares and Mirzapore combined contribute but a few more tax-payers in this class than are found in the one district of Allygurh; the numbers being Allygurh (333), Benares (165), and Mirzapore (196), 361. Allahabad again has even fewer than Allygurh, though more, *viz.* 299, than either Benares or Mirzapore; while Agra (216) and Muttra (229), 445, give but little in excess of Cawnpore and considerably less than Meerut.

15. Goruckpore and Bustee with their enormous population contribute only 296, or about one-fifth more than Azimgurh; Kumaon and Gurhwal give only 34 and 21 respectively.

16. In the 10th class (incomes between £50 and 100) there are 24,726 tax-payers, of whom 38 are Europeans and Eurasians. Here, again, Meerut is conspicuously successful, contributing more than one-sixth (4,256) of the entire number. Cawnpore comes next, *haud passibus æquis*, with 1,144 tax-payers, charged on incomes between £50 and £100.

17. Bareilly is again below Budaon, with 563 against 609; and Benares and Mirzapore are below both these two Rohilcund districts, the figures being

468 and 548. The districts of Seharunpore, Mozuffernugger, and Boolundshuhur stand far above the wealthier districts of the Benares Division already named.

18. Table C shows how the districts stand under the classification of professions, prescribed by the Government of India.

19. *Religion* has entirely escaped taxation, except in the districts of Meerut, Gurhwal, Futtehpore, and Banda; and there are, doubtless, many cases where rich priests have entirely escaped taxation.

20. The heading "Education and Science" is a blank in the return; while the "Fine Arts" contributes 57 tax-payers, of whom 54 belong to Meerut; Agra, Muttra, and Furruckabad supplying the other three.

21. Under "Law" there are 599 tax-payers, three of whom are in the 5th class (over £2,500), and seven in the 6th class (from £1,000 to £2,500). Meerut contributes 57, Agra 75, Cawnpore 21, Allahabad 28, Azimgurh 47, and Allygurh 58. Seharunpore, Kumaon, Gurhwal, Shahjehanpore, Muttra, Furruckabad, Etawah, Jaloun, Lullutpore, Banda, Humeerpore, and Bustee are all blank under this heading, though the Government Vakeel at Seharunpore is said to make Rs. 1,500—£150—by his practice; and there are, doubtless, others in other districts who are not less successful.

22. "Medicine" adds 13 to the number of tax-payers, but they come from only six districts.

23. "Engineering" gives 30; but one-half almost of this class (14) belong to Ajmere only; Allahabad, Cawnpore, Benares, and Agra are all returned blank under this head.

24. "Clerks and shopmen salaried" contribute 39, 29 of whom belong to Ghazeepore; while all the large towns but Benares seem to possess no such class of persons. "Jobbed servants," however, bring in 182, 53 of whom come from Meerut.

25. "Agents" contribute 39 tax-payers, and "Bankers and money-dealers" 13,400, of whom 1,606 come from Meerut, and 1,849 from Cawnpore. Mirzapore returns this class as a blank, and Jounpore shows under it only two persons; Benares has only 184, and the rich district of Ghazeepore 274.

26. "General Merchants."—This class comprises 2,290 persons; and "Piece goods" (dealers in) 2,186; "Grain dealers" show 3,887 tax-payers; "Salt merchants" 206.

27. Without making further comments on the list, it may be said that a careful examination of Statements B and C leads only to one conclusion, and that not favorable to the mode in which the tax has been worked.

28. It appears obvious that in the Meerut district only has an efficient control been exercised in this matter.

29. Mr. Forbes' report and those of his subordinates, by whom the tax was worked, Mr. Ward and Mr. Billings, accompany this report, and explain how it is that the Meerut district stands as high as it does in its collections under the Act.

30. The tax has been rigorously but carefully applied, only 29 appeals having been presented against the final assessments; and the result, most

creditable to Mr. Forbes' management, and to the labors of Messrs. Ward and Billings, has been that Meerut stands out prominent as the only district in which under Act IX of 1868 a larger income has been realized than under Act XXI of 1867.

31. Mr. Forbes himself does not consider that the proper standard has yet been reached in his district; but the extent to which he has been able to carry out his views has been most successful: and the Board recommend Mr. Billings, to whom is due the main credit of having worked out Mr. Forbes' principles, to the favorable notice of the Lieutenant Governor.

32. The Collector of Cawnpore, while referring to the fact of his collections under Act XXI of 1867 having been larger than those of any other city, hazards a surmise that this will again be the case. But, in regard to district operations, his conjecture is opposed to facts, and Meerut stands half as high again as Cawnpore in its realizations under the Certificate Tax.

33. Now there seems to be no reason to believe that Meerut has been over-assessed as a district; on the contrary, as Mr. Forbes points out, it is probable that the full amount which ought to have been assessed has not been levied; and from the nature and scope of the Act, and the circumstances of the country, it is only reasonable to suppose that the best endeavors of officers will never realize from this source an income which will at all correspond with the wealth of the people. It is therefore the more incumbent on district officers and their subordinates to have recourse to all sources of information which lie within their reach, so as to be in a position to apply the tax as thoroughly as possible. Their sources of information are doubtless not so numerous or so well supplied as is desirable, but in many cases, such as they are, they have not been tapped.

34. For instance, there are the returns for Act XXI of 1867. Though they do not exactly indicate what is the number of persons who should contribute to the tax under Act IX of 1868, it is evident that the first five classes, those comprising incomes above Rs. 500, should show the minimum number of persons who in ordinary circumstances would be liable to assessment under Act IX of 1868. This being the case, let us examine Meerut and Cawnpore by the light of the returns in question. We find the following results. A. shows number of persons assessed under Act XXI of 1867, as furnished to the Board in the monthly returns; B., number of persons assessed under Act IX. of 1868.

On Incomes.			Over Rs. 25,000.	Between Rs. 10,000 and Rs. 25,000.	Between Rs. 5,000 and Rs. 10,000.	Between Rs. 1,000 and Rs. 5,000.	Between Rs. 500 and Rs. 1,000.	TOTAL.
No. of Assessments.	Meerut ...	A.	2	10	38	471	1,173	1,694
		B.	1	13	59	799	4,256	5,128
	Cawnpore ...	A.	13	51	109	655	1,009	1,837
		B.	14	41	75	549	1,144	1,823

35. It will be seen from this that in Cawnpore on all incomes over £100, there has been a falling-off in the number of persons assessed, except in the 1st class, which has altered by one in favor of 1868. While in Meerut, leaving out class I, there has been a steady increase in all the classes.

36. It is the same again in Benares and Mirzapore; but as in Cawnpore there has been a fall in the number of persons assessed, which should not have escaped the notice of the Collector; the figures are—

No. of Assessments. On Incomes.		Over Rs. 25,000.	Between Rs. 10,000 and Rs. 25,000.	Between Rs. 5,000 and Rs. 10,000.	Between Rs. 1,000 and Rs. 5,000.	Between Rs. 500 and Rs. 1,000.	Total.
Benares	1867	5	12	62	264	551	894
	1868	2	12	33	214	469	730
Mirzapore	1867	9	32	64	358	642	1,105
	1868	7	25	29	243	548	852

37. In Benares the fall is the more remarkable, because had the Collector referred to the Income Tax returns, he would have seen (1863-64) that out of 2,365 persons, with incomes assessed at over Rs. 500, only 708 were assessed under Schedule I, *i. e.*, on incomes from land; while the other 1,657 should *primâ facie* have been embraced by Act IX of 1868. In fact, a reference to the Income Tax returns shows that under Schedules II and III, which embrace trades and professions, 1,933 persons were assessed in 1863-64, with incomes of Rs. 500, against 730 under the Certificate Tax in 1868.

38. Goruckpore, Bareilly, Ghazeepore, Jounpore, Shahjehanpore are amongst the districts which are conspicuous for the excessively light incidence of the tax per head of the population. Examining these by the light of the returns for Act XXI of 1867, we find in Bareilly taxable incomes between £1,000 and £2,500 have fallen in number from 8 to 3; those between £500 and £1,000 from 32 to 24; those between £100 and £500 from 275 to 260.

39. In Goruckpore, in the same classes, taxable incomes have fallen in number from 6 to 5, from 13 to 8, from 312 to 154; while in the lowest class of all (from £50 to £100) they have fallen from 833 to 698.

40. In Goruckpore the Collector has since pointed out that his realizations in 1867 were largely below his assessments that year, so that a comparison of the assessments in 1867 with the realizations in 1868 will not be crucial. But the fact of the very light incidence of the tax per head on the population remains the same.

41. In Ghazeepore the fall is from 20 to 3, from 57 to 25; and in the lowest class from 847 to 766; while those between £100 and £500 have risen from 270 to 308.

42. In Jounpore, again, the fall is from 8 to nothing, from 19 to 12, and from 167 to 145.

43. In Shahjehanpore there has been no fall to speak of, *viz.*, only from 16 to 12 on incomes between £500 and £1,000, which has been compensated by a rise in the class above this of from nothing to 4.

44. The statements altogether indicate what seems a very unsuccessful administration of the Act (except in the case of Meerut), whether districts are judged by the number of tax-payers in the population or by the incidence of the tax per head on the population. This is illustrated by Statements F and G.

45. The latter table shows that measured by the number of tax-payers in each 10,000 of the population, and excluding Meerut, where the figures are 43 per 10,000, Mozuffernuggur stands highest, with 18 per 10,000; and Goruckpore and Lullutpore lowest, with 4 and 3 per 10,000 respectively.

46. The rate of incidence of the tax per head on the population (excluding Meerut with 9 pie per head) ranges from 7 pie in Cawnpore to 1 pie in Gurhwal, Kumaon, Lullutpore, and Goruckpore.

Ajmere, Allahabad, and Allygurh give 5 pie per head on the population.

Mozuffernugger, Futtehpore, Muttra, Deyrah, Agra, Furruckabad, and Mirzapore give 4 pie per head on the population.

Boolundshuhur, Mynpoory, Saharunpore, Moradabad, Etawah, Etah, Jhansie, Budaon, Banda, and Benares give 3 pie per head.

Jaloun, Azimgurh, Shahjehanpore, Jounpore, Ghazeepore, Bijnour, Humeerpore, Bareilly, and Bustee give 2 pie per head; and the four districts, already named above, close the list with 1 pie per head.

47. Now it cannot for a moment be credited that the population of Futtehpore and Mozuffernuggur, quâ liability to Certificate Tax, is four times as favorably situated as that of Goruckpore; twice as favorably situated as that of Bareilly, Shahjehanpore, Ghazeepore, Jounpore, Azimgurh, and the other districts enumerated as paying 2 pie per head on the population; or 33 per cent. better off than that of Moradabad, Benares and other districts, which contribute 3 pie only per head.

48. The real cause of this apparent difference in circumstances is to be found in the very small number of assessments that have been made in those districts where the incidence of the tax is so light.

49. The district reports, as a rule, are meagre, and do not call for notice; but the remarks made by Mr. Tidy, Deputy Collector, Saharunpore, on the opportunities for extortion afforded by a tax like that imposed by Act IX of 1868, deserve attention.

50. Mr. Tidy writes—"It was not unfrequently found that names which should have been entered in the list had been omitted. The tehseeldar of course could not be blamed for occasional omissions of this kind, for he (especially when, as was the case in this district, none of the tehseeldars had long held the office, and three of the four had only just been appointed) could only depend on his subordinates. The opportunities of extortion, which any License or Income Tax gives to canoongoes, putwarees, and tehseel chuprasees, is one of the worst evils attending it; and the unwillingness of well-to-do traders, whose names had not been entered in the list, to pay when called upon to do

so, and their persistent endeavors even when they had paid to recover the money, led me to the conclusion that they had already had to pay for the omission of their names on a previous occasion. After assessing a portion of another district, I was informed that a canoongoe, whom I had frequently consulted as to the income of the persons who had come before me, had made a large sum by representing to the people that it would be advisable for them to secure his good offices. Remembering this I avoided, as far as possible, putting any question on the subject to canoongoes, putwarees, or other subordinate officials."

51. The Board have already referred to the success which has attended Mr. Forbes' application of the Act in Meerut. That officer in his report observes—"As I believe the results in the Meerut district may possibly exceed those in adjacent districts, I will at once explain the principles upon which I proceeded. I was determined that the trading classes should pay their full quota towards the burthens of the State under which they live, and have gone on prospering and accumulating wealth hitherto untaxed. I was determined that lists prepared by Native officials should not without check or scrutiny be accepted as a correct basis of assessment. I was convinced from my knowledge of the people of the district that former lists prepared for Income and License Taxes were not a true exposition of the distribution of capital; and lastly I was satisfied that there are few Native traders who do not, by retail sales and interest on moneys lent, make a profit of something under one rupee six annas per diem, which brings them within the lowest class of the present assessment.

"I was not content, therefore, that from the former lists the names of those rated under Rs. 500 per annum should be excluded, and the new assessment laid upon the remainder. It would have been an easy and rapid, though perfunctory, mode of getting through a troublesome duty; but at the same time the just claims of Government upon classes hitherto untaxed would have been sacrificed.

"I asked Messrs. Ward and Billings to undertake the preparation of the lists, because whilst knowing my principles and carrying them out, they were uninfluenced by what I must allow might have been my extreme views.

"The work in their hands has been well and mercifully done. Few, I believe, have been taxed who should have been excluded from the lists; and we may look for an increase rather than a decrease of revenue from this source in future years. I believe on income, License Tax should in Meerut produce one lakh of Rupees."

52. That the work has not been done harshly is evident, as already noticed from the small number of appeals made; and the Board consider that both the Collector of Meerut and Messrs. Ward and Billings are specially deserving of favorable notice for the successful manner in which they have applied the Certificate Tax.

53. To Mr. Billings has fallen the largest portion of the work of assessment, and the Board direct me to express their hope that His Honor will be pleased to mark his sense of that officer's assiduous labors by some substantial token of approbation. They would suggest, if the recommendation meets with the Lieutenant Governor's approval, that Mr. Billings should receive a donation of Rs. 1,000 for the successful mode in which he has discharged the difficult duty entrusted to him.

W. C. PLOWDEN,
Secretary.

Board of Revenue, N. W. P.,
Allahabad;
The 27th November 1869.

No. 898, dated 4th February, 1870.

From—G. H. M. Batten, Esq., *Under Secy. to the Govt. of India*, Financial Dept.,
To—*The Secretary to the Government, N. W. Provinces.*

I am directed to acknowledge the receipt of your letter No. 53 A, dated the 7th December last, forwarding a report by the Board of Revenue on the working of the Certificate Tax Act (IX of 1868) in the different districts of the North-Western Provinces, together with a copy of the orders of the local Government thereon.

2. The Board's report is interesting and valuable. At the same time, by the Board's own admission, it tells of wholesale failure on the part of the District Revenue Officers of the North-Western Provinces to collect the tax properly, and it must be added that the Board itself has not, from whatever cause, succeeded in duly controlling the Subordinate Revenue Officers. The Governor General in Council is glad to observe that the Meerut District is an exception to this state of things. The Collector of Meerut and his Subordinates have done their work intelligently and faithfully, and are entitled to the thanks of the Government of India. The results achieved by them shew what might have been done by an intelligent attention to their duties by the Revenue Officers generally, and by a really just and liberal assessment of the tax. His Excellency in Council desires that the passage from Mr. Forbes' Report, quoted at para. 51 of the Board's letter, may be circulated among the other District Officers, and that it may be pointed out to them once more that if, through inertness or carelessness, or a mistaken leniency, Collectors fail in recovering the just dues of the State, real injustice is done to the whole remaining body of tax-payers, upon whom the burden of any deficit must eventually fall.

3. From Appendix G of the Report, it appears that the district of Meerut, of which the total population is about one twenty-fifth of the whole population of the North-Western Provinces, and of which the urban population is about one-eighteenth of the entire urban population of those provinces, contributed nearly one-ninth of the whole tax. In this district, which does not contain many towns of great commercial importance, 5,218 persons were assessed (excluding assessments on official salaries). They paid Rs. 57,739, being at the rate of 9 pie per head of the population, and including 43 persons in every 10,000. In no other district were there more than 1,823 persons assessed. This is the number in the Cawnpore District, in which the work was next best done, and which produced Rs. 42,132, being at the rate of 7 pie per head of the population, only 15 persons in every 10,000 being assessed. In 23 out of the 35 districts, the incidence of the tax per head of the population was 3 pie or less. In no district, except Meerut, were more than 18 persons assessed in every 10,000, and in about half of the districts the number fell to 10 persons or less.

4. The district of Agra, for instance, the population of which is about one-nineteenth of the entire population of the North-Western Provinces, and the urban population of which is about one-fifteenth of the entire urban population of those provinces, contributed little more than one-twenty-fifth of the whole tax, or Rs. 20,032, paid by 952 persons, being at the rate of 4 pie per head of the population, and including only 9 persons in every 10,000. And this is not one of the districts which the Lieutenant Governor has mentioned as conspicuous for failure.

5. Again the district of Furruckabad paid only Rs. 16,916, that of Allahabad Rs. 37,254, that of Benares Rs. 13,712, that of Mirzapore only Rs. 19,676. The low assessment of these large and rich districts as compared with Meerut is manifest. Further, the Board justly observe that "Goruckpore, Bareilly, Ghazeepore, Jounpore, Shahjehanpore are amongst the districts which are conspicuous for the excessively light incidence of the tax."

6. In para. 4 the Board remark that the great firm of the Mutra Seths (bankers) is conspicuous by its absence; in para. 19 that "there are many cases

where rich priests have escaped taxation." Again, in para. 47, the Board remark—"It cannot for a moment be credited that the population of Futtehpore and Mozuffernuggur *quâ* liability to certificate tax is four times as favorably situated as that of Goruckpore, twice as favorably situated as that of Bareilly, Shahjehanpore, Ghazeepore, Jounpore, Azimgurh." Yet such is the strange result pourtrayed by the fiscal returns!

7. In short, after presenting a review which literally abounds with instances of failure, the Board conclude by remarking that "the statements altogether indicate what seems a very unsuccessful administration."

8. Now the Government of India must observe that something more is needed beyond an interesting and well constructed report. The Board of Revenue has produced a series of admirable reports ever since the introduction of the Income Tax Act of 1860, and for these they deserve great credit. But it is disappointing to find that the results repeatedly set forth with so much clearness should have led to such little improvement in administration. It will never suffice that confessions of failure on the part of the whole revenue administration should be published, unless amendment follows.

9. The Government of India regrets that the means have not yet been found of compelling all officers to do their full duty in respect of these particular taxes, and positively expects that such means will be found in the future. The censure of the Government of India should be conveyed to the officers named as censurable in the orders of the local Government. It has very properly been ordered that all instances of failure are to be promptly brought to the notice of the Lieutenant Governor. Doubtless His Honor will see fit to adopt such measures (if instances shall unfortunately continue to occur) as may cause it to be generally understood that failure in the fair and moderate realization of imperial taxes cannot be tolerated.

10. The Governor General in Council regrets that he cannot accede to the recommendation of the local Government for the grant of a donation of Rs. 1,000 to Mr. Billings, the Deputy Collector of Meerut, for performing his duty with care and ability. To make such a grant is opposed to the principles of administration. Officers are expected to do their duty thoroughly without special reward. Because other officers have failed in their duty, that is no reason why the Government should pay specially those who attend intelligently and faithfully. Promotion in due course, earlier than less efficient officers, is the proper reward of the efficient and successful servants of the Government.

11. Moreover, there is no doubt that the assessment of the Income Tax, in the various forms in which it has been imposed, has been hitherto extremely insufficient; and though there is no reason to suspect any improper severity in Meerut, it would be objectionable to mark high assessments by special pecuniary acknowledgments.

12. But while constrained to make these strictures on the insufficiency of past and present results, the Governor General in Council is confident that the local Government will without delay take such steps as will ensure a reasonable degree of success in future.

13. These papers will be published in the Supplement to the *Gazette of India*, with the exception of Table C of the appendix to the Board's report, in respect to which I am desired to point out that, as almost all the information contained therein, as well as that relating to the five higher classes in Table B, could have been more clearly given in a few sentences, a needless expense was incurred in printing it. Such tabular printing, being costly and cumbersome, though invaluable in its place, should be used with great discretion.

ORDERED, that a copy of this letter, together with a copy of the papers therein referred to, with the exception of Statement C, be forwarded to the Home Department for publication in the Supplement to the *Gazette of India*.

Printed and Published for the GOVT. OF INDIA, *at the Office of* SUPDT. GOVT. PRINTING, 8, *Hastings Street, Calcutta.*

No. 8 of 1870.

SUPPLEMENT TO

The Gazette of India.

CALCUTTA, SATURDAY, FEBRUARY 19, 1870.

OFFICIAL PAPERS.

A SUPPLEMENT *to the* GAZETTE OF INDIA *will be published from time to time, containing such Official Papers and information as the Government of India may deem to be of interest to the Public, and such as may usefully be made known.*

Non-Subscribers to the GAZETTE *may receive the* SUPPLEMENT *separately on a payment of six Rupees per annum if delivered in Calcutta, or nine Rupees four annas if sent by Post.*

No Official Orders or Notifications, the publication of which in the GAZETTE OF INDIA *is required by Law, or which it has been customary to publish in the* CALCUTTA GAZETTE, *will be included in the* SUPPLEMENT. *For such Orders and Notifications the body of the* GAZETTE *must be looked to.*

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Friday, the 11th February 1870.

PRESENT:

His Excellency the Viceroy and Governor General of India, K. P., G. C. S. I., *presiding.*
His Excellency the Commander-in-Chief, K. C. B., G. C. S. I.
The Hon'ble G. Noble Taylor.
Major General the Hon'ble Sir H. M. Durand, C. B., K. C. S. I.
The Hon'ble John Strachey.
The Hon'ble Sir Richard Temple, K. C. S. I.
The Hon'ble J. Fitzjames Stephen, Q. C.
The Hon'ble D. Cowie.
Colonel the Hon'ble R. Strachey, C. S. I.
The Hon'ble Francis Steuart Chapman.
The Hon'ble J. R. Bullen Smith.
The Hon'ble F. R. Cockerell.

REGULATIONS AND ACTS CONSOLIDATION BILL.

The Hon'ble MR. COCKERELL, in moving for leave to introduce a Bill to consolidate and amend the law relating to the local extent of the general Regulations and Acts and to the local limits of the jurisdictions of the High

Courts and the Chief Controlling Revenue Authorities, said that the immediate cause of the present proposal to legislate in this matter was the discovery that the district or tract of country called the Dehra Doon was not subject to the general Regulations.

A case instituted in that district under Act X of 1859 (An Act to amend the law relating to the recovery of rent in the Presidency of Fort William in Bengal) recently came before the High Court of the North-Western Provinces in appeal, in which it was contended that, as the Act just mentioned was not legally in force in the Dehra Doon, the Court had no jurisdiction in the matter.

The High Court in its judgment held that the enactment referred to was simply an amending Act and contained no special provision by which it could, *per se*, have a wider application than the Regulations which it superseded.

As there was nothing to show that the Act had been put in force in the Dehra Doon district by any special procedure, the question of its legal operation therein turned upon the issue of the broader question as to whether the district was subject to the general Regulations. On this point the Court found that the effect of the several enactments relating to this district, passed between 1817 and 1829, was to place it in the category of districts not subject to the general Regulations.

For the past thirty years, the administration of justice had been carried on in the Dehra Doon in the belief that the general Regulations were legally applicable to that district, and it now became necessary to give, by legislative enactment, validity to proceedings which had taken place under an erroneous impression as to the state of the law, as well as to provide for the future legal operation of those Regulations within that locality.

The present need for legislation in this matter was thought to offer a fit opportunity for consolidating the law as to the local application of the general Regulations and Acts.

About two years ago a Repealing Act was passed in this Council, by which a very large number of obsolete Regulations and Acts was removed from the Statute-book. The avowed main object of that action of the Legislature was to clear the way for the work of consolidating the extant Regulations, which, it was hoped, might be undertaken at no distant period.

There was perhaps no single branch of that work in relation to which more could be done towards disencumbering the Statute-book than that which was comprised in the subject of this Bill. The older provinces of the empire were formed into Presidencies and subjected by Acts of Parliament to such Regulations as might be passed by the Governor General of India from time to time; but in the case of all subsequent acquisitions of territory, the operation of those Regulations was secured by special local enactment, and the result of this practice was that there was now a large accumulation of Regulations and Acts, enacted solely to provide for the extension of the operation of the general laws, and to define the local limits of the jurisdiction of the several Courts established in these newly acquired provinces or districts.

It would be the aim of the Bill to dispense with the necessity for retaining these extending enactments, by declaring, in concise form, what provinces were subject to the general Regulations and Acts of the Indian Legislature.

The Bill contemplated no extension of those laws to places in which they were not already in force, except in so far as might be found necessary to remedy any mistakes which might have occurred, as in the case of the district of the Dehra Doon.

The Hon'ble MR. STEPHEN asked permission to make a single remark on the principle of the Bill, because it formed part of an extensive scheme to

which he hoped to refer more particularly at some future time. The present Bill was a proposal for the consolidation of the laws defining the local extent of the general Regulations and the local limits of the jurisdictions of the High Courts and the Boards of Revenue: it would consolidate into one Act, he could not at present exactly say how many, but certainly not less than a hundred, enactments scattered throughout the Statute-book, and would reproduce in a single measure what now had to be searched for in a dozen volumes. That would give some idea of the extent to which consolidation might be carried. He could hardly imagine any legal reform in this country greater than that of consolidating the Written Law, inasmuch as, after a careful consideration and examination of the subject, he had arrived at this amongst other results, that in British India there were no less than twenty-one classes of laws, enacted by nine different authorities for nine different provinces. This shewed how intricate and complicated the Written Law of British India had become. He thought that, if the matter were fairly managed, it would be possible to digest the Written Law in such a manner as to show that, although intricate and complicated to a person fresh to the subject, it was really of much smaller extent, and was less unsystematic than it appeared to be. This Bill was a step in that direction, and he hoped to be able soon to submit a comprehensive scheme for the consolidation of the unrepealed Regulations and Acts.

The Motion was put and agreed to.

EMIGRANTS' REGISTRATION FEE BILL.

The Hon'ble MR. CHAPMAN introduced the Bill to enable the Governor General in Council to increase the fees payable under section 31 of Act No. XIII of 1864 (*to consolidate and amend the law relating to the Emigration of Native Labourers*). He said that this Bill would empower the Governor General in Council, at his discretion, to increase the fee of one rupee now leviable in the Mofussil for the registration of emigrants, to two rupees. By this means the Government would be reimbursed the expense they were now put to in supervising emigration. The measure was of so simple a character that he would not move that it be referred to a Select Committee, and he proposed to ask the Council to pass it at their next meeting.

WEIGHTS AND MEASURES BILL.

Colonel the Hon'ble R. STRACHEY asked leave to withdraw his motion for leave to introduce a Bill to regulate the weights and measures of British India.

Leave was granted.

NATIVE PASSENGER SHIPS' BILL.

The Hon'ble MR. CHAPMAN moved for leave to introduce a Bill to make further provision for the regulation of Native Passenger Ships. He said that it had been brought to the notice of the Government of India that the practice of over-crowding pilgrim-ships from the British ports to Jedda prevailed to a frightful extent. The way in which the law was evaded was this: A ship cleared out of a British port with all her papers in regular order, and with the proper number of passengers. She put in at other ports not under British jurisdiction, and there took in any number of pilgrims. The miseries to which these unfortunate people were subject in these overcrowded vessels, would best be perceived by a perusal of a recent report on the subject to the Government of India. The first case cited was that of a ship which MR. CHAPMAN thought was miscalled the *Day Dream*, but which should rather be called the *Nightmare*. She was licensed at Singapore to carry 216 passengers. She took 150 pilgrims from Singapore; but, instead of proceeding direct to her des-

tination, she took twenty-three from Malacca, fifty from Pinang, one hundred and fifty from the Peder Coast (Diamond Point), sixty-three from Passangan, ninety-one from Jonkow, thirty-five from Peder, fifty from Acheen; thus carrying upwards of 613 passengers, when she was licensed to carry only 216. The sufferings of these unfortunate people were thus described by the chief officer of the vessel. He said—

"With regard to the space allowed to the passengers, the hold was full and the cabins were also full, and a small temporary house, a little better than a box, was put on board, wherein nearly forty women were stowed. This box was about ten feet in length and ten in breadth, and three to four feet high. In the round-house there were about twenty-four women with their husbands. The squares of all the hatches, which ought to have been left free for ventilation, were all lumbered up with jars of oil, and the pilgrims could but hardly creep out of the between-decks. The horrible state of the vessel was indescribable, and the stench arising from the hold was insufferable. There was no opportunity, from the crowdedness of the vessel, and the luggage being thrown over all the decks, to keep her clean, and she was consequently in the most filthy and dangerous condition."

Another case was that of a vessel which apparently bore an Arab name, the *Atiet Rahmán*, of 704 tons burden, from Jedda to Calcutta, whose space was registered at 23,364 cubic feet; but, after deducting for encumbrances, there remained only 14,700 feet, and allowing only fifty-four cubic feet for each person, there was barely accommodation for 272 persons; yet there were 461 pilgrims on board. The Master Attendant at Cochin thus described the condition of this vessel and the pilgrims it carried:—

"The effluvium escaping from the hatches was indescribable, and it is a matter of surprise that no contagious disease had generated. What prophylactic power the cargo of salt on board may have exercised, I am not prepared to say; but certain it is that the state of things was most favourable to the production of disease."

* * * *

"The men appear wretchedly weak and sickly, and their emaciated and squalid condition seems to support the complaint made by them of want of food, room, and general comfort. The women were mostly of very advanced age, and in a state of decrepitude that renders it surprising how they could have ventured upon these tedious and harassing expeditions. These unfortunate beings were so deplorably helpless, as to be scarcely able to go on deck for the purposes of nature. The children were poorly in the extreme, apparently from exposure and want of food. There were two infants in arms."

There was a mortality of thirty-one on board. MR. CHAPMAN thought that Hon'ble Members who knew what the temperature of the Red Sea was, even under the most favourable circumstances, in the commodious and well ventilated vessels of the P. and O. Company, need hardly be told of the miseries of the people in the cases to which he had just referred. It was high time that such practices were put a stop to, and he hoped the Bill he now moved for leave to introduce, would have the effect of doing so.

The Motion was put and agreed to.

The Council adjourned to Friday, the 18th February 1870.

WHITLEY STOKES,
Secy. to the Council of the Govr. Genl.
for making Laws and Regulations.

CALCUTTA,
The 11th February 1870.

GOVERNMENT OF INDIA.

HOME DEPARTMENT.

DESTRUCTION OF WILD ANIMALS AND POISONOUS SNAKES.

Nos. 600—609.

Extract from the Proceedings of the Government of India, in the Home Department (Public), under date Fort William, the 29th January 1870.

READ again the following papers on the subject of the ravages committed by wild animals in India and of their destruction:—

Extracts from the Revenue and Topographical Survey Reports for 1866-67 and 1867-68.

Extracts from the Proceedings of the Government of Madras in the Public Department for the months of April, June, July and October 1867, and March, April and June 1868.

Extracts from the Proceedings of the Government of Madras in the Revenue Department for the months of January 1867, and February, April, September and November 1868.

Extract from the Revenue Proceedings of the Government of the North-Western Provinces for 7th December 1867.

Extracts from the Police Reports of the Punjab and the Central Provinces for the years 1865, 1866 and 1867.

Extracts from the Administration Reports of the Central Provinces and Oudh for three years, from 1865-66 to 1867-68.

Extracts from the Judicial Proceedings of the Government of Bengal for July 1864 and October 1866.

Read Memorandum from Foreign Department, No. 1958, dated 30th September 1868, transferring certain papers connected with destruction of wild animals.

Read letter from Captain B. Rogers, Bengal Staff Corps, dated 9th August 1868, on the same subject.

RESOLUTION.—Although the reports available are far from affording full information, yet they are sufficient to convince the Governor General in Council of the great injury done by wild beasts in most parts of India, both to human life and to property, whether in the shape of domesticated animals or of crops.

2. His Excellency in Council has, therefore, determined to call the particular attention of local Governments and Administrations to the subject, and desires that full reports may be submitted, with as little delay as possible, showing, for each of the last three years (*i. e.*, 1866-67 to 1868-69 inclusive), (1), the loss of human life from the several kinds of wild quadrupeds; (2), the loss (where ascertainable) of cattle or crops from the same cause; (3), the number of the various kinds of animals killed; (4), the system for their destruction in force at the commencement of the period and any changes introduced during the three years; (5), the cost to Government of the measures adopted. When within one province special systems or scales of reward have been tried in particular localities, these should be separately shown.

3. After a review of the facts, the local Government or Administration should state its views as to the measures which should be adopted in future, and in this connexion Captain Rogers' proposals should be specially considered. It will, however, be impossible for the Government of India at present to entertain any scheme involving an increase of expenditure. What, therefore, should be attempted is to utilize to the utmost such amounts as have already been allowed for the destruction of wild animals.

4. A second section of the report should treat of the destruction of poisonous snakes, as to which the same information should be given as in the case of noxious quadrupeds, so far as the particulars apply. In those provinces where the rewards

for destruction of snakes once granted have now been withdrawn, an attempt should be made to estimate the result of this withdrawal.

ORDER.—Ordered, that copy of this Resolution be forwarded to all local Governments and Administrations, together with copy of the papers re-read and Captain Rogers' letter, for information and guidance.

Extract from the Annual Report of the operations of the 1st Division, Central Provinces Revenue Survey—Season 1866-67.

PARA. 28. *Tigers.*—In the vicinity of Guneshgunge, cattle are constantly killed by tigers which roam comparatively secure in the extensive jungles that flank the valley of the Bigna, and render their destruction by the Native *shikarees* a matter of considerable difficulty. Not long ago the mail cart, whilst descending a ghaut, was attacked by a tiger, and one of the horses slightly wounded; the coachman, with admirable presence of mind, sounded his bugle and fairly put this brute to flight.

Extract from the Annual Report of the operations of the 1st or Darjeeling Revenue and Topographical Survey— Season 1866-67.

PARA. 17. *Wild Animals.*—In the dense forest at the immediate base of the mountains, are found wild animals of every description. Amongst these are—elephants, tigers, leopards, panthers, bears, and buffaloes, also deer of many kinds. In passing through the Terai, I shot a boa constrictor, which measured 18 feet in length. I was told by the Mechias that they had seen some much larger.

21. There are no roads to be met with in the Sub-division (Daling), but the cleared foot-path leading from Darjeeling to Daling. To the eastern part of the district, and the hills overlooking the Terai, there is not the slightest trace of a human path. The tracks of wild animals are of course numerous.* * * *

Extract from the Annual Report of the operations of the 2nd Division, Lower Provinces, Revenue Survey—Season 1866-67.

PARA. 45. *Wild Beasts.*—In the jungles of Jeypore are found wild elephants, buffaloes, rhinoceroses, tigers, leopards, jackals, deer and wild pig, besides smaller game.

Extract from the Annual Report of the operations of the 2nd Division, Revenue Survey, Oudh—Season 1867-68.

PARA. 13. *Forests.*—These forests abound with all the large species of game,—tigers, leopards, the deer kind, wild pig, &c., and are the scene of those enormous hanuks, or bathres, we see described in the histories of the kings of Oudh. Even now they are still visited by European parties after *shikar*, and by the large and wealthy talookdars, such as the Rajahs of Kupoorthulla and Bulrampore, who come about the beginning of the hot weather, as water becomes scarce, with numerous elephants, and have generally good sport; and whilst we were in the field, we heard of many tigers having fallen. Although they are still numerous, yet they seldom attack men, and for some years past no report has been received by our officials of their having injured any one. This immunity is doubtless attributable to their being so well supplied with food from the herds of deer and other large animals, which are in such numbers in the forests, it is said, that the tiger has a preference for the flesh of the wild pig. Some well authenticated anecdotes are likewise told of the fearless way in which the cattle-keepers, with only a stick in their hands, go up to them and frighten them off when they have pounced upon any of their herds.

Extract from the Report on the Revenue Survey Operations of the 3rd Division, Central Provinces—Season 1867-68.

PARA. 70. *Work hindered by Tigers.*—Considering the unhealthiness of the tract, its densely-wooded character, and the uniform large scale of survey used throughout, the out-turn of the season is highly creditable to the management and energy of the Surveyor. No small obstruction was occasioned by the depredations of tigers which infest the district. A tigress is reported to have killed 127 people, stopped the traffic for many weeks on the road between Mooli and Chanda, until the brute was shot by Lieutenant Coddington near the village of Belzur.

Extract from the Report of the Assistant Revenue Surveyor in charge 1st Division, Lower Provinces—Season 1867-68.

PARA. 5. *Wild Beasts.*—The Doars swarm with animal life—tigers, bears, leopards, buffaloes, deer, pigs, &c.; along the forest strips skirting the hills, elephants; and towards the Monas, rhinoceroses.

Extract from the General Report of the Topographical Surveys of the Bengal Presidency—Season 1867-68.

PARA. 5.—Every district under survey is more or less mountainous, with a very large proportion of dense jungle, and the Native establishments have to take all sorts of precautions against tigers, which in some parts are so exceedingly numerous as to make all travelling on foot dangerous for solitary men. In the Central Provinces, the Surveyor came across a tract which had been utterly devastated by a single tigress, which was estimated to have killed upwards of 50 people, and was known to have driven the inhabitants away from 13 villages. This scourge was ultimately removed by Major Priestley, who very kindly accompanied the Surveyor and shot it.

6. In the Cossyah Hills, the tigers roam about at great altitudes, and are so bold that the party lost two men by them,—one being carried off in the night (the brute actually breaking through the side of the hut in which he had taken shelter), while the other was carried off in mid-day on the line of march.

Extract from the Report of the Surveyor of No. 2 Topographical Survey, Central Provinces.

PARA. 2.—The party completed 3,008 square miles of triangulation and 2,131 of topographical detail, with 165 linear miles of forest boundary. The country under survey was hilly, and generally covered with dense jungle; the jungle in some parts being so dense that there was considerable difficulty in tracing even large water-courses. Wild animals abounded, and tigers were so troublesome as to prevent the erection of signals in some parts. In one case, a single tigress seems to have caused the desertion of 13 villages and thrown about 250 square miles of country out of cultivation. This tigress killed upwards of 50 men and women before she was despatched by Major Priestley, who succeeded in shooting her in June last after a long and troublesome expedition. The district generally owes much to that sportsman's perseverance in the pursuit.

Extract from the Narrative Report of the Surveyor in charge No. 1, Topographical Party, Gwalior and Central India Survey—Season 1867-68.

PARA. 13.—The tigers which abound all over the hills create a good deal of havoc amongst the cattle, and the men themselves do not always escape. All the game in Ulwar is strictly preserved; the consequence is that, in many places, the Nilgáo and Sambar literally swarm. The Nilgáo do great damage to the crops at the foot of the hills, and I was more than once begged by the owners of the fields to shoot them.

Extract from the Narrative Report of the Surveyor in charge No. 2, Topographical Party, Central Provinces Survey—Season 1867-68.

PARA. 7.—Last year, while employed in triangulating the ridges adjoining the Gharaghât Pass, I noticed that a number of eligible hills had been left uncleared by the flagmen detached to erect staves, and on enquiring into the reason of this, was informed that owing to the ravages committed by the man-eating tigress of Gharaghât Pass, the whole of the villages within the tract frequented by the tigress had been deserted by the people. Believing that the underwood of the ridges would afford less cover during the hot weather, I deferred the triangulation of this portion of the Baitool District until I entered the Towa Valley later in the season. So many men, however, had been carried away by the tigress, and the Gonds living in the neighbourhood had become so alarmed, that I only succeeded in erecting eight staves on the principal peaks.

8. This season, after completing the triangulation of the hill jagheers of the Chindwarra District, I was desired by the Chief Commissioner of the Central Provinces to assist Major Priestley in determining the heights of the most favorable passes into the Chindwarra and Towa Valleys; and as this involved the examination of the tract frequented by the tigress, it affords me great pleasure in being able to add that Major Priestley succeeded in slaying this scourge of the people. The number of men and women killed by this horrible beast during the last three years is variously stated, at from 50 to 150, and, judging from the official reports, the number of deaths appear to have exceeded 50.

9. The following are the villages that have been depopulated by the ravages of this scourge of the Gharaghât Pass and the ridges adjoining, embracing an area of 250 square miles, over which, during particular portions of the year, the tigress appears to have roamed, *viz.*:—Rajra, Bichkan, Patargad, Naiagad, Bithu Asola, Rodri, Persadana, Bisighât, Dhangwa, Boldai, Bodur, and Sitagang.

10. The Gowli, whom the tigress attempted to kill three years ago, is residing at the village of Sornadai. He has the marks of two teeth on the back of his head, and the scars of a claw on his back. He stated that he was out grazing buffaloes, and that, while following them home in the evening, he suddenly heard a rustling behind him, and, on turning round, saw the tigress rapidly approaching him. Before he had time to move away, he was seized by the head and thrown upon his face perfectly senseless. When he was able to sit up, he found himself bleeding profusely, and surrounded by the herd of buffaloes, the tigress looking on at a short distance. Watching his opportunity, he fled home, leaving the buffaloes between himself and the tigress. Subsequently a lad bringing home cattle late in the evening, while half of the herd were within and half beyond the bounds of the village, was seized and carried away.

11. The above seem to show that, although the tigress had the choice of food, she preferred on both occasions a human victim.

12. On the 2nd May she killed a Gond while watching cattle below the village of Sornadai; and on the 11th of the same month, while Major Priestley and myself were encamped at Sornadai, she killed a Rajpoot employed with three others in cutting bamboos below the village. One of the latter, after witnessing the death of the Rajpoot, and joining the other two in scaring away the tigress, ran up to Sornadai to give notice of what had occurred, and point out the spot to Major Priestley. A very interesting account of the pursuit and slaughter of the tigress was given by Major Priestley.

13. Whenever a Gond or Kurku is killed by a tiger, his wife and children, and father and mother, if living, are thrown out of caste; all intercourse between them and the rest of the inhabitants being interdicted on the ground that they are laboring under the displeasure of the Deo. What makes this belief more distressing is, that the tiger is one of the principal Deos of both Gonds and Kurkus; and a man-eater is the Deo to whom the propitiatory sacrifice and

feast prescribed on these occasions is invariably offered often by taxing to the utmost the scanty means of the poor creatures afflicted by his ravages, and occasionally involving their proceeding upon begging expeditions to collect the amount required.

14. Prior to our arrival at Sornadai, the people intended to desert the village, and would have left after our departure had the tigress not been killed. The relief to the whole country has been very great; the sudden way in which men were carried off and devoured from different portions off the forest between Batune and Kolmesra, having rendered the whole of the intermediate ridges unsafe. Indeed, the dread of the tigress was so great that Gonds, who could furnish information regarding her locality, were afraid to do so, lest they should be asked to assist in tracking her. Before we left Sornadai, we had the satisfaction of learning that the whole of the villages would be re-occupied as soon as the old inhabitants could arrange for their return.

Extract from the Proceedings of the Government of Madras, in the Public Department, for the months of April and June 1867.

READ the following letter:—

Dated 18th April 1867.

From—The REVD. A. R. SYMONDS, M. A., *Secretary to the Society for the Propagation of the Gospel in Foreign Parts, Madras,*

To—The Right Hon'ble the Governor in Council, Madras.

Under permission, I beg to bring under your Lordship's notice the prevalence of tigers in one of the missions of the Society of which I am Secretary. In the month of October last, I made a tour of the mission which lies partly in the Cuddapah, and partly in the Kurnool Districts. At Mutyalapand (the head quarters of our Missionary, the Reverend John Clay), which is situated about 40 miles north of Cuddapah, and just to the north of the line which separates the Cuddapah District from that of Kurnool, I found considerable fear prevailing on account of a man-eating tiger which infested the neighbourhood, and which had carried off about 50 people. One of the Superintendents of the Survey Department was at that time at Mutyalapand, and he told me that his work was hindered in consequence of the men under him being afraid to go out on survey in the fields. Since then, I have received accounts from Mr. Clay of further ravages committed by this tiger, which has at times carried off people within a short distance of the station. I am not able to state the exact number, up to the present time, who have been killed, but I think I should be quite within the mark if I put it down at 60. I may mention that one of the passes through the hills, which separate this portion of the district from the Budwail Valley, and through which the Missionary and others used to go, in getting from the villages on the western side to those on the east, is completely stopped by a man-eating tiger. On a former occasion, I went through this pass on my way from Mutyalapand to the Budwail Valley; but on my last visit, when I proposed to go by the same route from Kalsapand (in the Budwail Valley) to Mutyalapand, I was told that I could not possibly go that way, for that not a single bearer or cooley would accompany me; I therefore took another, but more lengthy, route by the Nundy Ghât, which leads from the Cummun high road on the east, to Ghazilpally on the west; but even by this route I was obliged to commence my journey in the middle of the day, so as to get through the first part of the pass before dark as a tiger infested this region also. An East Indian employé (whose name I forget), who had charge of the road over the pass, told me that I must not think of going through it after dusk, and indeed, that the bearers would not be willing to go. He mentioned to me a fact which had not long before occurred, how that, when he himself was taking a gang of coolies to work on the pass, this tiger carried off one of the men before his eyes. And this reminds me of a

circumstance that, within the last few days, has been reported to me, and which only a short time since occurred. A string of bandies was passing along, when the tiger which infests the Mutyalapand neighbourhood suddenly sprang upon one of the drivers in the very middle of the string, and carried him off. This will show how bold the creature has become, and what terror it naturally occasions.

2. I venture to bring these facts under your Lordship's notice in the hope that you will be pleased to cause some measures to be adopted for the extermination of these tigers. I can assure your Lordship that if it can be done, not only will it be for the comfort and security of the people in whom I am more specially interested, but for the well-being of the inhabitants generally.

No. 426, dated 26th April 1867.

Order thereon by the Madras Government.

ORDERED, that copies of the foregoing letter be forwarded to the Collectors of Cuddapah and Kurnool, who will report how many persons have been killed by tigers in the localities mentioned by Mr. Symonds within the last six months, and will state whether any special measures have been adopted for the destruction of tigers in their districts during the same period.

2. The Collectors of the above districts, if satisfied that the alarm is well founded, are authorized to offer such increased rewards for the destruction of each man-eating tiger as may be necessary.

3. The Collectors will report their proceedings at once to Government, with any further suggestions for the extirpation of the tigers which they may deem expedient.

No. 20, dated 16th May 1867.

From—*The Collector of Cuddapah,*

To—*The Chief Secy. to Govt. of Madras.*

In reply to the Proceedings of Government, dated 26th April 1867, No. 426, I have the honor to state that only nine men, as shown in the margin, are reported by Mr. Cox, Superintendent of Police, to have fallen victims to tigers during the last six months ending 30th April 1867, in or contiguous to the tract of the country referred to by Mr. Symonds in his letter; that I have never heard of any ravage of tigers so serious as is reported by him in this district, and that I have duly published in the *District Gazette* notices offering a maximum reward of Rs. 100 for the destruction of each of the two man-eating tigers then reported to haunt the said locality or thereabouts.

	Males.
In Sidhout Talook	... 1
„ Proddatur „	... 6
„ Budwail „	... 2
Total	... 9

2. I feel certain that the people's reports to Mr. Symonds were most exaggerated, and I cannot understand why neither he, as head of the Church Mission, nor Messrs. Clay and Spencer, the Clergymen here, never represented this matter (for I am in constant communication with them) to me, instead of writing to His Excellency Lord Napier. With Mutyalapand I have nothing officially to do.

3. With reference to paragraph 3 of the Proceedings, I beg to state that I see no necessity for the present to lay before Government any suggestions to adopt further measures for their extirpation.

No. 36, dated 16th May 1867.

From—T. A. N. CHASE, Esq., *Magistrate of Kurnool,*

To—*The Chief Secy. to the Govt. of Madras.*

In reply to Government order No. 426, dated 26th April, Public Department, I have the honor to inform you that within the last six months twelve persons are reported to have been killed in the Sirwell Talook, and one in the Cumbun Talook, by tigers for whose destruction a reward of Rs. 100 for each man-eating tiger was offered.

2. The man killed in Cumbum was a Tappal runner while going through the Nandikanama Pass.

3. In March I gave a reward of Rs. 50 for a tiger killed in the Talook of Sirwell. The *shikaree* who shot it brought with him a broken piece of a glass bangle, such as is commonly worn by women, which, he said, he had found in the tiger's stomach, but as the skin was soft and glossy, and that of a young tiger, and the evidence connecting the piece of bangle in the tiger's stomach untrustworthy, I did not feel justified in giving Rs. 100, but gave more* than the sum sanctioned by the Board of Revenue, *viz.*, Rs. 35, as an encouragement.

* Rs. 50 under G. O. No. 184, dated 2nd February 1865.

4. In April another was killed near Nandikanama Pass, for which Rs. 50 were also awarded, as there was no evidence whatever of its being a man-eater.

5. In another locality, *viz.*, Markapore, during the same month, the Head Assistant gave a reward of Rs. 34 for a killed tiger.

6. I think, however, that the alarm is well founded, and shall avail myself of the powers† granted by Government, to award increased rewards for the destruction of each man-eating tiger.

† Paragraph 22.

7. I would suggest that Mr. Sheffield, the Assistant Conservator of Forests, be supplied with strychnine, and an endeavour made to poison some tigers. His head quarters are at Nundial, about 15 miles distant from the Nandikanama Pass, and all the hills in the neighbourhood are under his surveillance, so that he is peculiarly well situated for giving such an experiment a fair trial.

P. S.—After writing the above, Maistry Davud Saile brought the skin of a very large tiger, measuring with the tail nearly 12 feet. It is reported by the village moonsiff of Mememadgala, in the Talook of Nandikotkur, to have killed two persons—a Chensu and a Wadder. I gave a reward of Rs. 100 under Government order No. 184, dated 2nd February 1865.

No. 37, dated 21st May 1867.

From—T. A. N. CHASE, Esq., *Magistrate of Kurnool,*

To—*The Chief Secy. to the Govt. of Madras.*

I have the honor to inform you that on the 13th instant a man named Ramdu, of the village of Mutyalapand, in the Sirwell Talook, was attacked and killed by a tiger at Ahobalam in the same talook.

2. I have directed the Tehseeldars of the Cumbum, Sirwell, and Nundial Talooks to proclaim, by beat of tom-tom, that the sum of Rs. 300 will be granted to the person or persons who may kill this tiger. I have also published the reward in the *District Gazette*, and I trust the Government will sanction my proceedings.

No. 612, dated 5th June 1867.

Order thereon by the Madras Government.

The Governor in Council will not, in this instance, withhold his sanction from the offer made by the Collector of Kurnool of a reward of Rs. 300 for the destruction of the man-eating tiger referred to in his letter of the 21st ultimo, but he deems it proper to observe that so large a reward should not be offered, except for the destruction of a decided and notorious man-eater, which is known to be infesting a particular locality, and to be habitually preying upon human beings.

2. The Government approve of the Collector's suggestion that Mr. Sheffield, the Assistant Conservator of Forests, should be furnished with a supply of strychnine for the destruction of tigers in the neighbourhood of the Nandikanama Pass. Mr. Chase will obtain a supply either from the Zillah Surgeon, or from the Medical Stores at Madras, and furnish it to Mr. Sheffield.

3. The Government would further suggest that supplies of strychnine should be furnished through the Tehseeldars to any intelligent heads of villages in that part of the country which is infested by tigers, who might safely be entrusted with it.

Extract from the Proceedings of the Government of Madras, in the Public Department, for the month of July 1867.

READ the following letter:—

No. 23, dated 2nd July 1867.

From—H. S. THOMAS, Esq., *Acting Magistrate of South Canara,*

To—The Acting Chief Secy. to the Govt. of Madras.

Having just received the orders of Government marginally quoted, I have the honor to submit the required report on the ravages committed in this district by beasts of prey, and the measures which I would suggest for their extirpation.

Public Department, dated 5th June 1867, No. 612, and 26th April 1867, No. 426.

2. A reference to the death register kept in my office shows that in the official year 1865-66, no less than 40 human beings were killed by wild beasts, and that in 1866-67 the number of similar violent deaths premises to be equally high, having in 10 months risen to 33.

Deaths by wild beasts.

	1865-66.	1866-67.
July	5	1
August

3. These returns, it will be remembered, show only the deaths known and reported by the village authorities, and are rather under the mark than otherwise. If we add a slight margin, therefore, for a few cases of neglect to report —a not unusual accident—and for ignorance of those occurring in the more jungly localities, it will be found that death by leopards is an occurrence that, on an average, takes place once a week in this district.

4. But it is doubtful whether this loss of human life is by the people themselves considered more serious than the almost daily depredations on cattle, goats, and watch-dogs. The great majority of tigers and leopards are, for known reasons, not man-eaters. The great majority, therefore, must live on wild game or domestic cattle. There are few localities here in which deer are yet to be found. On the cultivator, therefore, falls the main burden of breeding and providing herds and flocks to feed these beasts of prey. One man alone complained that he had lost 50 head of cattle by leopards.

5. I should here mention that tigers are few here comparatively, and that it is by leopards that this destruction of life and property is wrought. Even since my arrival here one little child has, at dusk, been taken away from the street of the village, and one poor woman from the very verandah of her house, when asleep at night, and both by leopards.

6. The Government orders sanctioned the payment of an enhanced reward for man-eating tigers, but not for man-eating leopards, for I believe it is not generally known that leopards are capable of being as formidable as in South Canara they are. The largest reward at present sanctioned for the destruction of any leopard is Rs. 17-8.

7. And yet I would not seek sanction for any special reward for man-eating leopards, for I should be unable to award it, unable to satisfy myself as to which was, and which was not, a man-eater. In most districts a man-eater is well known by wide repute; his beat is known, and the surrounding open plain of ploughed fields prevents his changing it. Here, the cover is thick, nearly every quarter of a mile contains a well-wooded ravine, the cultivated valleys even are full of cocoanut, arecanut, sugarcane, catechu and shrubs on Kumaki lands, which affords such good shelter that any leopard can change his habital without being noticed; and, in practice, they generally take up their quarters within a mile of a village till they have cleared it of dogs and such goats and cattle as are not safely housed, when they remove to another village, and follow the same course; and it is by no means in special localities that human beings are carried off, or killed in self-defence. I believe it to be here generally the accident of their finding no other food on the occasion, or being interfered with. For reasons that I could give, a mangy skin, too, is by no means the sure indication of a man-eater that it is supposed to be; man-eaters are sometimes particularly sleek.

8. My predecessor, Mr. Cadell, seems to have had in view this difficulty of recognition when he enhanced the reward on all leopards generally. His letter* on the subject is enclosed.

* To Board of Revenue, No. 28, dated 16th February 1867.

9. The accompanying return of leopards and tigers killed in this district will show that Mr. Cadell's enhanced rewards were not without good effects, though possibly the increased numbers killed may, in some degree, be owing to the increase in leopards, which I shall explain below.

10. I conceive the most practical way of inducing an increased destruction of these beasts of prey is to hold out the extra encouragement of higher rewards. The present rewards,—a tiger, 10 star pagodas (*i. e.*, Rs. 35); a cheeta, 5 star pagodas (*i. e.*, Rs. 17-8),—were fixed in 1836, since when the price of the staple grain of this district has risen 228⅓ per cent., and Rs. 35 and Rs. 17-8 are not the liberal rewards they were. Their equivalents would now be Rs. 114-13 and Rs. 57-7. Moreover, the jungles then provided deer enough to obviate the leopards' present necessity for feeding on the cattle of the cultivator.

11. Considering the gravity of the evil to the cultivator, both in person and property, I venture to hope the Government may be induced to consider the present rewards inadequate, and accord me permission in this district to grant rewards of Rs. 60 and 40, respectively, for tigers and leopards, and especially for leopards. If other Collectors do not agree with me, I venture to think it is because they are not similarly circumstanced.

12. The successful sportsman feels it a great task to leave his house and march 50 or more miles with a heavy skin to head and divisional head quarters for the sake of the reward; it is discouraging. I should therefore propose to let all Tehseeldars pay it on the spot, and, to preclude a temptation to malpractices, I would leave them no discretion, but order one uniform sum to be paid in every

case, leaving the sportsman to take his luck of male or female, large or small, man-eater or not; and I would take means to make it thoroughly well known all over the district that one uniform sum was in every case to be had immediately on application with a head and unmarked skin of a tiger or leopard killed in the district. The Tehseeldars would have to support their payments each month with the skins as vouchers, which they would be instructed to mark when paying the reward. The status of Tehseeldars is very different since 1836, and thus checked, I think there is very little danger of the money not reaching the right hands. They are trusted to fine Rs. 50 and imprison for a month, and commit for murder, and I think they might be similarly trusted in this matter.

13. I should add that, pending instructions, I have taken upon me to authorise my Tehseeldars to pay the present sanctioned rewards on the spot, and that one wealthy man, the one who complained of losing 50 head of cattle, has undertaken to tell off a band of ten or fifteen of his farm laborers to the one duty of tiger and leopard shooting. Mr. Whiteside sent him powder, and I have arranged for his having the temporary loan of 12 muskets. If the reward is enhanced, and these picked men are successful, they may be encouraged to keep to their new, pleasant and profitable profession, and their example may, as in other districts, be followed by men calculated to live by their gun. I think nothing is so well calculated as a high and ready reward to induce the right class of men to take up this occupation. Such men, when successful, are also made welcome visitors by all cultivators. But it is a very precarious existence; there are many blank days and weary nights of watch to one successful shot, and nothing but a high reward will counterbalance the blanks, the difficulties, and, to the Native mind, the dangers, too, for he shoots not for sport but bread.

14. But the Government may desire to know whence this increase in the beasts of prey in this district. The Natives hasten to impute it to their old enemy, Coomery; the restrictions on the Coomery clearings have, they say, afforded more cover; but this, I think, is prejudice. Mr. Cadell has already reported that the restrictions hitherto sought to be placed on Coomery cultivation have been most successfully and generally evaded. Coomery has not *diminished*, and cannot affect the matter. Moreover, if it did, it would rather affect it the other way, for the underwood that springs up after a Coomery clearing forms a far denser cover than the more open virgin forest. I *am of opinion that the* real origin of the increase of leopards and tigers is to be looked for in the extensive clearings of coffee, on the tops of ghâts in Coorg, which are kept open and worked, and the wild animals naturally retreat from them to the jungles below, whence they follow the cattle, &c., to the villages.

15. With reference to the high rewards I have sought, I will venture to argue that it is good economy to be liberal. It will be very *much cheaper in* the end to have paid twice or thrice as much for the heads of the present tigers than to go on paying moderate sums for many years for all the many cubs that they and their cubs will keep on rearing from year to year. So far do I urge this argument that, I think, it would be good economy to enhance the reward in those districts also in which there are a few tigers, for then there would be some chance of their being thoroughly exterminated, and the evil and the expenditure for ever brought to an end. It was done in England with wolves, when the country was densely wooded, and not so well armed as India now is. I venture to think it a stain on our administration that, at this date, the beasts of prey should still contest the field with us, and no man dare leave his flocks out at night, except in those districts and localities where we have completed the work of extermination. I specially refer to such beautiful grazing grounds as the Neilgherries, the Palamies, and the Mookh, where man can claim the mastery for himself and his herds only by sufferance—only by day-light; whereas in Australia the cattle, sheep and horses are unhoused by day and night for months. The expense of secure housing is itself a very serious difficulty in the way of the grazier.

No. 28, dated 16th February 1867.

From—W. M. CADELL, Esq., *Collector of South Canara,*

To—*The Secretary to the Board of Revenue, Madras.*

The Board have disallowed from my contingent bills the sum shown in the margin in the grant of rewards over the sanctioned maximum scale for killing six cheetahs in September and October, and the Accountant General has consequently called on me to refund the amount of Rs. 35. I beg, however, to lay before the Board the circumstances under which these increased rewards were given, with the view of procuring their special sanction upon the same.

2. The depredations caused by tigers and cheetahs have of late been somewhat serious in the district, and even the town of Mangalore itself is not free from their incursions. In the month of June 1865 it was reported that, during the previous 12 months, no less than 16 human beings had been carried off in the Udipi and Candapore Talooks; and in the rest of the district the loss of life by this cause only was gradually on the increase. In addition to this, the losses by the villagers of their cattle, goats and pigs were in some localities very considerable. As a stimulus to the people to track out and destroy these obnoxious animals, I took advantage of G. O. dated 2nd February 1865, No. 184, which gives authority to Magistrates to offer as high a reward as Rs. 100 for man-eating animals, and issued a notification allowing a reward of Rs. 30 in the two above talooks for a cheetah, and Rs. 35 in the vicinity of Mangalore. In pursuance of this notification, the excess now retrenched was disbursed with reference to the dangerous character of the animals killed, and the depredations committed by them. These orders, I may observe, have had a very beneficial effect, and a large number of animals have been since destroyed by the people. In proof of this, I may mention that Lieutenant Thompson, of the Artillery, has, since the date of the above, killed five cheetahs or panthers in the very vicinity of this place.

3. Under these circumstances, I beg to request that the Board will be pleased to pass the small amount of Rs. 35 now under retrenchment.

4. The amount of Rs. 2, retrenched out of 7, paid upon the skin of a hyæna in September, also under retrenchment, will be refunded.

H. S. THOMAS,
Acting Magistrate.

MANGALORE,
The 2nd July 1867.

No. 878, dated 20th July 1867.

Order thereon by the Government of Madras.

In the above letter, which the Governor in Council has read with much interest, the Acting Collector of South Canara describes the ravages which are annually committed by wild beasts in the district under his charge. The loss of human life during the years 1865-66 and 1866-67 is lamentable; no less then 40 persons having been carried off in the former year, and 33 in the ten months of the present year; while the loss of cattle and domestic animals must have been proportionately great.

2. Mr. Thomas represents that the rewards at present sanctioned are not sufficient to induce the people to undertake the risk and labor of pursuit; that the scale of rewards now in force was sanctioned 30 years ago, when the value of money was undoubtedly greater, relatively, than it is now, and proposes that permission shall be accorded to him to grant rewards of Rs. 60 and Rs. 40, respectively, for every tiger or leopard killed. Mr. Thomas would also, as a further inducement to sportsmen, authorize the several Tehseeldars throughout the district to grant the above rewards at the head quarters of their talooks immediately on application, and on production of the head and unmarked skin of the slain animal, the skins being forwarded to the Collector's office each month by the Tehseeldar as vouchers in support of the payments made.

3. Mr. Thomas would not recommend special increased rewards for the destruction of man-eating tigers or leopards, owing to the facility which the peculiar nature of the country affords for shelter and easy migration from one place to another, and to the difficulty of deciding whether or not any particular tiger or leopard is an habitual man-eater or not.

4. The Government, as an experimental arrangement, approve the proposals made by the Acting Collector, and they trust that the increased rewards which will be promptly paid for every tiger or leopard killed, without entailing unnecessary trouble on the sportsman, may induce the inhabitants to devote themselves to the extirpation of the wild beasts which at present devastate their fields and homes.

5. Mr. Thomas will report at the expiration of six months the result of the measures now sanctioned.

6. On the receipt of the tiger and leopard skins, the Acting Collecter will take care that they are marked in such a manner as to preclude their being again offerred for the reward.

7. The Collectors of districts will forward, in January 1868, a return of the number of persons who have been killed by wild beasts in their respective districts during the year 1865-66 and 1866-67, and the amount paid in rewards for the destruction of these animals during each of these years.

***Extract from the Proceedings of the Government of Madras, in the Public Department, for the month of October* 1867.**

READ the following:—

No. 78, dated 9th October 1867.

From—*The Collector of Kurnool,*

To—*The Chief Secy. to Govt. of Madras.*

I have the honor to bring to the notice of Government the terrible ravages of the tigers in the Nandikanama Ghât, regarding which I reported to Government on the 21st May 1867, letter No. 37.

2. Lieutenant Russell, Assistant Superintendent of Police, has reported that, during this year up to the 27th September 1867, a man-eating tiger has carried off 64 human beings, and has caused such a terror that the post runners and beat constables will not traverse the ghât until large numbers of persons collect accompanied with numerous tom-tom beaters, and that the coolies of the Public Works Department have stopped work through fear of attack from this tiger.

3. It is a question in my mind whether it is one tiger only that causes this havoc, for the jungles are most dense, and afford remarkable cover for wild beasts of all descriptions; but when I went over the ghât in August, on the night after Mr. Russell's bullock-driver was carried off, the chensus and coolies working on the roads told me all the mischief is done by one individual tiger, and that it is known by its foot-marks, which are peculiar, showing an immense growth of one of the claws in one of its fore-feet.

4. On my recommendation, the Board of Revenue have sanctioned the expenditure of Rs. 1,200 towards clearing the dense jungle for a space of 100 yards on each side of the road. This, however, is but a precaution for the future. What appears necessary for the present is the adoption of some measure for the extirpation of the plague. I can think of none better adapted for the purposes than that recommended by Mr. Russell, and that is, placing at his disposal two Government elephants for the express purpose of pursuing and hunting down the tigers in the neighbourhood of the pass. Mr. Russell is placed in a dangerous position, for he has the superintendence of two talooks on the east, and one talook on the west, of the Nalla Malla Hills, and cannot do his work without having constantly to pass over this ghât.

5. At Bellary, I should think there were several elephants available in the Commissariat Department, and I can hardly see to what better use they can be put than in assisting toward the destruction of the tigers which have spread a fear throughout the hills in their neighbourhood.

Dated 14th October 1867.

From—The Assistant Inspector General of Police,

To—The Chief Secretary to the Govt. of Madras.

I annex copy of telegram received from Captain Stuart regarding a man-eater.

Dated 14th October 1867.

Telegram from—CAPTAIN STUART, *Depy. Inspr. Genl. of Police, Central Range, Kurnool,*

To—The Inspector General of Police, Madras.

Beat stopped on Nandikanama Ghât. Tiger carried off beat constable. Men being killed on an average of one in three days. Press Government for greater reward.

No. 1278, dated 16th October 1867.

Order thereon by the Government of Madras.

The Governor in Council authorizes the Collector of Kurnool to offer rewards to any amount he may deem proper, not exceeding Rs. 300, for the destruction of the tiger referred to in the foregoing papers, and of any other man-eating tigers in his district.

2. He is also authorized to employ skilled *shikarees* on daily wages, who will also be eligible to the reward, and, if necessary, to obtain arms and ammunition for them from the Arsenal at Bellary.

3. It will be ascertained, through the Military Department, whether elephants fit for use in tiger-hunting can be furnished from Bellary.

4. Ordered, that the following telegram be despatched to the Collector of Kurnool:—

> "You are authorized to offer such reward as you deem proper, not exceeding Rs. 300, for the man-eating tiger referred to in your letter of 9th instant; also to engage skilled *shikarees* on daily wages, who will also be eligible to receive reward. If necessary, obtain arms and ammunition for them from Bellary Arsenal. Your proposal to employ elephants has been referred to the Military Department."

Extract from the Proceedings of the Government of Madras, in the Public Department, for the month of March 1868.

READ the following:—

No. 92, dated 7th March 1868.

From—The Collector of Kurnool,

To—The Chief Secy. to the Govt. of Madras.

I have the honor to inform you that the man-eating tiger, regarding which I wrote to Government on the 9th October 1867, is reported by Lieutenant Russell to have been shot by his party on the night of the 3rd March 1868. It proved to be an old tigress.

2. I trust soon to obtain more details, regarding which I will again address you.

No. 324, dated 11th March 1868.

Order thereon by the Government of Madras.

The Government await a detailed report on the operations of the party, when orders will be passed as to the reward to be given, and as to the payment of the expenses.

No. 9, dated 18th February 1868.

From—The Acting Principal Assistant Collector, Chicacole,

To—The Collector of Ganjam.

I have the honor to forward to you a statement I have procured from Mr. Thomas Reay, the Jailor here, regarding an encounter he had on the 9th ultimo with a panther under circumstances which call, I think, for more than usual notice.

2. The animal, according to all accounts, was a particularly savage beast, and, on the morning in question, broke into the town, being within 100 yards of the Jail, when Mr. Reay came upon it. It wounded no fewer than four persons; first the owner of the field behind the jail, upon whom it came unexpectedly. He escaped away from it, and gave the alarm at the jail, and then followed the circumstances detailed in the enclosed statement of Mr. Reay. After Mr. Reay was removed by the Apothecary, in order that his wounds might be treated, one Lalamiah advanced towards the panther with a sword. The animal at once closed

with him and gave him such a severe bite on the sword-arm that his life was for some days despaired of. A number of people then advanced with clubs, and a constable with his bayonet, and the panther was despatched. As stated by Mr. Reay, pensioned Havildar Doorga Persaud has died since the encounter, though it was not thought at the time that he was so severely wounded as either Mr. Reay or Lalamiah.

3. The death of the panther was undoubtedly due chiefly to Mr. Reay, and he is entitled to the usual reward for killing it. The highest reward I am empowered to give is Rs. 17½, but I trust you will agree with me that the intrepidity displayed by Mr. Reay, as well as the peculiar circumstances of danger to the inhabitants, that a higher reward than this should be bestowed on him. I would, therefore, suggest the sanction for a special reward of, say, Rs. 50, and that Lalamiah also be recommended to receive a reward of Rs. 15.

4. I should have drawn your attention earlier to this subject, but I have been out on a jamabundy tour nearly all the time since I joined the district.

No. 144, dated 21st February 1868.

Endorsed by the Collector of Ganjam.

Copy submitted, with enclosures in original, for the favorable consideration of Government.

Statement of Mr. T. Reay, *Jailor,—dated Chicacole, the* 13*th February* 1868.

I beg to furnish particulars regarding the panther shot by me, and the injuries caused on the morning of the 9th of January. On my return from the jail, a native informed me that a panther was in the adjacent fields (back of the jail) which had already bitten two Natives. On receipt of information I went home, loaded, and went after the animal. On reaching the spot I found a vast number of Natives surrounding the field in which the animal was, but out of the number not one would venture into the cholum field, which was above six feet high. I directed two constables to follow me into the field, but they withheld on reaching. I entered at once, and was about firing when I gave instructions to the constables to clear the crowd; while doing this the animal made for me; as it was coming, I fired and struck it on the right shoulder; immediately after the animal sprang on me, and caught me by the shoulders. I then threw him full on the ground; he immediately rushed on to me and attempted to fasten to my throat. I however forced my right hand under his jaws and loosened the hold on my throat. He then fastened on my left shoulder. This time I received a bite on the throat, and he sunk five or six teeth on my left shoulder, one of which was about 1½ inches deep; this happened after he had thrown me. The way I got rid of him was by twining my legs round his body to throw him. He then slipped and ran into an adjacent brinjall field. I again loaded and went after him. On reaching the place I could not get sight of him. A pensioned Rajpoot Havildar,* who had just come, took a sword and entered the bush where the animal was, when it sprang on him unawares and bit him. I ran up and fired at the animal, and put the bullet through his leftside. I then brought the Havildar out, and Mr. Gillespie, who was at that time at the spot, dressed the wounds, which, however, caused his death on the 22nd ultimo. I then got tom-toms to try and beat the animal out of the bush, but it was of no avail. I loaded again and went into the bush, searching for the animal, but before I could observe him, he sprang at me; as he was in the act of doing so, I fired; he was on me twice; I again threw the animal, and the third time he threw me and caught me on the left shoulder again, and sunk five or more of his teeth. The animal would very likely have killed me, but that he had been

* Doorga Persaud.

wounded, and was weak from the loss of blood. On my twining my right leg on him the third time to attempt to throw him off, he left me and made off for the bush. I followed, but could not get sight of him. I felt then very weak, and went under a tree, when Mr. Gillespie, the medical officer in charge of the station, saw me and advised me to return as I was bleeding profusely; but, before doing so, I advised the village authorities not to meddle with the animal, as I would return and kill it after my wounds were dressed, but after half an hour the animal was brought to me dead. On enquiring, I found that during my absence an inhabitant of Chicacole ventured at the animal with only a sword; it made for him and bit him too. While it was on him, a constable of the jail guard had bayoneted him. The animal was at its last stage when this occurred. The animal is of the panther class, full grown, being in length six cubits.

I beg to attach a certificate from the medical officer regarding the state of my wounds.

Certificate of Apothecary D. Gillespie, *in medical charge of Chicacole,—dated* 13*th February* 1868.

This is to certify that Mr. Thomas Reay, Jailor at Chicacole, suffered severely from the bites of a panther: one of the wounds was about an inch or more in depth and about an inch in length, and several other smaller wounds on the left and right shoulders, and one on the right side of his throat; these wounds were, in my opinion, of a dangerous nature.

No. 331, dated 13th March 1868.

Order thereon by the Government of Madras.

The Governor in Council is pleased to sanction the payment of a reward of Rs. 50 to Mr. Reay for his gallant conduct in attacking and disabling a very dangerous panther, and also of a reward of Rs. 15 to Lalamiah for the assistance he afforded on the occasion.

Extract from the Proceedings of the Government of Madras, in the Public Department, for the months of April and June 1868.

Read the following:—

No. 106, dated 18th March 1868.

From—The Collector of Kurnool,

To—The Chief Secy. to the Govt. of Madras.

Referring to my letter No. 97, dated the 12th March 1868, and to the order of Government, No. 324 of the 11th idem, I have the honor to forward the detailed report submitted by Mr. Sharp regarding the destruction of the man-eating tigress on the Nandikanama Ghât.

2. I would recommend that the reward of Rs. 300 be given to Major Christie as head of the party which killed the tigress.

No. 15, dated 12th March 1868.

From—F. R. H. Sharp, Esq.,

To—The Magistrate of Kurnool.

In continuation of my letter No. 13 of the 9th instant, I have the honor to state that, on the night of the 3rd instant, *shikaree* Vencataswamy and constable Nagaloo were posted over a pool of water between the 72nd and 73rd mile-stones on Nandikanama Ghât, and *shikaree* Sheik Ali and another *shikaree* (name at

present unknown) were posted over the body of the man who had been recently killed by a tiger at a place about 300 yards from the other two.

2. Venkataswamy and Nagaloo then shot a large tigress, whose skin and claws have been produced here.

3. In my last letter I stated that it was at first* generally believed that the man-eating tiger on the Nandikanama was a tigress.

* That is, in November 1864, when the loss of life by tigers began.

4. That tigress, there is reason to believe, is at any rate one of the man-eaters which have so long infested the Nandikanama Ghât.

5. Six bandy men, who went of their own accord and saw its skin shortly after the animal had been killed, stated that about 20 days before, when passing over the ghât, they had seen a tiger carry off a man 30 yards from them near Dhoni Bhavi, and recognized the skin before them by its dark stripes, general appearance, and tail as that of the tiger they had then seen.

6. The man-eating tiger was commonly known as the Dhoni Bhavi tiger, and the animal now destroyed was shot about half a mile from the Dhoni Bhavi.

7. As the killing of this tiger is a special case, I think it best to report the matter for your orders, instead of disposing of it myself, and only conclude by recommending that the payment of the reward of Rs. 300 may be sanctioned, and by again requesting that a second reward of Rs. 300 may be offered for the destruction of another man-eating tiger, which, from the reasons mentioned in my last letter, is believed to be still infesting the ghât.

8. The *shikarees*, I understand, acted under the orders of Major Christie and Lieutenant Russell in occupying the position from which the tiger was destroyed, and Major Christie claims that the reward may be paid to him, as the tiger was shot under his arrangement, though he intends to transfer the sum to *shikarees*. In the event of your sanctioning the payment of the reward, I shall be obliged by your informing me to whom it should be paid.

No. 417, dated 2nd April 1868.

Order thereon by the Government of Madras.

The Governor in Council learns with much satisfaction that a tigress, which is known to be a man-eater in the neighbourhood of the Nandikanama Pass, has been shot by the party under Major Christie's direction. A sum of Rs. 1,000 will be placed at Major Christie's disposal, out of which amount he will disburse Rs. 500 to Venkataswamy *Shikaree*, and Nagaloo, Police Constable, in equal sums of Rs. 250 each.

2. Major Christie will distribute Rs. 500 in such proportions as may seem proper to him to those persons who, under his direction, have been engaged in the pursuit of this tigress.

3. With reference to paragraph 1 of the letter from the Magistrate of Kurnool, dated 12th March 1868, No. 97, it is observed, as already intimated in the G. O. No. 356 of date the 18th instant, that by G. O. No. 1278, dated 16th October 1867, the Collector was authorized to offer rewards to any amount he might deem proper, not exceeding Rs. 300, for the destruction of any man-eating tigers in his district.

Dated 1st April 1868.

From—Major H. L. Christie,

To—*The Chief Secy. to Govt. of Madras.*

Agreeably to your instructions, I have the honor to submit a report of proceedings against man-eaters.

Self and party took up a position at the foot of the Nandikanama Pass on the 17th February, and up to 25th March continued in incessant pursuit of tigers.

2. On the evening of 2nd March, "the tiger" killed a man. We went up the ghât following morning, tracked the man-eater to his lair, found the body, and posted two men over it, and two men over nearest water.

3. Up to date of our arrival, their bodies, I was told, had never been recovered, the people fearing to enter the jungle.

I may mention, on our arrival at the place, we found four village *shikarees* very indifferent ones; these men we employed, and strongly drilled and broke them in to assist us in night-work.

4. On the occasion in question two of these men shot the tiger over the water. During our stay at the place we all worked very hard after the tigers, and were very unfortunate, or should have killed at least three. But I think we have shown the people how to kill these animals at that place, and the remainder can be disposed of in like manner.

5. Should the Government be pleased to give the reward to me for distribution, I shall propose to divide it (*viz.*, Rs. 1,000) as follows:—Rs. 300 to village *shikarees* employed, the remainder for party, *viz.*, self, Captain Thompson, R. A., and Lieutenant Russell, Police.

6. I may state that the pursuit of these man-eaters is not only a very difficult but a dangerous undertaking, and we certainly did our utmost.

The very tigress we killed has, by Police reports, been killing men since November 1864. By the arrangements which we made we were fortunate enough to dispose of her in a fortnight.

7. Latterly our people all got so ill with fever that we were obliged to break up the camp for the time, but the operations will be continued at the Nandikanama, the principal place.

The village *shikarees* up to date of our arrival had never attempted to kill the tiger; they were in the habit of escorting the bandies and people up and down the ghât, and I suppose make a good thing of it in that way. We took the depositions of a number of people at the time as to the identity of the tiger; they appeared to be quite positive that it "was the one," having often seen it kill men close to them in the day-time. I beg to state, however, that others are left in the district; the destruction of human life has been very great; while we were there, some six men were killed. But there is no doubt the tigers can be killed; it merely requires method and perseverance.

8. I also submit a bill of expenses, which I hope will be considered moderate, as we spent as little money as possible on beaters, as I found it to be of no use.

Bill of expenses incurred by Major Christie's *party.*

	Rs.	A.	P.
Railway from Madras to Cuddapah, *viz.*, 2 1st class, 3 servants, 2 grass-cutters, and 2 horses	70	14	0
Railway from Cuddapah to Madras	70	14	0
Bandy-hire from Cuddapah to Nandikanama Pass and back ...	119	0	0
Coolies for beating	16	8	0
Batta for Mahouts and attendants, 12 in number	50	0	0
Extra baggage by rail, both ways	25	0	0
Total ...	352	4	0

Madras,
The 2nd April 1868.

H. L. Christie, *Major,*
Madras Army.

No. 456, dated 7th April 1868.

Order thereon by the Government of Madras.

The Government are much indebted to Major Christie and Lieutenant Russell for the skill and patience which they have shown in organizing the hunt which has succeeded in ridding the Nandikanama Pass of one of the man-eating tigers which have proved so destructive to human life in that neighbourhood.

2. These operations should be continued until the other tigers are killed.

3. With reference to paragraph 5 of Major Christie's letter, that officer is referred to G. O. dated the 2nd instant, No, 417.

4. The Governor in Council is pleased to authorize the payment of Rs. 352-4 for expenses incurred by Major Christie's party.

No. 133, dated 28th May 1868.

From—The Acting Magistrate of the Godavery District,
To—The Chief Secy. to the Govt. of Madras.

Captain W. Robertson, Superintendent of Police in this District, lately made a tour in the Rumpa country, which comprises the hill tracts.

2. He reports as follows :—

"The country in this part is overrun with tigers. When I was there, I was informed that almost every village had lately suffered from the ravages of man-eaters : no road was safe, and only a few days before my arrival a tiger charged a body of villagers within a few hundred yards of Kondada Station. A reward of Rs. 100 has already been ordered for one notorious man-eater; but I think that, if Rs. 100 were offered for all tigers killed in Rumpa (as is done in Jeypore), it might have a good effect. * * * I believe several of the smaller villages have been deserted. The villagers of Kondada told me that, were it not for the Police Station being there, they would move to other parts of the hills."

3. I have the honor strongly to recommend that Government will be pleased to sanction a reward of Rs. 100 being given for all tigers *bonâ fide* killed in the hill tracts of this district, as they have already done in this case of the Vizagapatam District.

No. 700, dated 9th June 1868.

Order thereon by the Government of Madras.

Sanctioned for a period of two years, at the close of which a report will be submitted as to the necessity for continuing the enhanced rate of reward.

Extracts from the Proceedings of the Government of Madras, in the Revenue Department for the months of January 1867, and February and November 1868.

READ the following :—

No. 3443, dated 7th December 1866.

From—The Collector of Ganjam,
To—The Secy. to Board of Revenue, Madras.

In reference to the enclosed copy of an account of the courage shown by five ryots of Tootipoorum in the destruction of a very savage bear and her cubs, I have the honor to request sanction for the disbursement of Rs. 40 to these five men, being about double the usual reward for three bears.

No. 207, dated 5th December 1866.

From—The Actg. Senior Assistant Collector,
To—The Collector of Ganjam.

I have the honor to forward, for your information, a report forwarded to me by the Carzee of Tootipoorum, in the Chikaty Division.

2. It appears therefrom that, for some time past, this village has been frequented by a bear, which, during the last few months, has killed no less than five persons, and on Saturday last, the 1st instant, wounded two* more severely, when five of the villagers hurried out in pursuit with only clubs and spears and fortunately succeeded in killing the bear and her two well-grown cubs without further loss of life.

* Lingum Ramdass and Goomsetty Ramaswamy.

3. The bears were brought into camp only a few miles distant, and I would beg to recommend that a suitable reward may be granted to the above individuals for the intrepidity shown by them in going to the rescue of the unfortunate two, who had been attacked by the bear.

Order thereon by the Board of Revenue, Madras.

Recommended for the sanction of Government.

No. 27, dated 7th January 1867.

Order thereon by the Government of Madras.

SANCTIONED.

No. 530, dated 5th February 1868.

From—The Officiating Conservator of Forests,
To—The Secy. to the Govt. Madras. Reve. Dept.

Man-eating tigers are causing a great loss of life along the whole range of Nallay Mallay Forests, from near Cuddapah up to the bank of the Kistna. There are said to be five altogether; one that frequents the Nandy Canama Ghaut is the most notorious, and is said to have killed upwards of 100 people. The Collector has already, I believe, reported to Government about this tiger, and a reward of Rs. 300 has been sanctioned. This might, I think, be raised to Rs. 500.

2. My Assistant at Nundial has, on several occasions, tried strychnine, but without success, as the tiger never comes back to his victim after his first meal, and he is never known to kill cattle. These jungles are not such as to allow of elephants being used, but the tiger might, I think, be killed if a large beat was organized. His whereabouts are generally well known, and as his depredations are considerably affecting our working operations, the Forest Department might give Rs. 100 towards the expenses of a beat if the Collector would organize one, and I have no doubt that sportsmen from Bangalore, Madras, and elsewhere would be glad to assist.

3. I have lately seen a large steel spring tiger-trap on the principle of a rat-trap; its cost is Rs. 70, and I have the honor to request sanction for purchasing it for use in these forests: its cost can be met from the amount sanctioned for contingencies.

No. 466, dated 19th February 1868.

Order thereon by the Government of Madras.

The purchase of the trap in question is sanctioned.

2. A beat with elephants for the tigers has been already organized.

No. 655, dated 14th October 1868.

From—The Collector of Kurnool,
To—The Actg. Secy. to the Board of Revenue, Madras.

I have the honor to inform you, in reply to proceedings of the Board of Revenue, dated 23rd September 1868, No. 6774, that up to the 1st September, from the date on which Major Christie's party killed a tiger on the Nallay Mallay Hills, eight men and two women have been killed on those hills by tigers.

2. On Nundial side, four *shikarees* at Rs. 7 a month, and on the Cumbum side five *shikarees* at Rs. 6 a month, have been employed since November 1867, as sanctioned by Government in their order dated 16th October, No. 1278.

3. They have not succeeded in killing any tigers, but they undoubtedly serve to give confidence to persons crossing the hills, and probably, through I have had no complaints against them, exact fees from the parties they escort. I do not think they are of any use, and would recommend that they should be discontinued.

4. The only way of rendering the pass through the hills safe, in my opinion, is to effectually clear the jungle for one hundred yards on each side of the road, and to keep up a regular establishment for keeping it down; but this has been objected to on account of its costliness, and the Board (*vide* Proceedings No. 6893, dated 28th September 1868) recommend four halting places at short distances along the road.

Submitted for the information of Government in accordance with their order of the 13th August 1868, No. 2155.

2. The Board have already in their Proceedings dated 28th September 1868, No. 6893, stated the course they recommend. They concur with the Collector in regarding the longer maintenance of nine *shikarees*, on Rs. 58 a month, as useless.

No. 2880, dated 17th November 1868.

Order thereon by the Govt. of Madras.

In their order under date 7th November 1868, No. 2805, the Government have sanctioned the adoption of measures calculated to contribute to the safety of travellers through the Nandikanama Pass, and, as observed by the Collector and the Board, the retention of the *shikarees* is a useless expense. Their discharge is accordingly sanctioned as recommended.

Extract from the Proceedings of the Board of Revenue,—No. 6893, under date the 28th September 1868.

The reports that have been from time to time received regarding the ravages of tigers on the Nandikanama Ghat indicate that the chief causes are the habit of night-travelling, and the excessive narrowness of the jungle-cutting through which the road is carried.

2. The jungle is described by Mr. Chase as in many cases brushing the bandies on each side.

3. The Board, in their Proceedings of the 4th June on reports from the Collector and his subordinates, selected the places noted in the margin as suitable points for the construction of secure halting places, considering that, by providing such at easy stages, the necessity for night-travelling would be to a great extent obviated.

1. Charavu Narasimha Pagoda.
2. Pacherla.
3. Mahodevooni Bhavy.
4. Ragoomani Guntalu.

	Rs.
Three enclosures with wells	1,970
Choultry with two wells ...	5,326
Total ...	7,296

4. It was also resolved that a choultry should be constructed at one of the stages, Pacherla. The Collector now submits estimates as noted in the margin, amounting to Rs. 7,296.

5. The Board consider the plan of choultry needlessly expensive, and would adopt the Malabar plan of a building enclosing three sides of a square, the fourth being enclosed by a strong palisade,—the building being, of course, so planned as to afford security from attacks of tigers.

6. As regards clearing the jungle, the Collector proposed, in the first instance, clearings on either side of 100 yards; but the estimated expense was so large, Rs. 10,000, that Government in their order dated 2nd April 1868, No. 876, declined to sanction it.

7. The Board consider that the safety of the road would be much promoted by the clearing, to a less extent, say of 20 yards, on each side.

8. An expenditure of Rs. 1,444-7-4 from the Road Fund has already been incurred, and it is impossible to indent further on this source for so large an expenditure as is required. The road, moreover, is an imperial one.

9. The Board, therefore, propose that Government should undertake to provide a moiety of the cost of choultry, halting places, and clearing, which will probably not exceed a total of Rs. 12,000.

10. In this case the Collector can be directed to revise his estimates, and to commence the work at once, and prosecute it vigorously in anticipation of sanction.

No. 2805, dated 7th November 1868.

Order thereon by the Government of Madras.

The propriety of taking some steps in order to protect travellers in the Nandikanama Ghât Road, in the Kurnool District, has for some time been under the consideration of the Collector and the Board of Revenue; but a former proposition of the Board, that a sum of Rs. 11,250 should be expended from imperial funds for clearing the jungle through the pass to the extent of 100 yards on each side of the road, was not acceded to by Government.

Proceedings dated 2nd April 1868, No. 876.

2. The Board now report that the chief cause of the frequent attacks made upon travellers by tigers are the habit of night-travelling, and the excessive narrowness of the cutting in the jungle through which the road passes. They therefore propose the construction of some secure halting places and an inexpensive choultry, considering that by this means the necessity for night-travelling will be to a great extent obviated. They also propose to clear the jungle on each side of the road to the extent of at least 20 yards. The cost of these improvements is roughly estimated at Rs. 12,000, and the Board request that a moiety thereof may be paid from imperial funds.

3. The Board's proposals are reasonable, and should be acted on with the least practicable delay. Much has been done towards opening the Nandikanama Pass, which is an imperial line; but it is still avoided by Native travellers and brinjaries owing to the want of secure and convenient halting places, and the outlay now proposed by the Board will serve to utilize what has hitherto been expended on the pass.

4. Orders will be issued by the Public Works Department for the payment of a moiety of the proposed expenditure, and the balance should at once be provided from local funds.

No. 259, dated 24th August 1869.

From—The Collector of Kurnool,

To—The Secy. to the Board of Reve. Madras.

I have the honor to bring to your notice that, having just passed through the Nandikanama Ghât, I made a point of considering what means might be taken either effectually to put a stop to the alarming ravages caused by tigers there, or at all events to lessen in some way the dangers of the pass from that source.

2. I hear that some 40 lives have been lost this year, and matters are coming to such a crisis that, unless some check is adopted, persons will entirely be prevented travelling on that road, and Cumbum and Markapore will become severed from the remainder of the Kurnool District. There is only one other pass, the Dornal, which at present is but little frequented owing to its being very far north, and the distance through the hills so very great without any intervening villages.

3. As an example of the dangers of the Nandikanama Pass, Lieutenant Russell, of the Police, was travelling at night on the 19th instant in a bullock carriage, with his driver in front of the bullocks leading them on, when suddenly a tiger rushed at the driver and within three seconds had carried him off and disappeared in the jungle.

4. The jungles for several miles is fearfully dense, and tigers hide quite near the road and run off with people passing before any resistance can be made. The road in the jungle is so narrow that a bullock carriage cannot pass without both sides touching the trees.

5. I think the only plan which could afford protection would be to have the jungle cut down for one hundred yards on each side of the road all through the pass, and this would open so large an area that probably tigers would not then come to the road at all.

6. In the Local Fund Budget sanctioned by Government there are several roads, which, for want of plans and estimates, cannot be commenced during the current official year. Rather than allow such money sanctioned to lie useless, I shall feel obliged if the Board would allow this clearance to be made.

7. For instance, Road No. 4, from Rampore Pass to Nandikanama Ghât, cannot, I think, possibly be commenced. For it Rs. 17,000 have been sanctioned. If the Board would allow some of this money to be laid out in clearing the jungle from the Nandikanama Ghât, commencing from near Kistam Shettypalli, the work might be taken in hand at once under the superintendence of the Acting Head Assistant Collector, and another commencement might be made at the other side of the Hill Gazerpally under the superintendence of Deputy Collector Sudarasana Row. At first about Rs. 1,000 might be entrusted to each of these officers, and, when some progress has been made, I should be in a position to estimate what the clearance through the whole length of road might be.

The Board sanction a grant of Rs. 1,200 from the Road Fund Reserve to commence the proposed work, which has their approval. Mr. Chase should send a detailed estimate of the cost.

No. 351, dated 20th November 1867.

From—The Collector of Kurnool,

To—The Secy. to the Board of Reve. Madras.

In reply to Proceedings of the Board of Revenue, No. 6132, dated 24th September 1867, I have the honor to forward an estimate for the cost of clearing the jungle through the Nandikanama Pass. The length that will require clearing is about 22 miles more, and the cost of clearing will be, at the rate of Rs. 500 per mile, Rs. 11,000, besides the Rs. 244-7-4 spent by Sudarasna Row in excess of the previous sanction, making a total sum of Rs. 11,244-7-4.

2. I have the honor, therefore, to request the sanction of the Board for the expenditure of this sum from the local funds from one of the roads which cannot possibly be put in hand for some time, as surveys, I hear, have not been commenced from Rampore Pass to Nandikanama Pass, No. 4.

3. I would urge most strongly the clearing of this jungle as soon as possible; for otherwise, from constant dread of tigers, I fear it will be entirely abandoned, as is almost the case at present.

The Board are of opinion that the Nandikanama Ghât is, and always has been, an imperial work, and therefore resolved to submit, for the sanction of Government, an estimate, received with the foregoing letter of the cost of clearing the jungle through the ghat. The total length of the ghat requiring jungle clearing was 25 miles, of which three miles have already been cleared at a cost of Rs. 1,444-7-4, though only a grant of Rs. 1,200 was made out of the

current year's road fund reserve in the Board's Proceedings dated 24th September 1867, No. 6132. Deducting the three miles, there remained 22 miles, which, at Rs. 500 a mile, would cost Rs. 11,000. Including the excess charge on the three miles, already cleared, the amount required will be Rs. 11,250. This is a heavy charge on the road fund, and can only be supplied by postponing more legitimate.

2. Should there be no imperial funds available for the work in question, the Board would not object to advance the required amount from the road fund, subject to recovery from the Public Works allotment.

Order thereon by the Govt. of Madras, No. 876, dated 2nd April 1868.

The Government are not prepared to adopt this recommendation.

Extract from the Revenue Proceedings of the Government of the North-Western Provinces for 7th December 1867.

PARA. 19. The year under report has not been without its gains and losses. The rains of 1273 ceased early; this enabled me to start my works sooner than usual. The sickness from the small amount of rain-fall was less; the rubbee crop all over the district was unusually good. On the other hand, cholera, during the months of April and May, carried off five hundred and ninety-six women and children. On the disappearance of the cholera, sickness attacked the cattle in these pergunnahs. Many ploughs in consequence coming to a stand-still, advances have been liberally made to enable the cultivators to replace their plough cattle; and lastly, the khurreef crop was very scanty; as an instance of what the cultivator in the northern villages bordering the forest has sometimes to go through, I would here mention an occurrence that took place on the night of the 27th March in the small village of Lohurra, Pergunnah Roodurpore (I do not believe that there is a similar case on record). About midnight, whilst most of the cultivators were out watching their rubbee crops, and there were only some fourteen or fifteen people in the village, a bear in the short space of two hours killed two men, three women, and one child, also wounding two men. He first entered the house of one Ahmed Yar Khan, Puthan, and killed two women. He next destroyed Sobratee, dhobee, who had come to the assistance of the women. He then entered the house of Ellai Buksh, butcher, and killed his wife and child. The husband attacked him with a knife, but the bear appears (from the investigation), with one blow, to have torn away his head and face. On retiring from the village he attacked six head of cattle, three of which died before morning. The cries from the village attracted the attention of two of the cultivators, who, proceeding from their fields to ascertain the cause, met the bear a short distance outside the village. He immediately attacked them, wounding them both, but the wounds were not serious. The following night the animal entered the adjoining village of Pertaubpore. He there entered the house of a "Raie" and wounded his wife; he then attacked the man, and had succeeded in wounding him badly on the arm, when he was shot by a man named Wully Mahomed; he was bit under the right shoulder and fell dead; he also wounded some cattle on approaching this village. The man who shot him was a "Shikary" of village Kutingree, in Pergunnah Kilpooree, and by great luck had come to the village the preceding day. Had he not been there, the beast would probably have taken more lives. I sent for the man and rewarded him. The cultivators came in a body, and stated that if matchlocks were not provided, and small walls built in front of their houses, they would leave the village. On making these arrangements, and explaining the improbability of such a circumstance again occurring, they were induced to remain. The "Booksas," who inhabit a village close to this, believe to this day that it was a man, who being a magician, under the influence of a devil, was enabled to destroy so many human beings. The beast, there is no doubt, was mad.

The year 1274.

It was at first supposed that it had been wounded by some one previously; and infuriated by his wounds, had attacked the village; but this was not the case, for I examined the skin carefully, and was only able to discover one small wound, and this corresponded to the account given by the people who saw the animal shot as to where he was hit. It was a small-sized male.

Extracts from Public Reports regarding wild animals.

Punjab Police Report for 1865.

PARA. 57. His Honor ordered this return to be included in the Police returns, and I therefore submit it:—

Statement showing the number of wild animals destroyed, the rewards paid for their destruction, and the number of persons killed and injured during the year 1865.

1	2	3	4	5	6	7					8					9

Paragraph 12 *of the Local Government's review.*

The return of wild beasts destroyed continues satisfactory. The number of licenses to manufacture arms and ammunition appears large in the Lahore,

Umritsur, and Rohtuk Districts; on the other hand, that of licenses to possess arms in the Umritsur District appears to be singularly small.

Punjab Police Report for 1867.

PARA. 41. The following table shows the number of wild animals destroyed during 1867:—

1	2				3	4					5					6				
Animals.	Number destroyed.				Total amount paid in rewards.	Number of persons killed.					Number of persons injured.					Total of persons killed and injured.				
	Males.	Females.	Cubs.	Total.		Men.	Women.	Boys.	Girls.	Total.	Men.	Women.	Boys.	Girls.	Total.	Men.	Women.	Boys.	Girls.	Total.

The three hyænas destroyed were in the Simla District; the rewards paid were not given in the return.

There has been a decrease in the number of wild animals destroyed, also in the number of persons killed and injured by them:—

Oudh Police Report for 1865.

PARA. 217. Deaths by wolves:—

In 1864	...	...	... 153
„ 1865	...	...	... 118
		Decrease	... 35

Oudh Police Report for 1866.

PARA. 217. Deaths by wolves:—

In 1865	...	...	... 118
„ 1866	...	...	... 140
		Increase	... 22

Oudh Police Report for 1867.

PARA. 231. Deaths by wolves:—

Districts.	Adults.		Children.	
	Males.	Females.	Males.	Females.
Lucknow	...	...	13	5
Oonao	...	1	7	6
Barabunkee	1	...	...	1
Pertabghur	3	1	2	1
Sultanpore	1	...	5	9
Fyzabad	...	...	7	9
Gondah	...	...	24	30
Baraitch	...	...	5	4
Kheree	...	...	2	...
Hurdui	...	...	7	14
Seetapore	...	...	...	1
Total ...	5	2	72	80

PARA. 232. There is a slight increase of deaths by wolves :—

1866	...	...	...	... 140
1867	...	...	...	... 159.

More than one-third of these deaths took place in Gondah, and in Lucknow, Oonao, Hurdui, Fyzabad, and Sultanpore. Wolves still appear to be pretty numerous.

Central Provinces' Police Report for 1865.

PARA. 31. The death of 2,593 persons and the injury of 386 persons by accidents were reported to the Police. The number of deaths is nearly the same as in 1864. Of the above, 546 persons were killed, and 137 persons were wounded by wild beasts. * * * * * * *

Paragraph 30 *of Chief Commissioner's review.*

The number of deaths from wild beasts is still considerable, though there is a diminution, probably owing to the increased destruction of these animals. The Police are frequently in a position to aid the District Officer in the preventon of these accidents, and to watch the localities likely to be infested. The District Superintendent should see that this is done.

Central Provinces' Police Report for 1866.

PARA. 40. By accidents 2,775 persons were killed, and 569 were injured. This is a considerable increase on the numbers shown in 1865, which were 2,593 killed and 386 injured. Of the above, 699 persons were killed, and 174 wounded by wild beasts. In 1865 the numbers were 546 killed and 137 wounded. The large increase in 1866 is greatly to be lamented. I have no return of the number of wild beasts killed, but I know it is considerable, and I should suppose it is larger than in 1865. Several of the Police Officers have earned the gratitude of the inhabitants of their districts by their success in destroying man-eating tigers.

* * * * * * *

Paragraph 25 *of Chief Commissioner's review.*

The number of persons injured and killed by accidents is very large, the returns showing an increase over the previous year; this is much to be lamented. An increase is also apparent in the number of human beings who have been killed and wounded by wild beasts, notwithstanding that many hundreds of wild beasts have been destroyed during the past and previous years, and that no opportunity has been lost by the Administration in offering inducements for their still more plentiful destruction.

The rewards paid by Government are very high, and it is feared that no good will accrue from their enhancement. During the year District Officers have been authorized to offer rewards ranging from Rs. 10 to Rs. 20 for the destruction of wolves, whenever it is found that they are more than ordinarily destructive to human life; of this authority in several districts advantage has been taken.

* * * * * * *

Central Provinces' Police Report for 1867.

PARA. 42. Two thousand nine hundred and nineteen persons were reported to have been killed and 620 injured by accidents during the year, being 144 in excess in the former and 51 in the latter of the number reported in 1866; of these 516 were killed and 256 were wounded by wild beasts. This is a decrease of 40 persons killed and an increase of 119 wounded as compared with 1866. As remarked in the observations on the Raepore District, I do not believe that all the deaths that occur from wild beasts, or nearly all, are reported to the Police.

Extract from the Administration Report of the Central Provinces for 1865 66

SECTION II

PARA 40 The Police Returns furnish the following statistics of death, which may be interesting —

	Died	Injured
* * * * * *	*	*
From wild beasts	546	137
* * * * * *	*	*

42 The following statistics of the number of wild beasts destroyed in the districts during the year may also be added in this place —

Tigers	543
Panthers and leopards	760
Bears	392
Wolves	168
Hyænas	387
TOTAL	2,250

for which rewards to the amount of Rs 35,462 (£3,546) were paid

Extract from the Administration Report of the Central Provinces for 1866 67

SECTION V

PARA 45 The returns showing the number of wild beasts destroyed during the last two years may be abstracted thus —

	During the year 1865	1866
Tigers	543	543
Panthers and leopards	760	982
Bears	392	512
Wolves	168	108
Hyænas	387	433
Snakes		6,010*

* This represents the number of snakes killed during the second half of the year 1866 previously rewards were not given for their destruction

for which rewards to the amount of Rs 49,820 (£4,982) were paid. Among the tigers killed were 13 man eaters, which used to live by destroying human life A few packs of man-eating wolves have recently been committing ravages in tracts of country near Jubbulpore Special rewards have been sanctioned for the destruction of these animals, and it is hoped that they will in time be killed off Heretofore the wolves of these parts have no habit of carrying off children, as is the case with wolves of Northern India

The Police Returns give the subjoined statistics of violent or accidental deaths in the Central Provinces —

		During the year 1865	1866
* * * * * *		*	*
From wild beasts		546	699
* * * * * *		*	*

Extract from the Administration Report of the Central Provinces for 1867-68

PARA 39 The Police have reported accidents to life during the year to the following extent as compared with the two preceding years —

	1865	1866	1867
From wild beasts	546	699	506
* * * * * *	*		*

The steady increase is probably to some extent owing to more correct reporting, but tigers are undoubtedly decreasing under the present liberal scale of reward still scarcely a year passes over but some man eating tiger is reported to have taken up his head quarters in the vicinity of a district road in the interior now falling on the unwary traveller, now on some unsuspecting cultivator, and by degrees grown bolder and more determined in his taste for human flesh, carrying off his prey from within the village enclosures The country *shikaree*

will have nothing to say to those man-eaters, and till special measures are taken, and the European District Officer or the European sportsman come to the rescue, the country round remains in a kind of panic.

40. The special attention of this Administration has, during the past few years, been given to the thinning, if not, of exterminating these wild beasts; and, in addition to the offer of liberal rewards, Government has sanctioned the allotment of several elephants to District Officers to aid in the measure.

The following is an abstract of what has been done in this way during the last three years:—

	Wild beasts destroyed during		
	1865.	1866.	1867.
Tigers	543	543	518
Panthers and leopards	760	982	895
Bears	392	512	534
Wolves	168	108	467
Hyænas	387	433	475
Snakes	...	6,910	13,644

Two reports of the destruction of man-eaters, one of which is said to have counted his victims by hundreds, have recently reached this Office.

Extract from the Administration Report of the Province of Oudh for 1865-66.

SECTION I.—PART III.

PARA. 76. The comparative number of accidental deaths are as follows:—

Mode of death.	1864.	1865.	Decrease.
By Wolves	153	118	35

* * * * * * * *

For the year 1866-67.

SECTION I.—PART III.

PARA. 64. The comparative number of accidental deaths is given in the following Table:—

Mode of death.	1865.	1866.	Increase.
By Wolves	118	140	22

For the year 1867-68.

SECTION II.—CHAPTER II.

PARA. 30. The number of accidental deaths has again increased—

Mode of death.	Adults.	Children.
By Wolves	7	152

Extracts from the Judicial Proceedings of the Government of Bengal for July 1864 *and October* 1866.

No. 251, dated Simla, 16th May 1864.

From—A. COLVIN, Esq., *Offg. Under Secy. to the Govt. of India*, HOME DEPT.,

To—*The Officiating Secretary to the Government of Bengal.*

I am directed to forward copy of a despatch from the Secretary of State, No. 31, dated the 14th March, relating to the depredations committed by tigers, wolves, and other wild animals in several parts of India, and to request that you will be good enough to move His Honor the Lieutenant Governor to take such action on the subject as he may consider necessary.

I am desired to add that the inhabitants of villages exposed to the ravages of these wild animals should, if deemed expedient, be at once authorized to retain such a number of arms as may be absolutely necessary for their protection.

No. 31, dated 12th March 1864.

From—The Right Hon'ble Sir CHARLES WOOD, *Bart.*, M. P. *and* G. C. B., *H. M.'s Secy. of State for India,*

To—His Excellency the Governor General of India in Council.

It has recently been brought to notice that in several parts of India, more especially in the Madras Presidency, the lives of the inhabitants are frequently sacrificed, and the cattle and the crops are exposed to serious depredations, from the increasing numbers of tigers, wolves, and other wild animals.

I am aware that it is customary to offer rewards for the destruction of beasts of prey, and I believe that this means has ordinarily been found effectual in checking the evil. It is evident, however, that it has failed of late, and in some parts of the country, to produce this effect, and it seems not improbable that this result may, in part at least, be owing to the villagers having been deprived of their arms through the operation of the General Disarming Act.

In 1860 the Government of Bombay, with reference to the number of deaths from tigers in the Kolapore State, authorized both an increase in the amount of rewards and the distribution of a greater number of guns among the villagers, and these measures appear from subsequent reports to have been attended with success. I have to request that you will take the subject into consideration, and that you will, if you see fit, authorize such a number of arms being retained by the inhabitants of those villages which may be more particularly suffering from the ravages of wild beasts as may be absolutely necessary for the protection of themselves and their property.

No. 1166T, dated 30th June 1864.

From—The Secy. to the Govt. of Bengal,

To—All Commissioners.

I am directed to forward herewith copy of a despatch from the Right Hon'ble the Secretary of State for India, No. 31, dated the 14th March last, relating to the depredations committed by wild animals in various parts of India, and to request that you will submit a special report on the subject, accompanied by a return of deaths caused by wild animals during the past six years. The Lieutenant Governor will be glad to receive any suggestions you may have to make in respect to the destruction of noxious animals.

2. In filling up the form of return, you should, in the column of remarks, distinguish whether the animals killed were cubs or full grown, and also give details of entries under the head of "other animals." Deaths from snakes and alligators must not be included in the return.

No. 1166T, dated 30th June 1864.

From—The Secy. to the Govt. of Bengal,

To—The Commissioner of the Patna Division.

I am directed to forward herewith copy of despatch from the Right Hon'ble the Secretary of State for India, No. 31, dated the 14th March last, relating to the depredations committed by wild animals in various parts of India, and to request that you will submit a special report on the subject, accompanied by a return of deaths caused by wild animals during the past six years. The Lieutenant Governor will be glad to receive any suggestions you may have to make in respect to the destruction of noxious animals.

2. In filling up the form of a return, you should, in the column of remarks, distinguish whether the animals killed were cubs or full grown, and also give details of entries under the head of "other animals." Deaths from snakes and alligators must not be included in the return.

3. I am to request that you will at the same time report how far arms should be allowed in the district of Shahabad to serve as a means of protection against wild beasts.

Abstract of replies to Circular No. 1166T, dated 30th June 1864, calling for special reports relating to the depredations committed by wild animals in India, accompanied by a return of deaths caused by those animals during the last six years.

Rajshahye.—The Commissioner remarks that both tigers and leopards are exceedingly numerous in the districts of his Division, with exception to Moorshedabad; but as both are called "baugh" by the Natives, it is impossible to separate the destructions of one from those of the other, and that deaths from these animals in Rungpore are very common, the leopard being, in the Commissioner's opinion, quite as destructive as the tiger. Mr. Campbell does not think that these animals are on the increase, quite the contrary, and says that the present reward for their destruction is quite high enough, unless where the death of a tiger is specially called for, in which case he recommends that the reward be raised to Rs. 25. He objects to the general distribution of arms among the villagers, as they do not know how to use them, but considers that it would be a good move to have one or two *shikarees* on Rs. 5 each per mensem in the districts of Dinagepore and Rungpore, furnishing them with a double-barrelled gun and allowing them, in addition to their pay, the usual reward for each animal killed.

Assam.—The Commissioner submits his return without any remarks beyond a few having reference to the cause of delay in its transmission.

Patna.—The Commissioner observes that in the two districts north of the Ganges, *viz.*, Tirhoot and Chumparun, noxious animals are few as compared with those to the south of the river. He does not think that the returns of the District Officers are absolutely correct, as they have been most likely prepared from the Police reports, and do not include animals shot by sportsmen; and after noticing the failure of the late attempt to destroy the wild animals in Shahabad by means of regular establishments of Native huntsmen, he says that the system of paying a reward for each animal destroyed is the only one likely to prove in any way successful. Mr. Cockburn states that the Magistrates are willing to grant licenses to persons requiring fire-arms, and adds that he does not think that any increase has taken place in the number of wild animals from the disarmament of Behar and Shahabad.

Nuddea.—The Commissioner says that the records of his Division do not furnish complete materials for a return, but that he submits one containing, as far as possible, the required information. He remarks that the greatest number of deaths from wild beasts occur in the Sunderbuns and Jessore, and that, so long as the forests of the former remain uncleared, it will be hopeless to attempt to exterminate the wild animals inhabiting them. Mr. Dampier promises to instruct the Collectors of the 24-Pergunnahs and Jessore to authorize officers who move about the Sunderbuns to grant the prescribed rewards for the destruction of wild animals on the production of the heads, and recommends that the reward for killing tigers and leopards be doubled.

Dacca.—Mr. Buckland simply submits his return, remarking that the statement from Sylhet has not come in, but will be forwarded on receipt. It is stated in the return that, owing to the gradual clearing of the jungle in Dacca (districts), deaths from wild animals are on the decrease.

Cuttack.—Mr. Shore states that the large number of tigers killed in Cuttack and the heavy rewards paid will excite attention, and observes that the labyrinth of creek and jungle extending along the Cuttack Coast is such a harbour for tigers that the Salt Department, with a view to check their ravages, paid Rs. 15 for each tiger killed in addition to Rs. 5 paid by the Revenue Department; but now that the former reward has ceased, these animals will probably increase in number. He recommends, in concurrence with the Magistrates of Cuttack and Balasore, that the ordinary rewards for a tiger, as distinguished from a leopard, be raised from Rs. 5 to 10; beyond this the Commissioner does not think that any special measures are called for in the Mogulbundee part of the province, as the inhabitants have not been subjected to the Disarming Act, and wild animals have not increased during late years.

The Commissioner says that the regulation part of the province is that least infested by wild beasts, but that the Tributary Mehals are full of them, and, except in the three Government killahs,* no rewards are, as a rule, paid even for the destruction of tigers.

* Bankee. Ungool. Kund Mals.

On the contrary, the sporting Rajahs do not wish the tigers to decrease in number, and have sometimes fined, instead of rewarding, those who have killed them. He suggests that rewards be paid for killing animals in the Gurjats, as well as in the Mogulbundee, but doubts if even this will have any effect so long as the present immense tracts of impenetrable jungle will exist; and, in proof of this, mentions that the Rajah of Dhenkanal has killed 200 tigers and leopards with his own hand, without in any way decreasing the number of those animals in that killah.

In noticing the destructiveness of wild elephants in the Gurjats, north of the Mahanuddy, Mr. Shore remarks that they roam about in herds of from 80 to 200; but, notwithstanding that a Government reward of Rs. 50 is offered for the destruction of each elephant, the Natives will not and dare not shoot them, and he suggests that this reward be increased to Rs. 100, but thinks that it would be best to form keddahs for their capture.

The Commissioner promises a return of the persons and wild animals killed in the Tributary Mehals.

Chota Nagpore.—Colonel Dalton thinks the return he submits of little use as a comparative statement, because more care has been taken in the last year or two than in previous years to secure a correct return of casualties.

He says that the people of Lohardugga and Singhbhoom are all given to hunting, and, as they have all bows and arrows, or arms of some sort, are more than able to hold their own. That in Maunbhoom the population (Bengalee) is not much inclined to hunting, and, as a consequence, the mortality is great. That the deaths in Hazareebaugh are mostly by wolves; that since the reward for tigers and wolves was increased, the number killed yearly is increasing.

The Commissioner says that he is satisfied that the best way to ensure the destruction of wild animals in his Division is to increase the amount of reward and allow a supply of gun-powder in some districts, and he suggests that the rewards in Lohardugga, Singhbhoom, and Hazareebaugh be allowed to stand as at present, but that those in Maunbhoom be raised to the Hazareebaugh scale, so as to induce *shikarees* to resort to the district.

Burdwan.—Mr. Montresor remarks that some of the districts of this Division embrace large tracts of woodland and jungle, particularly Bancoorah, through which the high road to Juggernath runs, whence numbers of pilgrims are carried off by tigers without any one being the wiser, and he proposes that the owners of land along the road be compelled to clear the jungle to one hundred feet on either side, and that the reward for a tiger be increased from Rs. 5 to Rs. 20, and that for a bear from Rs. 2-8 to Rs. 5. In Beerbhoom *shikarees* abound, and the Commissioner does not think that any special measures are called for in this district, or in those of Burdwan, Howrah, or Hooghly, where there are scarcely any wild animals, though deaths do sometimes occur from the bites of mad dogs, snakes, &c. Midnapore has a large expanse of forest and jungle-land, and a large number of deaths are occasioned by tigers, bears, and leopards; and, though the Government reward is higher than in other districts, it is not, the Commissioner says, sufficient. He suggests, as a general remedial measure, that in places where wild animals are known to exist, a certain number of villagers be allowed to keep and use arms, and that the reward for a tiger be raised to Rs. 20, and those for other animals to double the present rates.

Bhaugulpore.—In submitting his return, the Commissioner says that it is imperfect, owing to the destruction of records in some places, and that, as there has been generally a marked decrease of late years in the number of persons killed and an increase in the number of animals destroyed, nothing beyond the present rewards for the extermination of wild animals is called for.

Chittagong.—Mr. Young does not think that the returns have been kept with any method, and suggests the issue of instructions on this head to the Inspector General of Police. He adds that, in addition to the present rewards, every encouragement should be given to the clearance and cultivation of jungly tracts.

STATEMENT of the number of persons killed by wild animals and the number of wild animals destroyed in Bengal during the last six years.

* It is only in the districts of the Patna and Bhaugulpore Divisions that any rules are laid for granting rewards. In both Divisions the rewards are paid by Police Inspectors on the production of the dead animal, but in the Bhaugulpore Division the head and skin are sent in to the Magistrate by the Inspector.

Resolution by His Honor the Lieutenant Governor of Bengal, dated the 2nd November 1866.

Read a letter from the Government of India in the Home Department, No. 251, dated 16th May 1864, forwarding a copy of a despatch from Her Majesty's Secretary of State on the subject of the destruction of human life and the depredations committed by tigers, wolves, and other wild animals in India, and directing this Government to take such action on the subject as may be considered necessary.

Read also the reports and statements called for by Government and submitted by the Commissioners of the different Divisions in the Lower Provinces regarding the deaths caused by wild animals killed during the same period.

1. *Rajshahye.*—In the districts of the Rajshahye Division, with the exception of Moorshedabad, tigers and leopards are numerous; but the Commissioner thinks that the number is decreasing, and considers the present scale of rewards quite high enough, unless where the death of a tiger is specially called for; and he recommends that the reward in each case of this description should be raised to Rs. 25. The Commissioner objects to the general distribution of arms among the people, as they do not know how to use them, but thinks that two *shikarees* on a salary of Rs. 5 each per mensem, with other advantages, might be employed in the districts of Rungpore and Dinagepore.

2. The Lieutenant-Governor approves of the proposal to grant a reward of Rs. 25 in each case when the special circumstances of the case render it a matter of very great importance that any particular tiger should be destroyed. The Commissioner should, however, first satisfy himself in each case that the ordinary reward is not sufficient, and that special circumstances exist which warrant the grant of the special reward. Care must also be taken to ascertain that the tiger for which the special reward is offered has been killed, and that the body of another tiger has not been substituted.

3. The plan of employing paid *shikarees* for the destruction of wild animals has failed under more favorable circumstances than the districts of Rungpore and Dinagepore would present for the carrying out of the scheme, and it is not therefore considered advisable to try it in those districts.

4. *Assam.*—In Assam the existing scale of rewards is sufficient, and no special measures are called for.

5. *Patna.*—The same may be said generally of the Patna Division, where wild animals are not on the increase. In Shahabad there is great loss of life from wolves, but a special reward has already been sanctioned for the destruction of this animal in that district.

6. *Nuddea.*—In the Nuddea Division the greatest number of deaths from wild animals occurs in the Sunderbuns and in the Jessore Districts, where special arrangements for exterminating dangerous animals are impossible, until such time as the forests and the jungle in the Sunderbuns are more cleared.

7. The Commissioner may be desired, if he has not already done so, to authorize officers who move about the Sunderbuns to grant the prescribed rewards for the destruction of wild beasts on the production of the heads.

8. *Dacca.*—In the Dacca Division no special rewards are called for, as, owing to the gradual clearing away of all jungle, deaths from wild animals are on the decrease.

9. *Cuttack.*—In the Cuttack Division the reward for killing a tiger was formerly Rs. 20, of which Rs. 15 was paid by the Salt and Rs. 5 by the Revenue Department, and great numbers of these animals were annually destroyed, but the reward from the former Department has now ceased. As the Commissioner expects that tigers will increase in numbers owing to the smallness of the present reward, he may be informed that his recommendation to increase it from Rs. 5 to Rs. 10 for each tiger has been sanctioned.

10. In respect to wild elephants, the Commissioner observes that they are very destructive in the Gurjats, north of the Mahanuddy River, where they roam in herds of from 80 to 200; and as the Government reward of Rs. 50 for each elephant is not sufficient to induce the people to run the risk of attempting to destroy them, he suggests that the reward be increased to Rs. 100, or that kheddahs for their capture be formed.

11. The Lieutenant Governor would rather see these useful animals captured than killed, and the attention of the Commissary General will be drawn to the question whether kheddahs might not be established. The Commissioner should also consider whether private persons might not with his assistance find the capture of these animals a profitable employment.

12. *Chota Nagpore.*—The existing arrangements and rewards are sufficient in all the districts of Chota Nagpore, with the exception of Maunbhoom, where the people being Bengalees are not much given to hunting like the people of the other districts, and the mortality from wild animals is consequently great.

13. The Commissioner may be told that, under the special circumstances of the case, his proposal to raise the rewards for destroying wild animals in this district to the scale allowed in the Hazareebaugh District has been sanctioned. It is hoped that this measure will induce *shikarees* to resort to Maunbhoom to hunt and destroy noxious animals.

14. *Burdwan.*—The districts of Burdwan, Howrah, and Hooghly, in the Burdwan Division, are nearly free from wild animals; but in Bancoorah there are large tracts of woodland and jungle through which runs the high road to Juggernauth, whence numbers of people are said to be carried off by tigers.

15. The Commissioner should adopt measures to compel the owners of land along this road to keep it clear of jungle for 100 feet on each side of the road. The increase of the reward for each tiger killed from Rs. 5 to Rs. 10 is also sanctioned both for the Bancoorah District and for that of Midnapore.

16. *Bhaugulpore.*—No special measures are required in the Bhaugulpore Division, as there is a marked decrease of late years in the number of persons killed by wild animals and an increase in the number of animals destroyed.

17. *Chittagong.*—In the Chittagong Division also the existing rate of rewards is sufficient; but the Commissioner should be told that it is the duty of the Magistrates to keep the returns of deaths caused by wild animals, and of the number of wild animals killed, and to see that the Police are careful and precise in furnishing information under both heads.

18. It should be suggested to the Commissioners generally that strychnine might be used with advantage and without risk in all cases where a tiger takes up his abode near a village and preys upon the people or their cattle. The poison might be introduced into the body of a cow or other animal after it has been killed by the tiger, but it should only be so used by the Police, or at least under their orders and immediate supervision.

ORDER.—Ordered, that a copy of this Resolution be forwarded to all Commissioners, to the Accountant General of Bengal, and to the Inspector General of Police, for information; also that extract (paragraphs 10 and 11), with extract, paragraph 4, from the Report of the Commissioner of Cuttack, No. 20, dated 13th May 1865, be forwarded to the Commissary General.

No. 4775.

Copy forwarded to all Commissioners.

No. 4776.

Copy forwarded to the Accountant General, Bengal.

No. 4777.

Copy forwarded to the Inspector General of Police, Lower Provinces.

No. 4778.

Extract, paragraphs 10 and 11, of the above, with extract, paragraph 4, from Report of Commissioner of Cuttack, No. 20, dated 13th May 1865, forwarded to the Commissary General.

No. 383, dated 22nd September 1866.

From—COLONEL H. HOPKINSON, *Agent to the Govr. Genl., N. E. Frontier, and Commr. of Assam,*

To—*The Secretary to the Government of Bengal.*

I have the honor to report, for the information of Government, that tigers have become very numerous in the Jynteah Hills, and during last month the Assistant Commissioner in charge reported that no less than 14 human beings had been killed by them. Among the victims was a Havildar of the 5th Native Infantry, who was on his way to join the Detachment at Jowai.

2. In the neighbourhood of Cheera Poonjee and in Cheera Poonjee itself, tigers have also been doing considerable damage, four or five people having been killed by them within the last twelve months, besides a good number of cattle.

3. The Officiating Deputy Commissioner of the Cossyah and Jynteah Hills having been called on to report what measures he would recommend for lessening the number of tigers, suggests that the reward for killing them should be increased, so as to induce people to engage actively in their destruction, and the amount at which he would propose to fix the reward in future is Rs. 25 instead of Rs. 5, the present rate.

4. I beg to state that I concur entirely in Captain Clark's suggestion, and would recommend that it be sanctioned for the Cossyah and Jynteah Hills as a

special measure. The reward for tiger cubs and full-grown leopards now fixed at Rs. 2-8 per head should also be increased proportionately, and be equal to half the reward given for tigers.

No. 2862T, dated 5th October 1866.

From—J. GEOGHEGAN, ESQ., *Offg. Junior Secretary to the Government of Bengal,*
To—*The Commissioner of Assam.*

I am directed to acknowledge the receipt of your letter No. 383, dated the 22nd ultimo, and in reply to inform you that the Lieutenant Governor has been pleased to sanction the increase of the reward for killing tigers in the Cossyah and Jynteah Hills from Rs. 5 to Rs. 20 for each tiger.

2. His Honor also sanctions your proposal to increase the reward for killing tiger cubs and leopards in those hills from Rs. 2-8 to Rs. 10 each.

3. These increased rewards should, the Lieutenant Governor thinks, be sufficient inducement to the people to hunt and kill these animals, which are now so destructive to life.

No. 2863T.

COPY forwarded to the Accountant General for information.

Dated Simla, the 9th August 1869.

From—CAPTAIN B. ROGERS, *Bengal Staff Corps,*
To—*The Private Secy. to His Excellency the Viceroy.*

I have the honor to submit the following plans and suggestions, as I imagine they may be useful in case it should be the wish or intention of Her Majesty's Indian Government to take further measures, or adopt a regular system for the destruction of the wild animals that infest this country, killing large numbers of Her Majesty's subjects and committing such depredations on those poorer tribes who live in or near the jungles, and whose little all is vested in their one or two head of cattle on which these animals so frequently prey.

I am aware of a case in which a tiger entered a herd of cattle, and in a short space of time killed six in the sight of a friend of mine.

By killing as they do these cattle, not only are the villagers losers, but also the Government in an indirect way.

It is by these people, and these people again assisted by their live agricultural stock, that the vast jungles are becoming tracts of cultivated country; but the wild beasts greatly retard the same, and act as a considerable check on the energies of those unfortunates, who are now to a great extent at the mercy of any tiger or other beast of prey that may take up its quarters in their district.

I have on every opportunity visited the jungles, being fond of sport, and taken much pains in ascertaining the habits and peculiarities of all the larger game of this country.

There are many tigers, I have no hesitation in saying, now at large that have killed more than one hundred men each; and I have known of one that defied all the endeavors of some of the best sportsmen in India for upwards of three years, and during that time remained within a circle of 25 or 30 miles, killing, it was calculated, more than two hundred people and numbers of cattle.

A reward of two hundred Rupees was on its head, and most of its "kills" were carefully watched.

Had the system I am about to propose been in vogue, it must have been killed in a few days, or at the most a few weeks, and by the death of that one animal nearly all the lives taken by it saved.

I am also aware of a second animal in Chota Nagpore. Every hour I could get away I was after it, following it frequently day and night. Its deeds of blood were hardly less frightful than the former.

On finding myself so ill as to be obliged to proceed to England in 1864 on medical certificate, and being thus unable to kill the beast fairly, and at the same time not wishing to leave it alive, I had a trap laid very similar to the one I recommend, and it was killed on the second or third day.

No thefts or murders in India can exceed the horrors and misery caused by the wild animals, and no picture or language can give even a faint idea of the suffering of their victims. These poor creatures, living as they do for the most part in districts seldom or ever visited by any European, except an occasional sportsman, are obliged to bear their losses or sufferings with little or no chance of the same being brought to the notice of the Government whose subjects they are.

It is only by mixing with the villagers when out shooting, and being able to converse freely with them, that anything like an idea of their position can be realized. I have frequently assisted men who have been torn by tigers, and heard their history of the circumstances connected with their individual cases, and find that a Native, who is naturally well qualified to make a good story out of his heroic deeds and adventures, can hardly do justice to the positions they were in.

A short time since I would have scorned the idea of killing a tiger or other beast by stratagem, and would have felt the most supreme contempt for any English sportsman doing so. The same feeling is, I am confident, entertained by almost every sportsman, hence the reason of this most important subject not having been brought so prominently to the notice of Government as it otherwise would have been, as from this class of person alone the requisite information could be furnished.

My ideas are now changed, and I feel it to be much more commendable to save the lives and property of nominally protected human beings, and esteem it a matter of duty to thus address you, in the hopes of your kindly soliciting His Excellency the Viceroy to be graciously pleased to allow this communication to be laid before him.

I have, perhaps, gone into the subject too fully. I sincerely trust you will not consider it presumption my having done so.

I look upon it in the light of a question involving the lives of hundreds of persons yearly; and in a second and less serious light, as affecting the loss of cattle to the value of very many lakhs of rupees for the same period, and the same being almost entirely the only worldly property of thousands of half-starved creatures of a much more honest and truthful disposition than the inhabitants of the towns and villages in the immediate vicinity of our stations. ***There is a wide difference between cattle stolen and the cattle thus destroyed.*** In the former case the animals may be recovered, or if not, they are still available for human food, or to assist man in his daily labor; but in the latter, it is simply destruction. The victims knowing of no power to help them, look upon the loss of their one head of cattle as their fate, and experience has taught them that no effort of theirs can prevent it, and they are ignorant as to whom to apply for that assistance of which they stand in need.

It is almost ruin to them, and for years they feel the loss, having in all probability to borrow money from bankers or others at an exorbitant rate of interest to enable them to purchase another animal, and thus continue their vocations.

These mahajuns who furnish the requisite funds are, as a rule, grasping and cruel in the extreme in the manner they treat their creditors: he is a fortunate man who being once in their power has not good reason to regret it to his death.

Rewards cannot and will not reduce the number of wild beasts; but a regular system, such as I propose, must eventually exterminate them, or render their power of doing injury *nil*, as on their first appearance they find death on their road, and the missle that kills them has no power of injuring persons or property if used with the care that the most simple-minded *shikaree* can exercise.

Accidents will and must happen, but these, under all circumstances, are unavoidable.

One of the many objections to the present system of rewards is this—a *shikaree* knows of a tiger, and has the means of killing him; but he does not do so, but allows the animal to continue his deeds of blood undisturbed. "Why?" because he looks forward to a sahib coming out and shooting it, and his getting, not only a higher pecuniary reward, but also ammunition. Should such be the case, the sahib only in the end pays the sum he gives over and above the reward, as on application to the civil authorities he recovers the amount of the sanctioned reward, and retains what he greatly prizes, *viz.*, the animal's skin; of course the value of any ammunition he may, or may not, have given would be nominal.

I have also heard men complain of the trouble in obtaining the rewards. Native landholders also, in many instances, do not like wild beasts being killed on their estates, because they imagine it gives them a chance (if these jungles contain tigers) of making friends with some influential English gentlemen, especially when they find him in that most amiable temper that a sportsman always is when standing over the skin or body of a tiger he has killed and that has given him good sport. I do not for one moment intend to convey the idea that an English gentleman is influenced in any way by circumstances of the kind, but the result is the same—Natives believe such to be the case, and I am confident that this has allowed a tiger many times an extra draught of human blood, and over and over again left him undisturbed to feed on the cattle of the ryots, when otherwise he would have been destroyed.

To prevent the above no rewards would avail that could be sanctioned for killing the animal; neither will they in parts of India where superstition exists regarding the animal.

Many circumstances, differing widely from each other but with similar results, have induced me to recommend certain slight particulars in my form of returns, which experience has proved to be necessary. Of these forms, I have sent herewith only two, as I imagine they will be quite sufficient to explain how I propose my suggestions should be carried out; and I have endeavoured to be as brief as possible so as to prevent the perusal of this letter taking up more of your valuable time than is absolutely necessary to put you in possession of the basis of my proposed operations, the manner in which they should be carried out, and my reason for believing operations of the kind advisable.

The extent of country over which I would propose they are granted a trial is immense, and until it is proved by practical experience that the results are all I represent them as likely to be, of course the sum granted for carrying out the same would be very limited. They are therefore of the most simple nature that can, I believe, be arranged to ensure correct reports being received of the exact loss and injury caused by the different classes of animals, their estimated pecuniary value, and the result of the endeavours of the executive to improve matters.

With regard to the weapon, I propose the use of the old muskets, that have merely a nominal value as iron, and are constantly being broken up and sold as

such. These would still remain the property of the State, and could at any time be called in, and still retain as great a pecuniary value as they had when issued.

An adjustment attached to the trigger is the only expense, and this would not exceed four annas per musket.

There are three strings attached to this trigger adjustment. The one marked A is the fatal one, and, running along the barrel, crosses the path these animals frequent, and is set at the height of the shoulder of the beast it is desired should be killed; and that string represents the line of fire. The bullet, therefore, invariably enters the most fatal part. It is a well known fact that wild beasts do not wander, as animals of the deer tribe do, all over the jungle, but invariably travel by the paths and roads through the jungle when going for food or water; and that, in the event of one being killed, and another coming to the same district, the chances are ten to one that animal will use the same paths and roads, and take up his quarters in almost exactly the same spot as his predecessor. Their haunts and walks are well known to every *shikaree* in the district, and it would be a matter easily determined as to where to set the gun to ensure the animal's destruction before it had time to do much injury.

To prevent the destruction of animals that should not be destroyed, there are two other strings attached to the trigger, and these (marked BB) are laid at such a height from the ground as to allow a tiger or other animal it is wished to kill to pass underneath without touching.

These are not laid in the same straight line as the one laid for the animal to be killed, but right and left of it, at such angles and distances as may be necessary under different circumstances.

Cattle or persons coming in contact with these strings cause the gun to go off, and its fire is perfectly harmless. Other precautions of an ordinary nature, and depending on circumstances, and also on the ground, could be taken by any common *shikaree*, ensuring favorable results and the prevention of accidents. I will not, therefore, go further into the description of the weapon and its use, the diagram I attach renders it unnecessary.

Ammunition would be furnished as required on payment and at cost prices, and would be obtained from Government Magazines. On account of the extent of ground to be protected and watched, it would doubtless at first be imagined that a much larger amount of ammunition and number of arms would be required than are absolutely necessary. The exact quantity and number could not be stated until it was known where this is to be granted a trial, if it is to be tried. English fire-arms would only be given to men who would be best fitted to use them, and most men would have a roughly constructed adjustment given them to be placed on their matchlocks; but this would not in all cases insure fatal results, as their action is not certain or instantaneous.

In those districts where bows and arrows are the arm of the Natives, the same attachment can be used, and nearly equally fatal results secured with that antiquated weapon. At the same time, here and there in those districts, a gun would be issued to an intelligent Native, who would doubtless make good use of it, and many men would exert themselves in hopes of having a gun issued to them. The *shikarees* of the districts can be organised, and prove a most formidable body of Police (if I may call them so) to act, not against human robbers and murderers, but still the greater curse of the country—the animal tyrants of the jungle and forests. No Native *shikaree* should be granted the use of a gun without paying an annual tribute to Government of ten rupees. This may appear hard, but it is not so, when animals (deer) are plentiful, and it would be the wish of Government that they be destroyed, ten rupees would be easily earned; for, on a beast being killed by a *shikaree*, its flesh is exchanged for grain, and the

average value is about two seers of grain for one of flesh, which is the reason of so many lazy fellows being *shikarees* ; and if their number were reduced to one-third of what they now are, many men would be obliged to work at their trades or cultivation, instead of going out one or two days in the month and killing an occasional animal, which enables them to live in ease and luxury (according to their ideas) for the remaining days; and thus, as is always the case, one lazy man will not only not work himself, but keep others also from their work, and, instead of being a useful member of his society, he is a public nuisance. Most of the animals killed would come from the Government waste lands, and are thus the property of Government; and even, if such were not the case, the hardship would not be great. The payment need not always be in coin of the realm. It could be made in skins or horns. If he cannot kill enough during the twelve months to enable him to pay the license tax, either he is not fit for a *shikaree*, or lazy, or there is not a sufficient quantity of game to render it necessary for him to be granted a certificate without payment.

Eight rupees could be given as a reward, but never more, except under special circumstances, having no reference to the damage the tiger is doing, but to any extra trouble or injury the *shikarees* has sustained in killing it; for instance, if he has tied up cattle to entice the animal to pass the line of the fatal chord, and the beast kills them, I would recommend that he receive compensation in addition to the eight rupees, which is merely a remuneration for his time and trouble.

A certain number of *shikarees* should hold certificates gratis, and not pay the ten rupees yearly, for which favor, on them could rest the responsibility of wild animals being killed on their making their appearance, or committing any loss or injury in their district. The number of *shikarees* being reduced by not paying the ten rupees yearly would greatly increase the value of the privilege of those gaining a certificate gratis, and further stimulate the energies of others who pay for theirs to kill wild animals in hopes of having a similar favor conferred upon them.

It is only on due consideration, and with a general knowledge of the jungles and their inhabitants, both human and animal, that the full value of the license thus given in the certificate can be conceived, or how it would be appreciated by the individuals holding it. One or two men in each district would receive one of the guns furnished by Government, and in case of an animal being killed, the reward paid by the Government would not, as a matter of course, be given to one individual, but be divided between two or three, if it was considered right.

I would appoint in each district a jemadar of *shikarees*, who will report every irregularity committed by the others in his district, for which responsibility he would receive yearly one coat of the value of twelve rupees. Although this appears a small remuneration, yet it is enough, and carries with it a dignity of which that class of men would be greatly proud, and he would wear it on grand occasions; and, being a little chief of the jungles in his way, would be most zealous in his endeavour to retain his position. Of course his appointment would only be from year to year.

All skins of animals and their claws, for which a reward is paid, to become the property of Government, and no person should have the option of purchasing the same, but that they be sold at stated places and at appointed times, of which due notice would be given. These will realise a large sum of money, and, with a little management, a number of valuable skins can be brought into the market; and a small sum being given for skins on which care had been bestowed would soon induce the Natives to give them up in a better condition than at present.

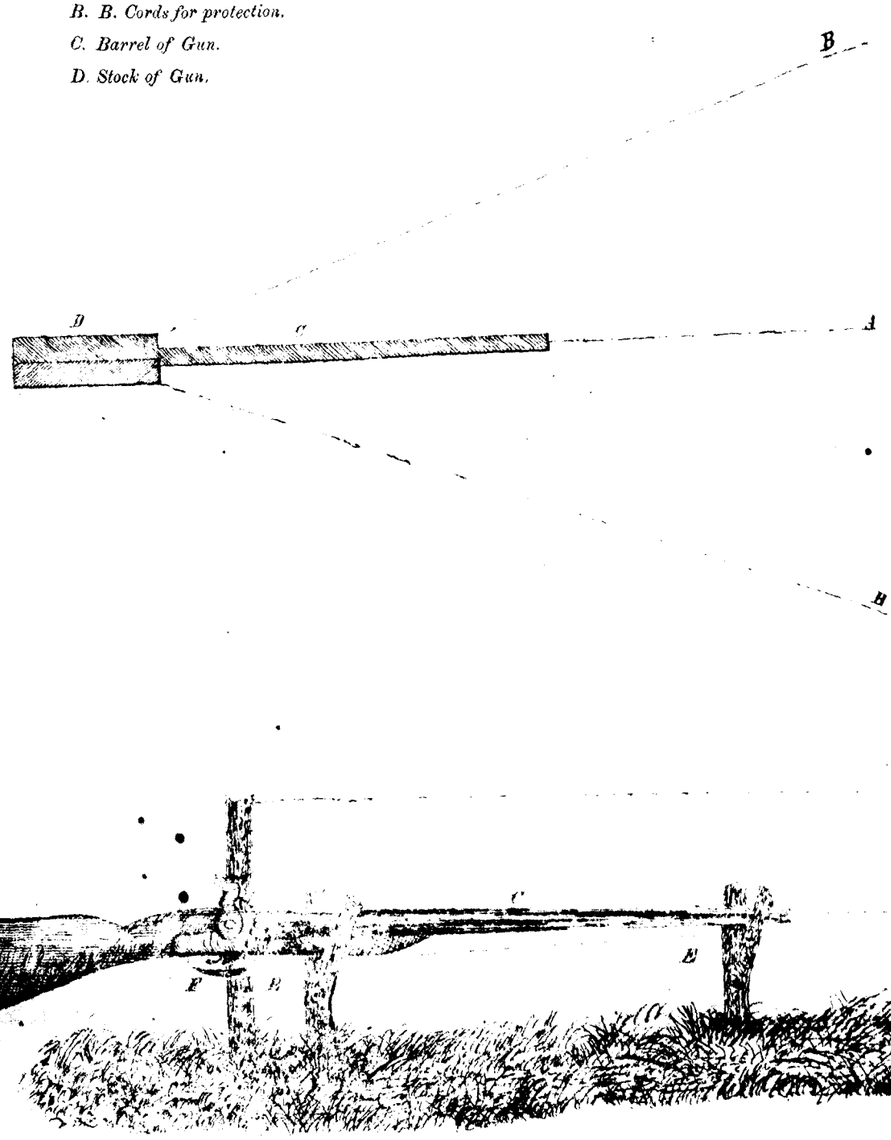
The granting of certificates should rest entirely with the officer of the district superintending the destruction of these animals, whether the certificate be paid for or not; and should the district civil authorities even consider it advisable for more certificates to be granted, they should refer the matter to that officer,

and that officer should, if he think fit, refuse to grant a certificate even on payment; and further, no man, European or Native, should be allowed to give his servant a gun to discharge with the intent of killing an animal, unless that servant has a certificate, without being liable to a fine for so doing, as well as the man using it. Any man having a certificate, paid for or not, and seeing another man use a gun for the destruction of animals without having a certificate, to be liable to forfeit his certificate if he does not at once report the same to the nearest Police Station.

A man holding a certificate never to go out with his gun without it, and on all occasions to produce it when called upon to do so by a man holding one, or by the civil authorities.

On an animal being killed, the man must report it to the nearest Police Station at once, where he will receive the authorized reward, and deposit the skin. If the skin is not perfect, the fact must be mentioned in the regular form reporting the case, and sent from the Police Station to the District Superintendent of Police, who will forward the same in the Vernacular to the officer superintendending the destruction of the animals, keeping a duplicate in his Office.

If the skin is in a very bad state, the reward could be withheld until the reason of the same was investigated.



In the event of any people or cattle being killed or injured, the headman of the village in which the same occured should report the same (whether they belong to his village or not) at the nearest Police Station, and, in the case of cattle, state their value, and always mention by what class of animal the injury was committed, and the date; and the above should be communicated in the form sanctioned to the District Superintendent of Police, who, if convinced of its truth, would forward it on as before to the officer superintending the destruction of wild animals.

Of course this return would be in the Vernacular; and the reason it is sent through the Police is to ensure its being a true statement, and prevent false records being framed.

A monthly and annual statement would of course be compiled, showing all the points above referred to, and reporting general progress.

In conclusion, I will say nothing further than to apologise for having written at such length, and I trust the subject will be considered a sufficient excuse for my having done so.

GOVERNMENT OF INDIA.

FOREIGN DEPARTMENT.

TREATY BETWEEN THE BRITISH GOVERNMENT AND THE MAHARAJA OF JEYPORE REGARDING THE LEASE OF THE JOINT PROPERTY IN SALT ON THE SAMBHUR LAKE.

I.

Treaty between the British Government and His Highness S. RAM SINGH, *Maharaja of Jeypore*, G. C. S. I., *his heirs and successors, executed on the one part by* MAJOR WILLIAM H. BEYNON, *Political Agent at the Court of Jeypore, under authority from* LIEUTENANT COLONEL RICHARD HARTE KEATINGE, C. S. I. *and* V. C., *Agent to the Governor General for the States of Rajpootana, in virtue of the full powers vested in him by His Excellency the Right Hon'ble* RICHARD SOUTHWELL BOURKE, EARL OF MAYO, VISCOUNT-MAYO OF MONYCROWER, BARON NAAS OF NAAS, K. P., G. M. S. I., P. C., &c., &c., *Viceroy and Governor General of India; and on the other part by Nawab* MAHOMED FAIZ ALI KHAN, *Bahadoor, in virtue of the full powers conferred on him by Maharaja* RAM SINGH *aforesaid.*

ARTICLE I.

Subject to the conditions contained in the following Agreement, the Government of Jeypore will lease to the British Government its right of manufacturing and of selling salt within the limits of the territory bordering on the Sambhur Lake, as hereinafter defined in Article IV, and of levying duties on salt produced within such limits.

ARTICLE II.

This lease shall continue in force until such time as the British Government desires to relinquish it, provided that the British Government shall give notice to the Government of Jeypore of its intention to terminate the arrangement two full years previous to the date on which it desires the lease to cease.

ARTICLE III.

To enable the British Government to carry on the manufacture and sale of salt at the Sambhur Lake, the Jeypore Government shall empower the British Government, and all Officers appointed by the British Government for such purposes, to enter and search, in case of suspicion, houses and all other places enclosed or otherwise within the limits hereinafter defined, and to arrest and punish with fine, imprisonment, confiscation of goods, or otherwise, any and all persons detected within such limits in the violation of any of the rules or regulations which may be laid down by the British Government in regard to the manufacture, sale, or removal of salt, or the prevention of unlicensed manufacture or smuggling.

ARTICLE IV.

The strip of territory bordering on the shores of the lake, including the town of Sambhur and twelve other hamlets, and comprehending the whole of the territory now subject to the joint jurisdiction of the States of Jeypore and Jodhpore, shall be demarcated, and the whole space enclosed by such line of demarcation, as well as such portions of the lake itself, or of its dry bed, as are now under the said joint jurisdiction shall be held to constitute the limits within which the British Government and its Officers are authorized to exercise the jurisdiction referred to in Article III.

ARTICLE V.

Within the said limits, and so far as such measures may be necessary for the protection or furtherance of the manufacture, sale, or removal of salt, the prevention of smuggling, and the enforcement of the rules laid down in accordance with Article III of this Agreement, the British Government, or the Officers by it empowered, shall be authorized to occupy land for building or other purposes, to construct roads, erect barriers, hedges or buildings, and to remove buildings or

other property. If any land paying land revenue to the Government of Jeypore be occupied under the authority of the British Government for any of the purposes aforesaid, the British Government shall pay to the Government of Jeypore an annual rent equal to the amount of such revenue. In every case in which anything involving injury to private property shall be done by the British Government or its Officers under this Article, one month's previous notice shall be given to the Government of Jeypore, and in all such cases proper compensation shall be paid by the British Government on account of such injury. In case of difference between the British Government or its Officers and the owner of such property as to the amount of the compensation, such amount shall be determined by arbitration. The erection of any buildings within the said limits shall not confer on the British Government any proprietary right in the land, which, on the termination of the lease, shall revert to the Government of Jeypore, with all buildings or materials left thereon by the British Government. No temples or places of religious worship shall be interfered with.

ARTICLE VI.

Under the authority of the Jeypore Government, the British Government shall constitute a Court, presided over by a competent Officer, who shall usually hold his sittings within the above-mentioned limits, for the trial and punishment, on conviction, of all persons charged with violation of the rules and regulations referred to in Article III, or offences connected therewith; and the British Government is authorized to cause the confinement of any such offenders sentenced to imprisonment, either within the aforesaid limits or within its own territories as may seem to it most fitting.

ARTICLE VII.

From and after the date of the commencement of the lease, the British Government will from time to time fix the price at which salt manufactured within the said limits, other than the salt to be delivered under the second clause of this Article, shall be offered for sale. The Jeypore Government shall be entitled to receive annually at the place of manufacture from the British Government, for the consumption of the Jeypore State, any quantity of salt which the Jeypore Government may demand, not exceeding one hundred and seventy-two thousand (172,000) British Indian maunds, paying for the same at the rate of nine (9) annas (British Currency) per maund. The Jeypore Government will be at liberty to sell such salt at any price that it may fix.

ARTICLE VIII.

Of the stocks of salt owned jointly by the Governments of Jeypore and Jodhpore, and existing within the said limits at the commencement of the lease, the share belonging to the Jeypore Government, being the half of the stocks above-mentioned, shall be transferred by the said Government to the British Government on the following terms:—In accordance with custom, the Government of Jeypore will transfer its share in five hundred and ten thousand (510,000) British Indian maunds of salt to the British Government free of cost. The price to be paid for the share of the Jeypore Government in the remainder of the said stocks shall be reckoned at six and a half annas ($6\frac{1}{2}$) per British Indian maund, and payment shall be made at this rate by the British Government to the Government of Jeypore, provided that the said payment of six and a half annas per maund to the Government of Jeypore shall only commence when salt in excess of eight hundred and twenty-five thousand (825,000) British Indian maunds is sold or exported by the British Government in any year, and then only on the share of such excess which belongs to the Government of Jeypore; and until the aggregate of such yearly excesses amounts to the full quantity of the stocks of salt transferred over and above the said five hundred and ten thousand British Indian maunds, the British Government shall not pay the royalty of 20 per cent. on the sale price of such excess, as provided in Article XII. In reckoning the said eight hundred and twenty-five thousand maunds, the amount of salt reserved for the consumption of the Jeypore State under Clause 2 of Article VII shall be included.

ARTICLE IX.

No tax, toll, transit duty, or due of any kind whatsoever, shall be levied by the Jeypore Government, or shall by it be permitted to be levied by any other

person, on any salt manufactured or sold by the British Government within the said limits, or while in transit through the Jeypore territory and covered by a British Pass *en route* to any place outside the Jeypore territory, provided that on all salt delivered under Article VII, or sold for consumption within the territory of Jeypore, the Government of that State will be at liberty to levy whatever tax it may please.

ARTICLE X.

Nothing in this Agreement shall be held to bar the sovereign jurisdiction of the Jeypore Government, within the aforesaid limits, in all matters, civil and criminal, not connected with the manufacture, sale or removal of salt, or the prevention of unlicensed manufacture or smuggling.

ARTICLE XI.

The Government of Jeypore shall be relieved of all expenses whatsoever connected with the manufacture, sale, and removal of salt, and the prevention of unlicensed manufacture or smuggling within the limits aforesaid ; and in consideration of the lease granted to it, the British Government agrees to pay to the Jeypore Government, in two half-yearly instalments, an annual rent of one hundred and twenty-five thousand (1,25,000) Rupees, British Currency, on account of the share of the Jeypore Government in the salt sold within the said limits, and one hundred and fifty thousand (1,50,000) Rupees, British Currency, in compensation for duties on salt now levied by the Jeypore Government, and surrendered under the present Agreement ; and the total sum of such annual rent, amounting to two hundred and seventy-five thousand (2,75,000) Rupees, British Currency, shall be paid without reference to the quantity of salt actually sold in, or exported from, the said limits.

ARTICLE XII.

If the amount of salt sold in, or exported from, the said limits by the British Government in any year shall exceed eight hundred and twenty-five thousand (825,000) British Indian maunds, the British Government shall pay to the Government of Jeypore on all such excess (subsequent to the exhaustion of the stock referred to in Article VIII) a royalty at the rate of 20 per cent. on the price per maund which shall have been fixed as the selling price under the first clause of Article VII. In the event of any doubts arising as to the amount of salt on which royalty is claimable in any year, the accounts rendered by the principal British Officer in charge at Sambhur shall be deemed conclusive evidence of the amounts actually sold or exported by the British Government within the periods to which they refer, provided that the Jeypore Government shall not be debarred from deputing one of its own Officers to keep a record of sales for its own satisfaction.

ARTICLE XIII.

The British Government agrees to deliver annually (7,000) seven thousand British Indian maunds of good salt, free of all charges, for the use of the Jeypore Durbar; such salt to be delivered at the place of manufacture to any Officer empowered by the Jeypore Government to receive it.

ARTICLE XIV.

The British Government shall have no claim on the land or other revenue, unconnected with salt, payable from the town of Samhhur, or other villages or lands included within the limits aforesaid.

ARTICLE XV.

The British Government shall not sell any salt outside the limits aforesaid within the Jeypore territory.

ARTICLE XVI.

If any person employed by the British Government, within the said limits, shall have absconded after commiting an offence, or if any person shall have absconded after committing a breach of the rules laid down under Article III, the Jeypore Government shall, on sufficient evidence of his criminality, make every effort to cause his arrest and surrender to the British authorities within the said limits, in case of his passing through, or taking refuge in, any part of the Jeypore territories.

ARTICLE XVII.

None of the conditions of this Agreement shall have effect until the British Government shall actually assume charge of the manufacture of salt within the said limits. The British Government may determine the date of so assuming charge, provided that such date shall be one of the dates following, *viz.*, the 1st November 1869, the 1st May or the 1st November 1870, or the 1st May 1871. If such charge be not assumed on or before the 1st May 1871, the conditions of this Agreement shall be null and void.

ARTICLE XVIII.

None of the conditions contained in this Agreement shall be in any way set aside or modified without the previous consent of both Governments; and should either party fail or neglect to adhere to these conditions, the other party shall cease to be bound by this Agreement.

TREATY BETWEEN THE BRITISH GOVERNMENT AND THE MAHARAJA OF JODHPOOR REGARDING THE LEASE OF THE JOINT PROPERTY IN SALT ON THE SAMBHUR LAKE.

II.

Treaty between the British Government and His Highness Maharaja TUKHT SINGH, G. C. S. I., *of Jodhpoor, his heirs and successors, executed on the one part by Colonel* JOHN C. BROOKE, *Officiating Political Agent at the Court of Jodhpoor, under authority from Lieutenant-Colonel* RICHARD HARTE KEATINGE, C. S. I. *and* V. C., *Agent to the Governor General for the States of Rajpootana, in virtue of the full powers vested in him by His Excellency the Right Hon'ble* RICHARD SOUTHWELL BOURKE, EARL OF MAYO, VISCOUNT MAYO OF MONYCROWER, BARON NAAS OF NASSA, K. P., G. M. S. I., P. C., *&c., &c., Viceroy and Governor General of India, and on the other part by* JOSHEE HUNSRAJ, *Moosahib of Marwar, in virtue of the full powers conferred on him by Maharaja* TUKHT SINGH *aforesaid.*

ARTICLE I.

Subject to the conditions contained in the following Agreement, the Government of Jodhpoor will lease to the British Government its right of manufacturing and of selling salt within the limits of the territory bordering on the Sambhur Lake, as hereinafter defined in Article IV, and of levying duties on salt produced within such limits.

ARTICLE II.

This lease shall continue in force until such time as the British Government desires to relinquish it, provided that the British Government shall give notice to the Government of Jodhpoor of its intention to terminate the arrangement two full years previous to the date on which it desires the lease to cease.

ARTICLE III.

To enable the British Government to carry on the manufacture and sale of salt at the Sambhur Lake, the Jodhpore Government shall empower the British Government, and all Officers appointed by the British Government for such purposes, to enter and search, in case of suspicion, houses and all other places, enclosed or otherwise, within the limits hereafter defined, and to arrest

and punish with fine, imprisonment, confiscation of goods or otherwise, any and all persons detected within such limits in the violation of any of the rules or regulations which may be laid down by the British Government in regard to the manufacture, sale, or removal of salt, or the prevention of unlicensed manufacture or smuggling.

ARTICLE IV.

The strip of territory bordering on the lake, including the town of Sambhur and twelve other hamlets, and comprehending the whole of the territory now subject to the joint jurisdiction of the States of Jodhpoor and Jeypoor, shall be demarcated, and the whole space inclosed by such line of demarcation, as well as such portions of the lake itself, or of its dry bed, as are now under the said joint jurisdiction shall be held to constitute the limits within which the British Government and its Officers are authorized to exercise the jurisdiction referred to in Article III.

ARTICLE V.

Within the said limits, and so far as such measures may be necessary for the protection or furtherance of the manufacture, sale, or removal of salt, the prevention of smuggling, and the enforcement of the rules laid down in accordance with Article III of this agreement, the British Government, or the Officers by it empowered, shall be authorized to occupy land for building or other purposes, to construct roads, erect barriers, hedges, or buildings, and to remove buildings or other property.

If any land paying land revenue to the Government of Jodhpoor be occupied under the authority of the British Government for any of the purposes aforesaid, the British Government shall pay to the Government of Jodhpoor an annual rent equal to the amount of such revenue.

In every case in which anything involving injury to private property shall be done by the British Government or its Officers under this Article, one month's previous notice shall be given to the Government of Jodhpoor, and in all such cases proper compensation shall be paid by the British Government on account of such injury. In case of difference between the British Government or its Officers and the owner of such property as to the amount of the compensation, such amount shall be determined by arbitration.

The erection of any buildings within the said limits shall not confer on the British Government any proprietary right in the land, which, on the termination of the lease, shall revert to the Government of Jodhpoor, with all buildings or materials left thereon by the British Government.

No temples or places of religious worship shall be interfered with.

ARTICLE VI.

Under the authority of the Jodhpoor Government, the British Government shall constitute a Court, presided over by a competent Officer, who shall usually hold his sittings within the above-mentioned limits, for the trial and punishment, on conviction, of all persons charged with violations of the rules and regulations referred to in Article III, or offences connected therewith ; and the British Government is authorized to cause the confinement of any such offenders sentenced to imprisonment, either within the aforesaid limits or within its own territories, as may seem to it most fitting.

ARTICLE VII.

From and after the date of the commencement of the lease, the British Government will, from time to time, fix the price at which salt manufactured within the said limits, and intended for exportation beyond the limits of the Jodhpoor and Jeypoor States, shall be offered for sale.

ARTICLE VIII.

Of the stocks of salt owned jointly by the Governments of Jodhpoor and Jeypoor, and existing within the said limits at the commencement of the lease, the share belonging to the Jodhpoor Government, being the half of the stocks

above-mentioned, shall be transferred by the said Government to the British Government on the following terms :—

The Jodhpoor Government will transfer its share in five hundred and ten thousand (510,000) British Indian maunds of salt to the British Government free of cost. The price to be paid for the share of the Jodhpoor Government in the remainder of the said stocks shall be reckoned at six and a half annas ($6\frac{1}{2}$) per British Indian maund, and payment shall be made at this rate by the British Government to the Government of Jodhpoor, provided that the said payment of six and a half annas per maund to the Government of Jodhpoor shall only commence when salt in excess of eight hundred and twenty-five thousand (825,000) British Indian maunds is sold or exported by the British Government in any year, and then only on the share of such excess which belongs to the Government of Jodhpoor ; and until the aggregate of such yearly excesses amounts to the full quantity of the stocks of salt transferred, over and above the said five hundred and ten thousand (510,000) British Indian maunds, the British Government shall not pay the royalty of 20 per cent. on the sale price of such excess, as provided in Article XII.

ARTICLE IX.

No tax, toll, transit duty, or due of any kind whatsoever shall be levied by the Jodhpoor Government, or shall by it be permitted to be levied by any other person, on any salt manufactured or sold by the British Government within the said limits, or while in transit through the Jodhpoor territory, and covered by a British pass, *en route* to any place outside the Jodhpoor territory.

ARTICLE X.

Nothing in this agreement shall be held to bar the sovereign jurisdiction of the Jodhpoor Government, within the aforesaid limits, in all matters, civil and criminal, not connected with the manufacture, sale, or removal of salt, or the prevention of unlicensed manufacture or smuggling.

ARTICLE XI.

The Government of Jodhpoor shall be relieved of all expenses whatsoever connected with the manufacture, sale, and removal of salt, and the prevention of unlicensed manufacture or smuggling within the limits aforesaid ; and, in consideration of the lease granted to it, the British Government agrees to pay to the Jodhpoor Government, in two half-yearly instalments, an annual rent of one hundred and twenty-five thousand (1,25,000) Rupees, British Currency, on account of the share of the Jodhpoor Government in the salt sold within the said limits, and the total sum of such annual rent, amounting to one hundred and twenty-five thousand (1,25,000) Rupees, British Currency, shall be paid without reference to the quantity of salt actually sold in, or exported from, the said limits.

ARTICLE XII.

If the amount of salt sold in, or exported from, the said limits by the British Government in any year shall exceed eight hundred and twenty-five thousand (825,000) British Indian maunds, the British Government shall pay to the Government of Jodhpoor on all such excess (subsequent to the exhaustion of the stock referred to in Article VIII) a royalty at the rate of 20 per cent. on the price per maund, which shall have been fixed as the selling price under the first clause of Article VII.

In the event of any doubts arising as to the amount of salt on which royalty is claimable in any year, the accounts rendered by the principal British Officer in charge at Sambhur shall be deemed conclusive evidence of the amounts actually sold or exported by the British Government within the periods to which they refer: Provided that the Jodhpoor Government shall not be debarred from deputing one of its own Officers to keep a record of sales for its own satisfaction.

ARTICLE XIII.

The British Government agrees to deliver annually seven thousand (7,000) British Indian maunds of good salt, free of all charges, for the use of the Jodhpoor Durbar; such salt to be delivered at the place of manufacture to any Officer empowered by the Jodhpoor Government to receive it.

ARTICLE XIV.

The British Government shall have no claim on the land or other revenue, unconnected with salt, payable from the town of Sambhur or other villages or lands included within the limits aforesaid.

ARTICLE XV.

The British Government shall not sell salt within the Jodhpoor territory outside the limits of such jurisdiction as may be assigned to it by this or any other agreement.

ARTICLE XVI.

If any person employed by the British Government within the said limits shall have absconded after committing an offence, or if any person shall have absconded after committing a breach of the rules laid down under Article III, the Jodhpoor Government shall, on sufficient evidence of his criminality, make every effort to cause his arrest and surrender to the British authorities within the said limits, in case of his passing through, or taking refuge in, any part of the Jodhpoor territories.

ARTICLE XVII.

None of the conditions of this agreement shall have effect until the British Government shall actually assume charge of the manufacture of salt within the said limits.

The British Government may determine the date of so assuming charge, provided that if such charge be not assumed on or before the 1st May 1871, the conditions of this agreement shall be null and void.

ARTICLE XVIII.

None of the conditions contained in this agreement shall be in any way set aside or modified without the previous consent of both Governments, and should either party fail or neglect to adhere to these conditions, the other party shall cease to be bound by this agreement.

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

MEASURES TAKEN FOR CARRYING OUT THE PUNJAB NORTHERN (STATE) RAILWAY.

No. 54 S, dated 15th February 1869.

From—LIEUT.-COLONEL H. DRUMMOND, R. E., *Under Secy. to the Govt. of the Punjab, in the P. W. Dept., Railway Branch,*

To—*The Secretary to the Government of India,* PUBLIC WORKS DEPT.

I am directed to forward, for the information of the Government of India, copies of correspondence as marginally noted, on the question of locating the Railway line from the River Ravee to Goojranwalla on the Grand Trunk Road, or parallel to, but independent of, that road.

Letter No. 51, dated 14th January 1869, from Superintending Engineer, Lahore Division, Northern (State) Railway, to Consulting Engineer, Punjab Government, with two estimates and sections.
No. 638, dated 22nd January 1869, from Consulting Engineer, Punjab Government, in reply to above.
No. 99 of 27th January 1869, from Superintending Engineer, Lahore Division, Northern (State) Railway, to Consulting Engineer, Punjab Government.
No. 818 of 26th January 1869, from Consulting Engineer, Punjab Government, to Superintending Engineer, Lahore Division, Punjab Northern (State) Railway.
Note by Consulting Engineer, Punjab Government, on Superintending Engineer's No. 51, and accompaniments.
Remarks by Lieutenant Governor on above Note.
Memorandum by Colonel Taylor on above, No. 51.
No. 104 of 30th January 1869, from Superintending Engineer, Lahore Division, Northern (State) Railway, to Consulting Engineer, Punjab Government.
No. 1248 of 9th February 1869, from Consulting Engineer, to Chief Engineer, State Railway.
No. — of 13th February 1869, from Chief Engineer, in reply to No. 1248.

2. The Lieutenant Governor recommends that the line of Railway from the point where it will cross the Trunk Road on the right bank of the Ravee be located parallel to, and independent of, the road, and that early sanction of the Supreme Government may be accorded to Estimate No. 2, which accompanies the Superintending Engineer Mr. Grant's letter No. 51, in order that a commencement may be made of the work.

3. The above estimate will be considered merely temporary and provisional, pending the submission hereafter of complete estimates by the Chief Engineer, Mr. Lee Smith.

No. 51, dated 14th January 1869.

From—A. GRANT, ESQ., *Supdg. Engr., Lahore Division, Punjab Northern (State) Railway,*

To—*The Consulting Engineer to the Government of the Punjab, Railway Dept.*

In conformity with your instructions, a survey and examination of the Trunk Road has been made between Lahore and Goojranwalla with a view to ascertaining the advantage, or otherwise, of the occupation of a portion of its width in the construction of the Punjab Northern Railway.

This work has been done by Messrs. Glin and Kelsey, Executive Engineers, and commences from the point at which the centre line of the proposed Ravee bridge intersects the Trunk Road, terminating at Goojranwalla, a distance of 36 miles, 1,600 feet.

These Engineers have run a traverse, and taken levels, with cross-sections, throughout this length, picking up in their progress complete information as to water-ways, &c., &c. The results of their examination I now beg to submit in the accompanying comparative estimates,—one of the cost of the Railway earth-work on that distance, when availing itself of a maximum width of 12 feet from the Trunk Road; and the other of the same, when Railway is laid down independently of road, but parallel to it.

The expenditure on bridges would be the same in either case, and has not been therefore noticed in the estimates.

Along with these estimates I forward two tracings, showing, respectively, sections of the Railway embankment when connected with road, and when clear of it. The traverse plan of Trunk Road and its longitudinal section throughout, I have not thought it necessary to send in. They, however, exist in my office for reference when required.

In connection with Estimate No. 1 (Railway in conjunction with Trunk Road), it is necessary to observe—

1*st*. *Flood-level.*—That, inasmuch as it has been ascertained that the flood-level of 1866, on the distance surveyed, was throughout the same as that of surface of Trunk Road, the level of Railway embankment (or formation) has been assumed as 2 feet 3 inches higher than that of present road surface, in order to keep bottom of girders at water-way openings at least 2 feet above the highest known flood level. This elevation over floods is not more than is strictly necessary, because, although the height of ascertained flood level in 1866 may have been to some extent due to the insufficient provision of water-way on Trunk Road, there is no ground for supposing that the local rain-fall of that year was entirely exceptional, and that it may not be in future considerably exceeded.

2*nd*. *Earth-work.*—That the rate for earth-work here assumed is Re. 1 per 1,000 feet cube higher than that taken for No. 2 Estimate (independent line). This augmentation is due to the fact that the excavations for banks must be made throughout from one side of the line only, so that the work will be done either from existing cuttings, or from new surface beyond with double lead.

3*rd*. *Fencing.*—The *fence* dividing off road from Railway will be fixed at the inner edge of berm on that side, so that there will be thus rendered useless for cart traffic 4 feet or so of the metalling alongside of same. It has thus been necessary to provide in estimate for a corresponding increase of 4 feet of metalling on the other side of Trunk Road, with a widening of the right hand side berm to the same extent.

4*th*. *Removal of road metal.*—Owing to the stacking of kunkur for road metalling on side cess, it has been necessary to estimate for its removal from same on left side.

5*th*. *Serais, Police Stations, &c.*—As the Serais, Police Stations, Road Inspectors' Bungalows, and large village of Kamokee, are all on the left or west side of Trunk Road, and would be therefore cut off from it by Railway, there has been provision made for raising the road to rail level at these places with proper inclines either way.

It should, at the same time, be noted that the Railway station buildings themselves must be all either on this, the left side of the line, or if not so placed, separated from it by the entire width of Trunk Road, &c. At all such stations when not placed near one of the crossings above provided for, there would necessarily be therefore a similar expense in raising Trunk Road, so as to permit the traffic from same to reach the Railway stations. This outlay would, with the full width required, be equal in each case to at least Rs. 1,500. As the number and position of these stations have not yet been determined, this item has been omitted from the estimate. It is further to be considered as a matter not taken into account in the estimate, that wire or other fence of an ordinary description will not be in any way a sufficient protection to the Railway, as the bullock cart-traffic on the Trunk Road would very soon destroy the whole of it; a post and rail fence of unusual strength would be indispensable, and at a cost of something like Rs. 25,000 for the distance in question in excess over an ordinary wire fence.

Considerable injury during rainy season (or expense in preventing it) would be caused to road metalling by the wash of the soil from Railway slopes.

With due allowance for extra earth-work in independent line, as also for purchase of land class A, required for same (Estimate No. 2), you will observe that, without including items of road crossings to Railway stations, or extra cost of fencing which do not figure in estimate, there is nevertheless an actual balance in expenditure on construction against Trunk Road occupation line of Rs. 38,544.

In the comparison so made, all considerations of expediency and advantage, or the opposite, in so far as the Trunk Road itself is concerned, have been waived, and the attention limited exclusively to question of relative cost between the two lines.

While the decision of Government is expected as to the one line or the other, Messrs. Glinn, Kelsey, and Storey are, as you are already aware, now occupied in making out, with the necessary survey of stream crossings, &c., the independent line, at a distance of about 1,500 feet from the Trunk Road on lower side; so that, on the adoption of either alternative, no time need be lost in putting the work of throwing up the embankments immediately in hand.

It may be here as well to state that the calculations on which No. 2 Estimate has been prepared are based upon the ground levels taken in survey of Trunk Road. As the surface alongside Trunk Road is practically the same over the entire distance, it can make little difference either way so far where the site of embankment is taken.

No. 63 S, dated 22nd January 1869.

From—Lieut.-Colonel H. Drummond, R. E., *Consg. Engr. to the Govt. of the Punjab, Railway Dept.*,

To—*The Superintending Engineer, Lahore Division, Punjab Northern (State) Railway.*

With reference to your letter No. 51, dated 14th instant, I have the honor to enquire whether the flood level of 1866 remained the same as that of the surface of the Trunk Road after the latter was breached. Also whether, with the existing water-ways in the Trunk Road between the River Ravee and Goojranwalla, there is any probability that such an exceptional flood as that of 1866 would rise to the level of the surface of the road.

No. 99, dated 27th January 1869.

From—A. Grant, Esq., *Supdg. Engr., Lahore Division, Punjab Northern (State) Railway,*

To—*The Consulting Engineer to the Government of Punjab, Railway Dept.*

In reply to your No. 63 S of 1869, I have the honor to state that flood level of 1866 was considerably higher on the upper or east side of the Trunk Road than on the lower or west side, and that this level, due to the obstruction of raised causeway, was lowered, when the dammed up water found escape through the breaches it made. Further, that it is not at all probable that a flood equal in character to that of 1866 would now rise as then to road surface.

At the same time, having regard both to the proximity of the Trunk Road to the hills, and to the fact that the experience of its 20 years' existence does not afford exhaustive evidence as to all the possibilities of sudden rushes of water, I could beg to state that I do not consider as at all unlikely a repetition of the same, or similar facts as to flood height on the length in question.

In connection with the preceding, and my letter No. 51, I may here observe that my assumption of a formation level for Railway of 2 feet over highest ascertained flood is based on the adoption for Railway of the same extensive waterway as that now provided for on Trunk Road. This water-way between Ravee crossing and Goojranwalla now amounts to 22,322 feet. Should, however, a less amount of passage be given for the Railway, it will probably be then found advisable to still further raise formation level.

No. 81 S, dated 26th January 1869.

From—LIEUT.-COLONEL H. DRUMMOND, R. E., *Consg. Engr. to the Govt. of the Punjab, Railway Dept.,*

To—*The Superintending Engineer, Lahore Division, Punjab Northern (State) Railway.*

I have the honor to make the following remarks on the estimates which accompanied your letter No. 51, dated 14th instant.

2. Two heavy items in Estimate No. 1 are—Rs. 15,111 for earth-work in widening road 4 feet, and Rs. 75,555 for road metalling on extra 4 feet width. If the sum of these two items, amounting to Rs. 90,666, can be eliminated from Estimate No. I, its total will be reduced to Rs. 1,11,662, which is Rs. 52,122 less than the total of Estimate No. 2. And it seems to me that both the heavy items referred to may be saved by simply putting the fence at the toe of Railway embankment instead of at the edge of the metalled portion of the road.

3. If 3 feet is not considered to be a sufficient distance from the metalled road to Railway fence, it might be increased to 4 feet (proposed to be effected by you by the removal of 4 feet of road metalling, and adding it to the other side, so as not to reduce the original width of road), and there would still be a considerable saving in earth-work.

For instance, thus: assume that only 8 feet of the road bank is occupied by the Railway—assume 6 feet as the average height of the Railway embankment, that its width at formation level is 20 feet, and that its slopes are 3 to 1, the area of section is $38 \times 6 = 228$ square feet.

4. As the side slopes of road embankment are 5 to 1, and the average height 5 feet, supposing that the Railway were to occupy only 8 feet of the road embankment, the saving of earth-work in section would be—$(8 \times 4) + (\frac{20 \times 2}{2}) + (\frac{12 \times 4}{2}) = 96$ square feet. So that if the Railway were put partly on the road, the section of earth-work to be executed would be 228—96 = 132, instead of 228.

5. Agreeing with you that an ordinary wire fence will not be sufficient protection between the road and rail, and that probably an extra expense of Rs. 25,000 would have to be incurred to strengthen the fence, and probably to provide for drainage between the road and the rail, I still think there might be a saving effected of from Rs. 20,000 to Rs. 25,000 by locating the rail on the road instead of independent from it.

6. A printed copy of your letter and estimates, together with your two sections in original, are herewith put up, and an early reply is requested.

Note by LIEUT.-COLONEL H. DRUMMOND, R. E., *Consulting Engineer to the Government of the Punjab, Railway Department.*

Letter No. 51, with two estimates and sections, from Mr. Grant, Superintending Engineer, Lahore Division, Punjab Northern Railway, also two letters from Consulting Engineer to that Officer, are herewith put up for His Honor's perusal.

If the Lieutenant Governor approves, Colonel Taylor may be asked to read these papers and record remarks. It will be observed that the question is treated merely as one of cost.

It is certain that there will be serious inconvenience to the road traffic while the Railway is *being constructed* on the road, and, after construction, constant risk of accident both on the road and the rail.

There can, I think, be no doubt that the rail on the road cannot possibly be made so perfect a scheme as the rail independent of the road, and I do not think therefore that, for the sake of an utmost possible saving of Rs. 25,000, the completeness in themselves of both road and rail should be marred.

Remarks by the Hon'ble the Lieutenant Governor, Punjab.

I quite concur in the foregoing remarks, but return the papers for transmission to Colonel Taylor, lest Under Secretary should have any further remarks to make when sending them to him.

Memo. by COLONEL A. TAYLOR, C. B., R. E., *on Mr. Grant's No.* 51.

The width of the metal on the part of the Trunk Road in question is for 13 miles, 12 feet, and for 23 miles and 1,600 feet, 16 feet.

The 16 feet width is only used where the material of which the embankment is formed is so deliquescent that a less width cannot be prudently used.

If anything be taken from off the metal on one side, it must, therefore, be added on to the other side as proposed by Mr. Grant.

The width of the earthen berm on the side on which it is proposed to place the Railway is everywhere 12 feet.

The wash from the Railway embankment could not be allowed to pass over the metal. An earthen drain at the foot of the Railway embankment is absolutely necessary, with masonry cross-drains at intervals, similar to what have been found to be necessary in all long cuttings throughout the line of road.

Again, this drain could not be placed close to the metal. A berm of 4 feet seems quite essential, and the earthen drain could not be less than 3 feet wide at top. Out of the present 12 feet of berm, 7 feet would be thus occupied, leaving 5 feet for the Railway.

The extra earth-work required would thus be a little more than is provided for in Mr. Grant's Estimate No. 1.

The item of Rs. 75,556 in that estimate might be omitted, but 360 cross-drains of masonry would have to be provided to discharge the water from the central earthen drain, and each would cost about Rs. 330, giving a total for these drains of about Rs. 1,18,900. (This allows ten cross-drains per mile, which is what experience has shown to be required in long cuttings when all external drainage has been thoroughly excluded.)

When Mr. Grant's Estimate No. 1 is amended in respect to the points above referred to, and the saving on metalling is set off against the extra cost of the cross-drains, its total will rise from Rs. 2,20,028 to Rs. 2,45,673-1; and if more of the berm be taken up, and the metal be moved, the cost will be greater still.

The remaining items in that estimate do not seem to me to be over-stated.

I certainly did not anticipate that no saving in construction would result from occupying part of the Trunk Road, but it seems beyond question that such must be the result.

In the interest both of the road and of the Railway, it is clearly proper for the Railway to be entirely separate.

No. 104, dated 30th January 1869.

From—A. GRANT, ESQ., *Supdg. Engr., Lahore Division, Punjab Northern (State) Railway,*

To—*The Consulting Engineer to the Government of the Punjab, Railway Department.*

I beg to acknowledge receipt of your No. 81 S of 1869, and have the honor to observe that the insufficiency of the information given on section No. 2 (Railway bank in connection with Trunk Road) as submitted by me, appears to have caused some little misapprehension.

This section shows the *average* difference in height between respective surfaces of road and Railway embankments, so that the dimension of 3 feet figured thereon between toe of slope to Railway bank, and fence dividing road from rail is also an *average*, and will vary with the relative heights of these surfaces; the difference in height will be frequently greater, chiefly where road level is lower, but also in some cases where Railway formation is higher than the average here shown, and consequently by the spreading of the base of embankment, the 3 feet average space, indicated between fence and toe to slope, will often diminish or disappear altogether.

R

It follows that, if no objection were made to giving this metalled width, and with it the dividing fence also, a wavy and irregular outline, due to both of them following closely the sinuosities of tail of slope, an important economy might be effected in the two items referred in para. 2 of yours under reply, and the two estimates be thus brought, after provision for extra expenditure on fence, to something like a parity in amount.

As it is, however, probable that this objection would be considered serious to the permanent efficiency of Trunk Road, I think that so long as the proposal stands to taking 12 *feet* from it for Railway, the estimated increase to its metalled width, and to east side berm, cannot be well dispensed with.

On the other hand, if, as you suggest in your para. 4, the maximum width to be thus appropriated for Railway were reduced to 8 *feet*, a very considerable alteration in Estimate No. 1 would easily result. Items Nos. 2 and 8 (*vide* estimate), amounting to Rs. 90,666, would be altogether eliminated, while the value of earth-work (No. 1 item) would be increased (cubic feet 2,694,000, at Rs. 5 per 1,000) by Rs. 13,470, giving a total advantage to this estimate of Rs. 77,196, and so, after deduction of Rs. 25,000 for extra fencing, &c., the relative amounts of two estimates would stand thus:—

	Rs.
Trunk Road, 8 feet occupation	1,50,132
Independent line	1,63,784

being Rs. 13,652 in favor of the former, or nearly, on the distance under question, Rs. 379 per mile.

P. S.—As you may again wish to refer to them, I beg to re-enclose tracings of sections Nos. 1 and 2.

No. 124 S, dated 9th February 1869.

From—LIEUT.-COLONEL H. DRUMMOND, R. E., *Consg. Engr. to the Govt. of Punjab, Railway Dept.*,

To—*The Chief Engineer, Punjab Northern (State) Railway.*

I have the honor to forward for your information printed copies of papers as marginally noted, and, with reference thereto, to request that you will be so good as to favor me, at the earliest possible date, with an expression of your opinion on the subject of locating the Punjab Northern (State) Railway on the Trunk Road from a point near the right bank of the River Ravee to Goojranwalla, or on a line parallel to, but independent of, the Trunk Road.

Letter No. 51, dated 14th January 1869, from Superintending Engineer, Lahore Division, Punjab Northern (State) Railway, to Consulting Engineer, Punjab Government, with two sections in original.
No. 63 S, dated 22nd January 1869, from Consulting Engineer, to Superintending Engineer, in reply to above.
No. 99, dated 27th January 1869, from Superintending Engineer, to Consulting Engineer, Punjab Government.
Note by Consulting Engineer on Superintending Engineer's No. 51.
Remarks by Lieutenant Governor on above Note.
Memorandum by Colonel Taylor on Superintending Engineer's letter No. 51.
No. 104, dated 30th January 1869, from Superintending Engineer, Lahore Division, Punjab Northern (State) Railway, to Consulting Engineer.

The return of the original sections accompanying Mr. Grant's No. 51 of 14th January 1869 is requested with reply.

Dated 13th February 1869.

From—H. LEE SMITH, ESQ., *Chief Engineer, Punjab Northern (State) Railway,*

To—*The Consulting Engineer to the Government of Punjab, Railway Dept.*

In reply to your No. 124 S of 1869, I have the honor to state that I no longer consider the question of locating the Punjab Northern Railway on the Trunk Road up to Goojranwalla as one which is worthy of serious consideration.

At the time when I called the attention of Government to the advisability of so utilizing a portion of the road, I was under the impression that its surface throughout, at least the greater part of its length, was so far above level of floods as to be at once fit for receiving the permanent way, but the sections recently taken have shown this to be an erroneous idea.

The formation would require to be raised in so many places that the slope would encroach more seriously upon the metalled surface than I could recommend, or Government be likely to allow, and as the comparative estimates prove that the saving in cost would be very trifling, whilst the efficiency of the road would be thus to a considerable extent marred, I think all idea of interference with it should be abandoned, and a separate embankment thrown up for the Railway.

P. S.—I beg to return tracings of sections as required.

No. 81 S, dated 2nd March 1869.

From—LIEUT.-COLONEL H. DRUMMOND, R. E., *Under Secy. to the Govt. of Punjab, in the P. W. Dept., Railway Branch,*

To—*The Secretary to the Government of India*, PUBLIC WORKS DEPT.

Copy of the following, and of Mr. Lee Smith's letter to which it is a reply, forwarded for the information of the Government of India, with the remark that as the matter is urgent, and there appears to be no room for doubt as to the course to be followed, the Lieutenant Governor trusts the action which has been taken will be approved of by the Government of India.

No. 199 S, dated 1st March 1869.

From—LIEUT.-COLONEL H. DRUMMOND, R. E., *Consg. Engr. to the Govt. of Punjab, Railway Dept.*,

To—*The Chief Engineer, Punjab Northern (State) Railway.*

I have the honor to acknowledge the receipt of your letter No. 23, dated 25th ultimo, on the subject of the flood levels between Lahore and Goojranwalla, and in reply to convey the approval of the Lieutenant Governor to your getting out as speedily as possible the sections, land-plans and earth-work quantities of the line as far as Goojranwalla in the manner proposed in your letter and for the reasons given therein.

No. 23, dated 25th February 1869.

From—H. LEE SMITH, ESQ., *Chief Engineer, Punjab Northern (State) Railway,*

To—*The Consulting Engineer to the Government of Punjab, Railway Dept.*

I have gone into the matter of flood levels all along the road thus far very carefully, and have come to the conclusion that we shall be perfectly safe if we keep our formation 6 inches above what we are told was flood level in 1866 before the present immense water-way was given. In all the smaller openings, we should thus have the bottom of girders one foot clear above these floods, and for the one or two more important, as the Bagh Butcha, I would give a rise of two feet. I am thoroughly satisfied that this is the right thing to do. I do not consider there is *any chance* in the next hundred years of the water again reaching the level, only due in 1866 to its being bunded up. And if it ever did, we should then still have six inches of earth-work and two feet of ballast, in all 2′ 6″ to be topped before it could breach the embankment. If you will agree to this view of matters, I will have the section, land-plans and earth-work quantities in before many days for Government sanction, and we can then look forward to getting the banks all thrown up as far as Goojranwalla before the rains commence. During the rains a careful observation of all the water-ways will be made by the staff on the ground, and if that anywhere, after all, shows the advisability of raising girders or banks higher, either locally or generally, there will then be plenty of time to do it before the bridge piles are in and iron-work is fixed. I am exceedingly anxious to have your earliest possible reply, as upon the settlement of these questions depends my being able to put the work immediately in hand in time to save this season.

No. 147 S, dated 10th April 1869.

From—LIEUT.-COLONEL H. DRUMMOND, R. E., *Joint-Secy. to the Govt. of Punjab, in the P. W. Dept., Railway Branch,*

To—*The Secretary to the Government of India,* PUBLIC WORKS DEPT.

I am directed to request the favor of an early reply to this Office No. 54 S, dated 15th February 1869. Sections, land-plans, and everything necessary for the immediate commencement of the work of the Railway from Lahore to Goojranwalla have been carefully prepared, so that there need be no unnecessary delay on the receipt of the orders of Government.

2. Independent of the reasons given in the papers forwarded with the letter above quoted, the Lieutenant Governor feels very strongly that the traffic on the road will be seriously affected by a Railway laid on the same bank, in this way that accidents on the road will be of frequent occurrence. A strong fence may protect the traffic on the rail, but the Lieutenant Governor thinks it cannot be expected that, under a combination of road and rail on the same embankment, the traffic on the road can be carried on in security.

No. 545 R, dated 12th May 1869.

From—COLONEL R. STRACHEY, R. E., *Offg. Secy. to the Govt. of India,* PUBLIC WORKS DEPT.,

To—*The Joint-Secy. to the Govt. of Punjab, in the P. W. Dept., Railway Branch.*

I am directed to acknowledge the letters noted in the margin, submitting certain questions relative to the mode of construction of the Punjab Northern (State) Railway, and in reply to refer you to my separate letter No. 544 R of this date, on the general principles to be adopted in the construction of the Railway, and further to convey to you the following observations on the points that have been specially brought forward in the letters referred to.

No. 54 S, dated 15th February 1869.
„ 81 S, „ 2nd March „
„ 147 S, „ 10th April „

2. His Excellency in Council, holding the general views as to the propriety of occupying the Trunk Road, if it be clearly shown to be likely to lead to important economy, which are stated in para. 12 of my separate letter already referred to, is not satisfied that the proposals that have now been submitted to the Government of India have been framed with that careful regard to the obligation to enforce economy which has been inculcated in that despatch, and thinks that they require re-consideration. With this object the following remarks are offered for the attention of the Engineers.

3. The earth-work estimates submitted purport to show that the utmost possible saving on the first 36 miles of the line by appropriating a portion of the surface of the road would be Rs. 25,000, a sum of small moment in view of the inconvenience likely to result to both road and rail traffic, but especially so to that of the road. In fact, the Chief Engineer, Mr. Lee Smith, no longer considers the question worthy of serious consideration, as the levels taken seem to him to have shown the necessity of making the Railway formation level 2′·3″ higher than the surface of the road. This height is proposed (according to the enclosures of the first letter under reply) so as to give 2 feet clear above flood level below the bottom of girders in water-way openings; but from the second letter it would seem that, in the interval that had elapsed, this clearance had been considered excessive and reduced to one foot, except in the case of the one or two more important openings. If this latter letter be rightly understood, the estimates should be modified, though the comparison would not be affected.

4. The estimate of the project for part occupation of the Trunk Road might, however, be reduced summarily by Rs. 75,555 (more than one-third its amount) by striking out the item "road metalling on extra 4 feet width." The manner of adding to the road embankment on *both* sides appears to be the sole reason for disturbing the metalling, but if the 4 feet in width proposed to be added on the east of the road embankment, together with the 4 feet on the east of the additional bank to carry the rails, were transposed to the west side, not a foot more of earth-work would be required, and 4 feet more of road surface would be left untouched, so that there would be no need to trench on the existing metalling. But even this reduction is not all that

appears fairly practicable. The existing breadth of metal being 16 feet, it would, if reduced by 4 feet, be still 12 feet wide, which is, in the opinion of the Government of India, more than would be essential after the fast traffic on the road had ceased. Therefore no such arrangement as is proposed for widening the road embankment on this account seems at all necessary.

5. In the next place, it is essential that the necessity for a 20-feet formation width for a single line of rail should be clearly established. With transverse sleepers, a width of 18 feet would apparently suffice, and with either longitudinal or pot sleepers a further reduction of 3 to 4 feet in the width, not only of the formation but of the ballasting, would be quite feasible. The effect of such charges on the estimates would have to be considered, but both estimates would be affected much the same.

6. But the question of appropriating a portion of the surface of the Trunk Road is not limited to the section south of Goojranwalla, and should not be disposed of without taking into consideration the probable saving which would result from occupying a part of the road to the north of Goojranwallah. The saving over the longer distance will obviously be more worthy of consideration.

7. Further, it is stated that no saving would be effected in bridging by adopting the Trunk Road surface. This can hardly be the case, unless the side slopes of the water-way openings are not to be rivetted, or protected in any way.

8. Also the reason for putting the embankment for the rails on the west or down-stream side of the present road, if to be attached to it, is not understood. The road, if too low, would be flooded in case of heavy inundation, whereas, if placed on the up-side, the higher embankment would protect the road.

9. If, as seems to happen, in some places the road embankment causes accumulation of flood water on its northern or upper side, then it would seem to be a question whether the Railway formation could not, in some parts at all events, be placed on the lower or west side, but at a lower level than the road surface, and still be free from risk of flood. Moreover, it seems impossible to ground any conclusions on a general average assumed surface level of the rail formation fixed in relation to the road surface. What is needed is the actual results derived from the adjustment of the levels of the rails (fixed with relation to the actual levels of floods and the road embankment) in such a way as to give a minimum of outlay. There is nothing to show that such a solution of the question has been obtained.

10. It might also usefully be suggested to the Engineers that consideration should be given to the practicability of passing some of the shallow drainage lines which occur between the Ravee and the Chenab by means of metalled gaps, such as are employed on the Trunk Road. Some additional precautions might be needed, but probably a large saving of expense might be secured. Such an arrangement would lead to modifications of the levels of the formation surface.

11. It is presumed that the plans and sections of the Grand Trunk Road, and the information already collected by the Railway staff, will at once give sufficient data for ascertaining what can be made of it. When a sketch project has thus been prepared, and an approximate estimate, it is suggested that the Chief Engineer, accompanied, if thought desirable, by the Consulting Engineer, and bringing with him any expression of the views of the Hon'ble the Lieutenant Governor which he wished to record on the subject, might be directed to proceed to Simla, when final orders could conveniently and expeditiously be issued.

12. An estimate should also be at once got out for the line from the Lahore station to the Ravee, and for the bridge over that river, so as to admit of work being begun as early as possible.

13. Proposals for the distribution of the Engineering Establishments can perhaps hardly be made in a complete form until some decision is come to as to the method of dealing with the formation of the Railway road. But whenever the Lieutenant Governor feels himself to be in a position to dispose of this subject, either as regards the general prosecution of the works, or in relation to any special work, such as the larger bridges, the Government of India will be prepared to take up the matter which is clearly of much importance for the early commencement of active operations.

No. 544 R, dated 12th May 1869.

From—COLONEL R. STRACHEY, R. E., *Offg. Secy. to the Govt. of India*, P. W. DEPT.,
To—*The Joint Secy. to the Govt. of Punjab, in the P. W. Dept., Railway Branch.*

In continuaton of former correspondence on the subject of the Punjab Northern (State) Railway, I am directed to inform you that His Excellency the Governor General in Council has recently again had under consideration the numerous important questions that have from time to time arisen in connexion with the measures to be taken for commencing active operations on this Railway, and I am to state, for the information of the Hon'ble the Lieutenant Governor of the Punjab, the conclusions that have been adopted on some of these points by His Excellency in Council.

2. A re-perusal of the papers that have already been before the Government of India shows that the outlay which has hitherto been spoken of as likely to be incurred on this Railway will not be less than £20,000, and may even amount to as much as £25,000 per mile, or even more. The Governor General in Council directs me to observe that, having regard to the general character of the projected line, and to the financial considerations which its construction involves, any such outlay must be regarded as quite out of the question, and that the works must be so designed as to reduce the expenditure to a sum very much below that above named. The whole amount available for the extension of Railways in India, whether viewed with reference to the capital that can be obtained, or to the sum that can be provided from the ordinary revenues to discharge the interest on such capital, is practically limited, while the demands for other lines of Railway in other parts of the country are most urgent. To permit any such outlay as has above been spoken of would virtually arrest the commencement of other lines but little, if at all, less important than that now under consideration. Further, having regard to the probable small traffic on this Railway, for many years to come at all events, the permanent burden on account of interest on a very costly line would be extremely onerous. Lastly, and this consideration has great weight with the Government of India, a high rate of outlay indicates extremely heavy works, and a corresponding long period occupied in construction.

3. On the whole, the Governor General in Council has no hesitation in adopting the conclusion that this Railway should be designed and carried out, so as to ensure the smallest expenditure that will provide a thoroughly permanent and useful iron road that can be traversed by the ordinary locomotive and wagon stock in use on the Punjab and East Indian Railways at a low speed.

4. The Government of India is satisfied that, by strictly limiting the works and outlay to what is absolutely necessary for a single line, by restricting the gradients to what may be regarded as the steepest that can be worked with ordinary locomotives and a small train, and arranging everything for low speeds, the cost of this Railway may be very much reduced below the sum beforenamed, and be brought to approximate to £10,000 per mile, anything in excess of which the Government of India regards as so objectionable as to be almost prohibitory.

5. The principle to be followed should be to commence the line on the most economical scale possible, and to look to improvements being carried out by degrees in the future, as the traffic is developed and an amelioration of gradients and addition to the conveniences first provided are justified by increased returns.

6. For short distances gradients even as steep as 1 in 30 might, it is believed, be accepted if indicated to be desirable in the cause of economy, though it is hoped that anything so bad as this will not be called for, or be quite exceptional. In like manner, accepting a limit of speed of 15 miles an hour, or for the difficult parts of the line even 10 miles an hour, curves which would be impossible on a high speed line may be permitted without objection. The keeping up of a few extra locomotives to meet emergencies would with such arrangements probably be expedient, but the cost of these

will not be worth considering by the side of the large reduction in the mileage cost over the whole length of the line that may be reckoned upon from the adoption of these principles.

7. The necessity for providing any station accommodation at all, excepting at the chief towns or cantonments, may be doubted. The buildings provided should at the outset be strictly limited to what is essential for the protection of the engines and vehicles, goods requiring cover, and the persons employed for the working of the line; and everything should be built in the most economical manner possible, and the accommodation allowed be on the most frugal scale. Raised platforms should be given up, and the system universally adopted on the Continent of Europe accepted. The traffic might be worked by the Station Masters at the chief stations, supplemented by the guards, so that all minor booking offices would be suppressed.

8. I have further been instructed to observe that the recent decision of the Government to maintain Jhelum as a Military station, removes all doubt as to the direction of the main line at that point, Jhelum will, therefore, be regarded as an obligatory point on the main line, and the mode of dealing with the salt traffic must be separately considered on its own merits.

9. Next, His Excellency in Council has no difficulty in determining that the line of the Grand Trunk Road shall be generally followed so far as may be necessary to admit of the great Railway bridges being made available for the ordinary traffic on that road. The Railway bridge road-ways should be so arranged as to be rendered suitable for the passage of carts, &c., separate roadways not being provided. This will lead to a very large economy, even if some slight diverson of the road be demanded in order to obtain suitable sites for the bridges, and, under the actual conditions of the traffic, will certainly be all that is essential. The bridge designs will be prepared accordingly.

10. It must be left to the Engineers to consider whether this plan can be satisfactorily applied to any of the minor streams or drainage lins if any such still remain unbridged on the Trunk Road.

11. Again, it is observed that the Government of the Punjab is opposed to the occupation of any part of the Grand Trunk Road by the Railway, and recommends that the line shall be carried alongside of, but quite separate from, the road for the first 36 miles from the Ravee, beyond which no conclusions as to the direction had been come to when the last reports were submitted.

12. The Governor General in Council, after carefully considering all that has been said on this subject, has no difficulty in arriving at the conclusion that every possible means of effecting any important reduction of the cost, and the necessary labour of construction, which might be shown to be made possible by occupying the Grand Trunk Road embankment and formation surface, should be accepted throughout the whole length of the line both to Jhelum and beyond it; and this general decision should not be again re-opened. The question whether or not any such saving can be effected by occupying the road, as will make it desirable to do so, is one of detail which can only be decided on a careful examination of the facts, and which the Government of India does not desire to prejudge.

13. The Governor General in Council directs me to add that these remarks will no doubt fully convey to the Hon'ble the Lieutenant Governor of the Punjab the general views of the Government of India relative to this Railway, and that both His Honour and the Engineers employed under his orders will have no difficulty in applying the spirit of these remarks to all matters of construction that may arise and call for determination. No further detailed observations, therefore, seem necessary on such subjects.

14. It will readily be understood by His Honour the Lieutenant Governor that, among the reasons which most imperatively call for the strictest economy in construction wherever it is possible, the chief is the very heavy obligatory expenditure which is rendered unavoidable by the physical difficulties of the country to be traversed. The bridges over the four great rivers—the Ravee

Chenab, Jhelum and Indus—which will be required to complete the communication to Peshawur in a solid manner, are, as the Government of India is informed, likely to cost something like one and a half million sterling. The difficulties of the country beyond the Jhelum are supposed to be such as have probably never been before encountered by Railway Engineers, or at least to be equal to anything of the kind that has had to be dealt with. The Governor General in Council is thus satisfied that whatever may be the careful economy displayed in the construction of the works, the outlay will still rise to so large a sum as to cause, for many years to come, an exceedingly heavy burden on the public revenues. Under these circumstances, it is that His Excellency in Council has felt it to be necessary thus strongly and repeatedly to urge the extreme importance of the considerations which I have had the honour to communicate to you for the information of the Government of the Punjab.

15. In conclusion, I am again directed by the Governor General in Council to lay great stress upon the necessity of enforcing perfect regularity in all the proceedings connected with this undertaking from the beginning. It should, therefore, be impressed upon the Chief Engineer that work can only be permitted to go on in accordance with sanctioned estimates. This may involve some little delay in the outset, but not in the end, and without strict attention to methodical procedure, the result can only be wasteful expenditure, disappointment, and discredit. Whatever establishments may be really required for the proper supervision of the work or the control of the accounts will be freely given, and it will be the constant aim of the Government of India to afford all such needful support to the Officers employed in carrying out this important State line, as will secure the earliest possible completion of the works in a thoroughly satisfactory manner, both as to constructive efficiency and economy of first cost.

No. 63 R, dated 23rd June 1869.

From—The Government of India,
To—The Secretary of State for India.

With reference to Sir Stafford Northcote's despatch No. 94, dated 24th November 1868, and previous correspondence regarding the Railway from Lahore to Rawul Pindee, we have the honour to forward, for your Grace's information, copy of correspondence with the Punjab Government on the subject.

No. 72, dated 20th October 1869.

From—The Secretary of State for India,
To—The Government of India.

I have had under consideration in Council your Excellency's despatch of the 23rd June last, No. 63, forwarding copies of further correspondence with the Punjab Government relative to the projected Railway from Lahore to Rawul Pindee.

2. The only remark I have to make at present on the correspondence is, that I agree in your Excellency's views as expressed in the 3rd and 5th paragraphs of the letter from your Officiating Secretary to the Punjab Government, No. 544, dated 12th May 1869, *viz.*, "that this Railway should be designed and carried out so as to ensure the smallest expenditure that will provide a thoroughly permanent and useful iron road that can be traversed by the ordinary locomotive and wagon stock in use on the Punjab and East Indian Railways, at a low speed," and that "the principle to be followed should be to commence the line on the most economical scale possible, and to look to improvements being carried out by degrees in the future, as the traffic is developed and an amelioration of gradients and addition to the conveniences first provided are justified by increased returns."

3. I desire that the works may, as far as possible, be so designed in the first instance as to admit readily of the future ameliorations and additions which may be found expedient.

Notes of a conversation between the Secretary in the Public Works Department, Government of India, and Mr. Lee Smith, *Chief Engineer, Punjab Northern (State) Railway, in which were discussed various matters connected therewith, held at Simla, on the 25th May* 1869.

Approach into Lahore Terminus of the Punjab Railway.—An estimate to be got out as soon as possible, for the distance between the Trunk Road Trans-Ravee and the Terminus for a single-track, 16 feet formation being regarded as the standard breadth, except for about a mile near the Terminus which may be for a double-track, for which 28 feet to be the standard formation. The bank can then be thrown up to limit the stream of the Ravee.

The line to avoid the Badamee Bagh and pucka road near the city walls, if possible, and the cost of the land required for the works to be as fully considered as the cost of the works themselves.

The old channel of the Ravee might be closed before the ensuing floods, if possible, and after the rains the necessity for acting on the cold-weather channels of the river by bandels and spurs, as their direction may show to be necessary, may be taken into consideration. But no actual works of this sort to be undertaken without further sanction, so as not to throw away money. The abutments of the bridge to be got in before the monsoon of 1870, and the banks on either side to be closed in above high flood-level, so that the river may have a fixed opening to go through in those floods.

The formation widths already mentioned to be adopted as standards. They will suit either longitudinal or cross-sleepers. The dimensions of sleepers may be—

Transverse, $9' \times 9'' \times 4\frac{1}{2}''$ longitudinal, $9'' \times 4\frac{1}{2}''$ with ties $4\frac{1}{2}'' \times 4\frac{1}{2}''$ at intervals of $4\frac{1}{2}$ feet.

The latter will require 20 per cent. less timber and ballast than the former, but this question to be re-considered on receipt of the report Mr. Lee Smith is understood to have under preparation.

One-half of the surface of the Trunk Road (whichever half Mr. Lee Smith prefers) to be made available for the Railway.

The existing timber-topped bridges to be used (if it be found on further calculation to be desirable), by substituting new superstructure as level-crossing bridges. This to be considered in connection with the position of stations and watering arrangements, as such level-crossing bridges will not be inconvenient at the stopping-places of the trains. Bungalows as residences to be erected only at places where likely to be required for large works, and at stopping-places.

The Road Department to abstain from further repairs to the portion of the road taken for the Railway. The width of metal on the other side may be increased at once in lieu of the repairs on the Railway half, if requisite.

Where the road passes through the middle of a town, *e. g.*, Goojranwalla, either road or Railway may be diverted, and suitable fencing given if the Railway goes through the town on the existing road.

Fencing, as a rule, need only be given near towns or crossings.

Facts as to floods in flood-openings to be collected this year; also the Chenab crossing to be specially considered without delay.

The maximum gradient over the Kharian Range may for the present be taken at $\frac{1}{100}$.

Proposals for the purchase of Mr. Coates' plant—(about 2 miles of rails) may be submitted, and on the estimate being sanctioned, the whole may be purchased, or such part as is deemed suitable.

Brassey and Company's Plant—difficulties with Irrigation Department concerning—to be settled personally by Mr. Lee Smith, with Captain Home and Brassey's Agent at Kussowlie.

Enquiries will be made regarding a store-yard site at Calcutta or Howrah, and something of the kind may be necessary at Kurrachee. Landing and transport arrangements to be considered as soon as the report called for as to the routes to be adopted may be submitted.

In the event of an arrangement being come to with the East Indian Railway, the best means of getting material across the Sutlej and Ravee should at once be taken into consideration, and it should be seen whether it will be possible to send the loaded wagons across boat-bridges at both or either of these rivers. At the Sutlej crossing a joint arrangement might perhaps be come to with the Railway Company.

Establishment matters.—Mr. Collett to be offered Rs. 1,200 per mensem on joining, in accordance with Secretary of State's permission to replace Mr. Stone.

A Deputy Controller and a Store-keeper to be appointed, and a Personal Assistant to the Chief Engineer for correspondence and general business. Temporary Office and other Establishments can be sanctioned by the Punjab Government, but with the proposals for the permanent distribution of the Engineers should be submitted proposals as to permanent Office, &c., Establishments.

As respects some expenditure incurred by Mr. Lee Smith, without proper authority, on tents and sawaree camels, the case should be sent up for orders. There is every desire on the part of the Government to condone breach of rules in the past, provided they be adhered to in the future.

Notes of a conversation between the Secretary in the Public Works Department, Government of India, and MR. LEE SMITH, *Chief Engineer, Punjab Northern (State) Railways, in which were discussed various matters connected therewith, held at Simla on the 22nd June* 1869.

Location of line from Terminus of Punjab Railway at Lahore towards the Ravee.—Approved as shown on plans with road diversion near the city wall, but this must necessarily be subject to the further approval of the local Government.

The Badamee Bagh, it is said, has ceased to be a place of public resort. There is, therefore, no apparent objection to the line intersecting it.

Formation width of this portion.—The width of the formation from the Terminus to the Ravee may be 20 feet, unless the cost of land in the immediate vicinity of the city should make it expedient to reduce the width to the 16 feet already decided on for a single track. The extra width is assented to on Mr. Lee Smith's representation of the double purpose of the embankment in the flooded ground, *viz.*, a bund as well as a Railway bank.

No part will be required to be made wide enough for a double track, as contemplated at the last meeting.

The gradient $\frac{1}{100}$ near the Terminus is not objected to, as it admits of a considerable reduction of the height of bank.

Ravee Bridge.—The bow-string wrought-iron girder design put in by Mr. Lee Smith is generally approved, subject to present expectations regarding quantity of metal in it being confirmed by the finished design, but to be modified as follows:—

The outside foot-ways to be suppressed, and single foot-ways to be given inside, the tracing being arranged out-side. The foot-passenger traffic will be shut off when trains are passing, so that the only load to be considered, besides the dead-weight of the structure itself, is the live-load of the Railway traffic. This may be taken as a live-load of $1\frac{1}{4}$ tons perfoot forward, or a dead-load of twice that amount.

The weight of the superstructure itself will be about 0·5 to 0·6 ton per foot forward. Thus, the total working dead-load to be provided for will be about 3 tons per foot run. The iron composing the girder is not to be strained more than 4 tons in compression, and 5 tons in tension.

The length of span (132′ 6″) is accepted as sufficiently manageable, and in the light of experience elsewhere, as likely to be fairly economical, though comparisons of cost of substructure with superstructure with varying spans would have afforded the means of a more correct judgment on this head, supposing that the depths of the wells could have been definitively fixed at this stage.

It is considered very desirable that the same description and size of girder should be adopted for the large bridges over the Chenab and Jhelum, and perhaps the Sohan, as over the Ravee. And for the piers brick-wells, two in number for each pier, and of $8\frac{1}{2}$ feet diameter, would seem preferable to a single well of larger diameter.

A complete design for one span of the bridge should be got out and submitted with an estimate at an early date to admit of final orders being passed, and of the needful Indents being sent Home.

Permanent-way.—The section of rail has been settled as far as the Jhelum, but Mr. Lee Smith will provide in his Indent for holes for spikes, or fang-bolts at the joints, and he will consider whether it is expedient to widen the foot of his rail to admit of fang-bolts being used throughout. For the present, however, except perhaps at joints, or on short curves, it will suffice if brob-spikes are used for securing the rails to the sleepers.

Transverse sleepers 9′ × 9″ × $4\frac{1}{2}$″ are approved as the rule, nine being used to each rail of 24 feet. This gives 1,980 sleepers, or 5,009 cubic feet of timber per mile; say for 200 miles of line 1,00,000 cubic feet of timber in sleepers. Dr. Brandis will be asked to state what prospect there is of this supply being forthcoming within (say) three years from local sources. Mr. Lee Smith will report as to protecting the sleepers, the means being available in Brassey's plant. It is doubtful whether Deodar timber needs such protection, however, and Cheer has not yet been tried.

Longitudinal sleepers may, however, be used in places if thought expedient, or as an experiment.

An Indent for rails, fish-plates, bolts and nuts, brob-spikes, some fang-bolts (for $4\frac{1}{2}$″ sleepers), and a few steel fish-clips (as an experiment) for 100 miles of line, should be sent in at once for transmission to England.

Transport of Stores. Route to be adopted.—**The East Indian Railway Company is prepared to transport the whole of the material of this Railway at a uniform rate of ¼ pie per maund per mile, with a certain amount of latitude as to time and quantity. Presuming that the same rate will be conceded on the Delhi and Punjab Railways, it is calculated that the cost from the ship in Calcutta to Lahore would be about Rs. 52 per ton, inclusive of an allowance of Rs. 2 to meet the extra cost caused by the Sutlej break. This route would be free from all risk, whether of loss of material, or of time.**

The most favorable of the estimates submitted by Mr. Lee Smith is that for the Indus route by boat and rail up to Lahore, by boat to Wuzeerabad and Jhelum. Omitting insurance, the rate per ton distributed over the line is about Rs. 40.

The next most favorable estimate, *i. e.*, for the same route by boat and rail to Lahore, thence by cart over the line. The rates arrived at, omitting insurance, are Rs. 37 to Lahore and Rs. 46 over the line. These are for permanent-

way. For bridge-work, which will be about one-fourth of the whole tonnage to be moved, the rates are, omitting insurance again,—

	Rs.	A.	
To Lahore	40	8	Supposing a uniform rate on the Railways for ¼ pie per maund per mile.
„ Chenab—			
By boat	43	12	
Viâ Lahore	52	0	
To Jhelum—			
By boat	43	12	
Viâ Lahore	59	8	

The adoption of the Indus route would involve the establishing of a transport service, and would be attended with great risks both of loss of material and of time. Mr. Coates' tender is for Rs. 60 per ton for permanent-way material, and Rs. 65 for bridge material distributed over the line, and bearing all risks. These rates to Lahore may be taken at Rs. 50 and Rs. 55 per ton respectively.

It appears probable that the total weight to be moved will be about 27,000 tons, of which 20,000 tons will consist of permanent-way, 1,000 tons miscellaneous, which may be classed with bridge material, and 6,000 tons of bridge material.

With a special transport service, this material might be placed at the following total outlay :—

	Rupees.	
A.—*Viâ* Indus to Lahore	10,23,500	With great risks of loss and of delay.
and distributed over line	250,000	
TOTAL ...	12,73,500	
B.—*Viâ* Indus by boats to Lahore, Chenab and Jhelum, and distributed	12,21,000	
C.—*Viâ* Indus, Mr. Coates' tender covering all risks, and distributed	16,65,000	
D.—*Viâ* Calcutta by rail to Lahore	14,04,000	No risks.
Distribution	2,50,000	
TOTAL ...	16,54,000	

Supposing, then, the rate of ¼ pie is conceded on the Punjab Railways, the Calcutta route is preferable, on the score of total outlay, to Mr. Coates' tender, apart from the greater facilities of obtaining freight to Calcutta, and the probable lower freights ruling to that port, than to Kurrachee; and looking on the cost of a special transport service on the Indus as likely to entail an outlay of 12⅓ lakhs, supposing the whole of the material were brought by that route, which is not probable under any circumstances, the cost *viâ* Calcutta would apparently be in excess by 4 lakhs. But on the East Indian Railway it may be reckoned that 50 per cent. of the amount paid as freight will be returned in profits, and on the undertakings of the Sindh Company 30 per cent. Thus, by the Calcutta route, the net outlay would in reality be reduced to Rs. 10,70,000 with no risks, and on the Indus route to Rs. 11,60,000 with all its risks. The latter route, moreover, is an estimate with, as respects the boat freight, an element of considerable uncertainty.

It seems, therefore, that the Calcutta route should be definitively adopted for the whole of the material. The difference, it may be noted, between the ⅓ pie and ¼ pie rates by the Calcutta route is Rs. 16 per ton, and one-fourth of the whole distance is on the Punjab Lines.

With reference to the break at the Sutlej, it is desirable that it should be ascertained what arrangements are possible for reducing this inconvenience to a minimum, and the Punjab Government will be addressed on the subject, in connexion with the experimental bit of line with a gradient of $\frac{1}{40}$, regarding

which a communication was recently made to the Punjab Government, and it should be moved to ascertain the rate the Punjab Railway Agent will concede for the transport of material.

Mr. Lee Smith will make his recommendations as to the latitude as to time and quantity in delivering material to be given to the East Indian Railway Company, and the Agency will then be addressed on the subject.

Mr. Lee Smith will also estimate what storage space would be required in Calcutta for his material, *i. e.*, the maximum at any one time.

Line from Jhelum to Pindee.—From an inspection of the section of the Grand Trunk Road, it appears that there are $6\frac{3}{4}$ miles of gradients worse than $\frac{1}{40}$, and $8\frac{1}{4}$ miles (in addition) worse than $\frac{1}{50}$, total worse than $\frac{1}{50}$, 15 miles.

The road surface is to be appropriated for the rails, as below Jhelum, subject to its being improved to a maximum grade of $\frac{1}{40}$, with tolerable curves for a slow traffic. If in places it should be expedient to divert the ordinary traffic, the formation of the diversion may be 20 feet in cutting, or 24 feet in bank, and gradients of $\frac{1}{20}$ may be adopted.

While a maximum grade for the Railway of $\frac{1}{40}$ is prescribed, it is left to Mr. Lee Smith to bring forward proposals for improving these severe grades; but the extra cost must be distinctly exhibited, and if the extra outlay be comparatively small, they will be considered. If, on the other hand, a very large expenditure is required to obtain even $\frac{1}{40}$, something worse must be adopted, and the question of adopting an incline with a stationary, or a bank, engine considered, if necessary.

Notes of a conversation between the Under Secretary in the Public Works Department and MR. LEE SMITH, *on the 6th July* 1869.

Kharian Range. Cuttings and Curves.—A maximum width of 20 feet at formation level may be given in cuttings, and a minimum curve of ¼ mile radius adopted, but the latter may be reduced to 1,000 feet, if it should appear that any material advantage would result.

Ballast.—With transverse sleepers, width of ballast at sleeper level to be 10 feet. Depth below sleeper to be 8 inches on the Trunk Road; 12 inches elsewhere.

Standard dimensions.—Plans showing standard dimensions on the guaranteed lines were made over for Mr. Lee Smith to propose any modifications that may be called for on them, with reference to the general style of line contemplated between Lahore and Pindee.

Brick-making and Fuel.—Papers relating to Hoffman's kilns were made over to Mr. Lee Smith, who stated his probable requirements in the way of wood-fuel to be—

At the Ravee	2	lakhs maunds.
„ the Chenab	6	„ „
„ the Jhelum	3	„ „
Total	11	

Timber.—Mr. Lee Smith mentioned that he would require 100,000 cubic feet of timber for staging. These wants and his sleeper requirements will be brought to Dr. Brandis' notice, in order that he may communicate with the Punjab Forest Department, and ascertain what quantities can be supplied by that Department, of what descriptions of timber, at what places, and in what times.

Mr. Lee Smith will be ready for sawing logs in three months, and the delivery of fuel cannot commence too soon.

Section of Sleeper.—Consideration of a form of sleeper adopted on the Brenner Railway was suggested to Mr. Lee Smith as affording a greater bearing surface with a given section than of rectangular, provided it can be cut economically.

General specification.—Mr. Lee Smith will draw up for approval a general specification for guidance in preparing the designs and estimates and carrying out the works throughout the line, to be submitted through the Punjab Government.

Indent for Permanent-way.—Mr. Lee Smith's Indent for 100 miles of permanent-way was approved, and will be sent Home by the Mail of the 8th instant.

Workshops.—With the large workshops of the Punjab and Delhi Railways at Lahore, the expediency of the Government establishing permanent shops on a large scale for the Northern Line cannot be admitted, but small shops of a temporary character will be required in connection with each bridge during construction, and it will be for further consideration whether any, and what, shops may be necessary, either at Pindee or elsewhere, for carrying out small repairs to locomotives, &c., when the line is opened.

Dated 6th July, 1869.

From—H. LEE SMITH, Esq., *Chief Engr., Punjab Northern (State) Railway,*
To—The Secretary to the Government of India, P. W. DEPT.

In the Notes of our last Meeting of 22nd June, I observe it is ruled that, in calculating the weights of the girders for the large bridges, the maximum moving load is to be doubled and added to the fixed load, and that the sum is not to strain any part to more than 4 tons in compression, or 5 tons in tension, per square inch. This is greatly in excess of the Regulations of the Board of Trade, and I think also in excess of our requirements. Its effect would be to increase the weight of iron in the Ravee Bridge by about 10 tons per span more than in the drawing with outside foot-paths which was discussed at the Meeting above referred to, and this notwithstanding the suppression of the outside foot-paths and the consequent diminution of the moving load.

The rule of the Board of Trade for wrought-iron bridges is that no part is to be strained to more that 5 tons per square inch when loaded with the heaviest engines. In other words, the fixed load plus the maximum moving load (*not double*) is not to strain to more than 5 tons in any part. This rule is a crude and unscientific one; it takes no note of the increased stress of a rapidly moving load, and allows the iron to be strained as much in compression as in tension. It is a relaxation of the older Board of Trade Rule still in force for cast-iron girders, and which is equally applicable to wrought-iron, and is the only accurate one, namely, let the *breaking weight* equal six times the maximum moving load plus three times the fixed load.

A mean between these two factors of safety (6 and 3) should be taken for the "mixed load." In our case this would be—maximum moving load 25 cwt. per lineal foot. Fixed load say $11\frac{1}{3}$ cwt. per lineal foot—then $\frac{(25 \times 6) + (11\frac{1}{3} \times 3)}{25 + 11\frac{1}{3}} = 5$ nearly. I take the breaking weight of rivetted work at 38,000 lbs. per square inch in compression, and 50,000 lbs. per square inch in tension.

These are the figures already adopted in designing these girders, and I would propose to adhere to them in getting out of the modified design, but any further progress in this must await the orders of Government on the rule to be adopted.

If these figures be followed, the saving effected by suppressing the outside foot-paths will be about 7 tons per span, amounting, in the 18 spans of the Ravee at the rate already taken of Rs. 410 per ton, to Rs. 51,660—say half a lakh.

At the last Meeting the saving was guessed at double this.

No. 956 R, dated 20th July, 1869.

From—The Secretary to the Government of India, P. W. DEPT.,
To—The Joint Secretary. to the Govt. of the Punjab, P. W. Dept., Railway Branch.

I am directed to inform you that the conditions on which the girders of the large bridges on the Punjab Northern Railway are to be calculated (*vide* Notes of Conversation of 22nd June 1869), should be amended as follows:—Mr. Lee Smith having brought to notice that, under the Board of Trade Regulations, the test load of engines is taken as a *dead*, and not as a *rolling*, load. Further consideration has also led to the conclusion that 1 ton per lineal foot is more likely to be the weight of the girders and their superstructure, including rails, foot-ways, cross-girders and platform for cart-way.

The *proof load* is to consist of a train of engines to be brought over the span at speed. This load, it is estimated, will be $1\frac{1}{4}$ tons per lineal foot, and taking the weight of the girders, &c., at 1 ton (which, however, may be corrected to the actual weight when more exact calculations are made), the total proof load will be $2\frac{1}{4}$ tons per lineal foot. Under this load, regarded as *dead*, no part of the girders should be strained more than 4 tons in compression and 5 tons in tension per square inch.

The ordinary *working load* may be taken to consist of a heavy goods train, 14 axles of which may be on one span at a time, each axle, with the improved vehicles which may be eventually looked for, carrying 9 tons. This would give a load of 1 ton per foot forward, and adding this to the weight of the superstructure, the total working load would be 2 tons per foot forward, or one-ninth less than the proof or test load. Under this load, then, considered entirely as a dead load, no part of the girders is to be strained more than $3\frac{5}{9}$ (say $3\frac{1}{2}$) tons in compression and $4\frac{4}{9}$ (say $4\frac{1}{2}$) tons in tension.

2. Adopting Mr. Lee Smith's* figures for the ultimate strength of wrought-iron rivetted work, the amended conditions will provide a safety co-efficient of five, estimated in Fairbairn's method for wrought-iron girders. Under the circumstances of the exceptionally small and slow traffic expected on this line, this may be considered sufficient, though Fairbairn advocates a co-efficient of six. The Board of Trade rule for cast-iron girders, if applied, as proposed by Mr. Lee Smith, would give a co-efficient of only $4\frac{1}{2}$, with the proportion between the fixed and rolling load as now amended.

If Mr. Lee Smith desires any further consideration of the above remarks, it will be well that his representation should be made as early as possible.

* Compression 38,000 lbs. per square inch.
Tension 50,000 lbs. ditto.

No. 287 S, dated 1st July, 1869.

From—LIEUT. L. CONWAY-GORDON, R. E., *for Joint Secy. to the Govt. of the Punjab, in the P. W. Dept., Railway Branch,*

To—The Secretary to the Government of India, P. W. DEPT.

I am directed to forward, for the information of the Government of India, the following remarks by this Government on the most advantageous system to

be adopted for the transport, from seaboard to site, of the permanent-way, bridge iron-work, and other materials required for the Punjab Northern (State) Railway.

2. It is observed that, in the Chief Engineer's letter of the 10th June 1869, to your address, on this subject, no less than four systems of transport are compared :—

1*st.*—*Viâ* Kurrachee to Kotree by rail; thence by river to the site of the Jhelum, Chenab or Ravee Bridges, thence by road to site.

By direct Government Agency.

Estimated cost of carriage.

Bridge-work	Rs.	55 per ton.
Permanent-way, &c.	„	44 „

2*nd.*—*Viâ* Kurrachee and Kotree as before, by River to Mooltan, by rail to Lahore, thence by road to site.

By Government Agency.

Bridge-work	Rs.	63 per ton.
Permanent-way	„	50 „

3*rd.*—*Viâ* Kurrachee to site.

By contract; the contractor taking all risk.

Bridge-work	Rs.	65 per ton.
Permanent-way, &c.	„	60 „

4*th.*—*Viâ* Calcutta, by rail and road to site.

By Government Agency.

Bridge-work	Rs.	80 per ton.
Permanent-way, &c.	„	62 „

3. With regard to these four alternative proposals, I am to observe that, in the opinion of His Honor the Lieutenant Governor, the first two may be put at once out of consideration, the difficulty, danger and delay attending the navigation of the upper parts of the Chenab and Jhelum entirely prohibiting the former; and with regard to the latter, as compared with the third alternative, not only is a large scattered establishment far removed from Head-quarters difficult to effectually supervise, but the action taken by the large Contractors, Messrs. Brassey, Wythes and Henfrey in similar circumstances, and with regard to similar material, appears also to demonstrate that, on the whole, the carriage of permanent-way, &c., cannot be effected more advantageously by direct agency than by contract. His Honor, too, is induced to believe that the cost by the first two routes has been slightly under-estimated.

4. Contrasting the two last systems proposed, I am to remark that the Calcutta route apparently possesses an advantage in time, but in no other respect. Till the Sutlej Bridge be completed (and the iron-work of this has only lately been ordered), the number of times the materials will have to break bulk will be equal.

On the one hand, a Contractor, Mr. Coates, has already offered to undertake the carriage at from Rs. 60 to Rs. 65, all loss remaining his, and it is possible that by inviting tenders even lower rates might be obtained on the same conditions. On the other, the estimated rates are from Rs. 62 to Rs. 80, and this without including the cost of the necessary Agencies at Calcutta, Loodianah and elsewhere, and the risk of loss or damage in passing the materials over the Sutlej. It is observable, too, that in estimate No. 4, no extra allowance has been made for handling the bridge iron-work, or for the difference of freight from England between Kurrachee and Calcutta.

The total difference in the cost of the two routes of the carriage of 29,000 tons cannot be less, it is believed, than 3½ lakhs of rupees, which appears to His Honor a sufficient ground for recommending to the Supreme Government

the adoption of the Calcutta route for such material only as may be urgently required either for commencing operations or otherwise, and that tenders for the transport of the remainder *viâ* Kurrachee be publicly invited.

5. In conclusion, I am to observe that though it is probable that Mr. Coates would have no competitor as a contractor, he has abundantly shown himself to be such an efficient and reliable one, that the fact of there being a man of his stamp on the spot greatly enhances the preference to be given to method No. 3.

It should not be forgotten, too, that by either route the permanent-way and girder iron-work would arrive before being required, nor that more delay has been experienced in the carriage of the permanent-way for the Loodianah Section of the Delhi Railway *viâ* Calcutta than of that of the Beas Section *viâ* Kurrachee.

No. 876R, dated 7th July, 1869.

From—*The Government of India*, P. W. Dept.,

To—*The Joint Secy. to the Govt. of the Punjab, in the P. W. Dept., Railway Branch.*

In acknowledging receipt of your No. 2878, dated 1st instant, recommending the route of the Indus Valley, and the agency of a Contractor for the transport of materials for the Punjab Northern (State) Railway from the seaboard to Lahore, I am directed to invite attention to the Notes of conversation between the Secretary in this Department and Mr. Lee Smith on the 22nd June 1869, and to enquire, with reference to the comparative advantages of the different routes as therein reviewed, whether the Lieutenant Governor is disposed to modify the above recommendation, or has any further observations to offer on the subject.

No. 396 S, dated 12th August, 1869.

From—Lieut.-Col. H. Drummond, R. E., *Joint Secy. to the Govt. of the Punjab, in the P. W. Dept., Railway Branch,*

To—*The Secretary to the Government of India*, P. W. Dept.

I am directed to acknowledge the receipt of your letter No. 876 R, dated 7th July 1869, on the subject of the inland transport of material for the Punjab Northern (State) Railway from Lahore to Jhelum, and in reply to forward, for the information and orders of the Government of India, copies of papers as marginally noted on the subject.

No. 11, dated 10th August 1869, from Chief Engineer, Punjab Northern (State) Railway.
No. 15 S, dated 12th August 1869, from Chief Engineer, Punjab Northern (State) Railway, in reply to above.

2. The Hon'ble the Lieutenant Governor agrees with the Chief Engineer Mr. Lee Smith in thinking that the cartage of the quantity of permanent-way material within the period (from 1st January to the middle or end of May 1870) will be a very serious difficulty, and would recommend that Mr. Coates be given the contract for the transport of a portion of the above material to Jhelum and the Chenab, as suggested by Mr. Lee Smith, provided that it is certain that freight to Kurrachee at the rate of 1,540 tons per month is likely to be obtained, but on this point His Honor is rather sceptical, for the reason that vessels will not ordinarily take more than 300 tons of such dead-weight as iron.

It would be necessary to obtain five vessels bound to Kurrachee every month for five months to accomplish the above, and this, the Lieutenant Governor thinks, is hardly likely to be secured from England to Kurrachee.

If, however, freight for even 1,000 tons per mensem can be secured, it would, in His Honor's opinion, be advisable to secure that quantity by Kurrachee, rather than not obtain any of the material by that route.

W

3. If, therefore, the required freight to Kurrachee can be obtained, and Mr. Lee Smith's proposals are approved by the Supreme Government, I am to request that the orders of the Government of India on the subject may be communicated by telegraph.

4. With reference to the Chief Engineer's remarks about cartage from Loodiana to the Beeas, I am to observe that it is probable that the Delhi Railway will be opened for traffic as far as Jullundur from the Beeas some months previous to its being opened down to Phillour; but with regard to this, more precise information will be obtained from the Agent.

5. In conclusion, I am to suggest that, in Telegram No. 1 proposed by Mr. Lee Smith to be sent to the Secretary of State, the words, "if possible," be added after "Kurrachee," and the word "first" omitted before "preference."

No. 118, dated 10th August, 1869.

From—H. LEE SMITH, ESQ., *Chief Engineer, Punjab Northern (State) Railway,*

To—*The Joint Secy. to the Govt. of the Punjab, in the P. W. Dept., Railway Branch.*

I have the honor to acknowledge receipt of your docket No. 3778 of yesterday's date, and in reply to state that I am very glad this opportunity is offered me for re-opening the question of inland transport of permanent-way material. It is, moreover, no slight relief to me to find the Punjab Government in favor of the measure which I am about to urge for adoption as strongly as I can, though principally on the score of an element which appears hitherto to have been hardly sufficiently considered.

2. In one of the conversations, records of which reached me under cover of yours under reply, it was arranged that the whole of the permanent-way material be shipped to the port of Calcutta, and thence brought up to Lahore by the East Indian Railway Company and the Punjab and Delhi Railway Company; the former having agreed, and the latter being expected to agree to the rate of quarter pie per maund per mile, and that from Lahore upward we should cart the material depositing it alongside the line.

3 I now wish to draw attention to the fact that this mode of conveyance above Lahore will be fraught with much difficulty, and even very considerable risk of failure so far as expedition of work is concerned, because the demand for carts for this purpose will bring our requirements in this line too far above the local resources.

4. The first consignment of permanent-way material is not expected to arrive in port till latter end of December next, the carting of it therefore above Lahore may be considered to commence with the beginning of January 1870, at the very earliest; and if, as the Government of India was allowed to expect, the line to Jhelum (with exception of the three large bridges) is to be opened for traffic before the end of 1870, it becomes almost an absolute necessity that the whole of the 11,000 tons of material be carted before the rivers rise and bridges are removed, which cannot be counted on being later than May, if an average season be assumed. We should, therefore, have to cart 11,000 tons of material in the first five months of 1870, taking it along the line with an average lead of 50 miles.

5. Assuming a two bullock-cart to lead 20 maunds 15 miles a day, and to make 25 miles a day on the empty-return journey, it would take 2,052 carts daily employed to do this work. Besides this, we shall require daily 866 carts to lead merely the first lift of ballast, assuming that work to be spread over eight months. Thus our requirements for these two items alone amount to 2,918 carts a day for a period of five months, besides whatever we may need to re-place break-downs and irregularities, carts at platelaying head to lead out sleepers, to do general work, especially at the bridges, and bullocks for mortar-mills, soorkee and brick machines, &c., so that, including all these, cattle for

3,500 carts may well be put down as an under rather than over statement of our daily requirements.

6. To calculate on finding this available is altogether out of the question, and would still be so even if we had not so formidable a competitor as the firm of Brassey, Wythes and Henfrey, who are our close neighbours, and, indeed, even now in matter of cartage draw on the local resources to exhaustion on three-fifths of our length.

7. Under these circumstances, I would strongly urge that we be relieved of the greater part of this cartage by giving Mr. Coates the conveyance of permanent-way material for the whole distance mid-way between Lahore and Chenab, say 30th mile-post up to Jhelum to be carried by river thus,—2,200 tons at Jhelum to be worked out telescopically, from thence to mid-way between the Jhelum and the Chenab, and 5,500 at the Chenab, 2,200 of which would be led out similarly towards the Jhelum, and the remaining 3,300 to the point mid-way between the Chenab and Lahore.

8. This would not only relieve us of a very serious difficulty, but would effect a very considerable saving. Assume the distance from Lahore to Jhelum to consist of what is very near the truth, namely, from Lahore to the Chenab, 60 miles, and from the Chenab to Jhelum, 40, then in having material delivered at the three stations of Lahore, the Chenab, and Jhelum in such quantities as above proposed, the lead from having been an average of 50 miles, will be reduced to the following, *viz.*:—

	Rs.
First 30 miles to be led out by us, average lead 15 miles, which (take 50 miles lead at 10 for basis) would make a rate of 3 per ton on 3,300 tons	9,900
Latter 70 miles to be led out by Mr. Coates, average lead 12 miles, computed on the same basis, at the rate of Rs. 2-6-5 per ton on 7,700 tons ...	18,488

This second item we would abate from Mr. Coates' tender on the ground that we would prefer his giving up the leading out rather than becoming a competitor in local cartage, and we would do it ourselves by working telescopically with trollies at a rate at least as low as carts if not lower.

	Rs.
9. Seeing, then, that the distribution on 100 miles would cost us	28,388
instead of 10 per ton on 11,000 tons led 50 miles	1,10,000
a saving on cartage would be effected, amounting to	81,618

besides which, the difference has to be considered between Mr. Coates' tender rate and that which the Calcutta rate was computed to amount to, *viz.*, Rs. 2 in favor of Mr. Coates' tender. This, on 7,700 tons, will be Rs. 15,400, so that with the saving of expense in lead and this, a diminution of expenditure of nearly a lakh of rupees would result.

10. Against this are to be considered the two elements recorded in the above-quoted conversation, namely, *first*, return profits from guaranteed Railways; and *second*, difference in probable ocean freight.

11. As regards the first item—return profits. Those on the East Indian Railway are taken at 50 per cent., and those on the Punjab and Delhi, at 30 per cent.; but would it not be well to consider that these profits are on all traffic throughout the year, and not the profits on first class (lowest rate) goods, still less on a rate that is abated even below that. I have not just now data at hand, but I have an extremely strong impression that it is the higher rates of goods from which the bulk of the profits arise.

12. Relative to the second item, ocean freights.—The Government of India do not say that the rates ruling to the port of Calcutta are lower than those to the port of Kurrachee, but only that they expect them "probably" to be so. With very extensive consignment to a new and only partially developed port, the doubt about obtaining return freights might likely enough have that effect, but in the absence of a glut in the market, and 7,700 tons could hardly be supposed to produce that, the shorter voyage to Kurrachee would seem, in the

absence of knowledge to the contrary, to be accessible at a lower rate of freight than Calcutta, if any difference does exist.

13. So for the question of mere outlay in inland transport. Even though the rate of $\frac{3}{4}$ pie per maund per mile be not the most profitable to the guaranteed Railways, yet it might suffice to turn the scales considerably in favor of the Calcutta route, so far as concerns mere outlay on that item; still even then the cartage difficulty, which really is a very serious one indeed, is not met, and remains as likely as ever to be the impediment that would stand in the way of our opening for traffic by the intended date.

14. I would, therefore, urge very strongly that the question be re-considered, and Mr. Coates' tender to deliver at Chenab and Jhelum, and distribute along the line for Rs. 60 per ton, be accepted, barring the distribution item; or if Mr. Coates be now no longer desirous to do the work, that tenders for the delivery of the material at the above-named places be invited by advertisement.

No. 15 S, dated 12th August, 1869.

From—H. LEE SMITH, ESQ., *Chief Engineer, Punjab Northern (State) Railway,*
To—*The Joint Secy. to the Govt. of the Punjab, in the P. W. Dept., Railway Branch.*

I have the honor to acknowledge receipt of your No. 395S of this day, that being a docket of No. $\frac{1}{1}\frac{7}{9}\frac{8}{0}\frac{9}{7}\frac{P}{D}$, from the Agent of the Punjab and Delhi Railways to you.

2. In reply, I beg to say that from it I learned for the first time that the East Indian Railway Company had made their rate of quarter pie per maund per mile for carrying our bridge and permanent-way material, contingent on the latter being not less 75 per cent. of the whole, so I could hardly be said to have overlooked the point, though it appears a very natural one for them to have pointed out and stipulated.

3. I was pretty well prepared for the news conveyed in yours under reply, that the gap of the Sutlej would be from the intersection of the Grand Trunk Road to Phillour for the whole time during which we should be having permanent-way material brought up, but it is to me fresh and unwelcome news that the line between Phillour and the Beeas River is sure to be unopened during an important part, and possibly during the whole of the time when our permanent-way material ought to be coming up.

4. Though it may be reasonably expected that the Punjab Railway Company having their bridge across the Beeas completed and rails laid would permit the material to be loaded on to the line on the left bank, instead of subjecting us to crossing it in boats over the river too, yet a cartage over the whole distance between the Sutlej and the Beeas above 40 miles, besides the gap on the left bank of the Sutlej, appears inevitable.

5. This, considered in connexion with what I pointed out in my letter No. 11 about our already existing cartage difficulty, appears to point even still more strongly to the port of Kurrachee being used largely for permanent-way material.

6. It appears more than possible that when the carriage of permanent-way material is to a great extent withdrawn from the East Indian and Punjab Railway Companies, they may quote a higher rate for the conveyance of bridge and miscellaneous material, but that after all is only on a smaller amount of tonnage compared to the great bulk of permanent-way, and is an unavoidable contingency. Better to be charged a trifle more for the conveyance of bridge work than risk having the whole work delayed, perhaps stopped for want of permanent-way material.

7. The letter from the Agent for the Punjab Railway is herewith returned.

No. 454 S, dated 31st August, 1869.

From—LIEUT.-COL. H. DRUMMOND, R. E., *Joint Secy. to the Govt. of the Punjab, in the P. W. Dept., Railway Branch,*
To—*The Secretary to the Government of India,* P. W. DEPT.

I am directed to forward you, in continuation of this Office letter No. 369S, dated 12th August 1869, a copy of a letter No. 33S, dated 28th instant, from the Chief Engineer, Punjab Northern (State) Railway, informing this Government that Mr. Coates is now unable to undertake the transport of permanent-way material from Kurrachee; and, with reference thereto, to state that under the circumstances, it now appears to this Government advisable to use the Calcutta route alone for the transport of all the permanent-way material, bridge iron-work, &c., required for the Punjab Northern (State) Railway.

I am to state that the proposal of the Chief Engineer to undertake the carriage of this material by direct agency under himself is, in the opinion of His Honor the Lieutenant Governor, wholly unadvisable.

No. 33 S, dated 28th August, 1869.

From—H. LEE SMITH, ESQ., *Chief Engineer Punjab Northern (State) Railway,*
To—*The Joint Secy. to the Govt. of the Punjab, in the P. W. Dept., Railway Branch.*

I beg to state that I am informed of a communication from Mr. Coates of Ferozepoor, in which he informs me that, owing to the dispersion of his establishment, he is now unable to undertake the transport of permanent-way material from Kurrachee.

It is thus rendered necessary that we should, without delay, take steps to ascertain if there are not other contractors willing and able to convey the material for us, in the manner required, and at suitable rates. I have accordingly prepared, and have the honor to submit herewith for your approval, an advertisement for insertion in the *Gazette*, and principal public prints of the West and North-West.

In the event of our, after all, failing to be able to make satisfactory arrangements for this transport by contract, I would here at the same time beg to state that there will be no difficulty in specially organizing for its execution in connection with my own staff. In order, however, to take the early measures which this would imply, it is of great importance that such an alternative should be now considered and provided for by Government.

No. 1398 R, dated 15th September, 1869.

From—*The Government of India,* P. W. DEPT.,
To—*The Chairman, Board of Agency, E. I. Railway Company.*

I am directed to acknowledge the receipt of your No. 479G, dated 28th ultimo, stating that the Board of Agency are prepared to carry a minimum of 20,000 tons of Railway materials for the Punjab Northern (State) Railway at the rate of $\frac{1}{4}$ pie per maund per mile, provided that not less than 15,000 tons, or three-fourths of the whole be permanent-way proper, and that if the proportion of higher classed goods be in excess of one-fourth of the whole, the Board are prepared to carry such excess at 1st class rates, or $\frac{1}{3}$ pie per maund per mile, if that excess be not more than 20 per cent. of the whole quantity of material.

2. You further state that the Board of Agency are prepared to carry Railway materials in the same proportion for the Jeypoor Lines to Delhi at a uniform rate of Rs. 1-10-8 a maund, which is equivalent to carrying 75 per cent. at $\frac{1}{4}$ pie, and 25 per cent. at $\frac{1}{2}$ pie. It is presumed that this average rate

of $\frac{5}{16}$ pie all round would apply equally to materials delivered for the same line at Agra, but it would be satisfactory to receive an assurance on this point.

3. I am directed to accept these proposed rates of freight, and, with reference to your No. 6493, dated 20th August 1869, to agree to the adoption of the Credit Note system of payment.

4. I am to suggest that it seems likely to be the most convenient plan if the first payments are made at the rates of $\frac{1}{4}$ pie and $\frac{5}{16}$ pie, respectively, on the whole quantity of each despatch, without reference to the proportion of differently classed material that may be invoiced, and that the account should be adjusted half-yearly, and the balance, if any, then due to the Railway Company, paid up. Any excess or defect in the proportion of higher-classed materials paid for in preceding half-years, could be allowed for in like manner in settling the accounts of the subsequent half-years. This will enable the actual earnings of the Railway Company in each half-year to be realized and embodied in the Revenue Account for that period.

No. 1399 R, dated 15th September, 1869.

From—The Government of India, P. W. DEPT.,

To—The Joint Secy. to the Govt. of the Punjab, in the P. W. Dept., Railway Branch.

I am directed to acknowledge the receipt of your No. 396 S, dated 12th August 1869, recommending that a tender for the transport of some of the permanent-way material for the Punjab Northern (State) Railway *vid* the Punjab rivers should be given to Mr. Coates, and also of your No. 454 S, dated 31st of the same month, intimating that Mr. Coates was not able to undertake this contract, and recommending that the original order of the Government of India that all material should be sent *vid* Calcutta should now be upheld.

2. I am directed to point out that even had Mr. Coates been able to accept this tender, no circumstances have been adduced that would make such a proceeding more advisable than when it was considered by the Secretary in this Department, in communication with the Chief Engineer, Punjab Northern Railway in June last, and deliberately rejected. At the rates and figures given in the Chief Engineer's memorandum, it would require not more than 315 carts to put the given quantity of materials in the given time on the western side of the Rivers Ravee and Chenab whence, it is stated, it could be distributed by trollies, whereas the Chief Engineer argues that no less than 2,052 carts will be required for the conveyance of permanent-way materials.

3. Enclosed are copies of letters which have passed between this Department and the Board of Agency, East Indian Railway, showing the terms that have been agreed to for the transport of materials for the Punjab Northern Railway. It is requested that when the material begins to arrive, the greatest attention may be given to the exact compliance with the terms thus arranged.

No. 501 S, dated 13th September, 1869.

Memo. from—LIEUT.-COL. H. DRUMMOND, R. E., *Joint Secy. to the Govt. of the Punjab, in the P. W. Dept., Railway Branch,*

To—The Secretary to the Government of India, P. W. DEPT.

Copy of the following proceedings of an official meeting held between the Government and Railway Officers on the 3rd September 1869, in respect to the carriage over the Punjab and Delhi Railways of permanent-way and other materials for the Punjab Northern (State) Railway, forwarded for the information of the Government of India, with reference to Public Works Department's letter No. 887R, dated 8th July 1869.

Resolution No. $\frac{261}{278}$ of Minutes of Official Meeting held on September 3rd, in respect of carriage of Permanent-way and other materials for the Punjab Northern (State) Railway.

Read correspondence ending with Officiating Traffic Manager's No. $\frac{151}{100}$, dated 30th August, submitting copy of No. 587 F—R of 24th idem, from the Traffic Manager, East Indian Railway, and copy of a Resolution passed by the Board of Agency of that Company, agreeing—

1*st.*—To convey not less than 20,000 tons of materials for the Punjab Northern (State) Railway at a uniform rate of $\frac{1}{4}$ pie per maund per mile, exclusive of loading and unloading charges, on the understanding that the proportion of permanent-way materials forms not less than 75 per cent. of the whole.

2*nd.*—That as Government will not bind itself to send a minimum quantity, the Railway Company will not bind themselves to carry a specific maximum each month, but that practically there is no doubt they will be able to carry any quantity that may be offered; and

3*rd.*—That if the Delhi Railway will consent to the arrangement, the East Indian Railway will not object to their wagons being run through to Lahore on the terms of the existing working agreement.

No. $\frac{261}{278}$.—Resolved,—that the Consulting Engineer be informed that the Punjab and Delhi Railway Companies agree to the carriage of materials for the Punjab Northern (State) Railway on the same terms as agreed to by the East Indian Railway.

No. 279 F, dated 25th June, 1869.

From—The Govt. of India, P. W. DEPT.,

To—The Secretary to the Government of the Punjab, in the P. W. Dept.

The Proceedings of the Punjab Government for April 1869, entry No. 13, of which contains correspondence relating to the fuel-supply for the Northern State Railway, have been laid before His Excellency the Governor General in Council. The papers on this subject have not been separately submitted to the Government of India, but the subject is one of the utmost importance, and I am directed to communicate for His Honor's consideration the following remarks and suggestions.

2. In the letters of the Financial Commissioner and Conservator of Forests, two sources of fuel-supply for the Railway are discussed, the existing rukhs and new plantations. The quantity of fuel now standing on the rukhs within 20 miles of the line is estimated at 1,480,225 maunds. But it is clear that these wood-lands are but poorly stocked, the estimated rate per acre varying from 8 maunds to 23·4 maunds.

The existing stock on these rukhs, it is calculated, will last seven years, assuming the line to be 120 miles in length, and run over by three trains each way daily. If the estimate is correct, His Excellency in Council observes that the supply may be expected to last even longer, as the traffic on the line is not likely for some time to require more than one train daily each way.

The existing rukh supply therefore if carefully husbanded, will give a good starting ground for the Railway, though it is clear that it cannot be relied on by itself. This is the more apparent from the consideration that, where the natural stock is so very scanty, reproduction will necessarily be both slow and uncertain.

3. Whatever may be the value of the estimate, His Excellency in Council trusts that the needful orders have been issued to secure the demarca-

tion and preservation of the more promising of these wood-lands. If these rukhs are to yield a permanent and increasing supply of fuel, they must be worked on a systematic plan by officers of the Forest Department, and it may become necessary to consider what will have to be done in this direction in connection with the recent proposals for the establishments of the Fuel Reserve Division. When selecting the lands to be made over to the Forest Department, adequate provision should be made for the people in the vicinity who have hitherto been in the habit of grazing their cattle in these rukhs, and of cutting fuel and wood for building and agricultural purposes.

The Government of India should be kept duly informed of the progress made in the demarcation and transfer to the Forest Department of these wood-lands.

4. In Public Works Department Resolution No. 308 F, dated 14th September 1868, attention was directed to the possible utilization of the wood of the inferior pines for fuel. It is believed that considerable tracts of the inferior pines exist in the outer hills, which at present are utilized to a small extent only. The principal question appears to be whether such wood can be cut and floated down at a sufficiently low price. I am to suggest that experiments might, on a moderate scale, be made, with a view to test the cost of landing such wood at depôts convenient for the Railway. The results of such experiments should be reported in due time.

5. At the same time it is clear that planting operations should be set on foot to supplement the existing fuel resources for the Northern State Railway. I am therefore to suggest, for His Honor's consideration, that steps may at once be taken to obtain suitable land for this purpose. His Excellency in Council is inclined to think that 4,000 acres may at present be considered as the limit of these operations. On previous occasions it has been explained that operations should not be commenced in a large number of small and scattered plots, but that large tracts should be selected within a suitable distance from the line. From the data given by Dr. Stewart, it would appear that the cost of taking up private lands for such purposes in the districts along the line would be very considerable. His Excellency in Council therefore considers that if Government land is available at a greater distance, it should not be rejected without first comparing the cost of carriage of the produce with the interest on the purchase money. Thus assuming the cost of carriage to be about 8 annas per mile for 100 maunds, a distance of 10 miles adds Rs. 5 to the cost of 100 maunds, which, under favorable circumstances, may perhaps be estimated as the annual produce of 4 acres. Assuming also Rs. 50 per acre as the cost of taking up private land, the interest at 5 per cent. would amount to Rs. 10 for 4 acres. In some cases it may therefore be desirable to go a distance of more than 10 miles from the line to get Government land, and where water-carriage is available the distance may be greater.

It appears to His Excellency in Council that an experienced officer of the Forest Department should be specially deputed to select and to take up in communication with the Deputy Commissioners of Districts the needful plots of land for these plantations.

6. As far as practicable, all spare land along the line of Railway should be planted. But the planting and management of such narrow belts and lines of trees must be left to the officers of the Railway Department, whose duties constantly take them to every part of the line. When the fuel-plantations are further advanced, the Forest Department may perhaps assist in giving the services of trained subordinates.

7. In conclusion, I am to observe that the present remarks have been made on the assumption of the line ending at Jhelum, but it is desirable to know, in the event of the line being continued to Attock, what are the sources of fuel-supply beyond Jhelum, and what lands will be available for plantations in the Jhelum and Rawul Pindee Districts. A report on this subject is requested.

Dated 22nd July, 1869.

Memorandum by DR. D. BRANDIS, *Inspector General of Forests, on the requirements of the Northern (State) Railway in regard to fuel for brick-burning and sleepers.*

I beg to submit copies of two letters which I have addressed on the subject of the supply of fuel and sleepers for the construction of the line. For all details I beg to refer to these letters, of which I have submitted copies to the Punjab Government.

2. The results are as follows:—

It appears probable that the arrangements which Mr. Powell made some-time ago in accordance with my suggestions to him in this matter will, if all goes well, and there are fair average floods in the rivers, enable him to place at the disposal of the Railway Department in 1869, 1870, and 1871, material for about 2,16,000 Deodar sleepers.

3. The quantities expected to come down the different rivers are estimated as follows:—

	1869. Logs.	1870. Logs.	1871. Logs.
1. Beeas (Nowshera Depôt) ...	5,000*	4,000	4,000
2. Ravee (Madhopoor) ...	3,000	3,000	3,000
3. Chenab (Wuzeerabad) ...	10,000*	15,000	20,000
4. Jhelum (Jhelum)	1,000	4,000	4,000

4. The Jhelum timber is generally from 10 to 20 feet long, and the logs measure from 20 to 30 cubic feet. The timber from the other rivers is smaller; it has lately averaged from 14 to 16 cubic feet per log, and from 10 to 15 feet in length. These logs may be expected to yield three, and the others five, sleepers on an average. In other words, half the wood of a log will be wasted in cutting sleepers. This is allowing a wide margin for splits, sapwood, cracks, and unsoundness. If due thrift is used in cutting up the timber, and rectangular sleepers are not always insisted upon, the out-turn will be much larger. Therefore, if all goes well, it is not impossible that the wood brought down by the Forest Department may after all furnish material for nearly all the sleepers required on the line. Nevertheless, arrangements should be made to supply the deficiency from other sources, and I have requested the Officiating Conservator to place himself in communication with the Chief Engineer of the line, in the event of his being able to make arrangements for the supply of Deodar timber from other sources.

5. In the event of arrangements for floating down timber of Cheer (*Pinus longifolia*) being successful, I would suggest, for the consideration of the Government of India, that, as an experiment, a moderate quantity of this wood be used for sleepers on the line. They should not be laid promiscuously, but say one mile near some of the principal stations. Precise date as to the duarbility of Cheer in the North-West Punjab are wanting; but I am inclined to believe that this wood will be found to last much longer than is generally supposed.

6. All sleepers, when laid down on this line, should be branded with the year when they were laid down. As there will only be two descriptions of wood, it will suffice to brand Cheer sleepers in addition with the letter C. Whenever any sleepers are taken up, the age of each sleeper should be recorded in a register, and the original registers should, at the end of the year, be sent to the Conservator of Forests.

7. I proposed this plan early in 1863 for all railways in India. Had it been carried out at that time, we should now have much more reliable information regarding the durability of different descriptions of wood. It should at once be adopted on all State Railways, and after the practical working of plan has been tested, it may be adopted on the other railways also.

* Of this quantity 10,000 logs will be required to meet previous Indents.

8. Regarding the report that a proportion of Deodar sleepers had been found rotten before being laid down on the Punjab-Delhi Line, I have set enquiries on foot, but I do not think this report need influence the decision as to the use of Deodar for the Northern Line. The results of my enquiries will be submitted in due time.

9. Regarding the supply of fuel for brick-burning, I would beg to draw attention to my letter No. 148, dated 21st instant, which shows that the probable sources are—

1*st*.—The rukhs in some of the districts through which the line passes.

2*nd*.—Private wood-lands and some of the outer hills in Cashmere.

3*rd*.—Wood floated down the Jhelum and Ravee Rivers.

Arrangements to secure a supply from the third source are about to be made, but I do not expect much wood from that source during 1869.

10. To guard against wasteful cutting in the rukhs, it is necessary that the Forest Department should take charge of them as soon as possible. This and the proper management of the Jhelum Depôt will require the sanction of two additional officers for the Punjab Forest Department. Application for these will probably be made by the Punjab Government as a necessary consequence of my proposals, and I trust that this application, when received, will be favorably considered by the Government of India.

No. 148, dated 21st July, 1869.

From—Dr. D. Brandis, *Inspector General of Forests,*
To—The Officiating Conservator of Forests, Punjab.

I have the honor to inform you that the following will, as at present known, be the requirements for the construction of the Northern Punjab State Railway in the matter of fuel for brick-burning to be delivered at the points where the line will cross the rivers.

2. I will assume the average weight of 1 cubic foot at 40 lbs.—

Ravee	2	lakhs of maunds, or	4	lakhs of cubic feet.
Chenab	6	„ „	12	„ „
Jhelum	3	„ „	6	„ „
Total	11	„ „	22	„ „

This quantity of fuel cannot be delivered too soon, and immediate arrangements must, therefore, be made to organize the needful establishments.

3. In his letter of 13th March to the Financial Commissioner, Dr. Stewart estimated the quantity available in the rukhs within 20 miles of the line as follows:—

Sharukpoor	21,230 acres, with 252,000 maunds.*		
Goojranwalla	None available nearer than 40 miles from Line.†		
Sealkote	None.		
Goojerat	35,000	822,000‡	
Jhelum	35,000	822,000	
Rawul Pindee...	53,000	7,500,000	
	144,230	9,396,000	

or 225 square miles.

It should, however, be borne in mind that the estimates of the fuel available from the Goojerat and Rawul Pindee rukhs was considered much too high by

* Cutting and carriage estimated at Rs. 6-5 per 100 maunds.

† Carriage alone 22—25 per 100 maunds.

‡ Carriage at Rs. 13 per 100 maunds.

‡ Note.—These are the figures printed in the Proceedings, but there is apparently an error.

Dr. Stewart, and that the District Officers state that a considerable portion of this fuel must be reserved for the use of the inhabitants.

4. Under these circumstances, it appears to me that it will be preferable to reserve as much as possible of the fuel standing on these rukhs for locomotive purposes after the line has been opened. By that time I hope the Forest Department will have taken charge of these rukhs and a proper system of cutting will have been arranged. If cutting were now commenced in order to meet the urgent requirements of the railway at all points, the result would, I fear, be the exhaustion beyond hope of re-production of a large portion of these rukhs.

5. For the Chenab crossing no other fuel can, I believe, be made available by the Forest Department, as all the outer ranges are in Cashmere, and it will, therefore, here be necessary to make arrangements as soon as possible to organize the northern division of the rukh establishment, and to commence by taking charge of those lands which are nearest to the Chenab crossing of the line. You should, I think, at once place yourself in communication on this subject with the Financial Commissioner and the District Officers, and arrange for taking charge of these rukhs at once, so as to guard against indiscriminate cuttings. Certain limited blocks might then be assigned to contractors to cut. At the same time everything should be done to encourage the importation of fuel from private lands and from the outer hills in Cashmere, so as to save the Government rukhs for the present as much as possible.

6. A small quantity of fuel may be furnished by broken logs and inferior pines that are collected at the depôt, and the whole of this quantity should be stored, offered to the railway, and not sold to other parties until refused in writing by a responsible officer of the railway. This source of supply might be increased for next year, and to small extent for the current year, if a quantity of the inferior pines were felled and launched in Pangi, and the needful orders should be issued at once for launching, say 5,000 logs, if labour can be got. At the rate of 15 cubic feet per log, this would yield about 38,000 maunds. A separate account should be kept of the expenses on account of this wood, so as to determine whether it will pay to send railway fuel down in this manner. I do not feel confident that it will be possible to land this wood at sufficiently low rates, say at Rs. 30 per 100 maunds, which would correspond to 2·4 annas per cubic foot.

7. At first, while the rukhs are untouched, and supplies from private lands will be available, the railway may be able to get fuel at the Chenab crossing for considerably less than the figure mentioned above, and you must therefore be prepared to have the attempt to send down pine-wood from the hills cried down as utopical. Nevertheless, the experiment must be made, and must be made on a scale sufficient to give liable results. The wood of pines has not the same heating powers as harder woods, but mixed with them it will do very well for brick-burning. In Canada and some parts of Europe it is used largely as locomotive fuel.

8. On the Ravee and Jhelum Rivers you have, besides the inferior pines in the inner, a supply of *longifolia* in the outer hills, and I would suggest your organizing the needful establishments at once for cutting and launching, say, 10,000 logs of *Pinus longifolia* on each river, which would yield upwards of 150,000 cubic feet of wood, and probably more. I hope that Government will see fit to give Cheer wood a trial for sleepers on that line. In that case, the best logs would be sold for timber, and the inferior pieces for firewood, and the experiment might prove remunerative, and might be continued next year. The success in this matter will depend on whether you have any tracts of Cheer sufficiently close to the river to keep down the expense of land-carriage.

9. Should these Cheer operations succeed, you might eventually send down oak and other heavy woods on rafts of Cheer to be sold as fuel. The felling operations of Cheer should be conducted with care in defined localities, to secure as far as possible the re-production of the forest, and as soon as local-

ities for felling have been selected, and operations commenced, I beg that you will furnish me with a special report on the subject. If labor can be had, I would also suggest your arranging to launch about 5,000 logs of the inferior pines, both on the Jhelum and Ravee. Separate accounts should be kept of the operations with Cheer as well as with inferior pines on these two rivers. It will probably be necessary to deliver the fuel to be floated down the Ravee at Lahore; this will create some inconvenience, as your timber depôt is at Madhopoor. I would suggest, after you have secured a supply of firewood on the Ravee, that you should place yourself in communication with the Chief Engineer of the Northern Line, on the subject of the locality where it should be delivered.

10. I would beg strongly to impress upon you the necessity of securing efficient superintendence of these operations. It is the only safeguard against waste, and, owing to the extent of country over which the operations of the Forest Department necessarily are spread, efficient and honest superintendence is doubly necessary, and any attempt to save and pare in this respect inevitably ends in increasing expenditure. It is beyond my province to offer specific suggestions on this subject, but I trust that the success of these operations will not be risked by any hesitation to take the needful steps in this respect.

11. After you have issued the needful orders, and after making all arrangements for carrying out the above suggestions, I beg that you will favor me with a detailed report of what you have done in this matter.

No. 151, dated 22nd July, 1869.

From—Dr. D. Brandis, *Inspector General of Forests,*
To—The Officiating Conservator of Forests, Punjab.

It is of the utmost importance that as large a portion of the sleepers required for the Northern State Railway as possible be furnished by the Punjab Forest Department.

2. The sleepers will be $9' \times 9'' \times 4\frac{1}{2}''$, and about 1,980 will be required per mile. Longer pieces may be required in places for longitudinal sleepers, and for other purposes. At present it is intended to use Deodar only, but I hope the Government will also consent to the use on this line, as an experiment, of a moderate quantity of *Pinus longifolia* sleepers. I understand from you that Mr. Harrison, the Chief Engineer of the Punjab Line, estimates the life of a Cheer sleeper at four years, and my opinion is that, if cut of heart-wood only, and well seasoned, and not employed in cuttings or damp places, Cheer sleepers will be found to last from five to ten years in the dry climate of the North-Western Punjab. But specific data on this subject are wanting; and as the extent of the Deodar forests under the control of the Forest Department is extremely limited, you will do an important service by collecting reliable information concerning the durability of Cheer timber in the plains of the Punjab, and by encouraging a more general use of this wood.

3. The quantity required will be for 200 miles, 3,96,000 sleepers, aggregating about 1,000,000 cubic feet, and distributed as follows:—

	Miles.	Cubic Feet.
Lahore to Chenab	65	370,000
Chenab to Jhelum	40	230,000
Jhelum to Pindee	70	400,000
Total ...	175	1,000,000

In addition to this, 100,000 cubic feet will be required for staging.

The timber will be sawn up by the Railway Department, and I understand that the Chief Engineer will be prepared to commence sawing operations on any of the three rivers, Ravee, Chenab, and Jhelum, early in October next, and that all timber must be delivered before the end of 1871. I also underst and that the Railway Department will be ready to take delivery of the timber at your depôts at Jhelum, Wuzeerabad, Madhopoor, and on the Beeas. Regarding the point where delivery should be taken on the Beeas, you should place yourself in communication with Mr. Lee Smith.

4. To increase the supply of Deodar for next year, you have already, at my suggestion, issued instructions for extraordinary fellings in addition to the usual quantity, which will bring up the total fellings of this season to the following amount:—

	Usual. Trees.	Additional. Trees.	Total. Trees.
Beeas Forests	400	500	900
Chenab and Ravee	1,000	1,500	2,500
Jhelum	400	1,000	1,100
Total ...	1,800	3,000	4,800

As the Railway will be a certain customer for sleepers during these three years, you should instruct Divisional Officers, wherever practicable, during the current and next year, to cut logs in two lengths only, 10 feet and 19 feet, those cases excepted where long logs can be sent down. These classes would yield one and two sleeper lengths respectively. This is important.

Considering that the estimate made by Dr. Stewart in 1865 and 1866 of the aggregate growing stock on these rivers was only 17,500 mature trees, and that about 10,000 trees have been felled since these estimates were made, it would not be right to increase felling operations further during the current year.

In 1870, a larger additional quantity may be felled on the Jhelum, as the number of dead trees is still very large. On this subject I beg that you will favor me with definite proposals by the end of this season.

Regarding the felling operations on the Chenab, Ravee, and Beeas, I have addressed you in a separate communication.

5. It will now be useful to review the probable quantity that may be expected to be available on these three rivers during the three years in question, after making allowance for previous engagements for the delivery of timber to other parties.

I understand from you that the average size of the logs on the Beeas, Ravee, and Chenab has been between 14 and 16 cubic feet, the lengths averaging from 10 feet to 15 feet on these rivers. I do not think that it would be safe to estimate a larger out-turn than three sleepers per log on the average.

The Jhelum timber is generally larger, from 10 to 20 feet in length, and measuring from 20 to 30 cubic feet. These logs may be expected to yield five sleepers on an average.

6. After discussing with you the various chances of the timber yield, we have come to the conclusion that the following quantities may fairly be expected during the three years in question:—

	1869. Logs.	1870. Logs.	1870. Logs.			
Beeas (Nowshera Depôt)	5,000	4,000	4,000	average	3	sleepers.
Ravee (Madhopoor „)	3,000	3,000	3,000	„	3	„
Chenab (Wuzeerabad „)	10,000	15,000	20,000	„	3	„
Jhelum (Jhelum „)	1,000	4,000	4,000	„	5	„
Total ...	19,000	26,000	31,000			

If, as noticed above, additional fellings are ordered for 1870 on the Jhelum and other rivers, the yield of 1871 might be considerably increased.

7. The previous Indents by which the Forest Department is bound are, I understand, as follows :—

1.—Beeas, Executive Engineer, 480 logs.

2.—Ravee, Baloon Barracks, any quantity that can be supplied.

3.—Chenab, Messrs. Brassey and Co., balance of an Indent of 1868 106,000 cubic feet. Other parties, about 2,000 cubic feet.

4.—Jhelum, Executive Engineer, 200 long logs.

I also understand that the stock on hand at the different depôts will not cover these Indents, and that the balance must be met from the timber expected this year. Perhaps you may be able to make arrangements for a part of Messrs. Brassey and Co.'s Indent being supplied from the Beeas Depôt, and to induce the Engineers at Baloon to use *Pinus Excelsa* in the place of Deodar for all in-door work.

8. Allowing, then, 10,000 logs, measuring 150,000 cubic feet, of the expected yield of 1869 on the Beeas, Ravee, and Chenab for these Indents, the following timber would remain available for the Northern Railway :—

1869.	Other rivers ...	8,000	logs, estimated to yield	24,000	sleepers.
„	Jhelum ...	1,000	„ „ „ ...	5,000	„
1870.	Other rivers ...	22,000	„ „ „ ...	66,000	„
„	Jhelum ...	4,000	„ „ „ ...	20,000	„
1871.	Other rivers ...	27,000	„ „ „ ...	81,000	„
„	Jhelum ...	4,000	„ „ „ ...	20,000	„
			Total material for ...	2,16,000	sleepers.

This is on the assumption that all logs will be fit to be converted into sleepers, and that all will be taken by the Railway.

9. These estimates are necessarily vague, and are based on the supposition that there will be fair average floods. It is clear that steps should be taken to supplement the deficiency from other sources. On this subject you should, I think, place yourself in communication with the Chief Engineer of the line, for you may perhaps be able to obtain the needful timber for him at lower rates from traders who have timber on the Chenab and some of the other rivers. If all these transactions were in the hands of your Depôt Officers, there would be less competition for labor, and less chance of other complications.

10. I now proceed to offer a few remarks regarding the mode in which the timber is to be offered and delivered to the Railway Officers. You have already, in accordance with my suggestions, instructed the Divisional Officers not to accept any fresh Indents for timber without your sanction, and for all Indents that are accepted hereafter, the condition should be distinctly made, that they will only be complied with from the balance of timber that may not be taken by the Railway and the holders of previous Indents.

11. On the first of each month all Government Deodar logs at each depôt should be marked with the initial letter of the month, and a statement should be sent by the Depôt Officer to the Chief Engineer of the Northern Line, or to such officer as Mr. Lee Smith may specially appoint for the purpose of selecting and taking charge of the timber. The Statement should show the number of logs on hand, and I would suggest that they be divided into three classes :—

Note.—Oil paint has been found useful in Burmah for such temporary marks in depôt.

I Class 8½ feet to 10 feet in length.
II „ 10 „ to 17 „ in „
III „ 17 „ to 20 „ in „
IV „ above 20 feet in length.

The first and third class logs, would give one and two sleeper lengths respectively. This classification, however, might be modified hereafter in case the first delivery should show a different classification to be desirable.

For these notices and statements, printed forms should be provided. The notice should be despatched punctually on the 1st of the month; it should state that the timber thus marked will remain at the disposal of the Railway Officers to the 1st proximo, and that, if not selected and bought before that date, it will be offered to other purchasers; and an acknowledgment of the notice by return of post should be requested.

12. I would suggest that all arrangements be so made as to commence this system on the 1st October next. Copies of the monthly notices and statements should, on the same date, be sent to you from the depôts on all rivers.

On the 1st November all logs marked O, that had not been bought by the Railway, would then be available for other purchasers, and all fresh timber would be marked with the letter N, and notices and statements would be sent as before indicated. It will be necessary to mark the fresh timber a few days before the close of the month.

Should the Railway Officers in any month not avail themselves of the opportunity offered them, they would, as regards the timber bearing the mark of that month, be in the same position as other purchasers.

13. When any timber is selected by the Railway Officers, each log should at once be marked by a current number, and two cross-lines drawn across the mark of the month, and its number, class, and cubic contents should be entered on a statement of measurements which should be signed by the Depôt Officer, and on the back of which the Railway Officer should enter his receipt. There should be no appeal against the measurement of the Depôt Officer, but he would, as a matter of course, before making his entries, consider any objections which the Railway Officer might raise on the spot. The entries once made, there should be no further question on the matter.

14. A similar practice should be introduced for the Indents of all other purchasers. The present system of accepting an Indent, and then leaving it to the choice of the purchaser when he will come to select his timber, must, in my opinion, be made to cease at once; and I would, with regard to the heaviest Indent, that of Messrs. Brassey and Co., suggest your causing similar notices and statements of all timber on hand at the different depôts to be prepared on an early date and sent to them with the intimation that the timber will remain at their disposal for a reasonable time, say one month, and that, if not taken and paid for within that time, the cubic contents of the timber thus offered to them will be struck off their Indent.

15. Should it not be found practicable to comply with all previous Indents before the 1st October next, these Indents would, after that date, be on the same footing as those of the Northern Railway; the monthly notices would be sent to all parties concerned, whom you may consider entitled to precedence, and the first comers during the month would then have the first refusal of the timber. It would, however, as suggested above, be very convenient if Messrs. Brassey and Co. would consent, after the 1st October next, to take their timber at the Beeas and not at the Chenab Depôt.

The system here sketched may require to be modified in details according to the peculiar circumstances of each river, it should be embodied in a set of rules for each depôt, and these should be observed with strict precision.

16. It is evident that the system cannot be worked unless you have a responsible officer at each depôt. I understand that trustworthy Assistants are now at the Nowshera, Madhopoor, and Wuzeerabad Depôts. I would suggest that you should lose no time in making suitable provision for the Jhelum Depôt. The officer in charge of that division will have more work in the forests than he can do, and he cannot possibly look after the depôt at the same time. It is also apparent that, if the present proposals of extending

operations on the Chenab and Ravee are to be carried out properly, none of the officers on these rivers can, for the next few years to come, be spared for the Jhelum Division.

17. In conclusion, I would offer the following suggestions regarding the price to be paid by the Railway for the timber which they may take from your depôts. For Cheer and other Pines, two rates might be fixed:—4 annas per cubic foot for short logs 9 feet and 10 feet in length, and 8 annas for all the rest. This would refer to good pieces only that may be used as timber; fire-wood would be sold at 2½ annas per cubic foot.

For Deodar, I understand that the following are the selling rates at present per cubic foot:—

	10′ to 16′	16′ to 20′	Above 20′	For picked logs.
Beeas	14 to 16 annas	Rs. 1-1 to 1-4	Rs. 1-8 to 3	50 per cent. in addition to these rates.
Ravee	10 to 14 „	„ 1-0 to 1-4 „	Do.	
Chenab	10 to 1-2 „	„ 1-2 to 1-10 „	2 to 3 Rs.	

These rates are subject to alteration from time to time, and they are sure to rise within the three years in question.

18. Considering this, and that the logs will be picked by the Railway, and that for three years their requirements are to take precedence of those of other purchasers, the following rates appear to me fair and equitable, and they should in this case be the same on all rivers:—

		Rs.	As.
I Class	... 8½′ to 10′ ...	0	12
II „	... 10′ „ 17′ ...	1	4
III „	... 17′ „ 20′ ...	1	12
IV „	... above 20′ ...	3	0

These rates as well as the classification proposed, I beg you will regard as suggestions only, regarding which you should solicit the specific instructions of the Punjab Government; also regarding the mode of payment or adjustment of the amount by the Railway. Arrangements should, I think, be made so as to secure the adjustment being effected at once after the receipts are granted by the Railway Officer as suggested above.

19. I have submitted a copy of this letter to the Punjab Government, and would beg that you will, with the permission of that Government, furnish me with regular monthly reports on the progress of the operations and measures proposed in this letter.

These reports should give an account of the timber received during the month on the different rivers, that offered to purchasers at the commencement, and taken by them during the month, and I should specially desire to be informed of the arrangements that you may make with Messrs. Brassey and Co. for the completion of their Indent, and the date by which you expect to complete the same.

No. 1123 R, dated 12th August, 1869.

From—The Government of India, P. W. DEPT.,
To—The Joint Secy. to the Govt. of the Punjab, in the P. W. Dept. (Railway).

Referring to the Notes of conversation between the Secretary in this Department and Mr. Lee Smith, dated 22nd June and 6th July 1869, I am directed to forward, for information and early report on points calling for further

consideration, and orders, after communication with Mr. Lee Smith and the Forest Department, copy of a Note dated 22nd July, by Mr. Brandis, Inspector General of Forests, and of two letters* addressed by him to the Officiating Conservator of Forests, Punjab, relating to the supply of timber, for sleepers, &c., for the Punjab Northern Railway.

* No. 148, dated 21st July 1869.
„ 151, „ 22nd „ „

2. From the Note it appears that the probable supply of Deodar sleepers from the State Forests will be—

	Sleepers.
In 1869	29,000
„ 1870	86,000
„ 1871	1,01,000

or rather more than one-half the total number required up to Pindee, including a liberal margin for sidings. This supply will be sufficient for the following lengths of line:—

	Miles.
1869	15
1870	43
1871	51
TOTAL ...	109

or including sidings, for about 96 miles. This will scarcely carry the line to Jhelum, and the sleepers for that section should be forthcoming in all 1870.

3. It will be observed, however, that Mr. Brandis considers that a much larger out-turn than the above may very possibly be obtained from the logs expected to be got down, and there would seem to be no doubt that by adopting, to some extent, a larger number of sleepers of smaller scantling than has been fixed as the standard rather than cutting the wood wastefully, and by using blocks or timber pressure plates, tied together by iron or wood, also by using longitudinal sleepers to a partial extent, the quantity of timber available may be made to go much further.

4. Some assistance may also be obtained by the experimental use on 10 or even 20 miles of line of "Cheer" sleepers, but it will be necessary to saturate them with chloride of zinc or sulphate of copper. Creosote is out of the question from its great cost and inconvenient form. The Government of India has desired for many years past that experiments should be made with *Cheer* saturated with preservative solution, and attach much importance to their being now made without loss of time.

5. But with all these supplementary means, it is evident that other sources must be resorted to for the full amount of timber required, and it is very desirable that the results of intercommunication on this subject between the Conservator and Chief Engineer, as to the probability of Deodar being procurable from other sources than the Forest Department, should be placed before the Government as soon as possible. It is also for consideration and enquiry what additional supply can be obtained from Cashmere.

6. The supply of timber being very limited, it must be carefully economized, and this should be strongly impressed on the Chief Engineer. If a narrow gauge line to the Salt-works at Pindadun Khan be carried out, the lighter sleepers and scantlings of timber which may be left over in converting the logs may be brought into use on it with advantage and economy.

No. 1124 R, dated 12th August, 1869.

From—The Government of India, P. W. DEPT.,
To—The Secy. to the Govt. of the Punjab, in the P. W. Dept. (Forest).

Referring to the letters marginally noted, addressed by the Inspector General of Forests to the Officiating Conservator of Forests, Punjab, copies of which have been submitted direct to the Lieutenant Governor, I am desired to attach copy of a

No. 148, dated 21st July 1869.
„ 151, „ 22nd „ „

communication this day addressed to the Joint Secretary in the Railway Branch, and of the Note by Mr Brandis referred to in it and to state that the supply of sleepers for the Northern Railway must be regarded as the first duty of the Punjab Forest Department for the next few years so far as is consistent with existing engagements With the extension of the Punjab Railway southwards to Sukkur, there need be no apprehension of the supply of timber from the Punjab forests being in excess of the demand Immediate and most careful attention should, therefore, be given to this matter by the local authorities, and the Government of India will be prepared to give all needful help on receipt of the proposals of the Forest Department approved by the Lieutenant Governor

2 It will be seen from the letter addressed to the Joint Secretary, in the Railway Branch, that the urgent need of exercising the greatest economy in the application of timber on the Northern Railway has been strongly dwelt upon but with every economy that it may be possible to practice, it will probably be necessary to cut more freely than otherwise would be desirable

3 Economy may also be practised in other directions, and in view of this, the use of Deodar for internal work should be limited in every possible way by Public Works Officers Copy of this letter should accordingly be communicated to the Public Works Department for information and guidance

4 The question of price to be charged to the *Railway* Department by the Forest Department, is not of serious importance as the money will go into the Government Forest receipts All that is necessary is, that a fair price should be settled upon, all things considered

5 Particular attention is requested to para 5 of my letter to the Railway Department, and to the importance of the Forest Department and its officers promptly and vigorously co operating with the Railway Officers in procuring wood from private dealers

---

No 524S, dated 21st September 1869

From—Lieut Col H Drummond, R E, *Joint Secy to the Govt of Punjab in the P W Dept Railway Branch*

To—The Secretary to the Government of India Public Works Department

I am directed to forward, for the information of the Government of India, copy of a letter No 512 S, dated the 19th September 1869, to the address of the Chief Engineer, Punjab Northern (State) Railway, with copy of its accompanying Note, dated 18th idem, by the Consulting Engineer to this Government on Mr Lee Smith's estimate for the line from Lahore to Jhelum, with the exception of the bridges over the Rivers Ravee, Chenab, and Jhelum, with the remark that the revision ordered by this Government will delay the departure of the Chief Engineer for two or three days and that he will arrive at Simla on the 27th, instead of the 25th September, as previously reported

---

No 512 S dated 19th September 1869

From—The Joint Secy to the Government of Punjab P W Dept Railway Branch

To—The Chief Engineer, Punjab Northern (State) Railway

I am directed by the Lieutenant Governor to request that you will revise the estimate of the line from Lahore to Jhelum, forwarded with your letter No 54 S, dated 16th instant, after perusing the accompanying remarks by the Consulting Engineer to this Government

2 The Lieutenant Governor considers it essential that the cost of the line on the length from Lahore to Jhelum should not be allowed to exceed £5,000 per mile, exclusive of the cost of the three large bridges and approaches over the Rivers Ravee, Chenab, and Jhelum He is of opinion that it will not do to trust that the limit of £10,000 per mile for the line complete which has been fixed by the Supreme Government will not be overstepped, when the cost of

the large bridges just mentioned has been distributed over the length of line from Lahore to Rawul Pindee, for it is not safe to anticipate that the cost per mile of the line from Jhelum to Rawul Pindee will not be considerably greater than that of the line up to Jhelum

3 The estimate for rolling stock and stations, included in the revised estimate received with your No 55S of the 18th instant, is approved, and should be entered in the Estimate now called for

4 With reference to para 6 of your letter No 54S, I am directed to suggest that a section intermediate between the two proposed would probably be the most suitable and the most economical The removal of the road metal from the one side to the other is not absolutely necessary, and the rate assumed for its removal and re laying is excessive I am to add if by the adoption of the modified section suggested in this para, you can avoid interfering with the road metal at all it will be desirable to do so

5 The plans and papers received with your No 54S are returned

---

Copy of a Note by Consulting Engineer to Government Punjab on letter No 54S dated 16th September 1869 from the Chief Engineer Punjab Northern (State) Railway, forwarding Estimate of the line from Lahore to Jhelum, with the exception of the bridges over the Rivers Ravee Chenab and Jhelum

The following is an abstract of the Estimate for 98½ miles —*(See Column 1 of Table at page 45)*

2 It will be seen at once that the heaviest items of expenditure are, earth work, ballast, timber, permanent way, laying road, and lead of materials

3 It will be observed that in this estimate, no provision is made for quarters either permanent or temporary, for subordinate staff or for buildings of any kind whatever for passengers goods, rolling stock and stores at any of the stations The purchase of land is not included This may be expected to be a small item, yet it should not be left out of the calculation In fact it has been noted that the cost of land is invariably to be entered in the estimate Telegraph and rolling stock have not been estimated for and fencing for only 9½ miles

It may be noted also that the cost of engineering supervision, past and future, and of previous surveys by Mr Lee Smith and Mr LeMesurier, are not included in the estimate And that the bridges and culverts and generally the metalled gaps of the Grand Trunk Road are to be adopted for the Railway instead of constructing new bridges and culverts And yet with all these omissions and deductions, and leaving out of the calculations the probable expenditure on the three large bridges and approaches to them, in all 3½ miles in length, the estimated cost of the line is nearly £7,000 per mile

4 The above are facts, and as the cost of the big bridges and approaches will probably not be less than £500,000, the conclusion appear inevitable that the estimate submitted by the Chief Engineer must be considerably reduced

5 I examined the estimate and plans yesterday with Mr Lee Smith, and I probably cannot do better than remark upon each item of the former, in order to aid Government to the issue of such orders as may be thought necessary

6 "*Earth-work.*"—The first and second rates may be reduced to 4 and 5 per hundred cubic feet, the other four rates may stand

"*Ballast*'—The rates for sand, kunkur, and broken stone are high, and as the item of ballast is a very heavy one in this estimate, it is of consequence to reduce it as much as possible I think this may be done in two ways—

1*st*, by limiting the depth of the ballast to 18 inches, instead of 21 inches, as proposed by the Chief Engineer taking the 3 inches from the bottom of the section, and

2*ndly*, by using for ballast ¾th sand and ¼th kunkur stone or burnt clay. The whole country to an unknown depth under the surface consists of layers of clay and sand with an occasional pan here and there of

kunkur. I have not the least doubt, therefore, but that sand suitable for ballast will be found everywhere along the line at an inconsiderable depth under ground, whence it may be excavated and laid on the line at a cost not exceeding Rs. 2 per hundred cubic feet. The average rate for the other kinds of ballast may be assumed at Rs. 6 per hundred cubic feet.

Taking the quantities entered in the estimate, and calculating as above for sand, &c., the total cost of ballast will be under Rs. 3,50,000, and the saving effected will be Rs. 6,50,000. The saving will, of course, be still greater if the quantity of ballast is reduced as proposed.

"*Road Metalling*" includes metalled platforms at stations. The first two rates may be reduced to 8 each, and the three last may stand.

"*Brick-work.*"—The rates, though high, may stand. The "ornamental" which is intended to be chiefly boundary walls at junction with Punjab Railway at Lahore may be admitted, or something less expensive in the way of a fence be substituted.

"*Concrete.*"—The rate may be reduced at 15 per hundred cubic feet, and the quantity I think by one-half. There seems to be a clerical error in this item for Rs. 6,441, should be 64,414.

"*Masonry.*"—The rates for rubble coursed and ashlar may be admitted.

"*Timber.*"—An average rate of Rs. 3 per cubic foot ought, I think, to be amply sufficient, and doors, hinges and locks included ought not to exceed Re. 1-8 per superficial foot.

"*Wrought Iron.*"—The rates are admissible.

"*Fencing.*"—The rate for wire fencing may be admitted, and as the post and rail fencing is estimated to cost five times as much as the former, I would recommend either the adoption of wire fencing or a mud wall near villages.

"*Flood gap openings.*"—The first rate may be reduced by decreasing the width of concrete under rails, the second and third rates may be accepted. I beg particularly to invite the attention of the Government to the plan proposed by Mr. Lee Smith of carrying the rail on cast-iron standards at Rs. 16 per lineal foot. It promises to be successful and at a moderate cost.

"*Level Crossings.*"—As the whole line with the exception of 9½ miles is proposed to be unfenced, I do not see the use of giving gate posts, booms, &c., and think they may be struck out altogether. "Signals" and "Points and Crossings" may be commented on together; the following table shows how they are to be disposed:—

Stations.	Miles.	Main.	Distant.	Bridge.	Points and Crossings.	
Lahore	...	2	1	...	3	
Shahdera ...	3½	1	1			
Moreedhee ...	17	1	...	...	3	
Kamokee ...	29	1	...	...	3	
Goojranwalla ...	41	1	2	...	6	
Wuzeerabad ..	61	1	2	...	6	
Chenab (Khotata) ...	66	...	1	...	2	
Goojrat	71	1	2	...	6	
Kharai	92	1	...	...	2	
Jhelum (left bank) ...	101	1	1	...	12	Jhelum Terminus.
5 L. C. Bridges ...	...	5				
Bhunber (Mudder) ...	...	...	...	2		
Cramways ...	...	...	...	...	6	
Total ...	...	15	10	2		

"*Water Tanks.*"—A cheaper description might be used, but I would recommend the sanction of those estimated and of the wells to fill them. The quality of the water at each place should be ascertained before the Chief Engineer commits himself to the construction of wells and tanks.

"*Ash-pits*" may be admitted.

"*Turntables.*"—Two of them may be admitted.

"*Permanent Way*".—The first seven rates may be admitted. Unless the English and freight prices rise, some saving, I think, may be expected. The rate for sleepers appear to me to be preposterously high. Deodar sleepers 10′×10″×5 are now being bought by the contractor of the Delhi Railway at Rs. 4 each. It seems altogether out of the question therefore that the sleepers for the State Railway which are to be 9′×9″×4½ should cost Rs. 9-4 each. Both that rate and the rate for longitudinal sleepers should, I think, be reduced to one-half at least. The saving would be the not inconsiderable sum of Rs. 9,60,000, or nearly £ 1,000 per mile in the whole distance from Lahore to Jhelum.

"*Iron Road, Mr. Coates'*."—This has formed the subject of a separate communication to the Government of India, and orders, no doubt, will be issued thereon.

"*Points and Crossings.*"—See Ante.

"*Laying Road*" includes also maintenance. I think the rate may be reduced to Re. 1 per yard.

"*Laying Points and Crossings.*"—An addition of 5 per cent. for sidings may be admitted.

"*Lead of Materials.*"—The rate appears to me to be high. It should not, I think, be more than 2 annas per ton per mile.

7. There is not time to work out here, the result of the above proposed reduction, and the omission is of less consequence, as the Supreme Government may not approve of all the foregoing criticisms. But if the suggestions made on this note are entirely approved and adopted, the effect would be to reduce the estimate, I think, to about £ 5,000 per mile, which should be the maximum admissible, *minus* the three large bridges and approaches, and if the cost of the line complete is not to exceed £ 10,000 per mile.

8. I beg particularly to draw the attention of Government to the proposed manner of dealing with the Ravee crossing as shown in Drawing No. 3. I am inclined to recommend it for sanction. The length of the protection bund appears at first sight to be excessive, but it will be observed that it sets off at a good point and passes over very favourable ground, and its total estimated cost, *viz.*, Rs. 70,317, is not great.

9. The drainage of the country is passed across the Grand Trunk Road, thus, first, under timber viaducts; secondly, under brick-work and masonry bridges and culverts; and, thirdly, over metalled gaps left in the road. The Chief Engineer proposes to adopt the first for the railway by adding additional timber to strengthen them both as piers and in the superstructure.

At the Bagh Bucha Nullah I should prefer to build up the piers and put on them wrought-iron girders to carry the rails.

In the second he proposes to lengthen and build up the abutments and piers, and place iron girders on them, reducing the width of the road bridge from 24 to 18 feet. The third he proposes to cross in three ways—first, by merely laying the rail on longitudinal sleepers, bedded on a block of concrete; second, by carrying the rail on cast-iron piers about 2 feet high; and, thirdly, by wrought-iron girders on screw piles; the last only where the depth of water passing through the gap is too great to admit of the adoption of either of the two previous methods.

No. 527 S, dated 23rd September 1869.

From—LIEUT.-COLONEL H. DRUMMOND, R. E., *Joint Secy. to Govt. of Punjab, in the P. W. Dept., Railway Branch,*

To—*The Secretary to the Government of India*, P. W. DEPT.

In transmitting papers in original as per margin, I am directed to enclose herewith copy of a note by the Consulting Engineer to this Government on the designs submitted by Mr. Lee Smith for the bridges over the Rivers Ravee, Chenab, and Jhelum.

Docket No. 57 S, dated 21st September 1869, from Chief Engineer, Punjab, Northern (State) Railway.
1 Abstract of Estimates.
5 Estimates.
1 Detail reference sheets.

2. I am to state that the Lieutenant Governor concurs in preferring Design No. 2, as No. 1 appears to be too narrow to admit of carts passing through the girder, and as No. 5 contains but a single roadway which in a bridge as that over the Chenab 1½ miles long would, His Honor thinks, not be unattended with danger.

3. The drawings, eight in number, and one tracing, have been returned to the Chief Engineer who proceeded this morning to Simla.

Dated Murree, the 22nd September 1869.

Note by the Consulting Engineer to Government of Punjab on Docket No. 57 S, dated 21st September 1869, from Chief Engineer, Punjab, Northern State Railway, forwarding estimates and plans of proposed bridges over the Rivers Ravee, Chenab, and Jhelum.

The Chief Engineer has not submitted plans and sections of the rivers to be bridged, showing highest and lowest water-lines, and without these plans and sections it is impossible to judge whether the waterways proposed to be given are suitable or not. The Chief Engineer has informed me that he thinks the waterway required for the Ravee may be considered as settled, but that the estimates for the Chenab and Jhelum do not profess to be more than approximations, that a great mass of facts regarding velocity, sections, and boring have been carefully noted this season at both the rivers, that he expects to gather up these facts at Jhelum and Goojrat on his way to Simla, and from them he hopes to be able to make some reduction in the amount of waterway which he has provided in the estimate now submitted. The drawings received being the originals, and no copies having been as yet taken of them, they must be returned to Mr. Lee Smith to-day in order that he may take them with him to Simla, for which place he is to start to-morrow morning.

2. Approximately the waterways allowed in these estimates are—for the Ravee 2,950, Chenab, including Pulkoo, 8,000, Jhelum 3,800, or a total for the three rivers of 14,750 feet. The length of the bridges is of course in excess of the waterway, and for the three rivers amounts to 15,840 feet. Taking the rough and ready way of estimating the cost of these bridges, *viz.*, at £40 per lineal foot, we obtain from the above data that the aggregate cost of the three bridges will be about £633,600, which it will be seen is not a bad approximation to the estimated cost (after working out details) of systems Nos. 1, 2, and 5 proposed by Mr. Lee Smith. On the subject of the waterways required for the Chenab and Jhelum, I beg to refer Government to Appendix No. I of Mr. LeMesurier's Report at page 635 of Proceedings for 1868. I would strongly deprecate any attempt to reduce the cost of these bridges by diminishing the waterway below that which may be deliberately recommended by Mr. Lee Smith after further consideration of the facts which have been collected this season.

3. The Chief Engineer has proposed five different plans of bridges, varying as to cost from £595,823 to £889,695, which he calls "system" Nos. 1 to 5, and it will be convenient to adopt the same word. Mr. Lee Smith does not say which system he recommends, but apparently prefers to allow the decision to depend on the result of discussion with Government and its officers. There is not time for me to go into close criticism of the plans and estimates,

but when Government has selected one of the designs, I will examine the calculations for weight and strength of the ironwork with the Chief Engineer. Judging from the weights, &c., shown in these estimates, I should say that it is not likely that any serious error has been made in the calculations of strains, &c.

4. Of the five designs submitted, the mere cost alone of Nos. 3 and 4, as they are, preclude them from consideration. It may, however, be worth while to calculate, if it has not already been done, whether a level crossing girder of span from 80 to 100 feet road and rail carried on the lower boom, or a girder like that of No. 2M, might not with economy and safety be carried on piers consisting of three screw piles. Of the remaining three designs, No. 2 although the most expensive will be the most generally useful, and I think that Government cannot do better than decide upon adopting system No. 2. It is in fact reverting to the choice of that form of girder which was recommended both by the Local and Supreme Governments last year. In my opinion it is the simplest, safest, and most useful system of all. A roadway 10×10 through the girder will be serviceable for almost every kind of goods traffic except a laden elephant. And although the cost of system No. 2 is estimated to be about £50,000 more than that of No. 5, *i. e.*, over the three bridges, yet it should not be overlooked that piers of precisely the same dimensions have been provided for both girders, although the width from centre to centre of No. 2 is only 11½ feet, while that of No. 5 is 17 feet 2 inches. Therefore it would seem either that both in the piers and abutments of the former some saving can be effected, or that the piers and abutments of the latter have been underestimated.

A pair of Warren girders for a single line with the road carried on top span 100 feet, weighs 32 tons.
Ditto, road on bottom, weighs 41 tons.

5. I think great credit is due to Mr. Lee Smith for the careful and complete manner in which these estimates and plans have been prepared by him in little more than two months, and as he has calculated out the size and section of every piece of ironwork, I am of opinion that the duty of getting out the working drawings may, if the Government deem fit, be safely entrusted to him, and should be entrusted to him if he can show that there will be saving of time and expense thereby.

No. 537S, dated 25th September 1869.

From—LIEUT.-COLONEL H. DRUMMOND, R. E., *Joint Secy. to the Govt. of Punjab, in the P. W. D., Railway Branch,*

To—*The Secretary to the Government of India*, P. W. DEPT.

I am directed to forward herewith copies of letters Nos. 54 S and 55 S, dated 16th and 18th instant, and of docket No. 61 S, dated 23rd idem, from the Chief Engineer, Punjab Northern (State) Railway, and the estimates in original received with the two last communications, *viz.*, those dated 18th and 23rd, and to remark as follows.

2. The revised estimates last submitted amounts, it will be seen, to Rs. 5,007,158 for 98½ miles of single line laid on the Grand Trunk road from Lahore to Jhelum with the exception of the portion passing across the valley of the Ravee at Lahore, and of the portion passing through the low range of hills on the left bank of the Jhelum.

At these places the line of railway is obliged to leave the Grand Trunk Road. The estimate also provides for 3½ miles of permanent-way required for the bridges and approaches over the Rivers Ravee, Chenab, and Jhelum.

Deducting therefore Rs. 1,07,614 per 3½ miles of permanent-way, the estimated cost per mile is Rs. 49,741 per 98½ miles of unquestionably the easiest section, after excluding the three large bridges between Lahore and Peshawur.

Adding Rs. 7,974 per mile for "rolling-stock" and "stations," this section is estimated to cost Rs. 57,715 or say £5,771 per mile.

3. I am desired by the Lieutenant Governor to state that, in the opinion of this Government, the estimate ought to be still further reduced; so that including stations and rolling-stock, the cost shall not exceed £5,000 per mile, and I am to add that it is hoped that letter to the address of the Chief Engi-

neer, No. 512 S, dated 19th instant, and its annexure note by the Consulting Engineer to this Government, forwarded to the Supreme Government with letter No. 524 S, dated 21st instant, will indicate the items of the estimate which are still capable of being further reduced.

I am also to suggest that "Turntables" may be omitted altogether, if no objection is made to the locomotives running one way tender first. His Honor thinks there is objection owing to the line being unfenced and on the Grand Trunk Road.

4. The Chief Engineer has not shown the saving effected by adopting for the rail the embankment of the road, and by making the bridges of the latter available for the former. And a comparative estimate seems hardly necessary, for, once admitted that a strong and efficient fence between the road and railway is not necessary, it is certain that there must be some saving of first expenditure by using the road as a substratum for the railway. I am to observe, however, that the Hon'ble the Lieutenant Governor of these Provinces, and the Consulting Engineer to this Government, are not reconciled to the project of an unfenced railway on the high road, and even now at the last hour His Honor would urge that an experiment, which seems to him to be so fraught with danger to life on both the road and the rail, be limited to a section, say from Lahore to Goojranwalla, until actual experience has shown that both descriptions of traffic may proceed side by side on the same embankment without any serious risk.

Comparative Abstract of Estimates of the cost of a single line from Lahore to Jhelum on the Grand Trunk Road, exclusive of the bridges over the Rivers Ravee, Chenab, and Jhelum.

	Estimate submitted with Chief Engineer's No. 54 S of 16th Sept. 1869.	Estimate submitted with Chief Engineer's No. 55 S of 18th Sept. 1869.	Estimate submitted with Chief Engineer's No. 61 S of 23rd Sept. 1869.

No. 55S, dated 18th September, 1869.

From—The Chief Engineer, Punjab Northern (State) Railway,
To—The Joint Secy. to Govt., Punjab, in the P. W. Dept., Railway Branch.

In continuation of my No. 54 S of 16th instant, I have the honor to enclose revised estimate of the line from Lahore to Jhelum, with exception of the Ravee, Chenab, and Jhelum bridges. The total distance is 102 miles, from which $3\frac{1}{2}$ have been deducted for these three bridges, making the length estimated for $98\frac{1}{2}$ miles.

2. The permanent-way has been estimated for the whole length, *viz.*, 102 miles.

3. I have endeavoured to render this estimate more complete than the one submitted on 16th instant, in that I have included the items of stations and rolling-stock.

4. As regards the first, I have no definite orders from Government on the subject, further than that the most rigid economy was to be studied. I have, therefore, endeavoured so to frame this estimate that the better class of dwelling houses required for the engineering staff shall be so designed and arranged as to answer pretty fairly for stations on completion of the works.

5. I have attached a detailed statement of the rolling-stock which I think would suffice for working a moderate traffic.

No. 54 S, dated 16th September, 1869.

From—The Chief Engineer, Punjab Northern (State) Railway,
To—The Joint Secy. to Govt., Punjab, in the P. W. Dept., Railway Branch.

I have the honor to enclose estimate of cost of the line from the Punjab Railway Terminus to the station of Jhelum, with exception of the Ravee, Chenab, and Jhelum Bridges which will follow in a few days.

2. This estimate is accompanied by the drawings and detail quantities from which it has been compiled, whereof a list is attached.

3. The drawings and detail quantities are the original documents with exception of those belonging to the Ravee Division; I regret that it has not been in my power to make copies of the others, but beg they may be returned to me for the purpose.

4. The Grand Trunk Road Bridges, which are suitable to such a purpose, have been estimated for as "Level Crossing Bridges" at the cost of additional timbers required for strength.

5. This season's observations of the floods in the metalled gaps have proved that in five of them the water has exceeded 12 inches in depth, and at these places I have estimated for raising the rails beyond the reach of danger. In one of these gaps, a branch of the Bhimbur, the water ran 2 feet 9 inches deep, and for this reason I have estimated for a light screw pile viaduct, as per tracing sent in original over a length of 600 lineal feet at a cost of Rs. 72 per lineal foot. In the other four, of the respective lengths of 600, 190, 170 and 120 feet, the water did not exceed 1 foot 6 inches in depth, and for them I have estimated at Rs. 16 per lineal foot, for raising the rails on cast iron standards fixed to longitudinal timbers, as per tracing submitted.

6. I also beg to attach a drawing numbered 50 showing two cross sections of bank, lettered respectively A and B, with an alternative estimate. The first A shows cross section of trunk road with the railway ballast laid upon the surface in accordance with the orders of Government. The second B is the same cross section of road, with the railway ballast sunk from 9 inches to 1 foot below surface of road. By this means a greater width of base is gained. The trunk road is less encroached upon, the rails are still well above the surface

of road, and therefore to judge from this season's floods, perfectly safe and a saving may be looked for of nearly two lakhs of Rupees.

P. S.—The price of timber sleepers is so enormous as to make the cost of permanent-way nearly £ 4,000 per mile.

No. 1659R, dated 22nd October, 1869.

From—The Government of India, P. W. DEPT.,

To—The Joint Secy. to the Govt. of Punjab, in the P. W. Dept., Railway Branch.

I am directed to acknowledge the receipt of your letters noted in the margin, forwarding estimates and other documents connected with the construction of the Punjab Northern (State) Railway between Lahore and Jhelum.

No. 524S, dated 21st September 1869.
„ 527S, „ 23rd „ „
„ 537S, „ 25th „ „

2. In reply I am desired to forward to you the minutes of two meetings held by direction of the Government of India to consider the designs and estimates for this line. These minutes have received the approval of the Governor General in Council, who is pleased to accord sanction to the abstract estimate forwarded herewith, amounting to Rs. 24,70,766, which is arrived at after making the modifications detailed in the minutes and fully explained by the notes attached to it. A further sanction is granted to the extent of Rs. 3,00,000 to provide for the preparation of materials for the piers and abutments of the bridges over the Ravee, Chenab, and Jhelum.

3. No time should be lost in taking all needful action to give effect to the conclusions recorded in the minutes of meeting, and in the preparation of detailed estimates in accordance with the principles of design which have now received the approval of the Government of India. If the amount of any head of these estimates is not more than 10 per cent. in excess of the approximate estimate now sanctioned, it may be finally passed by the Local Government, an abstract of such local sanctions being submitted for the information of the Governor General in Council; but any such items as show a greater estimated excess than 10 per cent. should be referred to the Government of India for sanction.

4. The estimates, drawings, and other connected papers have been returned in original to Mr. Lee Smith.

5. The Governor General in Council trusts that the works will now be promptly commenced along the whole line to Jhelum, and that all possible progress will be made, consistently with the requirements of thoroughly good workmanship and of careful economy. It is not the desire of the Government of India to force on the operations so as to lead to any extraordinary raising of prices; but so long as this point receives attention, the most active exertions may be made to secure the early completion of the line within the limits now dealt with.

6. This sanction has been entered as No. 3 P. N. R. of 1869-70 in the register of this Office.

Minutes of Meetings held on 13th and 14th October 1869 to consider documents forwarded under cover of—

Government of the Punjab, No. 524 S, dated 21st September 1869.

PRESENT:

THE HON'BLE COLONEL R. STRACHEY, C. S. I., R. E., *Offg. Secy. to the Govt. of India.*
MAJOR WILLIAMS, R. E., *Deputy Secretary to the Government of India.*
MR. LEE SMITH, *Chief Engineer, Punjab Northern (State) Railway.*
MAJOR POLLARD, R. E.
LIEUTENANT PYE, R. E.

DESIGNS AND ESTIMATES FOR PUNJAB NORTHERN (STATE) RAILWAY.

Ravee Embankment.—This should be at least three feet above the level of the highest flood, and further enquiry should be made with reference to the height of the flood of 1856. For the present, no protective works need be made, and in view of this, the bank from Lahore to the Ravee Bridge should have a formation width of 30 feet with slopes of 3 to 1. An additional strip of land may be taken up on the up-stream side for planting at the foot of the slope. The back channel of the Ravee should be stopped, and no time should be lost in getting in the Lahore abutment of the bridge to preserve the end of the embankment from the effects of flood.

2. *Minor Arrangements.*—Enquiry should be made as to the necessity for maintaining any irrigation channels which may at present cross the site of the railway bank.

3. The expensive arrangements for a transit instrument at the sites of the bridges should be modified.

4. Gate-keepers' huts at other places than the three large bridges should be of the most inexpensive description.

5. Ordinary brickworks should be substituted for the ornamental work in the walls of the Lahore Station.

6. *Ballast.*—The original instructions as to laying ballast on the surface of the road should be adhered to. The adjoining four feet of metalling may be taken up and used as ballast, so that the width of metal to be maintained for the road will be only 12 feet.

7. Sand should be used for ballast wherever it is economically possible. About seven-tenths of the section of ballast may be of sand, where it is available, if topped with kunkur or brick.

8. *Fencing.*—Such fencing as is at present required may be of stone walling or of wire with wooden standards. For the present, fencing will only be put up near villages or frequented localities, and it must be left to time to prove the necessity of fencing of the rail from the road throughout, as recommended by the Punjab Government.

9. *Stations and Buildings.*—The intervals between the proposed stations at Goojranwalla and Wuzeerabad and those at Goojerat and Kharian seem excessive, and should be reconsidered.

10. More detailed proposals for station buildings and bungalows should be at once sent up. The general style of such buildings should be a range of quarters conveniently divided into units of accommodation, which would be available as dwellings while construction is going on, and afterwards as rooms of the station. Temporary buildings which will not be utilised when the line is open should be constructed with the greatest economy, and so as only to serve their present purpose. Other buildings to be used as dwellings or for station purposes only may have their foundations laid in lime mortar, the walls being of burnt brick, or stone when suitable, laid in mud. All buildings which will be in positions where they will be subject to the vibration of passing trains should be built with lime mortar, such as engine stables, goods sheds, &c.

11. *Khurian Range Diversion.*—The width of formation should be 16 feet in bank and 20 feet in cutting, as previously ordered. It is believed that the slopes in cutting may be reduced.

12. The proposed location of the line is accepted as satisfactory, it being left open to Major Pollard, in communication with Mr. Lee Smith, to point out any advantages that may be gained by adhering more closely to the existing road.

13. The designs of the culverts are generally approved; but the question of replacing them in heavy bank by open girders may be considered by Major Pollard in communication with Mr. Lee Smith.

BRIDGES.

14. *Alterations of timber bridges.*—The design for the Bhimber Bridge is approved, but if a permanent iron girder bridge for the railway can be made for, say, Rs. 80,000, it may be substituted for the proposed timber design estimated to cost Rs. 42,000. This will make the whole of the bridges permanent, and obviate the necessity for guarding the bridge with gates and signals, as must be done if it be used as a level crossing.

15. At the Bagh Bucha Bridge, and at Nos. 6, 7, 7A and 7B, at miles 7, 19, 20, 22, iron girders will be used, and the piers may be built up in masonry on one side to carry the girders, the remainder of the road being left for the cartway.

16. *Bridges with* 26 *feet roadway.*—No addition need be made to the width of these bridges, the least possible portion being taken for the rails and the rest left for the roadway.

17. *Bridges with* 18 *feet roadway.*—The centre line of railway should be carried straight over bridges of this class (and, if possible, this should be done in all cases), any necessary additions being made to the abutments and piers to carry the girders. If it should be found objectionable to place one rail on old and one on new work, the old may be pulled down, and re-built with the new. The width of road that is left will probably suffice for the traffic, but, if not, a suitable alteration may be made in the parapet on the off-side of the bridge.

18. *Arched culverts of* 10 *feet roadway.*—The least possible width of this road should be taken for the rails.

19. No planking save a single plank for a platelayer should be laid on the girders, which may be left open.

20. Any minor details of the bridges should be settled by the Local Government.

GAPS.

21. *Metalled Flush Gaps.*—The general design for these is approved. The amount of concrete under the rails may be reduced to an average of 10 cubic feet per foot forward, and the longitudinal sleepers need not be of larger section than 9″ × 4½″. The width of road metalling in the approaches should be taken at 12′ instead of 16′.

22. *Metalled Gaps with Iron Standards.*—The design for cast iron saddles to carry the rails over gaps, where the depth of water is, though small, too great for flush gaps, is generally approved. Screw bolts passing through the sleepers should be used instead of screws into the wood. For the present, however, only 500 feet of this kind of way should be sanctioned, which may be laid as an experiment on the three smaller of the four gaps proposed to be treated in this way. Ten feet of concrete per running foot of line may be allowed as an average quantity.

23. *Metalled Gaps with screw pile viaduct.*—The proposal to utilise the screw piles and girders already under supply from England for one gap of 600 feet is approved.

PERMANENT-WAY.

The whole length of line from Lahore to Jhelum is 102 miles. With an additional length of 5 per cent. for sidings, a little more than 107 miles of single line will be required. An indent has already been submitted to the Secretary of State for the supply of 100 miles of line and 7 miles of tramway and crane roads, so that no further indent appears to be required for this section of the railway. It will be for the Chief Engineer to submit further proposals, if necessary.

Carriage of Permanent-way Material.—As sleepers are delivered on the line at the three great rivers, they may be carted out, on the understanding that the minimum lead from each point is adhered to as closely as possible, as the expected supply at each river will admit. The distribution of the iron portion of the way should be considered by Major Pollard in communication with Mr. Lee Smith, and the system approved by the Local Government detailing the extent to which carting, and distribution telescopically, is proposed, should be reported to the Government of India. Until the rails, &c., for the whole line from the Ravee to the Chenab have reached the right bank of the Ravee, none of this material is to be carted forward to the banks of the Chenab.

The Ravee, Chenab, and Jhelum Bridges.—The modified rough designs of girders for these large bridges handed in by Mr. Lee Smith at Simla, which have parallel girders carrying a combined road and railway on the top and an inner footway below for use when trains are not passing, are generally accepted in substitution for the design before approved, but an addition may be made to the proposed width between the hand-rails and the rails to give room for a platelayer to stand, or bays may be made at intervals for that purpose, and the lower footway should be made strong enough for loaded horses, ponies, and horned cattle. Mr. Lee Smith's ultimate proposals for the span and design of girder should be submitted without delay. As soon as they are finally approved by the Local Government, working drawings should be made for transmission to the Secretary of State. It would appear so far as a judgment can yet be formed, that these three bridges will cost not less than £600,000.

Iron Cylinders.—Proposals for the utilization of the iron cylinders, which were ordered from England for the Ravee Bridge, should be brought forward at an early date.

Small Girders.—Indents for small girders should be sent in at once.

Sanction will be recommended to the estimates to the extent of Rs. 24,77,766, in addition to Rs. 3,00,000 for the preparation of materials for the bridges over the Ravee, Chenab, and Jhelum. An abstract of the different items, accompanied by a detailed explanatory note, is attached to these Minutes—

Abstract of recommendations for sanction.

			Rupees.
1.	Earthwork		1,58,000
2.	Ballast		4,10,737
3.	Road-metalling		26,780
4.	Fencing		16,667
5.	Bridges and culverts (exclusive of Ravee, Chenab, and Jhelum Bridges)		2,60,700
6.	Gaps, flush		1,13,550
7.	,, cast-iron standard		8,070
8.	,, screw pile		43,067
9.	Level crossings		28,500
10.	Signals		15,870
11.	Stations, buildings, and bungalows		50,000
12.	Watering arrangements		41,463
13.	Ashpits		11,097
		No.	
14.	Turntables	2	
		Tons. Cwts. Qrs. lbs.	
15.	Permanent-way—		
	Rails 1⅞ miles, and fish plates ...	187 4 1 7	23,121

		Tons. Cwts. Qrs. lbs.	Rupees.
16.	Pot sleepers, tie rod, gibs, and cotters	297 8 2 8	31,082
17.	Additional fish plates ...	7 17 3 24	1,461
18.	„ gibs and cotters ...	7 12 1 26	1,906
		Mds.	
19.	„ tie rods	... 102	837
		No.	
20.	Transverse wooden sleepers ...	1,98,000	10,64,250
		Cubic Feet.	
21.	Longitudinal sleepers and struts...	... 17,650	39,675
22.	Iron cross-ties for sleepers ...	... ...	718
		Tons.	
23.	Carting sleepers an average lead of 12 miles...	11,000	24,750
		Yards.	
24.	Laying road	... 194,480	97,240
		No.	
25.	Laying points and crossings ...	... 49	1,225
		TOTAL ...	24,70,776
A.	Piers and abutments of Ravee Bridge	... ...	1,00,000
B.	„ „ Chenab „	... ...	1,00,000
C.	„ „ Jhelum „	... ...	1,00,000
		TOTAL ...	3,00,000

The rates which have been assumed in considering these estimates, in accordance with revisions made by Mr. Lee Smith in conjunction with Major Pollard, are as follows :—

	Rs. A.	Cubic Feet.
Earthwork, for temporary purposes ...	... 4-8	per 1,000
„ in cutting, banks, &c. ...	... 5	„ 1,000
Cutting through old brickwork ...	... 2	„ 100

„ over	... 3-9	„ „
Carriage per ton mile	... 0-3	
Laying permanent-way per yard of line ...	... 0-8	

The character of the estimates prevents sanction from being given under the headings shown in it, and the different charges are accordingly grouped under 25 heads. These items can, when sanctioned, be distributed by the Local Government under any other convenient heads in the final estimate, the correlation between the two beings clearly shown in the latter.

Sanction is also recommended to three sums for the preparation of materials for the piers and abutments of the bridges over the Ravee, Chenab, and Jhelum.

The sums recommended for sanction are only approximate estimates of probable cost, and are liable to revision upon due cause being shown.

Item 1.—*Earthwork.* The amount is reduced by the non-construction of protective works at the Ravee, and increased by the greater height and width of the bank at that river.

Item 2.—*Ballast.* The charge for ballast is recommended for sanction, but it will probably have to be modified according to the remarks in paragraphs 6 and 7 of the Minutes of Meetings of 13th and 14th October 1869.

Item 3.—*Road Metal.* This item, as now revised, excludes the cost of metalling in flush gaps and bridges.

Item 4.—*Fencing.* This is recommended for sanction, but the charge may probably be reduced.

Item 5.—*Bridges and Culverts.* This item is made up of Rs. 1,06,500 for the bridges of the Goojerat Division, Rs. 92,200 for the Goojranwalla Division, and Rs. 62,000 for the Kharián Pass diversion, and has been taken from the detailed estimates as modified by the rates, the omission of sleepers and planking, and the remarks in paragraphs 14 to 20 of the Minutes of the Meetings before mentioned. It includes Rs. 80,000 for the Bhimber Bridge (*vide* paragraph 14 of Minutes).

Item 6.—*Flush Gaps.* In this item and in Nos. 7 and 8, longitudinal sleepers of the dimensions laid down (9″ × 4½″), and cross struts, have been deducted, and charged to "permanent-way." Any further timber than this that the design may require, seems to be properly chargeable to the works, and is therefore included in these items. Item 6 is made up of Rs. 1,32,000 for the Goojranwalla Division and Rs. 19,740 for the Goojerat Division, less Rs. 38,190 for longitudinal sleepers and struts over the 27,160 lineal feet of flush gaps in the whole line. The estimate for the Goojerat Division is lumped together in a way that entirely precludes separation, and therefore the rate granted for the Goojranwalla Division is applied to its length to obtain the above-mentioned sum of Rs. 19,740. The gaps not allowed under Item 7 have been included in this item.

Item 7.—*Gaps with Cast-iron Standards.* This allows standards sufficient for 500 feet to bridge the 480 feet aggregate length of gap spanned in this way.

Item 8.—*Gaps with Screw-piles and Girders.* Provides 600 feet of screw-piling complete.

Item 9.—*Level-crossings.* Is passed provisionally, as it stands, as the Government of India is manifestly unable to judge of the precise necessity of the proposed gates. The Local Government will, however, have to take care that level-crossings are not needlessly constructed, or, on the other hand, omitted where safety requires that they should be placed. As it is not intended, at first at all events, to fence the line generally, the necessity for gates on crossings will probably only arise on the more important roads, or near villages or towns.

Item 10.—*Signals.* Passed, but is considered to be capable of reduction, in view of the rates adopted for timber which head these remarks.

Item 11.—*Stations and Bungalows.* Rs. 50,000 is here recommended for sanction that no time may be lost in the preparation of materials; but it is impossible to state from the estimates what the charge under this head will be, and no further amount can at present be passed. No time should be lost in the preparation of proper estimates.

Items 12 *and* 13.—*Watering and Ash-pits.* Passed, but the reduction in the rate for brickwork will also affect these works.

Item 14.—*Turntables.* An indent on the Secretary of State for these should be submitted.

Items 15 and 16.—*Permanent-way.* These cover the cost of 1⅞ miles of iron way belonging to Mr. Coates.

Items 17, 18, *and* 19.—*Fish-plates, Gibs and Tie-rods.* These provide for portions of the above length of way not included in Nos. 15 and 16, and that

can be procured in this country. Sanction to the purchase of the plant, if still required, has already been given.

Item 20.—*Sleepers, Transverse.* Provides for transverse timber sleepers, 1,980 to the mile, for 100 miles of way at Rs. 5-6 each. It is by no means certain that the rate will be so high as this, but the amount may be taken as an outside estimate.

Item 21.—*Sleepers, longitudinal.* Provides longitudinal sleepers and struts for 28,240 lineal feet of line in gaps, or $5\frac{3}{8}$ miles. Added to the foregoing items, this provides a total subway of $107\frac{1}{4}$ miles.

Item 22.—*Iron Cross-ties.* These are required in connection with the foregoing.

Item 23.—*Carting Sleepers.* The lead shown in the estimate appears to be correct. The weight is modified to suit the proposed kind of sleeper.

Item 24.—*Laying Road.* The length is that shown in the estimate, $110\frac{1}{2}$ miles. It is presumed that this allows for both temporary and permanent laying, as it is in excess of the whole length of way. The rate is eight annas a yard, which is considered to be sufficient.

Item 25.—*Laying Points and Crossings.* The number of points and crossings appears to be large, and the possibility of a reduction in the number should engage attention. An indent on England for 20 sets has already been submitted, and a further indent should be forwarded for more.

Items A, B and C.—These sums are to provide for the preparation of material for the piers and abutments of the three large bridges. When estimates are submitted for the design now approved, these items will be included under the proper heads.

No. 24 E—R, dated 25th October, 1869.

From—The Government of India, P. W. Dept.,

To—The Joint Secy. to the Govt. of the Punjab, in the P. W. Dept., Railway Branch.

In acknowledging the receipt of your letters marginally noted, I am directed to enclose a letter dated the 21st instant, received from Mr. Lee Smith, together with a proposed distribution of his Engineering staff, and to communicate the following provisional conclusions, which have been come to at an interview with that gentleman, for the information and approval of the Lieutenant Governor, and such further action to give practical effect to them as is called for, and notably for the submission of tabular statements for formal sanction in the Financial Department.

No. 471 S, dated 6th September 1869.
„ 474 S, „ 7th „ „
„ 506 S, „ 14th „ „
„ 560 S, „ 7th October „

2. At the meeting held at Simla on the 25th May 1869, it was settled that a Personal Assistant for correspondence and general business should be given to Mr. Lee Smith. The Government of India considers that such assistance is required, and it is left to the Punjab Government to make a recommendation for the immediate creation of the appointment if equally satisfied of its necessity. Mr. Lee Smith desires to nominate for the post a Mr. Robinson, whose services he has informed me may probably be obtained on a salary of Rs. 500 per mensem. The Punjab Government should enquire into Mr. Robinson's antecedents and qualifications, and make a definite recommendation as to salary.

3. Mr. Lee Smith has also asked for a professional Assistant, and has suggested the transfer from Bombay of Mr. Whiting, an Executive Engineer of the 3rd Grade, to fill the post. The Government of India acknowledge the necessity for such assistance, and the Bombay Government has been asked by telegraph whether Mr. Whiting's services can be spared, and if so, to order him to Lahore to report himself to Mr. Lee Smith.

4. These arrangements dispose of the subject-matter of your No. 471 S of the 6th September; but as the Chief Engineer should have a thoroughly efficient Chief Draughtsman, I am directed to add that the Government of India will be prepared to accept a recommendation from the Local Government to allow Mr. Lee Smith a Head Draughtsman on a salary of Rs. 300 per mensem.

5. The Distribution List of the Engineering Staff herewith forwarded is approved by the Government of India, so far as the proposed divisions and circles are concerned. There will be eight of the former, and three of the latter. It will be for the Chief Engineer to concert with the Local Government to detail the staff as may be most suitable. There need be no objection to the proposal to delegate to any one of the Superintending Engineers such special powers as Mr. Lee Smith may desire, provided the chain of responsibility be unbroken, and Mr. Lee Smith's proposal to keep a division immediately under his own orders may be agreed to. This disposes of your Nos. 505 S and 560 S.

6. The number of Assistant Engineers will be 17 in all, the number of Executive Engineers 12, including the professional Personal Assistant. One tabular statement should be submitted for the Chief Engineer, his Personal Assistant for general business, the Executives and Assistants. Of the last, the Secretary of State will be requested to appoint four, who may be employed for some time at Home in attending the shops where the iron-work for the large bridges is prepared, so as to make themselves acquainted with the details of the girders and of their erection. The remainder may be appointed, as their services are required, under the orders of the Lieutenant Governor, by transfers from the other branches of the Department in the Punjab, or from other Provinces, if they can be spared. The Government of India will be prepared to facilitate such transfers as may be proposed, so far as the interests of the public service generally will allow.

7. The strength of the Subordinate Staff to be allowed for construction on the 100 miles between Lahore and Jhelum, referred for orders in your No. 474 S, remains to be settled. The Governor General in Council has given this part of the subject careful consideration, and has come to the conclusion that the Chief Engineer's requirements have been under-estimated. Of the 55 men asked for by Mr. Lee Smith, 31 are required for special purposes. The remainder, 24 in number, may be considered as required for ordinary work, and of these there should be at least six experienced men for the large bridges, one for each bridge being a Sub-Engineer, 1st Grade. This reduces the number for distribution in the three bridges and two road divisions to only 18, which number, in the opinion of the Government of India, would be inadequate for efficient supervision and good progress, considering the magnitude of the works at the bridges, and the length of the road divisions. For the latter there should be 15 men as proposed by the Punjab Government; for the bridge divisions, the aggregate number proposed by Mr. Lee Smith may be accepted. This modification will involve the addition of 6 men, and make up the total number of subordinates for ordinary duties to 30. These should be distributed for sanction over the different ranks according to the rules in force in the Public Works Department, *i. e.*, there should be 12 Sub-Engineers and Supervisors and 18 Overseers.

8. It will not be possible to grade the men required for special purposes in strict accordance with the departmental system, but the scale of pay which it will be necessary to offer to secure the requisite qualifications, suggests that the scale may be partly worked to by including all of these appointments in the two higher classes of Upper Subordinates.

9. There will thus be 43 Sub-Engineers and Supervisors, of whom one-third should be Sub-Engineers; and the general distribution in classes and grades of the entire Upper Subordinate Establishment will be as follows:—

14 Sub-Engineers	...	4 1st Grade. 3 2nd „ 7 3rd „	
29 Supervisors	...	11 1st Grade. 18 2nd „	
18 Overseers	...	12 1st Grade. 3 2nd „ 3 3rd „	These proportions are not fixed, but are in general accordance with the present state of the Department.

61 Total, costing Rs. 10,570 per mensem.

10. The 31 special men proposed by Mr. Lee Smith made up as follows:—

6 Foremen for girders and machinery.
3 „ for brick-fields at the large bridges.
3 „ for brick-work for the well-sinking at ditto.
2 „ for carpenters.
3 „ for saw-mills.
1 Quaryman at the Jhelum.
4 Platelayers.
6 Enginemen at Steam-hoists.
3 „ at Saw-mills.

Subject to the scale above laid down, these men should be appointed on the salaries at which they may be obtainable, and as their services are found to be required. It may be necessary to send to England for some of them, in which case, the needful requisitions on the Secretary of State should be sent up.

11. The subordinates for ordinary work should be obtained, so far as is possible, from the other branches of the Department.

12. The tabular statements to be submitted for sanction in furtherance of these arrangements should be complete, so as to supersede all previous authorizations of Engineer or Subordinate Establishments, and to serve as a point of departure.

13. In submitting the indents for the girders, &c., of the large bridges, the appointment of the four Assistant Engineers from England should be referred to, in order that the needful communication may be made to the Secretary of State on the subject.

No. 856R, dated 3rd July, 1869.

From—*The Government of India*, P. W. Dept.,
To—*The Joint Secy. to the Govt. of the Punjab, P. W. Dept., Railway Branch.*

The adoption of the route of the Grand Trunk Road having been decided on for the Punjab Northern (State) Railway, it remains to consider what arrangements should be made for connecting the salt mines with the railway.

2. As at present informed, the Government of India are disposed to think that this would be best effected by carrying a light narrow gauge branch from some point south of the Kharian Range and of the Jhelum to a point on the left bank of that river opposite to Pind Dadun Khan, or thereabouts. It is believed that little drainage would have to be crossed, and that rails might be laid almost on the ground surface. With a bridge-of-boats over the river (it is not known whether there is one there at present), the trucks might be run from the mines right of the junction with the Main Line. There the salt would have to be shifted, but with sidings arranged on different levels, or other appliances, this may be done at a trifling expense. Trucks of special design may be essential, not only to allow of the easy transfer of their loads, but of their passing over the bridge-of-boats, and by a tramway up to, and even into the interior of, the mines to the actual workings. The gauge which may be 3 feet 6 inches, or less, down to 2 feet as on the Welsh Festiniog Line, if necessary, would probably be determined by the conditions prescribed by the boats available for the bridge, the tramway to the mines, and the method in which they are worked. The line would be worked by engine-power only so far as the Jhelum, unless it should appear expedient to follow the same plan trans-Jhelum.

3. I am to request that the subject may be taken into consideration by the Lieutenant Governor, and that, with His Honor's approval, Mr. Lee Smith (to whom a copy of this letter has been given) may be instructed to arrange that the drainage of the country through which the branch would pass may be watched during the approaching monsoon and the facts noted, and that a survey for such a line as is above indicated may be made. The results, with Mr. Lee Smith's recommendation as to gauge, rails, trucks, &c., should be submitted in the rough through the Lieutenant Governor, and accompanied by such observations as His Honor may desire to offer, at an early date for the consideration and orders of the Government of India.

No. 28R, dated 15th January, 1870.

From—Lieut.-Colonel E. N. Sandilands, *Executive Engineer, Jullundur Division, Punjab,*
To—*The Secretary to the Government of India*, P. W. Dept.

I have the honor to state that while down on a visit to the Salt Range the other day, where I once was Executive Engineer for three years, I heard that there is some intention of constructing a narrow gauge railway from left bank of the Jhelum to join the Northern State Railway. As I know the place and its resources pretty well, I take the liberty of pointing out a few things:—

1*stly*.—That it is doubtful whether for a long time at least the rock salt will be much more used, for the people outside the Punjab have a prejudice against it and consider it unwholesome. In the time of the Emperors, the mines were shut and only re-opened by the Seikhs. In old days I recollect the Hindostani sepoys used to eat it on ordinary occasions for economy, but on great days they ate the low country salt.

2*ndly*.—With river carriage only 51 miles below the new Northern State Railway, and if there be no great increase over present demand, the necessity of land carriage is not apparent, and, as I shall presently show, salt can be tracked up to Jhelum for less than it could be taken by railway.

It is to be recollected that to get to the rail, the salt must be ferried across the river and then loaded, and perhaps carried some distance to the station; while the salt, once in the boat, the native merchant, unless I greatly mistake, would sooner at once have it sent by river to Jhelum.

3*rdly*.—The railway is simply of use as a means of conveyance. In a country so destitute of fuel, it is injurious; if, therefore, the river be deemed not enough for the conveyance of the salt, a canal between the Jhelum and the Chenab joining the Northern State Railway about Wuzeerabad would carry salt, &c., save fuel, and fertilize the present desert which lies between these rivers. The salt could then be taken in canal boats at once from the right bank of the Jhelum at Chuck Nizam (eight miles from Pind Dadun Khan); the river runs through permanent banks, and is about 1,400 feet wide in flood, so without breaking bulk, it could be tracked on by the canal to Wuzeerabad for transport by rail.

It is only during the dead winter months that boats are towed with trouble up the River Jhelum from scarcity of water. During the hot weather, the wind almost always blows up-stream, and with sails the boats go up quickly and return in one night.

The mines are only worked for ten months in the year; the heat of the gorge and danger from slips in the mines combine in preventing the miners working during the rains, and they move in a body to a village provided for the purpose on the top of the highest hill in the neighbourhood. They stay there till time to recommence operations. The quantity of salt turned out in these ten months averages about 3,000 maunds per diem, and to remove the quantity to meet the train daily at Jhelum, only ten boats, holding 300 maunds each, would be required, and giving the absurdly long time for going and coming of 15 days, we have one boat carrying two freights per month of 300 maunds each, or 600 per mensem—

	Rs.	A.	P.
Allowing a crew of 6 men, @ Rs. 5 each per mensem ...	30	0	0
One tindal, @ Rs. 7	7	0	0

37 ÷ 6, or little over Rs. 6 per 100 maunds, but three trips in the month will be often practicable, which would be little over Rs. 4 per 100. The carriage to the river side is, of course, common to both water and rail carriage—

	Rs.	A.	P.	
The present ferry tolls levied for salt is 6 pies per maund, or	3	2	0	per 100 maunds.
And the carriage of salt by railway, @ ⅛ pie per mile, for 51 miles is anna 1-5 per maund, or per 100 maunds Rs. 8-13-8	8	13	8	
TOTAL ...	11	15	8	

Thus the Jhelum boatmen could underbid the railway offer.

Already the people are combining river with railway traffic for about one-third of the whole output of the mines, which is now conveyed by boats to Mooltan and thence by rail to Lahore.

No. 169 R, dated 25th January 1870.

Endorsed by the Government of India, P. W. Dept.

Copy forwarded to the Government of the Punjab, in the Public Works Department (State Railway), for consideration, with reference to Public Works Department No. 856 R, dated 3rd July 1869.

No. 272R, dated 11th February 1870.

From—MAJOR E. C. S. WILLIAMS, R. E., *Depy. Secy. to Govt. of India*, W. P. DEPT.,

To—The Joint Secy. to Govt. of Punjab, in the P. W. Dept., Railway Branch.

In continuation of my No. 169R of the 25th January 1870, I am directed by the Governor General in Council to request that the necessary measures may be taken by the Lieutenant Governor for ascertaining the probable cost of taking salt from Pind Dadun Khan up the River Jhelum by boat to the railway crossing, including loading and unloading, and to compare this with probable railway results in sending up the report on the salt mine branch, promised in Punjab Government No. 530 S, dated 23rd September 1869.

2. I am to state that, if thought desirable, an actual trial might be made on a sufficient scale to give real results, the salt being sent down the road afterwards by camel or cart.

No. 20, dated 15th February 1870.

From—The Government of India,

To—The Secretary of State for India.

In continuation of our Despatch No. 63 of 1869, we have now the honour to report the further steps that have been taken for carrying out the Punjab Northern (State) Railway.

2. In Despatch No. 72 of 1869, replying to the Despatch just quoted, your Grace has communicated approval of the conditions which we had prescribed for adoption in the construction of this Railway, and desired that the works might, as far as possible, be so designed as to admit readily of amelioration or addition as found expedient hereafter, the main essential being that the line should be commenced on the most economical scale consistent with the provision of a thoroughly permanent and useful iron road.

3. The staff of Engineers authorized to be engaged by your Grace's predecessor in office, began to arrive in India in November 1868, and Mr. Lee Smith returned to Lahore in February 1869. The necessity for an early settlement of the line to be followed was apparent, and at the end of March after personal communication between the Viceroy and the Lieutenant Governor of the Punjab, it was determined by us that Jhelum, which it had been recently determined to maintain as a Military Station, should be regarded as an obligatory point on the line, and that the formation of the Trunk Road should be occupied by the Railway, if, by so doing, any important reduction of the cost, and the necessary labour of construction, could be shown to be possible. By this decision the probable cost of the undertaking appeared likely to be brought within legitimate limits, and the way was cleared for active progress on the section, 100 miles in length, between Lahore and Jhelum, as soon as estimates had been approved.

4. In order that the many matters of detail involved in the preparation of the projects should not present any obstacles to progress, the Chief Engineer, Mr. Lee Smith, was instructed to place himself in personal communication with our Secretary in this Department, and such points as demanded early consideration were discussed, and with our approval settled, either finally or provisionally. The Minutes of these conferences accompany this Despatch (Enclosures Nos. 1 to 5).

5. It was thus decided that one-half of the Trunk Road should be taken for the Railway embankment (except in the Kharian Hills, a low range immediately south of the Jhelum, where a diversion seemed likely to be necessary), the existing bridges being utilised when possible. The description of permanent-way for adoption as far as Jhelum was settled and an Indent for 100 miles of material sent to England. It was decided that this material should be landed at Calcutta, and brought to Lahore by the East Indian and Delhi Railways. This involved a longer lead than by the Indus Valley route, but the advantages in point of economy and freedom from risk of loss and delay, appeared conclusive. Arrangements have since been made with these Railway Companies for the carriage of the material at a reduced rate (Enclosures Nos. 6 to 16), and there is no room for doubting the superiority of the plan adopted over all others that presented themselves. The question of the supply of fuel, both for work-

ing the line when opened, as well as for construction purposes, and of timber for sleepers and staging, has also been dealt with (see Nos. 17 to 20 of the Enclosures), and recent advices of the quantity of timber available are very promising.

6. Mr. Lee Smith's staff were busily employed throughout the summer and rains in the preparation of designs and estimates, in taking observations of the great rivers in flood, and in searching for ballast, and suitable positions for brick-fields, &c., &c. At the end of September the estimates for the section between Lahore and Jhelum were submitted (Enclosures Nos. 21 to 23), and Mr. Lee Smith was summoned to Simla in order that no time might be lost in paper discussions.

7. On the 13th and 14th of October, Meetings were held to consider the designs and estimates, and after full discussion between our Secretary and Mr. Lee Smith, the conclusions were arrived at which are recorded in the further Minutes which accompany (Enclosure No. 24). These have met with our entire approval, and we have sanctioned estimates for the section between Lahore and Jhelum to the extent of Rs. 24,70,766, as also a sum of upwards of Rs. 1,50,000 for the purchase of plant no longer required by the Contractors for the Delhi Railway, and the expenditure of a further sum of Rs. 4,00,000 for the preparation of materials for the piers and abutments of the bridges over the Ravee, Chenab, and Jhelum, and for protective works in the valleys of those rivers.

8. We have also expressed our general approval of the adoption of a design for these bridges, which comprises a pair of parallel girders, carrying a combined road and railway above, and a footway between them below for loaded cattle to be used when trains are not passing, and Mr. Lee Smith is now elaborating the designs. With the very small train service to be expected on the Railway, and the reduction that it will effect in the limited ordinary traffic of the road, we are of opinion, having regard to the extreme importance of keeping down the cost of this line in every possible way, that the accommodation which these bridges will afford, as long level-crossings, will be sufficient for the ordinary traffic for many years to come. We are advised that, so far as a judgment can at present be formed, these three bridges will cost not less than £600,000. It is incumbent on us, therefore, to see that the conveniences provided for the ordinary traffic in combination with these Railway bridges are limited most strictly.

9. The Superintending and Executive Engineers originally sent out for this Railway have been posted in three Circles, and eight Divisions. Five of the latter are for construction purposes between Lahore and Jhelum, the remaining three being for the surveys of the Salt Branch and the country beyond Jhelum as far as Rawul Pindee. For the instructions issued regarding the Salt Branch, we beg to refer to our Secretary's letter No. 856 R of the 3rd July 1869 (Enclosure No. 26). As at present advised, we are disposed to think that the salt trade would be sufficiently and efficiently served by a narrow-gauge branch taking off from the Main Line at some point south of the Kharian Range, and making for the left bank of the Jhelum opposite to Pind Dadun Khan, or thereabouts. The question however remains to be considered whether the requirements of the Salt trade may not be sufficiently met by the water communication in the Jhelum, and on this point further enquiry is being made (Enclosure No. 27).

10. Regarding the extension beyond Jhelum, we beg to refer your Grace to the concluding part of the Minutes of Meeting held on the 22nd June 1869 (Enclosure No. 2). The road surface is to be appropriated for the rails, subject to its being improved to a maximum grade of $\frac{1}{40}$ with tolerable curves for slow traffic. This will not forbid consideration of more gentle gradients, but the extra cost will have to be distinctly exhibited. The surveys for the diversions are now in progress, but it is improbable that the requisite preliminaries will be complied with in time to admit of construction operations beyond Jhelum being initiated before the next working season.

11. We have sanctioned a liberal scale of Engineering staff both of the Upper and Lower grades (see Enclosure No. 25) as well as of office and petty establishments, and no time has been lost in filling up the former. By the end of October, everything that could be done to ensure the present working season being fully availed of, was done, and, subject to the control of the Local Government, the Chief Engineer was in a position to give effect to our desire that the works should be pushed on vigorously. Anxious, however, as we are to see this Railway advancing rapidly towards completion, it is not our desire that the progress of its construction should be so forced on as to lead to any extraordinary rise in prices. With a caution, therefore, on this head, we urged a prompt commencement of the works, and the most active exertions to ensure the early completion of the line within the limits of these estimates.

SUPPLEMENT TO

The Gazette of India.

CALCUTTA, SATURDAY, FEBRUARY 26, 1870.

OFFICIAL PAPERS.

A SUPPLEMENT *to the* GAZETTE OF INDIA *will be published from time to time, containing such Official Papers and information as the Government of India may deem to be of interest to the Public, and such as may usefully be made known.*

Non-Subscribers to the GAZETTE *may receive the* SUPPLEMENT *separately on a payment of six Rupees per annum if delivered in Calcutta, or nine Rupees four annas if sent by Post.*

No Official Orders or Notifications, the publication of which in the GAZETTE OF INDIA *is required by Law, or which it has been customary to publish in the* CALCUTTA GAZETTE, *will be included in the* SUPPLEMENT. *For such Orders and Notifications the body of the* GAZETTE *must be looked to.*

GOVERNMENT OF INDIA.

FINANCIAL DEPARTMENT.

ANNUAL REPORT ON THE OPERATIONS OF THE POST OFFICE OF INDIA, FOR THE YEAR 1868-69.

No. 3575 A, dated, Simla, 25th November 1868.

From—A. M. MONTEATH, Esq., *Director General of the Post Office of India,*

To—The Secretary to the Government of India, FINANCIAL DEPT.

I have the honor to submit a report on the administration of the Post Office of India for the official year 1868-69. The submission of this report has been unavoidably delayed by the late receipt of the Bombay report, caused by the necessity of re-placing statistical records destroyed in March last when the General Post Office at Bombay was burnt.

2. As in my last report, I shall commence by noticing briefly a few of the principal events of the year.

3. The year under report is remarkable, both for an unusually large increase of revenue and an unusually large increase of expenditure; but as this subject falls appropriately under a subsequent head (Section VII, Financial Results), I shall not dwell upon it here.

SEA-SORTING.

4. The re-arrangement in the preceding year of the postal service between India and Europe, under which Bombay became the Indian port of embarkation and disembarkation of the entire overland mails, was followed in the early part of the year under report by the introduction of the system of sea-sorting, all paid letters and newspapers being sorted by a Postal Establishment on board the mail steamer, so as to admit of immediate despatch, if necessary, from Bombay. It formerly took about six hours to do this work in the Bombay Post Office, resulting often in the delay of a whole day, and, when it did not do so, in the

use of a special train. The overland mails are now landed ready for despatch inland. Sea-sorting had never before been tried on this side of Suez, and the introduction of the system required much care both in framing rules for the guidance of those employed and in the selection of officers for the work. It is due to Mr. Hogg, who, being then Officiating Post Master General of Bombay, was charged with the introduction of the measure, to say that every possible care was bestowed on it. Mr. Hogg personally superintended all the preliminary arrangements, and for many months after the service had commenced he maintained a close supervision of, and especial interest in, its working.

5. As might have been expected, there have been occasional failures and mistakes; but, on the whole, this important service has been well performed.

COMMUNICATIONS WITH PLACES ABROAD.

6. There have been various modifications of postage rates on correspondence with places abroad, but it is necessary to notice here only those changes more immediately affecting this country.

7. The re-arrangement of the Overland Mail Service was accompanied by an increase of 75 per cent. (4*d.* to 7*d.*) in the sea-postage on letters as per margin; but the old rates were continued in respect of letters sent by or addressed to officers of the Army in India. The whole of the sea-postage collected in India is credited to the English Post Office, by which the revenue of the Ocean service is set against the cost, the balance, or excess cost, shown against each of the several lines of communication, being borne, in certain proportions, by the British Government and the several Colonial Governments interested in the Ocean services.

	Former rate per ½oz.	*New rate per ½oz.*
	1*d.* Indian inland	1*d.* Indian inland.
	4*d.* Sea-postage	7*d.* Sea-postage.
	1*d.* British inland	1*d.* British inland.
Vid Southampton	6*d.*	9*d.*
	4*d.* French rate.	4*d.* French rate.
Vid Marseilles	10*d.*	13*d.*

8. There was some correspondence during the year under report, having for its object a re-distribution of the charges of the Ocean services, the idea being that India had been saddled with too large a share. The question is still under discussion, and I need not therefore advert to it further in this report.

9. Notwithstanding the considerable enhancement of postage rates, the correspondence between India and England has increased considerably under the new arrangement. This was to be expected, owing not merely to the greater frequency of the means of communication, but to the Bombay route being considerably quicker than the old routes. It appears from an estimate which I recently made that the correspondence with England has been affected as follows:—

From England *vid* Southampton, about				15	per cent.	increase.
,,	,,	,,	Marseilles	,, 6	,,	,,
To ,,	,,	,,	Southampton	,, 14	,,	,,
,,	,,	,,	Marseilles	,, 20	,,	,,

10. I may note here that one result of the new arrangement has been a considerable increase in the cost of Indian inland transit, while the share of Indian inland postage on overland correspondence has been virtually decreased. The increase of expenditure resulted from the necessity of conveying the entire mails for and from Bengal and Madras by long land routes, instead of having them landed at Calcutta and Madras. Formerly, there were only bi-monthly mails *vid* Bombay, and none of the heavy book and pattern mails for or from Bengal or Madras were conveyed by that route; but now there are weekly mails *vid* Bombay, including all classes of correspondence for the whole of India. At the same time, the value of the Indian share of postage, *viz.*, 1*d.* per ½ ounce letter, has virtually been reduced in respect of paid letters from India, for in India stamps are sold at a heavy discount, averaging 5 per cent., and the discount is paid on the whole amount of the increased postage. This may appear at first sight to be a very trivial source of loss, but it is not so, as will be seen from the following figures, showing the net postage remaining to India under the old and new rates, and also under the still further enhancement of rates resulting from the more recent opening of the Brindisi route:—

Indian share of postage per ½ ounce letter ... 8 pie or 1*d.*
Deduct discount at 5 per cent. on the whole postage pre-paid, *viz.*,

	As.	P.			
On former rate *vid* Marseilles of ...	6	8	...	4	Leaving 4 pie or ⅓*d.* for India.
On new rate *vid* Marseilles of ...	8	8	...	5·2	Leaving 2·8 pie or about ⅕*d.* for India.
On rate *vid* Brindisi of ...	10	8	...	6·4	Leaving 1·6 pie, or exactly ⅛*d.* for India.

11. Considering the now increased cost of the Indian inland transit of overland mails, the virtually reduced share of Indian *inland* postage, and the fact that the Indian Post Office spends much more on these mails than it receives by way of postage on them, it seems difficult to avoid the conclusion that the Indian share of postage must be increased. I had hoped that a reduction of sea-postage would make it possible to increase the Indian inland rate without enhancing the total rate charged to the public; and although this has been refused by Her Majesty's Post Master General, I still think it possible that the decision may be re-considered in connection with the recent resolve to abolish the privileged rates for officers' letters. A separate reference has already been made on this subject to the Government.

12. Turning now to other changes of communications with places abroad, I may note that, at the commencement of the year under report, the Government of Mauritius closed the contract with the Union Steam Ship Company for the conveyance of mails between Galle, Mauritius and Natal, the result being that correspondence between India and Mauritius is now sent *viâ* Aden by the French packets plying between that port and Mauritius.

13. Later in the year (November 1868), arrangements were made for exchanging mails with the United States of America *viâ* Hong-Kong by the vessels of the Pacific Mail Steam Ship Company plying between Hong-Kong, Japan and San Francisco.

14. Arrangements were also made with the Government of the Straits Settlement for the prepayment to destination of correspondence exchanged between the two countries by British, French, or Indian packets, or by private vessels.

15. The rate chargeable on newspapers sent from India to ports in Asia was also increased to the uniform standard of 2 annas, a free delivery of newspapers received being at the same time conceded.

LOCAL STEAM SERVICES.

16. The local steam services performed under contract with the British India Steam Navigation Company are as follows:—

(1). Calcutta and British Burmah, *weekly*, with a continuation to the Straits *once every four weeks*, the subsidy being Rs. 21,333 per mensem, of which Rs. 1,083 are paid by the Straits Government.

(2). Bombay and Kurrachee, *weekly*, with a continuation to the Persian Gulf *once a fortnight*, the subsidy being Rs. 23,111 per mensem.

(3). Calcutta, Bombay and intermediate ports on the East and West Coast, *fortnightly*, the subsidy being Rs. 10,000 per mensem.

(4). Madras, Rangoon and intermediate ports on the East Coast, *once every four weeks*, the subsidy being Rs. 6,000 per mensem.

No alteration was made during the year under report in the two first-mentioned lines; but line No. 3, which was formerly a monthly service with a subsidy of Rs. 7,500, was changed into a fortnightly one with a subsidy of Rs. 10,000; and line No. 4, which was formerly a monthly service, was changed (by consent of the Company) into a four-weekly service without any increase to the subsidy.

17. The subsidy payments on account of the above mentioned lines will, in future years, be shown as charges of the Post Office Department; for, though the object of the contracts is primarily that of providing for the conveyance of Government troops, stores, &c., and of encouraging inter-portal trade, it has been decided that it is more convenient for the Post Office Department to control them and pay for them.

18. There are also contracts for the following services, *viz.*:—

Irrawaddy Steam Flotilla Company ...	Rangoon and Thyet-myo (since extended to Mandalay).
Ditto Ditto	Moulmein, Tavoy, and Mergui.
Euphrates and Tigris River Steam Navigation Company	Bussorah, Bagdad, and intermediate ports.

None of the above mentioned services are under the control of the Post Office. The last mentioned contract is made by Her Majesty's British Government, but the subsidy is charged against the Indian revenue.

19. During the year under report, an arrangement was made with Messrs. Jardine, Matheson and Co., of Hong-Kong, and Messrs. Apear and Co., of Calcutta, for the more free

use of the opium steamers, plying between Calcutta, the Straits and Hong-Kong, for the conveyance of mails. These were formerly ranked as private vessels, the commanders being entitled to bounty money on the mails delivered by them, which had to be realized from the addressees, thus rendering it impossible to prepay letters to destination. Under the arrangement above referred to, the vessels are classed as Indian mail packets, letters being sent either prepaid or bearing, at the option of the senders.

MODIFICATIONS OF POSTAL ESTABLISHMENTS, &c.

20. Before resigning the direction of the Post Office in 1867, Mr. Riddell laid before the Government a strongly supported proposal for revising the pay of delivery peons throughout India, and that of Post Masters, Deputy Post Masters, and clerks in the postal circles of Bengal, the North-Western Provinces, the Punjab, and the Central Provinces. The revision was not sanctioned by Government till 1868, and took effect in the latter part of the year under report. These revisions involved a very considerable increase of expense, but they were much needed. The general scale of pay for delivery peons is now Rs. 6-8, rising, after five years' service, to Rs. 9, with a higher grade commencing at Rs. 9, and rising, after five years' service, to Rs. 12. Post Masters, Deputy Post Masters, and clerks have likewise been graded, with salaries rising by length of service between fixed limits.

21. An important change was made towards the close of 1868 by a re-arrangement of trains on the East Indian Railway, one daily train, running at a slightly increased speed, being substituted for the two daily trains previously existing. And in connection with this change, the mail route between Bombay and the Upper Provinces of the Bengal Presidency was diverted from the line *viâ* Khundwa, Indore, and Agra to the longer, but more expeditious, line *viâ* Nagpore and Jubbulpore, the mail cart establishment of the former line being largely reduced, and that of the latter being strengthened. This measure resulted in a considerable reduction of expense, while at the same time the transit of mails was more expeditious. Lower Bengal, the mails for and from which had for some time been conveyed *viâ* Nagpore, gained a whole day by the arrangement, and the mails for and from the North-Western Provinces and the Punjab were conveyed with at least equal speed and with greater regularity, the long road transit between Khundwa and Agra having always been the source of considerable uncertainty and occasional delay, especially during the monsoon season.

MODIFICATION OF INLAND POSTAL RATES AND CONDITIONS.

22. In 1865, representations had been made to the Government on behalf of an increase to the limits of weight allowed for the several rates of inland postage, and, after full consideration, the Government decided, in March 1867, on the expediency of the measure, observing that the time when it should be carried out depended on when the general revenues of the country could spare the estimated loss of postage without unduly restricting expenditure on the improvement of the Post Office. Towards the close of 1868 it was determined to introduce the measure, and the limits of weight were accordingly doubled.* This change had effect from the 1st April 1869, and will therefore fall more appropriately for remark in my next report.

* ½ anna—½ to ½ tola.
1 „ ½ „ 1 „
2 annas—1 „ 2 tolas.
3 „ 1½ „ 3 „
and so on

23. Towards the close of the year under report, the registration of letters containing coin or currency notes was made compulsory, in imitation of the similar rule in the English Post Office, which had been found to operate very beneficially. The rule had hardly time to become generally known in India during the year under report, but I trust that it will produce some effect in future years, for one of the greatest drawbacks to the efficiency of the Indian Post Office has hitherto been found in the temptation placed before its subordinates by the common habit of enclosing currency notes in unregistered covers.

24. Shortly after the introduction of the above rule, I deemed it necessary to revise the departmental system of treating registered letters, the object being to provide more effectually for the safe transit of such letters, and to afford the means of more prompt investigation in cases of apparent tampering. This change was not, however, actually introduced till after the close of the year under review.

POSTAL GUIDE.

25. In the year under report, arrangements were made for publishing what had long been felt to be a great want, *viz.*, a Postal Guide. The first number was published on the 1st April 1869, and further numbers have since been issued quarterly.

LOCAL POST IN CALCUTTA.

26. I adverted in my last report to the establishment of local posts in Bombay and Calcutta, mentioning the great success of the measure in the former city, and its failure in the latter. A modified system was introduced in Calcutta during the year under report; and, although the success has not equalled that in Bombay, the result is by no means unsatisfactory, the local correspondence having exactly trebled since the introduction of the change. Time will probably lead to improvement in the working of the Calcutta local post and to an increased use of it by the public.

GOVERNMENT BULLOCK TRAIN AND MILITARY TRANSPORT TRAIN.

27. The Government Bullock Train was re-established in the year under review, and a new Military Transport Train was also organized for the conveyance of the annual Military Reliefs between Jubbulpore and Nagpore; but as both these measures appertain to a succeeding section (VI, Non-Postal Branches of the Department), I need not refer to them here in detail.

GENERAL POST OFFICE, BOMBAY, DESTROYED BY FIRE.

28. On the 1st March 1869, the General Post Office at Bombay was totally destroyed by fire. The cause of the fire has not been clearly ascertained: it appears to have broken out in a room where the waste paper was kept, bursting forth with such violence, and spreading with such rapidity, that the whole building was consumed in a few hours. All the mails were saved, but the records of the Post Master General's and Post Master's Offices were totally destroyed.

29. The construction of a new building had been for some time in contemplation, and the plan and estimate had already been approved by the Government. It will probably be two years before the new building is ready, and meantime the requirements of the department are but imperfectly met in a hired house.

NEW GENERAL POST OFFICE, CALCUTTA.

30. The new building, recently erected for the Post Office in Calcutta, was occupied during the year under review. Although the structure has been the subject of unfavorable comment as regards outward appearance, it is, in respect both of accommodation and position, well adapted to the requirements of the Post Office.

31. I now proceed to give the usual statistical information respecting the working of the department, under the same heads as those adopted in previous reports.

SECTION I.—POST OFFICES AND LETTER BOXES.

32. The number of new post offices and letter boxes opened during the year is given on the margin. The details for each circle will be found in Appendix No. I. The difference between the aggregate return of the year under report and that of the previous year is mainly due to the Bombay circle, in which the number of new post offices opened has fallen from 178 to 113. But, notwithstanding this, the Bombay circle still exhibits a larger extension than any other circle; the Bengal circle, which comes next in order, showing a total of 106 new post offices opened. The extension of the department by the opening of new post offices during the last four years has been enormous, being at an average rate (about 350 new offices per annum) more than four times as great as in previous years.

	Opened in 1867-68.	Opened in 1868-69.
Post Offices	467	384
Letter Boxes	134	167
TOTAL ...	601	551

33. And, as observed under this head in last year's report, the extension of facilities for posting letters is not confined to the opening of new post offices and letter boxes, but has, within the last few years, been carried out to a considerable extent by the employment of what are called rural messengers or district letter-carriers, who not merely deliver letters in the agricultural villages, but collect them, each messenger having a prescribed round to be traversed

generally weekly or bi-weekly, and carrying about with him a bag with a locked compartment in which letters may be posted. In the previous year, 127 such messengers were entertained, and in the year now under report 227 were added. I look to this system as one of the best means of extending postal facilities to the agricultural population, and hope to see it largely developed in future years.

SECTION II.—POSTAL LINES.

34. The extent in miles of each class of postal lines at the close of the year, as compared with the returns of the previous year, is given in detail for each circle in Appendix II. The results for the whole of India are noted on the margin. The increase in Railway line mileage is composed of extension from Moodanoor to Tadputry (Madras), Delhi to Umballa and Amritsur to the Beeas (Punjab), and Khundwa to Beerh (Central Provinces). The increase of 320 miles of mail cart and horse or camel lines is due to various alterations, *viz*,—in Bengal, additions of Berhampore to Jeagunge, and Chuckada to Jessore; in Bombay, additions of Nundgaum to Julna, Akola post office to Railway Station, Ahmednuggur to Poona, Kowta to Mahableshwar, and Putton to Deesa; in the North-Western Provinces, additions of Meerut to Koorja (since abolished), Etawah to Bareilly, and Seharunpore to Rajpore, and reductions of Futtehgurh to Cawnpore, Futtehgurh to Shekoabad, Meerut to Ghazeeabad, and Meerut to Rajpore; and in the Punjab, reductions of Delhi to Umballa, and Beeas to Amritsur.

Year.	Railway.	Mail Cart, Horse Dâk, and Camel Dâk.	Runners and Boats.	Sea.	Total.
1867-68 ...	* 3,994½	5,140½	34,930	5,613	49,678½
1868-69 ...	4,234½	5,460½	34,973	5,613	50,281½
Increase ...	240	320	43	.....	603

* 6½ miles less shewn in Statement of previous year and now corrected.

35. The small net increase in the mileage of runners' lines is the net result of a large number of increases and decreases which need not here be specified.

SECTION III.—CORRESPONDENCE.

36. The correspondence returns of the year are given in detail for each circle in Appendix No. III., of which an abstract is entered on the margin. Under all heads there is an increase. The increase of letters (above 10 per cent.) shows a larger development than in any recent year. The increase in books and patterns is, like that shown last year, very large; and it ought to have been larger in both years, for I find that in some quarters an erroneous practice has obtained of classing packets of patterns under the head of parcels. This accounts for the otherwise strange increase in the number of parcels exhibited in the returns of the two last years, notwithstanding the extension of the Railway and the consequent operation of the prohibition against the conveyance of parcels by the Post Office. In point of fact, the parcel returns of this and the preceding year ought to have shown a decrease, and the returns of books and patterns an increase somewhat larger than what is actually shown.

Year.	Letters.	Newspapers.	Parcels.	Books and Patterns.	Total.
1867-68	62,567,255	5,411,110	651,428	525,050	69,154,847
1868-69	68,891,232	5,773,585	699,208	623,594	75,987,617
Increase	6,323,977	362,475	47,780	98,538	6,832,770
Increase percentage ...	10·107	6·69	7·33	18·76	9·88

37. The letter returns may be further analyzed as per margin. There is nothing in this analysis calling for remark or explanation, except perhaps that, as in previous years, the column for "paid letters" includes service letters prepaid with service postage labels.

Year.	Paid.	Unpaid.	Service.	Registered.	Total.
1867-68 ...	34,995,281	23,321,703	3,993,830	1,256,441	63,567,255
1868-69 ...	38,904,155	24,612,666	4,017,709	1,356,702	68,891,232
Increase	3,908,874	2,290,963	33,879	90,261	6,324,977
Increase percentage ...	11·16	10·26	·85	7·12	10·107

38. The correspondence received was disposed of as shown in the following statement :—

Directly delivered (Appendix III), 82 per cent.	56,258,994
Retained for re-issue, 18 per cent.	12,632,238
	68,891,232

Details of Re-issue.

Sent to district post office	4,698,361
Sent to dead-letter office	2,065,134
Remainder disposed of by re-direction to other offices, or sent to branch offices, or in deposit at the end of the year	5,868,743
Total ...	12,632,238

These results present no points calling for remark or explanation.

39. A statement of the number of articles mis-sent in each circle will be found in Appendix IV. The results for the whole of India, compared with those of the preceding year, are as follows :—

	Number of letters, papers, and parcels mis-sent.
1867-68	71,812
1868-69	74,950

In my last report, I observed under this head that, while the returns might show approximately the number of articles *received for delivery at the wrong office*, they were incomplete, inasmuch as they did not show articles mis-sent to the *wrong sorting office*. I was desirous of remedying this defect, but found that the trouble entailed would be quite incommensurate with the advantage, and I ascertained that, for like reasons, the English Post Office made no attempt at recording the number of articles sent to a wrong sorting office.

40. Appendix V contains details relative to the working of the several dead-letter offices and I give below, in the usual form, a comparison of the results for the last three years, *viz.*:—

	Number.			Proportion of each class to the whole.		
	1866-67, for 11 months.	1867-68.	1868-69.	1866-67.	1867-68.	1868-69.
Letters returned to senders	607,055	723,266	880,933	37·65	40·65	42·66
Letters undisposable	1,004,885	1,055,982	1,184,201	62·35	59·35	57·34
Total ...	1,611,940	1,779,248	2,065,134	100·	100·	100·

The proportion of covers returned to the senders is increasing.

41. The increase in the gross value of stamps sold in 1868-69 is 12·4 per cent. against a corresponding increase of 4·78 per cent. in the previous year. The increase and decrease in the sales of the several classes of labels are given below :—

The increase in the gross value of Stamps sold in 1868-69, *as compared with* 1867-68, *is* 12·49 *per cent. against a corresponding increase of* 4·78 *per cent.*

	½-Anna Labels.	1-Anna Labels.	2-Anna Labels.	4-Anna Labels.	6-Anna Labels.	6-Anna 8-Pie Labels.	8-Anna Labels.	½-Anna Notepaper.	½-Anna Envelopes.	1-Anna Envelopes.
1866-67, as compared with 1865-66		1·37	9·18	3·54	...	...	4·65	·38	6·73	32·23
1867-68, as compared with 1866-67, exclusive of Straits Settlement ...		3·76	·83	3·603	40·39	253·104	6·79	25·31	44·77	115·68
1868-69, as compared with 1867-68		4·47	5·28	7·69	83·88	43·88	32·15	146·37	45·69	62·19

Decrease. Decrease. Decrease. Decrease. Decrease. Decrease. Decrease. Decrease. Decrease. Decrease.

Increase. Increase. Increase. Increase. Decrease.* Decrease. Increase. Decrease. Decrease. Decrease.

* A temporary label, [illegible] discontinued.

The largely increased sale of 8-pie and 8-anna labels is accounted for partly by the modification of overland postage rates, the single postage rate *viâ* Marseilles (8 annas 8 pie) bringing these labels into use in supersession to a large extent of the 6-anna 8-pie labels, in the sale of which there is a large decrease. The increased sale of ½-anna note-paper was due to special efforts made during the year to expose it freely for sale, the stock on hand being inconveniently large.

42. The returns of the sale of service stamps will be found in Appendix VIA. The gross value of service stamps sold in the year was Rs. 2,85,644 against Rs. 3,18,169 in the previous year, the reduction being probably due to the inclusion of more public offices in the list of offices privileged to send and receive official correspondence without actual payment.

SECTION IV.—DISTRICT POST.

43. As explained in previous reports, the district post consists of lines of communication connecting the head quarters of each district with the interior police and revenue stations, and is maintained primarily for the purpose of conveying official correspondence, the cost being borne in some parts of the country by a local cess, and in other places by the Government as an imperial charge. I mentioned in the last report that the management of the district post had been made over in Bombay and the North-Western Provinces to the officers of this department, acting in that respect under the orders of the local Governments, and I stated that the improvement in working which followed the transfer had resulted in steps being taken for carrying it out in other provinces.

44. It has since been arranged that the transfer shall be carried out in the Punjab as the districts come under re-settlement, and as this will be a slow process, efforts will meantime be made by this department to improve matters as much as possible by extending the imperial post and employing rural messengers.

45. In Bengal, as stated in my last report, the local post of one district had been made over experimentally to the management of this department, and the result being favorable, steps were taken for assuming the management in various other districts where the local authorities consented to the change. The result will form the subject of report next year.

46. In Madras, a similar experiment was made, but the result has not yet satisfied the local Government of the expediency of extending the plan, which is still undergoing trial. I hope that I may be able next year to report favorably respecting the Madras experiment.

47. In Oude, there is still a difficulty about the transfer, owing to the fact of that Province being postally under the jurisdiction of the Post Master General of the North-Western Provinces, who could not obviously be of the same help to the local administration in the management of the district posts as an officer resident in the Province. The remedy for this will probably be the separation of Oude from the postal jurisdiction of the North-Western Provinces, and the appointment of a Chief Inspector exercising the powers of Post Master General; but as this measure would necessarily result in some increase of expense, I have not as yet felt warranted in proposing it.

48. The result of the district post operations, in so far as concerns correspondence passing between it and the imperial post, is given in Appendix VII, of which the following is an abstract:—

	Number.	Porcentage.
Sent to district post for delivery	5,029,074	Being 6·61 per cent. of the total number of covers received for delivery.
Portion of the above received back undelivered	537,257	Being 10·68 per cent. on the number sent to district post.
Received from district post	2,994,828	Being 3·94 per cent. on the total number of covers received by General Post Office for delivery.

These returns show a slight decrease, as compared with the previous year, in the number of covers sent for delivery to the district post and received from it, this result being due to the extension of the imperial post to localities previously served by the district post. The proportion of covers returned by the district post as undeliverable is much the same as before,

i. e. somewhat over 10 per cent. This is proof enough of the inefficiency of the present system; but, so long as the delivery is effected through the police and village chokeydars, no better result can, I fear, be expected.

SECTION V.—MISCELLANEOUS.

49. In Appendix VIII will be found the usual statement of complaints made by the public during the year. The return for the Bombay circle is wanting, owing to the destruction of records when the Bombay Post Office was burnt. As observed in previous reports, the statement of complaints is of no real use in measuring the extent of dissatisfaction with the working of the Post Office.

50. The number of cases in which punishment has been inflicted on Post Office employés for offences committed by them is 130 for the year under report, against 126 for the previous year, as shown in Appendix IX.

Total ...	11	19	30	17	16	33

51. Last year, I reported a reduction in the number of highway robberies of mails from 43 to 30, and in the year now under report the number is slightly larger, *viz.* 33, as per margin. The increase is entirely in British districts, there being a reduction of three in the number of robberies in foreign territory. The Government order of July 1866, under which Native States are fined to the value of the property plundered in their jurisdictions, has resulted in a steady reduction of the number of robberies in foreign territory, *viz.*, from 36 in 1865-66 to 16 in 1868-69. The reduction this year would have been much larger, but for the considerable increase in the Bombay circle. The foreign territories in which the robberies occurred are noted on the margin, and it is satisfactory to find that, for the first time, Hyderabad does not appear on the list. The most important of the robberies mentioned comprised the following, *viz.*,—the one in Mysore (between Mysore and Bangalore), one of those in Kattiawar (between Wudwan and Bhooj), the one in the Bhoree State (between Poona and Sattara), and the two cases in Bhurtpore, in all of which the intrinsic value of the plundered property was large.

Madras.
Mysore ... 1
Bombay.
Kattiawar ... ... 7 (Besides two unsuccessful attempts at robbery.)
Bhorée State ... 1
N. W. Provinces.
Gwalior ... ... 1 (Also two reported attempts at robbery.)
Jeswar, Marwar, and Kishengurh, one each ... 3
Bhurtpore 2
Central Provinces.
Holkar's Dominions ... 1
Total ... 16

52. The robberies shown under the head of British Districts were perpetrated in the localities shown on the margin. The large number shown under the North-Western Provinces is really more nominal than otherwise, for in all except one case (in the Bareilly District, close to the borders of the Rampore State) the mails were wholly recovered, and the robberies would seem for the most part to have originated not so much in the desire to plunder, as in subservience to private feuds and jealousies. The perpetrators of the robbery on the Calcutta and Midnapore line were captured and convicted, a portion of the mail being recovered. The robbery in the Kistna District was an important one, the intrinsic value of the plundered property being very large, but the robbers were apprehended and a portion of the plunder recovered.

Total ...	21,271	23,257

SECTION VI.—NON-POSTAL BRANCHES OF THE DEPARTMENT.

54. These branches were largely increased during the year under review by the re-establishment of the Government Carrying Agency, commonly known as the Government Bullock Train, the offices of which at the close of the year numbered 67, the communications consisting of a main line from Calcutta to Peshawur with various branches, the chief ones being those to Darjeeling, Nagpore, Lucknow and Fyzabad, Futtehgurh, Indore, Landour, Simla and other neighbouring Hill Stations, Sealkote and Murree.

55. A large Military Transport Train was also organized by the desire of Government for the winter season between Jubbulpore and Nagpore for the purpose of conveying the annual Military Reliefs. This train, consisting of about 30 carts per diem each way on a road of 164 miles in length, was organized on very short notice, and gave entire satisfaction to the Military authorities. The train being managed by the Post Office, the whole cost has been debited to this department, although it is, of course, in reality a Military charge.

56. The Punjab Military Van Dâk, consisting of lines from Lahore to Peshawur with branches to Sealkote (in the winter), Murree (in the summer), and Kohat (since abolished), was enlarged during the year both by increased establishment on the main line, and by extension between the Beeas and Umballa (now only Jullundur and Loodhiana, owing to further extension of the Railway).

57. Passenger services were also maintained on other lines in connection with mail cart establishment, the principal one being that between Nagpore and Jubbulpore, on which considerably greater provision was made for passengers than in previous years.

58. The financial results of these non-postal branches will be shown in the following Section, together with the financial results of the purely Postal Department.

SECTION VII.—FINANCIAL RESULTS.

59. The financial results are in one sense unusually satisfactory, and in another sense not so. Since 1858-59 (the year following the mutiny), there has not been a year with so large an increase in the revenue from private correspondence; but, on the other hand, for reasons presently to be stated, there has not been a year with so large an increase of expenditure. For the nine years from 1858-59 to 1867-68, the yearly increase in the revenue from private correspondence varied considerably, the average increase being 1½ lakhs, and the largest increase (in 1862-63) Rs. 2,15,836. This year the increase is Rs. 3,31,097. So far the results are good; but, on the other hand, during the same nine years above referred to, the average yearly increase of expenditure was only Rs. 1,37,205, while the increase in the year now under report is no less than Rs. 6,15,261. It remains to explain this increase. More than a quarter of it (Rs. 1,63,290) was due to the cost of special and express trains for overland mails, for which no payments had been made in the previous year. The trains were employed at the express wish of the Government, but the rate of charge had not been settled, and, under the orders of the Government, all payments were held in abeyance. The question was settled in 1868, all arrear charges being then adjusted and the cost thrown upon the year under review. Further, it was in 1868 that the Government determined to make the Post Office pay for the haulage of the sorting carriages by Railway, for which previously no charge had been made. Payments were made on this account during the latter part of the year under review to the extent of Rs. 49,628.

60. The two items above mentioned, both of them payments to the Railway and aggregating Rs. 2,12,918, being deducted, leave a balance to be accounted for of about four lakhs, *i. e.*, very little more than the year's increase of revenue from private correspondence. But, even as regards this balance, there are special explanations.

61. During the last five months of the year, heavy charges were incurred on account of famine allowances, which it is quite impossible to avoid in a department like the Post Office, the work of which is largely carried on by runners, who must be enabled to feed themselves, and by horses, camels, &c., the keep of which varies directly with the price of food. Further, the year under review commenced with expensive additions to several of the chief mail cart lines, consequent on the institution of weekly overland mails and the necessity of conveying the whole of them from Bombay, instead of having them distributed by mail steamer to Bombay, Madras, and Calcutta, as formerly.

62. There remains one other special cause of increase which I have already adverted to in a preceding paragraph (20), *viz.*, the general revision of Post Office Establishment proposed by Mr. Riddell in the early part of 1867, but not sanctioned till 1868. This revision, the necessity of which had been apparent for many years before, took effect in the latter part of the year now under report.

63. The above mentioned circumstances explain the unusual increase of expenditure, and the effect of some of them has as yet been only partly experienced, for the Railway haulage charges appertaining to the latter part of 1868-69 will be still higher when computed for a whole year, and the general revision of salaries will operate in a similar manner, the revised scale having been applied only during the latter part of the year under report, and being moreover of a progressive character, the emoluments rising, in almost all cases, with length of service.

64. It is clear from the above that, notwithstanding an unusual development of postal revenue, it will be some time before the Indian Post Office can show as good a balance sheet as was once shewn.

In making this remark, I put out of consideration altogether the revenue from official correspondence, for, if that be included, I have no explanations whatever to render, the net revenue of the department during the year under report being (notwithstanding all the increased expenditure) actually greater by about 1½ lakhs than in the previous year. But I understand the Government to wish rather to view the Post Office as an institution *deriving a revenue from the public only, in return for services rendered both to the public and to the Government.* This point of view is a useful one, and it may also be a reasonable one in respect of some countries, such as England, where the service rendered to Government forms but a small fraction of the total operations of the Post Office. It appears from the last English report that what is called official postage has for the first time been excluded from the revenue returns: but this exclusion is merely partial, for it applies only to some forty privileged offices in London, and not to other Government correspondence which is paid for, like that of private persons, by ordinary postage labels. But even if the exclusion of official postage from the English revenue returns had been complete instead of partial, the principle could hardly be regarded as in the same degree applicable to India; for, while in England it could probably be urged that the Government service, forming but a fraction of the whole operations of the Post Office, put the department in reality to hardly any appreciable additional expense, the case is far otherwise in India, penetrated as it is by State administration and State agency in every province, district, pergunnah, town, and village,—where the Government constructs buildings, roads, railways, canals, telegraphs, &c., not through private contractors (who pay their own postage), but through its own agency,—where education, surveys, and even Municipal matters, are, to a large extent, controlled or undertaken by Government,—and where, consequently, a very large proportion of the expenditure incurred by the Post Office is incurred directly on account of the service rendered to Government.

65. But admitting, as I have already done, that it is at least a useful thing to view the Post Office in the light above referred to, *viz.*, as an institution spending money on two objects (conveyance of official and private correspondence), and deriving a revenue from only one of them (private correspondence), I proceed to offer the following remarks.

66. The Indian Post Office once, in recent years, reached very nearly the point when it could be said that the revenue from private correspondence alone paid all expenses. This was in 1864-65, when, after several years of an almost stationary scale of expenditure and a steadily increasing income, the revenue from private correspondence fell short of the total expenditure by only Rs. 5,13,999. It now, after several years of increased expenditure, falls short by Rs. 12,64,497; and the current year will probably find that figure somewhat increased, for the revenue will suffer by the increased limits of weight allowed for letters. But allowing for all this, the lee-way to be made up, so as to regain the position of 1864-65, is after all but small, and a few years of economical management (by which term I do not mean an unwise repression of natural expansion) and of average prosperity will suffice for the purpose.

67. Every effort is being made this year to ensure economy, and the Government may confidently look for a speedy recoupment in respect of its outlay as well as of its concession of reasonable limits of weight for letters.

68. I now proceed to give the usual financial statistics, both as respects the Post Office proper and the several non-postal branches of its administration. These are exhibited in detail in Appendices XI and XII, and the following abstracts will show the general results, *viz.*:—

PURELY POSTAL SERVICE.	1867-68.	1868-69.
	Rs. A. P.	Rs. A. P.
Receipts, including official postage and sale of service stamps ...	60,84,447 0 6	68,60,720 12 3

	Excess of receipts.	Excess of disbursements.
	1,385 12 8	2,106 10 8
Passenger Services on Mail Cart Lines.		
Receipts	83,435 2 11	1,34,105 12 5
Disbursements	83,435 2 11	1,34,105 12 5
Military Transport Train.		
Disbursements	*Nil.*	1,84,611 10 9

69. Briefly stated, these results show,—

		Rs.	
(1).	A net revenue in the purely Postal Department of ...	14,90,518	If official postage be included.
(2).	A net deficit in ditto of	12,64,497	If official postage be excluded.
(3).	A net revenue in the Bullock Train of	1,24,630	This is the result of the year's operations. The expenditure was largely increased by the high price of grain, and it was not till after the close of the year, when a long continuance of high prices seemed certain, that the fares were increased. The Van Dâk has a large surplus at credit from previous years.
(4).	A net deficit in the Punjab Military Van Dâk of ..	2,106	

70. **The "Passenger Service on Mail Cart lines" exhibits neither loss nor gain, the fact being that it is impossible to divide the expenses into those incurred for passengers and those incurred for the mails: indeed, in most cases, it would be impossible to reduce the expenses even if there were no passengers, the latter being ordinarily conveyed in the same carriage as the mails, or in special carriages horsed by an establishment necessary for the mail service, but not employed daily in it. Under these circumstances, the passenger receipts are treated as a set-off against the cost of the mail service, only the net cost being debited to the Postal Department, and the remainder with the corresponding receipts being shown under the head of Non-Postal Branches.**

71. The Military Transport Train shews no receipts, for it is merely a troop-carrying agency placed at the disposal of the Military authorities, being managed and paid for by the Post Office as a matter of convenience.

72. As in my last report, I give on the margin certain items not hitherto included in the regular accounts. The estimate for Railway free service previously given at 2 lakhs has been reduced to 1½ lakhs, as ½ lakh has this year been actually paid to the East Indian Railway on account of haulage.

	Rs.
Railway free service (estimate) ...	1,50,000
Discount on sale of stamps ...	1,38,629
English stores (estimate) ...	31,310
Printing in Bengal and Madras (estimate)	50,000
TOTAL Rs.	3,69,939
Subsidies for local steam services ... „	7,12,332

The subsidies for local steam services will, as already stated, appear next year in the Post Office Accounts, it having been decided that these services, although maintained primarily for other than postal requirements, can most conveniently be controlled and paid for by the Post Office Department.

73. To this list ought, perhaps, to be added the payment (Rs. 4,800 I believe) made by Her Majesty's British Government to the Euphrates and Tigris Steam Navigation Company, and debited to the Indian Government. The communications for which this payment is made are, I believe, required for political or other purposes, and are controlled by Her Majesty's British Resident.

SECTION VIII.—GENERAL REVIEW OF PROGRESS SINCE 1854.

74. In accordance with previous custom, I annex a return (Appendix XIII) showing the number of letters and newspapers received for delivery since the introduction of the Post Office Act of 1854, together with an abstract comparison, as per margin.

Number of letters and newspapers received for delivery in the year under review, as compared with the number received in the year prior to the introduction of the Post Office Act of 1854.	
A year before the Act XVII of 1854 came into operation ...	19,082,676=100
1867-68	67,978,365=356
1868-69	74,664,817=391

75. I also submit a statement (Appendix XIV) showing the progress of purely postal revenue from 1853-54 up to date. The abstract on the margin relates to the revenue from private correspondence, that of 1855-56 (the first complete year after the reduction of postage rates in 1854) being represented by 100, and the revenue of the six last years in like proportion.

Year.	Percentage.
1853-54, last complete year of former rates	128
1855-56, first complete year	100
1864-65, tenth ditto	214
1865-66, eleventh ditto	222
1866-67, twelfth ditto	230
1867-68, ditto ditto (exclusive of Straits Settlement)	227
1867-68, thirteenth ditto	237
1868-69, fourteenth ditto	258

* Including sale of Service Postage Stamps.

† The apparent reduction is to a large extent nominal, owing to the introduction of a new system of accounting for Official Postage, under which a portion of the official correspondence between Government Officers in the same district is not brought to account.

No. 911, dated 17th February 1870.

RESOLUTION.—By the Government of India, Fin. Dept.

Read—

The Annual Report on the operations of the Post Office of India for the year 1868-69.

Resolution.—The chief points of interest in this report may be briefly reviewed thus :—

2. The system of sorting letters on board the mail steamers between Suez and Bombay, introduced by Mr. F. R. Hogg when Postmaster General of Bombay, has been successfully carried out. By this system a delay of at least eight hours, which formerly took place in the Bombay Post Office, is saved, the mails being landed ready for despatch inland.

Para. 4.

3. From these paragraphs it appears that notwithstanding the enhancement of the rates of postage between India and England by 3*d.* per ½oz., the correspondence has increased considerably.

Paras. 6 to 9.

The increase is estimated at—

15 per cent. on letters from England *viâ* Southampton.
6 " " " Marseilles.
14 " " to England " Southampton.
20 " " " Marseilles.

4. Owing to the mails for and from Bengal and Madras being conveyed through Bombay, the cost of inland transit has increased, while the share of inland postage on overland correspondence has, under the new arrangement, been virtually reduced in respect of paid letters from India, by the heavy discount on the sale of stamps, and generally by the increased cost of distribution. The Secretary of State has recently been asked to obtain a larger share of the postage for India.

Paras. 10 and 11.

5. The changes made in the postal communications with the Mauritius *viâ* Aden, with the United States of America by the vessels of the Pacific Mail Steam Ship Company plying between Hong-Kong, Japan, and San Francisco, and with the Straits Settlements, as well as the alteration in the rate of postage on newspapers sent from India to other ports in Asia, are satisfactory.

Paras. 12 to 15.

6. In the local Steam Services subsidized by Government the changes noted in the margin are the only changes which were made during the year under report. These, as well as the arrangements entered into with the Agents of the opium steamers running between Calcutta and China, for the regular conveyance of the China mails, are also satisfactory.

Paras. 16 to 19.

Line between Calcutta, Bombay, and intermediate ports on the Coast, *fortnightly instead of monthly.*
Line between Madras, Rangoon, and ports on the East Coast, *once in four weeks instead of monthly.*

7. The Postal Establishments of Bengal, the North-Western Provinces, the Central Provinces, and the Punjab have been revised at a considerable increase of charge, but the increase was needed to place these establishments on an efficient footing.

Para. 20.

8. The route for the mails from the North-Western Provinces to Bombay has been changed from *viâ* Indore to *viâ* Jubbulpore, a longer but a more expeditious and less costly line.

Para. 21.

9. The Government views with satisfaction the introduction of the rule for the compulsory registration of letters containing coin or currency notes, which was suggested in Financial Resolution No. 3021, dated 31st October 1868, and trusts it will be attended with beneficial results.

Para. 23.

10. The system relating to registered letters has been revised with a view to provide more effectually for the safe transit of such letters, and to afford the means of more prompt investigation in cases of tampering. Under orders lately passed, in connection with serious frauds committed on a Mofussil Treasury, the necessity has been pointed out for passing a rule regarding the delivery of registered letters to none but the addressee, or some person duly authorized by the addressee to receive them. Any laxity in this matter is likely to lead to serious consequences.

Para. 24.

11. A Postal Guide was published on the 1st April 1869, and is now continued quarterly. It has supplied a long-felt want.

Para. 25.

12. The success which has attended the local postal system in Calcutta, as modified in the year under report, is satisfactory, the number of letters having trebled since its introduction.

Para. 26.

13. The number of Post Offices opened during the year was 384, and the number of letter-boxes 167, compared with 467 of the former, and 134 of the latter opened in the previous year. The greatest decrease in the number of new Post Offices has been in the Bombay Circle, though that Circle still exhibits a larger extension than any other Circle. The extension of the Department during the past four years, by the opening of new Post Offices, has been at the average rate of 350 per annum.

Para. 32.

14. The increase in the number of rural messengers, or district letter-carriers, who are employed in the interior among the agricultural population, from 127 during the previous year to 227 during the year under report is very satisfactory.

Para. 33.

15. These paragraphs and the statement appended show the extent in miles of each class of postal lines at the close of the year, as compared with the returns of the previous year. The total number of miles open during 1868-69 was 50,281$\frac{8}{8}$, being 603 miles in excess of that in the previous year. Of this excess 240 miles are by railway.

Paras. 34 and 35.

16. The increase in the number of letters, parcels, &c., from 69 millions to nearly 76 millions is very satisfactory, especially when it is considered that a very small percentage of the increase in the number of letters is owing to an increase of Service covers.

Paras. 36 to 40.

The increase of 12·4 per cent. in the gross value of stamps sold in 1868-69, against the increase of 4·78 per cent. in the year previous, is very satisfactory. It is observed, however, that the gross value of Service stamps sold in the year has decreased from Rs. 3,18,169 in the previous year to Rs. 2,85,644, and the result is supposed to be attributable to the increase in the number of public offices privileged to send and receive official correspondence free of charge.

17. These paragraphs relate to district posts. In the review of the previous year's report, this Government desired that the plan of amalgamating the district with the imperial post,

Paras. 43 to 48.

in respect to management and control, should be extended perfectly in *all* the Provinces of India. The present report shows that the amalgamation has been completely effected in Bombay and the North-Western Provinces, that it is about to be carried out in the Punjab, and that the experiment is being partially tried in some of the Districts of Bengal and Madras.

18. In this paragraph the proportion of undelivered letters returned by the district posts is stated to be somewhat above 10 per cent., against 11 per cent. during the previous year.

Para. 48.

19. The Governor General in Council regrets to observe that the number of mail robberies has increased since last year from 30 to 33, 17 of which were in British territory, the greatest number having occurred in Madras and the North-Western Provinces. In 8 out of the 9 cases in the North-Western Provinces, however, the mails were wholly recovered.

Para. 51.

20. These paragraphs relate to the non-postal branches of the Department, *viz.*, the Bullock Train, which was re-established during the year under report; the Military Transport Train, organised for the winter between Jubbulpore and Nagpore for the purpose of conveying the annual military reliefs; and the Punjab Military Van Dâk. The successful way in which these services have worked prove them to be useful not only to Government, but to the public generally.

Paras. 54 to 57.

Under this head is shown in the account a net deficit of Rs. 62,088. But this includes Rs. 1,84,612 for the Military Transport Train, which is really a military charge. Excluding it there would be a net surplus of Rs. 1,22,524. The Bullock Train yielded a net revenue of Rs. 1,24,630, but there was a loss of Rs. 2,106 on the Military Van Dâk, which is explained to be owing to famine prices.

21. These paragraphs relate to the financial results of the operations of the Department during the year under report. It is observed that the gross receipts in the purely Postal Department amounted to Rs. 68,60,720-12-3, and that the gross charges were Rs. 53,70,201-15-8, the difference between which shows a net surplus of Rs. 14,90,518-12-7, or excluding —

Paras. 59 to 68.

	Rs.	A.	P.
Service stamps	2,85,644	15	0
Official postage	24,69,371	9	0
	27,55,016	8	0

from the gross amount of receipts, a net deficit of Rs. 12,64,497-11-5.

In reference to these results, the Governor General in Council observes that it is proper to distinguish clearly between the *pro formâ* receipts on account of official correspondence, and the real money receipts from the public, for, although the Department does perform very valuable services for the State, it is not in accordance with the principles of the administration to allow one Department to charge others, and thus show a nominal profit. The Post Office not being primarily a source of revenue to Government, any real profits which may hereafter accrue must be devoted to extending and improving the Department. But every effort should be made to keep down the expenditure of the Department, which in the year under report has exceeded that of the previous year by Rs. 6,15,261-9-3, and public officers should be careful to effect economy in the weight of their official covers. It has, however, been explained by the Director General that the increase of expenditure during the year under report is due to the payment of railway charges, including arrears, to famine allowances, to extension of mail cart lines, consequent on sending all mails for England to

Bombay, and to the general revision of salaries which had for a long time been pending.

22. Receipts on account of passenger service are set-off against charges on that account, and the sum is excluded from both sides of the account, as it is said to be impossible to distinguish between the costs of mails and of passengers. The receipts from passengers amounted to Rs. 1,34,105-12-5. The costs are assumed to be equal to the receipts, and deducting these costs the charge for the mail cart service was Rs. 13,89,971-7-10. It is, however, to be observed that if there were no receipts from passengers, the total cost would not be materially diminished, so that those receipts represent a clear gain, and show how great a convenience the mail carts are to travellers.

Para. 70.

23. Certain items of charge shown in these paragraphs have not again been included in the accounts, though in para. 19 of the Resolution of the 31st October 1868 they were ordered to be shown in future accounts. These charges, which nearly absorb the whole of the nominal surplus, are—

Paras. 72 and 73.

I.—Railway free service, estimated at Rs. 1,50,000. This of course is a nominal charge.

II.—Discount on sale of stamps, amounting to Rs. 1,38,629, which being a real charge should be shown in the accounts.

III.—English stores, estimated at Rs. 31,310, though paid for in England, should be shown in the Departmental accounts.

IV.—Printing in Bengal and Madras, estimated at Rs. 50,000. There seems no reason why the printing charges actually incurred in the whole of the Postal Department should not be shown in the accounts.

V.—Subsidies for local Steam Services, amounting to Rs. 7,12,332, which will appear in future accounts of the Postal Department, though the primary object of the contracts is the providing conveyance of Government troops, stores, &c., and of encouraging inter-portal trade.

24. His Excellency in Council considers that the Director General, Mr. Monteath, is entitled again to the thanks of the Government for his very efficient and successful management of the Postal Department.

25. His Excellency in Council observes that the Director General mentions Mr. F. R. Hogg as the officer to whose exertions the successful introduction of the system of sea-sorting of the mails between Suez and Bombay is mainly due. For these services Mr. Hogg deserves the acknowledgments of the Government, and as the practice of reporting on the conduct of the several officers of the Department, which has not hitherto been followed by the Director General in submitting his annual reports, is a good one, His Excellency in Council desires that the Director General will in future take occasion, in his annual reports, to bring to notice those officers who distinguish themselves by industry and efficiency.

ORDERED, that a copy of this Resolution be sent to the Director General of the Post Office, and the Comptroller General.

Ordered also, that a copy of the Report and Resolution be sent to the Home Department, for publication in the Supplement to the *Gazette of India*.

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

BUDGET ESTIMATE OF THE FOREST DEPARTMENT FOR 1870-71.

Circular No. 1 Forest, dated 21st February 1870.

RESOLUTION—By the Government of India, PUBLIC WORKS DEPARTMENTS.

Read again :—

The Budget-Estimates for 1870-71 of the Forest Department throughout India, including Hyderabad and Mysore.

Read also :—

The orders passed thereon by the Government of India, in the Public Works Department.

RESOLUTION.—The Budget-Estimates of the Forest Department for 1870-71 have, on the whole, been submitted with punctuality; the Coorg and Punjab Budgets only were late, the former having been received on the 18th November, and the latter on the 30th November 1869.

Madras	Received	4th	October.
Bengal	,,	4th	,,
Oudh	,,	11th	,,
Bombay	,,	13th	,,
Central Provinces	,,	13th	,,
Burmay	,,	14th	,,
Berar	,,	14th	,,
North-Western Provinces	,,	18th	,,
Mysore	,,	2nd	November.
Coorg	,,	18th	,,
Punjab	,,	30th	,,

2. The several estimates have been reviewed at length separately, and the figures are brought together in the annexed Table for convenience of comparison, and in order to exhibit the aggregate amounts involved.

3. In this Statement the estimates for the receipts and charges of the Canal Plantations in the North-Western Provinces and the Punjab have been removed from the Forest Budget-Estimate, with a view to their being placed in that of the Public Works (Irrigation) Estimate, as recently authorized by the Financial Department. The change will take effect from the 1st April next, and the following are the sums affected :—

		Rs.	Rs.
Receipts			74,000
Charges	Conservancy and Working	67,000	
	Establishments	17,080	
			84,080

ABSTRACT of the Provincial Budget-Estimates of the Forest Department throughout India for 1870-71, as passed by the Government of India in the Public Works Department.

Net Revenue ...	2,81,976	1,62,864	2,08,328								2,54,000					

4. The total amounts, omitting Mysore and the Berars, for the last few years, are—

	Receipts.	Charges.	Surplus.
	Rs.	Rs.	Rs.
1863-64, Actuals	30,44,430	...	...
1864-65, „	35,02,022	18,62,461	16,39,561
1865-66, „	35,63,382	21,36,387	14,26,995
1866-67, „	30,44,183	20,51,145	9,93,038
1867-68, „	33,15,884	22,44,564	10,71,320
1868-69, „	42,00,737	26,02,845	15,97,888
1869-70, Regular-Estimate ...	46,72,363	35,08,834	11,63,529
1870-71, Budget „ ...	59,61,800	44,51,386	15,10,414

5. A comparison of these figures with those given in the orders on the Forest Budgets for the current year, shows a satisfactory correspondence between estimates and actual results :—

1868-69.	Budget-Estimate.	Regular-Estimate.	Actuals.
	Rs.	Rs.	Rs.
Receipts	40,38,800	39,98,281	42,00,737
Charges	27,73,333	26,73,977	26,02,845

The financial results of forest operations in this country are affected to a great extent by the rain-fall of the year, by the greater or less unhealthiness of the seasons, and lastly by the fluctuations in the demand for, and price of, timber and other forest produce. Yet, upon the whole, the financial results of the Forest Department have, during the last few years, been fairly in accordance with the estimates, and His Excellency in Council accepts this as a satisfactory proof of the care bestowed in most Provinces upon the preparation of the Forest Budgets.

6. In the estimates now sanctioned for the current and next year, it has been necessary to provide for extended operations undertaken to supply timber and fuel for the construction of Railways from the Forests under the control of the Department in the Punjab and the North-Western Provinces. The success of these operations cannot at this time be accurately estimated, but it is certain that they will largely affect both the income and charges of the Department. It is possible that the actuals of the current and of next year may turn out somewhat different from the estimates. Making full allowance for some uncertainty in this respect, it is clear that, upon the whole, the Revenue of the Forest Department shows a steady and satisfactory increase, having risen from £304,000 in 1863-64 to £420,000 in 1868-69, and being expected to rise to £596,000 in 1870-71. Of the increase estimated for next year, about £100,000 are on account of the extended operations alluded to. A large portion of the additional supplies of wood and timber will be procured from forests in Foreign territory through the agency of the Forest Department, but a portion will come from forests in British territory; and though to a certain extent the supplies of future years will necessarily be anticipated to meet the present demand, still His Excellency in Council trusts that sufficient precautions have been taken to guard against any deterioration by overtaxing the productive powers of the forests. Without these extraordinary operations, the normal forest revenue in British India for 1870-71 might probably be estimated at £500,000.

7. On the other hand, the charges have risen in a much greater proportion. They were £186,000 in 1864-65, £260,000 in 1868-69, and are expected to be £445,000 in 1870-71. Of the last named sum, £100,000, or the same amount as under Receipts, has been entered on account of the operations in connection with the construction of the State Railways, so that the normal charges of 1870-71 may be estimated at about £345,000.

8. The expenditure of forest administration is divisible into three great classes,—charges for Establishments, for the working of the forests, and for works of improvement, such as the demarcation of the forests, planting operations, roads, the opening out of streams, and the like.

The charges for improving the forests have, His Excellency in Council believes, increased considerably of late years, and all operations which serve to increase the productiveness of the forests should everywhere be encouraged, as far as the outlay is justified on financial grounds. The charges for working the forests are necessary wherever it is found expedient to work them on Government account, and the charges for Establishments are unavoidable to secure the protection and proper management of the State Forest domains.

Nevertheless, His Excellency in Council feels assured that much still remains to be done, before the charges of the Forest Department may be said to have been reduced to the lowest figure compatible with efficiency. If the percentage of charges on receipts is considered in the different Provinces, it becomes evident that in some the charges are disproportionately high, whereas in others the proportion between receipts and charges is more satisfactory. Thus, in the Madras Presidency, the charges in 1868-69 amounted to 69 per cent. on the receipts; in the Central Provinces to 84 per cent.; and in the Punjab to 90 per cent. Whereas in Bombay, Sindh, Bengal and Burmah, the expenditure amounted to between 50 and 60 per cent. of the income, and in Coorg only to 22 per cent.

9. It is true that there are special circumstances in some Provinces which appear to a certain extent to account for the high proportion of charges. Thus, in the Punjab and the Central Provinces, it is admitted that the forests which are most accessible and easily worked are exhausted, or have at least been greatly over-worked, so that a small surplus revenue only can at the present time be realized; nevertheless, it seems probable that in those Provinces where the charges are high as compared with the receipts, something may be done to decrease them, and this subject is recommended to the earnest consideration of all Governments and Administrations, and of all Forest Officers.

10. The Establishment charges in the Forest Department will demand the special attention of all Governments and Administrations. In the following two Tabular Statements, the totals of these charges in the different Provinces since 1864-65 are exhibited, together with the classification of this expenditure in 1868-69. The percentage on Receipts of the Establishment charges has been heaviest in Madras, 35 per cent.; in the Punjab, 34 per cent.; and the Central Provinces, 31 per cent.

ABSTRACT of Charges under B. Establishments in the Forest Department since 1864-65.

11. It is evident, from the figures here put together, that there is great inequality in the different classes of Establishment charges in the different Provinces, and there seems at first sight to be room for greater economy in several Provinces. It would be most unwise to propose any retrenchments which would have the effect of limiting in any way the operations of the Forest Department, or of arresting its progress. It is in the opinion of His Excellency the Governor General in Council essential, for the future well-being of this country and its inhabitants, that the administration of the public forests and wood-lands should be placed upon a satisfactory footing. And it seems equally clear that any relaxation of our efforts in this direction at the present time would only increase the difficulties of hereafter attaining this object. Nevertheless, it is necessary that the administration of the public forests should be so conducted as to yield the largest possible amount of revenue, compatible with a due regard for the maintenance and improvement of these important public domains.

ORDER.—Ordered, that a copy of this Resolution, and of the orders on the several Budget-Estimates, be forwarded for information to the Financial Department, and to the Secretary of State for India.

Ordered also, that a copy of this Resolution be forwarded to the Accountant General, Public Works Department, together with the details of the Estimates of Receipts and Charges for the Canal Plantations in the North-Western Provinces and the Punjab.

Ordered also, that a copy of the Resolution be published in the Supplement to the *Gazette of India* for general information.

IRRIGATION OPERATIONS OF FUSL RUBBEE IN THE N. W. PROVINCES UP TO 31ST DECEMBER 1869.

No.	LAND IRRIGATED (APPROXIMATE). Zillas.	Acres.	RAIN-FALL. Total from 1st April to 31st December 1869.	RAIN-FALL. Average of nine preceding years for the same period.	REMARKS.
GANGES CANAL. Northern ...	9·00	7·46	491		Grains :—							Saharunpoor ...	27,247	17·5	37·2	The mean volume of the Ganges Canal passing the Roorkee Gauge during the month was 4,282 cubic feet per second. The volumes discharged by the canal were as follows :— Tail, Etawah Branch 26 cubic feet. Escapes „ ... 293 „ „ Tail, Cawnpore „ ... 191 „ „ Escapes ... no returns. 515 cubic feet. The expenditure of water shown in tabular statement for Cawnpoor Division includes, therefore, the escape-water. The Cawnpoor canal, of high and low supply, alternate weeks are given show the mean of the month. At the commencement of the month, the rubbee irrigation had entirely commenced. After the first week, however, the weather all over the Doab became, very cloudy, and the cultivators, induced by the prospect of rain, restricted their demand for water as far as possible. Heavy rain fell very generally over the Doab on the 20th to 24th instant, and the demand for water almost entirely ceased. Some considerable difficulty was experienced in getting rid of the surplus water occasioned by the sudden cessation of the demand; however, no breaches of consequence occurred. Only on the Eastern Jumna Canal was the supply unequal to the demand, due to the necessity this canal labors under of reducing its supply to meet the demands of the Western Jumna Canal when the river runs low. Tuccels of Zillahs had to be established on this canal to ensure the fair distribution of water.

IX.—To every specimen will be attached a label, containing the following particulars:—

1.—The name of the material.
2.—The express purpose for which it is used.
3.—The exhibitor's name.
4.—His address.
5.—The reasons why it is offered for exhibition, such as—
Its special mode of preparation for woollen and worsted fabrics.
Its comparative superiority.
Its peculiar qualities and properties.
Its commercial value and importance.
Its novelty of production or application.
Its cheapness.
6.—The price, unless the exhibitor objects.
7.—Any explanations, etc.

Foreign Commissions are requested to furnish these particulars on or before the 15th January 1871.

NEW MACHINERY FOR WOOL AND WORSTED FABRICS.

X.—New machinery and apparatus used in the cleansing, preparation, and weaving of wool and hair, will be admitted, and improvements of the different parts of the various machines and appliances may be shown separately.

XI.—Manufacturers, such as the following, engaged in the production of machinery and apparatus used in the manufacture of wool and worsted fabrics, may exhibit under this head:—

Bobbin manufacturers.
„ turners.
Card machine makers.
„ makers.
„ teeth makers.
Cloth press makers.
Flyer makers.
Fork manufacturers (weft).
Gear and slay makers.
Hackle and gill pin manufacturers.

Spindle makers.
Spinner flyer makers.

Tassel and fringe mould turners.
Teazle rod manufacturers.
Weavers' harness makers and enterers.
„ joiners.
„ leash makers.
„ loom makers.
„ mail makers.
Weavers' turners.
Winding frame makers.
Wool card makers.
Wool comb makers.
Woollen card makers.
„ machine makers.
Woolley teeth makers.

XII.—To every object will be attached a label containing the following particulars:—

1.—The name of the object.
2.—The purpose to which it is applied.
3.—The exhibitor's name.
4.—His address.
5.—The reasons why it is offered for exhibition, such as—
Its ingenuity.
Its novelty.
Its improvement on ordinary construction.
Its increased economy in producing.
The superiority of its execution.
Its increased efficiency.
Its cheapness.
6.—The price, when the exhibitor does not object.
7.—Any explanations, etc.

Foreign Commissions are requested to furnish these particulars on or before the 15th January 1871.

GENERAL REGULATIONS FOR EXHIBITING EDUCATIONAL WORKS AND APPLIANCES.

I.—The exhibition of educational works and appliances will include illustrations of all the subjects belonging to the following branches into which this class is sub-divided:—

1.—School buildings, fittings, furniture, etc.
2.—Books, maps, globes, instruments, etc.
3.—Appliances for physical training, including toys and games.
4.—Specimens and illustrations of modes of teaching Fine Art, Natural History, and Physical Science.
5.—Specimens of school work serving as examples of the results of teaching.

II.—The various trades engaged in the production of educational works and appliances will exhibit under this head, such as:—*

1.—*School Buildings, Fittings, and Furniture.*

Abacus frame makers.
Black board makers.
Diagram stand makers.
Easel makers.
Ink well makers.
Object lesson cabinet makers.
Reading frame makers.
School apparatus makers.
„ building model makers.
„ clock makers.
„ desk makers.
„ fitting makers.
„ form makers.

2.—*Books, Maps, Globes, Instruments, etc.*

Chart sellers.
Copy book publishers.
Engravers—(map).
„ (music).
Globe makers.
Ink powder makers.
Inkstand makers.
Map and chart sellers and publishers.
„ and print colorers.
„ engravers and printers.
„ mounters.
Mathematical instrument makers.
Music copyists.
Pen makers.
Pencil makers.
Penholder makers.
Publishers.
Quill and pen manufacturers.
Raised map makers.
School slate makers.
Slate pencil makers.
Steel pen manufacturers.
Topographers.
Writing ink makers.

* This list is of trades existing in the United Kingdom, but it may be suggestive to Foreign Commissions.

GOVERNMENT OF INDIA.

HOME DEPARTMENT.

ANNUAL INTERNATIONAL EXHIBITIONS OF SELECT WORKS OF FINE AND INDUSTRIAL ART AND SCIENTIFIC INVENTIONS.

ALLOTMENT OF SPACE TO INDIA.

In accordance with the general rule (F) the objects will be arranged in the following classes, and the amounts of space allotted to for each class will be as follows:—

	Horizontal space in Glass Cases about 7 feet high.	Horizontal space on the floor, unlimited in height.	Vertical space with projection not exceeding 6 inches on walls about 15 feet high, beginning at 2 feet 6 inches from the floor.	Vertical space with projection not exceeding 6 inches on screens about 7 feet high.
	Superficial feet.	Superficial feet.	Feet run.	Feet run.
I.—FINE ARTS—				
1. Paintings of all kinds ...	...	...	...	12
2. Sculpture in Marble, Stone, Bronze, or Plaster.	Unlimited space, but the objects, if many, may be liable to be arranged under open arcades, or in the Royal Horticultural Gardens.			
2*a*. Small Sculptures in other Materials.	80	...	...	...
3. Engravings, Lithographs, Photographs, &c.	...	...	8	12
4. Architectural Designs ...	...	...	...	6
4*a*. Architectural Models ...	...	20	...	...
5. Tapestries and Carpets, shown for their Fine Art.	...	...	40	...
5*a*. Shawls, Lace, &c., shown for their Fine Art.	...	...	...	36
6. Designs for all kinds of Decorative Manufactures.	...	...	...	12
7. Copies of Ancient or Mediæval Pictures, Mosaics, &c.	...	...	8	...
7*a*. Reproductions of large Monuments of Sculpture, or Architecture.	Unlimited if exhibited in arcades, or in the open air.			
7*b*. Reproductions of small Objects.	20	...	...	...
II.—SCIENTIFIC INVENTIONS AND NEW DISCOVERIES OF ALL KINDS.	...	10	4	...
	If any object is above 10 feet high, its height should be specified.			

ALLOTMENT OF SPACE, *&c.—continued.*

	Horizontal space in Glass Cases about 7 feet high.	Horizontal space on the floor unlimited in height.	Vertical space with a projection not exceeding 6 inches on walls about 15 feet high, beginning at 2 feet 6 inches from the floor.	Vertical space with projection not exceeding 6 inches on screens about 7 feet high.
	Superficial feet.	Superficial feet.	Feet run.	Feet run.
III.—MANUFACTURES—				
a. POTTERY of all kinds ...	60	...	...	...
An unlimited amount of space is assigned to special objects which may exceed feet in height, which can be shown under arcades or in the open air, but due notice of them, their character and dimensions, must be given before 1st November 1870.				
*a*1. New Raw Materials, Machinery, and Processes for Pottery.	...	30	4	...
b. WOOLLEN AND WORSTED FABRICS.	...	...	...	27
*b*1. Raw Produce, Machinery, and Processes.	...	30	4	...
*b*2. Woollens of all kinds, except Carpets.	...	...	...	27
*b*3. Shawls	...	...	...	45
*b*4. Mixed Fabrics ...	...	...	...	27
*b*5. Carpets	...	...	40	...
c. EDUCATIONAL—				
*c*1. School Buildings, Fittings, Furniture, &c.	12	...	5	...
*c*2. Books, Maps, Globes, Instruments, &c.	12	...	5	...
*c*3. Appliances for Physical Training, including Toys and Games.	12	...	5	...
*c*4. Specimens and Illustrations of the Modes of teaching Fine Art, Natural History, and Physical Science.	12	...	5	...
*c*5. Specimens of School Work, serving as Examples of the results of Teaching.	12	...	5	...

IV.—Her Majesty's Commissioners undertake to find the several spaces before described, and to arrange the objects in large glass cases where necessary. The spaces must not be exceeded, or the excess of objects will be liable to exclusion. Exhibitors who prefer it may place their objects in plain black frames glazed, not exceeding three inches in depth.

V.—Provided the aggregate space of each kind be not exceeded, Foreign Commissions are free to vary the proportions here allotted. Thus, in Paintings (No. 1) and Copies of Paintings (No. 7) to be hung on walls, and with Engravings (No. 3), Architectural Designs (No. 4), Shawls (5*a*), Designs (No. 6), to be exhibited on screens, the exact allotments need not be maintained. If no Architectural Designs are exhibited, the space may be allotted to Shawls or Engravings, provided always that the aggregate space of each kind be not exceeded.

SUMMARY OF ALLOTMENT TO INDIA.

	Horizontal space in Glass Cases.	Horizontal space on Floor.	Vertical space on walls 15 feet high.	Vertical space on screens 7 feet high.

THE RIGHT HON. ROBERT LOWE, M.P.
THE RIGHT HON. SIR S.H. NORTHCOTE, *Bt.*, C.B., M.P.
THE RIGHT HON. H. A. BRUCE, M.P.
THE RIGHT HON. JOHN BRIGHT, M.P., *or President of the Board of Trade for the time being.*
THE RIGHT HON. W. E. FORSTER, M.P., *or Vice-President of the Committee of Council on Education for the time being.*
THE RT. HON. SIR ALEXANDER Y. SPEARMAN, *Bart.*
THE RIGHT HON. A. S. AYRTON, M.P., *or First Commissioner of Her Majesty's Works for the time being.*
SIR THOMAS BAZLEY, *Bart.*, M.P.
SIR CHARLES LYELL, *Bart.*
SIR RODERICK I. MURCHISON, *Bart.*, K.C.B.
SIR FRANCIS GRANT, P.R.A.
SIR FRANCIS R. SANDFORD.
THOMAS BARING, Esq., M.P.
EDGAR A. BOWRING, Esq., C.B., M.P.
THOMAS FAIRBAIRN, Esq.
THOMAS FIELD GIBSON, Esq.
C. H. GREGORY, Esq., *or President of the Institute of Civil Engineers for the time being.*
PROFESSOR HUXLEY, F.R.S., *or President of the Geological Society for the time being.*
DR. LYON PLAYFAIR, C.B., M. P.
HENRY THRING, Esq.

A.

Her Majesty's Commissioners for the Exhibition of 1851 announce that the first of a series of Annual International Exhibitions of selected Works of Fine and Industrial Art and Scientific Inventions will be opened at South Kensington, London, on Monday, the 1st May 1871, and be closed on Saturday, the 30th September 1871.

B.

The Exhibitions will take place in permanent buildings, about to be erected, adjoining the arcades of the Royal Horticultural Gardens.

C.

The productions of all Nations will be admitted, subject to obtaining the certificate of competent judges that they are of sufficient excellence to be worthy of exhibition.

D.

The objects in the first Exhibition will consist of the following classes, for each of which will be appointed a Reporter and a separate Committee :—

I.—FINE ARTS APPLIED OR NOT APPLIED TO WORKS OF UTILITY.

1.—Painting of all kinds in oil, water colors, distemper, wax, enamel, and on glass, porcelain, mosaics, etc.
2.—Sculpture, modelling, carving and chasing in marble, stone, wood terra-cotta, metal, ivory, glass, precious stones, and any other materials.
3.—Engravings, lithography, photography, etc.
4.—Architectural designs, drawings and models.
5.—Tapestries, carpets, embroideries, shawls, lace, etc., shown not as manufactures, but for the fine art of their designs in form or color.
6.—Designs for all kinds of decorative manufactures.
7.—Copies of ancient or mediæval pictures, mosaics, enamels, reproductions in plaster, fictile ivory, electrotypes of fine ancient works of art, etc.

II.—SCIENTIFIC INVENTIONS AND NEW DISCOVERIES of all kinds.

III.—MANUFACTURES.

(*a*). POTTERY of all kinds, *viz.*, earthenware, stoneware, porcelain, parian, etc., including terra-cottas used in building; with any new raw materials, new machinery, and processes for the preparation of such manufactures.

(*b*). WOOLLEN AND WORSTED FABRICS.

With any raw produce from new sources or newly prepared, and new machinery for woollen and worsted manufactures.

(*c*). EDUCATIONAL.

1.—School buildings, fittings, furniture, etc.
2.—Books, maps, globes, instruments, etc.
3.—Appliances for physical training, including toys and games.
4.—Specimens and illustrations of modes of teaching Fine Art, Natural History and Physical Science.

Detailed rules applicable to each of the above classes, and lists of the separate trades engaged in the production of objects of manufacture, will be issued.

IV.—HORTICULTURE.

International Exhibitions of new and rare plants and of fruits, vegetables, flowers and plants showing specialities of cultivation will be held by the Royal Horticultural Society in conjunction with the above Exhibitions.

Special rules for Horticultural Exhibition will be issued by the Royal Horticultural Society.

E.

In Classes II. and III. producers will be permitted to send one specimen of every kind of object they manufacture, such object being distinguished for novelty or excellence.

F.

The arrangement of the objects will be according to Classes and not Nationalities as in former International Exhibitions.

G.

One-third portion of the whole available space will be assigned absolutely to Foreign Exhibitors, who must obtain certificates for the admission of their objects from their respective Governments. Foreign countries will appoint their own judges. The remaining two-thirds of the space will be filled by objects produced either in the United Kingdom, or, if produced abroad, sent direct to the building for inspection and approval of judges selected for the British Exhibi-

tors. Objects not accepted for exhibition must be removed according to the notices given, but no objects exhibited can be removed until the close of the Exhibition.

H.

All exhibitors or their agents must deliver at the building into the charge of the proper officers the objects unpacked and ready for immediate exhibition and free of all charges for carriage, etc.

I.

Her Majesty's Commissioners will find large glass cases, stands, and fittings free of costs to the exhibitors, and, except in the case of machinery, carry out the arrangement of the objects by their own officers.

J.

Her Majesty's Commissioners will take the greatest possible care of all objects, but they will not hold themselves responsible for loss or damage of any kind.

K.

Prices may be attached to the objects, and exhibitors will be encouraged to state their prices. Agents will be appointed to attend to the interests of exhibitors.

L.

Every object must be accompanied with a descriptive label, stating the special reason, whether of excellence, novelty, or cheapness, etc., why it is offered for exhibition.

M.

Due notice will be given of the days for receiving each class of objects, and to enable the arrangements to be carried into effect, strict punctuality will be required from all exhibitors, both Foreign and British. Objects sent or brought after the days appointed for their reception cannot be received.

N.

Reports of each class of objects will be prepared immediately after the opening, and will be published before the 1st June 1871.

O.

Each foreign country will be free to accredit an official reporter for every class in which objects made in such country are exhibited for the purpose of joining in the reports.

P.

There will be no prizes, but a certificate of having obtained the distinction of admission to the Exhibition will be given to each exhibitor.

Q.

A catalogue will be published in the English language, but every foreign country will be free to publish a catalogue in its own language if it think fit.

HENRY Y. D. SCOTT, *Lieut.-Colonel, R. E.*,
Secretary.

ANNUAL INTERNATIONAL EXHIBITIONS OF SELECT WORKS OF FINE AND INDUSTRIAL ART AND SCIENTIFIC INVENTIONS.

THE FIRST OF THE SERIES TO BE HELD IN 1871.

Special arrangements for foreign exhibitors whose objects are sent through the Commissions of their own Countries.

I.—In accordance with the general rule (H), Foreign Commissions must cause the objects to be delivered at the building into the charge of the proper officers, unpacked and ready for immediate exhibition, and free from all charges for carriage, &c.

II.—Foreign Commissioners must state their acceptance of the spaces respectively allotted on or before 1st May 1870. If not accepted by that time, the space will be treated as absolutely resigned.

III.—A preliminary list of the names of the exhibitors in each class to whom Foreign Commissioners have allotted space made out on the following form must be sent to Her Majesty's Commissioners on or before 1st November 1870 :—

(*a*).—Class.
(*b*).—Object to be exhibited.
(*c*).—Its dimensions.
(*d*).—Exhibitor's name and address.

IV.—Foreign exhibitors by general rule (G) are also permitted to send objects direct to London to be admitted by a British Jury, and therefore it is indispensable that this information be furnished by Foreign Commissions at the time appointed.

V.—Forms, showing the totals of space allotted in each class, are supplied and must be returned filled up by 1st November 1870.

VI.—In accordance with general rule (E), producers of scientific inventions and manufacturers are permitted to send one specimen of every different kind of object they manufacture, such object being distinguished for novelty or excellence, and according to general rule (L), every object must be accompanied with a descriptive label, stating the special reason, whether of excellence, novelty, or cheapness, &c., why it is offered for exhibition.

VII.—To enable Her Majesty's Commissioners to carry out their engagement to arrange all objects themselves, all objects being machinery or manufactures must be delivered at South Kensington on or before the 31st January 1871; all works of Fine Art must be delivered on or before the 15th February, and no objects sent through Foreign Commissions can be received after those dates. (See general rule M.)

Exception.—If machinery requires to be fitted, the exhibitor or his agent must d such fittings. Foundations will be provided, but notice of their being required must be sent on or before 1st September 1870.

VIII.—To assist in the preparation of the reports which, in accordance with general rules (N and O), must be published before 1st June 1871, Foreign Commissions are requested to send, as early as possible, the name of one representative for each of the following classes, who should be present in London for the opening on Monday, 1st May 1871, and prepared to commence the consideration of the reports on Tuesday, 2nd May :—

IX.—Painting of all kinds.
Sculpture of all kinds.
Engravings of all kinds.
Photography.
Architecture.
Fine arts applied to industry.
Copies of ancient and mediæval works of art.
Scientific inventions.
Pottery.
Woollen and worsted manufactures.
Education.
Machinery for the manufacture of pottery, and woollen and worsted manufactures.
Horticulture.

X.—Each representative will be at liberty to appoint a deputy to take his place in his absence.

XI.—Her Majesty's Commissioners will defray the cost of drawing up the reports.—*See Appendix B.*

XII.—A specimen of the proposed catalogue is transmitted, and Foreign Commissions are requested to collect the information relating to each individual artist or producer admitted to the Exhibition. Every effort will be made to render the information complete, so as to make the notices in the annual volume of International Exhibitions as valuable as possible, both to the public and to the exhibitor, and to cause the honor of gaining admission to be duly appreciated.

FINE ARTS.

GENERAL REGULATIONS RELATING TO FINE ARTS APPLIED OR NOT APPLIED TO WORKS OF UTILITY.

I.—The following objects will be included in the first Exhibition, and will be arranged in the under-mentioned classes, for each of which a reporter and committee will be appointed :—

Fine Arts applied or not applied to Works of Utility.

1.—Painting of all kinds in oil, water colors, distemper, wax, enamel, and on glass, porcelain, mosaics, &c.
2.—Sculpture, modelling, carving and chasing in marble, stone, wood, terra-cotta, metal, ivory, glass, precious stones, and any other materials.
3.—Engravings, lithography, photography, &c.
4.—Architectural designs, drawings and models.
5.—Tapestries, carpets, embroideries, shawls, lace, &c., shown not as manufactures, but for the fine art of their design in form or color.
6.—Designs for all kinds of decorative manufactures.
7.—Copies of ancient or mediæval pictures, mosaics, enamels, reproductions in plaster, fictile ivory, electrotypes of fine ancient works of art, &c.

II.—No artist can be allowed to exhibit more than two works in each class, unless under special conditions, but he may send works in as many classes as he pleases; thus the same artist may send for admission two oil paintings, two water-color paintings, two paintings on enamel, porcelain, &c., also two sculptures in marble, wood, &c.

III.—Paintings and sculptures may be either separate works, or form parts of the decoration of some object of utility, *e.g.*, fans, panels for furniture, wood carving for furniture, &c., provided that fine art is the predominant feature of the design.

IV.—The works of deceased artists are not admissible, except as copies or reproductions (Class 7).

V.—All works of art, except reproductions of ancient and mediæval works, must have been executed since 1862.

VI.—No work which has been previously exhibited in the United Kingdom can be admitted.

VII.—A producer may exhibit any number of reproductions of ancient or mediæval art, provided he obtains a certificate for their admission.

VIII.—Foreign Commissions will be required to furnish descriptions of all works, written only on one side of the paper, describing them as they are meant to be inserted in the catalogue, but no advertisement, unnecessary quotation, or narrative can be admitted. At the back of each frame or object must be written the name of the artist, and the number to which it refers in the list of the Commission: particular accuracy is requested in this respect.

IX.—Each picture or drawing must be in a separate frame, except very small miniatures, or sculptured gems, any number of which may be placed in a frame not exceeding six by five, or thirty square inches, and will be considered as one work; but if a series of designs from one story be admitted in the same frame, they must be enumerated as distinct pieces.

X.—All pictures and drawings must be in gilt frames. Excessive breadth in frames, as well as largely projecting mouldings, may prevent pictures obtaining the situation they otherwise merit; and oval frames should be avoided, as they are difficult of arrangement.

XI.—No mere transcripts of the objects of natural history, nor any drawings without abckgrounds, excepting architectural designs, can be received.

XII.—The prices of works to be disposed of, carefully described as in Section VIII, may be communicated to the Secretary.

XIII.—To every work will be attached a label containing the following particulars:—

1. The subject. 2. The artist's name. 3. His address. 4. Any explanations.

XIV.—Foreign Commissions are requested to furnish these particulars on or before the 15th January 1871.

SCIENTIFIC INVENTIONS AND DISCOVERIES.

I.—The exhibition of scientific inventions and discoveries will not be restricted to such as relate to the fine arts and to the three classes of manufactures included in this Exhibition, but will embrace all kinds of inventions and discoveries in physics, mechanics, and chemistry, which may be deemed worthy of admission.

II.—If any object requires for its exhibition fire steam, or water or any other motive power, the application must distinctly specify what provision is necessary to be made for working it, and what securities are required against danger or accident.

III.—As a general rule, explosive and dangerous substances, including such as are liable to spontaneous combustion, and substances deleterious to other ordinary exhibits, will not be admitted. Any imitations of explosive or dangerous compounds (such as the substitution of coal dust for gunpowder in sections of shells and the like) must be the subjects of special application.

IV.—To every object will be attached a label containing the following particulars:—

1.—The name of the object.
2.—Its use or application.
3.—The exhibitor's name.
4.—His address.
5.—The reasons why it is offered for exhibition, such as—
Its novelty.
Its ingenuity.
Its comparative superiority.
Its peculiar qualities or properties.
Its commercial, artistic, or scientific value and importance.
Its cheapness.
6.—The price, unless the exhibitor objects.
7.—Any explanations, etc.

V.—Foreign Commissions are requested to furnish these particulars on or before the 15th January 1871.

GENERAL REGULATIONS FOR EXHIBITING POTTERY AS A MANUFACTURE AND NOT AS A FINE ART.

I.—Pottery of all kinds will be exhibited, *viz.*, earthenware, stoneware, porcelain, parian, etc., including terra-cottas used in building, with new raw materials, machinery, and processes for the preparation of such manufactures.

II.—In this class, the following trades, together with any others engaged in the production of pottery, are eligible to send illustrations of their respective branches of production :—*

Brick and tile makers.
Brown stone potters.
Chemical potters.
Chimney top manufacturers.
China and earthenware manufacturers.
„ gilders.
„ menders.
„ riveters.
„ and porcelain door furniture makers.
„ and porcelain manufacturers.
„ drillers.
„ figure manufacturers.
„ ornament makers.
„ painters and gilders.
„ toy makers.
Drain pipe and tile makers.
Earthenware figure manufacturers.
„ manufacturers.
Egyptian blackware manufacturers.
Encaustic tile makers.
Fancy jug manufacturers.
Fire brick makers.
Jug manufacturers.
Melting pot and crucible makers.
Muffle manufacturers.
Parian manufacturers.
Plumbers' pottery makers.
Porcelain letter makers.
„ manufacturers.
Potters.
Potters' engravers.
Rockingham ware manufacturers.
Stone bottle makers.
„ mortar and pestle manufacturers.
„ potters.
„ ware manufacturers.
Terra-cotta manufacturers.
Tobacco pipe makers.
Vase manufacturers.

IV.—A producer in each of the trades may submit a specimen of each kind of object he manufactures, although such specimen may form only a part of a complete object.

V.—The aim of the exhibition being to bring prominently into notice specimens remarkable for excellence, novelty, invention, etc., it is desirable to have the fewest number of specimens from each producer, and only those which are absolutely necessary: consequently no duplicates of any object can be admitted.

VI.—Thus, it is desirable that exhibitors should send only one specimen of the same kind of object, such, for instance, as one tea-cup, one saucer, and one plate of the same tea service; one dish, etc., being of the same series or pattern; one plate, one tureen, one vegetable dish, etc., of the same dinner service; one jug of a series; one garden vase, one drain pipe, one tile of the same pattern, &c.; one toilet jug and bowl. But they may send several specimens each belonging to a different series or pattern; and if a different pattern is put upon the same shaped cup, the cup may be sent.

VII.—Two objects of the same pattern, such as jugs, differing only in size cannot be exhibited.

VIII.—To every object will be attached a label containing the following particulars :—

1.—The name of the specimen.
2.—The materials of which it is composed.
3.—The exhibitor's name.
4.—His address.
5.—If of sufficient importance, the name of the designer or actual maker.
6.—The reasons why it is offered for exhibition, such as—
Its body or composition.
Its form.
Its surface pattern.
Its novelty.
Its excellence.
Its cheapness.
7.—The price, if the exhibitor pleases.
8.—Any explanations, etc.

Foreign Commissions are requested to furnish these particulars on or before the 15th January 1871.

* This list is of trades existing in the United Kingdom, but it may be suggestive to Foreign Commissions.

NEW MATERIALS FOR POTTERY.

IX.—Newly-discovered materials used in the production of pottery, new combinations of old materials, and new processes of manufacture may be exhibited.

X.—Persons engaged in the following trades, or any other trades connected with the preparation of the materials used in the manufacture of pottery, may send illustrations of their productions :—

Ash merchants.
Cnert stone dealers.
China clay merchants.
Clay merchants.
Flint millers.
Manganese merchants.
Marble clay merchants.
Pipe clay manufacturers and merchants.
Zaffre refiners.

XI.—It is desirable that the specimens of materials should be as small as possible, and such as can be exhibited in bottles or glass cases on a wall. The opportunities of admission will be greatly increased if the object be small.

XII.—To every specimen will be attached a label containing the following particulars :—

1. The name of the material and source from whence it is obtained.
2. The exhibitor's name.
3. His address.
4. The reasons why it is offered for exhibition, such as—
Its value and importance.
Its novelty.
Its superior excellence.
Its cheapness.
5. The price, unless the exhibitor objects.
6. Any explanations, etc.

Foreign Commissions are requested to furnish these particulars on or before the 15th January 1871.

NEW MACHINERY FOR POTTERY.

XIII.—New machinery and apparatus will be admitted, and recent inventions relating to the different parts of the various machines and appliances used in the manufacture of Pottery may be shown either as complete machines, or separately in parts. Machinery in motion and processes may be shown.

XIV.—Persons engaged in the following and other trades in the United Kingdom connected with the manufacture of Pottery may send Exhibits :—

Brick makers' implement manufacturers.
„ mould makers.
Grinding mill makers.
Kiln builders.
Machinists in general.
Pug mill makers.
Potters' wheel makers.

XV.—To every specimen will be attached a label, containing the following particulars :—

1.—The name of the specimen.
2.—The purpose to which it is applied.
3.—The exhibitor's name.
4.—His address.
5.—The reasons why it is offered for Exhibition, such as—
The novelty of its invention.
The superiority of its productiveness or efficiency.
Its increased economy in producing.
Its cheapness.
6. The price, unless the Exhibitor objects.
7. Any explanations, etc.

Foreign Commissions are requested to furnish these particulars on or before the 15th January 1871.

XVI.—Exhibitors whose machinery is admitted and requires to be fitted together will have to arrange it themselves in the Exhibition, but Her Majesty's Commissioners will, unless otherwise stipulated when the objects are admitted, find the necessary foundations.

GENERAL REGULATIONS FOR EXHIBITING WOOL AND WORSTED FABRICS.

I.—Woolen and worsted fabrics of all kinds will be exhibited—

With the raw produce and machinery for manufactures in the same.

II.—Producers engaged in the various trades, such as the following, connected with the manufacture of wool and worsted fabrics, are eligible to send specimens of the particular work in which they are engaged, although it forms only part of a complete object. Thus, a "beaver-cutter" may exhibit beaver-cutting; a pulp cloth manufacturer may exhibit specimens of pulp cloth; a yarn manufacturer, yarn, etc.

(a). *Woollen Trades.*

Army cloth manufacturers.
Baize manufacturers.
Billiard table cloth manufacturers.
Blanket manufacturers.
„ yarn spinners.
Cloth dressers.
„ drawers.
„ embossers.
„ factors and merchants.
„ finishers.
„ frizzers.
„ fullers.
„ manufacturers.
„ millers.
„ waterproofers.
„ workers.
Doeskin manufacturers.
Drugget manufacturers.
Dyers and scourers.
Felt makers.
Flannel agents.
„ factors.
„ manufacturers.
Fulling millers.
Horse cloth manufacturers.
Hot pressers.
Ironing cloth manufacturers.
Kersey manufacturers.
Machine cloth manufacturers.
Mourning hat band makers.
Navy clothiers.
Painted baize makers.
Pianoforte hammer and damper cloth manufacturers.
Printers' blanket manufacturers.
Pulp cloth manufacturers.
Railway wrapper manufacturers.
Roller clearer and ironing cloth manufacturers.
Saddle cloth makers.
Scribbling millers.
Shag manufacturers.
Ship felt makers.
Shoddy manufacturers.
Table cover manufacturers.
Upholsterers' woollen manufacturers.
Wool carders.
„ sheet manufacturers.
Woollen agents.
„ dyers.
„ factors.
„ cloth manufacturers.
„ cloth waterproofers.
„ manufacturers.
„ spinners.
„ waste dealers.
„ weavers.
Yarn manufacturers.

(b). *Worsted Trades.*

Alpaca manufacturers.
„ spinners.
Band and galloon makers.
Bell rope makers.
Berlin wool manufacturers.
Bombasin manufacturers.
Braid makers.
Bunting manufacturers.
Carpet manufacturers.
„ pattern designers.
„ planners.
„ weavers.
„ yarn manufacturers.
Cashmere manufacturers.
Cashmerett manufacturers.
Challis manufacturers
Chenille manufacturers.
Coach lace manufapturers.
„ trimmers.
„ upholstery and trimming manufacturers.
Damask manufacturers.
Fringe and lace makers.
Galloon and double makers.
Girth web manufactuerrs.
Hearth rug makers.
Lamb's wool manufacturers.
Lasting manufacturers.
Lindsey manufacturers.
Livery lace makers.
Machine combers.
Merino manufacturers.
„ spinners.
Military embroiderers.
„ sash makers.
Mohair manufacturers.
Moreen makers.
Mousseline de laine manufacturers.
Poplin manufacturers.
Railway woven badge manufacturers.
Rug manufacturers.
Satteen manufacturers.
Serge manufacturers.
Shalloon manufacturers.

Shawl border and fringe manufacturers.
„ cleaners.
„ darners.
„ manufacturers.
Stuff finishers.
„ manufacturers and agents.
Tassel manufacturers.
Trimming manufacturers.
Tweed manufacturers.
Upholsterers' trimming manufacturers.
Waistcoating manufacturers.
Web and webbing manufacturers.
Wool combers.
Woollen cord manufacturers.
„ stuff manufacturers.
Worsted dyers.
„ manufacturers.
„ spinners.
„ waste dealers.
Yarn manufacturers.

Not Classified.

Beaver cutters.
Blackwell hall factors.
Calenderers.
Domett manufacturers.
Embroiderers.
Embroidery designers.
Fent dealers.
Flock manufacturers.
Flushing manufacturers.
Gunny bag makers.
Listing manufacturers.
Machine habit manufacturers.
Mungo merchants and dealers.
Plainback manufacturers.
Plush manufacturers.
Regatta manufacturers.
Stripes manufacturers.
Zebra dress manufacturers.

III.—The Exhibition will be limited to such specimens as are necessary to show the different fabrics and their patterns in a satisfactory manner, and the specimens will be restricted to goods made entirely of wool, worsted or hair, or of wool, worsted or hair, combined with cotton, silk, or other textile materials.

IV.—Exhibitors must not send whole bales of cloth, rolls of carpet, or complete pieces of goods, and specimens should, if possible, not exceed three yards, unless the pattern requires a greater length. They may be exhibited in glass frames, which must not exceed two inches in depth or one and a half inches in width. The frames must be black.

V.—No duplicates can be admitted, but the same design may be shown with different combinations of colors.

VI.—To every object will be attached a label containing the following particulars :—

1.—The name of the fabric.
2.—The material of which it is made.
3.—The exhibitor's name.
4.—His address.
5.—The reasons why it is offered for exhibition, such as—
Its excellence of manufacture.
Its beauty of design.
Its permanence of dye or color.
Its ingenuity in the application of new materials.
Its novelty of production.
Its cheapness.
6.—The price, unless the exhibitor objects.
7.—Any explanations, etc.

Foreign Commissions are requested to furnish these particulars on or before the 15th January 1871.

NEW MATERIALS FOR WOOL AND WORSTED FABRICS.

VII.—Wool and hair of various kinds not hitherto used in the manufacture of textile fabrics, and materials recently applied to the cleansing, preparation, and dyeing thereof, may be exhibited.

VIII.—Producers, such as the following, engaged in the preparation of the materials used in the manufacture of wool and worsted fabrics, may send specimens of them :—

Alkali manufacturers.
Alpaca wool merchants.
Alum manufacturers.
Ammonia manufacturers.
Annato manufacturers.
Aquafortis makers.

Arsenic manufacturers.
Bleaching liquid makers.
„ powder makers.
Blue manufacturers.
„ verditer makers.
Camel hair merchants.
Carmine makers.
Chemical color makers.
Chloride manufacturers.
Cobalt refiners.
Colorers.
Color manufacturers.
Copperas manufacturers.
Creosote manufacturers.
Cudbear makers.
Dye manufacturers.
Garacin manufacturers.
Goat's hair merchants.
Indigo blue manufacturers.
„ extract manufacturers.
„ manufacturers.
Indigo refiners.
Manganese merchants.
Merino wool merchants.
Mecklenburgh blue makers.
Mohair merchants.
Mordant makers.
Ochre manufacturers.
Oil of vitriol manufacturers.
Orchil and cudbear manufacturers.
Smalt manufacturers.
Soda ash makers.
„ crystal manufacturers.
„ merchants.
Spirits of salt manufacturers.
Sulphate of ammonia manufacturers.
„ of barytes manufacturers.
„ of copper manufacturers.
„ of soda manufacturers.
Turpentine distillers.
Ultramarine manufacturers.
Vitriol manufacturers.
Washing compound makers.
„ crystal manufacturers.
Wool factors.
„ merchants.
„ staplers.
Zaffre refiners.

IX.—To every specimen will be attached a label, containing the following particulars:—

1.—The name of the material.
2.—The express purpose for which it is used.
3.—The exhibitor's name.
4.—His address.
5.—The reasons why it is offered for exhibition, such as—
Its special mode of preparation for woollen and worsted fabrics.
Its comparative superiority.
Its peculiar qualities and properties.
Its commercial value and importance.
Its novelty of production or application.
Its cheapness.
6.—The price, unless the exhibitor objects.
7.—Any explanations, etc.

Foreign Commissions are requested to furnish these particulars on or before the 15th January 1871.

NEW MACHINERY FOR WOOL AND WORSTED FABRICS.

X.—New machinery and apparatus used in the cleansing, preparation, and weaving of wool and hair, will be admitted, and improvements of the different parts of the various machines and appliances may be shown separately.

XI.—Manufacturers, such as the following, engaged in the production of machinery and apparatus used in the manufacture of wool and worsted fabrics, may exhibit under this head:—

Bobbin manufacturers.
„ turners.
Card machine makers.
„ makers.
„ teeth makers.
Cloth press makers.
Flyer makers.
Fork manufacturers (weft).
Gear and slay makers.
Hackle and gill pin manufacturers.
„ makers.
Heald and slay makers.
Heddle makers.
Jacquard card cutters.
„ harness mounters.
„ machine makers.
Loom makers.
„ mounters.
„ passers and twisters.
Machine joiners.
Machine makers.
Reed and slay makers.
Shuttle makers.
„ tip makers.
Spindle makers.
Spinner flyer makers.

Tassel and fringe mould turners.
Teazle rod manufacturers.
Weavers' harness makers and enterers.
„ joiners.
„ leash makers.
„ loom makers.
„ mail makers.
Weavers' turners.
Winding frame makers.
Wool card makers.
Wool comb makers.
Woollen card makers.
„ machine makers.
Woolley teeth makers.

XII.—To every object will be attached a label containing the following particulars:—

1.—The name of the object.
2.—The purpose to which it is applied.
3.—The exhibitor's name.
4.—His address.
5.—The reasons why it is offered for exhibition, such as—
Its ingenuity.
Its novelty.
Its improvement on ordinary construction.
Its increased economy in producing.
The superiority of its execution.
Its increased efficiency.
Its cheapness.
6.—The price, when the exhibitor does not object.
7.—Any explanations, etc.

Foreign Commissions are requested to furnish these particulars on or before the 15th January 1871.

GENERAL REGULATIONS FOR EXHIBITING EDUCATIONAL WORKS AND APPLIANCES.

I.—The exhibition of educational works and appliances will include illustrations of all the subjects belonging to the following branches into which this class is sub-divided:—

1.—School buildings, fittings, furniture, etc.
2.—Books, maps, globes, instruments, etc.
3.—Appliances for physical training, including toys and games.
4.—Specimens and illustrations of modes of teaching Fine Art, Natural History, and Physical Science.
5.—Specimens of school work serving as examples of the results of teaching.

II.—The various trades engaged in the production of educational works and appliances will exhibit under this head, such as:—*

1.—*School Buildings, Fittings, and Furniture.*

Abacus frame makers.
Black board makers.
Diagram stand makers.
Easel makers.
Ink well makers.
Object lesson cabinet makers.
Reading frame makers.
School apparatus makers.
„ building model makers.
„ clock makers.
„ desk makers.
„ fitting makers.
„ form makers.

2.—*Books, Maps, Globes, Instruments, etc.*

Chart sellers.
Copy book publishers.
Engravers—(map).
„ (music).
Globe makers.
Ink powder makers.
Inkstand makers.
Map and chart sellers and publishers.
„ and print colorers.
„ engravers and printers.
„ mounters.
Mathematical instrument makers.
Music copyists.
Pen makers.
Pencil makers.
Penholder makers.
Publishers.
Quill and pen manufacturers.
Raised map makers.
School slate makers.
Slate pencil makers.
Steel pen manufacturers.
Topographers.
Writing ink makers.

* This list is of trades existing in the United Kingdom, but it may be suggestive to Foreign Commissions.

3.—*Appliances for Physical Training, including Toys and Games.*

Archery tackle makers.
Backgammon board makers.
Ball and balloon makers.
Bowstring makers.
Bicycle makers.
Chess board makers.
Cricket bat, ball, and stump makers.
Croquet manufacturers.
Dissected map makers.
Doll makers.
Foot ball manufacturers.
Gilt toy makers.
Glass toy makers.
Gymnasium makers.
Hoop makers.
Map dissectors.
Marble manufacturers.
Pedometer makers.
Puzzle makers.
Rocking horse makers.
Skate makers.
Skittle makers.
Target makers.
Top makers.
Toy makers.

4.—*Specimens and Illustrations of the modes of Teaching Fine Art, Natural History, and Physical Science.*

Anatomical figure makers.
Aquaria makers.
Artists' colourmen.
Barometer makers.
Bird and beast stuffers.
Black lead pencil makers.
Botanical collectors.
Camel hair pencil makers.
Chemical apparatus makers.
Coloured saucer makers.
Crayon makers.
Drawing board makers.
Drawing instrument makers.
Drawing model makers.
Electric apparatus manufacturers.
Fossil dealers.
Galvanic apparatus manufacturers.
Geological collectors.
Magic lantern makers.
Magnet makers.
Makers of musical instruments for schools.
Mechanical figure makers.
Microscope makers.
Mineralogists.
Naturalists.
Nautical instrument makers.
Optical instrument makers.
Orrery and tellurian makers.
Philosophical instrument makers.
Pink, &c., saucer makers.
Plaster cast figure makers.
Preparers of botanical specimens.
" of microscopic objects.
Stereoscope makers.
Sun dial makers.
Telegraph instrument makers.
Telescope makers.
Thermometer makers.
Ward's case makers.
Zoological artists.

III.—All the producers named in these lists are eligible to send new illustrations of their respective branches of production.

IV.—The aim of the Exhibition being to show specimens remarkable for excellence, novelty, invention, etc., it is desirable to have the fewest number of specimens from each producer, and only those which are absolutely necessary; consequently no duplicates of any object can be admitted.

V.—Models of school buildings, heating and ventilating apparatus, etc., ought not to exceed the scale necessary to show their construction or working parts intelligibly. But generally, drawings showing the buildings, etc., in plan, section, and elevation will be preferred to models, as they can be more easily exhibited.

VI.—Specimens of fittings, furniture, &c., such as desks and forms, must be kept within moderate limits; for instance, the desks and forms ought not to exceed four feet in length.

VII.—The specimens, illustrations, and collections used in teaching Fine Art, Natural History, and Physical Science ought not to be so large or costly as to be beyond the reach of ordinary schools.

VIII.—As far as possible, they should be exhibited in glass frames, which should not exceed two inches in depth and one and a half inches in width. The frames should be black.

IX.—To every object will be attached a label containing the following particulars :—

1.—The name of the specimen.
2.—The purpose for which it is intended.
3.—The exhibitor's name.
4.—His address.
5.—The reasons why it is offered for exhibition, such as—
Its special fitness for its purpose.
Its illustrative character.
Its novelty.
Its ingenuity.
Its comparative superiority.
Its cheapness.
6.—The price, unless the exhibitor objects.
7.—Any explanations, &c.

X.—Foreign Commissions are requested to furnish these particulars on or before the 15th January 1871.

5. *Specimens of School Work, serving as examples of the results of teaching.*

XI.—These will be confined to the following :—

(a.)—Writing, plain and ornamental.
(b.)—Drawing and design.
(c.)—Modelling in clay, terra-cotta, wax, &c.
(d.)—Models of machinery, building construction, &c.
(e.)—Needlework, plain and ornamental, lace, knitting, &c.
(f.)—Miscellaneous work by pupils in schools for the blind, reformatories, &c.

XII.—Under *(a). Writing*, will be included examples of dictation, translation, writing from memory, map drawing, and other school work which can be conveniently shown on paper. This should be on good paper, in single leaves not exceeding twelve inches by nine inches, written on one side only, and each complete in itself. No one school must send more than such leaves at the utmost, and the contributions should be chosen with the view of showing the general work throughout the school, and not that of one or two advanced scholars. The name of the school and the age of the scholar, with the time during which he has been under instruction, should be added. As the object is not to compare the work done in different schools in any one country, but rather to furnish the means of comparison between the school work of different countries, a limited number of examples only can be exhibited.

XIII.—Contributions falling under *(d). (e). (f).* must show some special excellence, ingenuity, or originality, in order to entitle them to admission. To each of these objects will be attached a label containing the following particulars :—

1.—Name of school.
2.—Age of scholar.
3.—Period of instruction.
4.—The reason why the object is offered for exhibition, such as—
Its excellence of workmanship.
The special circumstances under which it has been produced.

XIV.—Foreign Commissions are requested to furnish these particulars on or before the 15th January 1871.

ANNUAL INTERNATIONAL EXHIBITIONS OF SELECT WORKS OF FINE AND INDUSTRIAL ART AND SCIENTIFIC INVENTIONS.

ALLOTMENT OF SPACE TO FOREIGN COUNTRIES.

In accordance with the general rule (F) the objects will be arranged in the following classes, and the amounts of space allotted to for each class will be as follows :—

	Horizontal space in Glass Cases about 7 feet high.	Horizontal space on the floor unlimited in height.	Vertical space on walls about 15 feet high, beginning at 2 feet 6 inches from the floor.	Vertical space on screens about 7 feet high.
	Superficial feet.	Superficial feet.	Feet run.	Feet run.
I.—FINE ARTS—				
1. Paintings of all kinds ...	Unlimited space, but the objects, if many, may be liable to be arranged under open arcades, or in the Royal Horticultural Gardens.			
2. Sculpture, in Marble, Stone, Bronze, or Plaster.				
2*a*. Small Sculptures in other Materials.				
3. Engravings, Lithographs, Photographs, &c.				
4. Architectural Designs ...				
4*a*. Architectural Models ...				
5. Tapestries and Carpets, shown for their Fine Art.				
5*a*. Shawls, Lace, &c., shown for their Fine Art.				
6. Designs for all kinds of Decorative Manufactures.				
7. Copies of Ancient or Mediæval Pictures, Mosaics, &c.				
7*a*. Reproductions of large Monuments of Sculpture, or Architecture.	Unlimited if exhibited in arcades, or in the open air.			
7*b*. Reproductions of small Objects.				
II.—SCIENTIFIC INVENTIONS AND NEW DISCOVERIES OF ALL KINDS.	If any object is above feet high, its height should be specified.			

ALLOTMENT OF SPACE, *&c.*,—*continued.*

	Horizontal space in Glass Cases about 7 feet high.	Horizontal space on the floor unlimited in height.	Vertical space on walls about 15 feet high, beginning at 2 feet 6 inches from the floor.	Vertical space on screens about 7 feet high.
	Superficial feet.	Superficial feet.	Feet run.	Feet run.
III.—MANUFACTURES—				
a. POTTERY of all kinds ...	An unlimited amount of space is assigned to special objects which may exceed feet in height, which can be shown under arcades or in the open air, but due notice of them, their character and dimensions, must be given before 1st November 1870.			
New Raw Materials, Machinery, and Processes for Pottery.				
b. WOOLLEN AND WORSTED FABRICS.				
*b*1. Raw Produce, Machinery, and Processes.				
*b*2. Woollens of all kinds, except Carpets.				
*b*3. Shawls				
*b*4. Mixed Fabrics ...				
*b*5. Carpets				
c. EDUCATIONAL				
*c*1. School Buildings, Fittings, Furniture, &c.				
*c*2. Books, Maps, Globes, Instruments, &c.				
*c*3. Appliances for Physical Training, including Toys and Games.				
*c*4. Specimens and Illustrations of the Modes of Teaching Fine Art, Natural History, and Physical Science.				
*c*5. Specimens of School Work, serving as examples of the Results of Teaching.				

IV.—Her Majesty's Commissioners undertake to find the several spaces above described, and to arrange the objects in large glass cases where necessary. The spaces must not be exceeded, or the excess of objects will be liable to exclusion. Exhibitors who prefer it may place their objects in plain black frames glazed, not exceeding three inches in depth.

V.—Provided the aggregate space of each kind be not exceeded, Foreign Commissions are free to vary the proportions here allotted. Thus, in Paintings (No. 1) and Copies of Paintings (No. 7) to be hung on walls, and with Engravings (No. 3), Architectural Designs (No. 4), Shawls (5*a*), Designs (No. 6), to be exhibited on Screens, the exact allotments need not be maintained. If no Architectural Designs are exhibited, the space may be allotted to Shawls or Engravings, provided always that the aggregate space of each kind be not exceeded.

ANNUAL INTERNATIONAL EXHIBITIONS OF SELECT WORKS OF FINE AND INDUSTRIAL ART AND SCIENTIFIC INVENTIONS.

The objects in the first Exhibition will consist of—

I.—FINE ARTS APPLIED, OR NOT APPLIED, TO WORKS OF UTILITY.

II.—SCIENTIFIC INVENTIONS AND NEW DISCOVERIES OF ALL KINDS.

III.—MANUFACTURES.—

(a.)—Pottery.
(b.)—Woollen and worsted fabrics.
(c.)—Educational.

Under fine art, all works must be exhibited in the artist's own name; but the name of the firm for whom the object was designed will be added, or the name of the Rajah by whom the works are sent to the Exhibition. (See specimen of catalogue, page 5, under Carpets).

The exhibitors from India might exhibit paintings applied to boxes, &c., enamels and the like, ivory carving, mosaics, &c., Cashmere shawls.

The works of deceased artists are not admissible, except as copies or reproductions.

All works of art and manufactures must have been executed since 1862.

A producer may exhibit any number of reproductions or copies of ancient or mediæval art, provided he obtain a certificate for their admission.

The manufactures included in the first Exhibition will be restricted to three classes, *viz.*, pottery, woollen and worsted, and educational classes; but the exhibition of scientific inventions and discoveries will in no way be restricted, but will embrace all kinds of inventions and discoveries in physics, mechanics, and chemistry, which may be deemed worthy of admission.

A producer in each of the classes may submit a specimen of each kind of object he manufactures, although such specimen may form only a part of a complete object.

The aim of the Exhibition being to bring prominently into notice specimens remarkable for excellence, novelty of invention, &c., it is desirable to have the fewest number of specimens from each producer, and only those which are absolutely necessary, consequently no duplicate of any object can be admitted.

Thus it is desirable that exhibitors should send only one specimen of the same kind of object. In the woollen and worsted and educational classes, the specimens should be kept within moderate limits as to size. But producers may send several specimens, each belonging to a different series or pattern, and if a different pattern be put upon the same shaped cup, the cup may be sent. In woollen and worsted manufactures, the same design may be shown in different combinations of colors.

The exhibition of woollen and worsted fabrics will be limited to such specimens as are necessary to show the different fabrics and their patterns in a satisfactory manner, and the specimens will be restricted to goods made entirely of wool, worsted or hair, or of wool, worsted or hair, combined with cotton, silk, or other textile materials. It would be desirable to obtain a specimen of all the different modern woollen fabrics made in each district of India with the prices at which they are sold. India could make a capital collection of toys, games, perhaps apparatus for teaching.

New machinery and apparatus, newly discovered materials, and new combinations of old materials, used in the manufacture of objects comprised in the three classes, will be admitted, and recent inventions relating to the different parts of the various machines and appliances used in such manufactures may be shown either as complete machines, or separately in parts. Machinery in motion and processes of manufactures may be shown.

Appendix B.

FINE ARTS.

PAINTING IN OIL.

Painting in Oil.		Exhibitors' Names.
1	THE BATTLE OF COLIN, 1757 ... ... VIENNA. Born at ; pupil of ; Second Prize, 1867.	*S. ALLEMAND, Jun.*

11 A PARIAN VASE. Manufactured by ... ... *VILLEROY & BOCH.*
PRUSSIA. *Mettlach.* Established : Prize Medal, 1855; Medal, 1862; Gold Medal, 1867.

WOOLLEN FABRICS.

Woollen Fabrics. — Exhibitors' Names.

1 A SPECIMEN of CHIPPING NORTON DOESKIN for riding trousers. Exhibited for its superior fineness, and manufactured by ... ... *W. BLISS & SON.*
CHIPPING NORTON. Established : Prize Medal, 1851; Medal, 1862; Silver Medal, 1867.

2 SPECIMEN OF SCARLET CLOTH, shown for its superior finish. Manufactured by *CHARLES HOOPER & Co.*
EASTINGTON, *near* STROUD. Established : Prize Medal, 1851; Medal, 1862.

3 A SPECIMEN OF LIVERY CLOTH, shown for stoutness and colour. Manufactured by *B. GOTT & SONS.*
LEEDS. Established : Prize Medal, 1851; Medal, 1862.

4 A SPECIMEN OF BLACK CLOTH of superior finish. Manufactured by ... *J. SIMONIS.*
BELGIUM. *Verviers.* Established : (Jury, 1851); First Class Medal, 1855; Medal, 1862; Silver Medal, 1867.

5 SPECIMENS OF WHITE CLOTH, remarkable for purity of colour. Manufactured by *MORO BROTHERS.*
AUSTRIA. *Klagenfurt, Carinthia.* Established : Honourable Mention, 1851; 1st Class Medal, 1855; Medal, 1862; Silver Medal, 1867.

CARPETS.

Carpets.

1 A BORDERED TAPESTRY VELVET CARPET. Manufactured by ... *J. CROSSLEY & SONS.*
HALIFAX. Established : Prize Medal, 1851; Medal of Honour, 1855; Medal, 1862.

2 AN IMITATION SAVONNERIE CARPET. Manufactured by *SALLANDROUZE DE LA MORNAIX & Co.*
FRANCE. *Aubusson, Creuse.* Established : Commissioner for France in 1851; Juror in 1855; Juror in 1867.

SHAWLS.

Shawls.

1. A SHAWL, woven from Indian wool yarn, the finest ever spun. Manufactured by *F. DUCHE & Co.*
PARIS. 1, *Rue des Petits Peres.* Established : Prize Medal, 1851; 1st Class Medal, 1855; Medal, 1862; Silver Medal, 1867.

WORSTED FABRICS.

Worsted Fabrics.

1 SPECIMEN of FANCY FABRIC. Manufactured from yarn dyed alpaca wool *TITUS SALT, SONS, & Co.*
BRADFORD. *Saltaire.* Established : Grand Medal of Honour, 1855.

2 WHITE ALPACA. Exhibited for its fineness and delicacy of fabric. Sold wholesale at 2*s.* a yard; to be had through all retail dealers at an increased price. Manufactured by *TITUS SALT & Co,*

3 A SPECIMEN of DAMASK, of original design. Manufactured by ... ... *AKROYD & SONS.*
HALIFAX. Established : Prize Medal, 1851; Medal of Honour, 1855; Medal, 1862; Gold Medal, 1867.

4 A SPECIMEN OF FANCY REP, showing excellency in make, colour, and finish. Manufactured by ... ... *P. HAAS & SONS.*
VIENNA. Established : Prize Medal, 1851; 1st Class Medal, 1855; Medal, 1862; Gold Medal, 1867.

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Friday, the 18th February 1870.

PRESENT:

His Excellency the Viceroy and Governor General of India, K. P., G. C. S. I., *presiding*.
His Excellency the Commander-in-Chief, K. C. B., G. C. S. I.
The Hon'ble G. Noble Taylor.
Major General the Hon'ble Sir H. M. Durand, C. B., K. C. S. I.
The Hon'ble Sir Richard Temple, K. C. S. I.
The Hon'ble J. Fitzjames Stephen, Q. C.
The Hon'ble D. Cowie.
Colonel the Hon'ble R. Strachey, C. S. I.
The Hon'ble Francis Steuart Chapman.
The Hon'ble J. R. Bullen Smith.
The Hon'ble F. R. Cockerell.

COURT FEES BILL.

The Hon'ble MR. COCKERELL moved that the Report of the Select Committee on the Bill to provide for the better regulation of Court Fees be taken into consideration. He said that the Bill as amended by the Select Committee was published in the official Gazettes immediately after the presentation of this report to the Council, and had been before the public for some weeks.

Having regard also to the extreme inconvenience of any considerable delay in the disposal of a measure of this kind, which must necessarily, so long as it remained in abeyance, disturb and unsettle the entire litigation of the country, he thought they were clearly justified in proceeding now to the final consideration of the matter.

The amendments proposed by the Select Committee comprised several additions and alterations, chiefly directed to the removal of all ambiguity in regard to the proper valuation of suits and the more complete consolidation of the various provisions of the existing law, now scattered over several enactments, relative to Court fees.

The main provisions of the original Bill, namely, the rates of fees prescribed by its schedules, had undergone no material alteration. The contemplated distinction between probates and letters or certificates of administration, which followed the English law on this subject, had been abandoned; and it was now proposed to substitute an uniform two per cent. rate on both classes of instruments, for the rates, varying from two to one and a quarter per cent. on probates, and ranging between three and one and three-quarters per cent. in the case of letters and certificates of administration, propounded by the Bill as introduced. But the rates of fees chargeable on the institution of suits and appeals remained unchanged, save as regarded the maximum limit, which it was thought should be reduced from rupees 5,000 to 3,000.

From the general absence of hostile criticism it was to be inferred that public opinion was in favour of the proposed scale.

In two quarters only had the rates been objected to. In one of these, the objections raised went to the extent of condemning the principle of any special tax or charge upon the administration of justice. Now, he was not going to attempt to defend that principle. It seemed to him quite unnecessary to enter

into any discussion on that point at the present time. They were not considering a proposal to impose any new tax in this direction, or even to increase any existing charge. The present measure was one of absolute concession. It embraced a reduction, to some extent, of the fees hitherto levied in every case. They had also to consider the facts that a tax not substantially different in amount from that prescribed by this Bill had been in operation for upwards of half a century, and that the State could by no means afford at the present juncture to part with the revenue derived from it.

There was one statement, however, put forward amongst the objections just referred to, which appeared to him to misrepresent the facts of the case on such an important point as to call for some notice. It implied that the rates of fees in operation in the Mofussil Courts were much higher than those levied on the original side of the High Courts and in the Presidency Small Cause Courts; and that, consequently, the suitors in the former were thus placed at a disadvantage with the latter. He believed this assumption to be wholly incorrect.

In 1862, shortly after the constitution of the High Courts by the amalgamation of the late Supreme and Sadr Courts, it was proposed to substitute *ad valorem* rates for the fixed fees which had theretofore been in force in the late Supreme Court, in order that there might be an uniform system on both sides of the new Courts; but the project was abandoned in consequence of the Government being advised, on the most competent authority, that the change would most probably be attended by a considerable loss of revenue. And as regarded the fees levied in the Presidency Small Cause Courts, he (MR. COCKERELL) thought he was correct in stating that the charge amounted to two annas per rupee, or twelve and a half per cent. on every suit, which considerably exceeded even the highest percentage obtaining under Act XXVI of 1867.

The other objections urged against the proposed rates rested on a comparison which had been instituted between the scale of fees laid down in Act X of 1862 and that contained in the Bill. For the purpose of this comparison, the amounts had been selected on which the incidence of the rates chargeable under Act X was lightest; and the fees chargeable under the Bill on such amounts had been compared with the fees imposed by Act X, to the manifest disadvantage of the former. The radical objection to the scale of fees which obtained under Act X of 1862 was, as he had before stated, the extreme irregularity of its incidence. For example, under that law, the same fee—that is, one rupee—was charged on a suit for one rupee as on a suit for sixteen rupees; so also an uniform institution-fee was levied on every suit the amount or value of which ranged between rupees sixteen and rupees thirty-two.

Under the Bill, the fee was adjusted in gradual proportion to the amount of the suit; so that, in the case of suits of amount ranging between one rupee and sixteen rupees, the fee varied from six annas to one rupee and eight annas; and in respect of suits for any amount between sixteen and thirty-two rupees, from one rupee and eight annas to two rupees and ten annas.

The selection, therefore, of suits of sixteen rupees and thirty-two rupees' amount or value, on which the incidence of the tax imposed by the former law was lightest, as points of comparison, was obviously a fallacious test of the relative effects of the two scales. If the mean or average rates chargeable under either scale were compared, the charges contemplated by the Bill would be found, in the case of suits of small amount, to be more favourable to the suitor than the fees prescribed by the former law; *e. g.*, on a suit for eight rupees the fee prescribed by Act X of 1862 was one rupee; under the Bill it was only twelve annas. In respect of a suit for rupees twenty-four, the fee formerly was two rupees; when the Bill became law it would be one rupee and fourteen annas.

He would not take up the time of the Council with further illustrations of the relative effects of the two scales. It was sufficient to state that a detailed comparison of the average rates in force previous to 1867 with those of the

Bill would show that, as regarded the great mass of the litigation of this country—*i. e.*, suits the amount or value of which did not exceed one thousand rupees—the latter were not materially in excess of the former, and that a substantial concession was made in regard to claims for amounts under ten rupees.

The most important amongst the additions and alterations proposed by the Select Committee were the provisions relating to the valuation of suits, contained in section 7 of the amended Bill.

An attempt had been made to supply an omission common to all previous enactments, regarding fees leviable on the institution of suits. Hitherto, it had been the practice to provide only for the valuation of the property to which the suit had reference, leaving out of account altogether the various litigated claims to something less than the full interest or title in such property.

In the several descriptions of suits specified in clauses iv, vi and vii of section 7, the litigated matter was not the right to the possession of the property to which the suit related. Such possession was not disputed, and the question at issue involved merely some minor interest; yet, in the absence of any provision of the law applicable to such claims, it was probable that they were very generally valued by the parties instituting them as though they involved the entire interest in the property with which they were connected.

The Bill aimed at providing rules for the valuation of every known class of suits, as far as possible according to the interest actually in dispute in each case, by which the suitor would be relieved from his present liability to a self-imposed excess charge; and the uncertainty and want of uniformity of practice on the part of the Courts in determining the proper valuation of suits of this kind would be avoided.

To remove any doubt as to the intended application of the word "estate," which occurred frequently in the 7th section of the Bill, it had been defined to include every description of land-tenure subject to the payment of revenue to the Government. It was doubted whether, in the absence of this explanation, the term could be properly held to include the ryotwárí tenures in the Madras Presidency. It was thought that the valuation of Inám lands should follow the rule applied to land exempt from payment of Government revenue.

The revenue paid to Government on account of Inám land was a mere quit-rent; the market-value of such land was therefore in inverse ratio to the amount of such payment, *i. e.*, in the proportion in which the rent was less, the greater was the margin of profit to the holder, and the consequent market-value of the land. In such cases the amount of the revenue paid to Government obviously formed no proper criterion as to the true value of the property.

A rather important verbal alteration was proposed in section 8. This section, as originally drawn, followed the provision of the existing law on this subject; but the Committee were strongly of opinion that local investigations for the purpose of valuing a suit should be discouraged as much as possible, as, in effect, they entailed on the parties to the suit all the trouble and expense of an extra suit, merely to determine the question of the amount due to the revenue. They proposed, therefore, to substitute words the effect of which would be to require the Court to determine, in each case, whether such local investigation was necessary or expedient, instead of directing the enquiry to be made as a matter of course on the mere requisition of a party to the suit.

The original Bill contained no effectual provision as to the consequence of the non-payment of the additional fee discovered to be due by the results of the local enquiry as to the market-value of the litigated property. The amended Bill empowered the Court to fix the time within which such additional fee must be paid and to dismiss the suit in default of such payment.

In section 10 an omission of the original Bill and of the existing law had been supplied by the suggested provision for cases in which the amount of the mesne profits claimed was left to be determined in the course of the execution of the decree. It was proposed to apply the same consequence, as in the case just stated, to the non-payment of the additional fee which was found to be due.

In amendment of the existing law, it was proposed to make the decision of the Court in which any suit or appeal was instituted, in regard to the valuation of such suit or appeal, final as between the parties thereto, reserving to the Appellate Court, for the protection of the interests of the revenue, a power of interference of its own motion where the valuation admitted by the lower Court was clearly wrong and had occasioned loss to the revenue. It was thought that the interests of the parties to the cause should in no way be allowed to be affected by the question as to whether the just demands of the revenue had or had not been satisfied, and that the present practice, under which litigation might be protracted on grounds which had no connection with the question on which the parties to such litigation were at issue, was most objectionable, and should be discontinued.

Section 13 was in modification of section 377 of the Code of Civil Procedure. By the latter, on an application for review of judgment presented after ninety days from the date of such judgment, the same fee was levied as if it were a plaint in a suit; whilst an application made within the ninety days was subject only to the fee chargeable on ordinary applications. In many cases, where the delay had occurred through no laches on the part of the applicant, this rule had been found to entail hardship; and the measure of relief provided by this section, under which a refund of the difference between the amount paid and that which would have been payable had the application been presented within the ninety days might be obtained in such cases, was thought to be called for.

The amended Bill provided for the levy of *ad valorem* fees on applications for a review of judgment, in substitution for the fixed fee now chargeable thereon. This enhanced charge was recommended to discourage the practice, which was said to have become prevalent, of seeking to obtain the rehearing of a suit through an application for review of judgment on the most frivolous grounds, by which the time of the Courts was needlessly wasted.

It was proposed, through the provisions of section 14, to guard against the increased fee working harshly, by allowing a refund of the enhanced amount payable under its operation, where the result of the application was the reversal or modification of the previous judgment, on such grounds as amounted to an admission of the Court's error.

To section 18 it was proposed to add some additional exemptions. In England, the duties on probates and letters of administration relating to property of small amount were remitted. It seemed right that a similar exception should be made in this country, and that the limit within which such duties should not be made chargeable should be one thousand rupees.

Having regard to the relations subsisting between the Government and the agriculturists of this country in the matter of irrigation, it was clearly inexpedient to impose a fee which might operate as a restriction to free communication between the people and the officers of Government in regard to the irrigation of their land. The conditions of the ryotwárí settlement in Madras were also considered to call for the exemption, from any fee, of petitions or applications to extend cultivation or relinquish land.

Applications for compensation made under any law relating to the acquisition of property for public purposes were rendered necessary by the acts of the Government, and, consequently, could not justly be subjected to any fee.

The uniform fixed rates of fees chargeable for the service of processes, contemplated by the Bill as introduced, had been abandoned, and it was pro-

posed at present simply to transfer to this Bill, with some slight modification, the provisions of Act XI of 1863, and the Bengal Act V of 1863; the effect of which would be to extend the operation of those provisions to the whole of India and to make process-serving charges payable by means of stamps.

The statistics obtained from the several Local Governments, as to the charges for the service of processes now in force, showed a very striking diversity of practice, and the Committee, though recognizing the soundness of the principle of an uniform rate, were forced to the conclusion that the time for the general adoption of such rate had not yet arrived; that further local enquiry was needed, and a longer notice of the proposed change must be given ere its operation could be safely extended to the whole country.

By section 30 provision was made for compelling the repayment, to the complainant, of the amount of the fee paid by him on the institution of a complaint in the Criminal Court, when such complaint was substantiated and resulted in the conviction of the offender. In the opinion of the Committee where a complaint resulted in the conviction of the accused person, and the complainant was thereby shown to have sustained a *bonâ fide* injury, he was entitled to be re- [illegible] the amount which he had been compelled to pay to obtain the Magistrate's interference in his behalf. The policy of levying any fee in cases of [illegible] by the parties instituting them as though [illegible] applicable to such cases, [illegible] that [illegible] Nevertheless, this kind was strongly impugned in some parts of the country. reduced amount fixed by the Bill, subject to the provision for repayment in certain cases of the pro[illegible]. The fact that this result might be obtained by the operation of the Committee were agreed that it should be retained at the overlooked [illegible]visions of the Criminal Procedure Code (section 44) had not been was pure[illegible]. But, under that provision of the law, the action of the Magistrate plainan[illegible]ly discretionary, whereas, in these cases, it was thought that the complainant matter should recover his disbursement in the prosecution of his charge as a [illegible]of right.

suits; was proposed to reduce the maximum fee leviable on the institution of to r[illegible]nd appeals from rupees five thousand, the amount fixed by the original Bill, the [illegible]pees three thousand. It had been urged in some quarters that, although of return to the principle of a maximum limit conceded a substantial measure of relief, as compared with the unlimited and consequently prohibitory rates t[illegible] the present law, even rupees five thousand was a heavy sum to be paid ere [illegible]e Court could be put in motion in regard to claims of very large amount. The limit under Act X of 1862 was rupees two thousand, and the propriety of recurring to that limit was strongly urged. As a sort of compromise, rupees three thousand had been fixed as the maximum fee in the amended Bill. For his own part he could not say that he concurred as to the propriety or expediency of this conclusion. Its effect was to place all claims, the amount or value of which exceeded rupees 4,05,000, on the same footing, which was inconsistent with the principle of making suits of large amount bear their fair share of taxation.

He had already adverted cursorily to the change proposed in the case of probates and letters of administration. The rates fixed by the Bill as introduced were in general accordance with the provisions of the English law. It was thought, however, that the distinction there made between these two classes of instruments was not only unsupported by, but was altogether opposed to, equitable considerations. The levy of a higher rate of duty upon letters of administration than upon probates, was equivalent to the imposition of a heavier tax upon the property of a person who had died intestate, than was leviable on the property of a person who had left a will; and this, in effect, constituted the infliction of a penalty upon the innocent inheritor of the former class of property for the negligence of his predecessor, although, presumably, such heir had already suffered to some extent through this neglect. On these considerations the Committee rejected the English scale as a model for the adjustment of these duties, and proposed the substitution of an

even rate of two per cent. on the amount of the property affected by the probate or letters or certificates of administration. That rate represented, approximately, the average of the sliding scale projected in the original Bill, and was moreover the same as the present income-tax rate. A tax upon instruments of this description was in fact of the nature of an income-tax, and one moreover of the least objectionable kind.

The third or repealing schedule of the amended Bill had been greatly enlarged, the provisions of the enactments or portions of enactments which it was proposed to repeal being transferred to the Bill, so as to bring the entire law regarding fees leviable in judicial proceedings into one Act. The Bill, with the further amendments which he was about to propose, would effect a thorough consolidation of the law on this subject.

The original Bill provided for the entire repeal of Act XXVI of 1867. That Act exempted, by a special rule, any person who had been enrolled as an advocate of a High Court from the obligation of presenting a written authority empowering him to act in any Court. He stated, as the reason for discontinuing that rule, that such a provision, relating as it did to procedure and constituting in fact a modification of the provisions of the Code of Civil Procedure, was quite out of place in, and foreign to, an enactment on the subject of Court fees. The Committee, whilst entirely recognizing the correctness of that view, held that, although that consideration justified the ommission of such a provision from the Bill, as there was no reason for disallowing the exemption on other grounds, the existing law on this matter should be retained; and that so much of Act XXVI of 1867 as related to this subject should continue in force. The effect of this proposal was to constitute the provision referred to a special enactment for continuing the exemption in favour of the enrolled advocates of any High Court.

He had now explained all the material changes and additions that had been suggested. On the report being taken into consideration, he would proceed to move the adoption of the further amendments of which he had given notice.

The Hon'ble SIR RICHARD TEMPLE said that section 7, in respect to the valuation of land forming the subject of suits, provided that, in permanently settled estates, the value of the land should be assumed at ten times that of the Government revenue; that in estates not permanently settled, the value of the land should be assumed at five times the revenue; and, thirdly, that in estates which were not settled at all, where the ryot did not pay revenue at all, the value should be assumed at fifteen times the nett profits. He thought that the operation of these clauses of section 7 would lead to under-valuation, and sometimes to unjust valuation, of certain classes of estates which existed more or less in every province of India; for there were some estates which, though not exactly Inám, or free from the payment of revenue, nevertheless were subject, either to the payment of a lump-sum in the nature of a quit-rent, or to the payment of rates very much lower than the ordinary rates of revenue. Such estates would, under the Bill, be valued at fifteen times the nett profits. That would be found objectionable. He proposed to remedy it by adding to clause 5, paragraph *(c)*, of this section, the following words:—

"or is otherwise exempt from the ordinary rates of revenue."

That, he believed, would rectify the defect which had been brought to his notice.

The Hon'ble MR. TAYLOR said that what had just been stated by Sir Richard Temple merely confirmed the explanation which Mr. Cockerell had given of the meaning of the word "Inám" in the Madras and Bombay Presidencies: it merely explained in greater detail the meaning of that term. An Inámdár paid a quit-rent, which constituted a certain proportion of the ordinary assessment.

The Hon'ble SIR RICHARD TEMPLE said that, in many parts of India, the signification of the word 'Inám' would be doubtful; in some places it would mean land altogether exempt from the payment of revenue.

The Hon'ble MR. COCKERELL said that it seemed to him that there was some inconvenience in considering amendments of which the Council had had no notice. It struck him that the words employed by the Hon'ble Mover of the amendment were so vague as to convey no definite idea of the description of land to which they were intended to apply.

The term Inám was very generally understood and had an extensive application in the Madras and Bombay Presidencies, but it was by no means clear in his (MR. COCKERELL's) opinion to what class of tenures his hon'ble friend's proposed amendment was intended to apply.

His Excellency THE COMMANDER-IN-CHIEF said that he would bring to the notice of His Excellency the President that this Bill, as now presented to the Council, came before it in a very inconvenient shape. There were several amendments, which involved not only matters of detail of considerable importance, but also matters of principle. The amendment just moved also seemed to present considerable difficulty. Sir Richard Temple attributed great importance to the amendment, and Mr. Cockerell, who was in charge of the Bill, said that the words appeared so vague, that he could not accept it. Under these circumstances, it was almost impossible for the Council to proceed with the consideration of the Bill in its present shape, and it would be very convenient if the Bill and the amendments proposed were referred back to the Select Committee with the view of their presenting a further report.

The Hon'ble SIR RICHARD TEMPLE supported the suggestion of His Excellency the Commander-in-Chief.

The Hon'ble MR. STEPHEN said that, owing to the temporary absence of Sir Richard Temple, he was not appointed a member of the Select Committee, and the Committee had therefore lost the advantage of the valuable suggestions which they would no doubt have received if the Financial Member had been present. It would be convenient that the Bill should be recommitted, and that Sir Richard Temple should be added to the Select Committee.

His Excellency THE PRESIDENT said that he thought that it would further the convenience of the Council if the Bill was recommitted. It would be better that the Select Committee should take the proposed amendments into consideration, and submit a further report for the consideration of the Council.

His Excellency THE COMMANDER-IN-CHIEF then moved that the Bill be referred back to the Select Committee with instructions to submit a further report within a week.

The Motion was put and agreed to.

The Hon'ble MR. STEPHEN moved that the Hon'ble Sir Richard Temple be added to the Select Committee.

The Motion was put and agreed to.

PRISONS BILL.

The Hon'ble MR. STEPHEN introduced the Bill to amend the law relating to prisons in the Panjáb and the Provinces under the immediate administration of the Government of India, and moved that it be referred to a Select Committee with instructions to report in six weeks. He said that he thought that he need not occupy the Council to any extent in introducing this

Bill, but he would state generally what its nature was. The operation of the Bill in the first place was confined to the Panjáb, Oudh, the Central Provinces and British Burma. He thought that, when the matter was referred to a Select Committee, they would probably take into consideration whether or not it might not, with considerable advantage, be made to apply to some of the other Provinces, especially the North-Western Provinces. The occasion on which the Bill was brought in was, that it was found that, in carrying out proper discipline in some of the prisons in the Panjáb, there was considerable difficulty arising from the absence of any law enabling the Lieutenant Governor of the Panjáb to issue rules for the maintenance of discipline, and to provide penalties for their breach. The Bengal Regulation II of 1834, section 7, authorised the Governor General in Council to introduce a system of prison-discipline, but there was no power to prescribe penalties for its infraction, and the Penal Code did not provide for such offences as the abetment, by prison-officers, of violations of prison-rules. Moreover, the power in question clearly did not apply to the Panjáb: there was some doubt as to its application to Oudh and the Central Provinces; and, as regards Burma, it seemed to extend only to the Arakan Division. The difficulties experienced in the Panjáb would apply equally to other Provinces in India, and it would be for the Select Committee to say whether the local extent of the Bill should not be considerably enlarged. The Lieutenant Governor of the North-Western Provinces had expressed an opinion that in his Province no change was required. MR. STEPHEN, however, felt considerable doubt whether this opinion was not founded upon a misapprehension as to the state of the law. With regard to the substance of the Bill he need not at the present moment say much; it was principally taken from the Prison Rules actually in force in different parts of the country, and from the Act of Parliament (28 and 29 Vic., cap. 126) relating to the subject. The Bill consisted of twelve chapters, the provisions of which were not such as to require any statement from him, and he might observe that all of them referred to matters which must necessarily arise in the administration of all Prisons, wherever they might be situated. Local experience would add considerably to the knowledge of the subject, and he hoped that the Committee would obtain full information from the local authorities. The measure was essentially one of detail.

The Motion was put and agreed to.

EMIGRANTS' REGISTRATION FEE BILL.

The Hon'ble MR. CHAPMAN moved that the Bill to enable the Governor General in Council to increase the fees payable under section 31 of Act No. XIII of 1864 (to consolidate and amend the law relating to the Emigration of Native Labourers) be passed.

The Motion was put and agreed to.

NORTHERN INDIA CANALS AND DRAINAGE BILL.

Colonel the Hon'ble R. STRACHEY moved that the Bill to regulate the construction and maintenance of Public Works for Irrigation, Navigation and Drainage be referred to a Select Committee with instructions to report in a month. He said that the proposal to refer the present Bill to a Select Committee, which he was about to make to the Council, implied that they were asked to accept the principle of the measure.

In the present case it was, he thought, the more necessary to give some explanation of the principles that had governed the measure now before the Council, because it, in fact, for the first time proposed to declare and fix in an authoritative manner many very important matters relating to the practice of irrigation in Upper India. These had, till now, been left to be dealt with in a discretionary way, in accordance with certain customs that had grown up and

had been generally recognized as proper, but in many cases not under any legislative sanction.

The first point to which he would refer was the declaration contained in the preamble of the Bill, that the property of the water, &c., in India was vested in the State, but subject to rights acquired by usage or grant. This was the view that had been, he thought he might say universally, accepted by the best authorities on such subjects; and, as Mr. Maine stated, it was in conformity with the custom of Europe in those countries in which irrigation was practised. There could be no question, however, that private rights had in many cases been acquired, and there was nothing in the Bill that tended to question or disturb them, excepting under those circumstances in which private rights must always give way; that was, when the public advantage rendered it necessary to extinguish them. In such a case, of course, it was quite essential that full compensation should be given to any individual who suffered from the deprivation of an established private right in a water-supply, and one portion of the Bill was specially designed to deal with these cases.

The Bill, so far as it related to irrigation-works, proceeded, then, on the presumption that the water appropriated was the exclusive property of the State; it being understood that, when any previous private rights had existed in the water-supply, they had been extinguished, proper compensation having at the same time been given. The canals referred to were consequently only those constructed by the Government at the public expense, and the water-courses were only those fed by such canals; that was, with water which was exclusively the property of the State.

Before proceeding further to comment on the details of the measure, it would be convenient if he (COLONEL STRACHEY) said a few words as to the general position which the Government accepted, in carrying out irrigation-works, in relation both to the general community of tax-payers and the particular community for the special benefit of which the works were constructed. The water, as already said, had become the exclusive property of the State. But, in the nature of the case, this property could only be utilized in one way, and in a special locality. It was apparent, therefore, that the State could only act in the management of the property as a trustee for the community residing in this locality, and that this community in fact possessed, in its collective form, the right to enjoy whatever advantages could be obtained from the water. This indicated the first obligation on the Government in relation to canal-management, that the water should be, as far as was practicable, so distributed as to give the greatest general benefit to the agricultural population in the districts to which it could be taken. This distribution, however, should be so regulated as to produce on the whole the best results in the aggregate; and it might quite possibly be necessary to limit the sub-division of the water, or the extension of its use, so as to avoid waste, which, otherwise, must arise to an objectionable amount. Further, it was to all persons who might benefit by the use of the land that could be irrigated, that attention must be paid, whether they were proprietors or only occupiers.

Next, it appeared that the Government undertook the works either with funds supplied from the general revenues of the country, or with money borrowed on the general credit of the country. For the use of these funds, it was clear that the particular part of the community that benefited by the works should make a suitable contribution, in the shape of interest and profit, to the general revenues. The precise amount of this contribution it would not be easy to define, but it should apparently be sufficient to cover the direct outlay of the State, in connexion with any loan specially entered into to admit of the works being carried out, and should not be in excess of the sum which could be paid without placing the locality benefited by the works in a worse position, as regarded the aggregate demands

made upon it by the State, than that in which other districts were placed. The State might properly assist any section of the community in obtaining special advantages, subject to the condition that the ultimate burdens on all classes of the tax-paying community might as nearly as possible be equalized.

He (COLONEL STRACHEY) was aware that this did not give a very valuable practical criterion of the limits that should be placed to the charges made by the State for the use of irrigation-works constructed at the public cost and risk. But it at all events indicated that the idea of working such undertakings so as to give the greatest possible mercantile profit, was not to be accepted without many large reservations. On the whole, however, there was no great risk of the Government ever attempting to strain its powers of extracting too large profits from irrigation-works. Moderate charges, with a wide diffusion of the benefits of irrigation, would certainly give the results which would be most satisfactory to the Government and the people, and be most conducive to such financial success as the conditions of the undertakings required.

He would now pass on to consider some of the principal provisions of the Bill, on which comments seemed to be desirable.

The first point that might be noticed was the system under which the powers given by the Bill were to be exercised. On this, there had been some misapprehension, arising, no doubt, from the assumption that, in many cases, these powers would be vested in Engineers who had not the sort of qualification that fitted them for dealing with questions requiring a judicial or quasi-judicial method of treatment. The reply to such an objection was simple. There was no part of the law of this country the administration of which was not left to the officers to be selected for the purpose by the Executive Government. The power and responsibility of appointing proper officers was left to the Government, and there was no greater reason for fettering this responsibility in the case with which the Council was now concerned than in any other. The powers under this Bill, if it became law, would be entrusted only to such persons as the Local Government thought qualified to exercise them; and it would be an obvious duty of those Governments to take all needful precautions in making the selection. It would naturally become a part of a properly regulated system of canal-management, as of the administration of civil or criminal justice, to prescribe certain qualifications as essential before officers were vested with certain powers. The exercise of all powers under this Bill would be subject to suitable control by superior authority; and whatever precautions were deemed necessary to secure regularity and prevent oppressive action of individuals might, and no doubt would, be applied. So far as the Bill extended the criminal law, the rules of criminal procedure would still apply to the administration of such law, and in this respect the Bill would not in any way alter or diminish the checks against the improper exercise of authority.

The objection taken in some quarters to giving canal engineers any administrative functions or powers was one to which he (COLONEL STRACHEY) need not refer at much length.

It was natural that there should be differences of opinion on the subject of canal-administration, and this was one of the moot points. The fact, however, remained, that the experience of the past thirty or forty years had developed the existing system, which the responsible Executive Governments were not at all disposed to set aside in a summary way. The tendency of late years had been to make the canal-management more, and not less, separate from that of the ordinary land-revenues, and it seemed to him that this was a necessary consequence of improved administration, which, in all branches of the public service, tended to develop more completely the distribution of labour and the formation of special services. He had little doubt that the remedy for the evils, which to some extent, no doubt, were real, seen by the opponents of the present system of canal-administration, was to be found in strengthening and improving

the existing administration, and not in destroying it and handing over the duties to the district officers. Personally, he (COLONEL STRACHEY) was inclined to think that a greater separation of the engineering and fiscal and administrative duties of the canal-administration would be beneficial, and would hereafter be adopted; but it would be quite impossible to introduce any sudden changes of system without very great inconvenience. So far as the present Bill was concerned, it sufficed to say that it did not enter upon questions of this sort at all. It merely contemplated the necessity for certain things being done, and gave powers for their being done by the proper officers, leaving it entirely to the Executive Government to determine who those officers should be.

The second chapter of the Bill dealt with the procedure under which private rights in a water-supply might be taken possession of. The whole of the proceedings were to be taken by the Collector, an appeal being allowed to the higher Revenue-authorities, and the compensation would be given partly by a revision of the revenue of land deprived of the means of irrigation, to be made by the Collector in the ordinary manner, and partly by a money-payment, all money-compensation being settled in the way in which compensation was given when land was taken for public purposes. The proposed provisions had been generally assented to, the objections being confined to matters of detail.

The third chapter of the Bill dealt with the administrative powers of Canal-officers. In respect to these, the differences of opinion were also almost entirely confined to points of detail. On one subject only of any special importance had objections been raised, and this was the power of stopping the admission of water into water-courses. There had, he (COLONEL STRACHEY) thought, been some misconception as to the precise scope of the provisions of the Bill that referred to this. All that the Bill declared was that, in certain cases, the Canal-officer might stop the supply of water in water-courses without giving rise to any claim for reduction of the charges that would otherwise have been made. It was, as it seemed to him, essential for the canal-administration to have the most complete discretion in dealing with the water-supply in Government canals, as was deemed most suitable, whether for the proper distribution of the water, or to secure the works against accident. This must be an implied condition when water was supplied to any individual, and it was specially provided for in a subsequent part of the Bill (section 66), in which it was declared that no claim for compensation would be admitted against the Government for what might be termed unavoidable stoppages of the water; and that all that would be done in such cases was to remit the water-rate that would otherwise have been chargeable.

Section 43, which authorized the stoppage of water in case of certain breaches of discipline as they might be termed, waste of water, and refusal to allow water-courses to be dealt with in conformity with the law, merely said that, in those cases, the claims of Government for payment of water-rates might be enforced as though the stoppage had not taken place. It was not intended to relinquish in any way the full power of control over the water, which, as he had said, must be kept intact; but merely to declare what would be the result of a stoppage of water made under certain circumstances. The result of this section (43), which gave power to stop the water in certain cases, and of the other section (66), which declared that no compensation should be claimable in certain other cases, would be to leave it open to a person who was deprived of his water, otherwise than under those sections, to claim compensation for any injury he received by such stoppage. This appeared to give quite a sufficient safeguard against the arbitrary exercise of a power which it was certainly necessary to retain, and which would remain even if section 43 were removed from the Bill.

A desire had been expressed by the Government of the North-Western Provinces that power should be given to the Government to obtain possession of water-courses supplied from Government canals which are the property of private persons, when it is considered desirable for the general advantages of

the irrigating community that this should be done. The experience of the canals in those provinces had shown that such a power might be necessary. It might happen that a water-course was constructed by a person who had only a temporary interest in the land which it was intended to supply, or that such person had parted with his interest in the land, and thus only kept the water-course as a middleman between the Government which supplied the water and the cultivator who used it. This state of things was inconvenient in many ways. The remedy that was proposed was to extend the power given under the Bill, as it now stands, for taking land for the construction of new private water-courses—a power evidently necessary and proper—so as to make it include the taking of an existing water-course. In such a case compensation would, of course, have to be given to the former possessor of the water-course at the expense of the person to whom the water-course was transferred. This modification of the Bill would be submitted for the consideration of the Committee.

The next chapter of the Bill, the fourth, was that which had led to the most discussion, and which had a special interest to the general community, as it declared the manner in which payment was to be made for the use of canal-water. There were two important alterations of the existing practice proposed in this chapter, to which it would be right that he should direct the special attention of the Council.

The system of charging for canal-water, at the present time in force in the Government canals of Upper India, was entirely one of voluntary sale. Certain acreage rates were fixed for the ordinary crops raised, which a cultivator had to pay if he used the water, it being left entirely optional whether he did this or not. The Canal-officer only dealt with the occupier of the land, and he alone was responsible for the payment of the water-rate.

The result of this system, combined with the fact that the water-rates had been fixed at a very low rate, was, that the rents of canal-irrigated land were found to have risen considerably above those of unirrigated lands, showing that, in truth, the proprietor had, to an important extent, benefited by the increased production due to the irrigation. Speaking in general terms, it might be said that the average water-rate charged to the cultivator by the Canal Department being about two rupees per acre, the rents, after meeting this charge, had risen about two rupees per acre. This advantage was, of course, obtained by the owner of irrigated land altogether in consequence of the outlay of the State funds on the canals. In some cases the owner would, no doubt, have assisted in the construction of the water-courses which brought the water from the Government distributing channels to the land. But this was not always the case, and, anyhow, the largest part of the increase of the rents of irrigated land might be safely said to be an increment not due to any outlay or exertion on the part of the owner, but to the application of Government capital to the construction of the canals.

Under the present system, the owner was left in possession of the whole of this increase of his rents until a revision of the land-revenue took place, if, indeed, it was subject to revision; then, the Government, under the ordinary revenue-law, took a share of the rents, and thus indirectly took a part of the advantage due to the irrigation.

The first change in this system which the Bill contemplated was, that the Government would be authorized to charge directly a water-rate, not only on the occupier of irrigated land, but also on the owner of it. The Government would do this in its position of canal-proprietor, which it was intended hereafter to distinguish clearly from the position in virtue of which it shared in the rents of land in the form of land-revenue. A little reflection would, he (COLONEL STRACHEY) thought, show that there was exactly the same justification for the Government charging a water-rate on the owner of land, as there was for charging it on the occupier. He who benefited should pay. If both tenant and landlord benefited, both should pay.

The propriety of some such general plan as this was admitted by all the authorities that were consulted, and, in the revision of the land-revenue which was now going on in the Panjáb, a system had been actually adopted on the recommendation of Mr. Prinsep, which was very little different from what he had just explained. A somewhat different plan, leading, however, to very similar results, had been suggested some years ago by Sir William Muir. Where difference of opinion had arisen, it was entirely in respect to the manner of dealing with what he had spoken of as the landlord's water-rate in relation to the land-revenue, which, under the existing system, had become to some extent confounded; the distinction between the position of the Government as canal-owner, and as sharer in the rents of the land, not having been properly kept in view, under the practice that had arisen in the Upper Provinces, in making charges for canal-water.

The object of the Bill had in this respect been to provide that a canal water-rate should be assessed on the owner of irrigated land at a fairly moderate amount, in such a manner as to avoid all interference with the practice under which the land-revenue was now assessed and realized, so that the land-revenue should continue to be regulated in accordance with existing custom. The necessity for providing for the case of lands on which the land-revenue assessment now virtually included what would be a landlord's water-rate, would require attention, but there was nothing to indicate that the intention he had above stated might not be carried out with perfect facility.

Before passing on from this part of the subject, he (COLONEL STRACHEY) would explain that it was no doubt true that the Government could secure all the return it could properly desire to obtain from its irrigation-canals, by a single water-rate charged either on the occupier alone, or the owner of the land alone. But there were great practical objections to either of these courses. *First*, the charge was now virtually divided, and the system under which it was so divided had continued for many years, and had grown up and become the established custom of the irrigated districts of Upper India. *Second*, if the whole charge were placed on the owner of the land, and the entire responsibility of payment rested on him, it would necessarily follow that he must have a control over the water and its distribution. This would involve a power of interference with the cultivator in the crops grown by him, for the nature of the crop would depend on the supply of water. Such an interference was clearly objectionable, to say the least of it; and, in the case of tenants having occupancy-rights, it could not be tolerated. *Third*, if the whole charge were placed on the occupier, it would force the party least able to do so to advance the whole sum payable to the Government for the water-rates, and the occupier of the land would commonly be in a position in which he would not be able to pass on to the owner of the land the full and proper proportion of the charge which the owner should in equity bear.

On the whole, in this, as in many other matters of administrative practice, the safest and best course to follow was to work on the existing system as far as practicable, introducing such modifications as were necessary to remove defects as they arose. The Bill in these respects was permissive, and left a full power of selection to the Executive Government, among several plans of charging for the water, that were all equitable and might be found suitable, one in one place and one in another.

He (COLONEL STRACHEY) should not omit to notice that the existing system of charging for irrigation in the North-Western Provinces and the Panjáb virtually gave the advantages of irrigation to the proprietors of estates on which the land-revenue was fixed permanently, or in which the land-revenue was alienated, without any charge. In these cases the power of adding to the land-revenue on the revision of the settlement could not operate, and this class of proprietors might often be placed in the position of having their rents doubled or still further increased, without any corresponding contribution on their parts, by the results of works for which the general body of tax-payers had paid originally, and for the maintenance of which they continued to pay year by year. It was manifestly monstrous that the result of a permanent settlement, or of an alienation of the land-revenue of an estate, should indirectly be that the proprietor should receive, at the entire expense of the general body of tax-payers, the great advantages of irrigation. The Bill, as framed, would give a complete remedy for this anomaly.

The second important change which the Bill proposed was to permit of a compulsory rating of land which was irrigable from a canal, but not irrigated, if, after the lapse of a certain period, the nett income was not sufficient to cover the charge for interest on the capital expended on the works.

The object of this part of the Bill was evident, and all that he need say on the subject was to explain more fully the considerations which had appeared to justify the proposal and to meet the objections that had been made to it.

The events of the last few months would, he should imagine, have satisfied every one in the Council that the greatest caution would be necessary in carrying out the extensive systems of public works on which the Government had recently embarked. The financial consequences depending on the expenditure of the very large sums of borrowed money that would be applied to the irrigation-works and railways which the Government was about to undertake, were extremely serious, and financial disaster and collapse of a very alarming character might readily follow an inconsiderate line of action in such operations. The necessity for giving attention to these financial considerations could not be too strongly insisted on.

The character of the public administration in India tended, he ventured to think, to exalt unduly administrative requirements at the expense of financial possibilities. It was the natural, and almost the necessary, result of a Government like that of the British in India, to be oppressed, if he might use the word, with a sense of the obligation to carry out moral and material improvements, and it was to this really healthy tendency that the excellence of our rule—for it was in all essentials excellent—was to be attributed. But the great body of administrative officers was not concerned in any important degree with the duty of finding the means for meeting the necessary cost of the measures they proposed; nor was there, in the form of our administration, any corrective or compensating check to this. The great body of the tax-payers was not able to influence in any way the financial arrangements of the Government. But more than this, there was hardly any real or effectual criticism brought to bear on those arrangements from without, and the financial administration had been left to contend with a pressure for supplying the means of improvement which it had too often found difficult to resist, though the consequences should be serious ultimate embarrassment.

Perhaps he (COLONEL STRACHEY) might feel rather more than others the weight of such a responsibility as that of which he had spoken. He had for many years past advocated the policy of extending, within the bounds of prudence, the means of irrigation to all parts of India where there was danger from drought, and there were very few parts of the country to which this description would not apply. He had strongly supported the proposal that the needful funds for the construction of these works should be obtained by borrowing, and he had affirmed that, with due care, there need be no cause for anxiety as to the financial consequences of following this course. He felt, therefore, that, so far as his own voice had had any influence in bringing about the acceptance of the policy that he had advocated, he specially shared in the responsibility that rested on the administration of the Irrigation Department, that the great operations which they had in hand should be carried out to completion without detriment to the credit of the Government. It was in this sense that he personally claimed attention to the important aspect of the question of the extension of irrigation to which he had just been alluding, and it was in this

sense that the Government of India had deemed it necessary to take special precautions to provide against possible future difficulties arising from the obligations it accepted in applying these very large sums to the protection and improvement of the country by means of irrigation-works.

If the outlay on the works to which he had referred on a former occasion, as now contemplated in the Panjáb, North-Western Provinces and Oudh, were completed in eight or ten years, the Government would, at the end of that period, be liable to a yearly charge for interest of not less than £600,000, and a yearly charge of at least equal amount for maintenance and management; in all, nearly one and a quarter millions sterling. And this, it must be remembered, represented the liabilities on a part only of the undertakings on which the Government had embarked. Very large works were in progress in Bengal, and very large projects had been prepared, and only awaited a final removal of financial doubts to admit of their immediate commencement. In Bombay the position was the same, and Madras also would, without doubt, add to the drain in an important degree. He need not attempt to estimate in precise figures the full extent of the whole of the liabilities which were thus being permitted to arise, but it was certain that they would amount to an annual charge of several millions sterling.

The Goverment of India had accepted the responsibility of carrying out to its legitimate end the policy of providing this country with the best, nay the only, security that could be obtained against the recurrence of those terrific calamities in the form of general famine, produced by general drought. But in doing this it was bound so to take its measures as to prevent the contemplated benefits turning out causes of injury by reason of financial disorder arising from them.

In thus dwelling on the necessity for caution in prosecuting these works, he would distinctly guard himself against being understood to suggest that there was reason to think that they were likely to prove financially unsuccessful. He had no such fear. But as a prudent banker required certain forms to be complied with, and certain securities to be given, in dealing with his most trusted customer, and as, in the great majority of cases, such forms and securities might not be found to have been really important causes of the final satisfactory settlement of accounts; so the State, in entering on great financial operations, would do well to satisfy the community from which it derived the funds to be laid out, that there was in fact a substantial source from which the liabilities of the State in respect to its loans could without doubt be made good, however firm its own convictions might be of the prudence of its investments.

When considering the probable consequences of the works they were now about to undertake, it was proper to expect that the same general results would ensue that had been shown by actual experience to follow the prosecution of like works in past time. The main feature in the financial working of these undertakings had always been that a certain length of time had been required to develop the irrigation to an extent which made it properly remunerative. As to the end, there was no cause for anxiety; but an intermediate period would almost certainly occur, in which a heavy charge would have to be met from the general resources of the State on account of any new works. It was hoped that, under the improved system of management which they might now hope to secure, and in the light of the strict financial returns which would be an essential part of any satisfactory system, the financial operation of the works would receive closer attention than before, and causes of delay in the extension of the irrigation, or of failure in realizing a proper income, which were removable, might be ascertained and removed. But, after all possible precautions were taken, it could not be at all certainly hoped that a serious charge might not fall on the revenues in consequence of the new works, and it was necessary to consider thoroughly how such charges, if they arose, were to be dealt with.

It was impossible to overrate the importance to the Government of maintaining its credit on an indisputable footing, when it entered on the course of borrowing which was necessarily involved in the operations which it had been recently determined to carry out with a view to the extension of irrigation-works and railways in India. The power of the Government to continue in the course of improvement on which it had embarked, was directly and essentially dependent on the solidity of its credit. If money could not be got cheap, the Government must soon check its operations. Everything which depressed the credit of the Government acted directly as an obstruction to progress; everything that raised its credit facilitated progress. The Government considered that, among the methods by which its credit might be sustained, a very important one was to place a direct liability on those interests which benefited by irrigation-works, to provide any sum which might, after a reasonable period had elapsed, be found to be required to supply the funds necessary to discharge the interest on the capital by means of which the works were carried out, if not to pay off the capital-debt itself. The precise measures by which this end was to be attained would of course require careful consideration, and the proposals that had been made in the present Bill were designed to give the Executive Government the powers which it might be necessary to exercise to secure the object that had just been explained.

The first remark that suggested itself in connection with this discussion—and it was a very obvious one—was that, if the Government carried out works such as these with borrowed money, the burden that might arise must be borne somehow. The real question at issue, therefore, was, should this burden be left to fall on the whole community, and should the form of its incidence be left to be determined, from time to time, as the financial circumstances of the day required, or should it be placed specifically on that section of the community in whose behalf the works were constructed, in a shape now to be settled once for all? Should we, in short, postpone, till the necessity for action arose, all consideration of the means which we should take for meeting the obligations that were incurred, or should we now assign a specific security equitably adjusted?

The Government of India came to the conclusion that the last was, without doubt, the proper course to follow, if it were possible; and the general plan that was proposed in the Bill would, it was believed, give a satisfactory solution of the problem, when it was properly guarded and explained.

It was always a somewhat dangerous thing to argue from analogies which were necessarily more or less incomplete. In the present case, when we sought an analogy in English practice, we were met by the wide difference of the conditions under which public works for the general improvement of a district were undertaken there and in India. The common argument, that engagements entered into with the consent of the majority of the class interested should be held to bind the minority, could have no operation in India in relation to works such as we now were speaking of. The consent of the persons interested could not in reality be obtained in a form that would give it the slightest real value.

On the other hand, the mere fact that a given numerical majority of the persons for whose benefit works were undertaken had not specifically consented to their execution, could not at all affect the real equity of any arrangement under which such works might be paid for. So long as the essential considerations were respected, which would have guided an intelligent community thoroughly understanding its own interests and able to protect them, the circumstance that the State had acted authoritatively in behalf of a backward community could not make unjust that which otherwise would have been just. The Government in this country had extraordinary responsibilities placed upon it, arising from its extraordinary relation to the people of the country. Very frequently it was forced to act in behalf of the people, or of a section of the

people, guiding itself as best it might, by considerations of what was due to interests which the people themselves appreciated very imperfectly, or perhaps not at all.

From such considerations, he (COLONEL STRACHEY) concluded that, if the Government took all those precautions that should and would be taken by an advanced community acting in its own behalf, it might, circumstanced as the British Government in India was, without objection, regulate the management of works of public improvement in a manner that it was reasonable to suppose might have been agreed to by such an advanced community. And, hence, he concluded that the principle of establishing a local financial responsibility for works which were in their nature exclusively of local interest and value, was perfectly equitable in India as elsewhere.

In proceeding to apply this principle, the main point to attend to was that the burden which was to be imposed should only fall on those who really could benefit by the works. When, therefore, it was proposed that all lands irrigable from a canal should be liable to pay a rate towards the expenses of such a work, it should be seen that the lands were those which could, in fact, receive substantial benefit, and not those which might perhaps be benefited. It would be easy to guard the power proposed to be taken under the Bill so as to secure this object completely, and it would be his duty to propose to the Committee, if his present motion was carried, such amendments and additions to the clauses as they now stood in the Bill as would effect this in an unmistakable way. He might add that the first intention of the section was what he had stated; but it had been thought that the needful definition of the lands to be charged as irrigable might be left to the Executive Government.

It would further be for consideration whether it might not be desirable to prescribe some form of preliminary enquiry by which the Executive Government might satisfy itself, in a special manner, that all those measures had been taken by the canal-administration, for facilitating the extension of the usefulness of a canal, which should have been taken before recourse was had to a general and compulsory rate on lands irrigable but not irrigated. He might add that the Government contemplated giving additional facilities for the execution of agricultural improvements, by means of what were commonly known in India as tuccavy advances, and one of the classes of work to which such advances might most properly be applied would be the minor water-courses requisite for the introduction of irrigation.

Another point which would be suggested to the Committee for consideration was, whether it might not be expedient, in the event of a compulsory rate being charged on account of any new irrigation-work, to declare that a certain fixed maximum rate of profit should thereafter be prescribed, beyond which the Government charge for that work should not go; so that, if the locality benefited by the works was held to give a practical guarantee for the financial safety of the operations involved, it should, on the other hand, be secured against any charges in excess of what was necessary to cover all obligatory expenditure for maintenance and interest. As it might be argued that, if no guarantee was given against loss, no pledge should be given against raising the charges to any amount that the real value of the water would justify; so it might be said that, if the general tax-paying community were protected from all loss, they should be ready to waive their claims to all extraordinary profits, and the charges should be fixed so as just to cover the actual outlay, including a fair rate of interest on capital, and no more.

The sole intention of the Government was to place the future of these most important works on a thoroughly satisfactory footing, both as regards the interests of the agricultural community for which they were primarily designed, and the general financial interests of the State, which could not be endangered or injured without immediately affecting injuriously the interests of all classes.

The Government would hope that a satisfactory conclusion might be arrived at on the various points which arose in relation to this proposal, and that the objections that had been made to it might be removed by the consideration it would receive from the Committee.

The fifth chapter of the Bill, regarding navigation, called for no special remark.

The chapter which followed, on Drainage, was new. Its provisions were moulded on the same general principles that had been adopted in the preceding parts of the Bill relating to irrigation-works. Compensation would be given when any operation was undertaken for improving the drainage of any district, which involved the diminution of any advantage which had been enjoyed by any one for a period of twelve years, which had been generally agreed to as a suitable term to establish a right that should be respected. It might be said, generally, that all interruptions of the natural drainage of the country were made to the detriment of the community at large, and that any right to maintain such an interruption should not be too easily recognized. Where the public health or advantage required the drainage of land, it appeared to be no more than reasonable that the proprietors of the land should be primarily held responsible for removing the evils, whatever they were. A limit of charge was proposed to be fixed by the Bill, so as to prevent undue burdens being placed on the land for these purposes. Also, a proviso was made that the removal of artificial obstructions to natural drainage should be made at the cost of the persons who caused such obstructions. This met objections that had been made, that the Government should not be able to charge upon landholders the cost of drainage-works, the necessity for which had been caused by the neglect of the Government itself. On such a point there could be no difference of opinion.

The chapter relating to obtaining labour for canal and drainage-works had been generally accepted as suitable and sufficient. It enacted nearly what was the existing practice in the Panjáb. Under its provisions, an obligation was placed on all landholders to supply labourers according to a certain scale to be fixed by the Collector, and on all labourers to give their labour, when required so to do, in accordance with certain rules to be made by the Local Government, payment being made at the full rates in force in the locality. If these obligations were not complied with, the persons concerned might be fined. There was no power given of direct coercion.

The necessity and equity of provisions such as these seemed to him quite beyond dispute. Good government did not consist in breaking down human society into the individual elements of which it was composed, and removing from all men all obligations that might interfere with their personal advantages. A man, whether he were a labourer or a landholder, was a member of a community which could only satisfactorily exist by the mutual co-operation of all its members; and when an agricultural community had become dependent on works of irrigation or drainage or embankments for its very existence, the necessity for providing for the immediate carrying out of works of a certain class in connexion with the main canals or embankments was one which was absolutely paramount.

The eighth chapter only called for notice as containing provisions by which the jurisdiction of the ordinary courts was barred in respect of matters the cognizance of which was specially provided for under the Bill. These matters might be classed as questions relating to the supply of water, the use of canals and the charges of various sorts made by canal-officers, the use of water-courses, and claims for remissions of charges, or for compensation in the cases which were specifically described in the Bill. In all cases provision was made for appeals, and the reserved matters referred to questions of an administrative nature in relation to the canal-water which was exclusively the property of the State, or to those which were so related to the revenue-administration of the canals or the land as to make it desirable that

they should be dealt with by the special Revenue Courts or officers. In this, the analogy of other branches of the revenue-administration had been followed, and he might, he believed, add that the experience of European countries where irrigation was largely practised—Spain and Italy—showed that the propriety of maintaining special tribunals for the cognizance of questions relating to the irrigation of land had been universally recognized.

His Excellency THE COMMANDER-IN-CHIEF said that it was now many years, perhaps indeed more than he cared to count, since, as a member of Government on the other side of India, he was one of what might be called the official minority which pressed on the Government of India and on the Secretary of State the necessity of constructing reproductive works by recourse to other means than those presented by the ordinary resources of the country.

The struggle was a long one, but it was at length pressed to a successful conclusion. Finally the argument prevailed by which the notion was borne home to the Government in this country, to the Council at home, and to the public at large, that for this purpose of reproductive works in India we must lean on the public credit. But while the minority impressed the value of this policy till at length it came to be triumphant in all quarters, it was not forgotten by them that the public credit would suffer, as so ably explained by his hon'ble friend the mover of the Bill, if means were not taken carefully at the same time to insure financial safety; in short, to extinguish the loans by means of which the reproductive works were to be constructed. Some of the clauses in the Bill before the Council had been designed for such a purpose. This he (SIR W. MANSFIELD) saw with great pleasure. It was evident that, according to the provisions set out for their consideration, Local Governments and Administrations would be required to consider well the necessities of their provinces and districts, with a view to the responsibility imposed on the latter for the expenditure on account of the improvements and works by which they were to profit.

It was but too true that there was a sort of feeling among certain classes of the public, this including not only the ryots and the petty landholders, but even some of our own officers in responsible situations, that there was a kind of bottomless purse, into which all were free to dip their hands at pleasure for local objects, without any local responsibility of reimbursement, this unlimited treasury being what was called the Government.

We could understand the ryot or the petty landholder having this notion of the Sarkár; but it was difficult to comprehend how responsible officers charged with the care of administration, who were aware of the almost infinite demands on the Government, should fall into such errors of reasoning.

Well, this matter seemed to be fairly set right by certain clauses in the Bill. Some alteration in the wording, some modifications, might be required; but the principle according to which these works must be carried out henceforth was described in a manner admitting of no mistake in future.

It could not be too clearly declared that the provinces, the districts, the populations which benefited by the reproductive works must be responsible for the expenditure incurred on account of them, and that this must not be thrown on the country at large or the system of general taxation.

He (SIR W. MANSFIELD) congratulated His Excellency very heartily on the progress made by the policy of reproductive works in India,—a policy which, more than anything else, would tend to great development and prosperity. It was to him a matter of real satisfaction that, at the close of his career in India, he saw that policy triumphant for which in former times he had struggled, and that he was permitted to take a share in affording completeness to it by voting for the measure now submitted to the consideration of the Council.

Major General the Hon'ble SIR HENRY DURAND said that, when permission was asked to bring in this Bill, he adverted briefly to the fact that they had not before them the opinions of the Local Governments upon it, and he would have preferred that the Council should not have entertained the Bill until after those opinions had been laid before it. The Council had since obtained the views of the Local Governments, and he must say that some of them were very hostile to a particular clause of the Bill, which had been made the subject of discussion. He referred to section 56. We had some of the leading men, amongst others Sir William Muir, giving their opinions on that section. Sir William Muir said:—

"*Section* 56 *et seq.*—I earnestly dissent from these sections. The imposition of a rate on lands that might be held open to the benefits of canal-irrigation, but which do not actually share in them, is based on no principle which I can recognize as just and equitable, or (even if practicable) as expedient. If a canal will not prove remunerative by the assessment of those who directly profit thereby, it should not be undertaken at all. If Government makes a mistake, I fail to perceive why third parties, having no special concern or responsibility in the matter, should, any more than their neighbours, be subjected to a cess in order to make good the loss. The demand would create so much discontent, and would be so evidently inequitable, that, even if legalized, I much doubt whether it would ever be put in force: and its effect, if any, would probably be to make the canal advisers of Government less careful in sifting the financial prospects of their designs, because they would have, in the back-ground, the fallacious guarantee of an eventual rating on all the area which they might hold to be open to irrigation from their works."

We had others expressing equally strong opinions hostile to this particular section. The Board of Revenue, composed of able men of the North-Western Provinces, said regarding it:—

"But section 56 is open to very grave objections. It compels the owners of lands adjacent to, but actually deriving no benefit from, a canal to pay water-rate on such land, in order to bring up the proceeds of the water-rate to seven per cent. on the capital expended on the canal, and charges for maintenance, management and working not properly debitable to the revenue-account of the canal. It is notorious that the existing canals run through tracts where they are not wanted.

"Before the canal was made, the land now adjacent to the canal was easily and cheaply irrigated from *kacha* wells, and the advent of the canal has been anything but a boon. The proprietor of such land does not derive any benefit from the neighbourhood of the canal, any more than his neighbour whose land is not irrigable from the canal. Yet he is to be made to pay, when the other is exempted. The canal may have been constructed at an extravagant outlay. It may have failed to yield a profit to Government from mismanagement, or the entertainment of too expensive a supervising establishment. For all this the proprietor, who is in no way responsible for such results, and who derives no benefit from the canal, is *fined*, for the payment would be simply a fine. The Canal Department must look to economy in construction, management and maintenance, and to a judiciously adjusted scale of water-rates, and careful administration, to secure a fair profit to Government. We contend that it is most unjust to make the agriculturist pay towards the expenses of a canal from which he positively derives no benefit. The mere fact of his land being irrigable from the canal is immaterial, where it is irrigable by other existing means. If it is not so irrigable, he will irrigate from the canal, especially where his land is close to the canal.

"We think that section 56 should be struck out of the Bill, and with it sections 57 to 60."

There were others, again, equally hostile to it; but he (SIR HENRY DURAND) would not take up the time of the Council by reading their opinions, though some of them were very ably and forcibly expressed. We had also the views of the Panjáb Government, which at one time were extremely adverse to the section; and the Lieutenant Governor of the Panjáb, though he had himself modified his opinion to the following extent, now sent the opinion of the Financial Commissioner, which was extremely opposed to sections 56 to 62 inclusive:—

"The Officiating Financial Commissioner further objects to the provisions of sections 56 to 62, regarding compulsory irrigation-rates: the Lieutenant Governor formerly objected to these provisions; but he has recently, in a letter addressed to the Supreme Government, in the Irrigation Department, withdrawn his opposition, with reference to a proposed modification of the Bill, by which it is ruled the amount leviable from those who do not use canal-water shall never exceed half the full water-rates. His Honour is fully aware of the great advantage which would result from all irrigable lands taking water, but he desires me to state that the adoption of these compulsory provisions renders it all the more necessary, in his opinion, for the Government to be chary of extending canals to tracts largely irrigated from wells."

We had, again, the views of the Chief Commissioner of Oudh, who expressed an opinion as hostile to this particular section of the Bill as did the Financial Commissioner of the Panjáb. He said—

"In an abstract point of view, and apart from the complications of particular provinces, the Chief Commissioner can see no reason for the gratuitous sacrifice of revenue involved in the concession to the proprietor of 'a right to a large share of the increased profits due to the introduction of irrigation by expenditure of public money.' But if it be the pleasure of the Government to make this concession, then the Chief Commissioner thinks it a good reason for adjusting the canal-rates so as to prevent the deficiency which it is proposed to supply by the taxation of irrigable lands. Admitting the necessity for obtaining seven per cent. profit on the outlay on canals, the Chief Commissioner has as yet had no data before him showing that, if the canal-rates are fully assessed, the required amount of profit cannot be raised. The Chief Commissioner would cite the late revision of rates for the Bárí Doáb Canal, as exhibiting the considerations indispensable to the full realization of the revenue due from canals. There is no doubt about a full rate being the form of taxation to which the cultivators of Upper India will most readily assent. The Chief Commissioner feels quite sure that they will not understand a supplementary rate on irrigable land. He holds that the analogy of English circumstances spoken of has no existence. It is a very different thing, getting the intelligent assent of English proprietors to the payment of rates in defrayal of the cost of a local improvement; and persuading thousands, or rather millions, of disconnected cultivators, living on a line of country hundreds of miles in length, that it is to their advantage, contrary to old custom, to pay for water which has never reached their fields. There will always be the risk of causing general discontent by the sudden exaction of such an addition to the ordinary fiscal demands. The insertion, therefore, of such a provision into a legislative Act, not professedly a measure of taxation, and not easily repealable, may, the Chief Commissioner fears, lead to practical difficulties, and he ventures to recommend that the subject be further considered, and the necessity for the cess be clearly made out. This will allow of time to test the feeling of parties interested. If this be favourable, no harm will be done; if unfavourable, the degree of its intensity should then be ascertained. The subject would seem to be easily separable from a Bill to amend the administration of the existing canal-law, and to call for the attentive consideration of the revenue-officers."

In the Central Provinces alone, where there was not much experience in these matters, we had an opinion favourable to the principle of the section. SIR HENRY DURAND could not help thinking that the opposition to the policy of this particular clause had been due to the peculiar wording, in this matter, both of the Statement of Objects and Reasons appended to the Bill, and also of the somewhat arbitrary terms in which the section itself was worded. He found that, in the Statement of Objects and Reasons, where it laid down the principle on which the section was based, the principle so laid down was good, and that it could in itself hardly be objected to. It was there stated that—

"The Government constructs irrigation-works out of the funds or on the credit of the general tax-paying community, and, as trustee for that community, it must take the best possible security for the payment, by the districts which are benefited by any canal, of the actual charges to which the State is put by its construction and maintenance. It might be argued that the liability to meet such charges should be extended to the whole tract of country which receives any benefit from the irrigation-works. But it is believed that, under a satisfactory system of management, the needful returns to cover the charges may be obtained from the land which will directly benefit, and it is therefore considered sufficient to limit this liability to the irrigable lands only."

It was rather remarkable that, when you read section 56, you did not find any allusion to what was contained in the Statement of Objects and Reasons, confining the water-rate to lands which will directly benefit:

"56. If, at any time not less than five years after the commencement of irrigation from any canal, the average nett revenue in the three next preceding years, realized by the Government from the use of the water thereof, and including all sources of income dependent on such canal, and deducting all charges for maintenance and management and working properly debitable to the revenue-account of the same, shall not amount to a sum equal to seven per cent. on the capital expended on the said canal, the Local Government may charge on the lands irrigable by the water of such canal, but not paying any water-rate therefor, such a yearly rate or rates as shall, when added to the nett yearly estimated income, reckoned as aforesaid, produce a total amount, as nearly as may be, equal to seven per cent. on the capital aforesaid."

so that, at the first blush, he (SIR HENRY DURAND) could understand the Local Governments going against this particular section of the Bill; because, whilst there was no uncertainty as to the principle laid down in the Statement of Objects and Reasons, there was nothing to show that, in the section there was a corresponding condition affecting the application of the principle: he could quite understand the alarm of the Local Governments at the section. Then, again, in the Statement of Objects and Reasons the word "district" was used. A district was only an aggregation of villages. It did not always follow that the canal-districts and civil districts were of the same demarcation; nor did it at all follow that the villages which composed either canal or civil districts would all benefit from the construction of a canal. Some might benefit from it; others might benefit partially; some might not benefit at all, and some might even suffer detriment. So that, from the indefinite words used, the Local Governments might well be startled; but he did not think that, after a careful consideration of what the Local Governments had said, they really went against the principle involved. He thought that the financial policy was one which, stated generally, was a principle which would be accepted by every one: the difficulty, and it was the real difficulty, was as to its application. While he was not prepared to say, admitting, as he did, the soundness of the general principle, that that principle was in itself obnoxious to criticism: he was not prepared to say that this Bill, supposing the principle applied as it ought to be, and with some modifications of section 56 as it now stood in the Bill, might not be made a good Bill. If it were not for section 56, hardly any one would deny that the Bill itself was a good Bill: it really did very little more than bring into an improved shape what was now embodied in two or three old Acts and Regulations, and it invested the present practice with legal form. Therefore, excluding that section and some others connected with it, all of which the Hon'ble Mover of the Bill would, he was certain, amend, he thought the Bill was one that should be regarded as unobjectionable. At the same time, there were points in it which he should like the Select Committee carefully to take into consideration, for he was convinced that a good deal of the opposition that had been raised might very easily be remedied. With His Excellency's permission, he would take up those points *seriatim*.

There had been a great deal said as to the powers proposed to be conferred on canal-officers. Now, as to the particular part of the Bill in which certain powers were conferred on the canal-officers, he did not entertain any objection to its provisions; he thought that they were a body of men who would act carefully and well, both in the interests of the country and of the Government; but there were particular sections which might well be brought under the ordinary action of the civil courts. He could see no harm in their complying with the views expressed by some of the Local Governments and their officers who commented on the Bill, so as to alter the venue in proceedings under certain sections: he particularly alluded to sections 19, 21, 53 and 54. Now, all those sections had reference to rents, and he was not quite sure that they were not out of place in a Canal Act. He did not see that there would be any harm in leaving jurisdiction in this respect unshackled to the Revenue Courts. Such a course would not only prove a very great safeguard to the people, but would also operate as a real check on the canal-officers. It was very natural that the civil officers should entertain such a feeling, and he could see no objection to these sections being treated as he proposed, thus giving the canal-officers the assistance of the decisions of independent courts. It was entirely a rent-question. He was informed that, in the re-settlement of rents, which usually followed the settlement of the land-revenue of a district, there was no provision requiring that the rent should bear any proportion to the revenue-rates fixed by a revised settlement. We were, therefore, introducing a new element, and a new element in questions of rent in a Canal Act. He thought that the Revenue Courts should

be required to adjudicate on all claims to enhancement of rent, and to settle them as they did similar claims under the Acts which guided them. This was a point which he ventured to recommend to the consideration of the Committee as likely to remove objections to the Bill.

Section 56 was, as previously observed, a more difficult subject for consideration; but if the Council had paid attention to the somewhat lengthy extracts which he had read from the reports of the Local Governments, they would observe that the gist of their objections was founded on the fact of the powers conferred by this Bill for the levy of the water-rate on people who derived no benefit at all. If the rate was limited to lands in no other way irrigable, and which were within the sphere actually irrigated by the canal, there would be less ground for objections on the part of the Local Governments. But, as the Bill was worded, a village might find itself compelled to pay for no advantage received, or it might be required to discard its wells from which its lands were irrigated, and which were sunk at great cost, in order that it might contribute to the financial success of some undertaking of which it was wholly independent. Although there was a discretion left to the Local Governments as to the compulsory rate, and the action upon that discretion was subject to the control of the Governor General in Council, yet he thought that this point was one which, though guarded in this manner, had moved the Local Governments very much, and which admitted of an easy remedy in Committee; and he was under the impression that it would, coupled with other financial adjuncts which the Hon'ble Mover of the Bill would be able to add, in a great measure remove the objections entertained to the Bill. If he understood the section rightly, taken in connection with section 61, there was nothing to prevent very considerable practical injustice being done to a village, the lands of which were irrigable but not irrigated by, or requiring irrigation from, a canal which might run twenty-five or thirty miles off, and that village might be made to pay towards the general deficit of the work. That he thought should be carefully looked into.

As connected with this subject, he confessed he entertained great doubts as to the policy of section 62, to which he very earnestly asked the attention of the Council. It would be remembered by his Hon'ble colleagues that, with regard to reproductive works, he had urgently recommended that there should be a strict account kept of each separate work, and that its cost and the revenue and profits derived from such works should be laid periodically before the public at the time of the preparation of the Budget. Now, this section appeared to him really to militate against that which he held to be most important; for, although he himself was not of the opinion which he had heard advanced in that room against the construction of public works by loans, on the ground that loans necessarily led to extravagance—an opinion which he thought rather unworthy of a Government to bring against its own prudence and power of control—still he did think that the credit of the Government and of the country was involved in the results of its reproductive works being laid before the public without any jumbling or mixing up of one work with another.

The accounts rendered of separate works should be so clear and clean, that if any capitalist wished to know the outlay on, and the returns and profits from, such works as the Ganges or Jumna Canals, the Soane Canals, the works taken over lately from the Irrigation Company, the Godavery works, or any other reproductive work in any part of India, he should find no difficulty in ascertaining exactly how the account stood. There should be no blending of successful with unsuccessful reproductive works. Therefore he rather thought that these two sections, if they led to anything of the kind, were open to objection; and he recommended them to the consideration of the Committee, both in a financial and practical point of view.

Then, again, section 67 was to his mind one which required very careful consideration, for it appeared to him that it struck somewhat at the principles which ruled our settlements. The section provided that—

"67. Whenever any land, the owner of which is charged with a water-rate as aforesaid, or the land-revenue payable in respect of which includes an addition on account of the increase of rents or profits due to irrigation from any canal, shall from any cause be deprived of the use of canal-water, such owner shall be entitled to no compensation on account of such deprivation, other than a remission of such water-rate or reduction of such land-revenue.

"No such remission or reduction shall be allowed, unless it be established to the satisfaction of the Collector that the rents or profits receivable by the owner from the said land have been or will probably be reduced, in consequence of such deprivation, by an amount exceeding one-tenth part of the increase of rents or profits, in consideration whereof the said owner shall have been charged with water-rate, or his said land shall have been charged with additional land-revenue."

The question which arose on this was, Why should any revision be made of revenue, because the profits derived from the land were less than at the time of the settlement? If he (SIR HENRY DURAND) understood the principle of our settlement properly, it was that the people took their chance of loss in one direction, by balancing it with the chance of gain in another. A village might lose a certain proportion, say one-fifth, of its settlement-rate by loss of canal-water, but it did not at all follow that everything else might not increase in value; that prices of all kinds, demands for particular produce, the effect of railways, and a great many things might happen to make that settlement not only very just but profitable. That was a sort of section which should be left to the operation of the Revenue Courts, and it need not come into this Bill at all.

In section 68 there was a very considerable power conferred on the ordinary canal-officers, with the view of levying the water-rate where, by percolation of the water from a canal, benefit was conferred on the whole of the land. He was not sure that that was not right. But suppose there was any mischief committed by the percolation? He adverted to this particularly, because, in the sections headed "Drainage," he did not find in the Bill as it stood that, if a village suffered from damage caused by the canal, there was any provision to exempt the agriculturist from the payment of the rate, and the Bill, as it was generally read, proposed to make villages pay for drainage-works rendered necessary by the canal. We were aware that, in some districts, canals had done injury. Districts had been named to him of which he had no doubt the Hon'ble Mover of the Bill knew—he would instance Muzaffarnagar—in which the effect of the canal running through it was represented to him as having caused serious injury to the soil; it had raised the spring-level of water very much and had produced an immense deal of fever, so that literally, in those parts, the people had suffered most severely; so severely that, sometimes, in a bad year, the greater number of the people of whole villages were on their backs with fever, and the mortality was great. He thought that the drainage-works necessary for remedying these evils did not form a proper charge on those who suffered the injury. The people had derived no benefit, but were involved in lamentable losses and injury, caused by the construction of canals, and to make them pay for drainage under such circumstances appeared to him not right. He thought that the cost of such works was a fair charge against the profits of the work.

He had no objection to the chapter, which had been a good deal discussed, regarding compulsory labour; he had no more objection to that than he had to the powers proposed to be conferred on canal-officers. Compulsory labour was occasionally absolutely necessary for the welfare of the people, and although it might appear a rather arbitrary and harsh measure, yet he was confident that any one who had had experience of canals, the banks of which were, at particular points, liable to be easily broken through, swamping and desolating the country around in a way from which it took months to recover, could not for a moment doubt the advisability of these sections. Consequently, he entirely agreed with them, and, practically, he thought that, provided the Hon'ble

Mover of the Bill and his Committee could effect a modification with reference to section 56, such as he (SIR HENRY DURAND) had suggested, the Bill was on the whole a good and necessary Bill, but it required the amendments which he had ventured to recommend to the consideration of the Committee.

The Hon'ble MR. CHAPMAN said that, as at present advised, he objected to the principle of section 56. It seemed to him to contain an ingenious provision for guarding against the effects of errors of construction or of calculation. Now, the estimates of the Department with which Colonel Strachey was connected were not immaculate. The tendency undoubtedly was to under-estimate the cost of construction and over-estimate the probable receipts. He (MR. CHAPMAN) did not see why the public, who derived no direct benefit from the works, should be made to pay for these errors. As well might they call upon the inhabitants of a district through which an unproductive Railway passed to make good the deficit. You said to them "A beneficent Government has constructed this great work by which you will secure an outlet for your labour and your produce." Their answer would be, "We are the best judges of our own interests, and we consider your Railway a mistake, and leads to no place in which we have any interest."

His (MR. CHAPMAN'S) belief was, that if irrigation-works were only well conceived and executed, there need be no fear about their financial success.

His Excellency THE PRESIDENT said—"I intend to reserve the greater part of what I have to say upon this very important Bill for its future stage, when, after being amended in Committee, it comes up for final consideration in this Council. I will therefore content myself today with expressing an opinion similar to that which is entertained by my honourable friend, Sir Henry Durand, to the effect that a great deal of the objection that has been taken to some of its clauses can be removed by the amendments that will be proposed in Committee.

"Now, the most formidable objection taken to clause 56 is that stated in the remarks of Mr. Reid and Mr. Inglis of the North-Western Provinces.

"They say that 'it compels the owners of lands adjacent to, but actually deriving no benefit from, a canal to pay water-rate on such land, in order to bring up the proceeds of the water-rate to seven per cent. on the capital expended on the canal, and charges for maintenance, management, and working not properly debitable to the revenue-account of the canal.'

"I believe that, by the insertion in the Bill of a proper definition of the word '*irrigable*,' that objection can be entirely swept away.

"I am informed that it is intended to define the word 'irrigable' in this way; that the land irrigable is not irrigated from a canal; that it is cultivated and situated within such a distance of the canal as permits the irrigation of it by natural flow; that the profits of such irrigation shall increase the annual rent and value of the land to an amount equal to the charge that is placed upon it; and that, not only shall all these precautions be taken, but that the canal-officer shall have offered to construct the minor works necessary for 'conveying the water to the said land under section 29, or (if the said occupier or owner shall so prefer) to permit their construction under section 32 or 33, or shall have tendered an advance of money sufficient to provide for the construction of the said works, such advance to be made and to be repayable in conformity with the rules then in force for making and recovering advances of takkavi, or advances for making improvements in land.'

"I am in hopes that, if these definitions are inserted by the Committee in the Bill and adopted by this Council, many of the objections taken will entirely fall to the ground. I believe also that it will be possible to give to all these definitions practical effect.

"It might be said, and I think with truth, that irrigation-works in India cannot be constructed without conferring great benefits upon the whole

population of a district, and, speaking generally, without adding increased value to all the lands in the neighbourhood of those works.

"I believe that to be a sound axiom; but it is not the principle that is acted on in this Bill, which is more limited.

"The principle upon which the legislature in England has acted in respect to the prosecution of works of local utility is this—it has always considered it right to charge upon a certain district the repayment of capital and interest, and the cost of maintenance, because it is held that the construction of such works confers extensive advantages upon the whole neighbourhood. But this principle is only found to a limited extent in the Bill now before us, and it will be so guarded, that no people can be made to pay for this water who are not directly benefited thereby, unless their land is actually increased in value, and unless the water is actually brought upon the farm. And, here I think it right to say that, unless such a principle as this guides the future of our great operations of improvement in India, we are likely, at no distant time, to find ourselves in serious difficulty; and I believe that, unless the principle is adopted which was so well described by His Excellency the Commander-in-Chief, unless the whole of our loan-finance—the whole expenditure of a remunerative character for improvements to the land and other like objects in India—is removed from the ordinary finance of the country, you will find that it will be difficult to continue these most necessary works on a scale at all commensurate with the requirements of the country.

"I therefore think that those who argue against this principle argue against that upon which all security for the continuance and certain completion of these works is actually based.

"I will not now take up the time of the Council to go into details in proof of this axiom. On some future occasion it will probably be my duty to do so; but when we see that the cost of the ordinary administration of this country is such as can hardly be defrayed out of ordinary revenue, and, when we look to the increased cost of that administration which improvement must necessarily bring, I say that it must be plain that it is impossible to add indefinitely to our payments of interest in regard to these reproductive works without dangerously crippling our power in respect to military defence, the administration of justice, the spread of education, and many other objects which are so essential to the safety and progress of the country.

"I hope that these truths are now beginning to be recognized throughout this land, and it behoves us to look upon these questions, not from a provincial or a local point of view, but to ask ourselves the simple question, if these works are to go on, who is to pay for them; and can they go on if their cost is to be defrayed from the ordinary revenue of the country?

"This consideration has certainly not presented itself to the minds of those who object to this Bill.

"It is said that it is unfair that certain persons should pay for certain works; but if they are not to pay, who is to pay?

"There is no unlimited fund at the disposal of the Government of India which is available for such a purpose.

"If a work is not sustained by local resources, it can only be sustained by the contribution of the general tax-payer, and I ask, is it fair or right that works constructed for the exclusive benefit of the people in the Panjáb or the North-West should be paid for out of the pockets of the people of Madras or Bombay?

"It was the early adoption of the principle to which I have been referring that has led to the successful expenditure of the enormous sums which have been borrowed from the State or from private sources, for agricultural, municipal,

maritime, and other objects at home; and I do believe that, had it been attempted thirty or forty years ago in England to carry into effect the principle that has hitherto been adopted in India, that is, that the general revenues of the country were to be made liable for works of improvement of a limited and local character, not only would the expenditure on those works have been most extravagant (being conducted without that local control which is so necessary), but that the charge thrown upon the revenues would have been so enormous, that the construction of all such works would have long ago been arrested.

"When it is also said that, because engineers make mistakes, and that errors may be committed in the construction of these works, therefore, the loss occasioned by these errors, and the result of these mistakes, are to be thrown upon the general tax-payers of the country, it seems to me to be an objection that is wholly unsustainable.

"These works are not undertaken on the understanding that mistakes are not to be made; mistakes will occur, but to say that a great principle of this kind is unjust, because occasional mistakes, blunders, and errors may be made by persons occupied in the construction of these works, is, to my mind, an argument that can hardly be deemed serious.

"I believe that, in the interests of the thousands whose life (I may almost say), and certainly whose welfare, depend upon the early completion and construction of these works, this principle ought to be adopted; and I do believe that, when it does come to be thoroughly understood that those localities which are to be most benefited undertake to bear the other tax-payers of the Empire free from burden and cost; when the inhabitants come to understand what the object really is, and that in return they are to be guaranteed by Government that the profit of those works—above that which is absolutely necessary to defray the cost of payment of interest, repayment of capital and maintenance—is to be all their own, they will find that, so far from the present Bill being likely to throw unfair, unnecessary and burdensome charges upon them, it will cause these works to be constructed and completed with far more economy and care than they have been hitherto; that in their construction they will be subjected to much more accurate criticism than they have been before; that the whole claim of the Government in their respect will be greatly limited. I believe that, when people come to consider all these points, they can arrive at no other conclusion than that the principle of the Bill is just and fair, and calculated to secure the speedy completion of the works, and at the same time leave to the proprietors and occupiers of the land a larger portion of the profit.

"I am not surprised that objections are taken to this Bill. Everything that is new is liable to suspicion; but I think that the solid objections which have been made can be removed, and that, on further consideration, it will be found that this Bill, if it be properly worked, will confer lasting and immediate benefit on thousands, by securing to them, at the least possible cost, all the blessings of irrigation."

Colonel the Hon'ble R. STRACHEY said that he wished in reply to offer a every few remarks on some of the comments that had been made by Sir Henry Durand on certain sections of the Bill, which he (COLONEL STRACHEY) thought had been somewhat misunderstood. As to the general questions that had been discussed, he had no wish to add anything, as he considered that the servations of His Excellency had so completely met all the points that had been raised as to make further comment unnecessary.

The first point to which Sir Henry Durand had referred, was the extent of the powers to be given to the canal-officers. His Hon'ble friend had said that the matters proposed to be dealt with under sections 19 and 21, and 53 and 54 of the Bill would have been better left to the ordinary Civil or Revenue Courts, and that it was doubtful whether questions relating to the rent of land

should find a place in this Bill. But sections 19 and 21 could not possibly be dealt with except by the Revenue Courts, and the Bill distinctly provided that the whole of the proceedings taken under Part II, in which sections 19 and 21 were, should be before the Collector, whose orders would be liable to appeal in the manner prescribed by the Local Government. The canal-officers would have no share whatever in such proceedings. As to sections 53 and 54, the same general remarks would apply.

As to the propriety of referring in this Bill to questions relating to the rent of irrigated land, the sections 19 and 21 had been specifically approved by the Board of Revenue of the North-Western Provinces. Section 54 was open to more discussion, but the propriety of it was strongly advocated by Mr. Elliott, one of the most able Civil officers employed in settlement-operations in the North-West Provinces.

Next, section 61 was objected to as giving an arbitrary power to group together several canals in reckoning the nett profits which would determine whether a rate might be levied in certain cases on irrigable land not irrigated. But some such power was essential, because the term 'canal' was necessarily very aribitrary, and, in many cases, the irrigation of a district was provided from a number of small works, which might, in fact, be little more than large water-courses, to keep separate accounts of which might be inconvenient or even impracticable.

Section 62 was also noticed as naming the accounts of the local Public Works Department, as affording the standard from which the profits before referred to should be ascertained, and a remark was made by Sir Henry Durand to the effect that the proper standard would be the accounts as audited by the Government of India or its officers. But, as a fact, the local Public Works accounts were drawn up and corrected under the orders of the Governor General in Council, and the system to be followed in keeping the accounts of all irrigation-works would be entirely within the control of the Government of India, so that there would, in fact, be no difference between the local accounts and those of the Government of India.

Objection was taken to section 67 as interfering with the system under which remissions of land-revenue were allowed, which, it was said, should not be changed by this Bill. But, in fact, the remissions referred to in this section were not remissions of land-revenue, properly so called, but of canal water-rates charged on the owner of land, which, under the existing practice, had become confused with, or combined with, the land-revenue. If an owner's water-rate was to be charged, provision must be made for remitting it in case of failure of the canals. To what extent, if any, modifications of the precise terms of the section as it now stood might be desirable, was a question that might be properly dealt with in Committee; but some such provisions as those which it contained were essential.

The power given under section 68 to rate land not actually irrigated, but situate within a certain distance of the canal, and benefiting by percolation, was noticed as excessive. But the section plainly said that, to admit of the land being charged, the advantage to be derived from the canal must be equivalent to that which would be given by a direct supply of canal-water. This seemed quite sufficient.

The next point noticed had reference to the drainage of lands, and objection was taken that, under the Bill, a proprietor might be required to pay for the removal of evils which were caused by the errors of the Government Engineers, and were directly due to defects in the construction of the canal-works. COLONEL STRACHEY pointed out that the proviso at the end of section 84 distinctly stated that no charge should be made under the Bill for removing obstructions to drainage due to artificial causes, and that the persons who had caused such obstructions should be responsible for their remedy or removal.

He added that, although no doubt there were many instances in which the Government works had caused evils of this sort, the main cause of the worst cases was the neglect of the small water-courses, which, not being properly maintained, allowed the escape of water into hollows where it formed swamps of a most objectionable nature.

As to the means of obtaining compensation for injuries done by Government canal-works to adjacent lands, to which allusion had also been made, COLONEL STRACHEY observed, that he supposed that any proprietor placed in such circumstances could bring an action for damages against the Government, though he did not remember ever to have heard that such a thing had been done. But however this was, the present Bill provided a distinct remedy for all such cases. Section 24, read with section 106, provided that, in all cases in which injury was done to land by the escape of water from a canal or drainage-work, or from the failure of any drainage-work, or from the interruption of the drainage of lands, by canals or drainage-works, should be compensated, as though the loss had been caused by the interruption of a water-supply. Thus, in fact, the present Bill, so far from placing proprietors or occupiers in a worse position than before in these respects, for the first time prescribed a specific remedy for such cases.

The Hon'ble SIR HENRY DURAND asked permission to say that the explanations offered had not satisfied him, and that he would leave the Select Committee to deal with the objections he had raised.

The Motion was put and agreed to.

The following Select Committees were named :—

On the Bill to amend the law relating to prisons in the Panjáb and the Provinces under the immediate administration of the Government of India—The Hon'ble Messrs. Chapman and Cockerell and the Mover.

On the Bill to regulate the consolidation and maintenance of Public Works for Irrigation, Navigation and Drainage—The Hon'ble Mr. Strachey, the Hon'ble Sir R. Temple, and the Hon'ble Messrs. Stephen, Forbes, Chapman and Cockerell and the Mover.

The Council adjourned to Friday, the 25th February 1870.

GOVERNMENT OF INDIA.

HOME DEPARTMENT.

COTTON CROPS IN THE CENTRAL PROVINCES AND THE BERARS.

No. 572, dated 10th February, 1870.

From—H. RIVETT-CARNAC, ESQ., *Cotton Commr. for the Central Provinces and the Berars,*
To—*The Secretary to the Chamber of Commerce, Bombay.*

In continuation of former correspondence, I have now the honor to submit, for the information of your Chamber, the usual report on the state of the weather in the Central Provinces and the Berars during the month of January last.

2. Advices sent to your Chamber early in the month by letter and by telegraph, will have shown you that the New Year was ushered in with damp, gloomy, unseasonable weather, accompanied by heavy showers of rain.

3. By the 8th of the month, the clouds had cleared away, and the cotton plants began to revive with the help of the clear, bright days that followed. But on the 17th, the rain again returned, the bad weather extending from Khangaon to Hingunghât, and telling heavily on the crop which had already suffered severely. During the last week of the month, the weather was again clear, and, up to date, there has been no return of the damaging rain, and the equally disastrous close, cloudy weather which accompanies it.

4. *The Wurdah Valley* (*Hingunghât*).—You have received in a former communication a detailed account of the damage done to the crop in this quarter. Since the date of that report no material change had taken place. The more recent bad weather has not done much more damage there, as most of

the crop was off the ground before the rain returned, but the damp has delayed cotton-cleaning, and to this cause the comparatively small arrivals in the markets may partly be attributed.

5. The Assistant to the Cotton Commissioner in the Wurdah Valley reports, under date the 4th instant, as follows:—

"During the week, I have visited Wurdah and Arvee. Cotton is now coming into these places in greater quantities. The Hingunghât supplies also have much increased, and I hope that the real cause of the cotton not coming in earlier may have been more from the fact, that the Natives have been keeping it back than that the crops have been so bad that there is not the cotton to bring in. Captain Ricketts, the Deputy Commissioner of Wurdah, is also of opinion that the Natives are, to a great extent, keeping back the cotton."

6. The rain-fall registered at Hingunghât during the month was as follows:—

January 17th ...	... ...	Inches ·40
„ 18th ...	... ...	„ ·09
„ 19th ...	... ...	„ 1·63
„ 20th ...	... ...	„ ·10
„ 21st ...	... ...	„ ·90
	Inches ...	3·12
Registered previously from commencement of monsoon ...	... ...	39·61
	Total Inches ...	42·73

7. *East Berar* (*Oomraotee*).—The Assistant to the Cotton Commissioner, who, in accordance with my instructions, has been on tour through the districts, reports that the plants have suffered very severely from the rain and worm. Most of the cotton had been picked. Owing to the damp, the plants were beginning to flower again. It was not, however, expected that the bolls would come to maturity. The cultivators and small dealers, the Assistant reports, are inclined to put the loss down at "eight annas in the rupee" (50 per cent.), or even more of the crop, but then these classes are not, as a rule, remarkable for expressing the most cheerful opinions regarding the out-turn, and some of them perhaps realise that if the story that the crop is a short one can be well supported, prices may be affected. It would be well, therefore, to accept such accounts with caution, and although the damage has doubtless been considerable, still I am inclined to believe that the estimate noticed above is exaggerated, and the Commissioner of East Berar, who has been good enough to cause enquiries to be made through the District Officers, confirms this view. Writing on the 14th ultimo, Colonel Nembhard stated:—

"The result of enquiries made by me, first through the Deputy Commissioners, and secondly by myself, throughout a large portion of my division, is that the cotton has not suffered so much by the recent rain as articles published in the daily papers would lead one to suppose.

"The present crop was certainly not equal to that of last year, but then last year's crop was an exceptionally large one.

"I estimate the loss in the present crop caused by the recent rain as follows:—

Oomraotee District	...	... 2 annas.
Woon Districts	...	... 2 „
Ellichpore District	...	... 4 „ out of 16 annas."

Since the above was written, the plants have again suffered from the rain and the worm.

8. The Government Seed Garden at Oomraotee has not escaped; Mr. Pillans, one of the gardeners recently sent from England, reports:—

"I stated in my last report that I hoped to get nearly as much cotton from the garden as had already been picked, but, on examination of the plants, I found they were covered with worms and with a red fly, which were completely destroying the bolls."

9. Cotton is now coming into the Oomraotee market in larger quantities than before, as the accompanying extract from a letter just received from the Assistant to the Cotton Commissioner, and dated the 6th instant, will show:—

"During the last three days, cotton has been coming into the market in larger quantities than usual. This morning (the 6th) was the 'Busunth Punchmee,' when about 1,000 *Bhojahs** were in the market. On the 'Busunth Punchmee' the brokers and cultivators have to fulfil the contracts entered into with the merchants of Oomraotee for the delivery of cotton. Every cultivator, who had not made a contract, hoped, therefore, that on this day cotton would fetch a higher price than usual, and tried his best to keep back his cotton till then. On the 'Busunth Punchmee,' however, the price was only Rs. 90 per *Bhojah*, whereas on the preceding day, it was as high as Rs. 94 and 95."

10. *West Berar* (*Khangaon and Akote country.*)—The Assistant to the Cotton Commissioner, under date the 28th of January, writes as follows:—

"The weather has been cloudy and unsettled-looking, but there has been no rain, and the Natives have been busily employed in picking and cleaning. The most of the first picking is now secured, and the villages are full of cotton; but unfortunately there is a scarcity of labour to clean the *Kuppas* (cotton in the seed), and the receipts at the cotton marts are consequently small.

"The greater portion of the cotton that has been brought in up to date is stained and full of black leaf, but, as anticipated, some small lots from the Jurree country have been found to be very fair, and I hope, in the course of the season, to see a considerable quantity of this cotton.

"I still hear great complaints about the raid of the cotton worm, and the damage it has done is so great, that I fear, notwithstanding the increased area under cotton cultivation this season, the crop will not be so large as last year's."

Under date the 5th instant, he adds:—

"The general opinion appears to be that the crop this season is a very short one. Some say it is not more than an eight anna one, others put it down at equal to twelve annas. I think the latter calculation is likely to be correct, but it is very difficult to form an opinion. The worm has done immense damage, and in some beautiful fields which have come under my observation, fully one-half of the produce was destroyed by them. But some villages have been affected less than others, and, on the whole, considering the increased area under cultivation, I would venture to say the crop will not be less than a twelve or thirteen anna one.

"Merchants are alarmed at seeing the small receipts at the markets, but the villages are full of *Kuppas* (cotton in the seed), and the only reason of delay in bringing it in is the difficulty in getting it cleaned. The Khangaon market is, however, gradually assuming its usual appearance. The imports into the market up to date are 19,742 Bhojahs of cotton, 2,704 Kandies of Kuppas, and today as many as 2,500 Bhojahs were registered. Prices varied this morning from Rs. 87 to Rs. 92 per Bhojah according to quality.

11. This worm, which has caused so much anxiety this season, is, so far as I ascertain, identical with the "Boll-worm" of America, a description of which is contained in some papers, which the Minister of Agriculture of the

* The *Bhojah* is about ⅓rd of the Bombay Kandy of 7 cwt.

United States has recently been so good as to send me.* The non-appearance of the worm during a fine season is explained by the fact, that dry, hot days destroy the eggs of this cotton enemy, whilst the damp weather is favorable to them. Unfortunately it does not appear that any inexpensive artificial measures can be adopted to stop the ravages of this blight, which is equally destructive to the *thoor* (*Cytisus Cajan*) and other crops. It is to be noticed that the cotton plant, when in a healthy condition, resists the attacks of this worm. In an ordinary fine season, the exotic plants, which do not like bright, warm days, suffer from it, and the indigenous cotton escapes. During a damp season, the reverse is the case. In fact, the damp, unseasonable weather, so fatal to the indigenous plant, seems to suit the exotic cotton excellently, and the New Orleans and other varieties are now in far better condition than they have ever been before, and have suffered less severely from the worm than the indigenous cotton. Recently, I have visited several experimental fields of exotic cotton in the neighbourhood of Calcutta. Here the weather has been clear and fine, just what our Berar cotton would have liked. But the worm had attacked nearly every single boll on the foreign plants.

12. Your Chamber will realize that it is extremely difficult to estimate with any accuracy the effect of the damage done to the crop. My former reports, and the extracts from letters given above, will assist you in forming an opinion on the subject, and of judging roughly of the prospects of the supplies from the Central Provinces and the Berars during the present season. You will have seen that the crop of the Wurdah valley has suffered severely. As regards the Oomraotee country, the bad weather of the middle of January was subsequent to the date of the estimate of the crop, with which Colonel Nembhard was so good as to furnish me, and which has been quoted above, and that estimate consequently requires some emendation. The damage in East Berar has not been less than in Oomraotee, and I have also the authority of Mr. James Melville, who, early in the month, made a careful examination of much of the cotton country, for saying that the rain and worm have undoubtedly destroyed many of the plants and bolls; and my own inquiries and observation confirm this view. That the crop has suffered much in quality, there can be no doubt. On the other hand, in estimating the out-turn, and comparing it with last year's supplies, the extension of the cultivation which this season has witnessed, and the details of which have already been supplied to you, must be taken into account. It is also, I think, correct, as has been more than once noticed to me, that if the rain and damp weather have brought out the worm, they have also had the effect of bringing out many new flowers and pods, which would, to some small degree, balance the damage done. With the facts and figures which have already been communicated to you before your Chamber, you will be able to judge, nearly as well as I can, of the number of bales, which our cotton country is likely to be able to supply this season. My own view, such as it is, is as follows. Early in the year, when the fine weather returned, although I knew that the damage to the crop had been considerable, I was in hopes that the plants would recover, and that the extension of cultivation would nearly balance the damage done, and that there would consequently be hardly any appreciable falling-off in the exports. Since then, the return of the bad weather has not only prevented the recovery of the weak plants, but has also done much further damage. I fear, then, we must look for a smaller out-turn than usual. Any prediction of the number of bales that will be supplied by these Provinces this season, must, at the best, be a not-very-reliable guess. But the majority of well-informed persons, whom I have consulted on the subject, think that we must expect a falling-off of about one-fifth in this season's exports; and I believe this to be as correct an estimate as can at present be formed. I return to the Berars immediately, and I shall not fail to communicate without delay to your Chamber any further information that I may receive on this important subject.

* See Appendix.

13. This much at least is certain that as yet, this season's exports of cotton to Bombay have been very small as compared with the figures of last year. The usual statement in detail is given on the next page, and from this it will be seen that, taking the full-pressed bale and half-pressed bale to represent, on an average, the Bombay bale of half a Kandy, or 392 lbs., and the Dokra as representing ⅓rd of the above bale, the exports up to the end of last month amounted to but 23,391 bales, against 70,175, the figures up to the same date of the preceding year. This great falling-off is, to some extent, to be accounted for. The season was exceptionally late. The jowaree (millet) harvest was one of the fullest that has been known in the Berars for years, and the cutting and storing of this large crop delayed the picking of the cotton. Then the cleaning of the cotton has been, time after time, put a stop to by the rainy weather, for as you are aware, cotton, when damp, will not pass through the "churka." The extract given above from the report of the Assistant Cotton Commissioner at Oomraotee gives an example of one of the many causes that tend to keep back the cotton crop. Many of the cultivators and middlemen are now so well off that they can afford to hold their cotton for some favorable turn in the market, and as the price of cotton often rises as the season progresses, the cultivators have no great inducement to dispose of their crop before February.

14. The branch line of railway to Khangaon, in which your Chamber has evinced so much interest, is very nearly finished, and will yet, it is hoped, carry a large proportion of this season's cotton crop.

15. I have recently received, through the courtesy of the Board of Revenue, a copy of the report on the prospects of the cotton trade in the North-Western Provinces for the season 1869-70. As hereafter some portion of the cotton crop of Northern India may find its way across, by the main line of the Great Indian Peninsular Railway, to Bombay, the accompanying figures, taken from the report, may not be without interest to your Chamber. The following table shows the area under cultivation in the several divisions, or groups of Collectorates of the North-Western Provinces, during the present season, as compared with 1868-69:—

Divisions of the North-Western Provinces.	Area in Acres. Out-turn in Cleaned Cotton of Maunds of 40 Sheers or 80 Lbs.			
	1868-69.		1869-70.	
	Area in Acres.	Out-turn in Mds.	Area in Acres.	Out-turn in Mds.
Meerut	1,51,222	1,61,744	1,74,715	2,26,463
Rohilcund	1,27,540	69,330	1,74,681	1,46,811
Agra	2,60,296	1,61,659	3,52,132	3,07,351
Jhansie	49,379	9,550	75,829	40,567
Allahabad	2,58,179	95,974	3,18,553	2,31,176
Benares	18,667	14,390	22,649	14,547
Total ...	8,65,283	5,12,647	11,18,559	9,66,915

16. In regard to the season, it is stated that "the prospects of the crop are everywhere reported to be most promising, and there is apparently no question that the yield will be singularly good compared with last year." With reference to the out-turn, it is added:—

"The returns supplied to the Board can only be taken to indicate the breadth of land relatively under cotton in the years to which they refer. The estimated yield is far too rough to be of value."

STATEMENT showing in detail the quantity of Cotton exported from the Stations of G. I. P. Railway, in the Central Provinces and the Berars, from the 1st October 1869 up to 30th January 1870, as compared with the quantity exported up to the same date in the season of 1868-69.

Total Bales...	70,175		23,391	46,784

17. The latest figures represent the area under cotton cultivation in the several divisions of the Punjab to be as follows:—

Rawul Pindee	(4 districts)	1,29,230	Acres.
Delhi	3	„	87,166	„
Lahore	3	„	86,926	„
Umritsur	3	„	82,827	„
Mooltan	4	„	81,338	„
Jullundur	3	„	67,071	„
Umballa	3	„	41,269	„
Derajat	3	„	40,467	„
Peshawur	3	„	33,010	„
Hissar	3	„	30,490	„
Total	679,294	Acres.		

As you are aware, a portion of this crop finds its way to Kurrachee. I have recently seen in Calcutta some fine parcels of Umritsur cotton, which have come down nearly the whole distance by rail.

18. Oude, so far as I can at present learn, exports no cotton, but draws away some portion of the North-Western Provinces crop; and at Ghazeepore and other marts in the North-Western Provinces, large quantities of cotton are bought up for local consumption, and for export beyond our eastern frontier

19. The accompanying table, with which the Agent of the East Indian Railway has been kind enough to furnish me, shows the chief cotton-exporting stations on this line of railway. The large exports of Delhi may, I imagine, be partly accounted for by the fact that, during a portion of the period to which this return refers, the railway line was not open to Umballa, and much of the cotton from the North-West was taken to Delhi by cart along the Grand Trunk Road. I have not as yet been able to procure reliable returns of the quantities of cotton carried down the river by country boats.

STATEMENT showing the quantity of Cotton exported from the Stations on the E. I. Railway from the 8th November 1868 to 30th October 1869.

[The Bale here contains about 300 lbs. of Cotton.]

Cawnpore	41,193	Burdwan	85
Total ...	187,060	Total ...	2,20,887

20. The following figures received, within the last few days, from the Secretary to the Board of Trade, showing the total imports of cotton into the United Kingdom during the past year, will be of interest to your Chamber. It will be seen that India heads the list, 780,000 cwt., or about 200,000 bales of 400 lbs. more of Indian cotton having been imported during the year than American cotton, which stands next on the list. A very large proportion of the Indian cotton was however re-exported.

APPENDIX.

The following account of the American "BOLL-WORM" is taken from a paper by Mr. Joseph B. Lyman, of Louisiana, sent me by the Hon'ble Horace Capron, Minister of Agriculture of the United States of America. I fear the modes of expelling the pest herein suggested could not be undertaken in this country.

Enquiries are now being made to ascertain whether the boll-worm of Berar is identical with the species described in this paper.

Besides the "boll-worm," other destructive insects have been found on the cotton plants in Central India and in the neighbourhood of Calcutta, and specimens have been submitted for examination to Mr. Wood Mason, the Assistant Curator of the Indian Museum, who has very kindly consented to report on them.

H. RIVETT-CARNAC.

"THE BOLL-WORM."

"Unlike the caterpillar and the army-worm, the boll-worm is an annual pest of the cotton plant, hybernating in the ground, and commencing depredations as soon as the young forms begin to swell. He never destroys a crop as they do, but pierces three, four or sometimes ten, bolls, nearly or quite killing them, at length penetrating to the centre of a full-grown boll, where he lies concealed till near the time of his transformation.

"The peculiarity of this worm is that his natural food is corn, which he always prefers, but will attack cotton if the other plant is not at hand. The moth which produces the worm is thus described by a planter in Jackson, Mississippi, who has evidently made the subject a study:—'Of a pale yellow or shining ash color; length of body and wings, an inch and one-eighth; the wings expanded two inches, the upper covering the lower; below the centre, and near the border of the upper wings are two dark spots, with two or three indistinct ones on each upper wing: end of the wing whitish, having a wavy dark band near the border. Throat a little convex, downy: abdomen, color of wings, and downy: proboscis folded spirally underneath, double, half an inch long; eyes large, clear, yellowish-green. Six legs, antennæ fusiform: lies concealed in the day in fence corners and around stumps, flies only late in the evening, and at night near the ground, and rapidly.'

"In the early part of July, this moth pairs, and in four days lays about seven hundred and fifty eggs, soon after which it dies.

"These eggs are deposited on the silks of corn. In three days they hatch, and the young worms commence feeding on the green corn and the silk. Remaining here about two weeks, the worm then goes down into the ground to the depth of three inches, where it is transformed into a chrysalis of bright mahogany color and conical shape, and about an inch in length. In sixteen days the moth above described bursts from the chrysalis. The moth of the second generation finds, at this time of the year, little or no corn in the silk in the cotton latitudes, and in the absence of its favorite plant, lays its eggs on the top bud, or on the ends of the side buds, of the cotton plant.

"At the time of this deposit, if the weather is dry and the sun very hot, most of the eggs perish or become abortive. *This is the reason why moist wheather in August forebodes an attack of the boll-worm.* But no season is so hot and dry but some worms will be hatched, and they commence to spread downward upon the plant and commit depredations on the boll.

"The Boll-worm is thus accurately described by Mr. Boddie, of Jackson:—

"'The Larva or Caterpillar, when full grown, will measure from an inch and a half to an inch and three quarters in length: it looks, to a superficial observer, brown, pale yellow, and light green, though it has eight longitudinal

streaks of white, brown, and green, with one or two dots on each segment of the body along the lowest streak. It is smooth, shining, naked, with a few hairs on each segment of the body. It is of a cylindrical form, tapering a little at each end: rather thick in proportion to its length, and has six legs in the fore part of its body, eight at the middle, and two near the tail. The head is brown, smaller than the body, and oval in shape.'

"After thus destroying from one to eight or ten bolls, the reptile descends and rolls himself into a cocoon or egg, in which to get through the coming winter and spring, for nature prepares no food for him during nine months of the year. The eggs or cocoons that hybernate must be hidden in the neighbourhood where the perfect insect lived, that is, in the cotton-fields or near them. It is doubtful whether any are hidden in the soil of the corn-field where there is cotton any where near, for after July, the animal entirely deserts corn, and goes to the cotton-fields. This is the case, at least, in the district where cotton flourishes best, for there the corn nearly all hardens late in July, or early in August. Thus in the northern part of the cotton belt, as Tennessee and North Carolina, the boll-worm does little injury to cotton, for there he can find green corn till quite late in the season.

"These preferences and habits of the boll-worm understood, it is not so difficult to prescribe a course of treatment that will rid the cotton-fields of his presence.

"There are two modes, and, so far as now known, but two modes, of expelling this pest: starving or killing the moth, the other by drawing it to corn, its natural food, and keeping it there.

"Rotation of crops managed so as to place the corn at some distance from cotton, and throwing out the cotton-field to lie fallow a year, will destroy almost all the eggs of the boll-worm.

"Suppose that a cotton farm is so far remote from others as to enable the planter to interpose a mile of woodland or pasturage between the cultivated fields of each. In September, the worms descend from the bolls and enter the ground. Let the ground lie fallow, or be sowed with oats the following year. In August, when the moth emerges from the ground, she may find neither corn nor cotton within a mile upon which to deposit eggs. Her flight is low, and her days are brief. The chances are that she will perish before reaching either of the plants upon which she and her young feed.

"The exposure of a mixture of molasses and cobalt, with a little vinegar, at the edge of a cotton-field, and nearest the corn from which they migrate in the latter part of July and first of August, would probably attract and poison large numbers of them. By carefully noting the time of their moving upon the cotton, it might be effective to send out early in the morning the whole force with paddles or little hand-nets, to walk abreast down the rows next the corn, and catch and kill them as they fly up. Where corn and cotton are adjacent, the moth settles in the first rows of cotton as soon as she leaves the other plant, and by patrolling these rows every morning, the most of the invaders might be destroyed.

"Another mode of overcoming the difficulty would be to provide other and more attractive pasturage for them than the cotton boll. This could be done by having a small field of late corn next the cotton, that would be in silk as late as the latter part of August or the first of September. The worm would not be likely to leave the corn for the cotton, until it was too late for him to work much injury.

"The same might perhaps be better attained by having rows of late corn, at intervals of twenty or thirty feet, through the cotton-field. This arrangement would be sure to draw all the moths late in the season to that field. Their cocoons would be buried in the soil, and by turning out that field to rest for a year or two, and transferring the crops to some distance, the race of boll-worms on that place might be exterminated."

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

PROPOSED FLOATING BRIDGE ACROSS THE HOOGHLY BETWEEN CALCUTTA AND HOWRAH.

No. 108 B—C, dated 24th February, 1870.

From—COLONEL R. STRACHEY, R. E., *Offg. Secy. to the Govt. of India*, P. W. DEPT.,

To—*The Secretary to the Government of Bengal, in the P. W. Dept.*

I am directed to acknowledge the receipt of Major Taylor's letter No. 46 G, dated 8th ultimo, relative to the construction of the proposed floating bridge across the Hooghly, and Mr. Leslie's superintendence of the work.

2. Premising that the recent orders of the Secretary of State have finally settled that the floating bridge shall be carried out in preference to a permanent fixed bridge, the first point that calls for remark is the agency under which the work is to be executed. The Hon'ble the Lieutenant Governor, in the letter now under reply, repeats the conclusions stated in his Minute of the 30th June 1869, that the Government should construct the bridge, and that it should neither be given to a Company, nor entrusted to the Calcutta Municipality, as suggested by the Secretary of State in reference to the fixed bridge. The Lieutenant Governor, while expressing his concurrence in the opinion to the above effect given by the Commission on the bridge, does not state the specific grounds that have led him to the conclusion beyond saying, as regards the Municipality, that the work is one which should be undertaken by the State rather than by a local body, who have no special interest in the matter, and whose general functions and constitution do not point them out as being particularly well adapted to undertake such a work.

3. Referring to the Report of the Commission, it is seen that no specific reasons are given for the conclusions arrived at, that the Government should construct it, and that it should not be given over to a Company.

4. On the best consideration that the Governor General in Council has been able to give to the matter, the conclusion of the Hon'ble the Lieutenant Governor and the Commission on this point appear to be sound. The grounds on which this is arrived at may be stated.

5. First, the Government of India agree with the Commission that if it be practicable, the bridge should be toll-free. The precise manner in which it is thought such a result might be secured will be mentioned hereafter, but under no circumstances does this seem compatible with the construction of the work by a private Company. Further, the Government of India fears that the risk of unforeseen claims for compensation, arising from the possible necessity for removing the bridge, or from any of the arrangements made with a Company, proving in practice to be incompatible with the proper navigation of the river, or (as in the case of the levy of tolls) with the convenience of the traffic passing over the bridge, is such as to render the intervention of a Company inexpedient if other equally satisfactory means of carrying out the work can be obtained.

6. The suggestions that have been made for removing objections of the sort last mentioned do not seem to the Governor General in Council to be satisfactory. His Excellency in Council by no means affirms that such a bridge as is now proposed will lead to any serious difficulties in its construction or maintenance, or interfere objectionably with the navigation of the river. But it is impossible to avoid the conclusion that if public inconvenience be caused in any way by the bridge, and if its construction be permitted by the Government, the Government will be so far responsible that they would be bound to see that immediate measures were taken for remedying such inconveniences; and doing

this might readily involve heavy pecuniary liabilities. The suggestions of Mr. Leslie as to the terms on which the bridge, if made by a Company, could be taken possession of by the Government, do not appear to meet the point in a sufficient way.

7. The Government of India would have been glad if the requirements of the case had been compatible with the acceptance of the offers of private capitalists to carry out the undertaking without Government interference. But in the nature of the case, it seems impossible to accomplish such a result, and on a full consideration of the circumstances, the conclusion seems unavoidable, that the Government should construct the bridge itself.

8. The Governor General in Council continues to be of opinion that the general management of the bridge during its construction, as well as after it is opened, may best be handed over to a Trust, something of the nature of that about to be constituted for the improvement of the Port of Calcutta. It appears to His Excellency in Council, indeed, that there is no reason why the same body of Commissioners should not manage the bridge and the port improvements; it being understood that an entirely separate account would be kept for the bridge, which should financially be considered as altogether a distinct undertaking, a special Commissioner being perhaps added in the case of the bridge, in the interest of Howrah. The Office establishments and subordinate establishments, &c., of the Commissioners would be perfectly suited for the purposes of the bridge, and the engineering operations would, to a great extent, be alike in the two cases.

9. Such an arrangement would not, it appears to His Excellency in Council, at all interfere with the proposed employment of Mr. Leslie as Engineer for the bridge. Under any circumstances he must communicate with the Lieutenant Governor through some established Office, and the intervention of the Commissioners would not seem to be likely to lead to inconvenience, and would have some positive advantages.

10. It has already been explained to the Lieutenant Governor that the Government of India is not in a position at the present moment to offer continued employment to Mr. Leslie. It would consequently appear to be the best plan to make an arrangement with him, by which his remuneration should be fixed for the completion of the whole work in a lump sum. The Government of India would not object to the time during which he might be employed on the bridge being eventually reckoned as service under Government, should it be found possible to take Mr. Leslie into the service of the Government permanently on the completion of this work. Any arrangement that may be suggested by the Government of Bengal for giving effect to the above suggestion will receive immediate attention.

11. The Governor General in Council would have been unable to enter upon any question of specially allowing time to Mr. Leslie for pension, had he entered the service of the Government, for reasons which have been explained in reference to the claims of like nature made by officers of the East India Irrigation Company.

12. As to the amount of salary to be proposed to Mr. Leslie, the Government of India thinks that a sum equivalent say to 2 years' salary on a liberal scale might be named, a portion to be paid as the work went on, and the balance on completion. In this sense a total sum of £4,000 might be now suggested as suitable, it being left to the Hon'ble the Lieutenant Governor to modify the offer as he thinks fit, the final approval of the Governor General in Council being reserved to anything in excess of that amount.

13. It will no doubt be necessary to communicate with the Board of the Eastern Bengal Railway as to Mr. Leslie's undertaking the work of the bridge. Any plan that is agreed to by the Board, and supported by His Honour, is likely to receive the assent of the Government of India, and the further steps to be taken in this matter are left to the Hon'ble the Lieutenant Governor.

14. When an arrangement has been come to with Mr. Leslie, his advice might properly be taken as to the precise mode of proceeding further in respect to the preparation of designs and estimates, and setting about the execution of the works by contract or otherwise.

15. It only remains for me to refer to the financial part of the question. The Government of India, on a further consideration of the matter, is disposed to think that the needful security for the payment of Interest on the capital required, which would be advanced by the Government of India, and the necessary contributions to a Sinking Fund may be very conveniently obtained by placing a charge on the passengers and goods traffic of the East Indian Railway leaving and arriving at Howrah. A suggestion of this sort, it is understood, has been made by Mr. Leonard in an unofficial form, and there is reason to believe that the plan would be agreed to by the Railway Company.

16. The Governor General in Council is informed that a very small terminal charge on the Railway passengers and goods, which would fully meet all probable requirements for the bridge, would be less onerous than the actual existing cost of crossing the river by the East Indian Railway Company's steam ferry. The convenience of a free bridge to the passengers and goods seeking or leaving the Howrah Station would be very great, and the advantage would be felt alike by the Railway Company and its customers. The Railway Company might properly be paid a moderate percentage on the terminal rate which they received for the Bridge Trust.

17. It would, however, be right to consider at the same time whether a charge should not be put on carriages and carts crossing the bridge, not going to or from the Railway Station. It is believed that by a very simple arrangement the Railway Station traffic could be led from or to the bridge on the Howrah side of the river, by a different road to that used by the Howrah town traffic, and a toll could be put on the latter at a place far enough removed from the bridge, to prevent all risk of obstruction by the stopping of carts, &c., while paying toll. The Governor General in Council would be disposed to permit the foot passengers to cross free, if on a further calculation the income was thought likely to be sufficient without making such a charge.

18. In order to be prepared for all eventualities, however, His Excellency in Council thinks it will be better to take power to put tolls on the bridge or its approaches, as well as to levy the Railway terminal charge. It might also be considered whether a power should not be taken to commute the Howrah toll for a payment to be made from the Howrah Municipal Fund. These are points left for the consideration of His Honour the Lieutenant Governor.

19. A Legislative enactment may probably be found necessary to give effect to the conclusions come to, both as to the levy of tolls, &c., and the constitution of the Special Trust, and the disposal of surplus funds. Also, perhaps, some powers may be needed in respect to the erection of the bridge, and the obstruction it will cause in the river, so as to guard against risk of claims for compensation, based on real or alleged inconveniences to individuals or damage arising from accidents. This should be considered.

20. In conclusion, I am to observe that the views of the Governor General in Council on some of the points above noticed have been now stated in detail, with the object of facilitating an early decision as to the basis on which the construction and management of the bridge is to be placed, but the Hon'ble the Lieutenant Governor is requested to understand that the Governor General in Council has no desire to prejudge the questions that have been discussed, and will be glad if His Honour will favour the Government of India with any further remarks or suggestions on any point relating to any part of the subject, which are deemed likely to lead to an early and satisfactory settlement of the matters now calling for attention.

REDUCTION OF THE ORDINARY GRANT FOR PUBLIC WORKS.

No. 1, dated 4th January, 1870.

From—The Secretary of State for India,
To—The Government of India.

I have had under consideration in Council your Excellency's Despatch No. 134 of 27th September last, wherein are detailed certain arrangements in the Public Works Department deemed advisable for bringing the revenues and expenditure of India into early and permanent equilibrium.

2. It may be almost superfluous in replying to this Despatch to premise that the general views and sentiments expressed in it have my cordial concurrence. The paramount force of the financial necessity to which your Excellency appeals in justification of the course proposed to be pursued seems to me scarcely to admit of dispute, and your Government may rely on my earnest co-operation in enforcing whatever economy that necessity may enjoin.

3. I approve, too, with little more reserve, of the particular measures which your Government have in contemplation in order to give effect to their views on this important subject, and, by means of which, what may be taken as the normal expenditure out of revenue on public works ordinary may in future be reduced from about five and three-quarter millions to about four and a half millions sterling a year. It cannot indeed be otherwise than matter for regret that the prosecution of undertakings highly conducive in various ways to the well being of the country should be sensibly delayed, but progress of any kind must be dearly purchased at the cost of serious financial embarrassment, and I am, besides, very willing to believe with your Excellency, that with regard to one of the classes of work which the proposed reductions will affect the delay will be more apparent than real, and that, with regard both to it and to another class, some diminution in the recent rate of speed may be amply compensated by improvement in the mode of carrying on the works. If there be good grounds for the conviction entertained by your Government, that the system upon which barrack building has of late proceeded is susceptible of modifications which would allow of equal substantial advantages being afforded to the troops at greatly diminished cost, not only large pecuniary saving, but much earlier completion of the work may, as you say, be expected to result.

4. If, again, the impossibility of continuing the old rate of outlay upon roads from the national treasury should cause, as your Excellency appears to expect, the charge of road construction and road maintenance to be transferred from imperial to local funds, financial pressure will have hastened the adoption of another administrative reform which has long been recognized as very desirable.

5. In connexion with barrack building, I observe with satisfaction that it is by omission of superfluous items of construction, and by changes in the geographical distribution of the army, that the chief saving in that respect is to be effected. The language uniformly used by your Excellency in discussing this part of the subject shows how strongly you feel that any diminution of the accommodation really required by the troops would be the reverse of true economy.

LAHORE,
The 16th February 1870.

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Friday, the 25th February 1870.

PRESENT:

The Hon'ble G. Noble Taylor, Senior Member of the Council, *presiding.*
Major General the Hon'ble Sir H. M. Durand, C. B., K. C. S. I.
The Hon'ble Sir Richard Temple, K. C. S. I.
The Hon'ble J. Fitzjames Stephen, Q. C.
The Hon'ble Gordon S. Forbes.
The Hon'ble D. Cowie.
Colonel the Hon'ble R. Strachey, C. S. I.
The Hon'ble Francis Steuart Chapman.
The Hon'ble J. R. Bullen Smith.
The Hon'ble F. R. Cockerell.

COURT FEES BILL.

The Hon'ble MR. COCKERELL presented the second Report of the Select Committee on the Bill to provide for the better regulation of Court Fees.

OBSOLETE ENACTMENTS BILL.

The Hon'ble MR. STEPHEN, in moving for leave to introduce a Bill for the repeal of certain obsolete enactments, begged leave to make a few remarks on the principle involved in the Bill, inasmuch as it was part of a general scheme on which he should like to offer a few explanations. So long ago as the year 1797, it was enacted by the Statute 37 Geo. III, c. 142, s. 8, "that all Regulations which shall be issued and framed by the Governor General in Council at Fort William in Bengal, affecting the rights, persons, or property, of the Natives, or of any other individuals who may be amenable to the provincial courts of justice, shall be registered in the Judicial Department, and formed into a regular Code, and printed, with translations, in the country languages, and that the grounds of each Regulation shall be prefixed to it." He (MR. STEPHEN) was sorry to say that, except to a very limited extent, that provision had never been carried into effect. The exception to which he referred was the case of Bombay. The Bombay Regulations were in 1827 formed into a Code, which had many merits. There was no scheme under the consideration of the Government as ambitious as that which was suggested by the Statute to which he had referred, but the present Bill was part of a scheme for carrying into effect the more modest intention of consolidating and re-arranging the written law of India. The process of consolidation was now thoroughly understood, and had been carried to a considerable extent in England, but its importance here was, if anything, even greater than in England. It might be thought that any extensive scheme of legislation in India required an apology. A great deal had been said of late, both here and in England, on the evils of over-legislation in India, and there could be no doubt that every needless or ill-considered act of legislation was an evil; but he thought that, if the subject were carefully looked into, it would appear that the accusation made against the Indian Government of legislating too much was unjust, although there was some justification for the charge that their legislation was intricate and ill-arranged. Nothing, however, could be more natural than that persons who had not studied the subject carefully should suppose that there was too much of it. When people saw four separate Legislative Councils sitting for a great part of the year and passing a

large number of laws relating to every sort of subject, it was natural enough to speak of over-legislation, and to say that it was time that the process should be arrested. With regard to such remarks, there were several matters to be taken into consideration, which people were very likely to overlook. In the first place, it was easy to under-rate the demands of so vast a territory, and in the second place it was still more easy to confound the apparent with the real additions made by legislation to the body of law actually in force. If any one took the trouble to look closely into the matter, he would find that, so far from the whole body of law being rapidly increased by current legislation, a very large proportion of the enactments tended to diminish the number of laws. The work done was rather the adaptation of old laws to fresh circumstances, than the production of new ones. He (MR. STEPHEN) could hardly give a better illustration of this than the Court Fees Bill, the second report on which Mr. Cockerell presented this day. That Bill certainly, in one sense, was an addition to the law: it would put one new Act into the statute-book, but it repealed six Acts entirely and thirty others partially, and the consequence was that the effect would be, not to increase, but to diminish, the existing body of law on the matter. The process to which he referred, when thoroughly carried out, would result in this, that all Acts which related to the same subject, at least which related to subjects of importance, would be thrown each into one statute, and the repealed Acts and the enactments by which they were repealed would be omitted from the collection of statutes. If a distinction were made between Acts of local and Acts of general application, if the Acts which referred to British India generally were put into one collection, and if all those portions which related to separate provinces were separately published, the real extent of the law would be found to be far smaller than was supposed; the law itself would be rendered far more intelligible, and people would no longer be at a loss where to look for the information which they required. The advantages in fact of such an operation would be so great and obvious that he did not think it necessary to dwell on them.

He would now proceed to point out the reasons which made it specially desirable that the task in question should be undertaken. He did not think that the nett amount of the written law of the country was very large—it was rather, he thought, exceedingly small—when you took into consideration the number of provinces to which those laws related, their great extent, and the variety of circumstances in which they were placed. No doubt, however, the absence of an arrangement of the laws was a great evil, and few persons who had not specially directed their attention to the subject, had any idea of the extent of intricacy in which the written law of India was involved. He (MR. STEPHEN) would go into a short detail on this point, with the object of stating, for the information of the Council and of the public, what the actual state of the written law of British India was. The English Government had not enacted any written laws in India with which we need now concern ourselves before 1792, at which time began the Bengal Regulations made by the Governor General in Council. The Madras Regulations made by the Governor of Madras in Council date from 1802; the Bombay Regulations from 1827. Those Regulations applied to the Provinces in which they were made, and were the first of a series of repositories in which the written law of India was contained. They came down in each case to the year 1834. There, therefore, we had three bodies of local law, each separate and independent, affecting respectively the Presidencies of Bengal, Madras and Bombay. But the Bengal Regulations had a wider operation, because, as new Provinces, previously independent, were brought within the Empire, in some instances the Regulations themselves, and in other instances what was called the spirit of the Regulations, was extended to them; and the effect had been that those Regulations not only extended over Bengal, but also, to a somewhat indefinite extent, over the Non-Regulation Provinces.

In 1834, when the Charter of the East India Company was extended for the last time but one, power was given to the Governor General in Council

to legislate for the whole of British India, and the power to legislate, which the Governments of Madras and Bombay previously had, was taken away. The Act of 1834 was the foundation of the present Legislative Council; and from that date to this, although great modifications were introduced in 1853 and 1861, the laws affecting the whole of British India had been passed in this Council. But besides these laws, passed for the whole of British India generally, from 1834 to 1870, a large number were passed by the Legislative Council between 1834 and 1861 for the Presidencies of Bengal, Madras and Bombay, which during that period had no legislative bodies of their own; and therefore we got, besides the three bodies of law already referred to, four sets of Acts,—those relating to the whole of British India, those relating to Bengal, those relating to Madras, and those relating to Bombay, passed by the Governor General of India in Council in his legislative capacity. In 1861 was passed the Indian Councils' Act, under the authority of which legislatures were established for Bengal, Madras and Bombay. The Governor General in Council, sitting as a legislative body, continued, and had since continued, to legislate for the whole of British India; but, with some exceptions, the Governor General's Council had not legislated specially for Bengal, Madras or Bombay. On the other hand, it had legislated for the North-Western Provinces, and for the Non-Regulation Provinces, which included the Panjáb, Oudh, the Central Provinces and British Burma. In the interval between 1834 and 1861, the Regulations made for these Non-Regulation Provinces were made by the Governor General in Council acting in his executive capacity. These executive orders did not appear in any statute-book. The 25th section of the Indian Councils' Act recited doubts as to the validity of these orders, but confirmed those which were then in existence. This provision had been interpreted as prohibiting the Government from making them for the future. Since 1861, the three subordinate legislatures had legislated for their own Provinces, and the general result was this, that we had, as written law, first, the English Acts of Parliament relating to India; secondly, three sets of Regulations from 1792 to 1834; thirdly, the legislative Acts of the Governor General in Council, which might be divided into the Acts relating to British India, the Acts relating to Bengal, the Acts relating to Madras, and the Acts relating to Bombay; then the Acts relating to the Non-Regulation Provinces, namely, the North-Western Provinces, the Panjáb, Oudh, the Central Provinces, and British Burma, passed since 1861. There were, besides these, the Acts of the local legislatures of Bengal, Madras and Bombay, passed since 1861 and in force in those provinces. And in addition to all these, we had the executive orders for the five Non-Regulation Provinces, passed at various periods before 1861. The nett result of the whole was that, including the English Statutes, there were no less than twenty-one different classes of laws prevailing in different parts of British India, and these twenty-one classes of laws were made by eight different authorities.

The following statement exhibited the whole matter in a compendious form:—

There were in force in—

I.—British India—Acts of Parliament		1
	Acts of Legislative Council of Governor General since 1834	2
II.—Bengal—Bengal Regulations, 1792—1834		3
	Acts of Legislative Council, 1834—1861	4
	Acts of Bengal Legislative Council, 1861—1870	5
III.—Madras—Madras Regulations, 1802—1834		6
	Acts of Legislative Council, 1834—1861	7
	Acts of Madras Legislature, 1861—1870	8
IV.—Bombay—Bombay Regulations, 1827—1834		9
	Acts of Legislative Council, 1834—1861	10
	Acts of Bombay Legislature, 1861—1870	11
V.—N. W. Provinces—Executive Orders to 1861		12
	Acts of Legislative Council, 1861—1870	13

VI.—Panjáb—Executive Orders to 1861 14
Acts of Legislative Council, 1861—1870 15
VII.—Oudh—Executive Orders to 1861 16
Acts of Legislative Council, 1861—1870 17
VIII.—Central Provinces—Executive Orders to 1861 18
Acts of Legislative Council, 1861—1870 19
IX.—Burma—Executive Orders to 1861 20
Acts of Legislative Council, 1861—1870 21

These twenty-one classes of laws were made by the following authorities:—I—Parliament, II—The Governor General in Council (for Bengal), III—The Governor of Madras in Council, IV—The Governor of Bombay in Council, V—The Legislative Council of Governor General, VI—The Legislative Council of Bengal, VII—The Legislative Council of Madras, VIII—The Legislative Council of Bombay, IX—The Governor General in Council in his executive capacity.

That, certainly, if we regarded the whole result, was an extremely complicated state of things; but if we bore in mind the extent of the territory legislated for, the number of the provinces and the differences of every kind between their various populations, it was not a great but a small extent of written law. He might add that, if anybody thought that the amount of written law in India was too great, he might console himself with the reflection that we hardly possessed any substantive law at all, as distinguished from laws relating to procedure, applying to the whole of British India, with the exception of the Penal Code. The Indian Succession Act related only to Europeans. We had no general law relating to contracts, no law relating to torts, very little law relating to evidence, and no general law relating to insolvency. Those who thought that enough had already been done, should recollect that those immense heads of law were quite untouched by the legislature, and matters relating to them, where the English law did not prevail, were decided according to the dictates "of justice, equity and good conscience," which meant, in practice, according to the notions which the Judges formed from a few English text-books.

That was the state of things, and that being so, he thought that, on the one hand, the Government ought to be acquitted of having done too much, and, on the other hand, that it ought to be remembered that the course of events had produced a singular and exceedingly intricate state of things, which we ought to reduce as soon as possible to comparative consistency and simplicity. A great deal had already been done, though, for want of judicious arrangement, the fact was not apparent. There never was any authentic collection of the whole written law of British India. Some parts of the written law of India, and in particular the executive orders in force in the Non-Regulation Provinces, had never been collected at all. From time to time, collections had been made of large parts of it under the authority of Government, but there was no book which professed to be a complete compilation of the law, like the English statute-book. Enough had, however, been done to give a good notion of the extent to which the process of repeal and consolidation had been carried.

In 1854, there was published a collection of the Bengal Regulations and Acts, then in force, by Mr. Clarke of the Madras Civil Service, under the authority of the Government. That collection filled three quarto volumes, and contained the whole of the Bengal Regulations and the Acts of the Governor General in Council from 1834 to 1853. Of those three volumes of Acts, then in operation, MR. STEPHEN believed that not half a volume was now in force.

By Acts X of 1861, XVII of 1862 and VIII of 1868 nearly the whole of the Bengal Regulations had been repealed, except those which related to particular subjects, such as Revenue, the Management of Wards and Pensions.

The same was the case, to an even greater extent, with the Madras Regulations, a vast mass of which had been swept away by Madras Act II of 1869. The same process had been going on with respect to the Acts of the

Legislative Council. Every one who had occasion to administer the law of this country was acquainted with the collection of Acts published by Mr. Theobald. That collection consisted of five volumes, with a small additional part. He (MR. STEPHEN) had before him the first of these volumes, which contained the Acts from 1834 to 1848. He had been looking through the volume, in which the repealed Acts were struck out, and, of the Acts passed between 1834 and 1848, there were very few of any general interest or importance in force.

The whole of the Acts now in force, passed during the first forty years of English legislation in India, would go into a very small compass indeed; and it must be remembered that the process had been carried out only recently, because the volume which he held in his hand was published in 1860, and omitted the Acts which had then been repealed. All those Acts had therefore been repealed since, and a very large proportion of them within the last two years. He was not in a position to say to what extent the process had been carried out, but if all the repealed matter and repealing Acts were left out of these five volumes, they would be reduced to a very much smaller compass; and he might further add that, if the contents of that residuum were divided according to the local application of the Acts, it would be found that that comparatively small remainder of unrepealed law contained parts of nine different statute-books. It contained, on the one hand, the whole statute-law (except English Acts of Parliament) which was in force in British India generally; it contained all the laws passed since 1861 which applied to the five Non-Regulation Provinces, and it contained the laws—a very considerable number—which applied to Bengal, Madras and Bombay respectively. If, therefore, you were able to repeal the laws that were really useless, and to divide those which were of use into nine different classes, one for British India generally, one for Bengal, one for Madras, one for Bombay, one for each of the five Non-Regulation Provinces, you would see that the real written law of India was reducible to a very small compass indeed. He would add that many parts of it were arranged in as scientific a manner, and drafted in language as clear and terse, as any body of law in the world.

The present Bill was intended as a step towards the reduction of this intricate state of things to order. The Council would naturally ask, how that task was to be performed, and what part the Legislative Council would be asked to take in it? The answer to that was short and simple. Four things were necessary;—first, to repeal all useless matter; secondly, to consolidate the different Acts relating to the same subject; thirdly, to re-arrange the Acts, if possible, according to their subject-matter, certainly according to their local application; and, fourthly, to ascertain from the Non-Regulation Provinces what Acts and Orders were there in force, and to publish them in an authentic form. You would then have a complete body of written law divided according to subject and place. A considerable part of that operation would be matter of mere executive detail. As he had already said, there was no one authorised statute-book to which every one must refer; but although there was no book of that kind published under the authority of Government, books such as those prepared by Mr. Clarke and Mr. Theobald had repeatedly been published, and were indispensable to the administration of justice. It was a matter for the discretion of those who published such books how they should be arranged. The authority of the legislature would be required to repeal and consolidate, and to put on a satisfactory footing the executive orders having the force of law in the different Non-Regulation Provinces. Many considerations, one of which was the state of the finances, must influence to a considerable extent the time in which any scheme of the kind could be carried out. He held out no hopes of any rapid execution of it, but he (MR. STEPHEN) thought that we should look to the ultimate attainment of such a result, and that we should do something towards it, first by repeal, secondly by consolidation, and thirdly by obtaining an account of the different executive orders in force in the Non-Regulation Provinces. These orders had never, so far as he knew, been collected, and

there was considerable difficulty in ascertaining what they were. Government had, however, in May last, taken steps to have them collected and published; and in the Panjáb, Oudh, the North-Western Provinces, and, he believed, the Central Provinces, considerable progress had been made in the work. Many of these executive orders related to matters of the highest importance; as an instance he might refer to the Civil Code in the Panjáb: it was in point of law a mere executive order, but in point of fact it was an attempt, and by no means an unsuccessful one, to solve a problem with which the Government of India had not yet ventured to grapple. When we once had all these orders collected together, it would be possible to define the extent of their operation, and to do away with a great deal of uncertainty as to the extent to which other Regulations applied to those provinces.

That was the general scheme of which this Bill formed a part, and he hoped to be in a position, at no distant date, to lay before the Council a list of the enactments which it was necessary to repeal, as a first step towards the completion of a task which would be brought to a termination as rapidly as the state of business and other considerations would permit.

The Motion was put and agreed to.

The Council adjourned to Friday, the 4th March 1870.

GOVERNMENT OF INDIA

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP 67

The Council met at Government House on Friday, the 4th March 1870.

PRESENT

Major General the Hon'ble Sir H M Durand, C B, K C S I, Senior Member of the Council, *presiding*
His Excellency the Commander-in Chief, K C B, G C S I
The Hon'ble John Strachey
The Hon'ble Sir Richard Temple, K C S I
The Hon'ble J Fitzjames Stephen, Q C
The Hon'ble Gordon S Forbes
The Hon'ble D Cowie
Colonel the Hon'ble R Strachey, C S. I
The Hon'ble Francis Steuart Chapman
The Hon'ble J R Bullen Smith
The Hon'ble F R Cockerell

COURT FEES BILL.

The Hon'ble MR COCKERELL moved that the second Report of the Select Committee on the Bill to provide for the better regulation of Court Fees be taken into consideration He said that the effect of the amendment which was carried when this Bill was last under discussion, was to postpone the consideration of the Select Committee's first report thereon, there were consequently two reports before the Council He did not, however, on the

present occasion, propose to make any further reference to those provisions of the Bill which were embraced in the former report, but would confine his remarks to a brief statement of the reasons for adopting the additional amendments which had been introduced into the Bill since its re-committal.

At the suggestion of his hon'ble friend, Sir Richard Temple, the provisions of section 7, clause v, paragraph (*c*), had been made more comprehensive. As was justly remarked when this subject was last before the Council, there were estates or tenures not included in the term inám, which, as regarded the principle and measure of their revenue-assessment, were not very dissimilar to 'inám' lands, and seemed to require the application of the same rule in regard to the valuation of suits relating to such property. For instance, in the Lower Provinces of Bengal, it had been the almost universal practice, on the resumption of land which had escaped assessment at the general settlement of estates in its vicinity, to admit the holder of such land to engagement for the payment of the Government-revenue at half the customary rate of assessment; and this lenient settlement had been accorded, not with any reference to the productive character of the land, but in satisfaction of such equitable rights as the holder might be considered to have in virtue of his long possession of the land free from the payment of revenue. In such cases, no less than in that of inám-land, the amount of the revenue-assessment afforded no fair criterion of the value of the land; it was therefore thought expedient to substitute, for the term 'inám,' such general words as would embrace all estates and land subject to the direct payment of Government-revenue, but assessed at rates more or less below the full normal demand.

The Bill, as first amended, imposed a fixed charge of ten rupees on suits relating to rights of pre-emption, and the specific performance of a contract. In the case of the former class of suits, the effect of that provision would be to reverse the existing practice, under which such suits were assessed according to the value of the property regarding which a right of pre-emption was claimed. Further consideration of the matter had led to the conclusion that this practice was in accordance with the principle adopted throughout the Bill, that the valuation of suits should be regulated by the value of the subject-matter actually in dispute, and should therefore be maintained. In the cases referred to, the subject-matter was in fact the possession of the property which the litigants claimed a right to purchase, and the application of the above-mentioned principle to such cases was in no way barred or affected by the circumstance that one or other of the disputing parties had to pay a certain amount to some third person as a preliminary condition to obtaining the actual possession of the property to which the suit had reference. So, also, in respect of the various descriptions of contracts forming the subject of a suit to enforce specific performance, it could not correctly be said that the litigated matter had no appreciable market-value. The fixed charge formerly proposed was therefore thought inapplicable to this class of suits, and provision was made in section 7, clause x, of the re-amended Bill for substituting an *ad valorem* rate, regulated by the estimated value of the interest involved in the contract.

There was a property, or interest in land, the owner of which was in certain parts of the territories under the Government of the Lieutenant Governor of the North-Western Provinces termed an Ubáridár, and in other parts of India was known under various designations, for the litigation of whose rights no specific provision was made in the former Bill. The person in whom this interest was vested could not be said to have possession of the land out of which the interest arose. His position was rather that of a farmer or assignee of the Government-revenue payable in respect of the land in question; hence a suit affecting his rights would not come within the provisions of section 7, clause v: and even were this not so, there would be the same objection to make the amount of the revenue paid to Government

by such person the basis of the valuation of a suit relating to his interest, as had been shown to apply to this mode of valuation in the case of inám-land; for the revenue which the Ubáridár, or other person above referred to, paid to Government bore no adequate proportion either to the value of the land to which his interest related, or to the amount which he received from the persons in possession of such land, with whom the revenue-settlement had been effected. It was proposed therefore to apply the rule of section 7, clause v, paragraph (*c*), to this class of cases.

It was considered expedient that the sanction of the Governor General in Council should be required to validate the rules to be framed, under chapter IV of the Bill, for regulating the strength and cost of establishments, as well as the amount of the fees to be levied, for serving the processes issued out of the several courts. Imperial control was deemed essential to the well-working of the new system, the effect of which was to make the cost of serving processes a charge upon the general revenues. The difficulty which at first sight seemed likely to arise out of the habitual exercise of this power of control in regard to the numerical strength of the establishments to be employed in serving processes might be obviated, it was thought, by framing the rules so as to admit of fluctuations in the number of peons entertained from time to time, without the necessity of a reference to the Supreme Government in the case of every temporary increase.

As regards the determination of the description of stamp to be used for the purposes of this Bill, it had been strongly urged that the authority of the Governor General in Council should be substituted for that of the Local Governments. The stamps in use were for the most part supplied from England, and uniformity as to the style of stamp to be adopted was essential to their economical provision. The proposed change was needed, therefore, to guard against the increased expenditure which would be not unlikely to result from a divided control in this matter.

Heretofore, summary suits to recover possession of property from which the suitor had been forcibly ejected, and applications to a civil court for the enforcement of a specially registered bond or agreement, had been subjected to one-fourth only of the rates of fees leviable on the institution of a civil suit. It was thought that this privileged rate might now be fairly raised to one-half of the ordinary rates. The scale of fees imposed by the Bill afforded, in itself, such a material concession in favour of litigants for small amounts—and suits of the classes referred to usually involved only an inconsiderable amount or value—that the further retention of the one-fourth rates was held to be unnecessary. Moreover, great practical inconvenience must be anticipated in the operation of a scale of fees which would embrace several denominations, including the fractional parts of an anna.

It was at first proposed to substitute, for the fixed fee heretofore chargeable on applications for a review of judgment, an *ad valorem* fee of one-eighth of the ordinary rates leviable on the institution of a suit. The chief object of this change was to discourage the institution of such applications on frivolous or insufficient grounds. It had been represented that the practice of seeking to obtain a re-hearing of the suit in this way, on grounds not contemplated by the law, was greatly on the increase; and that the time of the courts was needlessly wasted thereby, the mere loss of the small fee paid on such applications being altogether insufficient to check their improper presentation. The Committee had since been advised on high authority that one-eighth only of the full *ad valorem* rate was far too inconsiderable an alteration of existing charges to secure the object in view, and that the fee in such cases should certainly not be less than one-half of the ordinary rates leviable on the institution of a suit. When it was borne in mind that, under the operation of section 15 of the Bill, the ultimate incidence of this enhanced fee on the applicant was restricted

to cases in which the application for a re-hearing was not warranted by the circumstances in which it was made, the increase now proposed seemed unobjectionable.

On suits coming under the Pársí Marriage and Divorce Act, an institution fee of thirty-two rupees was levied, whilst the fee on suits brought under the later Indian Divorce Act was fixed at only five rupees. As there was no marked disparity in the circumstances of the persons affected by these enactments, and the subject-matter of the suit was the same, the distinction in the amount of fee imposed by either enactment was only to be accounted for on the supposition that these fees were determined very much at hazard, and were certainly not regulated by any fixed principle. One of the useful results of the present attempt to consolidate the law on this subject had been the bringing to notice of inequalities of this kind, and the opportunity thus afforded for their rectification. The first proposal was to equalize these fees by reducing the higher to the level of the lower rate. Since the publication of the amended Bill, however, it had been pointed out that, with regard alike to the importance of the cause, the time occupied by the courts in its adjudication, and the circumstances of the general class of persons concerned, a fee of five rupees was far too low. It was proposed therefore to substitute the mean rate of rupees twenty for the different rates now in force.

A slight alteration had been made in section 22. As originally drawn, it provided for the specific apportionment of the number of peons to be employed in each court subordinate to a District Court, for serving the processes issued out of such courts. The Committee had since learned that the local High Court had in contemplation some new scheme for the remodelling of process-serving establishments, and that the above-mentioned provision of section 22 was regarded as likely to obstruct its operation. It was not, he (MR. COCKERELL) thought, quite clear that any difficulty would have been created by the adoption of the provision referred to in its original shape; but to remove all doubt on the subject, the words which might be construed as necessitating the maintenance of distinct establishments of process-servers in each civil court had been omitted.

There were other minor alterations which did not call for special notice.

The consolidation of the law relating to court fees, which was a prominent feature of the Bill, had been matured by the transfer of several provisions of other enactments, and there was good reason to believe that, in this respect, the measure was now as complete as possible.

The Hon'ble MR. CHAPMAN desired to make some general remarks on the alterations that had been made in Chapter IV, relating to process-fees. For his own part he should have wished that these funds had been kept, as heretofore, quite separate from the imperial revenues, and maintained on a self-supporting basis. But it had been decided that these fees should merge into the imperial exchequer. Such being the case, he was prepared to admit that it was necessary the Financial Department should have the same control over all disbursements from them as they had over ordinary public charges. He (MR CHAPMAN) wished he could think this control would be exercised in a generous spirit and in a comprehensive manner. Judging from the past practice of the Department he believed there was no chance of its being so exercised. He feared that, ere long they should hear complaints from the High Courts and others charged with the administration of justice of the inefficiency of these establishments both in respect to numbers and pay. It seemed to him that it would be particularly hard on suitors who were ready to pay liberally for honest and efficient service, to have their interests jeopardized simply because the Financial Department would insist on employing an insufficiently paid agency. He considered his Hon'ble friend Sir Richard Temple to be placed in a very unenviable and even unfair position in respect of the control over establish-

ments he was called upon to exercise. He was in charge of the State caldron—a vessel of limited capacity; and he was surrounded by a clamorous crowd of hungry applicants, each of whom was pushing forward his plate and 'asking for more.' Some of these, perhaps the most diffident and not the least deserving, he silenced in a summary manner, and to others, and generally the most noisy, he doled out a spoonful. Now he (MR. CHAPMAN) ventured to think it was not the proper way to deal with this crowd in this indiscriminate manner. He would muster them in regular order, separate the honest, hard-working, able-bodied men from the idle, useless hangers-on; give the former their fill, and once for all send the latter to the right-about. In other words, what he (MR. CHAPMAN) thought was very necessary in the present day, was a thorough, independent revision of establishments. Such a revision should be conducted by competent officers, well versed in each of the separate branches of the administration, and made after full local enquiry. It was expecting too much from human nature to ask the Departments to reduce themselves. The kind of supervision that was now exercised at the head-office in Calcutta, by men necessarily ignorant of the local requirements of the different parts of this vast empire, and unacquainted with the working of the different Departments, consisted in cutting down and, if possible, negativing each separate application for an increase. He (MR. CHAPMAN) believed they were most indefatigable in their efforts in this direction, and yet, in spite of their exertions, charges were steadily increasing to an alarming extent. He entertained the belief very strongly that there was not a single branch of the administration in which vast savings might not be made, and that, too, without any sacrifice of efficiency. He believed that it was only by such thorough scrutiny as he had suggested that retrenchment could be effected and economy enforced. And entertaining this belief, he was glad to have had this opportunity of expressing it

The Hon'ble SIR RICHARD TEMPLE said—"Sir,—I am sure that the Council will excuse me if I refrain from following my hon'ble colleague (Mr. Chapman) into the points which he has just adverted to. In reference to what he has said about the unremitting efforts of the financial authorities for reduction of expenditure, and to the need of continued vigilance in this respect, I am glad to hear such independent testimony publicly borne to the exertions of the Financial Department for the due discharge of its business, and also to the necessity which exists for ceaseless economy in our public expenses. But beyond making this acknowledgment, I shall hardly be expected by the Legislative Council to enter into the purely executive details which my hon'ble colleague has mentioned. I can only say that the Government of India in the Financial Department will continue to do, as it has heretofore done, its duty in these matters to the best of its knowledge and ability.

"I desire now to advert to one point which is of some importance. Though I acknowledge that the Bill as last amended has, in some five instances, equitably raised the stamp-duties to an extent which may yield two lákhs (£20,000) or more to the State; still there is one point in which I think that full justice has hardly been done to the financial interests of Government; and that point is the valuation of land in permanently settled provinces.

"The Council will bear in mind that, in section 7 of the Bill, it is provided that the value of land shall (for purposes of this Act) be deemed to be ten times the annual land-revenue in permanently settled districts, and five times the land-revenue in districts not permanently settled. Now, in districts not permanently settled, the above valuation, though very moderate, perhaps even low, is tolerably even and uniform, and so far correct, inasmuch as the land-revenue is a sufficiently fair index of the value of land in all parts of the country. And if, as time goes on, rectification becomes necessary, it is supplied periodically by revision of settlement. But, in permanently settled districts, the case is quite different. There, the land-revenue has probably long ceased to be a fair index of the value of the land in different parts of the country; and it

will become more and more disproportionate to value as the country advances in prosperity In some cases indeed the standard of ten times the land revenue may prove to be too high a valuation But in many cases it will prove much too low and on the whole I fear that the tendency of this section will be to under value (for the purposes of this Act) the lands of the permanently settled districts And inasmuch as these rich districts are the very places where large suits regarding land are most likely to arise the under valuation for stamp purposes will be of some financial importance I admit however that the section does not make any unfavourable change but merely leaves the law as it was

But if this valuation be defective how is a better valuation to be devised? This is indeed not an easy question and as at present informed I am only able to answer it by saying that the market value of the land and the average nett profits might in each case be ascertained Some authorities of local experience are as I understand in favour of this view If an attempt were made to give effect to such a view some such amendment would have to be proposed as follows section 7 clause v in suits for the possession of land— according to the market value of the land Such value shall be deemed to be fifteen times the average amount of the nett profits obtained from the land during the three years next preceding the year in which the plaint is filed in court provided that such value shall be estimated to be not less than ten times the revenue payable for the land where the land forms an entire estate or a definite share of such estate paying annual revenue to Government or forms part of such an estate and is recorded in the Collector's register or separately assessed with such revenue and such revenue is permanently settled

Such an amendment would no doubt meet the object in view and would guard against the State losing stamp revenue by reason of imperfect valuation inasmuch as a minimum standard (ten times the land revenue) is fixed below which no valuation would be allowed to go

But to any such amendment there would be this manifest objection that in every case there would have to be an ascertainment of the market value and the nett profits In some cases it might be said that an essential preliminary to the institution of a suit regarding land would be an elaborate enquiry in order to fix the amount of the stamp to be presented

When I brought the question before the Select Committee, the above objection seemed to have such weight as to preclude the entertainment of any such proposal I myself however while sensible of the force of the objection do not consider it an insuperable obstacle For the principle of ascertaining market-value for stamp purposes is already sanctioned by the Bill for several classes of cases Still having regard to the objection raised in Committee and in the absence of complete local knowledge I refrain from pressing the matter further at present

I merely make these remarks in the hope that the point may continue to receive attention and that if hereafter a better mode of valuation for land in permanently settled districts can be found it may be embodied in our Court Fees Law

The Hon ble MR STEPHEN wished to offer one observation on the remarks made by the Hon ble Sir Richard Temple in relation to the assessment of estates No doubt the mode which had been adopted in the Bill as Sir Richard Temple had said was arbitrary but MR STEPHEN thought it followed from the fact that Sir Richard Temple did not propose any amendment that of necessity we must make a somewhat arbitrary valuation on account of the extreme difficulty of deciding upon any principle of valuation which was not arbitrary There was no doubt too that any rule which was difficult of application and which might involve nice calculations would be so very great an evil to suitors and open so wide a door to litigation that the proposed plan

was the least of two evils A rule by which the Government revenue would sometimes lose and sometimes gain was not so bad as a rule that would open the door to litigation on the question as to the sufficiency of the stamp on the plaint To introduce a question as to the market value of the land in dispute in order to decide what stamp was to be placed on the suit would lead to uncertainty and be a hardship on suitors The person who was to decide the question of the value of the land the subject of the suit was the plaintiff and it was very hard to call on him to apply a difficult rule The market value of land was a matter on which you might raise infinite discussion especially in all permanently settled provinces where land had become subject to a very intricate system of sub divisions These were considerations which weighed very much with the Select Committee in adopting the present rule of a fixed ascertainable value The question had been carefully considered by the Committee and the result had been arrived at after much discussion

The Hon ble MR STRACHEY said that but for one reason he would probably have said nothing regarding this Bill and that reason being a purely personal one he must apologize to the Council if he took up a few minutes in making an explanation which concerned nobody but himself When the measure was introduced in 1867 which the Council was now asked to repeal it was stated that the main reason for a change in the law arose from the necessity of carrying out certain propositions which he (MR STRACHEY) had made and which had been approved by the Government for making a large increase to the salaries of the subordinate Judges and to the allowances of ministerial officers in the Civil and Revenue Courts throughout India It was estimated that this increase of salaries would cost £300 000 a year and it was avowed that it was a main object of the Bill to enable the Government to obtain additional funds to meet this additional charge The Act of 1867 or at least that part of it which referred to Court fees having thus been declared to have had its origin to a great extent in the propositions made by himself, he found that he frequently got the credit of having had something to do with the preparation of that law and this had been so repeatedly said in one shape or another that he took this opportunity of correcting the mistake The fact was that there had hardly ever been an Act passed by the Indian legislature to which he more strongly objected and the disappearance of which from the statute book he would see with greater satisfaction He had always believed that of all bad taxes that existed there were none worse than high taxes on the administration of justice and the taxes imposed under the existing law were in his opinion enormous

In a paper which he had before him written by the Advocate General of Madras and circulated to the Council there was an illustration of this which was worth repeating He quoted a case which lately came before the High Court at Madras—the case of a suitor who had to pay the enormous sum of 32 000 rupees before he could even ask the Court to hear his case, whereupon the Chief Justice remarked that in no country but India could such a state of things exist MR STRACHEY agreed with the Advocate General that schedule B of Act XXVI of 1867 was as unwise and unjust a measure as ever emanated from any legislature and he thought that the remarks made by the Advocate General and which MR STRACHEY would now read to the Council were perfectly justified by the facts The Advocate General said that what was formerly foretold by him as to the Act of 1867 had admittedly come to pass He said—

> The Act has proved repressive of litigation not dishonest litigation but the *bonâ fide* pursuance of real or imagined rights and when we learn that while litigation has fallen-off twenty per cent and revenue from judicial taxes increased by thirteen lákhs I think it is hardly possible to bring forward two more damnatory statements for while twenty per cent of those seeking justice have been absolutely debarred from redress additional revenue has been squeezed out of those unfortunate suitors whose necessities compelled them to persevere in claiming their rights in the face of prohibitory and oppressive fines

MR. STRACHEY did not pretend to say that, in his opinion, the present Bill afforded a really adequate measure of relief; but, in the existing state of the finances, he thought that it must be admitted that it gave as much relief as we could reasonably expect could be given. It would now be waste of time to talk of reducing, to an extent which he himself believed would, under other circumstances, be proper, the taxes which were levied on suitors for justice. But while he certainly hoped that the time would come when we should see a much larger measure of relief than the present, this Bill was, he thought, a decided step in the right direction. He (MR. STRACHEY) believed that it would remove a very considerable amount of hardship and of injustice, and he thought that, by adopting it, the Council would get rid of an extremely bad law, which had been proved by actual experience to have been the cause of very serious denial of justice.

The Motion was put and agreed to.

The Hon'ble MR. COCKERELL then moved that the following clause be inserted after section 32:—

"And the Indian Income Tax Act, section twenty, shall be read as if, for the words 'the value of the said stamp,' the words 'the fee on the petition,' were substituted."

The Hon'ble SIR RICHARD TEMPLE expressed his concurrence.

The Motion was put and agreed to.

The Hon'ble MR. COCKERELL also moved that the Bill as amended be passed.

The Motion was put and agreed to.

WEIGHTS AND MEASURES BILL.

Colonel the Hon'ble R. STRACHEY, in moving for leave to introduce a Bill to regulate the Weights and Measures of British India, said that the Bill was designed to give effect to the conclusions lately adopted by the Governor General in Council, and concurred in by the Secretary of State, as to the steps to be taken towards reforming the weights and measures of British India.

"The proposals of the Government of India, which were entirely approved by the Secretary of State, were as follows:—

"We therefore consider that the new unit of weight should be a ser, equal to the kilogramme, or 2·205 lbs. avoirdupois, and that a system of decimal multiples and sub-divisions of the unit of weight should be accepted as a fundamental part of the new scale to be recognized by law. We are, however, of opinion, for the reasons stated by Mr. Strachey in his minute, that other multiples and sub-divisions should not be prohibited wherever their continued use appears to be demanded on considerations of present convenience and expediency, and that, while it is desirable that the new system of weights should be brought into general use as speedily as possible, it should not be forced on any class of the community until such class is to some extent prepared to accept it. The best preparation for the general adoption of the new weights will undoubtedly be their introduction and authoritative use in the public Departments of the Government, which are so widely scattered over the whole of the country. We therefore propose that the new unit of weight, with a system of decimal multiples and sub-divisions, should be authoritatively adopted in all Departments of the Government, by all municipal bodies, and on the railways, as soon as practical convenience will admit."

The discussions that had taken place on the subject of the weights and measures of India had now been prolonged over, he (COLONEL STRACHEY) thought, something like thirty years, and it might safely be affirmed that all that it was possible to know on the subject, likely to have any influence on a decision, whether they referred to the facts of the case or the opinions formed on those facts by persons worthy of attention, were before the Government when it came to the conclusion he had just stated.

At the present time, India was in the somewhat singular position of having no weights or measures recognized by any law. The only law that referred to the weights of India had recently been repealed, with a number of other old Acts considered to be obsolete, he did not know under what exact circumstances. He referred to Bengal Regulation VII of 1833, which established for the purposes of the Government Mints certain weights to be employed in dealing with the bullion brought to the Mints for assay. These weights were based on the tola or the weight of the rupee, 180 grains, which had about the same time been finally adopted as the standard of the currency of India. The ser under this system consisted of 80 tolas, the maund of 40 sers, and it was exactly equal to 100 pounds troy.

But hardly any attempt was ever made to adopt these weights authoritatively in any part of India, excepting in a limited way in some of the Government Departments, and their inconvenience in relation to commercial transactions with Great Britain, owing to their being related to the pound troy, and not to the pound avoirdupois, had long been apparent.

The adoption of these weights was moreover limited, with some few exceptions, to the Government offices in the Bengal Presidency, and they might be said to be unknown in the provinces of Madras and Bombay.

The result of the enquiries that were made after the general subject was taken up in 1863, on the motion of the Government of Madras, which, he (COLONEL STRACHEY) thought, was due to the then Governor, Sir. W. Denison, was to bring out, in a very unmistakeable manner, the fact that there were no such things as recognized weights and measures in any part of India; and of all the suggestions that were made with the object of remedying this confusion, none, he thought, were to the effect that any existing Indian weight or measure could be accepted as worthy of constituting new units for general use.

The following general description of the existing weights and measures of British India would enable the Council to appreciate the state of things that had to be dealt with:—

"Throughout India the old standard of weight seems almost universally to have been the current coin of the locality, and the multiplicity of coinages has been, and is still, accompanied by an equal or even greater multiplicity of weights. Not only do the weights vary from province to province, but from town to town, and even within the same town or rural district. Different weights are used in various trades in the sale of different commodities, and in wholesale and retail transactions.

"In Northern India, the usual unit of weight is the tola, which is the weight of the current rupee-coin. The ser is a given number of tolas, varying from 70 to 100. The *man* (by the English commonly called maund) is usually 40 sers. A weight of five sers, called pusseree, is generally recognized, and the ser is sub-divided into sixteen chittacks. The rupee of the British Government weighs 180 grains; the ser of the British Government being 80 tolas is equal to $2\frac{2}{55}$ lbs. avoirdupois, and the Government maund is $82\frac{2}{7}$ lbs. avoirdupois, or 100 lbs. troy. Local sers and maunds vary on either side of 2 lbs. avoirdupois, and 80 lbs. avoirdupois.

"In Southern India, the original unit of weight commonly used was the pagoda, a coin no longer current. The common katcha ser was 80 pagodas, and was equivalent to 24 current rupees. The maund of Southern India usually contains 40 such sers, and is commonly divided into 8 viss, or five ser weights, and forty palams. The khandi of 20 maunds is another weight in ordinary use. At Madras the Government, some years back, endeavoured to establish a local system of weights on the basis of the rupee weighing 180 grains. The ser was not acknowledged in this system, but would be 0·617 lbs. The viss was 3·086lbs., and the maund 24·686 lbs. This system, however, never came into use. In practice, the commercial maund in the town of Madras is taken at 25 lbs. avoirdupois, and the viss and khandi are modified accordingly; but beyond the municipal limits, other weights are employed. The weight in common use in Burma is called viss also; it is 3·65 lbs., and is sub-divided into 100 ticals each of 252 grains.

"In Guzerat, a ser of 40 local rupees weight, a maund of 40 such sers, and a khandi of 20 maunds, are the common weights. These maunds vary from 37 to 44 lbs, and the sers are about 1 lb.

"In Malwa, a ser of 80 local rupees weight, and a maund of 20 such sers, are common. This maund is approximately the same as the Guzerat maund, the ser being about 2 lbs, as in Northern India.

"At Bombay, the old ser was about 10 or 12 oz. avoirdupois, being reckoned as equal to 30 pice. The Bombay maund being 40 such sers is nearly 28 lbs, at which it is now commonly reckoned. This maund is the usual one also on the Malabar coast, south of Bombay; but the ser is the Madras one of 24 rupees weight, so that the maund consists of 46 to 48 sers instead of 40. At Bombay and in the Deccan, the sub-division of the ser is into 72 parts called tank. The Deccan ser is commonly 80 of the local rupees, or about 2 lbs; the maund varies greatly. In the Deccan the weights seem to merge into the Madras systems on the one side, and into the systems of Malwa and Northern India on the other.

"Measures of capacity are hardly known in Northern India. In Bengal and Southern India they are more frequently used, and, as a rule, are intended to be equivalent to certain determinate weights of grain. In Burma, grain is universally sold by measure. There is, however, such great variation among measures having the same name, that it would be useless to refer to them in detail.

"The usual lineal measures are the cubit or háth, and the yard or gaz, the latter being divided in Upper India into 16 girás or 24 tasus. The háth varies from 14 to 20 inches; the gaz from 28 to 40 inches. Thirty-three inches is the length assumed for the gaz in fixing the official land-measures in the North-Western Provinces. The kos is sometimes taken to be 4,000 gaz, about 2¼ miles, and sometimes half that distance; but 5,000 gaz, equal to about 4,500 yards, or 2½ miles, would seem to have been the old kos of North-Western India.

"Measures of area are commonly based on the háth or gaz, but vary so exceedingly from one district to another, that no general account can be given of them. Frequently the denomination of the land-measures is the same as that of the grain-measures, it being understood that the quantity of grain in a given measure will sow the area of land having the same name. It is common in Southern India to find the land-measure of the same name differ considerably according as the crops are irrigated or unirrigated. For all Government purposes, the English acre has now almost universally been adopted, and the revenue-records are, I believe, almost everywhere drawn out on this basis, though the local measurement is at the same time still recognized."

This state of confusion was without parallel in any country in which even a moderate amount of supervision had been exercised over the weights and measures, and it led naturally, and he might say necessarily, to proposals that some one of the established systems of Europe should be accepted for India. The proposals of this sort could be divided into those for adopting the English pound and yard as the new units, and those in favour of the adoption of the metrical system.

The arguments for and against these alternative plans had been long and thorough. The Council would, he thought, hardly expect him to follow these arguments at length on this occasion, and he would ask a reference to the papers on the subject, published in the *Gazette of India* of the 18th February 1869. These contained all the more important elements of the controversy, as he supposed he must call it, as to the merits and demerits, respectively, of the British metrical systems of weights and measures as related to their suitability for adoption in India.

The Government of India thus summed up the grounds on which it adopted the metrical unit of weights in preference to the British:—

"For the reasons there assigned, we are of opinion that the adoption of the English system of weights is not advisable. Neither the English pound, nor any multiple of it, can be a convenient unit of weight for India. It has been almost universally admitted that the new unit should approximate to the existing Indian ser, the average weight of which is about 2¼ lbs. To reduce the ser to 2 lbs. would be extremely unpopular and objectionable.

"On the other hand, the kilogramme of the metric system, which weighs 2·205 lbs., at once provides a ser, which would certainly be as acceptable to the people as any that could be chosen. Further, we consider that, on account of its simplicity and its symmetrical form, the metric system of weight in its integrity will be more convenient for India than any other. While it will be perfectly suitable for the internal wants of India, it will be in harmony with the system which has been already adopted in the greater part of the civilized world, and which may be ultimately adopted by England herself. In any case, it will be more convenient for commercial transactions between England and India than any other system not really commensurable with that of England."

He (COLONEL STRACHEY) might add that, so far as could be ascertained from the expression of opinion on the subject in the newspapers of India, these conclusions had met with the general assent of the public. Also, if he did not mistake the reference made to the subject in the last report of the Calcutta Chamber of Commerce, that influential body accepted with satisfaction the proposals of the Government.

The question might be asked, perhaps, what was the necessity for interfering by a legislative enactment in this matter? The reply was easy, and he thought complete. At the present time, it was practically impossible to say what was a false weight, because there was no such thing as an established and recognized true weight. Any one might say, in a manner that could not be controverted, that the particular weights that he used were those by which he consented to sell, and that it was the affair of the purchaser to satisfy himself what was the magnitude of these weights, and whether the terms of the sale were satisfactory or not.

Quite recently he was informed by a district officer that, in a part of the country where he had been employed, it was the practice of the sellers of goods at the bázárs or markets to go provided with a series of weights of increasing magnitude. The bargaining for the goods brought for sale began by an offer of a certain quantity for a certain sum, according to the weight which was produced. If this was not accepted as too high, the seller, instead of reducing the price, increased the size of his weight, and produced the next larger weight of his series. And so he went on until, by a suitable variation of the weight, the price having remained unchanged, the customer was satisfied.

No doubt trade could be conducted on such a system, but he thought few persons would argue that it was likely to be convenient. If, instead of altering the prices we paid for commodities, we discussed the intrinsic value and weight of the coin with which we purchased, and varied these, instead of varying the quantities to be got for a fixed quantity of money of a certain standard-value, we should not do what was more inconvenient.

Of course, the illustration he had just given of the condition of the weights of the particular district referred to, was a very extreme one, but it was instructive, as indicating the rudimentary condition of the trade of parts of this country and the singular expedients to which the people were forced to resort in the absence of fixed weights or measures.

In truth, the step which the Government of India now purposed to take in regard to the adoption of a standard for weights, was quite analogous to that which was taken some thirty or thirty-five years ago in adopting a standard of value. Before that time, there were a vast number of various sorts of rupees of various values. In all purchases, the precise value of the coin in which payment was made was just as important as the precise quantity of the article sold. The adoption of a single standard of value had removed all necessity for considering the variation of more than one element in commercial transactions, all dealings being now based on a definite money-value, the only doubtful matter being the quantity of the article bought or sold.

What was now desired was to give a common standard of weight, which should be as generally accepted, and with as great security to buyers and sellers, as was the standard of value.

By persons not acquainted with the results of the absence of precise and recognized standards of value and quantity, the extreme inconvenience of not having such standards would not easily be appreciated. The only thing to which the want of such standards could be compared was the want of a common language or of the arts of writing or printing. That societies could go on without these artificial helps was not to be disputed, but that very great inconvenience was thus caused, and very great obstruction placed in the way of the growth of trade and improvement generally, was incontestable.

He could not conclude these observations without remarking that it seemed to him certain that it would be a cause of no little astonishment to those who succeeded us, how it could have happened that the Government of India so long left the country without any defined standards of quantity. The necessity for such conveniences in the transactions of a community so wealthy and engaged in so vast a commerce, external and internal, was so obvious and so urgent, that it was marvellous, not that the present proposal was now made in the year 1870, but that it should have been so long delayed. What was proposed for India was in no sense what certain persons in England had desired in respect to the weights and measures of that country. We did not ask for an assimilation of weights and measures with those of other neighbouring countries with which we had great transactions, on the score of the greater convenience of the other weights and measures, and the importance of having uniformity in transactions conducted on so large a scale. What was desired for India was for the first time to adopt some fixed standard of quantity where none had hitherto existed, and to place once for all on a definite basis the multitude of transactions of trade and commerce which had till now been left to be settled too often in a manner that placed the buyer at the complete mercy of the seller, and gave the most objectionable openings to fraudulent dealings. We hoped, it was true, at the same time that we did this to give the greatest possible ultimate convenience to the community in their internal trade, by the adoption of a system which was in itself very simple and more perfectly suited to arithmetical computations than any other system could be. While, by accepting the system which was now almost exclusively used on the continent of Europe, and the recognition of which in England also seemed now almost certain to come to pass before many years were over, we might expect to place the external commerce of India, in respect to the weights it employed, on a footing in which no further change was ever likely to be called for.

The Motion was put and agreed to.

The Council adjourned to Friday, the 11th March 1870.

WHITLEY STOKES,

Secy. to the Council of the Govr. Genl. for making Laws and Regulations.

CALCUTTA,
The 4th March 1870.

GOVERNMENT OF INDIA.

HOME DEPARTMENT.

MANUFACTURE OF QUININE IN BENGAL.

No. 478, dated 21st February 1870.

From—H. S. BEADON, ESQ., *Offg. Under Secy. to the Govt. of Bengal,*

To—*The Secretary to the Government of India*, HOME DEPT.

I am directed to forward, for the information of His Excellency the Governor General in Council, the accompanying copy of a correspondence noted on the margin, relating to a proposal for the manufacture of Quinine in Bengal.

1. From Dr. T. Anderson, Superintendent of the Botanical Gardens, on leave in England, dated the 20th November 1869, and enclosure.
2. From the Officiating Superintendent of Botanical Gardens, No. 165, dated the 10th February 1870.
3. To the Officiating Superintendent of Botanical Gardens, No. 476, dated the 21st instant.

2. The Lieutenant Governor has sanctioned the expenditure of the sum of Rs. 2,500 applied for by the Officiating Superintendent of the Botanical Gardens to procure machinery for the experiment, the charge being met from the allotment for contingencies in the budget estimate of the Superintendent for the current financial year, as proposed in the 20th paragraph of his letter of the 10th instant.

3. His Honor has also authorized Mr. Clarke to proceed to Madras for the purpose of holding an interview with Dr. Broughton.

Dated 20th November 1869.

From—T. ANDERSON, ESQ., M. D., *Supdt. of the Botanical Gardens, Calcutta, and in charge of Cinchona Cultivation in Bengal,*

To—*The Secretary to the Government of Bengal.*

I have the honor to forward to you, for submission to His Honor the Lieutenant Governor of Bengal, a letter which I wrote last January narrating the result of some experiments I made at Darjeeling in the attempt to separate the cinchona alkaloids in a cheap and coarse state from young cinchona bark. The letter was not then despatched to you, because, immediately after it was written, the state of my health would not allow of my carrying out part of the object I had in view in writing the letter, *viz.*, a journey to Ootacamund. But the main object of the letter—the utilization of the young bark from the trees in the Government plantations at Darjeeling by the manufacture from them of a cheap but powerful febrifuge well suited for use in native hospitals and charitable dispensaries—is more important than ever. Mr. C. B. Clarke, the officer who is in charge of the Botanical Gardens during my absence, has also had this subject forced on his consideration by the very advanced condition of the cinchona trees at Darjeeling. It is evident that they will almost immediately require to be pruned by the lopping off of branches from the largest trees to admit air and light and to give room.

Mr. Clarke is aware, I believe, that such young bark will be almost unmarketable for the reason stated in my letter enclosed, *viz.*, that crystalline salts of the alkaloids cannot be prepared from such bark, at least in any quantity, and he has therefore been endeavouring to prepare a rough and cheap form of the alkaloids from the bark of the branches.

Besides the two preparations I have described in the accompanying letter, there is a third form in which the alkaloids might be separated, and which may be cheaper and easier of manufacture from young bark than either my grey powder or the one made by Mr. Broughton.

I am indebted to my friend Dr. DeVrij, of the Hague, one of the most distinguished quinologists of the day, for the account of the process by which this third substance can be prepared. The young undried (fresh) bark should be macerated in water (cold) strongly acidulated by hydrochloric acid for about 48 hours; the water is after that to be strained off. The rough alkaloids are to be precipitated from this acid infusion of the bark by carefully adding lime (milk of lime). The precipate, after removal of the supernatant liquid, should be thoroughly well washed with cold water, pressed gently and well dried.

This precipitate consists of all the alkaloids present in the bark of the species, and dried bark can be used for this preparation as well as in any other process, but if the manufacture is carried on near the plantations, it is better to use fresh bark than to spend time and labour in drying it. I regret that I am at present unable to forward the specimens of the preparations referred to in my letter of last January, as they have been given to Dr. Christison, Professor of Materia Medica in the University of Edinburgh, who has offered to examine and report upon them.

It does not seem necessary that I should make any suggestion about conducting further experiments, beyond saying generally that the practical result of these experiments and which I have always had in view—the extensive use of all the alkaloids found in one species of bark unseparated from each other—will be most readily attained by the experimental administration in hospitals of all of these three substances,—Mr. Broughton's powder, my grey powder, and that obtained by Dr. DeVrij's simpler process.

Such experiments will be necessary in the first place to fix the proper dose of the new preparation, and if the result is also favorable as regards the cure of fever, as no doubt it will be, there will be no difficulty in introducing these cheap preparations of the alkaloids into medical practice in India.

Dated 14th January 1869.

From—T. ANDERSON, ESQ., M. D., *Superintendent of the Botanical Gardens, and in charge of Cinchona Cultivation in Bengal,*

To—*The Secretary to the Government of Bengal.*

I have the honor to report the result of some investigations I have recently made at the cinchona plantations near Darjeeling, with the view of discovering a cheap process for separating the alkaloids from the cinchona bark. I undertook these experiments because I am convinced that one of the main objects in forming plantations of cinchona would be attained if a cheap prepararation of the alkaloids could be made, and especially if such a form of the medicine could be procured from young bark. The investigations of Mr. Howard, Dr. DeVrij, and Mr. Broughton, the quinologist in the Neilgherries, prove that alkaloids in the young bark are not in that highly elaborated condition which they attain in mature bark, as is proved by the small percentage of crystallizable combinations of the alkaloids with acids procured from young barks, although the presence of a considerable amount of alkaloids may have been discovered by the usual tests. It is almost certain that the alkaloids in the uncrystallizable state will prove quite efficacious in curing fevers.

I have lately prepared two substances from the young cinchona bark grown at Darjeeling; these contain all the alkaloids mixed with some extraneous matter in different degrees. The first of these, the brown viscid substance in the small jar, is called quinium. It is fully described by Mr. Markham in his letter to the Government of Madras, dated 16th January 1866, as "extrait alcolique de quinquina a la chaux." I prepared it very much in the same manner as described by Mr. Markham. The process I followed was to macerate about 10lbs. of dried coarsely powdered bark with half its quantity of lime, moistening the mixture with a small quantity of water. The mixture was frequently stirred during the process of maceration. Spirit obtained by distilling the common weak spirits manufactured in the hills from *eleusive coracona* was then added to the mixture, which was boiled for half an hour and then strained. This clear strained spirit was placed in a small still and distilled until the spirit was removed; the residuum was then carefully evaporated in a water bath until it acquired the consistency of the specimen now sent. The native spirit from *eleusive* is so weak that, on distilling it, water only slightly flavoured with spirit comes over after the first half of the original quantity has been procured. However, about three-fourths of the alcohol used to dissolve the alkaloids are recovered by distillation.

The slaked lime I used in this process is the lime in common use at Darjeeling, and is collected from the sides of certain small streams in the hills which deposit carbonate of lime when they issue from the hill sides. This carbonate of lime is burned in kilns on the spot where collected.

I have treated some cases of fever with this substance (quinium), and I find that it is a powerful febrifuge, as indeed it must be, as it contains all the alkaloids present in the bark. It dissolves with some difficulty in cold water, but readily in warm water, and this solution does not become turbid on cooling.

Notwithstanding its undoubted efficacy as a febrifuge, it would, I think, be generally objected to by medical men both on account of its appearance and the difficulty the dispenser would have in accurately measuring it.

The second substance (a grey powder) consists of the alkaloids in an impure and non-crystalline condition. Mr. Markham also refers to this preparation in the letter I have already quoted; but his knowledge of this preparation of the alkaloids was derived from Dr. DeVrij, who thought this powder would be "more conducive to the objects in view than quinium."

The process apparently by which Dr. DeVrij separated the alkaloids in this form is mentioned at page 227 of the last Blue Book on Cinchona, published in June 1866.

I obtained the grey powder forwarded with this letter by following a different process from that described by Dr. DeVrij. Young bark about 16 months old was dried and coarsely pounded in a large wooden mortar similar to those used by natives for husking rice; the powdered bark was boiled in water in which a certain proportion of solution of caustic soda had been mixed. The dark colored liquor, the result of this boiling, was thrown away, and the bark was well pressed and slightly washed with cold water and again boiled in an alkaline water similar to the first, and the result of this second boiling was also thrown away. The bark after this second boiling was thoroughly well washed with cold water and pressed. The bark, now thoroughly decolorized, was then boiled in water, strongly acidulated with sulphuric acid, pressed after thorough boiling, and the liquor kept. This process was repeated a second time. These acid liquors were then mixed together and evaporated by slow boiling to one-fourth of their bulk and then filtered. To the filtered cold liquor solution of caustic soda was carefully added until a strong alkaline action was obtained, and until no more precipitate resulted from the addition of the soda solution. The dark grey precipitate (impure alkaloids) was collected on a cloth, well washed, carefully dried in a water bath, and reduced to powder.

Since writing the above, I have received from the Medical Department a yellowish grey powder closely resembling the powder I prepared, and, like it, containing all the alkaloids in a non-crystalline form. This powder was prepared at Ootacamund by Mr. Broughton, Government quinologist, from bark grown on the Neilgherry plantations, and was sent to Bengal for experiment in the hospitals as to its efficacy as a febrifuge. The cinchona plants at Darjeeling are now so numerous and vigorous that a considerable quantity of young bark could be at once obtained from them by pruning and lopping off superfluous branches, treatment which would render the plants symmetrical and advance their growth as trees. From my knowledge of the chemistry of the cinchonas, I am unable to recommend now on my own responsibility a method by which these barks could

be utilized, but I feel certain that either my grey powder or Mr. Broughton's somewhat different and probably superior one could soon be made on such a scale at Darjeeling as to supply a considerable amount of a valuable and very cheap febrifuge as efficacious as expensive sulphate of quinine to the native hospitals in Bengal. I know quite enough of the process of obtaining the alkaloids from the bark to benefit from a consultation with Mr. Broughton, and afterwards to recommend to Government and to inaugurate some cheap and simple manufactory of the alkaloids in the rough state. I have therefore to request that I may be permitted to proceed to Ootacamund and spend eight or ten days there to consult with Mr. Broughton, and observe his processes in the laboratory.

No. 190, dated 20th January 1870.

Endorsed by Govt. of Bengal.

Copy forwarded to the Officiating Superintendent of the Botanical Gardens for perusal and for any remarks he would like to make on the subject of Dr. Anderson's communication.

No. 165, dated 10th February 1870.

From—C. B. CLARKE, ESQ., M. A., *Officiating Superintendent, Botanical Gardens, and in charge of Cinchona Cultivation in Bengal,*

To—The Secretary to the Government of Bengal.

I beg leave to acknowledge the receipt of your memorandum No. 190 of 20th January 1870, enclosing the letter of Dr. T. Anderson, concerning quinine manufacture at the Government plantations near Darjeeling; also of your memorandum No. 225 of 25th January 1870, accompanying the copy of the quinology of the East Indian plantations by John Eliot Howard.

2. The work of Mr. Howard should more strictly have been entitled the Quinology of the Plantations of the Peninsula of India, as the facts discussed are drawn exclusively from the peninsula plantations, and the conclusions, though stated as general, do not in many important points hold good as regards the Bengal plantations.

For example: on page 1 of Part I, Mr. Howard opens the discussion of the proper elevation at which to grow cinchonas in India in these words:

"Recent observations on this point may save the apparently useless attempt to cultivate these plants at a level below 4,000 feet above the ocean."

Upon this I remark that the whole of the 1,000,000 plants of C. Succirubra at Rungbee are below that level. The species appears to thrive best at about 2,000 feet elevation, and grows very well down to the river at 800 feet elevation. Cinchona Calisaya grows best at similar elevations, but on the whole will not grow so high as C. Succirubra. In short, the only plants in the Rungbee plantations, which are *above* 4,000 feet elevation, are some C. Officinalis, which are being tried at this higher level as a last experiment, whether the species can be profitably cultivated at all at Rungbee.

3. The plantations at Rungbee appear from the reports to be fully as large and well advanced as the Neilgherry plantations; and though the Rungbee plantations are several years younger than the Neilgherry plantations, the specimen bark sent home from Rungbee is considered (as I learn from Dr. T. Anderson) superior in quality to any that has ever been sent home from any other part of Asia. Hence the limitation, which I assert ought to have been made in the title of Mr. Howard's valuable work, is a material one.

4. From the 6th August 1869 up to the present date I have been almost incessantly employed on experiments with C. Succirubra bark up till 1st November at Rungbee, subsequently in Calcutta; and I wish to state that any success which has attended my efforts is due to my friend Mr. Blanford,

the meteorologist to Government, who is an experienced chemist. Before commencing experiments I had the advantage of his advice. During my experiments at Rungbee, I was in constant communication with him, and referred each difficulty, as it occurred, to him; and in Calcutta, Mr. Blanford has not only allowed me the use of his laboratory and apparatus, but has devoted to my instruction and assistance many hours weekly during the last three months.

5. In his budget estimate for 1869-70, Dr. T. Anderson estimated that the thinnings and prunings of the Rungbee plantations during the cold weather would produce Rs. 1,000 worth of bark, and he estimated that the drying, packing, and carriage of this bark to London for sale would cost Rs. 1,000.

6. Dr. T. Anderson, as appears by his letter aboved quoted, is now desirous that the attempt to manufacture should be commenced at Rungbee. This is, I believe, a very general wish with the Medical Department in Bengal, and Dr. Ewart in his pamphlet on the subject has urged that the quinine should be manufactured by Government rather than that the bark should be sent for sale to London.

7. The manufacture of the crystallized sulphate of quinine now in general use (so far as can be afforded by its very high price) consists of two stages. The bark is treated with dilute acid, which takes up the alkaloids contained in it, and also a certain quantity of coloring matter, resin, and other rubbish, which quantity is considerable in C. Succirubra bark, the only bark which for some years will be produced in quantity at Rungbee. The acid infusion is neutralized by an alkali, when the quinine alkaloids are precipitated, accompanied with more or less of the rubbish. These precipitated alkaloids (more or less impure) are known as the result of the first stage of the manufacture. The second stage is in actual manufacture, generally performed by washing out of these precipitated alkaloids (by strong alcohol) the quinine, and evaporating the alcohol.

8. It will be seen from Dr. Broughton's letter forwarded to me by the Government of Bengal, No. 3601 of 1st November 1869, that there are reasons why the alcoohlic process cannot be well performed at Rungbee, and that some "unusual" process must be employed. Dr. Broughton has been (he says) for some time engaged in devising a new process, but has not as yet carried his experiments to such a result as would justify him in making it public.

9. It is in contemplation of this state of the case that Dr. T. Anderson now advocates the manufacture of a rough hospital quinine at Rungbee, by which he means the production of the precipitated alkaloids in a more or less impure form.

10. Before I commenced my experiments, I addressed the Inspector General of Hospitals on this subject. He is of Dr. T. Anderson's opinion upon this question, and is desirous to try the rough alkaloids in hospital practice.

11. It seems now pretty well settled (*vide* last edition of the London Pharmacopœia, Dr. T. Anderson's letter, and Dr. Broughton's cinchona report of August 1868) that the other quinine alkaloids are valuable febrifuges and operate pretty much as quinine, but are less powerful. Roughly it may be said that two grains of cinchonidine are equal in all respects to one grain of quinine. The action of cinchonine and the other minor quinine alkaloids is less satisfactorily made out, but in the C. Succirubra bark, usually 75 per cent. of the alkaloids present are either quinine or cinchonidine.

12. If, therefore, the medical practitioner dissolves the precipitated alkaloids in dilute sulphuric acid, he can give the same dose as is given by diluting in acid the crystallized sulphate of quinine. But I must here state that several doctors of experience in the Medical Department object that the crystallized sulphate is pure, and that they can be sure of the dose they give to a grain; whereas in the precipitated alkaloids the proportions of cinchonidine and even more inert alkaloids will be variable and doubtful.

13. This objection to the putting out of the precipitated alkaloids from the Government plantations is entitled to some weight. But contra, I doubt whether the medical officer is at present at all sure of the dose of quinine he gives. Cinchonidine is about one-third the value of quinine, and the crystals of cinchonidine are exceedingly like those of quinine. There is really very little quinine in general use that is not at present deeply adulterated with cinchonidine, and I doubt whether any amount of chemical knowledge will enable the medical officer to detect the percentage of cinchonidine present, unless he were provided with quite a different laboratory apparatus from that generally at his command.

14. Further, should the production of the precipitated alkaloids be carried on upon a large scale hereafter, it would be possible to thoroughly mix a large quantity, analyze a sample, and then issue it with the percentage of quinine and cinchonidine certified on the labels of the bottles.

15. With these views I engage in my own experiments with Rungbee C. Succirubra bark, and have confined myself mainly to the first stage of manufacture. I submit with this letter a sample No. 1 of the precipitated alkaloids which corresponds to the "grey powder" mentioned by Dr. T. Anderson. This grey powder is completely soluble in dilute acid, and is very clear, both of cinchona red and of resin. By treating it with scalding water and a little sulphuric acid and allowing it to cool, a portion of the alkaloid crystallizes (this is the sample No. 2 submitted), and the remainder may be re-precipitated (this is sample No. 3).

16. These samples are merely submitted as specimens of the products mentioned, for they are principally made from American Succirubra bark, as I have lately been in Calcutta without Rungbee Succirubra bark. The portion of these samples made from Rungbee Succirubra bark was exactly similar to that obtained from the American Succirubra bark, but in much smaller quantity in proportion to the weight of bark used.

17. Dr. Ewart has well pointed out that by working up the bark at Rungbee, not only would the expense of packing the bark and its carriage to England be saved, but there would be a great economy in fuel. (There is much boiling in the early stage of the manufacture). At present, at Rungbee, our very excellent charcoal only costs us 5 annas per maund, and the high tree forest, reaching from the upper level of cultivation (5,000 feet) on the cinchona reserves to the summit of Sinchal, will furnish charcoal for a very long series of years, unless Government resumes these forests from the cinchona reserves for other purposes.

18. On the other hand, Mr. Howard has devoted himself for years to the manufacture of quinine, and it must not be expected that by working out in the jungle with Nepalese coolies, the same money value will be got out of a pound of bark as could be got out of that pound by an accomplished European quinologist. Much less can it be expected that *at first* any approximation to such a standard can be attained. The impression which I have gained from my protracted experiments is, that the successful manufacture of quinine (like most other manufactures) is not any particular secret or the adoption of any particular route, but is the result of the application of skilful manipulation and minute experience at each step and turn of the work. In asking Government, therefore, to authorize me to commence the manufacture there with the present season's thinnings and prunings, I should consider my recommendation would be justified by the result. If a product should be obtained that can just be serviceably employed, it might be then confidently anticipated that improvement step by step would follow.

19. In case the precipitated alkaloids should ultimately not prove satisfactory to the medical profession, and assuming moreover that we never discover how to produce therefrom economically a pure crystallised sulphate of quinine in sufficient quantity, it will nevertheless probably be found most profitable to Government to manufacture the precipitated alkaloids at Rungbee, and send them for sale to London rather than the bark itself. Not only is fuel and rough labor cheap at Rungbee, but the expenses of carriage will be reduced to about one-fiftieth of that of the bark.

20. The prunings and thinnings of this season at Rungbee are now proceeding, and are estimated to produce about 1,500lbs. of bark, of which nearly 1,000lbs. will be bark from wood three or four years old, the remainder from second year bark. I am sending 2 maunds of the very best for sale in London. The rest I propose to work up experimentally myself at Rungbee. I therefore now ask Government to sanction the expenditure from the current year's contingency of Rs. 2,500 for the requisite machinery. The sanction is needed in point of form, as there is an ample margin of contingency available to meet the charge; but I feel that the embarking in a manufacture of this magnitude and difficulty should have the express sanction of Government.

21. Besides the expense of machinery, the experiment will cost Government the loss occasioned by not selling the bark, for though Dr. Anderson as above stated) in his budget estimate gave the cost of drying, packing, and carriage to be as much as the bark would fetch, the 1,000lbs. of higher class bark would doubtless produce, if sold in London, a large profit over those expenses.

22. I propose, if this experiment is sanctioned, to work up the year's crop at Rungbee into a grey powder similar to the sample transmitted. This grey powder can afterwards partly be issued to the Inspector General of Hospitals, partly to be sold in London, and partly be experimented on in Calcutta, for production of the crystallised sulphate therefrom.

23. Regarding the process to be followed, I have travelled over most of the ground pointed out in Dr. T. Anderson's letter, and I consider that the same process cannot be followed exactly with all bark.

In the bark, from very young shoots, the quantity of resin present is large, and I have been unable to deal with it at all except by following Dr. T. Anderson's plan of a previous boiling in alkaloid water. This, however, doubtless sacrifices a percentage of the small quantity of quinine present on such bark; and Mr. Blanford greatly doubts whether the bark from young shoots will ever prove remunerative to work up.

24. I have been exceedingly desirous of working the bark cold altogether, as suggested by Dr. T. Anderson. There is great advantage in working cold, not merely in saving of fuel and labor, but in diminishing the quantity of the vexatious resin (as Dr. Broughton calls it) and coloring matter. But I am sorry to say that bark, after repeated and protracted infusions, has produced with me large percentages of the alkaloid by decoction.

25. In the matter of infusion, I should therefore, as Dr. Broughton says, "proceed according to circumstances." With the better class of Rungbee bark of the present year, I should be inclined to infuse it first and decoct it afterwards; interposing between the infusions and the decoction an alkaloid treatment in those cases where the resin proves very vexatious.

26. On another important point, I do not propose for the present season to adopt Dr. Anderson's suggestion, *viz.*, that of working the bark fresh. It has been stated that bark gives up its quinine more readily in a fresh state. I have tried the fresh bark, and I have not obtained a good result. I have little doubt that this failure was because my bark was not cut fine enough. Indeed, I could see that the dilute acid discolors the bark hardly one-fortieth of an inch deep. To cut up 1,500 lbs. of bark very fine would require special machinery, the expense of which I wish to avoid for the current year's experiment, especially, as by drying the bark in the present drying-house, it can then easily be pounded in a mortar to a very great fineness.

Moreover, there will always be a great practical difficulty in working the fresh bark on a large scale. The fresh bark cannot safely be stored, as it soon ferments. Now the bark only "rises," that is, is fit for stripping at certain times, so that in the factory, if we worked fresh, we should be compelled to provide a very large quantity of machinery indeed so as to be able to take in hand, at once, the bark that would come in upon us irregularly in masses.

By working it dry, we can work it regularly at our leisure. Should my process not succeed well on the large scale, I can stay my hand, try any further experiment before proceeding, or finally in despair ship the dried bark to England.

27. A very large portion of the present book by Mr. Howard, and also a great many of Dr. Broughton's experiments, refer to the process of mossing up the trees devised by Mr. McIvor. Before I took charge of the Rungbee plantations, Dr. Anderson had decided, after no very long experimenting, to have nothing to do with that process. About that decision there is no second opinion at Rungbee. Any person may, however, quickly decide it for himself in Calcutta.

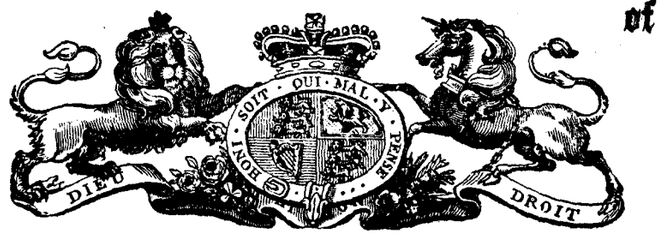
Let him select a dozen trees 20 feet high (the Rungbee Succirubra trees have reached that height already, and will probably be 30 feet in a couple of years' time); let him get moss enough for the purpose (if he can—we cannot at Rungbee); let him tie this moss round the stem and branches up to the second year wood; let him watch the trees six months, and loosen the bonds, where necessary, to prevent the trees being cut (working with the lowest coolie labor and superintending himself); then let him sit down and calculate the quantity of moss required for 1,200,000 trees (which there will be at Rungbee planted out by 31st March 1870), and where it is to be collected, and how much labor it will take to apply it, and how much superintendence to watch it. Then he will be in a position to form a very fair opinion on the process of mossing [illegible] indeed, I do not think Dr. T. Anderson's opinion was founded on any more extended experiments or recondite speculations. Granting that the mossed bark produces ten times the quinine that the unmossed does, I would unhesitatingly prefer growing ten times the number of trees in order to get the required amount.

28. At Rungbee Dr. T. Anderson has kept quite clear of the refinements which have, apparently, so largely occupied attention at the Neilgherry plantations, and has devoted himself to growing the cinchona trees in the largest size and quantity at the lowest rate of expense possible. In this he has succeeded, not in the qualified degree which it would appear from Mr. Howard's book; success has been attained in the Neilgherries, but completely and beyond the most sanguine anticipations that were formed by any one. Moreover, it now turns out that this bark is superior in value to that from the peninsula plantations. The problem now remaining is to get the febrifuge out of this bark in a form practically available in medical practice and at the lowest possible cost.

29. With regard to the suggestion in the last paragraph of Dr. Anderson's letter, it would give me great pleasure to meet Dr. Broughton, and I do not doubt but that with a word he could save me the labor of many of the experiments which I shall have yet to make to clear up points of working detail. I also should like to obtain the aid of his experience in several questions connected with the machinery. I believe I might find time for a short visit to Dr. Broughton in March, and I have the honor to request Government to send me to Ootacamund, on deputation, for one month, more or less.

No. 476, dated 21st February 1870.

From—H. S. BEADON, ESQ., *Offg. Under Secretary to Government of Bengal,*



To—*The Offg. Superintendent, of the Botanical Gardens, and in charge of Cinchona Cultivation in Bengal.*

I am directed to acknowledge the receipt of your letter No. 165, dated the 10th instant, submitting your report on the subject of manufacturing quinine in Bengal, and in reply to inform you that the Lieutenant Governor has been pleased to sanction the expenditure of Rs. 2,500, applied for in paragraph 20, for machinery requisite for an experimental working of the manufacture. The charge will be met, as suggested by you, from the allotment for contingencies in your budget grant for the current financial year.

2. With reference to paragraph 29 of your letter, I am to say that the Lieutenant Governor is willing that you should proceed to Madras, as proposed by you, to hold an interview with Dr. Broughton.

No Official Orders or Notifications, the publication of which in the GAZETTE OF INDIA *is required by Law, or which it has been customary to publish in the* CALCUTTA GAZETTE, *will be included in the* SUPPLEMENT. *For such Orders and Notifications the body of the* GAZETTE *must be looked to.*

GOVERNMENT OF INDIA.

HOME DEPARTMENT.

NEILGHERRY CINCHONA PLANTATIONS.

Proceedings of the Madras Government, Revenue Department.

No. 268, dated 22nd February 1870.

Read the following Report from J. BROUGHTON, Esq., Quinologist to Government, Ootacamund, to the Acting Secretary to Government, Revenue Department, Fort Saint George, dated Ootacamund, 9th December 1869:—

The present condition of the Neilgherry Cinchona Plantations, both absolutely and with reference to the changes that have taken place during the past year, may be aptly discussed in the beginning of this Report.

2. Constant examinations of the bark of the oldest part of the plantations of *C. Succirubra* have demonstrated that the amount of alkaloids therein contained has *increased* during the past year. The amount of this increase has necessarily been determined by the comparative examination of a part only of the plantations conducted at different seasons, and hence a certain error may be committed by applying the definite number thus obtained to the plantation generally. I therefore content myself with stating that the increase in the amount of alkaloids contained in the trunk-bark of the oldest trees from May 1868 to May 1869, has not been less than 0·5 per cent.

Red bark has increased in yield of alkaloid, 1868-69.

3. In a Report, dated 17th August 1868 (Proceedings of Madras Government, Revenue Department, 22nd September 1868, No. 334), I had the honor of stating the *a priori* probability of the annual increment of alkaloid therein mentioned decreasing in amount till an equilibrium is established between formation and internal consumption. The respective numbers representing this annual increment for the last two years coincide with this view, being 0·75 and 0·5 respectively.

Annual increments are decreasing in amount.

4. The mean percentage of quinine has, on the other hand, diminished during the past year among the red barks, as was the case during the previous year. This diminution will be considered below. Analyses which are believed to fairly represent the mean yield of the bark of the oldest trees, may be stated thus in percentages of the dried bark :—

Quinine has not increased in red bark.

Mean present yield of red bark.

	May 1868.	May 1869.
Total alkaloids	6·74	7·43
„ sulphates obtained crystallized* ...	6·06	6·43
Quinine	2·40	1·72
Cinchonidine and cinchonine	4·34	5·71
Crystallized quinine sulphate obtained ...	2·21	1·51
„ cinchonidine sulphate obtained ...	3·85	4·92

5. During the past year I have paid much attention to the varieties of *C. Officinalis*, which constitute the "crownbarks." The varieties we possess of these are far more numerous than are usually recognized by the botanists who have studied cinchonæ in Europe. With the exception of the very distinct kind (provisionally called *Lanceolata*), whose great excellence I have pointed out on former occasions, (Proceedings of Madras Government, Revenue Department, 22nd September 1868, No. 334, paragraphs 12 and 13, and 19th June 1869, No. 422), I can discover no invariable connection between the external appearance and the chemical constitution; while the varieties themselves merge into one another by slight gradations.

C. Officinalis.

6. But, on the other hand, the yield of alkaloids varies greatly according to the vigour of growth, size of tree, and consequently with character of soil. The most vigorous and quickly-grown trees yield a far richer bark than the more stunted ones of the same age; while at the same time they, of course, yield more bark. This circumstance strongly indicates the advantage of high cultivation: thus, an acre of land planted with trees growing at a doubled rate will yield more alkaloid than two acres of trees growing at the ordinary rate. It is a singular circumstance that the alkaloids should be the constituents most affected by the tree's vigour, as it would seem far more likely *a priori* that all the constituents would be affected in equal proportion. I have some reason for thinking this circumstance is closely connected with the amount of nitrogenous constituents in the soil.

Vigorous trees contain most alkaloid.

7. This variation in the amount of alkaloid, with the size and vigour of the tree (age being constant), renders any numerical estimate of the annual mean increase in the percentage of alkaloids exceedingly difficult to obtain. I believe the increase during the past year has been considerable, but feel hardly justified in stating a definite number that would apply to the whole plantation. The diminution in the amount of quinine with age, perceptible in *C. Succirubra*, certainly does not obtain in *C. Officinalis*. To illustrate the great difference in the yield connected with the vigour of the trees, I quote the following results obtained

Increase during past year.

Analyses showing difference of yield according to vigour.

* The numbers express the pure and not the commercial salts. From the crystalline sulphates that of cinchonine is excluded. These observations apply to all analytical statements in this Report.

from trees of same age (five years old), each analysis being the mean of several trees :—

	Bark from fine vigorous trees.	Bark from fine vigorous trees.	Bark from trees of mean growth.	Bark from trees of stunted growth.
Total alkaloids	6·76	6·94	4·34	2·40
„ sulphates crystallized	5·39	5·59	3·60	1·65
Quinine	3·76	3·80	2·18	0·90
Cinchonidine and cinchonine ...	3·00	3·14	2·16	1·50
Quinine sulphate obtained crystallized ...	3·45	3·55	2·00	Undetermined.
Cinchonidine sulphate obtained crystallized	1·94	2·04	1·60	Ditto.

8. On the 30th of August last I obtained a mixed sample of Calisaya bark from sixteen trees grown at Neddiwuttum, rather more than two years old. It gave as a result :—

C. Calisaya.

Total alkaloids	4·53
„ sulphates	2·87
Quinine	3·27
Cinchonidine, quinidine, and cinchonine	1·26
Sulphate of quinine obtained	2·17
Other crystalline sulphates	0·70

9. The above result is very promising, and ought to lead to the extended cultivation of this species, which has a greater established reputation in Europe than any other kind. The numbers above may fairly be taken as expressing the mean general yield at the period stated.

10. I had the honour, in May last (Proceedings of Madras Government, Revenue Department, 19th June 1869, No. 422, paragraphs 13 and 14), of adducing some considerations which appeared to me to show the expediency of discontinuing the planting of *C. Succirubra*, of which kind we have a sufficiency. The reasons I then gave I still hold to be sound; but since I wrote, from 100,000 to 150,000 additional trees have been planted. I therefore am compelled to think that Government do not coincide with me on this point. I also, in June last, addressed the Commissioner of the Neilgherries on the same subject, strongly urging the discontinuing of the planting of red bark trees in favour of other kinds on the small part of land allotted to Cinchona cultivation at that time remaining unplanted. For my present and future justification I respectfully reiterate the substance of what I then said both in the report and letter. The other kinds to which I refer are *Lanceolata*, *Calisaya*, and *Pitayo*, of which the remainder of the plantation should consist.*

Further cultivation of *C. Succirubra* unnecessary.

11. In my first Report I had the honour of communicating some facts concerning the occurrence of alkaloids in the leaves of Cinchona. I have since investigated the question more perfectly than I was then able to do. From 20 lbs. of the leaves

Leaves of *C. Succirubra*.

* Since the above was written, I have received G. O. No. 2936 of 9th November, in which orders are given on this matter.

of *C. Succirubra* I was able to obtain 0·372 gramme of alkaloid, of which 0·153 was quinine. The quinine yielded 0·070 gramme of crystallized sulphate. After considerable labour I was enabled to obtain positive evidence of the presence both of cinchonidine and cinchonine in the leaves, and also to obtain them in well-marked microscopic crystals. Below I give the respective percentage amounts of the alkaloids in the leaves, both fresh and dried :—

	In fresh leaves.	In dried leaves.
Total alkaloids	0·0041	0·019
Quinine	0·0016	0·0080
Cinchonidine and cinchonine... ...	0·0025	0·0110
Quinine sulphate obtained in crystals ...	0·00078	0·0037

12. Similar observations may be made, *mutatis mutandis*, respecting the leaves of the crown barks. The following statement expresses the percentages obtained :—

Leaves of *C. Officinalis.*

	In fresh leaves.	In dried leaves.
Total alkaloids	0·0035	0·0111
Quinine	0·0015	0·005
Cinchonidine and cinchonine... ...	0·0020	0·006
Quinine sulphate obtained in crystals ...	0·0008	0·002

13. The circumstance of the occurrence of the several alkaloids in the leaves in so definite a manner is one of considerable interest, but as a source of supply it obviously is of no practical value. The state of their occurrence is different to that in which they are found in the bark, and it is laborious and difficult to obtain them in a pure state. The quantity is very small in amount, and certainly gives no support to the impression so often stated as a fact (on slight grounds) that the leaves are an effective febrifuge. According to the above it would take many pounds of leaves to be equal to a dose of quinine.

Leaves of no practical use as source of alkaloid.

14. The leaves contain quinovin, to which they owe their bitter taste. The therapeutic effects of quinovin are under trial by the Medical Department.

Quinine in leaves.

15. In the original instructions I had the honour of receiving from the Home Government, I am directed to investigate the blossoms of Cinchona for alkaloids, &c. This has been done. The beautiful and scented blossoms contain no alkaloid, but a considerable amount of quinovin. The act of flowering does not appear to have any direct influence on the amount of alkaloid in the bark—a point on which I have made a careful inquiry—though it is by no means unlikely that blossoming has an indirect effect on the seasonal changes which I discuss below.

Blossoms of Cinchona.

16. In fulfilment of G. O., Revenue Department, 16th January 1869, paragraph 2, I have continued the examination of the wood for alkaloids. I find the wood of *Officinalis*, when dried, to contain 0·0101 per cent. of total alkaloids, of which 0·004 was quinine. This wood does not appear to be of any account as a source of alkaloid; it contains not a tenth of the amount found in the wood of *C. Succirubra*. The wood of *Officinalis* unlike that of *C. Succirubra* is very hard and dense, and may hereafter be found of value.

Wood of *C. Officinalis.*

17. Several remarkable kinds, which are now engaging my attention, have appeared on the plantation. I have many reasons for thinking they are really *hybrids*. None of them which I have examined appear to yield bark of special excellence, but the subject is nevertheless one of great importance, and merits a thorough study.

Occurrence of hybrids.

18. As the age of the various barks increases they lose less weight on drying. Hence, the fresh bark is more productive than it was from another cause besides the increased percentage of alkaloid in the dried bark.

Amount of moisture in barks decreases with age.

19. In 1867 the oldest red bark contained 73 per cent. of water, and the crown barks 69 per cent. They now contain an average of 68 and 64 per cent., respectively. This progressive alteration is what might be expected, and will doubtless continue to take place for many years to come.

20. I have had many opportunities of examining barks grown in the various parts of India on private and Government plantations. In almost every case the quality has been satisfactory. The *C. Succirubra* appears to flourish almost everywhere, and to produce a bark containing abundance of febrifuge alkaloids. Generally speaking, I find the barks somewhat thinner than those of a similar age on the Government Neilgherry Plantations, and yielding rather less quinine and more colouring matter and resin—qualities doubtless resulting from the less elevated sites of their growth. The crownbarks appear to enjoy less favour with cultivators; but the few specimens I have received have always been of good quality.

Good quality of India Cinchona barks generally.

21. The satisfactory quality of the bark of *C. Succirubra* in all South India localities, where the tree will grow at all, appears to be certain; and this statement may in all probability be still further generalized.

Mode of drying the barks.

22. The greater part of the inquiries given in this and foregoing Reports have been concerned with the Cinchona barks in the fresh green state. I have already in other Reports adverted to the advantages that are experienced by dealing with the bark in its natural state. The labour of drying and powdering preparatory to the extraction of the alkaloids is avoided; and in addition to this, from the softness of the tissues, the alkaloids are obtained in a state of solution with greater ease and less expenditure of acid. I estimate the saving from the latter cause at rather more than one-fourth.

The fresh bark is preferable to the dried.

23. The best means of drying the bark so as to preserve, as far as is consistent with economy, the contained alkaloids from alteration is one of the points which I was directed by the Home Government to investigate. I have therefore, during the past two years, at various times conducted experiments with this end both with the red and crownbarks. It would be tedious if I

Experiments made to determine best mode of drying.

were to quote the whole of the numerical results on which I base the conclusions; but in the Appendix to this Report I cite certain of them which indicate sufficiently the influence of the various modes of drying upon the subsequent yield of alkaloids, as determined by analysis. (Appendix A).

Principal possible methods.

24. The modes of drying that I have studied are (1), spontaneous drying in vacuo; (2), drying in a stream of air at about 36°—45°C;* (3), direct exposure to sunshine; (4), drying at a steam-heat, which at Ootacamund is about 96°C. The results were compared with those obtained with the fresh bark.

Effects.

25. The results show that the fresh bark gives a larger yield of crystalline sulphates than that artificially dried, though the difference is usually but slight. If the drying be quickly conducted at ordinary temperatures, as *in vacuo* over lime or sulphuric acid, the effect on the barks is not prejudicial. This is also the case with drying in a stream of warm air. The former conditions are not readily obtainable in practice, and from the cost can in no case be applied. It would, however, not be difficult to devise a system whereby the bark could be dried by a current of artificially warmed air; but the trouble and cost would, I think, under present circumstances, render it unadvisable to adopt such a process if it can be avoided.

Proportion of quinine not altered by drying the bark.

26. The processes of drying were each carefully tried also, in order to ascertain whether the proportional amounts of quinine and cinchonidine were affected by the methods employed. They were found not to be appreciably altered; and hence, in subsequent trials, the amount of total crystalline sulphates obtained was employed as the standard of comparison of the various modes.

General conditions to be fulfilled in drying.

27. The general conditions to be fulfilled in drying the bark as indicated by the results are—to dry it at a low temperature—as quickly as possible—and without prolonged exposure.

A steam-heat frequently injurious to the bark.

28. A high temperature, or even merely a steam-heat, is generally prejudicial to the bark from a remarkable reason. The alkaloids are associated in the bark with a peculiar tannin, the so-called quino tannic acid. This, under moderate heat, absorbs oxygen, and unites with the alkaloid to form a compound, which frequently is decomposed with great difficulty by acids. Hence, when such bark undergoes the ordinary manufacturing-process, a part of the alkaloid does not get into solution; and thus a practical loss takes place from the imperfect exhaustion of the bark. This effect of heat occurs in different degrees, being sometimes very marked, and at other times in but small amount. It is singularly apparent in those crownbarks which abound in colouring matter, especially in var. *crispa*, and was a source of much confusion until the cause was ascertained. Thus, a sample, which when green yielded 3·52 per cent. of alkaloid, after two days' exposure to a steam-heat, gave but 1·92 per cent. The loss appears to affect all the alkaloids equally. That the above explanation is really the true one has been demonstrated by special experiment. Again, if bark be exposed to a temperature

A high temperature alters the alkaloids.

much exceeding 100°C. the alkaloids become altered, and lose their property of crystallization, so that the bark becomes worthless. The foregoing reasons, therefore, exclude artificial heat as a general method for drying the bark.

* These methods were necessarily examined for the sake of comparison.

Sunshine also injurious to Cinchona bark.

29. M. Pasteur has stated on deductive grounds that the drying of Cinchona bark in the sun is injurious. I have abundantly corroborated the general truth of this statement. But to render the change clearly apparent it requires a certain exaggeration in the conditions, such as prolonged insolation, or else exposing the bark in a divided state in order to have an increased surface of action. If this be done a decrease of a half per cent. in the amount of crystalline sulphates obtainable from the bark takes place. If the bark be exposed to sunlight, and at the same time evaporation is checked (as in a box covered with glass), the decrease becomes very marked. If shred bark be allowed to remain a fortnight exposed to the sun of the Neilgherries, the decrease amounts to one per cent.

Bark may with care be dried in the sun.

30. But as the injurious action of sunlight is comparatively slow, and as bark dries rapidly under the fierce sun and dry rarefied air of the Neilgherries, it is not difficult to manage so that, while the action of the light is reduced to a minimum, the conditions of short exposure and moderate temperature may be fulfilled.

Cannot be dried during the south-west monsoon.

31. If recourse be not made to artificial heat it is scarcely possible to dry bark during the south-west monsoon on these hills. But the quality of the bark (as I shall show hereafter) will render any extensive harvesting of bark during that season unadvisable. I feel therefore justified on all grounds in recommending that the bark of the Government Plantations should be dried by natural means only.

Precautions.

32. I have repeatedly satisfied myself that if due care be exercised, the bark may be dried and prepared for export without appreciably deteriorating from the quality it possessed in its fresh state. The precautions to be taken are simple; the bark must be in as large pieces as possible (in order to expose a proportionally small surface), frequently turned, and so managed as to be as short a time exposed as possible. From January to the end of March when the atmosphere is very dry, bark could be dried on stages one above the other so as almost entirely to avoid exposure to sunlight, in which case no deterioration of quality is possible. Under other circumstances, unless the exposure to sunlight be carelessly prolonged, the alteration in quality is practically imperceptible.

Permanence of the alkaloids.

33. Long keeping of the bark in an undried or partially dried state impairs its appearance when subsequently dried. But under such circumstances the quality of the bark is affected to a much less degree than is generally supposed, provided it be not exposed to sunshine. I find by direct trial that bark may be kept more than three weeks without in any degree yielding an inferior amount of alkaloids on analysis. If it be kept six weeks and become mouldy, a deterioration becomes apparent; but it is slight, amounting in my trials to about 0·40 per cent. The alkaloids appear in such circumstances to be very permanent substances, and remain almost unaltered; while other constituents, such as quino-tannic acid, cinchona red, &c., are greatly changed. Even after three months' keeping in a moist place, during which time fermentation accompanied with spontaneous heating took place, I found that at least two-thirds of the original amount of alkaloid was to be obtained from the mouldering mass. In very singular contrast to this is the fact that quinine and cinchonidine are not to be found in the bark of trees that have been dead a short time.

34. The above facts show that, with ordinary management, there is but little risk of deterioration during the harvesting of the bark, provided the simple principles indicated above are kept in mind.

I have been requested to analyse bark which I found subsequently to have been baked in order to dry it. It was, of course, entirely spoilt.

35. Bark carefully dried, kept in a dry state, and analysed at the expiration of six and nine months, respectively, has given me no indications of any deterioration or change whatever. Hence, bark can be exported without loss of quality.

Bark does not perceptibly alter when dry.

36. The above facts appear to furnish answers to the questions which are likely to arise regarding the preparation of bark for exportation. When the drying of bark is carried on with large quantities, it will, of course, be useful to ascertain the exact effect of the above principles under the special circumstances.

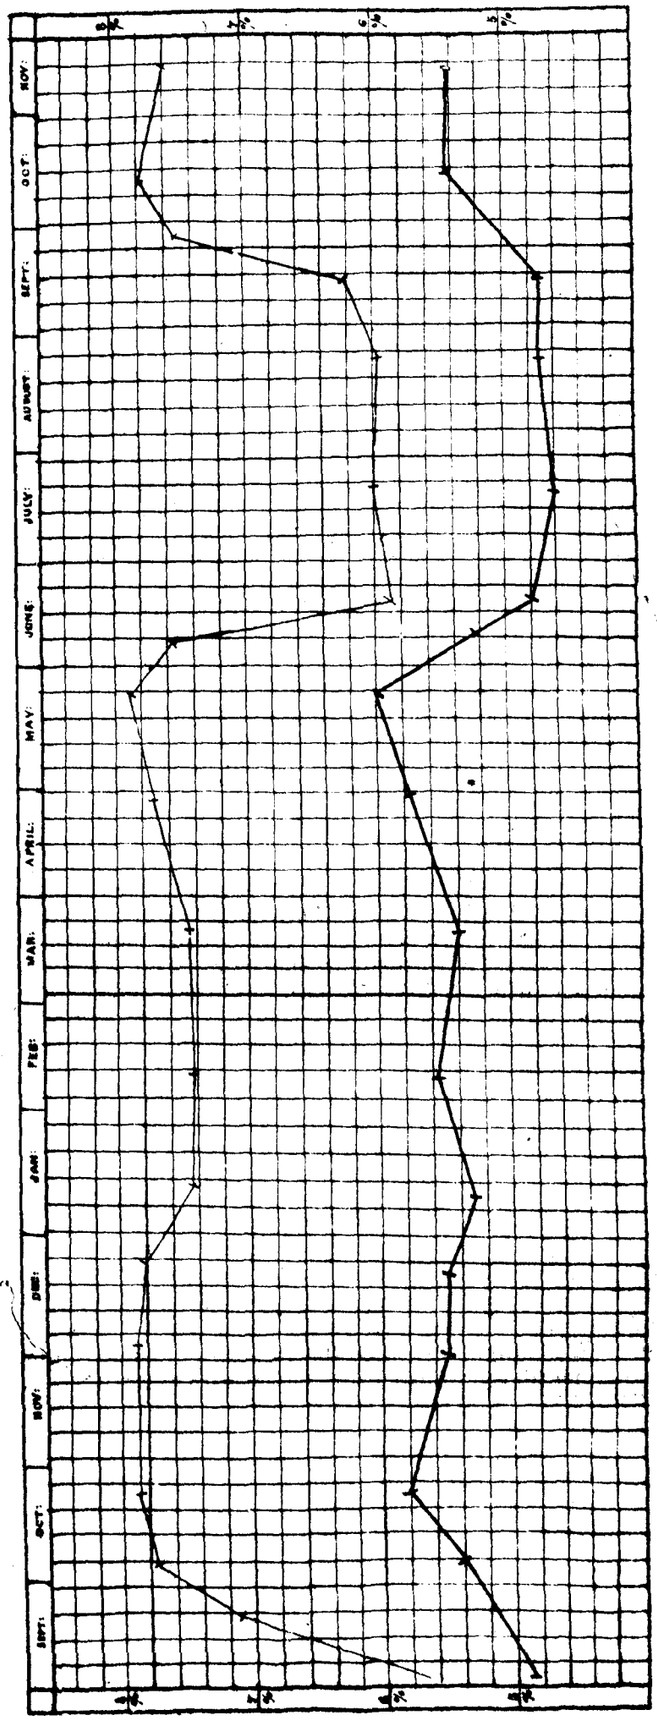
Influence of the Seasons.

37. The influence of the seasons on the amounts of alkaloid in the bark of the living Cinchona trees is a subject which merited a full inquiry for several reasons. The best time of the year for collecting bark depends on the time of maximum yield. The knowledge of the variations in the amount of the alkaloids under the influence of external circumstances tends to throw light on those conditions of their occurrence on which the possibility of controlling their formation depends. As soon, therefore, as I possessed means for the investigation of this question, I commenced a series of inquiries. But the subject was found one of considerable difficulty. After nine months' continuance of a series of periodic analyses, I felt some reason to doubt whether my plan of investigation was calculated to exclude disturbing circumstances, some of which might be unknown. I therefore felt it necessary to begin the inquiry afresh, which was accordingly done, with the advantage of knowing the general direction to which the more precise results might be expected to lead.

Importance of inquiry.

Difficulties.

38. A set of six trees was selected from the oldest part of the plantation. A narrow strip of bark was taken from each, and the mean average sample thus obtained was analysed. This was done periodically throughout the year. The strip being but a very small portion of the whole trunk, its loss would not affect the natural changes which take place in the whole. Except at the latter end of the dry season the bark rapidly renewed itself. As a means of safety and control another set of six trees was selected whose bark had the average quality of the first six. From these at various times bark was also taken in order to verify and to complete the results obtained.



Method adopted.

The changes in composition observed agreed satisfactorily with other observations, and corroborated those which the former inquiry had shown to take place. The means of checking employed preclude the idea of any other cause seriously influencing the results. I therefore report them, with the conviction that they express with fair accuracy the variations in yield of the bark according to the seasons of the year. As a criterion I place most stress upon the amount of total crystallized sulphates, since that, upon the whole, is the truest standard of the commercial and practical value of the bark.

39. In order to render the bearing of the results more obvious to the eye, they may be conveniently given in a graphical form. The following diagram, in which the ordinates of the respective curves represent percentage amounts, and the abscissæ the times, expresses the seasonal changes, and render apparent the numbers which may be obtained by interpolation.

Curve best expresses results.

DIAGRAM

The thin line expresses the total alkaloids.
The thick line expresses the total crystallized sulphates.
The unit of measurement of the abscissæ is one week.

40. The above curves show two "singular points" which are periods of maximum yield. One occurs in October, and the other in May, or nearly at the opposite seasons, or shortly before the beginning and shortly after the cessation of the south-west monsoon. The ascent and descent of the sap are less marked in cinchonæ than in the trees of more temperate climates; but there is a connection between the maxima and the latter processes. The period at which the bark is richest in alkaloids that yield the largest amount of crystalline sulphates is during the month of May.

Discussion of diagram.

41. The above curve shows a very marked decrease in the amount of alkaloid during the monsoon months, so that it is during the dry season that the operations of cropping, &c. must be conducted. During that time not only is the bark better in quality than during the monsoon, but it is more conveniently dealt with. The exact periods of maximum yield do not, indeed, occur at the most convenient seasons; but the amount of alkaloids during the greater part of the winter (if it can be so called) does not greatly differ from the maximum yield. There appears to be no practical reason why a compromise should not be made between slightly opposing grounds of quality and convenience, and why the wide period between November and May should not be that of bark harvest. It is, however, probable that this period must be shortened on other grounds, since the bark at the latter end of the dry season separates with difficulty from the wood. It will always be a loss to collect bark in any quantity during the monsoon.

Consequences.

Time of harvesting.

42. The branch bark appears to share in the progressive changes that are undergone by that of the trunk.

Branch bark.

43. Circumstances have scarcely permitted a similar investigation being conducted with the crownbark trees. The few observations I have made appear to show that those grown at Neddiwuttum vary in yield in a similar manner to their red bark neighbours. The crownbarks of the Dodabet Plantations certainly show a less marked diminution in their yield during the rainy season than the red barks at Neddiwuttum. This is probably a consequence of the climate being not so sharply divided into a very rainy and very dry season as it is at the latter place.

Seasonal changes in *C. Officinalis*.

44. I have considerable reason for believing that the variations in the amount of alkaloids in the bark at various seasons become less marked as the trees grow older. During the first year of my acquaintance with the plantations I found somewhat greater differences in yield between the barks collected during the dry and rainy seasons than the above diagram indicates. This is what might be expected, since the older tissues take a less active share in the vital processes of the plant than those more recently formed. With increasing age and thickening bark it follows that there is more and more tissue which remains comparatively quiescent, and thus prevents the variations in the younger portions from affecting the gross yield to so great an extent.

Variations tend to a minimum.

Conditions upon which depend the amount of Quinine in the Cinchona barks.

45. The alkaloid, which first appears in the bark, is one which has all the properties of quinine, except that of yielding crystalline salts. It is found in very young plants, and in considerable quantity in the freshly formed bark which re-places the loss of strips of original bark, when the latter is removed without injury to the cambium. It forms, indeed, nearly the whole of the alkaloid that

Order in which alkaloids are formed.

is to be found in renewing bark. As time goes on the alkaloid acquires the property of crystallization, and is then *quinine*. Cinchonidine does not appear in any quantity till a later stage. This is no hypothesis, but the conclusion from many concurrent observations. For example, I may cite the following series of analyses of bark of *C. Succirubra* for the first seventeen months of its natural renovation without any artificial protective:—

	I.	II.	III.	IV.	V.
	Four Months.	Six Months.	Ten Months.	Fifteen Months.	Seventeen Months.
Total alkaloids	4·30	5·3	5·03	6·00	5·47
Quinine	4·20	4·4	4·02	3·03	3·65
Cinchonidine and cinchonine	0·10	0·9	1·01	2·97	.....
Sulphate of quinine obtained	0·25	1·56	2·20	2·30	3·12
„ of cinchonidine obtained ...	None.	.....	.....	1·13	1·24

46. These results leave no doubt that quinine is the alkaloid first produced. The gradual acquirement of the property of crystallization with the increase in the amount of cinchonidine is also clearly shown. The order in which the alkaloids are formed in the cells of new and rapidly forming tissue are, uncrystallizable quinine, ordinary quinine, and cinchonidine. Cinchonine is also formed at a late stage.

Quinine first formed.

47. It is thus scarcely possible to resist the conclusion, that it is in this order they are actually formed in the plant. Since the amounts of the first formed alkaloids diminish, and are replaced by others as age increases, an actual conversion of one into the other is at least a legitimate hypothesis.

Actual conversion probable.

48. Though I have never yet succeeded in converting quinine into cinchonidine, or *vice versâ*, by artificial means, the intimate relationship and close resemblance of the two substances taken in connection with appearance of the latter in increasing amounts with the increasing age of the bark lead me to consider it in the highest degree probable that cinchonidine is formed in the tree by the progressive alteration of quinine, and not as an independently formed substance. There are further corroborations of this view on quite other grounds.

Cinchonidine due to alteration of quinine.

49. It is remarkable among the crownbarks that the most rapidly growing trees are richest in quinine, and contain but a comparatively small amount of cinchonidine. If there be trees which, while quite healthy, are stunted in their growth, and in a quiescent state, such trees are almost sure to be poor in quinine and rich in cinchonidine.

Rapid growth favourable to the occurrence of quinine.

50. All the cinchona alkaloids are altered in composition by long exposure to light, but in different degrees. The salts of quinine are particularly sensitive. It is well known

Sunlight inimical to quinine.

that samples of sulphate have to be kept in a shaded or dark place, or else they become discoloured.*

Sunlight appears to encourage formation of cinchonidine.

51. I am by no means justified, by direct evidence, in stating that quinine is converted in the living tree into cinchonidine by the action of light; but it seems certain that such conversion is greatly expedited by that agency. Trees, whose bark has been long exposed to sunshine, and whose growth has been sluggish, always contain the largest proportion of the latter alkaloid.

52. The above observations apply to *C. Succirubra* and *C. Officinalis* and their varieties. I am strongly inclined to believe that the chemical changes connected with the occurrence of alkaloids are identical in the various species, and differ only in degree.

Form in which the Alkaloids occur in the living bark.

State of combination in which the alkaloids occur.

53. The state of combination in which the alkaloids occur in the living bark has not hitherto been known with certainty. As this is a point of great importance, from its bearing on the chemistry of the formation and functions of the alkaloids, I have endeavoured to ascertain it as completely as possible. As this is scarcely the place in which to detail the methods employed in the investigation, I merely state the results.

As determined by immediate experiment.

54. In the bark of *C. Succirubra* four-fifths of the whole amount of the alkaloids are contained in the *solid* state within the tissues (most probably, almost exclusively, in the parenchymatous cells) of the bark in combination with quino-tannic acid. These alkaloid tannates are but slightly soluble in cold water, more soluble in hot, but are quite insoluble in the surrounding plant juices. They thus cannot be very active constituents. They are, in all probability, the stored alkaloids of the bark, of which only a small portion at the most shares in the charges incident to growth. When freshly taken from the plant the substance has a grey color; but rapidly absorbs oxygen from the air, and becomes of a dirty red tint. This substance has all the appearance of the artificially prepared quino tannate, and is, as mentioned above, liable when dried at 96°C. to pass into a state in which the alkaloid is separated with great difficulty. The remaining one-fifth of the alkaloid is in solution in the juice of the bark. It is there associated with quino-tannic acid, quinic acid, and probably also another acid, which exists in small quantity. As the tannic acid present in the juice is amply sufficient to form a tannate with the whole alkaloid present, it seems probable that the juice contains the alkaloids also in form of tannate, held in solution by the free acids.

Occurrence of quinovin.

55. Quinovin is a less abundant constituent than the alkaloids. It is to be detected in the clear juice in very small quantity, but is mainly to be found in the solid cell-contents. As the combination of quinovin with the alkaloid is so readily destroyed by acids, it appears almost certain that the quinovin is in the free state.

Current notions concerning the functions of the alkaloids.

56. A speculative opinion has been long held concerning the functions of the vegeto-alkaloids in the plants producing them, whose importance is so great that its practical

* A slight admixture of cinchonidine sulphate renders it far less easily affected. A specimen of quinine sulphate containing 5 per cent. of cinchonidine salt retains its whiteness, while a pure specimen becomes brown when exposed to the same circumstances.

verification or contradiction is almost necessary to the scientific cultivation of those plants. This hypothesis is mainly due to Liebig, and dates as far back as 1840, and since that time has continued to rest on little else than speculative grounds.

Application of Liebig's "Mineral Theory."

57. It is believed that the alkaloids are the substitutes for the mineral bases which are the constituents of all plants, and which constitute the larger portion of the ash obtained when the plants are burnt. The alkaloids possess the same general properties as these mineral bases; they completely neutralize acids; and comporting themselves in so chemically similar a manner, it is thought that their functions were identical, and that certain tribes of plants were enabled to produce actual substitutes for these necessary bases, which are frequently meagrely furnished by the soils in which they grow.

Applied to the Neilgherry Cinchonæ.

58. The simplicity and beauty of this hypothesis has always rendered it, in the absence of more precise information, a favorite one. On my first acquaintance with the living Cinchonas (*par excellence* the alkaloid-producing plant) there were several circumstances which seemed to show its truth. Among these were the exceptionally large yield of alkaloids in the Neilgherry Cinchonas, combined with singular poverty of the soil of the Neilgherries in lime—a base which is the main constituent of the ash of most plants. These circumstances led me to institute a series of experiments in which the amount of organic bases was compared with the amount of ash yielded by the same bark. This has been carried on with all the species of Cinchonas, and under all the diversity of conditions, I could devise. During the last two and a half years upwards of seventy determinations have been made with this object.

Experimental evidence adverse to the above hypothesis.

59. The results have convinced me that the relations of the organic to the mineral bases is by no means so simple as the hypothesis assumes. The contradictions are numerous. Trees growing under similar circumstances may have the same amount of mineral constituents, while the organic bases are as 1 : 2. The general distribution of the mineral bases is quite similar in Cinchona to that which obtains in other trees yielding *no* alkaloids; and what is still more important, I find that trees grown for two years in a soil made artificially calcareous have not shown any difference either in their yield of alkaloid or amount of ash.

The substitution for mineral bases either untrue or very partial.

60. But there are several cases in which the amount of organic bases do really show a tendency to appear in the inverse amounts, which would result from a mutual substitution. These cases occur, however, in an incoherent manner and can frequently be explained satisfactorily on quite other grounds. **I am therefore compelled to believe that the physiological equivalence of function attributed to the organic and inorganic bases, is either untrue or much more partial than is assumed to be the case in this application of the "mineral theory." I do not, however, propose to abandon the subject, since collateral points remain which require thorough investigation.**

During these inquiries I have received valuable help from Mr. C. Dawson, the Assistant Superintendent of the Neddiwuttum Plantations, which are the most advanced. I therefore take this opportunity of acknowledging my obligations to his knowledge of the details of the present and past operations under his charge, and for the active and intelligent assistance I have constantly received.

APPENDIX A.

The following results form a portion of the grounds upon which the conclusions in the Report are based, and are here quoted for the sake of illustration.

A quantity of the bark finely shred was submitted to the various methods of drying. The various amounts of alkaloid and crystalline sulphates are given in the following table; A being the amounts yielded by the fresh bark :—

Red Bark.

———	A.	Dried at 17° C. in vacuo.	Dried at steam-heat.	Dried in current of air at 35°-45° C.	Dried in sunshine.	Dried in sunshine slowly.
Total alkaloids	6·89	6·67	5·92	6·64	5·90	5·85
Crystalline sulphates obtained ...	6·12	5·98	5·31	5·89	5·28	4·78
Comparative amounts of acid required to neutralize the alkaloids	13·2	13·1	11·8	13·1	12·0	11·6

Mixed Crownbarks.

———	A.	Dried at 17°C. in vacuo.	Dried at steam-heat.	Dried in current of air at 35°-45°C.	Dried in sunshine.	Dried in sunshine slowly.
Total alkaloids	3·93	3·92	3·52	3·85	3·63	3·04
Crystalline sulphates obtained ...	3·67	3·52	3·01	3·50	3·11	2·88
Comparative amounts of acid required	7·2	7·0	6·6	6·6	6·7	5·9

The amounts of crystalline sulphates obtained were adopted as the most accurate numerical standard of comparison.

APPENDIX B.

The remarkable effect produced in some barks by exposure to a temperature of boiling water with access of air is shown by the following analyses of the same bark. In A analysed while fresh; in B after three days' exposure to a steam-heat :—

———	A.	B.
Total alkaloids	3·52	1·93
Quinine	2·48	1·03
Cinchonine and cinchonidine	1·04	0·90
Quinine sulphate obtained	2·46	0·88
Cinchonidine sulphate obtained ...	0·66	0·56

The peculiar insoluble compound which gives rise to the above apparent loss of alkaloid is decomposed by the action of alkalis, and the missing alkaloid can thus, in great part, be recovered. Nearly all acid extracts of Cinchona barks, if evaporated to dryness at a steam-heat, undergo a similar change. Certain methods occasionally employed in the analysis of Cinchona barks (such as that known as Wöhler's) yield inaccurate results from this cause.

(Signed) KRISTNIENGAR.

Order thereon by the Govt. of Madras.

The Right Hon'ble the Governor in Council has perused Mr. Broughton's satisfactory Report with much interest. It will be forwarded for the information of the Right Honourable the Secretary of State, and copies will be furnished to the Government of India, the Local Governments, and to the Governments of Ceylon, the Straits Settlement, Batavia, and the French Settlements in India.

2. His Lordship in Council does not understand why the further plantation of the red bark variety was not discontinued in favour of those mentioned in Mr. Broughton's Report dated 24th April 1869. The necessary instructions to this effect should have been issued by the Commissioner of the Neilgherry Hills on receipt of the G. O., under date 19th June 1869, No. 1740; but, as observed by Mr. Broughton in his foot-note, in the Orders of 9th November 1869, Nos. 2935 and 2936, specific instructions have been issued for the extended cultivation of the new varieties.

3. Mr. Broughton's experiments on the leaves, blossoms, and wood of the Cinchona tree are highly interesting, and his remarks on the best system of drying the bark and regarding the proper period of the year for collecting it, will prove of great value to all who are connected with the cultivation.

(True Extract).

(Signed) R. A. DALYELL,
Acting Secretary to Government.

Northern ...	9·00	7·95		428	Grains :—											Saharunpoor ...	35,264	17·5	38·0	The mean volume of the Ganges Canal passing the Roorkee Gauge during the month was 4,675 cubic feet per second. The volumes discharged by the canal were as follows :— Tail, Etawah Branch 42 cubic feet. Escapes ,, ... 76 ,, ,, Tail, Cawnpoor ,, ... 271 ,, ,, Escapes ... no returns. 389 cubic feet. The Cawnpoor and Etawah Branches have alternate weeks of high and low supply. The gauge readings show the mean of the month. Owing to the heavy and general rain in December, there was no great demand for water till the close of the month. Such demand as existed on the Ganges Canal during the first part of the month was for crops sown on sandy soil. The Futtehpurh Branch having no demand for water at its tail, could only run half supply till the 20th of the month, to the inconvenience of irrigators at the head of the branch. On the Eastern Jumna Canal the demand during the whole of the month was greater than the supply, as the Jumna River was very low, and the available supply had to be divided proportionally between the Western and Eastern Canals. Towards the end of the month, things began to wear a critical aspect, owing to the enormous demand for the first waterings and cries for the second of early sowings, which suddenly arose.

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Friday, the 11th March 1870.

PRESENT:

His Excellency the Viceroy and Governor General of India, K. P., G. C. S. I., *presiding*.
His Excellency the Commander-in-Chief, K. C. B., G. C. S. I.
Major General the Hon'ble Sir H. M. Durand, C. B., K. C. S. I.
The Hon'ble John Strachey.
The Hon'ble Sir Richard Temple, K. C. S. I.
The Hon'ble J. Fitzjames Stephen, Q. C.
The Hon'ble D. Cowie.
Colonel the Hon'ble R. Strachey, C. S. I.
The Hon'ble Francis Steuart Chapman.
The Hon'ble J. R. Bullen Smith.
The Hon'ble F. R. Cockerell.

FEMALE INFANTICIDE BILL.

The Hon'ble MR. STRACHEY presented the Report of the Select Committee on the Bill for the prevention of female infanticide.

INDIAN WEIGHTS AND MEASURES BILL.

Colonel the Hon'ble R. STRACHEY applied to His Excellency the President to suspend the Rules for the Conduct of Business, to enable him to introduce the Bill to regulate the Weights and Measures of British India. He said that he made this request to render possible what he feared would otherwise hardly be the case, the passing of this measure before the Government of India left Calcutta, if it should be approved by the Council after the detailed consideration which they would be asked to give.

The Bill was very simple in its form, and its object was to give effect to the conclusions of the Government of India on the general question which had now been before the public for more than a year. The Council would, he thought, be fully as able to discuss the principles of the Bill today as they would have been had the longer period usually allowed elapsed since the Bill was in the hands of the members of the Council.

He might mention that it was the desire of the Agency of the East Indian Railway Company to adopt the new unit of weight on the opening of the Chord Line Railway, which might be expected to take place towards the end of the coming rainy season. The opening of this line would necessitate the re-arrangement of the whole of the charges for goods sent between Howrah and the stations above the end of the new line, and new tables would have to be prepared in consequence. The Agency wished to make the change as far as possible a final one, by adopting, in the new tariff, the ton of 1,000 kilograms as the unit on which their charges were to be made. It was evidently desirable that the new weights should, if possible, be authorised by the legislature before they were adopted by the Railway Company, and it was therefore desirable that the law should be passed before the Government of India returned to Calcutta.

It would, he thought, be generally considered that a Bill relating to the weights and measures of India should be fully discussed by the non-official

members of this Council, as well as by those members who represented Madras and Bombay, and the Government would be reluctant to deal with such a measure at Simla.

If the Rules were not suspended in the present case, he feared that the time left for the consideration of the details of the Bill would be so short, and would come into a period when the attention of the Council would necessarily be given to other questions of great importance, that there was much danger that the Bill could not be passed at all before the Government left Calcutta.

The President declared the Rules suspended.

Colonel the Hon'ble R. STRACHEY then introduced the Bill and moved that it be referred to a Select Committee with instructions to report in a fortnight. He said that, after the explanations that he before had the honour to offer on the subject of the Bill, he need not detain the Council with many remarks on the present occasion. The first object of the Bill was to declare, in an authoritative manner, the determination of the Government of India that certain new weights and measures should eventually be received as the established weights and measures of the country. These weights and measures, it would be seen, were to be based on the units of the metrical system. But considering the difficulty of accomplishing any fundamental change in such matters otherwise than gradually, it had not been thought desirable to affirm that the precise system of weights and measures commonly known as the metrical system should be adopted in its entirety, and it was left to the discretion of the Government of India to declare, from time to time, what the precise denominations and magnitudes of the authorized weights and measures were to be, subject to the proviso that they should all be based on the metrical units. In like manner it would not be required that the sub-divisions of all the new weights and measures should necessarily be expressed in decimals, though a preference would be given to decimal divisions, if it was thought practicable to ensure their adoption. The formal declaration by the Government, under the provisions of a legislative enactment, that it had adopted the resolution to accept such a system of weights and measures to the exclusion of all others, would, he ventured to think, be one of the steps most likely to bring about a spontaneous adoption of the new system without any pressure under an obligatory law. Until the Government had pronounced in an unmistakeable way its intentions, it was not to be expected that persons engaged in trade would run the risk of supplying themselves with new weights or measures, and adopting them in their business, when some fresh declaration of the Government might, at some future time, render them all useless. He (COLONEL STRACHEY) looked confidently therefore on the declaration on this point which the Bill contained as being likely of itself to do a great deal towards the ultimate general adoption of the new system, and in fact to make practicable, at no very distant period, the application of the other parts of the Bill, first in the larger towns, and subsequently and by degrees in the country generally. The Bill made a distinction between weights and measures. No power was taken to require the compulsory use of measures excepting in Government offices, and by municipal Bodies and Railway Companies. The compulsory powers affecting the general public only referred to weights. This distinction was made in accordance with the conclusions of the Government that it was not desirable at first to deal with anything but the weights of the country, the use of which, in the transactions of everyday life, stood on a totally different footing to the use of measures. As regards the Government departments, of course it would have been quite optional with the Government to determine at any time what weights or measures they should use, without legislation, supposing that legislation had not been thought desirable on general grounds. But, for the reasons he had already given, it was very expedient to show what the intentions of the Government were, and to pledge the Government to move, when it thought fit so to do, in a certain direction and no other. The

Bill therefore declared that the Government might, when it thought fit, require the use of the new weights and measures by all Government departments. It had been thought proper to deal with municipal offices in the same way as those of the Government. In fact, in the majority of cases, the influence of the Government would no doubt have sufficed to ensure this without a legislative provision for it. But the same argument applied to such cases as in that of Government departments, and these municipal bodies, when not directly under Government influence to such an extent as would have ensured their acceptance of the wishes of the Government, might reasonably be looked to as bound to give the Executive Government all practicable help in carrying out a great public improvement such as that which this Bill contemplated. The Railway Companies had been included with the Government and municipal Bodies for similar reasons to those he had just explained. But in their case there was, in addition, an obvious pressing necessity for establishing uniformity in the weights they used. He (COLONEL STRACHEY) was glad to say that the chief of these great and influential bodies had most cordially accepted the proposals of the Government of India, and, as he had already stated, the Company in which Calcutta was most interested—the East Indian—had even outrun the Government in its desire to co-operate in the difficult task of introducing uniformity into the weights of the country. He was glad to have this opportunity of expressing the special obligations that he felt were due in this matter to the Agency of the East Indian Railway Company, and in particular to their able Chief Engineer, Mr. Sibley, and to Mr. Cecil Stephenson.

Although the Government had not yet taken any resolution in respect to the adoption in any of its departments of any of the new measures, it was probable that the convenience of the department with which he was himself specially connected, that of Public Works, would before long lead to the adoption of the metre as the unit of length for the purposes of that department. If this was done, it would be an almost necessary consequence that the Railway Companies should follow the same course. He might mention that he had consulted the heads of all the Engineering Departments of all parts of India, including the Railways, and that, while three-fourths of the officers consulted expressed an opinion that the simultaneous adoption of the metre and kilogram as the units of length and weight was advisable, only one-fourth opposed that conclusion, and of these several opposed any change. He thought that, on such a subject, so large a preponderance of opinion might be received as conclusive, at all events of the certainty that any decision of the Government to adopt the metre as the unit of length for engineering purposes would be well received and cordially responded to. As he (COLONEL STRACHEY) before observed, it was only in the case of weights that the Government desired to obtain any compulsory powers. The Bill provided that, when the Government had satisfied itself by a local public enquiry that the adoption of the new weights in any locality was expedient, it might be ordered. A power was then given to inflict small fines on persons using weights other than those authorized. Also a power was given to search for unauthorized weights. This was the whole of the compulsory portion of the Bill, and the power of inflicting such fines was limited by a proviso that it must be proved, before a conviction took place, that the authorized weights were procurable for sale at the time and place. The rest of the Bill might be described in general terms as making provision for a proper system of verification and inspection of weights and measures. Experience had everywhere proved that, to ensure proper correctness in the weights and measures of any country where weights and measures were regulated by law, a system of verification and inspection was essential. The verification under the Bill was proposed to be extended to balances as well as to weights. No doubt a considerable length of time must have elapsed before the provisions of this part of the Bill could be put into operation in a systematic manner over the country generally. But the adoption of properly verified weights of the new description in the chief towns must before long lead

to the adoption of similar weights in the rural districts, from which the supplies of produce came which formed the articles of trade in the towns. It was only by a gradual change extending over a long period of time that ultimate success could be obtained in the substitution of a uniform system of weights in place of the infinite variety of existing local weights. They must begin on a moderate scale, and by degrees introduce the new system, first in the largest towns, and afterwards in those of less size, until, eventually, the chief centres of trade had become habituated to it. The process would necessarily be slow, like that of education, but the object in view was of great social importance, and they must be content to attain it by the only means through which it could be attained.

The Hon'ble MR. STRACHEY said that Colonel Strachey had explained so fully the objects of the Bill that he only wished to make a very few remarks on the subject. The reasons which led the Government of India to the determination to adopt the conclusions which the Bill was intended to carry out had been before the public for more than a year, and he believed that he might safely say that they had been generally accepted by all the more intelligent classes of the community as the best which, under the circumstances, were possible. There was, however, one point on which there had been a good deal of misconception, and although the matter had been referred to by Colonel Strachey, MR. STRACHEY would like to say a few words regarding it. There had been a not uncommon impression that, in determining to adopt the kilogramme of the metric system as the unit of our new system of weights for British India, the Government was to some extent influenced by considerations of a theoretical nature, and that it chose that unit because it believed it to be theoretically and scientifically the best. This he would venture to say was a complete error. The Government did not choose the kilogram as the new standard of weight on any such grounds, and this had been distinctly and fully explained in the papers which had long been before the public and the Council. The Government believed, as Colonel Strachey had all along declared in the series of valuable papers which had led so greatly to the settlement of this question, that all standards of weight and measure were essentially arbitrary, and that no existing standards, whether of the metric or any other system, had really any intrinsic value of their own. The Government adopted the kilogram as a standard of weight for no theoretical reasons, but simply because it was convinced that this was the most convenient unit of weight that could be adopted in the interests of the people of India. It was this conviction alone which led His Excellency's illustrious predecessor, Lord Lawrence, to the conclusion that we ought to go to the metric system for our standard of weight, and he might safely say that no man could be found who was less likely than Lord Lawrence to be led away in such a matter as this by purely theoretical considerations. Lord Lawrence and his Government and the Secretary of State, MR. STRACHEY would repeat, chose the kilogram as the standard of weight, because they were convinced that it was the most convenient standard for the people of India that could possibly be chosen, and it was their conviction, not only that it would be the most convenient at some future time, but that it was the most convenient at the present moment and for the wants of the present generation. The reasons which led the Government to that conclusion had already been fully stated by Colonel Strachey and in the papers before the Council; but MR. STRACHEY would repeat some of those reasons which seemed to him to have a special importance. These papers shewed that it had been generally admitted in all parts of India, that in the interests of the people the most convenient unit of weight which could be adopted was the well known weight called the ser. The existing ser varied greatly, but it might be said generally that it varied from $1\frac{3}{4}$ to $2\frac{1}{2}$ lbs. English, and its average weight might be reckoned at $2\frac{1}{4}$ lbs. Consequently, the Government was led irresistibly to the conclusion that the most convenient unit would be a weight of about $2\frac{1}{4}$ lbs. English. The old British Indian or Government ser was equal to very little more than 2 lbs.

That weight, as Colonel Strachey had already explained to the Council, had ceased to have any legal existence, the law on which it was based having been repealed, but it never came into common use. One of the main reasons of its unpopularity was the fact that it was considerably below the average weight of the local sers. MR. STRACHEY thought (as he had written in a paper now before the Council) that there could be no question that the general belief of purchasers that loss would be entailed on them by the diminution of the standard-weight was not merely a fanciful belief. In reality, that belief was an expression of the well known fact that prices depended, not only on competition, but to a very great extent on custom. The Government was thus, as he had said, led to the conclusion that, in the interests of the people of India, the most convenient ser that could be adopted would be one considerably larger than the old so-called Government ser, and that it ought to be equal to about $2\frac{1}{4}$ lbs. English. Now it so happened that, by what he might call a fortunate accident, this was for all practical purposes the precise weight of the kilogram of the metric system, and that being so, when the Government adopted the kilogram as the new standard, it was adopting as close an equivalent as could be found to the average ser which had been generally admitted to be the most appropriate unit of weight.

He would not speak now of the many other conveniences and advantages which the Government believed would follow from the adoption of the proposed unit for our new system, but he thought the papers before the public would convince every one who took the trouble to study them, that the proposals of the Government had been really based on no theoretical conclusions, but simply in consideration of the real convenience of the people of India. At the same time, of course, the Government felt that it was an immense advantage that, owing to what he had called the fortunate accident that the kilogram was equal to the ser most commonly adopted throughout India, we should obtain a standard which would give us the means of placing our system of weights in harmony with the system which already prevailed in the greater part of the civilized world, and which there could be very little doubt would ultimately be adopted by England herself.

The results of the proposed measure would of course be very slow. The Government was not so foolish as to suppose that it could force on the people of India, suddenly, any new system of weights, nor had the Government the remotest idea of attempting anything of the kind. The steps must be extremely gradual, and he thought it very probable that the present generation would not see completed the reform which they were now commencing. But it might be confidently said that every step wisely taken to bring about certainty and uniformity of weights and measures would be in the highest degree beneficial. The inconvenience, and, worse than that, the endless and abominable frauds to which the poorer classes were now exposed by the confusion and diversity of weights, were most lamentable, and he thought, as Colonel Strachey had observed, that it was really wonderful that we should have arrived at the year 1870 before any measures had been taken to reform the present state of things.

The Hon'ble SIR RICHARD TEMPLE said that he approved of the substance of the Bill, and concurred generally in the observations that had been made by the Hon'ble mover of the Bill, and by the Hon'ble Mr. Strachey; but there was one remark which he wished to make. In section 2 of the Bill he found the words "which was equal to the kilogram known in France as the Kilogramme des Archives," and, in section 3, there were the words "which is equal to the metre known in France as the Métre des Archives." SIR RICHARD TEMPLE would like to omit those expressions in both those sections as surplusage and not necessary for the real purposes of the Bill, and also as being somewhat strange and not quite consistent with the practice of British legislation in India. Why there should be a reference to foreign weights and measures he did not understand. Reference to standard British weights and measures would be quite intelligible, because India formed a part of the British

Empire. If the new ser and the new metre were equal to the standard weights and measures of France, that was an advantage no doubt, but still, that in no way, primarily or secondarily, directly or indirectly, affected the object of the Bill. As the Hon'ble Mr. Strachey had correctly observed, the object in forming the new ser was not to produce uniformity with the standard on the Continent of Europe, but to form a standard which would be convenient solely for India, which would embody the average standard prevailing here: that being the case, what was the use of inserting any reference to a foreign standard and denomination? They were a British legislature, and why should they go beyond the British nomenclature. He (SIR RICHARD TEMPLE) presumed that other countries did not allude to the British weights and measures. The words to which he had referred were foreign to the purposes of the Bill, and were especially unnecessary, inasmuch as the British equivalent of the new ser was stated in the Bill with great minuteness and precision. It would be rather confusing than otherwise to add a second and foreign equivalent: the Bill would be quite as good, if not better, without these French equivalents, and he would therefore suggest the omission of those words.

The Hon'ble MR. BULLEN SMITH said that he desired in one single sentence to say with what great satisfaction he saw the introduction of the present measure. He felt, as a business-man, that the inconveniences of which mention had been made were not merely ideal ones. Even here, in the Presidency town, we had different sorts of maunds and sers, and as our transactions extended to the Mofussil, the difficulties and inconveniences increased. It was not surprising that there were some objectors to the measure, but he felt convinced that, when the measure was matured, even those who now objected would accept it as a substantial reform and substantial convenience to all engaged in trade.

Colonel the Hon'ble R. STRACHEY said that he desired to make a short explanation in reply to what had fallen from the Hon'ble Sir Richard Temple. Objection had been taken to the reference, in sections 2 and 3 of the Bill, to the standards of weight and measure in France known as the Kilogramme des Archives and the Mètre des Archives. COLONEL STRACHEY thought that Sir Richard Temple had overlooked what was an essential part of any system of weights and measures, that the only standards that could be used were what in scientific language were termed *material* standards. What was proposed to be the basis of the new system of weights for India was the precise weight of that particular piece of metal which was preserved at Paris, and went by the name of "Kilogramme des Archives." It must be nothing more and nothing less, and in no other way could a precise definition of the new ser or "kilogram" be obtained. It had been ascertained, it was true, some years ago, that two pounds and rather more than two-tenths of a pound avoirdupois were equal in weight to that piece of metal, and a reference had been made to that circumstance in the Bill. But the fundamental fact was that it was the weight of that particular piece of metal which was a kilogram, and the reference to the English weights was only explanatory. Subsequent weighings of the particular kilogram referred to might give results slightly differing from those first arrived at, and, owing to this, the stated equivalent in English weights might be found not to be quite exact. It was an exceedingly difficult task to ascertain with complete accuracy the weight of anything, no two operations producing precisely identical results. Therefore the only safe and exact plan was to refer to some one specific standard piece of metal on which to base any system of weights.

The same remarks would apply with respect to the metre as a standard of length; the metre would be (according to the particular standard adopted) the distance between the centres of two studs at the end of a piece of platinum or other metal of a certain definite length, or between two lines engraved on

it. That was a metre, nothing more and nothing less. In this way the English yard was defined, and it was the only way in which any measure could be defined. The law simply said that a mass of metal was deposited as the standard of weight and called the pound, and that a certain bar of metal was deposited as the standard of length, the distance between specified marks on which was the yard. For these reasons he had thought it necessary to introduce the specific reference to the material standards of weight and length kept at Paris.

Major General the Hon'ble SIR HENRY DURAND said that he did not understand the objection raised by Sir Richard Temple to be precisely that to which Colonel Strachey had replied. Sir Richard Temple, as SIR HENRY DURAND understood him, objected to having a foreign standard instead of an English one: it did not matter whether the English standard was precisely the same as the foreign standard advocated by Colonel Strachey or not, though certainly it was preferable to have it precisely the same. SIR HENRY DURAND quite agreed that it would be of immense commercial advantage, as well as a great simplification in trade transactions, that the weights should be precisely the same as those in use on the Continent of Europe; but the objection taken was that the standard should be an English standard, and, if he understood his hon'ble friend, he would put it in this way. Suppose a contention arose before the Courts with reference to the standard, and it came to a question of reference, how were you to carry out a reference of that sort to a foreign standard in a foreign capital over which we had no sort of control, and in the case of a war occurring between the two countries, how were you to carry out the reference? In the objection raised, there was a practical conclusion that it would be as well to eliminate the words which had been referred to, and to make the standard a practical English standard, although precisely the same as the French standard.

The Hon'ble MR. STEPHEN said that discussions of this kind were better suited to the Select Committee to which the Bill would be referred. He would, however, just make one remark to remove a slight misconception that appeared to exist. He presumed that the Government of India would have no objection to having a standard of the exact weight and keeping it in Calcutta. A standard was a material thing, and the keeping of such a standard would tend to the convenience and advantage of the mercantile community.

His Excellency the COMMANDER-IN-CHIEF said that he thought that the distinction taken was one of words rather than of substance. As he understood the Bill, they were about to introduce into India a system of weights and measures exactly similar to the system existing in France for many years. It appeared to His Excellency that, if they went to give an exact definition of the system they were about to introduce, they could hardly make the law plainer than by making a reference to the system which they were about to copy. He could not understand that there was anything degrading to the English law because it had reference to the system of weights and measures of another country, when we were about to copy that system. We could not describe that system merely by reference to a certain weight or measure; what we wanted was a practical reference to that which had been accepted scientifically as a standard. He could not see that the distinction was anything more than one of words and not of substance.

Colonel the Hon'ble R. STRACHEY said that the remark which had fallen from the Hon'ble Mr. Stephen entirely concurred with his own views, and that, in fact, the provisions of section 6 of the Bill entirely met the point that had been raised. There were to be provided, for each district in India for which the Government considered it necessary to provide standards, material standards which would be the only standards recognized in that district. The Bill

declared how the magnitude of the new standards was to be ascertained, but it was left entirely to the Governor General in Council to take the needful steps for providing the standards, and for securing their proper conformity with the description that was given of them in sections 2 and 3 of the Bill. Such standards having been provided, no question could arise regarding their accuracy under the law.

The Motion was put and agreed to.

The following Select Committee was named :—

On the Bill to regulate the Weights and Measures of British India—The Hon'ble Messrs. Strachey, Stephen, Gordon Forbes, Cowie, Chapman, Bullen Smith, and Cockerell and the Mover.

The Council adjourned to Friday, the 18th March 1870.

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Friday, the 18th March 1870.

PRESENT:

His Excellency the Viceroy and Governor General of India, K. P., G. C. S. I., *presiding.*
His Honour the Lieutenant Governor of Bengal.
His Excellency the Commander-in-Chief, K. C. B., G C. S. I.
Major General the Hon'ble Sir H. M. Durand, C. B., K. C. S. I.
The Hon'ble John Strachey.
The Hon'ble Sir Richard Temple, K. C. S. I.
The Hon'ble J. Fitzjames Stephen, Q. C.
The Hon'ble Gordon S. Forbes.
The Hon'ble D. Cowie.
Colonel the Hon'ble R. Strachey.
The Hon'ble Francis Steuart Chapman.
The Hon'ble J. R. Bullen Smith.
The Hon'ble F. R. Cockerell.

OBSOLETE ENACTMENTS BILL.

The Hon'ble MR. STEPHEN introduced the Bill for the repeal of certain obsolete enactments, and moved that it be referred to a Select Committee with instructions to report in a fortnight. He said that, when the Bill was last before the Council, he explained the object with which it had been introduced, which was to relieve the Statute-book of a considerable number of obsolete

enactments as a step towards the consolidation and reproduction, in a better form, of the Regulations and Acts in force. The Bill itself consisted of only one section, which had been worded with great care. The wording had been taken from a Statute prepared in England by the most experienced Parliamentary Draftsmen, and he might shortly describe its effect. It was to repeal or sweep away a quantity of Acts which had become useless, but not to invalidate any institution dependent on them or any Act passed under their authority. There was no clause providing that the repeal of repealing Acts should not revive Acts repealed by them. But it was not necessary to have a provision to that effect in the present Bill, because, by the General Clauses' Act, I of 1868, it was provided that, in order to effect the revival of a repealed Act, it should be necessary expressly to state such purpose; it would therefore now be sufficient simply to repeal the repealing Act. The schedule to the Bill was of great length, but the length was more apparent than real. A very large portion of it consisted of the repeal of repealing sections of Acts, the object being to render the Statute-book as compact as possible. He proposed to repeal every repealing section yet passed, down to the repealing section of the Court Fees' Act, VII of 1870. He hoped that some other less cumbrous way might be devised of carrying out repeals in future. That accounted for a considerable number of the sections repealed by the present Bill. Some persons might think that it was hardly worth while to effect such a small reform; but the Council would see the extent to which the mere titles of the sections amounted, and it was obvious that the sections themselves must amount to much more. A good many repealed Acts were needless because they had done their work. For instance, Acts like 37 Geo. III, c. 142, s. 17, which provided for the transfer of records from one court to another: those transfers having been effected long since, there was no use in keeping the Acts providing for the transfer on the Statute-book. So, a statute like 11 Geo. IV & 1 William IV, c. 75, for the relief of sufferers by the insolvency of a Government officer in Madras many years ago, was no longer necessary. Other Acts had been superseded without repeal; as, for instance, Act XI of 1844, as to the administration of justice and despatch of business in the Supreme Court at Fort William, had been since superseded by the Charter and the Code of Civil Procedure. So, several enactments with regard to salaries and pensions had been superseded by later enactments. Besides those enactments which had become superfluous, and besides the repeal of superfluous sections, there were a certain number of Acts of Parliament which the Council had a right to repeal under the Indian Councils' Act, and which, although in force, had absolutely ceased to have effect by lapse of time. There were some extraordinary provisions in two statutes of George the Third (21 Geo. III, c. 70, secs. 11 and 15, and 37 Geo. III, c. 142, s. 15) about the registration of Natives of India who held office, who were incapacitated from receiving salaries unless registered. These enactments, if acted upon, would produce most disastrous results. There was also a statute (33 Geo. III, c. 52, s. 137) which incapacitated all Her Majesty's subjects from various branches of trade, which rendered it penal in them, for instance, to trade in rice, tobacco or betelnut, and which would enable evil-disposed persons to bring actions for the purpose of harassing others. There were not very many Acts of this nature, but there were a certain number, and he hoped they would be able to sweep away the whole of them, and to take away a great number of provisions which were unsuited to the present times. There were also some obsolete provisions which empowered the Governor General in Council to hold Quarter Sessions four times a year. He did not know whether the Governor General in Council ever had done so; but the provision (which was to be found in 13 Geo. III, c. 63, s. 38) was certainly useless now. There were also other Acts conferring powers on the Governor General in Council, which were also clearly inapplicable to the present times: they applied to the time when the Governor General in Council was an appellate Court of record. It was just as well that these provisions should be put an end to, even if only

to shorten the Statute-book. All these matters would be carefully considered in Committee, so that nothing should be repealed which was of use and ought to remain in force. He had every hope that the result would be to diminish the Statute-book to a considerable extent, and thus be a step towards the consolidation of the law and the preparation of a new edition of the Statute-book in a better form.

The Motion was put and agreed to.

FEMALE INFANTICIDE BILL.

The Hon'ble MR. STRACHEY moved that the Report of the Select Committee on the Bill for the prevention of female infanticide be taken into consideration. He said that the Select Committee had made very few alterations, for the most part of no great importance, in the Bill as introduced. The principal alterations were these:—It was originally provided that rules should be made for prescribing the manner in which information should be given to the proper officer of births, marriages and deaths. Doubt was expressed whether, as the section was originally worded, it would be open to the Local Government to prescribe by whom information should be given. To remove that doubt, an alteration had been made. The Committee also recommended that the rules should provide that information should be given when births, marriages and deaths were about to occur. A clause had also been added to section 6, providing that, in the case of neglected children, the Magistrate of the District might compel the person responsible to make a monthly allowance for their support, not exceeding fifty rupees. Some other verbal alterations had been made; among them one, which was an obvious improvement, in the title of the Bill.

There was nothing else which it was necessary for him to refer to, the object of the Bill having been so fully explained on former occasions. The Bill had been so universally approved in all quarters, that it seemed unnecessary to take up the time of the Council in referring to the matter further. If the Bill should today receive the sanction of the Council, it would immediately be the duty of the Local Governments and Administrations to whom the Bill referred to proceed to make rules under the Act. It would be obvious that the success or failure of the measure would depend on the manner in which the rules were made. The Government would have the great advantage, as had already been stated when the time came for drawing up the rules, of the advice and co-operation of His Highness the Mahárájá of Jaypúr, which MR. STRACHEY was sure would be of high value and importance. He would only add that he thought they might confidently hope that the result of this measure would be to enable the Government to repress this abominable practice, which had too long been suffered to remain as a reproach to our administration.

The Motion was put and agreed to.

The Hon'ble Mr. Strachey then moved that the Bill as amended be passed.

The Motion was put and agreed to.

NATIVE PASSENGER SHIPS BILL.

The Hon'ble MR. CHAPMAN introduced the Bill to make further provision for the regulation of Native Passenger Ships, and moved that it be referred to a Select Committee with instructions to report in a week. He said that the chief object of this Bill was to prevent the overcrowding of Native Passenger Ships proceeding to ports in the Red Sea with pilgrims *en route* to Mecca. When he obtained leave to introduce it, he instanced to the Council some of the cases of overcrowding that had recently been brought to notice, and which had induced the Government to take action in this matter. He thought it would

be impossible to exaggerate the sufferings the passengers must have been subjected to on those occasions—sufferings which must have equalled any which slaves in former days endured when making the middle passage. There was, however, this material difference between the two cases. Here, the sufferings were voluntarily incurred, and they had to protect the people against themselves. The Muhammadans set so high a value on a pilgrimage to Mecca that they were willing to undergo any amount of distress and privation to accomplish it; and the poor, who were only able to undertake the journey on the cheapest terms procurable, were not, under the circumstances, likely to complain of the treatment they were subjected to. He thought the fact of these sufferings being to a great extent wilful ought not to prevent them from endeavouring to lessen them as much as possible. A very intelligent and influential Muhammadan gentleman had recently told him (MR. CHAPMAN) that his co-religionists would be most thankful for any measure that would have the effect of mitigating the hardships they now had to encounter in making these pilgrimages. Another reason for legislating in this matter was this:—The Ottoman Government had of late years subjected all vessels arriving from India to very strict quarantine; and the belief was general that cholera and other diseases were introduced into Europe through Indian pilgrims arriving at Mecca. Whether this belief was well founded or not, he thought it behoved the Government to take care that proper sanitary arrangements were enforced on these vessels, and he need hardly remark that sufficient space and ventilation were not the least important points to be attended to. These were the principal reasons for taking action in this matter. He would now endeavour briefly to explain the state of the existing law, and the alterations they proposed to make in it. The application of the present Act (XXI of 1855) was limited to the cases of vessels proceeding from ports under the jurisdiction of the British Government. The consequence was, that its provisions were evaded by owners of ships, after clearing out from these ports, putting into others belonging to Foreign States, and, regardless of all restrictions, stowing away any number of passengers they could procure. They proposed to remedy this defect by extending the operation of this Bill to all ports within the dominions of Princes and States in India in alliance with Her Majesty, and to all ships commanded or owned by subjects of Her Majesty conveying passengers between all ports and places situated east of the Cape of Good Hope and ports and places in the Red Sea and Persian Gulf. They proposed, also, to render masters violating the provisions of the Bill liable to imprisonment as well as fine; and, in order to facilitate prosecutions, they proposed that depositions taken before Consuls, and authenticated by their signatures, should be admissible as evidence. These were some of the chief points in the Bill. But the main safeguard against overcrowding would, he (MR. CHAPMAN) thought, be found in the provision obliging masters going to the Red Sea to obtain a clean bill of health at Aden, which bill was to be withheld, if the ship had a greater than the prescribed number of passengers. He trusted the Bill would be effectual in suppressing the horrible sufferings which they knew were now entailed on the poor people making these voyages. It seemed to him the Government had a perfect right to insist on passengers on board ships sailing under British colours being treated with common humanity. And this was all the present Bill aimed at.

The Motion was put and agreed to.

REGULATIONS AND ACTS LOCAL EXTENT BILL.

The Hon'ble MR. COCKERELL, asked leave to postpone his Motion to introduce the Bill to consolidate and amend the law relating to the local extent of the general Regulations and Acts, and to the local limits of the jurisdictions of the High Courts and the Chief Controlling Revenue Authorities.

Leave was granted.

The following Select Committees were named:—

On the Bill for the repeal of certain obsolete enactments—The Hon'ble Messrs. Gordon Forbes, Chapman and Cockerell and the Mover.

On the Bill to make further provision for the regulation of Native Passenger Ships—The Hon'ble Messrs. Stephen, Gordon Forbes and Cockerell and the Mover.

The Council adjourned to Friday, the 25th March 1870.

WHITLEY STOKES,
Secy. to the Council of the Govr. Genl. for making Laws and Regulations.

CALCUTTA,
The 18th March 1870.

GOVERNMENT OF INDIA.

HOME DEPARTMENT.

THE RHEEA PLANT.

No. 704, dated 23rd February 1870.

From—H. RIVETT-CARNAC, ESQ., *Cotton Commissioner for the Central Provinces and the Berars,*

To—E. C. BAYLEY, ESQ., *Secretary to the Government of India.*

As the Government of India has evinced much interest regarding the "rheea plant," I may, perhaps, be permitted to submit, for your information, copies of some papers on the subject which the Hon'ble the Commissioner of Agriculture for the United States of America has recently been so good as to send me.

CHINA GRASS.

The nettle of the East, Boehmeria tenacissima, vulgarly called ramie and by other local names in different districts of Southern Asia and the islands adjacent, has excited much attention in the Southern States since its introduction there by M. Roezl in the spring of 1867, though it was first introduced into the country in 1855 from the Botanical Garden of Jamaica, and cultivated in the United States Botanical Garden, and subsequently in the experimental garden of the Department of Agriculture. It was there grown from seed, a fact that should be mentioned, a general impression having been received in the South that it is propagated only by cuttings.

The high price of cotton and the disturbance of the economy of its culture by the results of the war have given an absorbing interest to the feasibility of substituting ramie fibre for the Southern staple, and led thousands to experiments which they otherwise never would have undertaken. The Commissioner of Agriculture, to afford an opportunity for a thorough test of a fibre of superior strength and great lustre and beauty, has imported from Paris, for trial in 1868, seed of the B. tenacissima, and also of the B. candicans. These seeds have been distributed, and many reports have been received by the Department of their failing to germinate, and yet the failure attached to the experimenter, and not to the seeds, as portions of the same importation, in every instance of trial by the Department, germinated readily. The seeds are very small, and require slight covering, and, being very near the surface, need protection from the rays of the sun, as well as the right degree of moisture.

The experiment in this country.

SINCE March 1867, when the dissemination of this plant commenced at New Orleans, an interest, amounting almost to a furor, has been excited in that vicinity, and sub-divisions of roots have been freely sold at a dollar each. Exaggerated representations have been made, and it is feared that the ardor of experimenters may be cooled by disappointment. There seems to be no reason to doubt its rampant growth and great thriftiness in that latitude; it has been planted in every summer and autumn month, and reports of rapid growth have been invariable; the question now to be solved concerns the economy of its production and preparation as a fibre in competition with cotton and other textiles. It is increased not only by root divisions, but with perfect ease by cuttings, by layering, and by planting the seed. From one root, planted in March 1867, Mr. F. J. Knapp reports an increase of 100, and from layers and cuttings of the same more than a thousand. It is stated that in one instance 100 roots in nine months produced 40,000 plants.

The beauty, durability, and value of the fabrics made from this fibre are unquestioned; the desirability of its success as an important accession to the products of American agriculture is conceded; the only point to be made clear at the present time is the profit of the production. Will it pay? That is a more difficult question, and one that should be answered; all present experiments should be directed to its solution. The plant will grow; it may yield a large product per acre. Then how can it be most successfully and economically grown? How, especially, shall it be most cheaply and efficiently prepared for the market? And finally, what modifications and improvements in its manufacture can be made to insure a large demand for the raw material? The drawback to its more general use is its brittleness, which prevents weaving it by machinery; while the Chinese hand-loom is inadmissible in these days of steam and water power. Therefore it is not used alone, but always in combination with other material, the warp generally being cotton, the weft China grass.

Manufacturers are anxious to use it; many of them have spent time and money in attempted discoveries of means and appliances for working it to better advantage. A chemical process of treating the fibre has resulted in producing, in combination with cotton and an article resembling the best mohair, a stiff strong and cool texture, silky and beautiful. It is possible, perhaps probable, that further discoveries in this direction may give a ten-fold impetus to the manufacturer's demand. It must also be had at a low price, or it never can compete with cotton. Misapprehensions of its present marketable value are current, which should be corrected. The British imports of China grass (probably also including a portion of the fabric of the Neilgherry nettle) amounted to only £65,208 in 1867, and the average cost was scarcely 19 cents per pound; while the cotton imports of the same year were £1,262,536,912, and the average cost nearly 21 cents per pound. One great want in this connection is suitable machinery for separation of the fibre and preparation for manufacture. This was mentioned as a desideratum in the report of the International Exhibition five years ago. A machine for separating the fibre has been invented by Mr. Benito Roezl, which is claimed as a success. The machine is a metallic cylinder, three feet in diameter, driven at the rate of 300 or 400 revolutions per minute. It is provided with transverse bars or knives projecting from the perimeter (for breaking up the wood and extracting it from the fibre) in combination with alternate concave and convex table edges. The plants are first subjected to the action of the machine, then soaked in hot water, again passed between the knives and table edge, and finally, soaked several hours in a solution of common *lye*, soap and water, heated nearly to the boiling point. The first operation stripes off the leaves, scrapes away the bark, and takes out the woody substance and three-fourths of the gummy matter, and is performed with the concave edge adjusted to the table. The second is simply steeping in water to soften the remaining gum. The convex edges of the knives then soften and flatten the fibre, which is ready for manufacture after the second steeping and subsequent drying.

Acclimating tests in other countries.

THE history of its introduction into Europe has some curious features. Sir W. J. Hooker was early interested in the experiment at a period when little was known of the plant that produced so beautiful a fibre. He identified the B. *nivea* and B. *tenacissima* as really the same species, and sought to introduce the fibre into Great Britain in large quantities, and to encourage its systematic production in British Colonies, with the hope of reducing the price which it had commanded (from £60 to £120 per ton) to a figure which should encourage its general manufacture. In 1851, referring to plants then growing in the Royal Gardens at Kew, he says—

> "Long previous even to the time when the commercial importance of the fibre became known among us, we had raised this plant and had it in cultivation in a hothouse, or in a warm green house. This present year we have planted it in the open ground, rather with a view of showing that it cannot succeed, than with a hope of its bearing our climate unharmed save during the hottest of the summer months. But this is no reason why the 'Chinese grass' should not be cultivated, and advantageously, in our colonies—that is, such of our colonies as possess a climate nearly analogous to that of Canton; and we cannot doubt that it would, with due care, prove a most valuable and important article of export. It is only a true and correct knowledge of such plants and of the peculiarities of soil and climate necessary for their being successfully reared that can enable us to grow them to good purpose."

For sixteen years this recommendation was practically unheeded; but official action was finally taken in consequence of a communication to the United States Department of Agriculture by one of its foreign correspondents, George J. Abbot, Esquire, United States Consul at Bradford, England, which was made public in the Annual Report for 1865 in a practical essay upon this plant and its products. Specimens of the manufacture sent by the same gentleman were at the same time deposited in the Museum of this Department. The fact was stated that considerable quantities were produced in China, but that the civil war there had interfered with its production, as civil war in this country had reduced the yield of cotton; that it was then worth in England £80 per ton; and that it might perhaps be profitably grown in the Southern States, and its production become a valuable addition to American industry.

Great Britain was at this time engaged in a solution of the question of the cotton supply, and this official mention at once attracted the attention of the British authorities, who immediately communicated with Dr. Hooker, at Kew, asking his opinion as to the colonies most suitable to the cultivation of this fibre. In response to despatches sent to Colonial Governors, facts are reported concerning experiments with this plant.

Mr. Wilson, of the Jamaica Garden, from whom seed was received for the Botanic Gardens of this city in 1855, reports to the Colonial Secretary that the Boehmeria was introduced in 1854, was found to thrive admirably, and to produce two crops of shoots annually of 8 to 10 feet high. He says—

> "The plant being suffruticose, the shoots die down to the crown of the stool as soon as the seed ripens, and are rapidly succeeded by others; and I find by an experience of twelve years, that two regular crops of growth or shoots are all that can be reasonably expected or naturally produced per annum. I have found the luxuriance

of growth to be all that could be expected, and even to vie with most of our rank growing weeds. The peculiarities best suited for the most successful culture of this plant are a rather rich and porous soil, warm and moist climate, and at altitudes not exceeding 3,000 feet. In this description of land and climate the island abounds, more particularly in this country, in the lower hills and abandoned sugar estates. I have distributed this plant largely, which has thriven well in general; but it is held in little estimation, being looked upon more as a weed than as containing the germ of a future new and valuable staple; however, the experiment has placed beyond the shadow of a doubt the entire eligibility of soil and climate for the full and healthy development of the plant in general. Some years ago I received a fine sample of this fibre from London, where it was cleaned from the raw material sent from India; the marketable value of this fibre was 2*s.* 6*d.* per pound, being equivalent to £280 per ton."

A report from Mr. Prestoe, of the Botanic Garden at Trinidad, represents that the plants thrive well there, and might be increased at a small expense to many thousands in a few weeks.

The soil and climate of the Bahamas are stated to be unsuited to its successful growth.

Mr. Home, Sub-Director of the Mauritius Botanic Garden, states that a few plants only were grown at the date of the reception of the despatch, but that efforts would promptly be made for their propagation, and a portion of the garden would be set apart for the especial cultivation of fibre-yielding plants, with a view of testing their commercial importance. Sir Henry Barkly, Governor of the Mauritius, has no doubt that B. *tenacissima* will thrive there, as two species of the same genus are indigenous to the island; but he mentions as a drawback to practical operations with it the larger amount of capital invested in the sugar manufacture, which may prevent the "large proprietors" engaging with spirit in the enterprise, while the smaller planters, many of them Natives of Bengal, and presumed to be acquainted with the mode of culture, may find in it an important resource.

In the Straits Settlements, little is expected, unless the Government shall test its profit by cultivating a small experimental patch, as was done by the Indian Government in the case of tea and of cinchona.

An interesting report of the experiment in Queensland is made by Mr. Walter Hill, Director of the Brisbane Botanic Gardens, to Sir G. F. Bowen, the Governor, from which the following extract is made:—"I received plants of the 'China grass' so far back as in 1855 from the late Sir W. J. Hooker, of the Royal Gardens, Kew. About a quarter of an acre of the Brisbane Botanic Gardens was for two years devoted to their special cultivation. They flourished vigorously, and required comparatively little care in their preparation or preservation. There being at the time no very tempting demand in the European markets for the fibre, and their being no machinery or appliances in the Colony for extracting it, and finding that the plant had attained an exuberance and tenacity of growth which was gradually encroaching upon more ground than could be properly spared, I caused it to be removed to the border, on the bank of the river, where it can now be seen growing in a very thriving condition. Some of the fibre, however, was sent home to the International Exhibition in 1862; and, as I believe there are no means in this Colony for extracting it on a more extensive and systematic scale, I have lately been contemplating the desirability of again setting apart a portion of ground for the exclusive cultivation of the plant in the hope of being able to give a more practical illustration as to the quality of the fibre producible in Queensland, and also with a view of stimulating others to embark in the enterprise."

Its culture in China.

In China the seed is gathered very carefully before the approach of frost, and, when sufficiently dry, is placed in a jar or basket, mixed with sand or dry earth, and the vessel covered with straw as a protection against the frost. At the time of planting they are tested by immersion in water, the imperfect ones floating at the top.

The proceedings of the Agri-Horticultural Society of India give an idea of the mode of culture and means of preparing the fibre. A loose dry soil is selected near a stream. The ground is well broken and manured, and laid out in beds eight yards long and one wide, which are carefully raked and watered one day, and the same processes repeated on the following day preparatory to sowing. The seeds are then mixed with a little dry earth and sown broadcast, and afterwards the beds are swept lightly with a broom, covering the seeds and smoothing the surface at the same time. Matting is suspended on a temporary frame-work over the beds before the plant emerges from the soil for protection, until the plant is two inches high, and this covering is watered every day and removed at night. When three inches high they are transplanted in rows four or five inches apart; watering is continued three or four times daily for the first ten days, when an occasional wetting suffices. At the approach of cold weather the field is covered with a heavy coating of manure for winter protection. In March the manure is removed, and watering in dry weather resumed. In the third or fourth year, as is stated, the stems are ready for cutting, and sometimes in the second year; if grown from roots (cut in pieces and planted eighteen inches apart), they are ready for cutting the second year, and after a plantation is established three crops per year are secured.

The stems are cut an inch from the surface; the first cutting occurring in June, and the last in September or October, the stems being six or eight feet high. After cutting, the plants are covered with manure and watered.

The first step in preparing the fibre is the striping of the leaves by women and children, then the stems are soaked in water, and afterwards broken in the middle, thus loosening the fibrous portion, when the finger nails are inserted between bark and stem, and passed from top to bottom, separating one-half the fibre. The remaining fibre, after further soaking, is taken off with a rudely made knife, with a blade about two inches long. "This rude implement is held in the left hand, its edge, which is dull, is raised a line above the index finger, strips of hemp (or fibre) are then drawn over the blade from within outwards, and being pressed upon by the thumb, the fibrous portion of one surface and the mucilaginous part of the other are thus taken off. The hemp then rolls up like boiled tendon. After being wiped dry, it is exposed to the sun for a day, and then assorted; the whitest being selected for fine cloth." It is then bleached by boiling and drying in the sun, when the tedious process of separating the individual fibres with the finger nails is dexterously accomplished by women or children, leaving the material exceedingly fine and soft, and afterwards a further bleaching is secured by soaking in water with a little lime, or the ashes of mulberry leaves. During the bleaching process the fibre must be dry, as moisture will give it a dark color.

China Grass fibres of Commerce.

The China grass cloth has long been known to commerce, and the fibre was many years since brought to Europe, where it attracted the attention of manufacturers for its fineness, strength and beauty. It was found to be stronger than hemp, with the lustre of silk. At the British International Exhibition of 1862 several specimens from India, Assam and Malacca, were exhibited. The report of that Exhibition referred to these samples as attracting more attention than any other products of India, and stated that late experiments had shown that the fibre was susceptible of manufacture in a great variety of useful and valuable fabrics.

At the same Exhibition samples were exhibited bearing the name of *Boehmeria nivea*, a fibre believed to be identical with the *B. tenacissima*, of the same commercial value, although represented as botanically a different species. The plant flourishes at Darjeeling and other places in the North of India.

The Neilgherry nettle (sometimes written Nilgiri nettle), *Urtica heterophylla*, abounding in the hills of that name in India, possesses a fibre used for similar purposes, sold at the same price, and is sometimes included with China grass fibres. It has been called "vegetable wool," is abundant in a wild state, and it is assumed that its cultivation would be profitable. The bark of the young wood, steeped in water twenty-four hours, renders easy the separation of the fibre. The nettle is one of the most formidable of the stinging tribe, a fact which might militate against its utilization. The Technologist says that "the fibre is brilliant and strong, easily separated, regular in fineness, from six to twenty-eight inches in length, of good natural whiteness, similar in fineness to the coarsest mohair, much twisted, generally flattened at the root end. The last peculiarity is a defect, otherwise it is a fibre perfectly adapted for spinning with coarse combing wools. It seems to be specially applicable for fabrics where bright stiffness is the quality desired. It dyes in a similar manner to China grass, but does not possess equal brilliance, strength or whiteness. If it were forced on the market, it would immediately take a position as a combing fibre probably second only to China grass. It is reported to be obtainable in abundance, but the plant is a formidable one to manipulate."

The B. *candicans*, of which seed has been imported from Paris by the Department, is thus characterized by Professor George C. Shaeffer, Librarian of the Patent Office, a well known expert in fibres, in a note to the editor of this report:

"The *Boehmeria candicans* was first brought to notice in 'England at the Exhibition of 1857, when, according to Royle, a prize medal was awarded for some beautifully white and silky looking fibre sent by the Singapore Committee from M. Weber, of Java, as the produce of a plant which he called *Boehmeria candicans*, and also *Linum usitatissimum*' (but this is the botanical name of our own flax) 'on the same label. The former is probably another name for our plant;' (he is speaking of the B. *nivea*) as it is said to be the *ramie* or *ramee* of the Malays. The plant is cultivated by the Dutch in Java, and its fibre has been introduced into Holland, and gold medals awarded to Messrs. Meerburg, of Leyden, for specimens of sail-cloth, ropes, cables, &c., and also for some finer kinds of cloth and tablecloths. The plant producing this fibre was called *Boehmeria candicans*, and also B. *utilis*, by Professor Blume; but it is probably only a variety of B. *nivea*, or perhaps a nearly allied species.

"From this it will be seen that the B. *candicans* is the plant a specimen of which I have, from Mr. Ballestier, gathered by him from a Dutch plantation in Java, and which he called *ramee*, and said was identical with the 'China grass.' This, if at all different from the B. *nivea*, is the plant cultivated by the Dutch in Java, named by Blume, and by him introduced into France. It is, therefore, the same as that 'pushed' by Roezl, the Austro-Belgian Botanist of Texas, which he says cannot be raised from seeds. But it is to be remembered that in his elaborate display of synonyms, he omits this very one of B *candicans*.

"Of course it will be worth while to carefully distinguish in the culture of this plant, and establish the fact whether it can or cannot be raised from seeds, and whether it is essentially distinct from the B. *nivea*. It should be borne in mind that it was shown in Holland mostly in the form of the coarser fabrics."

GOVERNMENT OF INDIA.

FOREIGN DEPARTMENT.

THE NEW CUSTOMS LAWS FOR MOZAMBIQUE, ANGOLA AND PORTUGUESE INDIAN POSSESSIONS.

POLITICAL.
No. 17.

INDIA OFFICE;
LONDON, *the 17th February* 1870.

To His Excellency the Right Hon'ble the Governor General of India in Council.

MY LORD,—I have received with satisfaction the copy of the edict published in the *Mozambique Official Gazette* of the 14th July last, abolishing slavery throughout the Portuguese dominions, without compensation to owners, contained in the Foreign letter of your Excellency's Government, No. 373 of the 30th November 1869.

2. I take this opportunity of furnishing you with two printed copies of a Foreign Office letter, dated 10th January 1870, and of a communication* addressed to the Secretary of State for Foreign Affairs by Her Majesty's Minister at Lisbon, accompanied by a translation of Royal Decrees which have appeared in the *Diario de Lisbon*, establishing new Customs tariffs in the Portuguese possessions of Mozambique, Angola and India, and by a report† from the Minister of the Colonies, exhibiting the prospective advantages of these reforms, following upon the abolition of slavery.

* Commercial No. 15, dated 17th November 1869.

† Dated 12th November 1869.

3. One copy of this despatch, and two copies of the printed enclosures, have been forwarded to the Governments of Madras and Bombay.

I have, &c.,
ARGYLL.

FOREIGN OFFICE,

10th January 1870.

The Under Secretary of State for India.

SIR,—I am directed by the Secretary of State to transmit to you, to be laid before the Secretary of State for India in Council, a despatch from Her Majesty's Minister at Lisbon, inclosing a translation of the new Customs laws for Mozambique, Angola and Portuguese Indian possessions.

I am to request that the enclosed papers may be returned to this Office when done with.

I am, &c.,

CHAS. SPRING RICE.

COMMERCIAL.

No. 15.

LISBON,

17th November 1869.

The Earl of Clarendon, K. G.

MY LORD,—I have the honor to transmit herewith to your Lordship copies of Royal Decrees which have appeared in the *Diario de Lisbon*, establishing new Customs tariffs in the Portuguese possessions of Mozambique, Angola and India, accompanied by a report from the Minister of the Colonies, exhibiting the advantages which it is expected will result from these reforms.

With respect to the tariff for the Province of Angola, His Excellency states that it is substantially the same as that introduced at Ambriz by the Local Government in December 1868, and which has been in force since the 1st of January last; and that it has already had the result of inducing many of the larger foreign commercial houses, which had hitherto been established to the north of the Rio Loge, to remove their establishments to Ambriz.

In the tariff for Mozambique, while a protection of 30 per cent. is still retained in favor of Portuguese goods, all differential duties on the flag are abolished.

In consequence of the extreme length of these documents, I have not been able to enclose translations with them, but I shall not fail to transmit the latter to your Lordship as soon as they can be prepared.

I have, &c.,

CHAS. A. MURRAY.

Extract from the Report of Senor L. A. Rebello da Silva, Minister of Marine and Colonies, of November 12th, 1869, addressed to the King of Portugal.

Diario do Governo, No. 260, Lisbon, Novembro, 15, 1860.

Sire,—The remarkable progress which two of our most important possessions, *viz.*, the provinces of Angola and Mozambique, have lately exhibited, imposes upon the Government the imperious duty of aiding the development thereof by the adoption of those measures of which enlightened nations give us the example, carrying into practice the rules of science with prudence, but at the same time with perseverance.

(The Minister then proceeds to remark that the period of transition between the suppression of the slave-trade and the application of the Colonies to legitimate trade, although it was certainly one of trial and difficulty, did not produce that great subversion which it had been foretold would be the immediate result of that measure. He then refers to the "abolition of slavery" as opening a new field to Portuguese energy and capital in those vast and fertile regions. But he insists upon the necessity of co-operation on the part of the Government in the endeavours of the local population, by facilitating the means of public education and communication, by encouraging religious

missions, by affording protection to the fluvial navigation, by extending the political and commercial relations, and, in fine, by suppressing all unnecessary expenses in the Colonies. With these objects in view, the Minister promises on a future occasion to submit to His Majesty several modifications in the administrative and judicial organization of some of the Colonies, and a project of Penal Colonies, &c.)

And he then continues as follows :—

Among these reforms, which, on account of their number and importance, although designed from the same point of view, can only be gradually submitted to your Majesty's superior judgment, one of the most important is the reform of the colonial tariffs, which has been so often, and for so many reasons pressed upon the Government by the opinions of enlightened and competent persons.

The improvement in the condition of the trans-marine Provinces depends to a great extent upon the adoption of a system which will not drive away from, but will rather attract to, the ports thereof the ships of all nations. Agriculture, mining operations, and every kind of progress in general would become paralysed should we insist upon opposing an unjustifiable veto to the commercial policy followed by the great majority of civilized nations, and sanctioned by facts. The revision of the trans-marine tariffs which has been intrusted to the study and zeal of a committee composed of persons duly qualified for it by their capacity and practical knowledge is already far advanced, and will, I trust, be brought to a conclusion very shortly, but not so soon as I wish, owing to the fact that more exact and ample information is required from some of the provinces.

The increase which has taken place in the receipts of the Mozambique Custom Houses, and the peculiar circumstances which promise a hopeful future to the privileged bay of Lorenzo Marques, have decided me to press for the revision to begin by the tariff of that rich possession. The chief object I had in view was to place the Custom House of Lorenzo Marques in a position to compete with those of Foreign Colonies. With respect to articles of extensive trade, such as brandy, wine, and gunpowder, the duties of the Portuguese tariff are more favourable than those levied in the former. In other articles, such as for instance, cotton tissues, the same amount of duties is levied. With reference to the other ports of the province, I have endeavoured to give every facility to foreign trade, without endangering the actual revenue.

Articles of national production continue to be protected with a favour of 30 per cent. in the import duties; but the differential duties on the flag, the chief obstacle to the development of foreign trade, are entirely abolished. In laying down the fixed import duties, the revised tariff has adhered, as much as possible, to the duties at present levied upon articles of national production; and, with respect to the export duties, it has adopted, with very slight difference, the duties at present levied upon merchandise destined for foreign ports, doing away with the distinction made in the tariff still in force with respect to destination of re-exported merchandise.

Respecting the mode of calculating the *ad valorem* duties, a method was laid down which appeared to be the most convenient to trade, and the safest to the interests of the public treasury, bearing in mind the provisions contained in the 11th article of the last Commercial Treaty concluded with France.

Under the present circumstances, I have not considered it prudent to do away altogether and immediately with the special tax of 3 per cent. *ad valorem*, applied to the public works of the province, which has now been recovered for more than a year without opposition.

In fine, in the tariff which I now submit to your Majesty's approval, being aware that it is not and cannot be perfect, and that it ought only to be taken as the basis for gradual improvements, by classifying in a better manner beverages and other articles, in order to facilitate the clearance thereof, and by

specifying, as being free of duty, animals of all kinds, coal, and books, it has been my wish to advance as far as it was possible to do so without risk, never losing sight of the interests of the public treasury, of those of trade, and of the good example set us by other countries.

In the reform of the Indian tariff, which is connected in many points with that of Eastern Africa, I did not also hesitate to reject such provisions as were less conformable to the principles which are to be found in the original draft sent out to that State. The obstacles prejudicial to trade, and useless to the treasury, which ordered merchandise of a certain district to be considered as foreign, and subjected it to the payment of the highest duty, for the sole reason of their removal to another district by a foreign conveyance, which prohibited the importation of salt and gunpowder, which levied excessive duties upon articles of foreign production shipped by foreign vessels, were utterly unjustifiable; the more so as, after all this, an exception was made in favour of those nations with whom we had concluded Commercial Treaties, that is to say, all those that carry on commercial relations with Portuguese India. On the other hand, the tariff accorded the privilege of nationality to the products of Oceania and China for the sole reason of having passed through Macao, where they pay no duties. I did not, however, think proper to abolish, without further information, a few other regulations; although I did not look upon them as being altogether conformable to principle, I was deterred by the scruple of sacrificing important items of the revenue of the State, without possessing sufficient information as to the effects of a fundamental change.

I shall not attempt to justify either the abolition of the privilege of nationality accorded to merchandise from Oceania and China, or the grounds upon which salt and gunpowder will be allowed to be imported. The former, as a means of protecting the navigation between India and Macao—the only pretext which might be alleged in its defence—cannot be maintained, when a bi-monthly line of steam navigation places the two provinces in communication with each other. The prohibition to import gunpowder and salt, which are thus rendered monopolies, the former because it is made at Goa on account of the State, and the other, in spite of the duties which are charged upon it exceeding 50 per cent., can meet with no reasonable explanation.

In the revised tariff which I now propose, many imposts are abolished which yielded but little, and among them the additional 10 per cent. upon the importation and exportation of all merchandise. With respect to the application of the proceeds of this tax, I have endeavoured to conciliate justice with economy and regularity in the public service. I did not hesitate to add 29 reis (about 1½*d.*) to the duty upon unmanufactured tobacco, and 119 reis (6½*d.*) to that upon tobacco made into cheroots, because, inasmuch as the importation in 1864 went as high as 16,088 arrobas, the difference will produce an increase of revenue of nearly 18,000,000 in provincial coinage, and at the same time the alteration is not so great as to affect the consumption or to encourage smuggling.

In Western Africa, the situation of the district of Ambriz demanded the special attention of the Government. There were opinions in favour of the establishment of a free port on the spot, in the hope of overcoming the repugnance which kept away wealthy foreign commercial firms from the place, inducing them to open factories at Quicembro, Ambrizette, and at other places on the coast to the north of the River Lage.

Experience settled the question. The new tariff authorized by the decree (Portaria) of the Governor General of December 31st, 1868, and which came into operation in the month of January of this year, showed that its enactments were sufficient to induce the wealthiest merchants to prefer the safety which our port offered to the contingencies of a precarious position in native territory belonging to independent Chiefs. Several firms have already settled at Ambriz, and it is stated that one of them has got merchandise in its warehouses of the value of nearly 2,000 cantos (£444,444.)

Foreign trade having thus shown a tendency to settle in that region, and having accepted, without the slightest objection, the duties decreed in the new tariff, which only levies an import duty of six per cent. upon the value, as stated in the invoices, it would be more than imprudent to despise the revenue of this Custom House, the more so as the difficulties under which the province is laboring are considerable, in consequence of the large deficit, and when everything gives the assurance that the Custom House of Ambriz may shortly become an abundant source of revenue.

It was the opinion, therefore, of the Committee appointed to revise the trans-marine tariffs that the idea of the establishment of a free-port ought to be laid aside, and, acceding to their opinion, I tried to ascertain whether it might be more expedient to accord the free importation of merchandise, and to exact from the exportation the tax which cannot be directly levied upon property. At first sight it would appear that the method would be successful in attracting trade, by affording it greater facilities, by promoting the development of the depôts, and by simplifying, to a great extent, the mode of clearance and the fiscal control. Information, however, which has recently been received, has convinced the Government and the Committee that the most expedient course to pursue at present was to confirm the tariff published on the 31st December, the conditions contained therein having been fully accepted, not only because merchants do not at present aspire to anything but the assurance that the duties will not be increased within a period of sufficient duration to enable them to avoid risk in their transactions, but also because the system which has been adopted promises a revenue to the province, which everything shows will increase, and which it would be inexcusable levity to diminish without some cause in return for concessions which no one asks for.

It still remained to examine whether it would be expedient to establish some difference between national and foreign merchandise. After hearing the most explicit explanations upon the matter, as well as the opinion of the Tariff Committee, I have come to the conclusion that the duty of 6 per cent. *ad valorem* ought to be kept up, indifferently, for natives and foreigners. There is no direct trade between Lisbon and Ambriz; all goods are received from England; and even if some favor were accorded to Portuguese merchandise, it would never be able to compete with foreign merchandise, which can be taken there by merchants of different countries; and it is well to take notice that, if such favor were excessive, it would drive away foreign trade from Ambriz, and would render void the design which dictated the regulations of the new tariff, and would be the cause of the withdrawal from our port of the firms which promise to enrich it.

The tariff which I propose for the Custom House at Ambriz, and in favour of which the results of a lengthy experience can already be adduced as an argument, is based upon a reasonable reduction of the duties, abolishes the privileges of flag and of port of shipment, and will continue to attract to the place the traffic from the north, without injuring in any way the trade of Loanda.

I intend to submit to your Majesty's consideration other important alterations in the tariffs of the remainder of the Province of Angola, of the Islands of San Thomé and Principe, of the Ports of Portuguese Guinea, and of Cape de Verde. Some of these, however, require a more detailed consideration, after receiving more minute consideration, which is being collected, and which must be submitted to serious investigation. I trust, however, that the reforms of which I this day solicit your Majesty's approval will immediately confer a great benefit upon the trade of several important places, and while characterizing the commercial policy which the Government intends to pursue in accordance with the principle adopted by the most enlightened Colonial nations, will encourage capital to avail itself of the advantages which facilitate the carrying on of a profitable trade in many places of our trans-marine provinces.

Mozambique.

Taking into consideration the Report of the Minister and Secretary of State for the Department of Marine and the Colonies;

Availing myself of the authorization accorded in virtue of the first paragraph of the fifteenth Article of the Additional Act to the Constitutional Charter of the Kingdom;

And after consulting the Board for the Colonies and the Council of Ministers,

I am pleased to decree as follows:—

Article I.—The tariff annexed to this Decree, and which forms part thereof, as well as the twenty-two preliminary Articles which accompany the same, is declared to be in force in the Custom Houses of the Province of Mozambique.

Article II.—All legislation to the contrary is hereby revoked.

The Minister and Secretary of State for the Department of Marine and Colonies shall accordingly cause the same to be carried into execution.

At the Palace, November 12, 1869.

(Signed) THE KING.

(Countersigned) LUIZ AUGUSTO REBELLO DA SILVA.

TARIFF OF THE CUSTOM HOUSES OF THE PROVINCE OF MOZAMBIQUE.

Preliminary Rules.

Article I.—All goods and merchandise of foreign production imported through the Custom Houses of the Province of Mozambique, either in national or in foreign ships, shall pay, when mention is made thereof in the tariff, the duties laid down therein.

Section.—An exception is made in the Custom House of Lorenzo Marques with respect to cotton tissues, olive oil and of other qualities for food, hempen cables, tin or Indian pewter (calaim), copper from China, or Chinese butter, linseed oil, dyes, and iron nails, which shall pay 6 per cent. *ad valorem*.

These goods, imported into the Custom House of Lorenzo Marques, when cleared for transit to other ports of the province, shall only pay in the latter the difference between the duties already levied in that Custom House and those which they ought to pay in accordance with the present tariff.

Article II.—All goods and merchandise, being the produce of the continental part of the kingdom, of the adjacent islands, or of the trans-marine possessions, as well as those which may have been nationalized in the Custom Houses of the continental part of the kingdom or of the adjacent islands, through the payment of the duties of consumption, shall pay, when imported in Portuguese ships, seventy (70) per cent. of the duties laid down in the tariff.

Section.—An exception is made with respect to wines and spirits, either national or nationalized by the payment of the duties of consumption, shall pay fifty (50) per cent. of the duties laid down in the tariff.

Article III.—All goods and merchandise, being the produce of the province, exported from the Custom Houses thereof in national or foreign ships, shall pay, if mentioned in the tariff, the duties laid down therein, although they may be destined for foreign ports.

Article IV.—All goods and merchandise imported into the Custom Houses of Mozambique, and not mentioned in the tariff, shall pay 6 per cent. *ad valorem*, whatever may be the origin of the goods and merchandise, and the nationality of the importing ship.

Article V.—All goods and merchandise exported from the said Custom Houses, and not mentioned in the tariff, shall pay 3 per cent. *ad valorem*, excepting cotton, which shall be exported free of duty until the 4th of December 1871. (Decree of the 4th of December 1861.)

Article VI.—An exception is made from the rules contained in the 3rd and 5th Articles with respect to the goods and merchandise exported through the Custom House of Lorenzo Marques, which shall pay an export duty of 1 per cent. *ad valorem*.

Article VII.—In order that any goods and merchandise may enjoy the favours accorded in the 2nd Article, they must be accompanied by the clearance tickets of the Custom House whence such goods and merchandise shall have been exported.

Article VIII.—The *ad valorem* duties shall be regulated in the following manner:—

The importer shall sign a statement, describing the goods, and the value thereof in their original market, accompanying the statement with the respective invoice.

The exporter shall present a similar statement, merely describing the goods, and the value thereof in the market of the province.

In case the Custom House Officers should think that the valuation is prejudicial to the interests of the Public Treasury, the Chief Officer of the Custom House shall appoint a clerk as arbiter, and the merchant shall appoint another on his side, and if their award should be alike, it shall be immediately adopted; in case, however, they should differ, the said Chief Officer shall appoint a second arbiter, who shall decide in favour of either award, which shall become the definitive award.

To the value, as stated by the importer, or as fixed by the arbiters in cases of doubt, 10 per cent. on such value shall be added, for levying the import duties, on account of freight, insurance, and commission, and the import duties shall be calculated upon this total value.

The export duties shall be calculated merely upon the value as stated by the exporter, or as fixed by the arbiters in accordance with this Article.

Article IX.—The following shall be exempt from export duties:—

1st. All merchandise nationalized in the Custom Houses of the Province by the payment of the duties of consumption.

2nd. All national and nationalized merchandise employed under the supervision of the Custom Houses, for the purpose of repairing any national or foreign vessels anchored in the ports.

3rd. Any goods or articles purchased on shore for consumption on board the national or foreign ships of war employed on the station.

Article X.—All goods and merchandise being the produce of the province of Mozambique, as well as any goods and merchandise, either national or foreign, that shall have paid in the Custom Houses of the province the duties due thereon, shall be allowed to be transported freely from one port of the province to another without being subject to any tax.

Article XI.—No goods exempt from duty shall be either entered or cleared until the quantity and value thereof shall have been registered in the Custom House books.

Article XII.—All luggage is exempt from duty; the word luggage meaning articles of clothing and others, such as instruments for the personal use of an individual, on the latter proving his respective profession.

Everything shall be conveyed to the Custom House for examination, and shall be accompanied by a statement signed by the Captain of the vessel, specifying the number of parcels and the name of the owner thereof.

The Chief Officer in the Custom House shall, as soon as application is made to him, order the luggage to be examined, and, if found in proper condition, shall cause it to be delivered to the owner free of any tax.

Article XIII.—All goods imported in bond into the depôts of the Custom House of the city of Mozambique may be re-exported therefrom on payment of a duty of ½ per cent. *ad valorem*, whatever may be the nationality of the goods re-exported or of the ship in which they are re-exported.

Section 1.—In addition to this duty, all merchandise warehoused in the Custom House shall pay, after six months from the date of entrance thereof, a warehouse rent at the rate of 5 reis (about ¼*d.*) per 15 kilogrammes upon dry articles, and of 15 reis (about ¾*d.*) per decalitre on liquids for each succeeding month.

Section 2.—Warehouse rent shall always be computed monthly.

Section 3.—The warehouse rent comprises porterage.

Article XIV.—The term during which merchandise shall be admitted in bond is limited to two years, reckoning from the date of the ship's entry. At the expiration thereof, should the merchandise not have been cleared for consumption or re-exportation, it shall be sold by public auction, after 30 days' notice; the owners, however, or their representatives shall be allowed, up to the day of the auction, to withdraw the said merchandise on payment of the respective duties and warehouse rent.

Section.—The expenses of the auction shall be paid with the proceeds of the sale, and the duties and warehouse rent shall be discounted from the said proceeds, and shall be entered in the Custom House receipts, the balance, should there be any, being kept at the disposal of the parties interested.

Article XV.—The Custom Houses shall allow the trans-shipment, free of duty, of any merchandise from any merchant ship to another, which must sail for another port within the period of 60 days.

Article XVI.—All national and foreign vessels entering the ports of Mozambique for the purpose of taking in water, for repairs, for ascertaining the state of trade in the province, or for any other reasonable purpose, provided they carry on no trade beyond taking in articles of consumption for the same, or whatever may be necessary for the repairs thereof, shall be exempt from the payment of shipping and port dues.

Article XVII.—The Custom Houses shall not be responsible for any damages which may befal the merchandise deposited in their warehouses, provided such damages shall have been caused by accidental or unforeseen circumstances, and not by the negligence of the Custom House people; and no compensation for duties shall be allowed on account of any difference in the quality of the merchandise offered for clearance, excepting the case mentioned in the following Article.

Article XVIII.—Whenever any merchandise shall appear in the Custom House with average exceeding 3 per cent. on the primitive value, not of the damaged article only, but of the whole parcel of which it forms part, should the owners or receivers make an application to that effect, a reduction shall be made in the duty in proportion to the value of the merchandise in its primitive state and its value after being damaged.

Section.—Articles of food, medicinal drugs, and medicines are not included in this rule; and if they should have suffered an average exceeding the said 3 per cent., they shall be immediately destroyed, if the owners or receivers should offer no objection thereto; but, in case they should, they shall only be destroyed with the assent of experts, among whom there shall always be, if possible, a representative of the Board of Public Health of the province.

Article XIX.—For the purpose of fixing the reduction to be made on the damaged articles, the Chief Officer of the Custom House shall appoint an arbiter from among the Custom House clerks; and the owner or receiver of the

merchandise shall appoint another, who shall declare the cause of the damage, and the difference between the value of the merchandise in its actual state, and in that before the damage occurred, and in view of this declaration, which shall be drawn up in the form of a public deed by the proper officer, the reduction of the duties applied for shall be made.

Section.—In case the arbiters should not agree, the Chief Officer of the Custom House shall appoint a third arbiter, who shall have the casting vote in favour of either award, without further appeal of any kind.

Article XX.—All goods shall pay the respective duties on their net weight, an allowance for tare being made in accordance with the Table annexed to the tariff.

Section 1.—The merchants shall have the option of weighing the goods without the tare.

Section 2.—Whenever the tare containing the goods shall be articles saleable in the markets in the state in which they arrive, such tare shall pay the respective duty.

Article XXI.—The special duty imposed by the decree (having the force of law) of the 30th of December 1852, is hereby abolished, as well as any other duties levied in the Custom Houses of Mozambique, under any denomination whatever, and not mentioned in this tariff.

Article XXII.—A permanent Tariff Committee shall be appointed, which shall be consulted with regard to any alteration which it may become necessary to make for the future in the tariff now put in force, and with regard to any questions or disputes which may arise in carrying the same into effect.

Section.—The reports of this Committee shall be forwarded in draft form to the Governor General of the Province, who shall be the competent person to decide; but his decision with respect to any alterations in the tariff shall remain subject to the approval of the Government.

Portuguese Indian Possessions.

Taking into consideration the Report of the Minister and Secretary of State for Marine and Colonies.

Availing myself of the authorization accorded in virtue of the 1st Section of the 15th Article of the Additional Act to the Constitutional Charter of the Kingdom.

After consulting the Board for the Colonies and the Council of Ministers, I am pleased to decree as follows:—

Article I.—The tariff annexed to this decree, and which forms part thereof, as well as the 18 Preliminary Articles which accompany the same, are declared to be in force in the Custom Houses of the Portuguese Indian Possessions.

Article II.—All legislation to the contrary is hereby revoked.

The Minister and Secretary of State for Marine and the Colonies shall accordingly cause the same to be carried into execution.

(Signed) THE KING.
(Countersigned) LUIZ AUGUSTO REBELLO DA SILVA.

PALACE,
12*th November* 1869.

TARIFF OF THE CUSTOM HOUSES OF THE PORTUGUESE POSSESSIONS IN INDIA.

Preliminary Articles.

Article I.—All goods and merchandise of foreign production imported through the Custom Houses of the Portuguese Indian Possessions shall pay the duties of consumption as laid down, in provincial reis, in Table No. 1.

Article II.—All goods and merchandise of national production, and imported through the Custom Houses of the Portuguese Indian Possessions, shall pay 50 per cent. of the duties of consumption as laid down in Table No. 1.

Section. An exception is made with respect to wines from grapes of national production which shall pay 420 reis per almude.

Article III.—All goods and merchandise of foreign production which shall have paid the duties of consumption at any Custom House of the kingdom, or of the adjacent islands, shall be held to be national unto all the intents of the foregoing Article.

Article IV.—All goods and merchandise, being the produce of the Portuguese Indian Possessions, which shall be imported from any port in those possessions to another, in national or foreign vessels, aswell as all goods and merchandise of foreign production which shall have paid the duties of consumption in any Custom House of the said possessions, are to be admitted free of any duties of consumption.

Article V.—Cocoa and its pith or marrow (copra) of foreign production imported into the same possessions for the purpose of being converted into oil shall be admitted free of duty.

Section 1.—Such oil shall be exported within the term of one year, counting from the clearance inwards of the said raw materials at the rate of 4 almudes per 1,000 cocoas or 8 arrobas of "copra."

Section 2.—The infraction of the rule in the foregoing paragraph is liable to the payment of double the amount of duties of consumption as laid down in the above-mentioned table, upon the importation of the said articles.

Section 3.—The importer shall find sufficient surety to ensure a compliance with the rule laid down in the foregoing Article.

Article VI.—Cotton stuffs of any kind or origin imported into the Portuguese Indian Possessions for the purpose of being dyed or printed, and then re-exported, shall be admitted duty-free.

Section. The clearance of this merchandise is subject to the same term, fine, and surety, as laid down in the paragraphs 1 to 3 of the foregoing Article.

Article VII.—All goods and merchandise, either produced or manufactured in the Portuguese Indian Possessions, and exported either to foreign countries, or to national territory, shall pay the duties laid down in Table No. 2.

Article VIII.—All salt exported in vessels with a castle (penão) shall be cleared under surety, or after depositing a sum equal to the highest amount of duty to which this article is liable.

Section 1. The exporter is bound to prove, within the term of two years from the date of clearance, that the salt exported was landed on the south beyond Compta, and on the north beyond Ratanagueri.

Section 2. In case of non-compliance with the rule laid down in the foregoing paragraph, he shall forfeit the sum in deposit, or in case surety should have been found, he shall pay a sum equal to the amount of the highest duty.

Article IX.—All goods produced or manufactured in the Portuguese Indian Possessions, and exported overland, shall pay the duties laid down in Table No. 3.

Article X.—All articles not specified in the tariff shall pay an import duty of six per cent. *ad valorem*, whatever may be the nationality or origin of the merchandise, and the exportation thereof is to be free.

Article XI.—All goods and merchandise, no matter from what territory or under what flag they come, shall be admitted in bond for the purpose of re-exportation.

Section.—Re-exportation is free of duty, but is subject to the payment of werehouse rent, if the period of their being in bond should have exceeded 30 days.

Article XII.—The *ad valorem* duties shall be regulated in the following manner:—

The importer shall sign a statement describing his goods, and the value thereof in their original market, annexing the respective invoice to the statement.

The exporter shall present a similar statement, merely describing his goods and their value in the markets of the province.

In case the Custom House Clerks should consider the valuation to be prejudicial to the interests of the Public Treasury, the Chief of the Custom House shall appoint another Clerk as arbiter, and the merchant shall appoint another person on his side, and should they agree in their award, it shall be immediately adopted; in case, however, they should differ, the Chief of the Custom House shall appoint a second arbiter who shall decide in favour of either award, and this shall be the final valuation.

To the value as stated by the importer, or as fixed by the arbiters in case of doubt, 10 per cent. on the amount of such value shall be added, for the recovery of the import duties, on account of expenses of conveyance, insurance, and commission; and the import duties are to be computed upon the sum total.

The export duties are to be computed merely upon the value as stated by the exporter, or as fixed by the arbiters, in accordance with this Article.

Article XIII.—No articles of which the importation, re-exportation, and transit are not subject to duty, shall be cleared either inwards or outwards until such clearance is registered in the respective Custom House book, with a statement of the quantity and value of such articles.

Article XIV.—In all the Custom Houses of Goa, the weights and measures shall be in accordance with the standard of the Municipal Chamber of the district "of the Islands," and in those of Damao and Diu in accordance with those of the respective municipalities.

Article XV.—The additional 10 per cent. levied by the "portaria" of the Governor General, No. 135 of the 16th of December 1852, the two "tangas" additional per "arroba" of sugar at Damao, the additional ½ per cent. on imports, and 2 per cent. on imports, and 24 reis on the tissues of brancavara at Diu, and the taxes called imports upon cocoa, copra, and areca, and one-third upon "parangues" (vessels), "goddi," and the duties on wine, jagra, sugar, and "sura," which are conveyed from the "New Possessions" to the old ones, are abolished.

Article XVI.—The importation of gunpowder is allowed, as well as that of tobacco, in leaf and in powder, and in cheroots and cigarettes, on payment of the duties as laid down in Table No. 1.

Article XVII.—There shall be a Permanent Tariff Committee, which is to be consulted with respect to any alteration which it may be necessary to make for the future in the tariff, and with respect to any doubts and disputes which may arise in carrying the same into execution.

Section. The reports of this Committee shall be submitted in draft form to the Governor General, who will be the competent person to settle the matter

but everything having reference to any alteration in the tariff shall be subject to the approval of the Government.

Article XVIII.—The Governor General of the Portuguese Indian Possessions is hereby authorized, after consulting the Tariff Committee, to organize and publish a Table of Tares.

(Signed) LUIZ AUGUSTO REBELLO DA SILVA.

MARINE DEPARTMENT, 12*th November* 1869. (Signed) LUIZ AUGUSTO REBELLO DA SILVA.

Ambriz.

Taking into consideration the Report of the Minister and Secretary of State for the Department of Marine and Colonies;

Availing myself of the authorization accorded in virtue of the first paragraph of the fifteenth Article of the Additional Act to the Constitutional Charter of the Monarchy;

After having consulted the Board for the Colonies and the Council of Ministers,

I am pleased to decree as follows:—

Article I.—All goods and merchandise, national or foreign, imported into the Custom House of Ambriz shall pay, whatever may be the port of shipment and the flag of the importing vessel, a duty of four (4) per cent. *ad valorem*, calculated upon the price of the exporting market as shown by the invoice.

Article II.—In the same manner two (2) per cent. more shall be recovered, to be specially applied to public works.

Article III.—Exportation is free from the payment of any duties or taxes.

Article IV.—The Custom House at Ambriz shall admit in bond all articles of trade whatever, shipped from any national or foreign port.

Article V.—All goods and merchandise admitted into bond shall be free from the payment of duty when re-exported; but they shall pay a warehouse rent, for each succeeding month after the expiration of six months from date of entry, at the rate of 5 reis per 15 kilogrammes (·26*d.*) upon dry articles, and of 15 reis (.80*d.*) per decalitre upon liquids.

Article VI.—The maximum period allowed to liquids in bond shall be one year, and two years for dry goods, counting from the date of entry. Upon the expiration of this period the goods shall be sold by public auction, after 30 days' notice. Up to the day of the auction, however, the owners, or their representatives, will be allowed to withdraw such goods, after paying the respective duties and warehouse rent.

The expenses of the auction are to be paid out of the proceeds of the sale, and the duties and warehouse rent shall be deducted from the said proceeds, and entered as revenue, the remainder, should there be any, being kept in deposit, on account of the interested parties.

Article VII.—The Custom House shall not be held responsible for damages accruing to merchandise while deposited there, if such damages should have been caused by any accidents or unforeseen circumstances, and not from any neglect on the part of their responsible *employés*; and no compensation for duties will be allowed on account of any difference in the quality of the merchandise presented for clearance, with the exception of the case mentioned in the following Article.

Article VIII.—Whenever any merchandise shall appear in the Custom House with average exceeding 3 per cent. on the primitive value, not of the damaged article only, but on the whole parcel of which it forms part, should the owners or receivers make an application to that effect, a reduction shall be made in the duty in proportion to the difference between the value of the merchandise in its primitive state and its value after being damaged.

Section. Articles of food, medicinal drugs, and medicines are not included in this rule; and if they should have suffered an average exceeding 3 per cent., they shall be immediately destroyed, if the owners or receivers should offer no objection thereto; but in case they should, they shall only be destroyed with the assent of experts, among whom there shall always be a representative of the Board of Public Health of the Province.

Article IX.—For the purpose of fixing the reduction to be made on the damaged articles, the Chief Officer of the Custom House shall appoint an arbiter from among the Custom House Clerks, and the owner or receiver of the merchandise shall appoint another arbiter, both of whom shall state the cause of the average, and the difference between the value of the merchandise in its then present state, and that which it had before the average; and in view of this declaration, which shall be embodied in a public deed by the proper officer, the reduction of the duties, as applied for, shall be made.

Section.—In case the arbiters should not agree, the Chief Officer of the Custom House shall appoint a third arbiter, who shall decide in favour of either award, without further appeal.

Article X.—When once the merchandise has entered the Custom House, it shall not be taken out without a regular clearance, and without paying the proper amount of duties.

For the convenience of the public service and of trade, the following articles are excepted, brandy, wine, vinegar, combustible articles, salt, tiles, lime, stone blocks, wood, and fruit.

All the foregoing goods, after undergoing examination on the quay by a Custom House Officer, may be delivered to their owners, after obtaining the permission of the Chief Officer of the Custom House.

Before the delivery of such merchandise, a declaration, signed by the Custom House Officer and the receiver, shall be written out in a book for that special purpose describing the merchandise thus delivered, stating the weights, marks, and designation, and mentioning especially the amount of duties due thereon, together with the condition that they are to be paid within the period of eight days.

Article XI.—It is altogether forbidden to send goods and merchandise to be exchanged at any point to the south of Ambriz by Commercial Deputies or by any other means.

Section. Infractions of the enactment shall be liable to the penalties imposed upon smugglers.

Article XII.—Goods imported into the Custom House of Ambriz, when cleared in transit for other ports in the Province, shall pay therein the duties of consumption, as laid down in the Customs' Tariff of the Province.

Article XIII.—The duties laid down in this decree shall not be altered before the year 1880, unless it should be deemed expedient to reduce these duties.

***Article* XIV.—All legislation to the contrary is hereby revoked.**

The Minister and Secretary of State for the Department of Marine and Colonies shall accordingly cause the same to be carried into execution.

(Signed) THE KING.

STATISTICAL BRANCH,
FINANCIAL DEPARTMENT:
Fort William, 26th March 1870.

R. B. CHAPMAN,
Offg. Secy. to the Govt. of India.

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Friday, the 25th March 1870.

PRESENT:

His Excellency the Viceroy and Governor General of India, K. P., G. C. S. I., *presiding.*

Major General the Hon'ble Sir H. M. Durand, C. B., K. C. S. I.
The Hon'ble John Strachey.
The Hon'ble Sir Richard Temple, K. C. S. I.
The Hon'ble J. Fitzjames Stephen, Q. C.
The Hon'ble Gordon S. Forbes.
The Hon'ble D. Cowie.
Colonel the Hon'ble R. Strachey, C. S. I.
The Hon'ble Francis Steuart Chapman.
The Hon'ble J. R. Bullen Smith.
The Hon'ble F. R. Cockerell.

PAPER CURRENCY BILL.

The Hon'ble SIR RICHARD TEMPLE, in moving for leave to introduce a Bill for the further amendment of Act No. XIX of 1861, said—

"The point of amendment will be found on reference to section X of the said Act, which runs thus—

'The whole amount of the bullion and coin so received for notes shall be retained and secured to pay such notes, with the exception of such an amount not exceeding four crores of rupees such as the Governor General in Council shall fix. The amount so fixed shall be invested in Government Securities.'

"The limit of investment then is fixed by law at four crores of rupees, or four millions sterling. We now propose to increase that limit to six crores or six millions. Before explaining the grounds of this proposal, I should state that it has received the express sanction and approval of the Secretary of State.

"In order to make the above grounds clear, I must ask the Council to revert to the principles on which our Paper Currency was established. These principles will be seen from the following extracts.

"In March 1860, the Secretary of State, addressing the Government of India, wrote:—

'The sound principle for regulating the issue of a paper circulation is that which was enforced on the Bank of England by the Act of 1844, *i. e.*, that the amount of notes issued on Government Securities should be maintained at a fixed sum, within the limit of the smallest amount which experience has proved to be necessary for the monetary transactions of the country; and that any further amount of notes should be issued on coin or bullion, and should vary with the amount of the reserve of specie in the Bank, according to the wants and demands of the public.

'The important condition is thus realised, that the mixed currency of notes and coin should vary in quantity exactly as if it were wholly of coin.

'In this country the smallest amount of notes required had been ascertained by long experience; but what that quantity may be in India, can only be ascertained in like manner; and as it is impossible, at present to say what the minimum amount of notes in India will be, the proceedings for determining this point must necessarily be tentative and experimental.'

* * * * * * * * *

'As the circulation of notes is extended beyond the immediate neighbourhood of Calcutta (and the advantages to be derived from the system will be very incomplete until this is done), a much larger amount of notes will be required; and under those circumstances, the limit of the fixed amount may be raised. But as this should only be done after full experience of the working of the system, I think it better that any change should be made, either by legislative enactment at the time, or by an order of Government, with the sanction of the Secretary of State in Council, to be published in the Gazette, power for doing this being contained in the Act which may be passed on the subject.'

"Subsequently, in 1861, the following year, the Secretary of State addressed the Government of India further as follows—

'4. The principle now adopted is that on which the currency of this country is based, namely, that a fixed amount of notes should be issued on Government security, and any amount beyond that should be issued on bullion or coin. The result will necessarily be, not that the quantity of paper in circulation is identical with the quantity of coin which would otherwise exist in the country, but that the variation in the quantity of paper and coin together corresponds with the variation which must have taken place if the circulation had been altogether of coin.'

"Next, inasmuch as my predecessor, Mr. Laing, took special interest in the existing system of our Paper Currency,—indeed, it was under his auspices that the present law was framed—it is important to see what he recorded at the time. In 1861 he wrote thus:—

'This majority has, however, been divided into two sections, one who hold that, to the condition of convertibility must be added that of absolute identity with the metallic circulation which it displaces; and that these two conditions can only be secured by making all Paper-issues the representatives of actual coin or bullion in the vaults of the Bank or Treasury, beyond a certain fixed issue, strictly limited within the bounds to which experience has shown that no conceivable contraction of the currency can approach.'

* * * * * * * * *

'I assume, therefore, that, in accordance with the opinion intimated by Sir C. Wood, the first consideration, in introducing a system of Paper Currency in India, must be to place its convertibility beyond question.

'For this purpose, I know of no other means than to adopt the principles of the English currency-laws, limiting the amount of fixed *minimum* issue for India to a figure which experience may show to be clearly within the mark to which the Paper circulation can be reduced under any conceivable circumstances.

'The present authorized issues of the three Chartered Banks of India are £5,000,000, *viz.*—

Bank of Bengal	... ...	£ 2,000,000
„ Bombay	... ...	„ 2,000,000
„ Madras	... ...	„ 1,000,000

* The actual issues are—

Bengal	£	1,964,000
Bombay	„	1,087,000
Madras	„	266,000
TOTAL ...	£	3,317,000

'Against which, by the charters, one-third in specie, leaving £3,750,000 as the amount issued against securities*; and the lowest of the issues were ever reduced during the month, informed, about £2,000,000.†

† The lowest issue of Bank of Bengal was £1,030,000.

'I think it would be unsafe, with our present information, to assume a much larger than that of the present authorized Bank-circulation as the *minimum* limit which it prudent to issue, against anything but actual coin or bullion; and even this limit should be approached gradually and with due caution. No doubt this limit may be extended in course of time, as the Paper-circulation becomes generally adopted; but it will be possible to amend the Act, and India has a right to know that the limit which has been fixed upon as safe under existing circumstances, shall not be exceeded on merely speculative grounds, or without a formal application to the Legislative Council for a fresh Act, giving time for reflection and opportunity for discussion.'

"Such then being the principles on which the present law was framed, I have to explain why the limit which it imposed, of four crores for the investments, ought to be extended to six, in accordance with those principles, it having been acknowledged, at the time, that the original limit was only experimental and might thereafter be raised according as circumstances might warrant.

"I have shown that the prescribed and established basis of our Paper Currency in India is this,—that the lowest amount be estimated to which, according to all reasonable experience, the Paper Currency might be expected to fall; that a portion of the money paid in exchange for the notes be invested in Government Securities up to the above amount, and that all notes above that amount must be issued against cash and bullion alone. The question, therefore, now would be this,—what, under the circumstances of the currency, is the lowest amount to which our circulation could reasonably be expected to fall? Then, given that amount, are we not justified in investing up to that limit?

"The four millions limit set forth in Act XIX of 1861 was necessarily assumed on the data of the known circulation of the three Presidency Banks in previous periods (the right of issuing currency-notes was transferred from 1st March 1862 from these Banks to the State). It was considered, in the circumstances of that day, that the circulation could not be reasonably expected to fall below four millions.

"Now, since 1861, what has been the circulation of the Government Paper Currency? I give the amounts of average circulation year by year in millions and fractions of millions:—

	Millions. £
1862-63 ...	4·42
1863-64 ...	5·23
1864-65 ...	6·88
1865-66 ...	7·73
1866-67 ...	8·99
1867-68 ...	9·29
1868-69 ...	10·14
1869-70 to date	10·53

"For the current official year 1869-70, the amounts have been—

	Rs.
7th April ...	9,74,25,840
„ May ...	9,83,86,380
„ June ...	10,72,97,130
„ July ...	10,72,53,300
„ August ...	10,44,63,350
„ September ...	10,07,65,210
„ October ...	10,39,10,050
„ November ...	10,97,12,500
„ December ...	11,33,83,900

"In round numbers our circulation has touched $11\frac{1}{3}$ millions. It has risen from $3\frac{2}{3}$ millions in March 1862 to $11\frac{1}{3}$ at the end of December 1869; in other words, it has increased by $7\frac{2}{3}$ millions in eight years. And though there have been, as fluctuations, still, on the whole, the increase has been steady and in order to revert to the prin the same period, of course, the public revenue, the private principles will be nternal traffic, the external commerce, the monetary transactions

"In March try have proportionally increased. In fact, the increase of the India, wrote:—ation is only an index or consequence of the increase in all these

'The sound cts. When we remember that since the Paper Currency was set in enforced on the e external traffic of the country has increased by some forty millions issued on Gov of annual value; that an internal traffic by rail of six millions of tons the smallest a has arisen; that the public revenue and the public expenditure have of the count increased each by ten millions; that some fifty millions sterling of British capital have been expended in India; that the banking-business of the country has increased beyond calculation,—we see that the development of the Paper Currency has only kept pace with the general improvement of the country.

"Against a circulation of upwards of eleven millions, we have a reserve in Government Securities of four millions, and a reserve in cash and bullion of more than seven millions. According to the experience of other countries possessing a Paper Currency, I should say that, in India, the reserve in Government Securities bears a somewhat unduly small proportion to the reserve in

cash and bullion. In other words, the Government in this country is hardly deriving from its Paper Currency the full advantage to which it is entitled.

"Under these circumstances, what is the lowest amount to which our circulation could reasonably be expected to fall? It might readily be expected to decrease under certain contingencies by two or even three millions; say it might possibly decline to eight millions. But it is difficult to anticipate its declining to five or even to six millions. This would represent a fall of fifty per cent. There has never been an instance of any such fall since we have had a Paper Currency. And this, too, notwithstanding that we have passed through political convulsions. For instance, in the period of the mutiny and rebellion of 1857, the annual average of the circulation of Bank of Bengal notes was £1,524,000, against £1,471,000 in 1856; £1,443,000 in 1858; £1,400,000 in 1855; and £1,717,000 to £1,825,000 during May to August 1867; *i. e.*, it was highest in the worst months of the mutiny. After the fall of Delhi in September 1857, the circulation declined owing to a depression of trade, and it continued depressed up to February 1858, and fell again in June 1858.

"The statistics of the Currency Note circulation are still more encouraging, the fluctuations in any year having been generally within the amount of increase of that twelve-month over the previous year, as may be seen from the Statement which I shall now read. The figures represent millions and fractions of millions.

"It is seen that, in 1866-67, there was a sudden fall of two millions' but it was the mere collapse after a casual inflation, the amount to which the circulation fell up to 30th April 1867 being still four-fifths of a million in excess of the circulation on 30th April 1866.

"In 1865-66, a fall of one million after the 30th September of that year did indeed reduce the circulation to an amount less by £600,000 than that of 30th April 1865, but coincidently with this fall, the following amounts of silver-bullion were lying in the Currency Department, *viz.*—

(Millions and fractions of millions.)

	£
On 30th September 1865	1·26
„ 31st October „	1·26
„ 30th November „	·96
„ 31st December „	1·56
„ 31st January 1866	1·12
„ 28th February „	1·08
„ 31st March „	1·01
„ 30th April „	·35

"The pressure on the occasion above alluded to occurred in December of 1865, in the Christmas season. But probably it would not have been felt had the bullion been available as coin.

"Moreover, the circulation of 31st December 1869 exceeds that of 30th April 1866 by four millions, while the amount of the invested reserve is the same as in the latter year.* The silver-bullion in the Currency Department on the last day of each month in 1869 has been as follows:—

January	1·49	July	1·58
February	2·10	August	·99
March	2·09	September	·98
April	2·42	October	1·51
May	2·37	November	1·58
June	2·07	December	1·45

This amount of bullion is unduly high, and we may have to issue orders for a portion of it being coined.

"If, then, we cannot reasonably apprehend the currency-note circulation falling to six millions, we might legitimately, under the fundamental principle of the Paper Currency, ask for power to invest up to that amount. But if we hesitate to invest up to that amount at present (as I should hesitate), we might at all events invest up to nearly five millions.

"Supposing the average circulation to be standing at not less than eleven millions with investments up to five millions; then, of the total reserve, there would be 46 per cent. in securities and 54 per cent. in cash and bullion. In that case the proportion of securities would be moderate, and the proportion of cash and bullion strong. In England the total reserve of securities represented, on 31st December 1865, 51 per cent.; on 31st December 1866, 46 per cent.; on 31st December 1867, 42 per cent.; while that of cash and bullion on those dates represented 49, 54 and 58 per cent., respectively, of the total circulation.

"As already stated, I would not exercise the power of investing, if it were given us, up to the full amount immediately. I would do so gradually. For some time to come it might not be desirable to go beyond five millions. But as it might be expedient that such application to the Legislature should be rare, I would ask that the limit be extended to six millions.

"In order to show how careful and tentative our practice has been in making these investments hitherto, and how fully we may be trusted to con[illegible]

* This is correct; notwithstanding the fact that we have recently invested more than half a million. In 1865-66 the invested reserve was four millions. Then half a million of that was gradually sold. We have since invested half a million, bringing up the amount again to four millions.

"It will hence be seen that the securities gradually rose in amount from half a million in 1862 to four millions in 1866. Then they fell gradually to $3\frac{1}{3}$ millions in 1868. After October 1868, they gradually increased again to close on four millions, the legal limit.

"Such, then, are the reasons why I propose to raise the limit from four to six crores of rupees, or from four to six millions sterling.

"There is another proposed amendment in the Act which I may briefly explain; it is this: In certain sections of the Act, it is said that the Mint Master may be the Head Commissioner. Doubtless, it was not the intention of the law that the Mint Master must always be the Head Commissioner. Still, while these words remain as they are, it may be often understood that the Mint Master generally ought to be the Head Commissioner. But in reality there is no necessary connexion between the Mint and the Paper Currency Department. The Mint Master may, and often does, make a good Paper Currency Commissioner; but he has no special qualifications for this work; and he has to perform it in addition to his proper duties. As the Currency work more properly pertains to officers who have received training in the Finance and Account Departments, it may often happen that the work can be best entrusted to those officers. I therefore propose to omit the words in question from the Act, and to leave the Government quite free to nominate whom it sees fit for the Head Commissionership.

"There is one more amendment which I may mention, which is this.

"Though there may be nothing in the Act to prevent the Commissioner holding the currency-reserve in the hands of any officers subordinate to him for that purpose, but sanction seems necessary to the deposit of bullion-reserve in the hands of the Mint Master for coinage purposes, and if it be determined to distribute a portion of the reserve in important Mofussil treas[illegible]er to cash notes for the convenience of the public, it might be Dec. 1·31 } 1·53 advantage of this Bill to introduce a clause empowering the Head C[illegible] or Commissioner to hold a certain portion of the reserve or unissu[illegible] any Government treasury fixed with the approval of Governme[illegible]two millions' purpose of affording greater facilities to the public for the issnt to which cashment of notes, provided that all such notes or coin so depos[illegible]of a million be held at the sole disposal of the Currency Commissioner, and sha[illegible] be used for any other purpose than those allowed by Act XIX of [illegible] and shall be separately held from all other Government moneys, and shall be subject to such rules for custody and verification as the Head Commissioner, with the approval of Government, may from time to time appoint."

The Motion was put and agreed to.

LAND ACQUISITION BILL.

The Hon'ble MR. STRACHEY presented the Report of the Select Committee on the Bill to consolidate and amend the law for the acquisition of land needed for works of public utility.

NATIVE PASSENGER SHIPS BILL.

The Hon'ble MR. CHAPMAN presented the Report of the Select Committee on the Bill to make further provision for the regulation of Native Passenger Ships.

ELPHINSTONE LAND AND PRESS COMPANY, LIMITED, BILL.

The Hon'ble MR. CHAPMAN, in moving for leave to introduce a Bill to enable the Elphinstone Land and Press Company, Limited, when in voluntary liquidation, to sell their property to Government, said that this property had been reclaimed by the Elphinstone Company from what was formerly a noisome portion of the foreshore of the harbour of Bombay. The Company was formed in 1858, and was called after the lamented Lord Elphinstone, than whom, he (MR. CHAPMAN) humbly ventured to think, a braver gentleman or a wiser Ruler never governed an Indian Presidency. In 1862, the Company entered into an agreement with the Government to provide upwards of one hundred acres of land for the terminus of the Great Indian Peninsula Railway and other purposes. In return they obtained the right to reclaim from the sea, for their own advantage, about two hundred and fifty acres. At first sight, and, in a simple business-point of view, the bargain was an exceedingly favourable one for Government. They conceded what to them, in its natural state, was quite valueless, and in return obtained property which they were bound to provide for the Railway, and which was estimated to have cost over three hundred thousand pounds to reclaim. He (MR. CHAPMAN) had said that the bargain was a good one, viewed in a purely commercial light; but, politically, it was unquestionably a mistake. By it the Company secured a monopoly of the harbour-frontage immediately opposite the Native town, and were in a position to subject a very considerable portion of the entire trade of the port to wharfage and other dues. He ought to mention that the Government had the foresight to reserve to themselves the right to regulate the rates at which these dues were to be levied. But the transaction was nevertheless one which should not have been entered upon; and for the sake of obtaining an immediate pecuniary advantage, however large, the Government should not, in the interest of the public, have allowed the foreshore to pass out of their possession, and have given the Company so dominant a position. Shortly after the contract had been entered upon, an unexampled tide of prosperity set in to Bombay, owing to the American war, and to the stimulus consequently given to the cotton-trade. The Company, the managers of which were the enterprising firm of Messrs. W. Nicol and Co., set to work with their able and energetic Engineer, Mr. Ormiston, to carry out their contract. He (MR. CHAPMAN) supposed this country had never witnessed such extraordinary vigour in the prosecution of any public work as was then displayed. Gangs of stalwart Chinese labourers were imported, a fleet of barges was constructed on the most improved principles to bring earth from the other side of the harbour, and a regular service of trains was established to bring in material from Coorla on the main land. In short, everything that a combination of capital, skill and energy could do was done. In the meantime the speculation-mania rose to its height, shares in Companies of all kinds and descriptions commanded ridiculously high prices, and, in common with those of the wildest schemes, the shares of this solid *bonâ fide* Company reached quite a fabulous premium—at one time, he believed, as high as eighteen thousand pounds. As the Council were aware the era of prosperity was not of long duration, and a time of humiliation was at hand for Bombay. Consequent, mainly, on the cessation of the American war, and the extent to which insane speculation had been carried, the whole trade of the place collapsed, and the ruin became general. The property of the Company participated in the general depreciation; and the shares fell to fifty per cent. discount. In the meantime the Company had almost entirely completed their agreement with Government. Out of a subscribed

capital of two millions one hundred and sixty thousand pounds, one million two hundred and eighty thousand had, at this time, been paid up, and had been nearly all expended. The Company felt it would be impossible in the then state of affairs to call in the remainder of their subscribed capital. There could be no doubt that, in the year 1866-67, the Company were in considerable difficulty. Government were applied to for assistance, which resulted, he (MR. CHAPMAN) believed, ultimately in a loan of one hundred thousand pounds. During the last two years the value of the stock had revived; and the Company had now agreed to sell their entire property to Government at the par value of the paid-up capital, such value to be paid in four per cent. stock at the price of ninety-three. He understood it would be necessary to issue stock to the amount of one million seven hundred thousand pounds, which, at ninety-three, would represent one million eight hundred and thirty thousand. In consideration of this outlay, Government would secure, he believed, a property of two hundred and fifty-nine acres that had already been reclaimed, inclusive of the one hundred and twelve acres agreed upon in the first instance to be reclaimed for the Railway Company. A further expenditure of about a million would be required to complete the project as originally designed. Looking to the vast commerce that was now certain to concentrate in Bombay, consequent on the opening of the Suez Canal and the completion of the Railway system, the advantage to the public of this fine property, with its extensive water-frontage and facilities for the construction of docks, being in the hands of Government, was great. He understood the idea was that its management should be placed under a Trust, and he thought there was little fear of the State revenue suffering any eventual loss from this investment. He had mentioned these particulars, because he thought it would be interesting to do so. But in point of fact this Council had nothing to do with the past history of the property, or with the policy of the Executive Government in purchasing it. All they were asked to do was to formally ratify, by an enactment, the purchase that had been agreed upon. The Law Officers had expressed a doubt whether, in the absence of an express enactment, Voluntary Liquidators could carry out the sale in the manner proposed, and considered that dissentient shareholders might appeal to the interference of the Court. He wished to explain that there was nothing in this Bill to interfere with the volition of the shareholders. Dissentients, as the law now stood, could not prevent the majority from selling the property if they chose to do so; but they might perhaps prolong the proceedings by objecting to the manner in which payment had been arranged. Hence the necessity for the present Bill being brought under the consideration of the Council.

The Motion was put and agreed to.

The Hon'ble MR. CHAPMAN having applied to His Excellency the President to suspend the Rules for the Conduct of Business,

The President declared the Rules suspended.

The Hon'ble MR. CHAPMAN then introduced the Bill and moved that it be taken into consideration. He said that, as he had already endeavoured to explain, this Bill was of an entirely technical character. It had been drawn in consultation with, and with the concurrence of, the legal advisers of the Company, and it had for its object the formal ratification of a transfer of property which both parties were desirous to effect. They, as he had already said, had no concern whatever with the considerations which had induced the Government on the one hand, and the Company on the other, to enter upon this transaction. The Bill would authorize the Voluntary Liquidators to receive payment for the property in the form of Government paper, and would prevent dissentient shareholders taking exception to this procedure and appealing to the Court.

The Hon'ble MR. STEPHEN said there was just one point which he wished to mention. It might appear rather remarkable that this Bill was not introduced in the legislature at Bombay; but the reason of this was that the effect of the Bill would be to interfere to a certain extent with the jurisdiction of

the High Court of Bombay, which interference was beyond the competency of the Council at Bombay. As the Hon'ble Mr. Chapman had pointed out, it would produce no difference if this Bill were passed by the local Council, except the delay which a single dissentient shareholder might cause (he would have no power to prevent it) by instituting proceedings in the High Court of the Presidency.

The Hon'ble SIR RICHARD TEMPLE said that the arrangement which the Hon'ble Mr. Chapman had described would not involve any annual charge on the general revenues of the country: the charge would be transferred to the Bombay Harbour Trust Fund.

His Excellency THE PRESIDENT said that the negotiations between the Supreme Government and the Government of Bombay, were conducted on the distinct basis that, if the purchase was effected, such measures would be taken by the Bombay Government as would be necessary to secure the payment of the interest of the loan and the creation of a Fund for the gradual extinction of the capital from the Port and Harbour Fund of Bombay, so that, in lending the money, the Government of India did not intend to throw any charge on the general revenues of the country.

The Motion was put and agreed to.

The Hon'ble MR. CHAPMAN also moved that the Bill be passed.

The Motion was put and agreed to.

LOCAL PUBLIC WORKS BILL.

Colonel the Hon'ble R. STRACHEY, in moving for leave to introduce a Bill to facilitate the construction of works of public utility from Local and Municipal Funds, said that, during the last few years, the Government of India had frequently been asked by the various Local Governments to make advances for works of local improvement. In many cases these proposals had been made for State money for carrying out works of local improvement in towns: in several cases the object to be effected had been the improvement of water-supply; in other cases, it had been to improve drainage. Occasions also had occurred in which the Local Governments had asked the assistance of the Government of India in carrying out other improvements. The Madras Government had asked and obtained assistance in carrying out the excavation of a canal called the East Coast Canal, which made a communication between Madras and the districts to the north and south of that city, and admitted of permanent navigation along the Coast during that time of the year when the sea coasting trade would be stopped. There had been other cases in which small demands had been made on the Government of India. In almost all, sufficient grounds had been shown for making such advances, and the Government of India had never hesitated in assisting the Local Governments when satisfactory reasons had been established. But it had been ascertained that, in almost every case, excepting those of the Municipalities established for managing the Presidency towns, the Municipal bodies had not the power of legally entering into obligations under which they could raise money by law. These bodies were administrative authorities appointed to manage Local Funds, and had no power to deal with anything but the revenue that came into their hands year by year. The consequence was that the Government of India, in making these advances, had in reality no security for the loans it made to such bodies. It was the desire of the Government of India to do everything in their power to facilitate the carrying out of works of local public improvement, and with this object it had been considered desirable to obtain by law proper power for enabling the local bodies in various parts of the country to enter into agreements with the Government of India for the purpose of obtaining loans for carrying out such works. The Bill was intended to provide for this object.

REGULATIONS AND ACTS LOCAL EXTENT BILL.

The Hon'ble MR. COCKERELL introduced the Bill to consolidate and amend the law relating to the local extent of the general Regulations and Acts and to the local limits of the jurisdictions of the High Courts and the Chief Controlling Revenue Authorities, and moved that it be referred to a Select Committee with instructions to report in six weeks. He said that the Bill purported to effect a complete consolidation of the existing law regarding the operation of the general Regulations and Acts, and the local limits of the jurisdictions of the highest Courts of Judicature and the Chief Revenue Authorities. That law at the present time was spread over upwards of fifty enactments. As from time to time it had been found necessary to extend the operation of the general Regulations to any fresh territory or to exclude from such operation some tract formerly subject thereto, the extension or exclusion had, in each case, been effected by special legislation. The result of this process was that the Statute-book had been greatly encumbered with enactments of this class, and the ascertainment of the fact of the legal application of a particular Regulation to any place involved the labour of a vast amount of research; whilst, in some cases—as for instance that of the Dehra Doon District, to which he made particular reference when asking leave to introduce this Bill—the ambiguity engendered by repeated legislation in this direction regarding the same tract of country had caused the long-continued misapplication of the law by the judicial authorities. As regarded the territories subject to the control of the Lieutenant Governors of Bengal and the North-Western Provinces and the Madras Presidency, where the area within which the general Regulations were not in force was comparatively small and briefly definable, the object of the Bill was more conveniently and succinctly attained by a detailed specification of the portions of those territories to which the general Regulations did not apply. The first three schedules, consequently, were framed in accordance with this view. The circumstances of the Bombay Presidency, however, did not admit of the adoption of a similar course. In the case of the territories belonging to that Presidency, the application of the general Regulations had been of a very piece-meal character; in no district, apparently, had such application been universal. It had been confined to specified divisions of each district, and the detailed mention of these divisions, which formed the subject-matter of the fourth schedule, could not be avoided. It was to this clause alone that the Bill owed its somewhat cumbrous proportions. It might be objected, in reference to this circumstance, that the design of the Bill being to consolidate and condense the existing law, very little was gained where such lengthened recapitulations as were embraced in the fourth schedule were necessary. The answer to this was, that the scheme of the Bill being of general application, it would have been incomplete if its reference to any particular Presidency had been omitted; and although, on the score of brevity, the gain was far less than in the case of the other Presidencies, yet even in this respect some not inconsiderable advantage was secured by the proposed consolidation; for, as under the existing arrangement of the law there was a double reference to places to which the general Regulations were formerly extended, and which had been subsequently removed from their operation, the effect of the Bill would be to get rid of this double reference, and thus far at least to shorten the provisions of the law on this subject. It could with much reason be urged that a measure of this kind, so far as it related to the minor Presidencies, involving as it did purely local details, and consequently more fit to be dealt with by local experts, should be left to the Local Councils. That course would certainly, for many reasons, be more convenient, but there were legal difficulties in the way of its adoption which were insuperable. The first of these had already been alluded to by his hon'ble friend (Mr. Stephen), in reference to another Bill which had today been under consideration. It was that the Local Councils were not competent to vary or affect by their legislation the jurisdiction of the High Courts. Owing to the legal disability, from this cause, of the Local Council, to legislate in a matter of this kind, it was found necessary, about two years ago, to pass in this Council an Act for removing certain places in the Bombay Presidency from the operation of the general Regulations. The other obstacle to local legislation in this direction was the want of power in the Local Council to set aside or alter any Act passed by the Imperial Legislature since 1861. The Act which he (MR. COCKERELL) had just referred to as passed by this Council in 1868, and which it was now proposed to repeal in this Bill,

could not have been touched by the Local Council; hence the work of consolidation to be effected by this Bill, even if it could have been undertaken by the Local Council, must necessarily have remained incomplete. There were some other provisions of the Bill which, perhaps, called for explanation, as having apparently no connection with its general purport. He referred to sections 15, 16 and 17. The substance of these sections had been introduced into several Acts, from time to time enacted for the purpose of removing certain tracts of country from the operation of the general Regulations. For the purpose of consolidation, it was now proposed to repeal these several repetitions of the same subject-matter, substituting therefor the sections to which he had referred. The present measure was intended merely to affirm the results of past legislation in regard to the local limits of the general Regulations and the jurisdiction of the High Courts and Chief Revenue Authorities. He (MR. COCKERELL) was not prepared to say that the Bill now before the Council accurately fulfilled this intention. If it was referred to a Select Committee, the first step would be to consult the several Local Governments. The aid of local experience was essential to the correct adjustment of the details of the proposed enactment.

The Motion was put and agreed to.

GOVERNMENT RAILWAYS BILL.

Colonel the Hon'ble R. STRACHEY, in moving for leave to introduce a Bill to apply the provisions of Act No. XVIII of 1854 to Railways belonging to, or worked by, Government, said that it had been brought to the notice of the Government of India within the last few days, that the language of the Railway Act was such as to render it inapplicable to Railways belonging to, or worked by, the Government. There was no intention in this Bill to alter in any way the law relating to Railways: all that was proposed was so to modify the language of the Act as to make it applicable, in all cases, to Government Railways, precisely on the same principle as it now applied to Railways belonging to or worked by Companies. Under these circumstances he would give notice, now, that it was his intention at the next meeting to ask His Excellency the President to suspend the Rules for the Conduct of Business, in order to admit of the Bill being then passed. At the present time he (COLONEL STRACHEY) might say that the Calcutta and South-Eastern Railway, leading to Port Canning, was practically, as he believed, under no law whatever, and it was evidently desirable that that condition of things should not be allowed to continue.

The Motion was put and agreed to.

INDIAN WEIGHTS AND MEASURES BILL.

Colonel the Hon'ble R. STRACHEY also presented the Report of the Select Committee on the Bill to regulate the Weights and Measures of British India.

The following Select Committee was named :—

On the Bill to consolidate and amend the law relating to the local extent of the general Regulations and Acts, and to the local limits of the jurisdictions of the High Courts and the Chief Controlling Revenue Authorities ——The Hon'ble Messrs. Stephen, Gordon Forbes and Chapman and the Mover.

The Council adjourned to Friday, the 1st April 1870.

WHITLEY STOKES,
Secy. to the Council of the Govr. Genl.
for making Laws and Regulations.

CALCUTTA, SATURDAY, APRIL 9, 1870.

OFFICIAL PAPERS.

A SUPPLEMENT *to the* GAZETTE OF INDIA *will be published from time to time, containing such Official Papers and information as the Government of India may deem to be of interest to the Public, and such as may usefully be made known.*

Non-Subscribers to the GAZETTE *may receive the* SUPPLEMENT *separately on a payment of six Rupees per annum if delivered in Calcutta, or nine Rupees four annas if sent by Post.*

No Official Orders or Notifications, the publication of which in the GAZETTE OF INDIA *is required by Law, or which it has been customary to publish in the* CALCUTTA GAZETTE, *will be included in the* SUPPLEMENT. *For such Orders and Notifications the body of the* GAZETTE *must be looked to.*

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Friday, the 1st April 1870.

PRESENT:

His Excellency the Viceroy and Governor General of India, K. P., G. C. S. I., *presiding.*
His Excellency the Commander-in-Chief, K. C. B., G C. S. I.
Major General the Hon'ble Sir H. M. Durand, C. B., K. C. S. I.
The Hon'ble John Strachey.
The Hon'ble Sir Richard Temple, K. C. S. I.
The Hon'ble J. Fitzjames Stephen, Q. C.
The Hon'ble Gordon S. Forbes.
The Hon'ble D. Cowie.
Colonel the Hon'ble R. Strachey, C. S. I.
The Hon'ble Francis Steuart Chapman.
The Hon'ble J. R. Bullen Smith.
The Hon'ble F. R. Cockerell.

LAND ACQUISITION BILL.

The Hon'ble MR. STRACHEY moved that the Report of the Select Committee on the Bill to consolidate and amend the law for the acquisition of land needed for works of public utility, be taken into consideration. He said that the Council would see from the Report of the Select Committee that numerous alterations had been made in the Bill as originally introduced; but those alter-

ations might, with two exceptions, be considered to be of a minor character, not affecting the principle of the Bill as introduced. Two substantial changes in the Bill had been proposed by the Select Committee, and these required some notice from him; in only one of them, however, was there really any novelty. The alteration to which he would first refer was a matter which had long been before the Council. When the Bill was introduced about a year ago—or he ought rather to say immediately after its introduction—it was explained in a note circulated by the Legislative Department, and which had long been before the Council, that while the Bill laid down principles for the guidance of the persons officially employed in valuing land required to be taken up for public purposes, there was nothing to preclude the Executive Government, if it so desired, from giving, by way of percentage or otherwise, something additional to the price fixed, in consideration of the compulsion to which the owner of the land was forced to submit when it was so taken up. Whether, if given at all, this additional sum ought to be given in all cases, whether the owner was really disinclined to part with the property or not, was a question regarding which there was much difference of opinion. The Bill as originally drawn did not attempt to deal with the question, and it was reserved for future consideration. When, in December last, the Bill was referred to a Select Committee, MR. STRACHEY stated that, in his opinion, it would be proper to allow something over and above the market-value of the land, in consideration of the compulsory character of the sale. The Committee had decided in favour of the same view; and he thought, for his own part, that this addition was one which it was quite right to make. This was one of the only two really important alterations which had been made in the Bill as originally introduced.

The other substantial change was one regarding which nothing had been said on the previous occasions when the Bill was before the Council. The matter was raised for the first time before the Select Committee. It was brought to the notice of the Committee that Act VI of 1857 did not really contain the whole law in regard to the acquisition of land for public purposes. Act XXII of 1863 enabled the Government to take up land for works of public utility proposed to be constructed by private persons or by Companies. The first part of that Act regarded the procedure under which the Government was to satisfy itself whether it was really right or not to take up the land, as if it were required for public purposes, for works of public utility proposed to be constructed; and the Act then went on to give power to the Government, in the event of the proposed work being constructed, to prescribe the conditions under which the work was to be allowed, and the measures which should be taken fully to protect the interests of the public and its convenience and security. It seemed to the Select Committee that there was no reason for keeping on the Statute-book a separate law in regard to this particular subject, and that the opportunity should be taken of consolidating the whole law on the subject of acquiring land for public purposes or for works of public utility. The Committee had therefore proposed to repeal Act XXII of 1863, and to re-enact, as part of the present measure, those portions of the Act which were really of importance. Act XXII of 1863 was rather a complicated measure, which had been hardly ever brought into practical effect. It contained, also, many conditions regarding the acquisition of land required for railway-construction by private persons or Companies other than the guaranteed Companies by which the existing Railways had been made. There had been no case in which these particular provisions referring to Railways had been put in force, nor was there any present probability of their being required, because no such Railways were under construction, nor were any such, he believed, contemplated. It appeared to the Committee that, whatever provisions of this kind might be really required, they would more fittingly find a place in a Railway Act, than in an Act regarding the acquisition of land. It had long been admitted, as the Council were aware, that a review of the existing law regarding Railways was

very necessary, and the subject was now under the consideration of Government. Meanwhile, pending the conclusions that the legislature might arrive at regarding the general law regarding Railways, there could be no doubt, he thought, that the repeal of that portion of Act XXII of 1863 referring to Railways could lead to no possible inconvenience, and every thing which that Act really contained of present value it was proposed to include in Part VII of the present Bill.

These were the only two real substantial changes that the Committee had proposed. There were many other alterations, however, as the Council would see from the Report of the Select Committee, and, although he had called them minor alterations, there could be no question that they very greatly improved the Bill. They had made it, MR. STRACHEY was satisfied, a much more complete measure than it was before, and they had rendered it much more likely to be successful. He thought that, if the Council consented to pass this Bill into law, there was every reason to hope that it would remove the gross abuses of which so much complaint had been made, and from which both the public and the State and private interests had frequently suffered.

The intention of the Government, when this measure was first brought forward, was to take the law of England, as interpreted by the English Courts, as the basis of our legislation. He had formerly stated this on the authority of Mr. Maine and of the learned Secretary to the Council, and he thought the Hon'ble Mr. Stephen would probably confirm his statement, if he said that the present measure did little more than endeavour to adopt, in a spirit liberal towards private interests, the principles recognized by the law of England and other civilized countries.

The Hon'ble MR. STEPHEN said that his Hon'ble friend had been good enough to refer to him for confirmation of the statement, that what the Bill supplied was a liberal interpretation and application of the law of England to the circumstances of this country. It gave him great satisfaction to corroborate that assertion in the strongest manner. With reference, in particular, to the leading alteration to which his Hon'ble friend had referred, MR. STEPHEN would say a few words with the view of showing that we had adopted the law of England, and done so in a spirit of somewhat greater liberality towards the public than that which prevailed in England. According to the law of England, the compensation was assessed by a jury summoned by the Sheriff, and generally presided over by an assessor. No rules had been laid down to guide them in the exercise of their discretion, and the consequence was, that a branch of business had grown up in England, eminently profitable to lawyers, eminently profitable, in some instances, to those who received compensation, but in no way profitable, either to the undertaking for which the land was required, or to the general interest which the public had in a fair and equitable arrangement on such occasions. During the early history of this subject, those from whom lands were taken used to get enormous compensation. After that there was a considerable re-action, and cases of hardship sometimes occurred the other way. But at length, without any explicit legislative provision on the subject, but partly by practice, and partly by the decisions of the Courts of Justice, a sort of general rule was arrived at, more particularly in London, with regard to the amount of compensation to be awarded, and that general understanding was, that you were to pay the fair price which a prudent purchaser would accept for the property, plus an addition for the forced sale, which, by practice, was taken at ten per cent. Besides this, special compensation was made for severance, for expenses of removal, and any damage to trade that might result. The law in England thus rested practically on usage, and was subject to great variations: it rested also on a series of judicial decisions known to the public.

The Bill which was now submitted, and particularly that part of it to which his Hon'ble friend had referred, threw into the form of explicit propositions those general principles which had gradually come to be recognized

in England; but it treated the persons subjected to these compulsory sales somewhat more liberally than was the practice of London juries of late years. It gave them the market-value, not the auction-price, but the market-value plus fifteen per cent. He must say, he thought that when this arrangement was made known to the public—when they understood how fully the owner's interests had been consulted by his Hon'ble friend and the Select Committee to which the Bill was referred—the only doubt that could possibly be entertained on the subject would be whether we had not gone rather too far in liberality towards the individual at the expense of the public. MR. STEPHEN could hardly imagine that the Bill in its present form could be regarded as a measure of confiscation, or that it would work with any degree of hardship on persons whose property was taken in order to be used for public purposes.

The Hon'ble MR. COCKERELL said that, in concurring entirely, as he did, in the equity and propriety of the proposed enactment; entertaining also the opinion that, in its progress through Committee, the Bill had undergone most useful elaboration in detail and was now converted into a thoroughly workable measure, he should have thought it unnecessary to offer any remarks on the subject, but that he had seen it stated in a communication, emanating from a quarter from which this Council had, on several occasions, received very valuable opinions and suggestions, that, in proposing to pass this Bill to-day, we were proceeding with unusual and altogether unnecessary precipitancy. Now, it appeared to him that such a statement was wholly inapplicable to the circumstances attending the passage of this Bill through the Council, and to show this, he need only point to the facts that the first step towards the proposed legislation was taken so far back as the time of His Excellency's predecessor; that what might still be termed the main provisions of the Bill were explained at great length and discussed on each of the three previous occasions on which the measure had formed the subject of debate in this Council, and that, in the intervals between the occasions referred to, the utmost possible publicity was given to the policy of the Government in this matter. The call for the expression of public opinion in regard to the measure might be said to have been fully responded to, and the Committee had thus had the advantage of going into the consideration of the Bill with very full information in regard to all its material provisions. As the result of their deliberations, the Committee had framed a report which shewed, as had been explained by his Hon'ble friend the mover, that the main features of the original Bill were considered fit for adoption with but slight modifications. Under these circumstances, it could not reasonably be affirmed that the proposal to take the report into immediate consideration, and thereafter to proceed to the passing of the Bill as amended, was otherwise than in accordance with the usual practice of the Council. With still less reason could it be maintained that this course was, as regarded the measure now before the Council, unnecessary; for the extent to which, under the present state of the law, the whole tax-paying community was defrauded for the benefit of the few owners whose property was needed for public purposes had been fully demonstrated, and it was certainly incumbent on the legislature to apply a remedy to so gross an evil with all practicable dispatch. It had been urged in the communication to which he had referred that, as the Bill had been greatly altered in Committee, the proposed amendments should be published and time given for the public to become acquainted with their purport ere they were finally adopted by the Council. His Hon'ble friend the mover of the Bill had already explained that these amendments comprised only two changes of substance, and he would remark that, of these main alterations, the one to which Mr. Strachey gave the greatest prominence in his statement, namely, the proposal to give a bonus of fifteen per cent. in excess of such ordinary compensation as the owner of land required for a public purpose might be held entitled to receive, was not only sure to be viewed with general favour as a liberal measure, but would also be accepted as a not unexpected concession; for the substance of the proposal was distinctly set

forth, in the statement made by the mover of the Bill immediately before it was referred to a Select Committee, as worthy of consideration, and, if approved by the Committee, likely to be assented to by the Government.

The other proposed change, which had been described as of special importance, *i.e.*, the application of the provisions of the Bill to the case of land needed by Companies undertaking works of public utility, amounted in fact to no more than the consolidation and simplification of the existing law on this subject. The amended Bill contained a large number of other changes, but they were exclusively alterations of detail, and were in no way repugnant to the principles which guided its original construction. Their operation was calculated to improve and simplify the procedure in acquiring land for public purposes; where they affected the interests of the owner of land, they would be found to place him in a better position than he was under the original Bill: it was not likely, therefore, that the proposed amendments would be objected to, and consequently no useful purpose would be served by further delay. There was one, as he thought, very important provision in section 3, to which he wished to draw attention. He referred to the fourth clause, which, purporting to declare the meaning of the expression 'Court,' as used throughout the Bill, in effect provided for the constitution of the tribunal by which all claims to compensation for property acquired under the operation of the law which could not be settled between the Collector and the 'persons interested' were to be adjudicated. This question underwent most careful consideration, and the Committee determined that, ordinarily, such cases ought to be tried by the chief local Civil Court. The alternative provision was intended to be applied only in special cases, the circumstances of which might be such as to make it clearly for the interest and convenience of all parties that some special agency should be employed for the adjudication of those cases. It was hoped that local Governments would very sparingly exercise the special power vested in them by this clause. The intention of the Bill was that cases coming under it, in which the Collector and the owners of the property to be acquired could not settle the terms of purchase, the question should be referred to the most competent, and at the same time most independent, judicial agency to be found in the locality where the acquisition was to be made.

The Motion was put and agreed to.

The Hon'ble MR. COCKERELL stated that, with the concurrence of his Hon'ble friend the mover of the Bill, he would now ask leave to move for the insertion of the following new section immediately after the present section 56. The new section to bear the number 57, and the numbers of the subsequent sections to be altered accordingly.

"No award made under this Act shall be chargeable with stamp-duty, and no person claiming under any such award shall be liable to pay any fee for a copy of the same."

This amendment was designed to repair an oversight in the settlement of the clauses in Committee, and was absolutely needed to give full effect to the policy of the Bill as regarded the relief of the owner who was compelled, for the sake of public convenience, to part with his property, from all loss and annoyance of any kind, arising out of such compulsory surrender, that could be avoided. It would be clearly unreasonable to subject to any tax for revenue-purposes, transactions forced upon the owners of property in which they were not, by the necessity of the case, free agents. The recognition of this principle dictated the exemption of applications for payment of compensation in the recently enacted Court Fees Act; and the framers of this Bill had been careful to relieve persons interested in property acquired for public purposes of all costs of proceeding, taken for the purpose of such acquisition, except in cases where such costs had been clearly entailed by the wrong-doing of such persons.

Colonel the Hon'ble R. STRACHEY said that the awards which the Hon'ble Mr. Cockerell proposed to exempt from stamp-duty would only include awards made by the Collector under section 14 and those by the Court under section 34;

but under Part VI of the Bill, relating to the temporary occupation of land, analogous proceedings took place between the Collector and the person interested. COLONEL STRACHEY desired to point out that there were orders of Court, under section 45, in the case of a difference arising when the land was temporarily occupied. Also, there were agreements come to under section 43. Therefore he thought his Hon'ble friend would not object to treating agreements under section 43 and orders under section 45 in the same way as awards made under the two other sections.

The Hon'ble MR. STEPHEN remarked that there was nothing in the law to render such orders liable to stamp-duty. Nothing, therefore, need be said about them in Mr. Cockerell's amendment.

His Excellency the COMMANDER-IN-CHIEF said that he had listened to what had fallen from Mr. Cockerell and Colonel Strachey, but he had as yet not heard any reason given why this exemption should be made. It appeared to HIS EXCELLENCY to be worthy of consideration whether this particular class of business did show any special features which called on the Council to make a distinction in the application of the provisions of the Stamp Law.

The Hon'ble MR. STEPHEN said that in this instance, the action of the Government in taking land caused the persons interested to give up their lands for public purposes, and then to get an award made, or else to make an agreement, and it would be rather hard if they were compelled not only to give up their lands for public purposes, but also to pay a tax on the instruments by which they would get compensation. That, he thought, was the ground on which the distinction was made.

The Hon'ble MR. COCKERELL said he had already explained that the amendment was in accordance with, and in pursuance of, the policy of the Bill. In his opinion that policy would be incompletely carried out if the amendment were not adopted. The case was one which, for obvious reasons, excluded general considerations of the interests of the revenue. The effect of subjecting to a tax any of the proceedings forced upon the owners of property by the conditions of this Bill was to reduce, *pro tanto*, the amount of the compensation to which they were held to be entitled.

His Excellency the Commander-in-Chief said that it should be observed in the interests of the finances that the Bill was of a peculiarly liberal character towards the person proposed to be ousted from the property which was to be taken for a public purpose. We had only to turn to the forty-second section, and it would be seen that, in consideration of the compulsory nature of the sales, fifteen per cent. was to be added to what was considered the real value of the estate. When we were about to give such large advantages to those who were to part with their property, in the interests of the public, for public purposes, no reason, HIS EXCELLENCY thought, had been made out why these parties should be exempted from the small dues of the revenue by which their interests were affected. All exemptions from the operation of financial laws were greatly to be deprecated.

The Hon'ble SIR RICHARD TEMPLE concurred with His Excellency the Commander-in-Chief.

The Hon'ble MR. STRACHEY said that it appeared to him that no question was involved in the motion before the Council which could affect the imperial revenues at all. He did not suppose that the revenue realized from these fees could possibly amount in the course of a year to £5; at the same time it seemed quite clear that justice required that if we took a man's property for public purpose, against his will, he ought to be in every possible way protected against unnecessary loss and inconveniences of every kind, and MR. STRACHEY thought that it was clear that the owner ought to be exempted from liability to payment of stamp duties

in consequence of transactions forced on him by the Government, and although, as he had said, the loss of these duties was a matter of absolutely no importance to the Government, it was quite possible that their payment might be a matter of very considerable importance to the extremely poor people, whose land would not unfrequently be taken up. Consequently he entirely concurred in the propriety of the amendment proposed.

The Hon'ble MR. COCKERELL then moved, by way of amendment, that the following section be substituted for that which he had at first proposed:—

57. "No award or agreement made under this Act shall be chargeable with stamp-duty, and no person claiming under any such award or agreement shall be liable to pay any fee for a copy of the same".

The Motion was then put, and the Council divided:—

AYES.	NOES.
His Excellency the President.	His Excellency the Commander-in-Chief.
Major General the Hon'ble Sir H. Durand.	Hon'ble Sir R. Temple.
Hon'ble Mr. Strachey.	
Hon'ble Mr. Stephen.	
Hon'ble Mr. Gordon Forbes.	
Hon'ble Mr. Cowie.	
Colonel the Hon'ble R. Strachey.	
Hon'ble Mr. Chapman.	
Hon'ble Mr. Bullen Smith.	
Hon'ble Mr. Cockerell.	

So the amendment was carried.

The Hon'ble MR. STRACHEY also moved that the Bill as amended be passed.

The Motion was put and agreed to.

PAPER CURRENCY BILL.

The Hon'ble SIR RICHARD TEMPLE applied to His Excellency the President to suspend the Rules for the Conduct of Business, to enable him to introduce the Bill for the further amendment of Act No. XIX of 1861.

He said—"In making this application, I have little to add to what I stated at the last meeting of the Council (on the 25th March) when I moved for leave to introduce the Bill. I then shewed by statistics (the result of which will be in the recollection of the Council) how the progress of our Paper Currency justifies us in asking for power gradually to raise the limit of that portion of the reserve which is invested in Government Securities, from four crores or millions sterling to six crores or millions of rupees. In addition to those statistics there is one set of figures which, I think, would now interest the Council, and which I will present, in reference to remarks which have been made in some public quarters. It seems to be believed by some that the mass of our notes is held in the Presidency towns, and by a few parties or corporations like Banks, and that the circulation in the interior of the country is comparatively small.

"Now, how stands the circulation in the interior, and how is it to be measured? I will take the figures of the circulation for the month just expired (March). It then stood at Rs. 10,27,50,640, or 10¼ crores or millions, of which 9 crores or millions pertained to the Presidency towns, leaving 1¼ crores or millions for the circles in the interior. This sum was divided as follows among the circles of the interior; Allahabad £355,000, Lahore £244,000, Calicut £77,000, Trichinopoly £43,000, Vizagapatam £33,000, Nagpore £274,000, Kurrachee £233,000, Akola £87,000.

"Or, again, let us take the month of January last, when the circulation stood at its highest, namely, Rs. 11,48,06,470 or just 11½ crores of rupees or millions sterling. Of that, 10 crores or millions pertained to the Presidency towns, leaving 1½ crores or millions for the circles of the interior. This sum was divided among the interior circles as follows:—Allahabad £362,000, Lahore £274,000, Calicut £66,000, Trichinopoly £57,000, Vizagapatam £34,000, Nagpore £277,000, Kurrachee £266,000, Akola 196,000.

"Now, this circulation in the interior is considerable and increasing, though still very much below what we hope it will be some day. And it is the product of the Government system of Paper Currency within the last few years. Though the greatest part of the circulation is in the Presidency towns—which is only what might be expected, inasmuch as they are the great centres of trade—still, the circulation in the interior of the country is growing fast.

"Further, I have heard it remarked in some quarters that, in England, when there is a demand for money, then money is taken quite as much in notes as in coin, and that, at such times, the note-circulation often increases. Now, if I understand the argument rightly, it is assumed that, in India, the process will be virtually different; that is to say, when there is a demand for money, the money will be taken, not in notes, but in coin; or, in other words, when the money-market is in tightness or distress, there will be a rush, not for paper-money, but for cash; or, again, that the Banks, which generally hold large quantities of notes, would present their notes for encashment. Now, I cannot find that there is any reason for supposing that, in the above respects, the commercial centres of India are different from those in England or elsewhere. I have compared the rise and fall of the accommodation rates of the Bank of Bengal with the fluctuations of the note-circulation from 1865-66 to the present time, and I fail to find that when those rates have been high the note-circulation has been low. For instance, in April and May of 1865, the Bank's rates were thirteen and eleven per cent. for private bills; the note-circulation in the Calcutta Circle stood at £2,909,000. In April, May, June and July 1866, the Bank's rates were sixteen, fifteen, fourteen, and twelve, per cent.; the Calcutta circulation stood at £2,600,000, £2,713,000, £2,817,000 and £2,924,000. At both these troublous periods the note-circulation was well sustained, for the average circulation of 1865 stood at £3,033,000 and of 1866 stood at £2,799,000. In short, looking at the figures month by month for the last four years, I cannot perceive that the fluctuations of the note-circulation are materially, if at all, affected by the tightness or easiness of the money-market, as evidenced by the accommodation-rates of the Presidency Banks. Indeed, the absence of any relation between the two sets of phenomena may be accounted for by the steady progress of the Paper Currency.

"I regret to see that in some quarters it seems to be supposed that, if the power of investing up to six crores or millions is conceded to us, it will be exercised at once and not gradually. I trust that it will suffice to remind this Council of the assurance which I gave at the last meeting, on behalf of that Department of the Government of India which I represent, to the effect that it is our intention to exercise the power, if it be voted us, in a tentative and cautious manner. If the Council will bear in mind the statistics I presented at the last meeting, of the very gradual manner in which the investments were brought up to the present limit of four crores or millions, it will be apparent that in the past our practice has been cautious; and that is the best guarantee that the intention I now declare of continuing in the same cautious course will be fulfilled.

"I may conclude by observing that the measure I now propose has the support and approval of our distinguished colleague His Excellency Sir W. Mansfield, who, as the Council knows, has for many years paid special attention to currency-questions, and was President of the Commission which sat four years ago and reported on the whole subject of the Paper Currency of India."

The President declared the Rules suspended.

The Hon'ble SIR RICHARD TEMPLE then introduced the Bill and moved that it be referred to a Select Committee with instructions to report in a week.

The Hon'ble MR. COWIE said that, as this measure had called forth a certain amount of adverse criticism, he wished to record his opinion that he thought it a correct and advantageous system, and one which the Government could not have postponed much longer. He had formed this opinion on the assumption that the approach to the new maximum of six millions would be as carefully made and would be as guardedly approached as was done some years ago to the present maximum of four millions.

His Excellency the COMMANDER-IN-CHIEF said that, having been appealed to by his hon'ble friend for his opinion, he begged to say that the Bill had his entire support. He thought it not impossible that the uncertainty created in the public mind by the proposal of his hon'ble friend had arisen from the terms in which the Secretary of State for India announced his views in 1860 with regard to the manner in which the Paper Currency should be organised in this country. If the Council referred to the Despatch of the Secretary of State quoted at the last meeting, they would find that he made use of these words:—

"The sound principle for regulating the issue of a paper-circulation is that which was enforced on the Bank of England by the Act of 1844, *i. e.*, that the amount of notes issued on Government securities should be maintained at a fixed sum, within the limit of the smallest amount which experience has proved to be necessary for the monetary transactions of the country; and that any further amount of notes should be issued on coin or bullion, and should vary with the amount of the reserve of specie in bank, according to the wants and demands of the public."

Perhaps it would appear strange to the Council that that which was announced by Sir Charles Wood to be a sound principle, was condemned by many great banking authorities in England. There was perhaps no question with regard to the Paper Currency which had excited so much adverse criticism at the remark that it was prudent to issue paper as against securities. It was laid down with an authority which HIS EXCELLENCY believed it to be impossible to controvert, that if you committed yourself to this principle in its integrity, you embarked in the channel which, in the days of Law under the Regent Orleans, in France, and again in the South-Sea time in England, and with regard to the convulsions which fell on the commercial world four years ago, led to wholesale ruin; that if you adopted this principle and accepted it in its integrity, you were liable to consequences, from which sooner or later escape was impossible, such as those to which he had adverted as the most serious instances presented by financial history. Perhaps it might seem that His EXCELLENCY was splitting words, because it was clear that Sir Charles Wood wished to guard himself, and believed himself to be guarded, from any such dangerous consequences by the precautions he described. Yet there was always a danger in describing a system to exist on a basis the soundness of which was open to question, and which was questioned by scientific authorities, one result being, as it appeared to him (SIR WILLIAM MANSFIELD) in this instance, that a wrong impression had been produced in the minds of the public with regard to the very innocent measure under consideration. The principle, as he understood the various works which he had consulted on this point—the fair principle—on which a Paper Currency should be founded, was that it should have a solid basis; that it should be issued on a metallic foundation alone, partly bullion and partly specie. That, he thought, was the principle generally admitted, and which alone could be admitted as sound. Having laid down a solid basis and issued paper against bullion and specie, it was then for the Member in charge of the finances to determine how much of this currency we could afford to face, with regard to the absolute convertibility of the note, without the corresponding portion of bullion and specie in hand; that, as was said by McLeod in his valuable work on Banking,

was a matter of experience. His Excellency would read to the Council a short passage in which that proposition was maintained:—

"As all Paper Currency is a 'promise to pay' gold or silver bullion at some definite time, it is quite evident that the 'promises to pay' floating in a nation must bear some proportion in quantity to the actual quantity of the bullion. It is quite impossible to fix any definite proportion, because that depends upon a multitude of peculiar circumstances; experience is the only guide on the subject."

Well, then, as His Excellency had attempted to explain, the currency of the country was founded on the principle of the notes being issued against bullion and specie. Then, at a certain point, the Hon'ble Member who was in charge of the finances declared that it was safe to invest a certain quantity of bullion and specie in hand, because it could not in any possible manner be called upon to assist in the convertibility of the note. His Excellency drew particular attention to that point, because he considered that, if from the nature of things it were possible that the whole of the notes in circulation could return to the vaults of the Currency Department, it would be absolutely unsafe to invest even the smallest portion with regard to the principle stated in the paper from which he had quoted. Then it appeared to His Excellency, according to the best investigation he had been enabled to give to the subject, that such a currency-system as that introduced by the late Mr. Wilson, and which had now been in progress for eight or nine years in India, was founded on a thoroughly sound and solid basis; and it was within the province of the Hon'ble Member in charge of the finances to tell the Governor General in Council when he considered that the proper point had been reached, demanding further investment of bullion and specie. In support of that, His Excellency would venture to read a definition he had prepared for his own guidance.

"The currency-reserve, whether as held in the Bank of England, or in the Indian Currency Department, is, in point of fact, a kind of trust-investment made under certain legislative enactments, for the purpose of giving the utmost assurance to the respective Governments and the public for the redemption of the Paper Currency, without causing that loss to the treasury and to the public which would ensue on the retention of many millions of specie in Bank or Currency Department cellars, which cannot from the nature of things be possibly wanted."

The figures placed before the Council by his Hon'ble friend showed a most remarkable development of the Note-circulation. Of those who had first listened to Mr. Wilson's proposition ten years ago, and who had been called on to investigate its development since, there was hardly an authority who would not say that this development of the currency in this safe and solid manner had surpassed our anticipations. Well, having reached this point, we might ask, has not the time arrived when, as the Hon'ble Mr. Cowie stated it, the four millions of investment should not be gradually extended to six millions? His Excellency had no doubt that that time had now arrived.

It was said, in some circles, that this question was first raised with regard to certain projects which Sir Richard Temple would state to-morrow with reference to his Budget; but His Excellency could affirm that this question first received the attention of the Government of India many months ago, when his Hon'ble friend was in England; the matter was discussed, and we had made up our minds that there could be no harm in the matter. On his return, Sir Richard Temple found the Council Notes, and having turned his attention to the subject and agreed in the conclusions arrived at during his absence, the result was the measure before the Council. This Bill had nothing in any way to do with the Budget projects which would be announced to-morrow.

His Excellency had nothing to add, except that, as far as he had been able to judge, he believed that there was no currency-system in the whole world which was at present on a more solid and scientific basis than the Paper Currency of this country.

The Motion was put and agreed to.

OBSOLETE ENACTMENTS BILL.

The Hon'ble Mr. Stephen presented the Report of the Select Committee on the Bill for the repeal of certain obsolete enactments.

HINDU WILLS BILL.

The Hon'ble Mr. Stephen also presented the Report of the Select Committee on the Bill to regulate the Wills of Hindús and Buddhists in the Presidency Towns.

INDIAN WEIGHTS AND MEASURES BILL.

Colonel the Hon'ble R. Strachey moved that the Report of the Select Committee on the Bill to regulate the Weights and Measures of British India be taken into consideration.

The Hon'ble Mr. Forbes said that he had opposed the Bill before the Council, as the Hon'ble Mover was aware, on various points during its progress, and he wished, before the Bill became law, to say a few parting words of disapprobation regarding some of its provisions. He was aware of the labour and ability which his Hon'ble friend had devoted to the construction of this Bill; but, looking to the result which he had produced, it seemed to him (Mr. Forbes) that the Hon'ble Mover had to some extent enacted the part of Frankenstein, and produced, not a monster perhaps, but a very unsymmetrical creation. The Bill was neither the fulfilment of the views expressed by Government in their despatch, dated November 1868, to the Right Hon'ble the Secretary of State, and approved by him, nor was it the metrical system in its proper form. Here was indeed the body, or rather the members of the metrical system, but joined together after a fashion devised by the Hon'ble Member. He (Mr. Forbes) knew that the reason which his friend alleged for this course was, that he believed the measure in this shape would encounter less opposition than would be offered to the metrical system. He (Mr. Forbes) could not see this. He thought that it was a mistake, and that the Indian public would prefer the metrical system to the creation of the Hon'ble Member. For his own part he (Mr. Forbes) believed that the wisest and best course would be to pass a measure which should introduce standards of weight and capacity only; a less ambitious measure certainly, but one better suited to this country. In order that he might justify the terms by which he had characterized the Bill, he begged the attention of the Council to the latter part of section 5, which provided that, unless it should be otherwise authoritatively notified, sub-divisions of weights and measures should be expressed in decimal parts. If the Hon'ble Mover had introduced the metrical system in its proper form, decimal numeration would have followed as a matter of course; and would have been intelligible to the simplest mind; but it seemed to him that his Hon'ble friend had done too much and dared too little, and in this Bill decimal numeration simply appeared as an arbitrary condition. He (Mr. Forbes) was quite sure that the addition of this condition would prove a great obstruction to the cordial acceptance of the Bill by the people of India, and that they would shrink from what would otherwise be regarded as a boon and a benefit. Every one who was acquainted with India knew that the Hindú system followed the currency, and used the factors and multiples of sixteen. He thought that most of the members of this Council must have observed the operations of a shroff counting a heap of rupees; he drew the coin to him by fours and numerated accordingly. Many of the members must also be aware that a cultivator, in describing a crop, spoke of it as a twelve-anna crop, meaning that it was a three-quarter crop, or a fourteen-anna crop, and so on, as the case might be. This system was familiar to Hindús of all ages; it was simple and led to no confusion. He was persuaded that to attempt to substitute the decimal numeration for it would be to encounter as great a difficulty as

the removal of any caste or religious custom. He thought that the Council ought to reject the concluding part of section 5, and, if he met with any encouragement to do so, he was prepared to move its rejection from the Bill.

Colonel the Hon'ble R. STRACHEY said that he had intended to have explained the form into which the Bill had been finally thrown by the Select Committee before the Hon'ble Mr. Forbes made the remarks which had just fallen from him, and he would now offer a few remarks on this subject. As to the change which had been referred to in the scope of the proposed legislation, all that had to be said was that in fact the present Bill did nothing more than what the Government of India recommended to the Secretary of State, and what the Secretary of State agreed should be done. What the Government of India proposed was that, as regards any general change of weights and measures in British India, nothing should at present be carried out excepting a change in the weights; and that the change in weights should be made very gradually and with very great care. There was no specific allusion made in the despatch of the Government of India to the Secretary of State to measures, but it was understood at the time when that despatch was written that the time had not come for dealing with the question of measures at all. Before the Bill now before the Council was prepared, and during the interval between the writing of that despatch and the preparation of the Bill, it had been brought to the notice of the Government that for the purposes of some of the departments of Government, it might be found to be expedient—he might almost say necessary—that the metre should be adopted as the unit of length simultaneously with the adoption of the new ser, which it was determined should be equal to the Kilogramme as the unit of weight. Consequently, in framing the Bill, it was thought right that a distinct reference should be made to the metre, and that it should be defined in the same general way that the new unit of weight was defined. There would be a manifest inconvenience if the Government adopted in any of its departments, or required the Railway Companies to adopt, any measure which could not be legally substantiated in India. The only way in which legal form could be given to any measure which the Government proposed to adopt, was to declare by law what should be the standard by which such measures were to be tested. Provisions were made in the Bill for testing and verifying weights. It was evident that, if the machinery which the Government proposed to create for the purpose of testing and verifying weights could not be applied to the testing and verifying of measures, the community at large, in its dealings with the Government or in its dealings with the Railway Companies, would not have that amount of protection afforded to them which they had a right to demand from the Government. Under these circumstances, it was thought proper to define in the Bill what should be the metre. The application of the metre however merely extended to the transactions of the Government Departments, Municipal Bodies and Railway Companies. As he had explained on a former occasion, the Government practically had the power, in respect to such Departments, Bodies and Companies, in its executive capacity, to order the adoption of any of the measures referred to in the Bill without having recourse to legislation. But, for the reasons he then explained, and which he had now again repeated, it was considered better, when the Bill was put before the Council, to include in it a reference to the metre. He might add that these views had been agreed to by a large majority of the Select Committee.

As regards the form given to the Bill and the manner in which the metrical units had been dealt with, the Hon'ble Mr. Forbes was, he thought, somewhat under a misapprehension. As COLONEL STRACHEY had endeavoured to explain before, the idea of establishing any theoretical units of weight or length had been entirely given up by scientific men, and the only basis on which any system of weights and measures could be safely framed

was now universally admitted to be the basis of material standards. On that basis it was proposed to construct the system of weights and measures to be adopted in British India. There was no reference to any theoretical connection between the unit of length and the unit of weight; there was no necessity for any such reference, and in fact any such reference that could be made must be incorrect. Consequently, in the Bill as it now stood, the units of weight and length were defined, in the one case as a weight of metal in the possession of the Government of India, and in the other case as the distance between the marks at the end of a rod of metal in the possession of the Government of India.

In connection with these remarks, he might add that the Committee unanimously adopted the conclusion that any reference to English weights and measures in the definition of the units was objectionable. It was brought to the notice of the Committee that the figures originally inserted in the Bill were questioned. Those figures, he should say, were inserted in opposition to his own views of what was proper, and on its being explained to the Committee that no figures could give a precise or certain equivalent, in English weights or measures, of the new weights and measures, the Committee unanimously agreed that it was proper to omit all reference to English weights and measures and to define the new units as had now been done in the Bill, that was, by reference to certain precise material objects, the Kilogramme des Archives, and the Mètre des Archives which they were to represent.

An addition had been made to the portion of the Bill which referred to the compulsory introduction of the new system. It was brought to the notice of the Committee that, in many parts of India, particularly in the South, the ordinary transactions of the people in grain were carried on with measures of capacity and not with weights. It was true that these measures of capacity represented certain weights of grain. The introduction of measures of capacity, which, under the new system, were also based on the unit of weight, did not in fact introduce any reference whatever to the new standard of length. The unit of measure of capacity was defined to be a measure containing a ser of water. Therefore, although there was an apparent departure from the original intention of confining compulsory action to weights alone, measures of capacity were in fact representatives of weight, and therefore there was no divergence on that point from the original intention.

An important addition had been made to the Bill by the proviso which had been added to section 22, which declared that the possession of any weight or measure in accordance with the standards of weights and measures established throughout the United Kingdom of Great Britain and Ireland would not subject the possessor to any penalty. This was an addition obviously very proper, as transactions between India and England would, to a very great extent, be carried on with the weights and measures of England.

Although it would perhaps have been more proper if he had reserved his reply to the particular remarks the Hon'ble Mr. Forbes had made on some of the details of the Bill to a later stage of their proceedings, he might save the time of the Council if he now made one or two observations in reply to those remarks. Mr. Forbes had particularly referred to the last clause of section 5, which said that, unless it be otherwise ordered, the sub-divisions of all weights and measures should be expressed in decimal parts. The manifest scope and intention of section 5 was to give power to the Executive Government to declare what new weights should be adopted, but subject to the proviso that they were to be exact multiples or sub-multiples of the units. This had been done advisedly and altogether in opposition to the views of the extreme partizans of the metrical system. Such persons affirmed that the only proper way to proceed was to introduce the decimal system once for all in its integrity, however troublesome such a radical change might be, and they deprecated any gradual change. COLONEL STRACHEY personally did not entertain those views, and the Committee, he saw, had adopted the view found in section 5, that it should be left

to the Executive Government to prescribe the precise form of the new system of weights and measures that should be adopted, in addition to the new units. The provision that had been introduced empowering the Government not to make decimal multiples compulsory, unless they were fully convinced that such divisions should be made, so far from suggesting that the divisions should necessarily be decimal, would obviously be quite in the opposite direction. There was no doubt, as his hon'ble friend Mr. Gordon Forbes had remarked, that there would be great difficulty in carrying out any decimal system of weights and measures, or any change of the units such as was contemplated by the Bill. There was no question that the difficulty in India, of carrying out these changes effectually, would be greater than in any country in which education was further advanced. If it was really desirable to introduce, early, a good system of weights and measures into the country, the sooner we began it the sooner would it really take effect. That the change was difficult was no reason why we should shirk it. If the ignorance of the people was to be received as a reason for not adopting improvements, he thought India would be in a very bad way indeed. It would be for the Government to see that all changes of the sort contemplated in respect to the weights of the country were carried out with great caution, and that nothing should be done to force any change on the people until they had been gradually prepared for that change by the adoption of the new system in the Government Departments. The transactions of the Government Departments and the Railway Companies were on so large a scale, that the community at large would, in a measure, be forced to adopt whatever the Government and those large Carrying Companies adopted; and there was no reason to doubt that the people in the districts and towns in the vicinity of the larger Government establishments and of the lines of railway would soon become habituated to the use of the new weights, and that it would then become possible and reasonable to extend their use to such localities.

Major General the Hon'ble SIR HENRY DURAND said that there was a point in connection with this Bill which he did not see touched upon, but which was, incidentally, rather important. He wished to be informed whether, as the statement mentioned that Government offices were to adopt the new system of measures, it was intended that the unit of measure should extend to the great geodesical operations carried on in the country on the basis of English measures, involving a long series of most scientific observations and labours carried on for a long series of years. There were volumes based on those calculations. Was it intended that the whole of those labours was to be of no effect, and that we should remodel the whole triangulation of the country, all the maps based on it, and the whole of the revenue-surveys in connection with those labours? If that were so, it would be a very serious proposition indeed.

Colonel the Hon'ble R. STRACHEY said, in reply to the Hon'ble Sir Henry Durand, that section 9 merely declared that, whenever the Governor General in Council considered that proper standard-weights and measures of the new system had been made available, he might direct that any of such weights and measures should be used by Government Offices, Municipal Bodies and Railway Companies. All that he could say in reply to the question put by the Hon'ble Member, as to the probable effect of the passing of this Bill on the operations of the Survey Department, was that he was not aware that there had been under consideration till the present time any proposal to make any alterations in the operations of any Public Department in connexion with the proposed change of weights and measures. The question had been incidentally raised in the Public Works Department, whether, for some branches of that Department, the adoption of the metre simultaneously with the kilogramme might not be desirable, but the question had not taken a definite form, and no decision to do anything had as yet been come to. He presumed that, if the Executive Government considered that it was proper to alter the scale on which the public maps were constructed, it would be optional with it to do so. The departmental officers of the Government would necessarily be asked to advise the Governor General in Council on the subject, and the Government, after full consideration it may be presumed, would come to a decision as to any change that might be suggested. There was, however, nothing in the Bill which implied that any such change as had been referred to was contemplated; all that it said was that, when the Government considered it proper to make a change in the unit of length, it should be made in a certain way. Obviously, the executive Government could do this whether the Bill became law or not, and he could not see how it could be supposed that the Government could be in any way forced to make changes merely because this Bill contained a declaration of the indisputable fact that they could on their own authority order their own offices to make changes.

Major General the Hon'ble SIR HENRY DURAND said, he was aware that the Bill was permissive and left much to the discretion of the Government, but the reply was not satisfactory; for the Bill and statement intimated a clear intention as to the early introduction, through the Government offices, of the new system of measures, and it was a very material question whether the whole of those scientific operations, on which all the surveys and maps of the country were based, should stand fast or not, whether, in fact, the Great Trigonometrical Survey was to continue to work with the old English measures hitherto employed, or with the new.

The Motion was put and agreed to.

Colonel the Hon'ble R. STRACHEY then moved that the Bill as amended be passed.

The Motion was put and agreed to.

NATIVE PASSENGER SHIPS'. BILL.

The Hon'ble MR. CHAPMAN moved that the Report of the Select Committee on the Bill to make further provision for the regulation of Native Passenger Ships be taken into consideration. He said that he had to request the special attention of the Council to sections twenty-four, twenty-five and twenty-six. These sections constituted the back-bone of the Bill. By the first of them all ships sailing from any port in British India to any port in the Red Sea were bound to touch at Aden and there obtain a clean bill of health, and the owners, or masters, were liable to a civil penalty of rupees five thousand if they omitted to do so. By section twenty-five, all ships sailing from any port east of the Cape of Good Hope and commanded by persons to whom the Bill applied were liable to a criminal penalty of two thousand rupees if they did not touch at Aden and obtain a clean bill of health. The reason of the difference between the two penalties was this. In the case of ships clearing from British ports, the officers of the Government would be able to insist on the owner or commander entering into a civil bond before allowing the ship to clear out; whereas, of course, in the case of vessels sailing from foreign ports, there would be no opportunity of doing so. The only way in which the criminal penalty could be enforced in the latter case would be by information on the part of some one of the crew or passengers on the arrival of the ship at a British port, or by an inspection of her papers.

Section 26 provided that the bill of health which ships were bound to obtain would be withheld in all instances where there were more than the authorized number of passengers. When MR. CHAPMAN took charge of this measure, it became his duty to devise the most effectual means he could think of to prevent the fearful amount of overcrowding which there was

reason to believe prevailed on board these pilgrim ships. Looking to the geographical position of Aden, it at once occurred to him that the best plan would be to overhaul them there. It would be impossible, considering the number of foreign ports in the Straits and elsewhere, to arrange, in concert with the several Governments of these ports, for the examination of ships before departure. He admitted that the provisions of the present Bill were very stringent, and were likely to occasion considerable inconvenience and expense. All he could say was, that he should be happy to make less objectionable provisions if he thought they would secure the desired ends. The practical result of the measure would be that pilgrims would have to pay more for their passage than they now did. He had received a petition signed by some members of the Muhammadan community, in which, while approving generally of the measure, they suggested that, in cases where the wind was favourable and there was ample time to reach Jeddah at the proper season for making the pilgrimage, the ship should be obliged to touch at Aden; but if not, she should be permitted to proceed direct to Jeddah, and there the passengers should, previous to landing, be subjected to an examination by the Consul. He need hardly remark that, in point of practice, it would be impossible to give effect to this suggestion. In his opinion, if the Government were to legislate at all on these matters, it was advisable to do so in a complete and effectual manner.

The Hon'ble MR. COCKERELL said that as a member of the Select Committee on this Bill, he wished to state that the Committee had not lightly, or without a full sense of their rigour, adopted the very stringent provisions contained in sections 24 and 25. Indeed he might say that his Hon'ble friend's proposals in this direction were very reluctantly assented to. It was felt, however, as had been stated by his Hon'ble friend, that the very objects of the present legislation, which had been undertaken in the paramount interests of the cause of humanity, could not be effectually attained in any other manner. The obvious objection to these provisions was, that they imposed a similar obligation and burden on all masters or owners of Native passenger ships, including those who might have never carried more than a fair complement of passengers, with those who, for personal gain, had disregarded the dictates of humanity and rendered necessary such strong preventive measures as were provided by the Bill. As regards the expense entailed by the proposed provisions, it was within the power of the Executive to mitigate the burden to a considerable extent. He understood that, quite recently, vessels touching at Aden for the sole purpose of using the telegraph had been exempted from the payment of port-dues.

It was only reasonable, under the circumstances in which Native passenger ships were compelled to enter that port, that a similar exemption should be applied to them, and he had no doubt but that this would be done.

The Motion was put and agreed to.

The Hon'ble Mr. Chapman then moved the following amendment. That in section 24, line 12, after the word "Aden," the words "on her outward and also on her homeward voyage" be inserted.

These words were omitted by an oversight. The effect of them would be to subject the ship to examination both on going to, and returning from, the Red Sea. The practice of overcrowding prevailed on both occasions.

The Hon'ble MR. CHAPMAN also moved that the Bill as amended be passed.

The Motion was put and agreed to.

GOVERNMENT RAILWAYS' BILL.

Colonel the Hon'ble R. STRACHEY introduced the Bill to apply the provisions of Act No. XVIII of 1854 to Railways belonging to, or worked by, Government. He said that the object of the Bill was perfectly explained in the title. As he had stated when he asked for leave to introduce the Bill, it had been observed that the language of Act XVIII of 1854 was such as to make that Act inapplicable to railways belonging to the Government, and it was necessary to correct this.

Colonel the Hon'ble R. STRACHEY having applied to His Excellency the President to suspend the Rules for the Conduct of Business,

The President declared the Rules suspended.

Colonel the Hon'ble R. STRACHEY then moved that the Bill be taken into consideration.

The Motion was put and agreed to.

Colonel the Hon'ble R. STRACHEY also moved that the Bill be passed.

The Motion was put and agreed to.

The following Select Committee was named:—

On the Bill to amend Act No. XIX of 1861 *(to provide for a Government Paper Currency)*—The Hon'ble Messrs. Stephen, Gordon Forbes, Cowie, Chapman, Bullen Smith and Cockerell and the Mover.

The Council adjourned to Saturday, the 2nd April 1870.

WHITLEY STOKES,
Secy. to the Council of the Govr. Genl. for making Laws and Regulations.

CALCUTTA,
The 1st April 1870.

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Saturday, the 2nd April 1870.

PRESENT :

His Excellency the Viceroy and Governor General of India, K. P., G. C. S. I. *presiding.*
His Excellency the Commander-in-Chief, K. C. B., G. C. S. I.
Major General the Hon'ble Sir H. M. Durand, C. B., K. C. S. I.
The Hon'ble John Strachey.
The Hon'ble Sir Richard Temple, K. C. S. I.
The Hon'ble J. Fitzjames Stephen, Q. C.
The Hon'ble Gordon S. Forbes.
The Hon'ble D. Cowie.
Colonel the Hon'ble R. Strachey, C. S. I.
The Hon'ble Francis Steuart Chapman.
The Hon'ble J. R. Bullen Smith.
The Hon'ble F. R. Cockerell.

FINANCIAL STATEMENT.

INCOME TAX BILL.

The Hon'ble SIR RICHARD TEMPLE, in moving for leave to introduce a Bill for imposing duties on Income and Profits, said—MY LORD, "I have now to present the Budget for British India for the official year 1870-71, this being the eleventh annual statement presented to the Legislative Council. During my absence from India for six months of the year 1869-70, the finances were administered by my hon'ble colleague Mr. John Strachey, and some of the measures which I shall hereafter have to mention were commenced or carried on by him. The ability and carefulness with which he conducted the administration are too well known to your Lordship and to the Council to require any further commendation from me.

On this, as on former occasions, my statement will be divided into three parts, namely, the actual account for the past year 1868-69; the regular estimate for the year just closed 1869-70: and the budget estimate for the current year 1870-71, now commencing.

Before adverting to the three divisions in the order above named, I must explain certain improvements now made for the first time in the mode of exhibiting the figures.

In the first place I am about to show the account of the working of the State railway, and the account of the Government with the several guaranteed railway companies, in the same manner as all other parts of the public accounts, that is to say, the real receipts will be shown on the receipt side, and the full payments on the expenditure side. Hitherto, as the Council will remember, the plan followed has been a different one. For instead of showing the receipts on one side and the payments on the other, that is treating the account in the gross, we have shown nothing at all on the receipt side, and only the nett payment (after deduction of receipts) on the other side. This has been the meaning of the item which has hitherto appeared in our financial statements, under the designation of guaranteed railway interest, less nett traffic receipts. In my exposition of last year, I furnished a summary of the main facts from which that important item was derived, namely, the gross amount of interest

payable by the State to the shareholders of the guaranteed companies, then the amount recovered by the State from the traffic receipts, and so on. Whether the Council was able to follow me through that explanation, I cannot say. But I felt at the time that it was hardly a satisfactory circumstance that so much had to be said to elucidate an item which ought not to need such elucidation at all, and which ought to be in its nature apparent from the face of the statement. Subsequently this consideration further forced itself upon me. The figures of all other departments are exhibited not in the nett but in the gross. No other heavy payment is shown in diminished proportions by reason of a set-off. If this were to be done generally, then the financial statements would lose half their clearness, and the publicity half its value; and the real nature of the income and expenditure would not be intelligible. Why then should an exception be made in the case of the railway expenditure, which has been for years a large and growing item in the charge side of our financial accounts? There is no good reason whatever for this. On the contrary the public has a clear interest in seeing this part shown in the same way as all other parts of the account. For the payments by Government of interest now approach the sum of 4½ millions sterling annually. How is the rapid accretion of this interest to be appreciated, if it is not shown in the annual statements? On the other hand, the set-off against this is the amount of nett traffic receipts, that is the gross traffic receipts, less working expenses. This also is happily growing fast, and now exceeds 2½ millions sterling. But still it is, and will probably for some time remain, inadequate; in other words it is and will be less than the interest payments. But we hope that this may gradually approach nearer to the balance of the account; and it concerns every one to know how far this desirable approximation is or is not being attained. This depends on the development of railway traffic and the economy of working expenses. Indeed the working expenses now amount to nearly four millions sterling per annum, and constitute virtually a branch of public expenditure in which the public is as nearly concerned as in any other branch. These points are not only fraught with general interest, but also affect the ultimate financial result and the determination of surplus or deficit. I therefore propose to show the two great items each on its proper side of the account. This course too strictly accords with the terms of the contract between the State and the Companies. After providing for the regular payment by Government to the Companies of the five per cent. interest on the capital paid up, the contract goes on to say that "all monies received by or on account of the Railway Company in India * * * shall be paid into the Treasury" of Government; that the "nett receipts after deducting all sums * * * for the current expenses of working the railway" * * * "shall be applied in the first place towards the discharge of the interest payable" by the Government.

In the second place, as the Council will recollect, the practice has been to exhibit the expenditure in India in detail under the main heads or branches, and then to show the expenditure on account of India in England in the lump or aggregate. Nevertheless the expenditure in England was for the most part not divisible under any new or separate heads, but really pertained to the several branches of the administration in India. Still it was not divided nor classified in our financial statements. Its amount is very considerable, being almost 12 millions, or more than 22 per cent. of our total expenditure. Though of course classified for official purposes, it has heretofore remained absolutely unclassified in our financial statements. One consequence has been this, that the expenditure shown separately in our regular financial statements has never represented the full and complete cost of many of our greatest departments, such as Army, Marine, Public Works, Interest, and others. That the arrangement is so far improvable seems to be beyond question. Last year I did present a supplementary statement calculated to meet the want. But this year I have prepared the statement with a combination of the figures derived from India

and from England; so that they now display the full cost of each branch, whencesoever derived and wheresoever incurred. The formal and principal statement being thus comprehensively prepared, supplementary statements are added, showing how much is spent for each head in India and how much in England.

In the third place the water rent paid by the landholders for the water obtained from the State canals, has been transferred from the heading of public works income to the heading of land revenue. The amount is important, being more than £500,000, or half a million. The public works income properly includes only sale proceeds of old stores and other items technically called recoveries, with which canal water rent has of course nothing to do; whereas this water rent is income derived by the State from its measures for improving the land by means of irrigation.

In the fourth place, the item of "allowances to village officers" has been combined with the expenditure relating to land revenue, and is no longer shown in a separate heading; and for it has been substituted a heading "Minor Departments" under which will be shown the charges of the trigonometrical, topographical, and geological surveys, and other Departments not readily assignable to any other existing head.

In the fifth place, from the heading of "Education, Science, and Art," we have eliminated, as just explained, the cost of the Survey Department. The surveys, though scientifically conducted, are executed in but a small degree for purposes of science and almost entirely for fiscal, engineering, and other practical purposes. On the other hand, it is of consequence to all those who are interested in the moral and intellectual progress of India that the true charge for education should be shown on the face of the statement. Heretofore the precise progress of this important item has not been perceptible from the statement; and never could be so, while other and foreign charges were mixed up with it. On this occasion, then, the figures which I exhibit are those for education alone.

In the sixth place, the abstract which the Council will remember having seen on former occasions under the title of "statement of estimated cash balances," has been superseded by an improved cash statement, exhibiting an abstract of the entire financial transactions of British India, and showing in a clearer form how for each year the total disbursements of all kinds are actually met, or, in other words, how the ways and means of each year are provided.

So much then for the improvements in the form of the Statements, and I must ask the Council to remember that by reason of these improvements, the figures I now give will not be comparable in detail with those I gave last year, though the ultimate result will be duly comparable.

After this preface (the length of which will be excused from regard to the importance of the topics), I proceed to the actual account of the past year 1868-69.

The receipts were £51,657,658, or more than 51½ millions sterling. The ordinary expenditure amounted to £54,431,688, or near 54½ millions, causing a deficit of £2,774,030, or 2¾ millions of receipts as compared with ordinary expenditure.

In my last financial exposition I explained that there would be a deficit in that year of income as compared with ordinary expenditure. The deficit was then estimated at £970,471, or 1 million. That estimate was necessarily incomplete, being based on eight months' actuals and four months' estimate; the last four months too constituting the most important and critical part of the year. Still the difference between the estimate and the result is very considerable; and I must, as briefly as possible, recapitulate the reasons.

These reasons have arisen in small part only from shortcomings of receipts on the whole. Exclusive of the railway earnings, the receipts in India indeed were £49,077,007, actual, against £49,288,700, of the regular estimate, the

difference less being £218,458, or ¼th of a million. I attribute this to the fact of the yield of the Malwa or Bombay opium having been over-estimated by us. The amount indeed taken was fair enough as compared with the actuals of the two preceding years; but the last four months of the year proved abnormally unproductive, and these were the months which did not come within the regular estimate.

The difference, then, between the estimated and the actual deficit was caused mainly by excess of expenditure. In the first place an item of £505,922 is brought about by charging in the accounts the liabilities of the Government in respect to the late Military and Medical funds, which existed chiefly for the benefit of the widows of deceased officers. The arrangements made on the transfer of the fund provided that assets should be gradually year by year appropriated by the Government, which was on the other hand to pay all the pensions and allowances. The transfer occurred during 1867-68. It commenced in that year, and came into full operation during the year under consideration, 1868-69. At the outset these pensions disbursed in England by the Secretary of State were not charged in the English expenditure, but were held by the Secretary of State in a suspense account, that is in the account current between England and India, and were so held at the time when my last financial statement was made. But inasmuch as the Secretary of State has ruled that the pensions are to be included in the expenditure in England, and as they now constitute a real charge against the revenues, we have deemed it best to include them (subject to the sanction of the Secretary of State) in the English expenditure once for all; and to finally adjust the account. The amount thus to be charged comes, as above stated, to £717,734, of which two-thirds relate to the year 1868-69, and the rest to the previous year 1867-68. Of this sum, £211,812 had already been provided for, being charged in the Madras accounts. The remainder, or £505,922, has now been added, and the whole charged in the English accounts.

Another cause was an excess of £492,004 on the expenditure on public works ordinary. This arose partly on works emergently undertaken in districts suffering from drought or famine. Owing to certain defects in the control of the Public Works Department, some portions of the grants for extraordinary works were made use of for the ordinary works, and the circumstance was not known to the Department when it rendered its estimate to me at the time of my last financial statement. The occurrence of this excess, and the fact of its not being known in time, undoubtedly indicated, as I have above stated, defects in financial control. Those defects have now been carefully searched out, and remedies are being applied, which will we hope prove effectual for prevention in future. Their efficacy will be tested by experience.

Then there was an excess of £186,346 in the Army expenditure, arising partly from the high prices of provisions in drought-stricken districts, and partly from field operations on the frontier. There was a nett excess expenditure again in the Civil departments, chiefly in Marine, Interest, and Miscellaneous, amounting in all to £350,541.

These several items, together with a few others with which I cannot detain the Council, account for the difference between the estimated deficit of one million and the actual deficit of 2¾ millions.

Besides the ordinary expenditure above alluded to, there was during the year an extraordinary expenditure of £1,370,613, or 1½ millions devoted in nearly equal proportions to irrigation, to Bombay special fund works, and to the purchase of the State Railway in South-Eastern Bengal.

Thus, the past year 1868-69 ends with a deficit of 2¾ millions; and this circumstance suggests the following observation. The Council will remember that in my last financial statement, I put the deficits of the three years 1866-67, 1867-68, and 1868-69, at 4½ millions. This was on the supposition that the deficit of 1868-69 would be one million, whereas it is now seen to be 2¾ millions. Thus the 4½ comes up to 6¼ millions. I then showed that there had been an

expenditure of 3½ millions on new barracks, which had been undertaken partly in the belief that they would not be treated as ordinary works, and would be excluded from the ordinary account. From that point of view the new barracks would have mainly accounted for the deficits. But now this can no longer be said. The deficits being 6¼ millions, of which only 3½ can be accounted for by the barracks, and are susceptible of special justification, it must be admitted that the remainder, 2¾ millions, are due to excess of expenditure accepted as chargeable against current income, and represent deficit pure and simple without such special justification.

So much then, in brief, for the actual account of the year that is passed 1868-69. I now have to advert to the year just expired 1869-70, the figures for which are derived chiefly from actual accounts and partly from estimates.

For 1869-70, then, the receipts are taken at £52,942,482, or 53 millions, which amount exceeds by £699,542, or ¾ of a million, the sum of £52,242,940, or 52¼ millions estimated in my financial statement of March 1869. The Council will remember that these figures will not admit of simple comparison with that statement by reason of the inclusion of the nett railway traffic receipts and of the receipts in England.

This increase of receipts has arisen notwithstanding failure of the customs and the opium to yield the amount estimated in the budget. The customs revenue was taken at £2,773,500; it is now expected to yield only £2,416,500, showing a difference less of £357,000, or about ⅓ of a million. The opium revenue was taken at £8,286,540; it is now expected to yield only £7,953,800, showing a difference less of £332,740, or ⅓ of a million. This falling off of opium revenue has occurred entirely in Bengal, where the price per chest was estimated at Rs. 1,330 or £133, while only an average of Rs. 1,199 or £120 has been realized. In the Madras and Bombay Presidencies, the rate of duty on salt has been raised from Rs. 1-8-0 per maund to Rs. 1-13-0 for the latter half of the year. Had it not been for this additional duty, the deficiency in the salt revenue would have been considerable. On the whole, it may be said that the salt estimate has been just maintained and no more. There have been also other items of deficiencies, which, together with the above two main items, bring up the gross deficiency of regular estimate below budget estimate to £899,222, or nearly one million.

The Council will then ask how, despite of this deficiency, is a nett result of increase on the whole arrived at? Well, it is arrived at as follows. There is an increase of £461,778, or nearly half a million in land revenue. This is caused partly by the adjustment in account of the accumulated proceeds of the sale of waste lands, the Government promissory notes in which these funds were invested having been cancelled, and debt to that extent having been reduced. Also in the Punjab and notably in the Madras Presidency, the collections of the revenue have proved more favorable than was expected. There is an increase of £71,943 in tributes; this arises from the partial capitalization of the political contributions payable by His Highness the Maharaja Holkar. The increase of £151,600 under the head of assessed taxes is entirely produced by the additional one per cent. income tax imposed for the latter half of the year, without which there would have been a deficiency. The yield of the additional duty is estimated at £350,000. There is taken an increase of £448,472 under the head of miscellaneous; this arises chiefly from adjustment of accounts consequent on the arrangements regarding the Police superannuation fund and the transfer to Government of the Bombay Medical fund. The army receipts show an increase of £181,760. These main items, together with some lesser items, bring up the total increase to £1,598,764, or over 1½ million. And thus on the whole the receipts of the year are now taken at an increase over the budget.

On the other hand, the ordinary expenditure in 1869-70 was estimated in the budget at £52,190,290, or nearly 52½ millions; it is now expected

to rise to £53,568,076, or upwards of 53½ millions, showing a difference more of £1,377,786, or 1⅓ million.

This excess has occurred notwithstanding that the expenditure on public works ordinary has been reduced to £5,040,395, instead of £5,834,160 provided in the budget, showing a reduction of £793,765, or ¾ of a million. There have been also various savings, such as £33,938 in the Post Office, £47,673 in the Electric Telegraph, £39,300 in Education, which, together with other items, bring up the total decrease of charges to £1,107,131, or over one million.

Here again the Council will ask, how comes it that, despite these reductions, the total charges and expenditure show an increase on the whole? The answer is that in several departments there have been increases over the budget estimate, some of which I must now explain.

In the two items of interest on public debt and on other accounts, there are increases of £73,516 and £124,925. This has arisen from the proportion of unclaimed dividends having been less than was expected: from the charging to our accounts of certain interest payments on account of the expedition to Abyssinia, which amount we had hoped to recover from Her Majesty's Government: and from the raising in India of a loan of two and a half millions for public works extraordinary. When the budget was framed, we believed it most probable that this public works loan would be raised in England, and during the latter half of the year, in which case instalments of interest would not fall within this year. Subsequently we received the Secretary of State's sanction to raise the amount in India, and we preferred to bring the loan out at an early period: consequently the payment of interest has fallen within this year.

The increase on forests of £35,084 leads to more than corresponding increase of revenue. The same remark applies to the increase of £123,870 in the payments for opium. This arises from the yield of the opium crop being better than was anticipated when my budget was framed, and consequently greater quantities of the drug being brought to the store-houses. Under the contracts with the cultivators, the quantity brought by them must be paid for. Such payments in a fiscal point of view are not indeed to be regretted, as they conduce on the other hand to enhancement of revenue.

The Police charge was estimated at £2,374,290, and has now risen to £2,440,900, showing an increase of £66,610. This difference, which would have been larger but for counteracting economies, has been caused by the delay in carrying out the abolition of the Police superannuation fund. The delay has arisen (notwithstanding this Council having passed the requisite law) from the difficulty of arranging the details with the several local Governments. The excess charge caused by the delay is neutralized by the consequent increase in the assets credited under Miscellaneous.

There is an increase of £381,882 in Marine. This partly arises from our having charged off finally as expenditure the sum of advances on account of the Mutla or Port Canning port fund, which it is prudent to treat as irrecoverable; and from our proposing, after protracted enquiry, to remit a portion of a long outstanding debt due by the Calcutta port fund to the Government. In this heading, too, is included a sum of £45,000 as a contribution by the Government of India towards the cost of the naval force which Her Majesty's Government is to maintain in the East Indian waters. This is a new charge, entered under instructions from the Secretary of State. It was hardly possible to provide for these in the original estimate, as there was no information at that time as to whether these charges would accrue at all, or in what year they would fall.

The increase of £448,728 in miscellaneous is mainly due to difference between the actual and the estimate of the loss by exchange on Secretary of State's bills and to the charge for the freight of stores from England. The charges of the Political department have increased by £152,290. This increase arises from

the payments and presents made to the Ameer of Cabul, which were inadvertently omitted from the estimate.

The increase of £303,972 in superannuation allowances arises from the adjusting of the accounts of the Military Fund already explained. When the budget was framed, the amount of these pensions (£396,292) was entered by the Secretary of State in his remittance account, and not (except the Madras portion (£120,000), which was entered in the estimates in India) included in the charges. But we have deemed it necessary (subject to the sanction of the Secretary of State) to take the remainder, £276,792, out of the English remittance account, and to charge the whole in the regular expenditure in England.

There is an increase of £122,831 in the army charges, of which £292,831 accrued in England for stores, furlough allowances, and pensions, and the rest in India, from the high prices of food and a variety of lesser causes which it would be tedious to detail.

These items, together with some others, for which I need not stop, bring up the total increase to £2,484,917, or 2½ millions.

I have now stated the causes of all the variations in estimate on both sides of the account. That the amount of these variations should be so large is matter for regret. One main cause is traceable to the difficulty of adjusting the accounts under a necessarily complex system dealing with a great variety of interests. And if it be difficult to adjust these accounts with certainty, how much more difficult is it to estimate beforehand what form the adjustment will ultimately take, and what its precise result will be. This year special efforts have been made to clear off all old accounts and to have the books as unencumbered as possible for future years. The subject has my unceasing attention.

The items of expenditure as above specified are taken from the combined figures, Indian and English. It may be interesting however to the Council to note exactly what has been the increase on the English figures taken separately under the old heading of "nett expenditure in England including stores." The amount then for this total set down in the budget, as taken from the Secretary of State's estimate, stood at £10,996,950, it is now expected to stand at £11,868,869, showing an increase of £872,119. This has arisen partly as already explained from the Military Fund payments (£396,292) not having been included in the estimates of charge, partly from the cost of stores for the different departments in India, and partly from the increased allowances payable under the new rules to civil and military officers.

This particular part of the expenditure is, as the Council knows, under the control of the Secretary of State, and so far no remark is required from me. I should say however that as regards the "stores," the Secretary of State only acts on behalf of the Government of India, like an agent, if the expression may be allowed. The stores are ordered by the India Office in London on indents received from the Government of India; and the Secretary of State's estimate is framed in reference to those indents. It sometimes happens that emergent indents are sent home from India within the year, and these must, *pro tanto*, disturb the estimate, and for that much of disturbance the Government of India is solely answerable. Such has been the case this year in reference to a portion of the stores. I must add that heretofore the financial control in India over the indents sent hence for stores from England has been defective, and measures are being adopted to render it more efficient in future.

Thus much on the details of the receipts and expenditure. In the budget it was estimated that there would be an equilibrium with a small surplus of £52,000. But the receipts being now expected to stand at £52,942,482, or nearly 53 millions, and the expenditure at £53,568,076, or more than 53½ millions, there is anticipated a deficit of £625,594, or more than ½ a million, of receipts below ordinary expenditure.

Besides the above ordinary expenditure, there has been an expenditure extraordinary of £2,616,743, or upwards of 2½ millions, on reproductive public works during the year, such as irrigation, State railways, and on Bombay special fund works.

Instead of an estimated equilibrium, then, the year has ended with a deficit of a considerable amount. In some respects, the adjustment of accounts has improved the figures on the receipt side; while in some respects it has made the figures worse on the expenditure side. If there are windfalls on the one side, there are unexpected drawbacks on the other. Also some share in the responsibility rests with the home authorities. But after allowing for all these considerations, I must fully acknowledge a deficit, for which we are clearly responsible, and regarding which I desire to offer the following observations.

As already seen, we suffered a heavy disappointment in respect to our estimate of the opium revenue on the Bengal side. This arose from a fall in the market price, which fall again is believed to have been caused mainly by the extension of opium cultivation in China itself. We were indeed aware that such cultivation was being in some degree extended, but there was no information at that time to lead to the apprehension that this extension would spread so much as it now appears to be spreading. The further information since obtained of the extension, was not then available. For two years and more previous to the framing of the estimate, the prices had ranged at very high rates which indeed were well sustained up to the eve of the budget being produced. There was no known fact to warrant the rate being taken lower than what was then actually ruling. Still on general and prudential considerations, we took the price at an average of the realizations of the past three years, which brought out a rate less by Rs. 50 or £5 a chest less than what we were then receiving. This estimate has indeed partially failed by reason of events in the interior of a remote, half civilized, and comparatively unknown country like China, the nature of which circumstances is even now but vaguely ascertainable by us.

Then the Customs duties have fallen not only below the budget estimate, but also below the actual realizations of the two preceding years. There has been, as the Council knows, a depression of trade not only in India but in many other countries; and this has mainly caused the falling off in our Customs. But when the budget was produced, there was not a single fact to indicate that such a depression was about to set in. Up to that date the Customs revenue had been increasing yearly for several years; that very year they both increased as was proved by the latest statistics and fiscal returns. The authoritative commercial reports up to date, though noticing fluctuations, and not in all respects sanguine, were yet on the whole favorable and hopeful. There had indeed been drought in some parts of India, but that had not up to date affected trade or Customs, and the prospects of the season had recently improved. There had also been some modifications in the valuations of the tariff in favor of the merchants, but this was allowed for in the estimate.

From the several financial statements made in this Chamber, the Council knows how constant has been the increase in the State income of India. However, not even that normal increase was estimated for. The revenue was estimated at just the sum which had been received in the preceding year, and no more. A slight increase only was taken on account of additional taxation. Does not this look *primâ facie* as if the estimate was moderate?

These causes (which were, as I contend, misfortunes hardly to be foreseen), together with lesser circumstances with which I need not now trouble the Council, threatened the Government of India with the prospect of a serious deficit. How has this prospect been met? Why, by increasing resources, that is by additional income tax, and additional salt duty on the one hand, and by reducing public works ordinary expenditure on the other. Moreover there have been numerous savings and retrenchments carried out in all the provinces of India (for which the general finance is much indebted to the cordial exertions of the several local Governments), which it would be tedious to specify, but of which the total effect is estimated at £200,000. The condition of the year's finance

has been bettered by the above measures to the extent of £530,000 on the receipt side and £993,765 on the expenditure side, the total improvement being represented by £1,523,765, or 1½ million.

When introducing into this Council in November last the Bills for extra taxation, I stated that every "effort would be made to destroy the remaining deficit, to run it hard, to break its back so to speak." This promise related of course to receipts and expenditure in India. The figures show that it is in a fair way of being fulfilled.

These last figures, however, are not altogether actuals, but belong to the regular estimate. In India these regular estimates have sometimes been so far falsified by results as to have acquired an ominous significance. On previous occasions the practice has been to frame these regular estimates on eight months' actuals and four months' estimates. In some respects the actuals did not extend to eight months, but only to seven or even to six. This method left a large margin for uncertainty, for the four months of estimate were, as I have explained once to-day, about the four most important in the year, and the very ones when the financial transactions were the largest. The regular estimate which I now present, however, ought to be of a better kind, for it is based on eleven months' actuals for nearly all the receipts and for all civil expenditure in India and ten months for army, marine, and public works; leaving only one month, or in some cases two months, for estimate, which estimate is based again on the actuals of the last months of former years. But even for the last month we have obtained actual data for some important branches on the receipt side especially.

Another cause of the uncertainty in the regular estimates has been the adjustment of many items in the twelfth month. And this cause may perhaps to some extent operate to throw out parts even of the regular estimate I now present. We have striven to ensure these adjustments being made more and more regularly month by month; so that the pressure may cease to be thrown on the close of the year.

Still after allowance shall have been made for all that can fairly be said in defence of our estimates and accounts,—the recurrence of deficits in time of peace, and the discrepancies between estimates and results which have so frequently happened, do compel us to search for and remedy whatever defects there may be in our system. Despite the many improvements that have been effected, the result proves that some defects must still remain. Two main defects I have above indicated—one of which was vital certainly. They have been, as we hope for the most part, remedied. We shall strive to make the remedy more and more complete after each year's experience.

Over and above these, however, there doubtless are lesser defects. Addressing this Council in November last, I said "we must examine more thoroughly than heretofore the monthly statements of actual receipts * * * we have such an examination now; but we must have it more strictly in future; we must check our financial conclusions more immediately by actuals up to the latest day; we must base our estimates more strictly on the actual results up to date, and less on general conclusions."

I need hardly add that we are acting and shall act more and more closely on these views.

Having thus dealt with the years 1868-69 and 1869-70, I arrive at the third and most important part of my exposition, namely, the budget estimate for 1870-71.

The receipts are taken at £52,327,755, or 52⅓ millions, to be compared with the £52,942,482, or 53 millions estimate for the year just closing, 1869-70.

The land revenue estimate is an aggregate of the estimates received from the local Governments, which have not been materially departed from in any case. There is a decrease of £515,646 as compared with the previous

year, of which the return was swollen by the inclusion of the waste land receipts and the collection of some arrears. The effects of the drought of 1868-69 have been felt throughout 1869-70. The stocks of grain in some parts of the country are believed to have become exhausted. The rains of last season, though somewhat delayed, were ultimately abundant. In many provinces the harvests have been good. In some districts, however, there are still fears. On the whole, the advent of the ensuing rains must be looked for with some anxiety.

The decrease of £28,070 under tributes arises from the capitalization of the Holkar tributes in 1869-70 already alluded to.

The forest revenue shows a continued increase, more than balanced, however, by increased cost on the expenditure side.

Under excise we venture to expect a small increase of £39,300.

The item of assessed taxes I shall reserve for further mention hereafter.

For the Customs we have only taken £2,416,500, being the same amount as that which we have received in the year just expired, during which so much commercial depression has prevailed. That the present yield should not be greater than it is, must be regarded as an unfavorable indication respecting the condition of the people of India. In some places the inhabitants are impoverished by the late drought, or are still apprehensive about their crops; and are unwilling to buy European cloths or other things comparatively luxuries, until they are sure of their food; all which circumstances cause the up-country markets to continue slack. Still in most parts of India the people are advancing in prosperity as much as ever; and regard being had to this consideration, a revival of trade might be hoped for. Again, there have been fluctuations in the trade: January, a very important month, turned out badly; but February was better. March, the month just over, has been a little more favorable. On the other hand, the reports issued by the Calcutta Chamber of Commerce have been and still are unfavorable, and the opening of the Suez Canal has caused some forestalment of imports, and consequently of duty. I trust that things will not become worse than they are, and that we shall receive at least as much in the year 1870-71 as we have received in 1869-70, but I know no fact which would justify me in raising the estimate.

We have carefully considered the expediency of reducing or remitting the export duty on rice exported from India and from Burma. This branch of trade was for some months much depressed, but has of late shown signs of improvement. The depression, however, arose, as we believe, from other causes besides the duties. The prices of produce are rising rather than falling. The demands in China and Japan seem likely to become more brisk; indeed, scarcity is understood to prevail in some parts of Japan. Though fully sensible of the objections which can be urged against these duties, yet looking to the circumstances of the case and to the financial exigencies of the time, we have decided not to propose any change in the duties at present.

We propose to remit the export duty on shawls and on a few insignificant articles; and on the other hand to include some others in the tariff, and to levy the duty on galvanized iron *ad valorem*. These modifications are not expected to cause any loss of revenue. The shawl duties have operated as virtually transit dues on the shawls from Cashmere, and as regards the British Indian shawls, it is well that they should not be weighted in their competition with the shawls of other countries.

In my last statement I alluded to the progressive increase in the foreign trade of British India, and I stated that the sum total of value had risen from 95 millions in 1866-67 to 101 millions in 1867-68. Since then the ascertained trade of 1868-69 has amounted to 106 millions in value. But after some years of satisfactory progression, the year 1869-70 is almost certain to prove one of retrogression. We now possess the complete returns for nine

months of that year, and they show a decrease of 8 per cent. in value and 5 per cent. in quantity as compared with the corresponding period of the preceding year. That the comparison as regards value should be less favorable than that as regards quantity is accounted for by the fact that there has been a reduction of the valuations by tariff. Still there is a falling off of 5 per cent. on the whole; and this is specially perceptible in some important staples of import, such as piece goods and metals, and of exports, such as cotton, rice and indigo. One important item of export, namely jute (fibres) has kept its place as well as ever. The cotton export of 1868-69 amounted to 700,000,000 lbs., or $1\frac{3}{4}$ millions of bales; but the quantity for 1869-70 will prove considerably less. In 1868-69 there were $11\frac{1}{2}$ millions of lbs. of tea exported; the quantity for 1869-70 seems likely to prove as great. In 1868-69 there were 48 millions of lbs. of coffee exported; the quantity for 1869-70 will certainly prove less. The causes of the depression of trade must doubtless be sought for in other countries besides India. But they have been aggravated by the drought and distress which have prevailed in some parts of India itself.

The salt revenue has been taken at £6,177,370, an amount considerably over that of the previous year, chiefly because the increased duty in Madras and Bombay (5 annas per maund) is to operate for the whole of 1870-71, whereas it operated for only half of 1869-70.

For the opium revenue we have taken £6,922,281, of which £4,905,281 pertain to Bengal and £2,017,000 to Bombay. The Bengal estimate has been taken at Rs. 975 or £97-10 per chest on 49,000 chests. For the first three quarters of the year, the provision is, with the exception of a small deficiency of 1,104 chests, actually in store. For the last quarter, from the information given by the Local Government, we trust that the number of chests is tolerably certain. To provide it we ought to sell 52,000 chests in 1871, a supply which we hope to be in a position to bring forward, but which is certainly not likely to be much exceeded. The real doubt is as to the price per chest, the calculation of which solely depends on forecast. The price, as the Council know, averaged Rs. 1,379, or £137-18 per chest in 1868-69. In 1869-70 it has averaged Rs. 1,199 or £119-18. It has fallen with an unfortunate regularity from Rs. 1,324 or £132-8, at the beginning of the year, to Rs. 1,093 or £109-6 at the close. So far as we can judge from China advices and from local prices, the tendency is downwards. The Government of India possesses now a mass of information, which, though not always clear, does in the main show that the cultivation of the drug is increasing, and is likely to increase further, in China itself. So far as opinion goes, nearly all authorities believe that the opium trade of India with China will be subjected to a degree of competition not heretofore experienced. Taking all these things together, I anticipate the possibility of a further fall in prices, and have considered the rates to which prices have fallen within recent experience. They have gone as low as Rs. 900 and 850 a chest. Though hoping that they will not again fall so low, yet I consider that no estimate of a higher average than Rs. 975 or £97-10 a chest would be safe; and a reasonably safe estimate we must have. So also with the Malwa opium, having regard to the manifold fluctuations of the Bombay market from year to year, even from month to month; and to the probability of its sympathizing with any fall on the Bengal side, I do not consider that any estimate much over 2 millions would be safe. We are indeed receiving $2\frac{1}{3}$ millions (£2,357,000) for the year just closed, which quite fulfils the estimate. But then we only received £1,800,000 in the preceding year, when circumstances were more favorable than this. The estimate of the current year, though realized at last, has been a constant source of anxiety. The present crop is reported to have been seriously injured by unfavorable weather. Judging by all known circumstances, I should fear that a falling off may shortly be looked for. So recently as November last, we were confidently assured by the authorities at Indore that we should not realize even two millions in the year just closed.

On the whole, it will be seen that our opium estimate stands at £6,922,281, or $6\frac{3}{4}$ millions, being less by £1,031,159, or one million, than the receipts of the previous year; while our expenditure is expected to rise by £164,910, making a total deterioration under this head of £1,196,069.

It will be observed that a decrease of £1,604,600, or $1\frac{1}{2}$ millions under stamps, is balanced by an increase of £1,692,700 under law and justice. This represents the transfer of the receipts of judicial stamps (now levied under the new Court Fees Act) from the one head to the other.

The large decrease of £677,298, or $\frac{2}{3}$ million under the head of miscellaneous, arises from the fact of there having been extraordinary receipts, commonly known as "windfalls," in 1869-70 which are not expected to recur.

The railway receipts net are taken at £3,125,258 at an increase of £211,084 over the year just passed, that is £6,795,058 gross earnings less £3,669,800 working expenses, the traffic being represented by seven millions of tons and fifteen millions passenger journeys; and all this on 4,840 miles of open line. These are high figures: if realized, they will indicate a satisfactory progress of railway traffic; they are rendered by the Public Works Department. Seeing that some 600 miles of new line are to be opened in the year, increase of traffic may be looked for; but then there will be increase of working expenses. On the whole, this item must be regarded as necessarily uncertain, as being dependent on traffic the growth of which we cannot exactly foresee.

I now turn to the expenditure side, and shall notice together firstly the items of the increase; and, secondly, the items of decrease.

There is an increase of £270,032 in interest. This increase is due to our having to pay a full year's interest on the loans of 1869-70, on which only half a year's interest fell to be paid in that year; to a large amount of interest properly pertaining to 1869-70 being thrown forward to 1870-71, owing to the late arrival of the last English mail, and to a new loan to be raised this year, the particulars of which I shall explain presently.

There is an increase of £117,606 for forests, which is almost met by the corresponding increase of revenue. Also there is, as already stated, an increase of £164,910 in opium, owing to extension of cultivation, and of £27,944 in excise for the purchase of opium for home consumption: these items also tend directly to increase of revenue. Similar remarks apply to the increase of £103,299 in salt, attributable chiefly to the arrangements for the manufacture of alimentary salt at the Sambhur lake in Rajpootana and in various parts of North-West Provinces and of Oude, all which measures are connected with fiscal improvement.

The increase of £178,698 in law and justice is due chiefly to the transfer of discount from stamps, the revenue from which is now to be credited as law and justice receipts, and to the charges for the service of processes, which with the corresponding receipts are now entered in the imperial accounts.

The increase of £66,498 in education will not be regretted.

The increase, £126,681, in superannuation allowances is due to the reductions in the police (which involve gratuity payments) and to the anticipated operation of the rule for the compulsory retirement of public servants at the age of 55 years.

There are small increases under several civil departments, such as land revenue, ecclesiastical, medical services. These are inevitable, as they are brought about by the progressive scale of salaries so frequently allowed of late. In recent years it has been thought more economical to sanction gradual progress towards a maximum than to allow the maximum at once. Of course, this practice, however good in itself, does at first cause the expenditure to rise slightly from one year to another. The increase in law and justice arises partly from a transfer of charge from the head of stamps, which department shows a corresponding decrease.

An increase will be observed of £56,181 for the Electric Telegraph department, not counterbalanced by any increase of receipts from this source. This arises chiefly from stores not having been sent out from England during the current year, so that an extra supply must be paid for in 1870-71.

The increase of £275,268 in railway charges relates chiefly to interest, and is due to more capital being raised in England for the prosecution of the works.

The increases of all kinds amount to £1,496,219 or 1½ million, apparently a large sum. But the above analysis shows that £678,964, the aggregate of the increase under forests, excise, assessed taxes, salt, opium, and railways, is absolutely necessary to be laid out in order to bring in a more than corresponding return of revenue. Again, £452,894, the aggregate of the increase, under interest, telegraph, and superannuation allowances, is inevitable, and under existing rules is not preventible by any action we could take. Thus the sum of £1,131,858, or nearly three-fourths of the total increase, is demonstrably indispensable. To this category the increase for education forms, of course, a special exception.

On the other hand, among the decreases of expenditure, there is the item of £129,633 under interest on service and other accounts; this arises from cessation of payments on the Police Superannuation and Medical funds and to the Presidency Banks for temporary advances.

There is a decrease of £120,936 in the Police department, of which however, a part is owing to the reduction of pay from gross to nett upon the abolition of the Superannuation fund, the rest being due to reduction of establishments. The decrease of £481,009 in the Marine department is mainly owing to the large adjustment in 1869-70 of irrecoverable advances. Here also is included a sum of £70,000 as the contribution of the Government of India towards the maintenance of naval squadron to be kept up by the Admiralty in the Indian seas as already explained.

In the army charges, there is an important reduction of £731,551, or ¾ million: the total being lowered from £16,476,892 to £15,745,341; this is partly nominal, the expenditure in England in 1869-70 having been, in some respects, abnormal. But about two-thirds are real, brought about chiefly by the reductions in the general staff in India, and in the European cavalry and infantry, as sanctioned by Her Majesty's Government after some correspondence with the Government of India. We have been only able to take a very small decrease on account of the reductions in the artillery and the native army, regarding which the recommendations of the Government of India are under the consideration of Her Majesty's Government in England. After setting off the diminished recoveries which we expect, the net estimated saving in the army is £554,016, or ½ a million, the net expenditure for the army being estimated at £15,009,116, or just 15 millions, a lower sum than has been paid in any year since 1863-64.

The grant for public works ordinary exhibits a reduction of £1,041,995, or more than a million; the amount for 1870-71 being £3,998,400 against £5,040,395 in 1869-70 and £5,834,160 in 1868-69. Thus in the course of a year, we have lowered our grant by £1,835,760 or more than 1¾ millions, or 31½ per cent. on a total of about six millions. The necessity for such reduction, which must of course retard the completion of many useful works, is much to be regretted. But financial exigency is imperative.

I should add that out of the above grant of four millions, £658,955 or more than ½ million represents the expenditure on the new barracks for the European troops.

The total of these decreases amounts to £2,883,669, or nearly 3 millions. This for the most represents real reductions of establishment or of works; and y it may be measured, to some extent, the efforts made by the Government of India to meet the financial exigency of the time.

The Council—remembering that retrenchments made on paper have sometimes failed to be carried out, and that reductions in estimate are sometimes found to be not realized in actual accounts—may ask me how I can affirm that the above large amount of reduction will really be effected? To this I should answer that the largest part of the reduction, that relating to public works, is so far certain in that the disbursements depend solely upon the grants. No more than what has been granted will be disbursed, and the orders in detail regarding the grants have been sent already to the several Local Governments. So with the army reductions; those which I have allowed for have actually been sanctioned by the Secretary of State, and the orders have gone to the proper authorities: some have even been carried out,—for instance two cavalry regiments have actually embarked for England. Some further reductions are almost certain, but we have ventured to allow for them only the sum of £70,000. So with the interest reduction, the charges in question have actually ceased. Again, as regards the police reduction, a part of it is quite certain, nothing more being needed than orders to the audit department; and to the rest of that reduction the Local Governments have actually signified their agreement.

The increases being balanced against decreases, the result is an expenditure of £52,164,315, or 52⅕ millions, against £53,568,076, or more than 53½ millions of the preceding year, with a net reduction of £1,403,761, or nearly 1½ million of expenditure.

In framing the estimate I have not forgotten that there are certain pecuniary claims on the part of His Highness the Náwab Názim of Bengal, still pending. I cannot at all foresee whether they will be found sustainable. We have decided that we are not justified in making any budget provision in this year on this account.

After this analysis of the receipts and expenditure of the current year now commencing, I must ask the Council to revert to the heading of assessed taxes which I reserved for separate consideration. We have taken for this the sum of £2,180,000 or nearly 2½ millions sterling. The additional rate of one per cent., levied by Act XXIII of 1869, in order to bring the one per cent., rate up to 2 per cent., expired on the 31st of March. As the law stands then at this moment, the one per cent., is all that is leviable. According to the experience of the year just over, 1869-70, the yield of one per cent., would amount to £700,000. Now, if we were to take that amount only instead of the £2,180,000 now taken, there would be a difference less of receipts to the extent of £1,480,000, or 1½ million, and this difference would cause a deficit on income below ordinary expenditure of £1,316,560, or 1⅓ million. As the Council so well knows, we could not at this time appear before the public with a deficit in our budget. At least we could not adopt such an alternative, while any legitimate or reasonable resource remained to us.

My exposition of the estimate of the receipts will have proved to the Council that the revenues generally are flourishing, though not quite so prosperous as they sometimes are. But in one important item, opium, there is a serious falling off, mainly owing to events and circumstances in China.

I have shown to-day what large reductions of expenditure have been effected, always with hard effort, and sometimes with much sacrifice. Then I have shown how inevitable are most of the increases of expenditure. Still after reckoning the sum of these as a set-off, the net result is a decrease on the whole of nearly 1½ million (£1,403,761) of expenditure. I by no means intend to imply that reduction has reached its final limits; we shall continue to strive for further reduction more and more. But it is impossible to say at what time or on what date additional reductions may take effect. Indeed the incessant demands made on the treasury for countless objects of reform and improvement are too well known to the Council to require recapitulation here. Meanwhile we must take the receipts and expenditure as they are expected to

stand. And with a deficit of 1⅛ million distinctly apparent, some recourse to additional taxation, some resort to means of enhancing income, becomes altogether unavoidable. Considering the actual deficits which have occurred in past years, and the circumstance that the year just over is expected to close with a substantial deficit, instead of the equilibrium that was expected, and this too despite all the exertions that have been put forth, we regard it as essential to the due administration of the finances and to the maintaining of the financial credit of the country, that yet further exertions should be made. Moreover, this is, if possible, even more needful than ever, since, as shown in my last financial statement, the public credit is to be pledged for the construction of extraordinary public works of a character remunerative to the State and beneficial to the people.

We are, therefore, compelled to propose, however reluctantly, to raise the income tax to 6 pies in the rupee or 3⅛ per cent., and to apply to this Council to vote us the power of thus covering, by additional taxation, the deficit which must otherwise be presented.

As explained in my last financial statement, there are great difficulties in immediately adding to our resources by any other means than direct taxation. If then the revenues are to be immediately enhanced, this can only be effected by the help of the income tax.

Such then is the proposal which I have, on behalf of the Government of India, to make to this Council, together with a request for leave to introduce a Bill for the imposition of an income tax, at the rate of six pies in the rupee.

I need not repeat the arguments used in my last financial statement regarding the imposition of an income tax in India. It is with regret and reluctance that we bend to the necessity of raising the rate from 1 to 3⅛ per cent. within so brief a period. But the recurrence of deficit at this time cannot otherwise be prevented.

I have stated the rate at 3⅛ per cent. In England, as the Council knows, there is no percentage rate adopted for this purpose; the duty being levied at so many pence in the pound sterling. We have determined to adopt, as in England, a poundage in place of a percentage rate. Following that principle, I have to propose that the duty be for the future taken at so many pies in the rupee: two pies would be assumed as the approximate equivalent of one per cent., four pies of two per cent., and so on. I should add that this mode of rating the duty will be somewhat (though very slightly) in favor of the revenue.

But if the rate is to be thus raised, then the principle of rough assessment by classes in the schedule which regulates the existing tax, can no longer be adhered to. A system which may have worked sufficiently well while the rate of duty was low (that is, one per cent.) will no longer work satisfactorily when the rate becomes higher. When people come to be assessed to 6 pies in the rupee income tax, they will assuredly demand a more precise mode of assessment than that which now prevails. The tax-payer will require that the assessment be made upon some fair estimate of his particular income, and will not be content to be assessed upon an average derived from the maximum and minimum incomes of a class. Now, if anything like an assessment on estimated income of each individual tax-payer is to be attempted, returns of income must be called for from the tax-payers. Or even if with the lower classes of income the Collector may be able to dispense with the returns, he must clearly have the power of calling for such returns in all cases of more considerable income, and with the higher classes of income he should be obliged to call for such returns. The new Bill, then, which I have to lay on the table provides for the assimilation of the procedure to the more regular methods of assessing income tax: care having been taken to render it as simple and easy as possible, consistently with the important object in

view. If the Council shall grant me leave to introduce the Bill, I shall have further opportunity of explaining its provisions.

Having thus explained the principle of the tax, I must advert to the method by which the estimate of its probable yield has been framed. As the Council will have observed, the amount is taken at £2,180,000, of which £2,100,000 is assumed at the known rate of £700,000 for each one per cent., and £80,000 for the gain by the substitution of 6 pies in the rupee for three per cent. I say known rate, inasmuch as the regular estimate of the one and a half per cent., income tax of 1869-70, based on data of eleven months' actuals, gives £1,051,600, which again gives £700,000 for one per cent. This seems a sure foundation to proceed upon, especially as it is known that in 1869-70 the tax was exposed to disadvantages which will not recur. Some portions of the tax collected in the first month had to be credited to the preceding year; the extra one per cent., imposed in the middle of the year, could not be fully realized at first; some arrears are indeed known to be outstanding. This consideration justifies our expecting more than £700,000 for one per cent., and our assuming £700,000 for each one per cent.; though otherwise it might be apprehended that each ascending step in the percentage would yield somewhat less and less. The estimates of the local Governments embodying what they intend to demand and collect, framed for a 1⅛ per cent. tax, amount in the aggregate to £1,103,740, which at three per cent., would yield £2,287,480, which is more than what we have ventured to take. Then we have compared the yield of the first income tax of 1860. The only year in which that tax was fully collected was 1861-62, when it produced £2,054,696, or just over two millions at four per cent., on incomes down to Rs. 500 (£50) and at two per cent., on incomes between Rs. 500 and Rs. 200 (£20). What portion of this belonged to the division between Rs. 500 and 200, I cannot state; but it must have been small. On the whole it may be said that we now expect to get from a three per cent. tax rather more than what we got from a four per cent. tax ten years ago, showing an expected improvement of 25 per cent., and more. This seems a reasonable expectation, when it is considered not only that the income of the country has greatly increased within the ten years, but also that our administration of these kinds of taxes has improved. As a proof of the improved administration, I may observe that in 1864-65 there was a three per cent. income tax like the one now proposed. It yielded £1,300,000, which gave £433,000 for each one per cent. But then the assessments made at the outset had been continued without alteration from year to year, and the administration was less strict than it now is; though it is still far from being as strict as it might be. But we have seen that in 1869-70 one per cent. yields £700,000 for one per cent., showing an improvement of 61·7 per cent. over 1864-65.

As to the duration of the new income tax, I can make no promise whatever. It is our earnest hope that the tax may not last beyond the current year 1870-71, at its present rate. But the realization of any such hope must be entirely dependent on circumstances.

Such then is the budget for 1870-71, the estimate of receipts amounting to £52,327,755 or 52⅛ millions, and of ordinary expenditure to £52,164,315 or 52¼ millions, leaving a small surplus of £163,440, a balance which hardly amounts to more than an equilibrium. We bear in mind that the above estimated surplus is very small; smaller than we should wish it to be; smaller indeed than it ought to be. But then what difficulties, what sacrifices we have had to undergo, in order to make it even the little that it is! The Secretary of State has enjoined us to provide a substantial surplus if we possibly can. His Grace, commenting on my last financial statement, wrote thus:—"In previous financial despatches to the Government of India, it has been stated that your estimates should be so framed as to show a probable surplus of from half a million to a million sterling; in that opinion I concur* * * I have already called your attention to army charges* * * and I shall hope to find that you have been able to effect reduction of expenditure also in some other branches of adminis-

tration. Unless this can be done, it is clear that it will be necessary to devise some means of increasing the annual income, or otherwise a failure in the full estimated receipt from opium, the loss of any portion of revenue from unfavorable seasons, or any extraordinary military charges, would certainly convert the estimated surplus into a large deficit."

My exposition to-day will have shown how hard we have striven to act up to these instructions. We have reduced the army charges and other expenditure. We have devised means of increasing the annual income. But we have not yet been able to provide a surplus of half a million in the estimate. To effect this, we must have proposed a greater reduction of expenditure than what we can surely reckon on effecting within the year; or else we must have proposed additional taxation even beyond the proposals I am announcing to-day; and the difficulty of doing this is manifest. But though we are unable to provide the surplus to-day, the necessity of such provision within the earliest practicable time is constantly present to our consideration. Until this is fully effectually provided, I shall not be able to affirm that our finance is in a satisfactory condition. As yet I can only express my hope that it will be found to be improving.

Besides the ordinary expenditure, we are prepared for an expenditure of £3,062,300, or over 3 millions, on public works extraordinary, to be provided for by loan, of which £1,732,500 or $1\frac{3}{4}$ millions are for irrigation works, and £1,229,800 or $1\frac{1}{4}$ millions for State railways. The irrigation works relate to projects in Bengal, in Madras, in Bombay, in the North-West Provinces, in the Punjab, in Oude, and in the Central Provinces.

The principle of constructing some portion of the railways in India by direct State agency instead of through companies, has been further affirmed during the year by the Secretary of State. The lines on which the above expenditure is to be incurred, are the Lahore and Peshawur Railway, the railway between Delhi and Jyepore passing through the salt-producing districts of Rajpootana. Within the year it has been decided that the Bombay special funds works shall no longer be classed as extraordinary, but shall be included in the category of ordinary works: they are, therefore, not included in the above description. I may here note that the purchase of the property of the Elphinstone Land Company will not form any charge to the State.

I may here add that negotiations are in progress with the Maharaja Holkar, whereby His Highness will provide funds at $4\frac{1}{2}$ per cent. interest for the construction of a railway from Malwa to join the trunk line of the Great Indian Peninsula Railway.

A desire has been often expressed that an audited account should be promulgated annually of the sums raised for, and spent on, public works extraordinary. Such an account is now being prepared, and is to be kept up from year to year. We have decided to commence the account from 1869-70, being the year when the classes of works to be reckoned as extraordinary were for the first time defined, and when the raising and the expending of money for those purposes were regulated on that principle.

I have now to advert to the loan arrangements of the year 1870-71.

It will be recollected that in my last financial statement I announced a series of loans aggregating five millions, of which one million consisted of renewal of old debt, $3\frac{1}{2}$ millions of loans for public works extraordinary, and $\frac{1}{2}$ a million to recoup the cash balances for advances made to municipalities. The renewal of one million has been effected within the just expired year. Of the $3\frac{1}{2}$ millions for public works extraordinary, 2 were to be raised in India and $1\frac{1}{2}$ in England. The $\frac{1}{2}$ million has been raised in England, instead of being raised, as was first intended, in India.

In my last financial statement, however, I mentioned that the cash balances are not even yet restored to their due proportions, and I added that "if, as

the year proceeds, the accounts shall be unfavorable, some additional temporary resource will have to be provided." Within the year, the Government of India has accepted an offer of the Maharaja of Puttiala to invest £400,000 in our public securities. This having now been treated as permanent debt, we have decided to consider it as having been raised for public works extraordinary.

This sum, added to the sums raised on account of the three millions and a half loan which were slightly in excess of that amount, brings up the total to upwards of four millions.

Out of the four millions raised as above for public works extraordinary, and held at the credit of this branch of the public works department, £2,616,743, or more than $2\frac{1}{2}$ millions, are being spent in the year, leaving £1,383,257, or, nearly $1\frac{1}{3}$ million, balance in hand due by the loan department to the public works, and to be carried on to credit in the State account of the works.

So much for the year 1869-70; then for the year 1870-71, the proposed arrangement is as follows.

As I have already explained to-day, the proposed expenditure during the year on public works extraordinary amounts to £3,062,300, or just three millions to be provided for by loan.

The Secretary of State has intimated his intention of raising two millions in England, leaving us to borrow in India such sums as may be found necessary to carry on the works on the scale intended. But, considering that we have as shown above, a balance in hand of loan money to the sum of $1\frac{1}{3}$ millions from 1869-70, we are unwilling to borrow if we can help it. And in the present state of our cash balances, there is no apparent necessity for bringing out any loan in India at all. It is not then our intention to raise any funds by loan until the autumn at least. By that time, the prospects of the year will be more clear, and our position in respect to ways and means can be reviewed, and a further decision as to the necessity or otherwise of raising any loan can be arrived at. But it is our hope (as at present informed) to conduct the finance of the year without further loan.

I should here add that in December last, we decided that the holders of the 5 per cent. public works loan of 1855, amounting to two millions, which fell due for repayment on the 31st March, should have the option of either receiving payment in cash, or of accepting fresh stock of the four and a half per cent. loan. The returns are not quite made up, but about $\frac{7}{8}$ of the stock has been or is being tendered for conversion; so that it may be said that our terms have been generally accepted. This indeed is only what might have been anticipated, inasmuch as for some time past the $4\frac{1}{2}$ per cent. stock has been quoted at or above 2 per cent. premium.

Such being the provision made for the ways and means of the year, I have to explain the returns of the cash balances. In my statement of last year I explained what a variety of large items, over and above the revenues and expenditure proper of the Government, contributes to make up this great account. It has been found, however, that the old form of statement was in some respects obscure, and an improved form has been devised, as the Council will see, according to which the figures are exhibited for the years 1868-69, 1869-70 and 1870-71. As the returns received from England often affect those obtained in India, both categories have been combined in this statement. I shall just glance at the main features of the statement for 1870-71, so as to make the technical designations intelligible. The headings of ordinary income, of ordinary and of extraordinary expenditure, are taken from the budget of the year as to-day presented. The heading of deposits and advances comprises the finances of the local funds, the funds of the civil services, the judicial deposit branch, the advances for local works and for a variety of purposes. The heads of local remittances and inter-provincial and inter-departmental transactions represent the unadjusted expenditure of India, and are interesting items. The remittance account between England and India comprises a large

amount of civil service pensions, and a variety of petty advances in the military branch. There are also a good many unadjusted items under this head. The bills of exchange represent the amount remitted from India annually to meet the expenditure in England. The railway capital heading means the amount raised in England for the construction of railways in India. Here it may be observed that year by year we are spending more in India than we raise in England; this arises from the fact that in previous years we spent less in India than we received in England, and that we have now to make up the difference. The last item, namely, "borrowed," must be taken together with the item of "debt paid." This year we are to borrow 5¾ millions (£5,808,770) but then we are to pay off old debt of 2¼ millions (£2,220,470), which leaves £1,830,000 for the Elphinstone property at Bombay and £1,758,300 or nearly 2 millions new loan in England. In all £3,588,300 or 3½ millions will be added to our debt.

I must now advert to the amount of the cash balances. According to my last statement we hoped to commence the year just closed, 1869-70, with a cash balance of £ 11,917,473, or close on 12 millions, but we really did commence it with a balance of only £10,175,804, or less than 10½ millions. In case this discrepancy be attributed to some fault in the Account department, I should, in justice to that department, explain that such is not the case; for that part of the statement which depended on the Account department turned out correct enough; the discrepancy occurred in that part of the estimate for which the Government of India is responsible. The difference indeed arose solely from the income of the year 1868-69 being less, and the expenditure more, than was anticipated. The causes I have already explained to-day in the earlier part of this exposition. Again, in my last statement the cash balance at the close of the year 1869-70, was estimated at £11,627,310, or 11½ millions. It is now expected to amount to £13,644,859, or more than 13½ millions. The Council will naturally ask, how it is that, notwithstanding the financial troubles of the year, we end with more money in the treasury than was expected? The answer is, that out of the 3½ millions borrowed for public works extraordinary during the year, we have still one million in hand, and that there was the Puttiala loan besides to the amount of £400,000. Also the accident of the first English mail of last month, March, not having reached Calcutta till just after the close of that month, has caused a quarter of a million of bills and drafts, which were expected to be paid in March, that is in 1869-70, to fall into the following year, 1870-71. This too partly accounts for the difference observable in the cash statement between bills drawn and bills paid. The last-named sum of the cash balance is still, however, to some extent only an estimate which may be disturbed by variations in items on either side of an account, which, both sides taken together, amounts in all to 168 millions. This estimate then of cash balances is nothing more than the balancing entry at the end of a really vast account. It has however been further checked by the actual assets in the various treasuries in India at the latest dates. On the 31st January last, there were actually £11,839,097, or nearly 12 millions in hand; on the 28th February (the latest month), there were £12,692,129, or over 12½ millions. Telegraphic estimates received from the several local Accountants General so recently as yesterday, make the actual cash balances on the 31st March £13,500,000. These estimates being framed with a knowledge of the actual balances at the presidency towns and with recent information as to the state of the balances at the more important treasuries in the interior, are not likely to be far wrong. The result—thus derived from opposite and independent data—corresponds very nearly with the amount (£13,644,859) worked out from our estimate and gives me considerable confidence in its general accuracy. The estimate must be exhibited in this manner, under our existing system, although it is exposed to so many chances. But I have now endeavoured to narrow the uncertainty by the comparison with the actual assets at the commencement of the eleventh month of the year, and at even later dates, which leaves a margin of one month only, or even less than one month, for uncertainty.

Commencing then the current year 1870-71 with a cash balance of 13½ millions as above seen, we estimate the receipts of our general treasury, including revenues, deposits, recoveries, loans, and the like at £84,265,466, or 84¼ millions on the one side: and the disbursements, including expenditure, ordinary and extraordinary, payments on account of debt, of Secretary of State's bills and the like at £73,699,023, or 73⅔ millions on the other side, leaving a balance of £10,569,443, or 10½ millions, as the cash balance at the close of the year. It may be here asked why we expect the cash balances to be less by three millions this time twelve month than they are now. The answer is that we are to spend one million on public works extraordinary more than we borrow; that we are to advance half a million for the construction of railways in India more than we receive on that account in England; that the remittance account shows an adverse balance; that in the deposit and advance account the payments are slightly to exceed the receipts. These several items fully account for the difference.

Having now completed my exposition of the finances, I shall, before concluding, mention that the subject of the financial relations between the Supreme Government and the several Local Governments is still under the consideration of the Government of India. I have of course formed and recorded my own opinion on the whole subject. But it is really not in my power to say anything regarding the matter on the present occasion, as I cannot tell what decision will be arrived at, or by what time, if formed, it could be carried out.

I may here add that some additional portion of the cash reserve of the Paper Currency department will probably be invested in Government securities. The Council may remember that in my last financial statement, I mentioned that the note circulation had risen to an amount above ten millions; it has since then risen further at one time to a sum between 11⅓ and 11½ millions, though of course there are fluctuations from time to time. The gradual and progressive increase in the circulation has been held to justify our enhancing a portion of the reserve which is held in Government securities. The amount thus to be held in securities is limited by law to four millions. We propose to extend that limitation to six millions, and for this we have the express sanction of the Secretary of State. I have introduced a Bill for this purpose into this Council. The operation if authorized would be cautiously tentative, and some considerable time may elapse before the limit is approached.

It is a source of much regret to me that we have not yet been able to promulgate the rules, long since prepared, for the further development of Savings Banks in the interior of the country. But it has been necessary to consult many local authorities, and some delay has been unavoidable. The matter is however receiving attention.

As the Council probably knows, no marked result has as yet been produced by the Notification of November 1868, whereby it was announced that the sovereign would be taken at the Government treasuries as an equivalent for ten rupees four annas, instead of ten rupees as before. The total number of sovereigns received in the Calcutta Treasury alone since that date exceeds 150,000. The importation of gold into India from November 1868 to January 1870 amounted to 7 millions sterling against 6 millions of the corresponding previous period.

In my last financial statement, allusion was made to the satisfactory condition of our public credit as proved by the prices of the Government stocks of all denominations. This favorable indication has again lasted throughout the year 1869-70, and this notwithstanding the prospect of the revenues turning out less, and the public expenditure more, than was estimated for. During this year the premia on Government 5 per cent. stock reached 9½ per cent., which rate was maintained through the months of June and July 1869; at the same period the premia on 5½ per cent. stock exceeded 14 per cent., the price of 4 per cents. at that time ranged between 94 and 95, a rate that has since been steadily maintained. The gradual decline since 1868 in the value of 5 and 5½

per cent. stocks may of course be attributed to the diminution of the period for which the loans at those rates have currency. The loan of two millions bearing four per cent. interest, which was raised in India in April, the first month of the year, was subscribed on favorable terms, that is to say, at the average rate of 90 $\frac{3}{16}$ for every hundred rupees; the result being that the money was obtained at just over 4$\frac{1}{2}$ per cent. Subscriptions were invited by tenders, that is by open competition. Though the amount required was not more than two millions, yet the aggregate of tenders came to upwards of 5$\frac{1}{2}$ millions, and the number of persons who made tenders came to 611. Of the amount of tenders accepted, about one-fourth belonged to Natives of India; again out of 246 parties whose tenders were successful, 121 were Natives.

Such then is the budget for 1870-71. The main points in my exposition have been—

that, for 1868-69, the deficit of income as compared with the ordinary expenditure, originally estimated at one million, has, from various causes, swollen to 2$\frac{3}{4}$ millions;

that, for 1869-70, instead of the equilibrium expected to be maintained between income and ordinary expenditure, there will be a deficit;

that, nevertheless, this deficit, which at one time threatened to be great, has been much reduced by additional taxation and by retrenchment of expenditure;

that from this additional taxation and this retrenchment of expenditure, the total gain to the finances within the year has amounted to 1$\frac{1}{2}$ millions;

that, for 1870-71, there is estimated a small surplus of income over ordinary expenditure;

that this estimate is arrived at after doubling the income tax, and reducing expenditure in the army and on the public works by 1$\frac{3}{4}$ million;

that after balancing increases against decreases of all kinds, there is still a nett reduction of 1$\frac{1}{2}$ million on the total expenditure of all descriptions;

that, in 1870-71, there are to be two millions of new taxation as compared with 1868-69, and three quarters of a million as compared with 1869-70; which taxation, however, for the most part, falls on the middle and upper classes, and but little on the poorer classes of the Natives of India;

that the expenditure on public works ordinary which stood at 6$\frac{1}{2}$th millions in 1868-69, has been reduced to 5 millions in 1869-70, and to 4 millions for 1870-71;

that, besides the ordinary expenditure, there has been an extraordinary expenditure on reproductive public works, to be provided for by loan, in 1868-69 of 1$\frac{3}{4}$ millions, and in 1869-70 of 2$\frac{1}{2}$ millions, and that in 1870-71 there is proposed to be an expenditure of 3 millions;

that while the expenditure on public works ordinary has been falling, the expenditure on public works extraordinary has been proportionably rising;

that for the public works extraordinary, in 1869-70, there were borrowed 4 millions, out of which 2$\frac{1}{2}$ millions have been actually expended in the year, leaving 1$\frac{1}{2}$ million in hand;

that for the carrying on of public works extraordinary in 1870-71, at an expenditure of 3 millions, there are 2 millions to be raised in England, and that no new loan is to be raised in India at present; save the $\frac{1}{4}$ of a million to be advanced by the Mahárájá Holkar for State railways.

that the object of our financial arrangements at present is to surmount the difficulties of the time, without adding any thing to the national debt for ordinary expenditure;

that we are striving to adhere strictly to the principle of accounting separately for sums borrowed for extraordinary and reproductive public works.

In concluding my exposition last year, I spoke of growing commerce and of expanding income. To-day, unfortunately, I have had to speak of trade depressed and of income diminished. But last year, I spoke also of an ordinary expenditure held in control; of the application of State capital to material improvement; of the resources furnished by public credit. And to-day, fortunately, I have been able again to speak of these. Last year the burden of my exposition was the existence of deficit. My hope then was that the deficit would be put an end to, but to-day I have had to acknowledge that the evil still exists, despite our efforts for its extinction. Once more, however, we have endeavoured to provide for at least an equilibrium, and even for a surplus. It remains to be seen whether this will be accomplished; but at all events no exertion will be spared for its accomplishment. And although great financial difficulties have occurred, still the general condition of the people, and the continued progress of the country, encourage us to hope that those difficulties, already so strenuously encountered, will be ultimately overcome."

His Excellency the COMMANDER-IN-CHIEF,—"MY LORD, the time being very short which is to elapse before I quit India, I trust Your Excellency in Council will excuse me for offering a few remarks to-day, instead of waiting for the discussion on my hon'ble friend's projects, which will take place at a date prohibiting my presence with regard to my engagements.

"In the first place, I would venture to say that the proposal to raise the income-tax has, under the special circumstances which have been stated, my full support. I have always been opposed to a high income-tax in India, and I am opposed to it still, and I have been engaged in many a struggle against such a tax for this country when reasons could not be assigned sufficient to satisfy my judgment. I believe that a sound policy, under ordinary circumstances, demands that an income-tax should not exceed one per cent. in India, and that a higher rate should be reserved as the resource for extraordinary emergencies.

"It must, I think, be admitted, with regard to what was published under the authority of Government last year, that although it may be inappropriate to apply the word 'crisis' to our difficulties of the autumn, it is certainly accurate to say that an extraordinary emergency had arisen. Unfortunately, as so clearly shown by my hon'ble friend, we are still labouring under the difficulties which may thus be called extraordinary, the inference being that the Government is justified in having recourse to what, I for one, must characterise as extraordinary.

"In support of this position I need hardly remind the Council that, whatever the good-will of the departments of administration, the financial effect of reduction, even if as large as described by my hon'ble friend, stands, as he has so forcibly impressed on the Council, in need of other assistance. In short, it is to the development of resources, as well as to ministerial reduction, that we must look for relief of an effective kind. Perhaps, however, with my views about an income-tax, I may express the hope that, at no great distance of time, other financial arrangements may lead to a reduced income-tax. I may give utterance to the belief that the Budget, now produced by my hon'ble friend, is one of transition; a Budget which, by its trenchant, but as I hope temporary, dealing with the income-tax is to afford the time which is required for the elaboration of other plans—plans calculated to add to the responsibility of local administration, to add to its independence with a corresponding relief of the imperial revenues. In support of this view I may mention that the Income Tax Bill is framed so as to affect but one year only, and that it will expire on the 31st March 1871.

"I now pass on, from the general question of the policy of taxation announced by my hon'ble friend, to a subject with which I am more immediately connected.

"It is apparent to the Council from the figures laid before it, that certain credit is taken for military reductions, which either have been ordered, or which are expected to be ordered, in the course of the current financial year. The actual nett financial result has been stated at half a million of decreased expenditure. This result might have been larger but for circumstances beyond our control. Rather more than a year ago we received a very peremptory order from the Secretary of State to revise our military expenditure with the view, if possible, of reducing it by a million and a half of money. The challenge was fairly accepted by the Government, and after prolonged and careful consultation, comprehensive schemes were sent to England, which, if carried into execution, would not finally have fallen far short of a million in their economical results. These schemes affected the British Cavalry and Infantry in India, the British Artillery and the three Native Armies. It was believed that these schemes had overcome the practical difficulty of all military reductions, namely, the combination of economy with the maintenance of existing strength where it was really wanted, the insurance of a considerable saving of money, without in any manner sacrificing military efficiency or political security. The strength of the British Forces was to be maintained at the same number as that comprehended in the existing establishment, the staffs, both of the Army and of the Administration, were to be clipped, while the Native Forces were to be reduced in the provinces where, with the advance of civilization and in a peace which has now lasted for three-quarters of a century, the Government is able to dispense with a large part of its Army.

"This opinion, with regard to Madras, is not only that of this Government, but we learnt from the Governor of Madras in Council two years ago, that he considered his military establishment too large: this opinion was uttered emphatically, and, to the best of my recollection, without solicitation from elsewhere.

"My testimony may not be worth much, but when appealed to for an opinion as Commander-in-Chief of the Bombay Army about the year 1864, I admitted that that Army was capable of reduction with regard to the wants of the peaceful provinces it guards. At the same time some regiments were employed in guarding jails, that is, performing the duty of policemen.

"I now understand that Madras is willing to do something of the same sort with her soldiers. But I believe I am not wrong when I assert that the cost of a military sepoy is actually more than double that of a police sepoy, this difference of cost being produced by the larger number of officers connected with the former, the more expensive armament and clothing and so on.

"Now it is clear that, if the expensive military sepoys are not wanted for other purposes, it is an extravagance to keep them up for civil ones, which would be as well, some say better, performed by the inexpensive policeman.

"I have often heard it asserted,—I am not sure that I have not myself made use of the argument in former times—that it may be well to keep up a military reserve beyond immediate actual wants, and to employ this reserve on such duties I am led to believe, now, that such an argument is hardly defensible, the more especially since our modern means of movement cause the State to hold at its disposal a military reserve not previously existing, namely, in the power for rapid combination and concentration of the Forces from almost any part of the Empire.

"I believe that my hon'ble friend the Lieutenant Governor of Bengal has strong opinions on this matter, it being one of his recommendations, for an important part of the territory subject to him, to substitute military policemen for soldiers, on the ground of economy first, and, with regard to the special duties required, of efficiency also. I am not prepared to say that I entirely go along with my hon'ble friend, as I cannot hide from myself that the effect of military demonstration on the mind of a barbarous and uncivilized people is not without considerable political advantages, even if the soldiers be kept

in a state of idleness as compared with the activity of policemen in discharge of duties. I am not prepared to admit that any duties of a military nature, which may be done by military policemen, may not be at least equally well done by the regimental sepoys. If there be failing with the latter, either as regards efficiency or mobility, this failing of efficiency or mobility is not really to be attributed to a particular organization, but to those who direct forces, whatever may be their denominations. But this I do say, that that opinion is right in principle which asserts that a given duty, if it can be done by economical means, should be so performed, and that we therefore should shut out from our consideration all proposals having in view more expensive means of action for the avowed purpose of cherishing ancient establishments.

"In this Presidency it may be said, without fear of contradiction, that the Government of India has long been superior to any such considerations, the Army having been treated and considered solely with a view to its public uses only.

"Accordingly, when reviewing the Forces last year, when considering our wide frontiers, and the extremely dangerous character of a large portion of them, the necessity of occasional concentration for the prosecution of a campaign almost at a moment's notice, we came to the conclusion that we must maintain the number of British and Native Troops in Upper India as an absolute military and political necessity, although we might do something, by the reduction of some corps with their officers and the manipulation of the remainder, towards the reduction of expense, and also to show that the Bengal Army would not escape its share of the general discomfort following on a large measure of reduction.

"I would ask the attention of the Council to consider the enormous area guarded by the Bengal Army, stretching as it does from Pesháwar in the West, over twenty-five degrees of longitude, to Debrugarh in the East; I would invite you to consider the object of an Army posted in the Panjáb, which not only looks to the peace of the frontiers and of the province, but is the guarantee of our foreign relations. I would ask you to recollect the duty of the Government of India as a paramount power to insist on peace being kept by the numerous feudatories subject to her.

"In a speech which I lately read, of Mr. Grant Duff's, I observed that he could find no proper illustration of the areas and distances in India but the map of the whole of Europe excluding Russia,—in point of fact the hon'ble gentleman was referring to arrangements and distances in this our Presidency of Bengal only. In an Empire of this magnitude it is interesting occasionally to scan the forces holding the possession. I think their slender numbers, when they come to be investigated, may fairly excite the surprise of the civilized world, if those numbers are compared with the duties performed, and the absolute security provided for the vast provinces and populations and outlying dependencies of this Empire. I invite the attention of the Council to a return I hold in my hand furnished by the Military Department at my request.

Return of Nominal Establishment and of actual Strength of Troops in India, 29th March 1870, according to latest Returns received in Military Department.

	Nominal establishment.	Actual Strength.
British Forces in India	61,634	55,333
Bengal Native Army (including Panjáb Frontier Force)	63,131	60,900
Madras Native Army (including 4,729 serving in Bengal, China and Straits)	32,431	31,202
Bombay Native Army	26,880	25,178
	184,076	172,613

NOTE.—The establishment of British Troops has been recently altered to some extent, but details of future establishment are not exactly known.

The establishments given do not include 7,086 officers, including those in civil and miscellaneous employments.

The nominal establishment includes certain Corps under the Foreign Department in Rájputána. They are not included in the column of "Actual Strength of Troops under this Department."

Owing to the overland relief being in progress the actual strength of British Troops is lower than it would otherwise be.

"Well, my Lord, from these slender numbers we proposed to reduce ten thousand Native troops on the understanding that they would be taken from the Provinces where they are admittedly not wanted, but that military strength is to be carefully preserved where it is wanted.

"As a Commander-in-Chief about to hand over my not inconsiderable responsibilities to a successor, I can only say that I dare not recommend a reduction on any other principle. If we reduce our troops to a minimum, we must have them in places where they are really wanted and where they are quickly available, and we must pay much attention to the military character of the tribe or population from which our Native regiments are recruited.

"I am sorry to say we have not as yet been able to come to an agreement with the Secretary of State on this matter. I venture to think his advisers have not appreciated the value of the principle I have stated with regard to the slender general figure of our modern military resources. Agreed as we are, both in England and in India, that a reduction is proper, I trust this Government will be permitted to give effect to it in that manner alone which appears to be safe and sound. Otherwise there should be no reduction.

"Financially, this becomes the more important when it is recollected that the troops in Southern India are much more expensive than those in this Presidency.

"So far for the general question of distribution and reduction of troops.

"With reference to our European Forces, according to the figures I have already read, it must I think be clear to the meanest apprehension that we have reached the absolute minimum. I believe that, by means of certain changes which have been laid before the Home Government, these Forces may be actually rendered more efficient than they now are, while their cost is considerably reduced. Our proposals are before Her Majesty's Government, who to a certain extent have moved in the directions indicated by us with regard to the Infantry, although, as respects the Cavalry and Artillery, we are as yet unacquainted with the conclusions formed at home. The number of infantry-corps has been reduced, but the number of infantry-soldiers remains as heretofore.

"My Lord, I have been in the most important situations in these armies for more than twelve years. I have been an acquiescing party to the successive reductions in European strength which began with the cessation of hostilities in 1859, because, till the last reduction of four years ago, I held the opinion that we were still maintaining war-establishments. But I am convinced that we should not go further, and that to attempt a diminution of the existing British Forces in India is an expedient fraught with so much danger as not to be thought of.

"Although it is a mistake to say, as it is so often alleged, that the British Empire in India is merely one of the sword, and although we recollect that this Empire really rests on a policy founded on justice and the rugged British character, it is nevertheless true that a certain armed British demonstration is absolutely necessary for dominion over public opinion, and the insurance of the institutions to which we trust for the civilization of the country. It is, to your administration, what iron is to the blood—on the due proportion of the iron, vital power depends.

"I came out to India in 1857, to assist in putting out the terrible conflagration which had been caused by the forgetfulness of this simple truth on the part of the authorities responsible for India in this country and at home. I pray to God that such blindness may not overcome, again, those who have to answer for the destinies of this magnificent country!

"My Lord, there are many things on which I could willingly descant with reference to the systems, and the recourse to more economical arrangements, which might be pursued in these Armies. In those with which I am acquainted, namely, of Bengal and Bombay, I believe the existing system is working

fairly well. So far as I am able to judge, the discontent which was rife some years ago has generally died out. For Madras I cannot answer, as I have no personal knowledge of the Army of that Presidency. But the changes which have been stereotyped with us, and have now lasted for many years, are comparatively new to Madras. For such things, the action of Time is at least as much required as any artificial resource. This, as yet, Madras has not enjoyed.

"Your Excellency has had an opportunity of seeing the troops of this Presidency on two great occasions, and also, I believe, in Bombay; and I will leave it to you to say whether in appearance they can be surpassed by troops of other countries. During the last few years, there have been the campaigns of Bhután, Abyssinia and Hazára; and it is but right to say, for the troops, that their zeal, readiness, mobility and forwardness in the field were not to be surpassed. There is one thing, of which in the interest of true economy and of political safety, I would warn the Government, and, perhaps, I may say the officers of the Army. I would warn them against the vice which is apt to creep insidiously over all Armies in times of peace, namely, the tendency to press for more comforts, more material advantages, in short, for things which cause the soldier to forget the object of his enlistment, and to believe that he is to be preferred to the public economy.

"In a country of caste like India, unless the officers who deal with the Native troops watch themselves, the influences of caste are apt sometimes to affect even the British officers, and to cause them occasionally to think caste-interests of greater importance than military ones. This mischief was actually seen in the old Bengal Army. It does not, I believe, now exist, at all events in this Army of Bengal; but I must repeat, it requires never-ceasing vigilance to prevent the vicious tendency from cropping out.

"In the British Army we have not this to contend against; but we have something else which also requires the utmost watchfulness. I allude to what may be called the exaggeration of sanitation-theories, which, while exhibiting at times the utmost difference of opinion among the authorities proffering their advice, would, not seldom, if listened to in their integrity, deprive the British soldier of his usefulness altogether for the purposes on account of which he is brought to India. Whilst warning against the exaggeration, I gladly admit the facts of the great improvements of late years for the health of the British soldier, and I believe I have not been slow to forward them during my long term of office in Bombay and this Presidency.

"I have had the great satisfaction of urging forward the two new Hill-stations of Chakráta and Ránikhet, the former of which is already occupied by a British Regiment, and the latter will receive some 500 men this year. I think this policy may be still further extended, and that we may safely create Hill-stations for three more British Regiments, in addition to those already occupied. Then, in addition to our sanitary depôts, we should never have less than seven or eight entire Corps on the mountains in this Presidency; that is to say, a fourth of the Infantry Regiments quartered in the Himalaya as entire Corps, while very large detachments from the remaining Infantry, the Cavalry and Artillery, would fill the depôts. My recommendations to this effect have been before the Government for some time.

"As a matter of economy as well as of humanity to our countrymen, this policy should be extended to the utmost limit consistent with political security.

"In the course of my remarks, I have adverted to the new military strength accorded to us in these days, as compared with former times, in the power for immediate combination and concentration. This reflection leads us at once to another point, namely that, in the combination of the Military Departments of the several Presidencies into one War Department under the Government of India, with a corresponding change in the system of Command-in-chief, may be found a measure giving at once improvement in economy and increase of

strength. There should be but one War Department, which would at once involve the consequence of one Ordnance Department; in short, the concentration of the Army in the largest sense in the hand of the Government of India. This need by no means interfere with the local character of the Native Forces of the other Presidencies, a character which, I believe, a sound policy bids us carefully to maintain.

"It has always appeared to me that, in this country, many things are centralized which ought to be local and dependent on the Local Governments; whereas those establishments are kept separate, and, as it were, almost distinct from the immediate control of the Supreme Government, which, from the nature of things, especially belong to it. Such is the case with military administration. We do not see the Federal States of America maintain distinct military organisations for the payment of which Congress is responsible, although, in other matters, the provincial Governments of the States exercise a very large power.

"There is no reason for separate military administration in Madras or Bombay, which would not equally apply to the several Governments making up this Presidency. So long as the separate system lasts, I am hopeless of real economy or of breaking down the influences and jealousies which meet your Excellency at every turn when economical schemes issue from this Council. I need hardly remind this Council that I ventured to utter these opinions very many years ago, when they might have been supposed to be contrary to my personal interests. A long and practical experience of government and command, first in Bombay, and afterwards in association with the Governor General, have only tended to convince me that these opinions are right and should be carried into execution. Whenever reforms in such a direction take place, I may say, with regard to the office I am about to lay down, that some modification is necessary.

As your Excellency is aware, I received the instructions of the Secretary of State for India, when I was appointed to this command, to be as much with Government as possible, regard being had to my essential military duties. That instruction was enforced by the orders of His Royal Highness the Field Marshal Commanding in Chief. Well, I have tried to fulfil those instructions, and have been more assiduous in my seat in Council than, I believe, the great majority of my predecessors. Not sparing exertion and activity, I have sought to carry out my duties of inspection in hurried Spring and Autumn tours. I believe that, in consequence, the troops have been visited by Head-quarters quite as much as in former commands. But the strain imposed in the attempt to carry out the instructions with regard to the two sets of duties has been often such as almost to exceed the strength of any man, while my visits to the several stations and my residence among the troops have been shorter than I could have wished; this not unnaturally caused my mode of exercising command to be misconstrued in many quarters. I think, then, that, in any revision of the establishments with regard to economy or other considerations that may be entertained hereafter, the points I have mentioned, although personal to myself, are not without significance, and should be duly weighed. How the necessities of the administration, on account of what is now done by three Military Departments, and how the military command should be dealt with in the three Presidencies, in order to overcome the inconvenience and the want of economy now experienced, I have more than once during the last ten years suggested to Government. It is sufficient to say that we have, in my opinion, the right model in France, where the Head of the Army is the executive War Minister, while the Military Command of the Corps d'Armée is conducted by Lieutenant-generals, whatever their titular military rank.

"There is one more point to which I would invite the attention of the Council, that being the tendency to growth of non-effective establishments. I need not advert to the statements of General Hanyngton and Colonel Broome,

beyond uttering the remark that, while these distinguished authorities differ in detail, they are agreed in presenting a picture of future liability which is positively alarming. In short, we are threatened with the serious danger of all our economies in India, in the combative Forces being eventually greatly more than swallowed up in the growth of the non-effective expenditure. Under such circumstances, a further greater danger might be forced on by public outcry, involving perilous reductions to meet non-effective charges.

"It has been my duty, more than once, to submit my views as to how this difficulty may be fairly and properly encountered while there is yet time. It would be premature to dwell on the suggestions of one member of this Government on this particular subject, which I presume must be sooner or later dealt with in an authoritative manner, and may be said to be still *sub judice*, although this Government and the Secretary of State have not as yet come to an agreement on the subject. But I need not suggest to the Council that the subject is one of great and of increasing importance. My Hon'ble friend in charge of the finances cannot press his attention too strongly to it.

"In conclusion, my Lord, as one who has been intimately associated with the Armies of India for more than a quarter of a century, and, for the latter half of that period, has been in places of the greatest responsibility, who has watched the causes and progress of change through this long period, and has been in general one of the chief executive authorities for carrying out the reforms impressed on us from time to time by Her Majesty's Government, I may, at this last moment of my discharge of duty, declare my confidence in the military arrangements sanctioned by your Excellency in Council, and my belief that the Army does justice to the care bestowed on it by the Government.

His Excellency THE PRESIDENT—"I am anxious on this occasion to deviate somewhat from the usual course, and to make to my colleagues in this Council a statement with regard to the proceedings of the past and ensuing year of the Department of Public Works, of which I am the Member of Council in charge.

"I believe that great advantage would be derived if this practice were more generally adopted, and if Members of Council in charge of the great expending departments of this Government would take advantage of the production of the Budget to lay before their colleagues a short abstract of the mode in which these great sums of money have been and are to be disposed of, in order to give to the public an opportunity of knowing in detail how these sums are likely to be expended.

"I think, therefore, that in adopting this course, I am adopting a course which is now pursued in almost every Government in the world, namely, that at certain periods of the year, even under the most absolute rule, ministers do, on their own responsibility, make statements on the position of the departments over which they preside.

"Should the course that I now propose to take with regard to Public Works in India receive the general approval of the public, I propose to extend that practice to another year, and endeavour to induce some of my colleagues to make similar statements.

"No other opportunity is likely to occur—I regret that the present hour is so late, but still I am anxious that at the earliest possible moment the public should be placed in possession of those important facts to which I now invite the consideration of my colleagues.

Many of these facts which I now bring forward and state to the Council would, in ordinary course, hereafter be laid before the public. But we are all aware that when facts such as these are merely stated in various departmental reports, they are necessarily stated at great length and in a somewhat disjointed form, and my belief is, that these matters do not receive from the Indian public that fair attention which their importance deserves, and I think the

Government would obtain much advantage from wider criticism and greater discussion of these subjects by those who take an interest in public affairs.

With this preface, I propose to make as brief a statement as I can as to the expenditure of the Public Works Department during the past and ensuing years.

The total expenditure on public works in England and India for 1869-70 will be about £8,000,000.

I give the figures as nearly as possible in round numbers.

This great sum will be divided into two heads, *viz.*, Ordinary and Extraordinary expenditure; the Ordinary expenditure representing that which we expect to be able to pay out of the revenues of India, and the Extraordinary, that which is to be defrayed by loan.

Under the head of Ordinary we shall have spent in the year which has just come to a close a sum of something like £5,300,000.

Under the head of Extraordinary we shall have spent the sum of £2,600,000.

Of the £5,300,000 which I have just mentioned under the head of Ordinary, £5,000,000, as nearly as possible, will be spent on public works. The remainder will be made up of smaller items, such as State railways, official expenses connected with guaranteed railways, and loss by exchange.

In the Extraordinary expenditure for the past year, the great item will be that of two millions of money spent on Irrigation works; a small sum has also been taken for the commencement of State railways.

The principal items of expenditure in India under the head of Ordinary will be—first, for Military works nearly a million and a half sterling, of which the original works will take about £1,200,000 and repairs £227,900.

£478,000 will be spent on Agricultural works, of which £192,000 will be taken for original works and £279,000 for repairs.

£680,000 will be spent on Civil buildings, of which the original works will cost £562,000 and the repairs £122,000.

We then come to the important item for communications, which really means the construction and repairs of ordinary roads. In the year that is just closed we shall have spent under this head, as nearly as possible, £1,000,000—£600,000 of which will be spent on original works and £4,900,000 in repairs.

A smaller item of £58,000 follows for miscellaneous and public improvements, and then there will be the great item of £1,000,000 for cost of establishment, of which £70,000 will go for tools and plant.

These will form the principal items of the Ordinary expenditure of the Government of India in the Public Works Department for the year just closed.

Of the million and a half spent in India on Extraordinary works in 1869-70—

Irrigation Works will take about...	...	£ 950,000
State Railways about ...	...	„ 144,000
The Bombay Special Fund ...	...	„ 350,000

and the remainder will be made up of smaller items.

It will be interesting to the public to know how this large expenditure of 6½ millions was distributed among the various Presidencies.

Madras will have received for its public works about		£ 835,000
Bombay	...	„ 1,450,000
Bengal	...	„ 1,360,000
N. W. Provinces	...	„ 865,000
Panjáb	...	„ 866,000
Central Provinces	...	„ 328,000

The remainder will be distributed between British Burma, Oudh, Hyderabad, Rájputána, Central India, Coorg and Port Blair.

In the middle of the year 1869-70, as the Council are aware, upon investigation and enquiry made at Simla into our financial position, the absolute necessity of an immediate reduction in the Public Works Department became apparent to all the Members of the Government. After the fullest and most careful consideration, we came to the conclusion that unless a large reduction was made in this item of expenditure, it would be impossible to look to financial safety in the year. We, therefore, with very great reluctance made up our minds to a reduction of the public works expenditure of the Government of India to an amount of nearly £800,000, the actual sum being £792,500.

Well, the necessity of the case was speedily recognized in a manner that was almost surprising, and with scarcely a single exception, the local Governments so far seconded our efforts that the result has been obtained, and it appears that a saving will have been effected in the Public Works Department's Ordinary expenditure during the year even to a greater extent than was suggested.

There are only two cases in which local Governments will have exceeded their grant. Madras will have exceeded its grant by the small sum of £3,000, while according to the latest accounts Bombay will have spent £29,700 more than the reduced grant.

This is the only case where a local Government has been unable to carry out to the full the orders and wishes of the Government of India.

I find that Bengal will spend less than the reduced grant by £2,400, North-West Provinces £500 less, Panjáb £82,700 less, Central Provinces £14,300 less, British Burma £30,900 less, while the smaller Governments will show a proportionate reduction. The result will be that, under this head of public works expenditure, the reductions that were ordered in so unusual a way will be entirely and successfully carried out.

When we think of the very great sacrifice that the local Governments have been called upon to make, when we know the great interest they take, and justly take, in all these works, I must say that the Government of India are deeply indebted to those Governments for the manner in which they have adopted our recommendations, and for the way in which, at very great sacrifice, they have been able to carry out our wishes.

Well, so much for expenditure in the Public Works Department in the year that is just passed.

I now propose to lay before the Council a similar statement with regard to the expenditure of the year upon which we have entered.

I must, however, remind the Council that both as regards the past and the future years these statements are to a certain extent approximate. It is impossible, speaking on the second day of the financial year, that the fullest information with regard to the past can be at the disposal of the Government of India, and, as every one knows, with regard to the future the statement I am about to make is one entirely of estimate. All I can say is that in respect to large expenditure much power rests in the hands of the local Governments, if they choose to exert it, which I am sure they will, to keep the expenditure within the estimate, and in some instances to realize even more than the suggested saving.

The expenditure, then, for the ensuing year in the Public Works Department will be placed at about £7,475,500.

Of this £6,900,000 will be expended in India, and £500,000 in England.

Under the head of Ordinary, £4,300,000 will be expended, and under the head of Extraordinary £3,100,000.

Of Ordinary, the large sum of £3,900,000, or nearly £4,000,000, will be spent entirely on public works; the rest will be made up of the smaller items, such as official expenses connected with guaranteed railways, Calcutta and South-Eastern Railway, and loss by exchange.

In Extraordinary, that is, the loan-works for the ensuing year, the two great items will be £1,730,000 for irrigation, and £1,220,000 for State railways. This head of expenditure appears for the first time in any magnitude in the public accounts. The remaining item is a smaller one for Port-trust works at Bombay.

Well, then, of the £4,300,000 to be devoted to Ordinary works, the Military works will take about £1,120,000; of that £900,000 will be expended on new works, and £200,000 on repairs.

The Ordinary agricultural works will take £490,000, the greater part of which will be spent on original works, repairs, with a small outlay on guaranteed irrigation works.

£518,000 will be spent on Civil buildings, of which the new works will demand £390,000, and the repairs £120,000.

£840,000 will be spent on communications, that is, on roads. The expenditure on roads and repairs will be divided very nearly in equal parts, as the original works will come to £400,000, and the repairs £430,000.

There will be a small sum of £40,000 spent on miscellaneous public improvements.

The cost of establishment which directs the whole will stand at something less than it did last year, being £900,000, and £60,000 for tools and plant.

As I said before, of the £3,100,000 which will be spent on Extraordinary works—

	£
Irrigation will take	1,700,000
Original works	1,200,000
Establishment	300,000
Tools and Plant	180,000
State railways	1,200,000
And Port-trust works	150,000

This gross sum will be as nearly as possible distributed to the different local Governments in the following proportion: —

£	
817,000	to Madras,
1,370,000	to Bombay,
1,212,000	to Bengal,
1,137,000	to N. W. Provinces,
1,800,000	to the Panjáb, and
300,000	to the Central Provinces.

The reason for the Panjáb figuring for such a large sum this year is, that the great State railway from Lahore to Pesháwar is to be commenced this year in that province.

"The remainder of this large sum will be divided between British Burma, Oudh, Hyderabad, Rájputána, Central India, Coorg, and Port Blair.

"In round numbers, then, the expenditure on public works in 1869-70 will have been £8,000,000; in 1870-71 £7,500,000, or 7½ millions. But a heavy payment of an unusual character took place in 1869-70. Of the £1,400,000 which was spent in England in 1869-70, £1,040,000 was paid to the shareholders of the East India Irrigation and Canal Company for their property, which is better known under the name of the 'Orissa and Soane Irrigation Company.'

"If, therefore, this heavy item be left out, it will bring down the real expenditure in 1869-70 to £6,900,000.

"From this point of view, therefore, the total estimated expenditure for 1870-71, namely, £1,400,000, is in reality half a million more than the corresponding expenditure for the past year; so that if we exclude from the expenditure of the year that is just closed the payment for the property of the Orissa Company, we hope during the ensuing year to expend on works of public utility a much larger sum than we spent during the past year.

"But I must remind the Council that those great sums of 8 millions in 1869-70 and 7½ millions in 1870-71 by no means represent the whole of the expenditure on works of public utility, and for which the Government is responsible in India.

"We shall pay in 1869-70 £1,570,000 in interest and nett charge on account of railways. The Railway Companies under Government guarantee will spend in the same year upwards of four millions on construction; so that in reality the gross expenditure on works of public utility in India during the past year, and the necessary expenses, that is, payment of interest on loans expended for similar objects, will amount to the enormous sum of nearly fourteen millions.

"In 1870-71, that is, in the ensuing year, in addition to the 7½ millions before referred to, we shall spend as our nett charge on account of railway interest £1,600,000, and the Railway Companies under Government guarantee propose in the same year to spend upwards of £5,100,000 on construction, making in all a total for the present year of upwards of £14,288,000.

"I wish the Council particularly to note these facts, because I do not believe that it is generally known that there is such an enormous expenditure going on in India for works of public utility.

"If we put these two great sums together, we shall have expended in the two years ending 31st March 1871, either from ordinary revenue, either from loan for interest, or through the agency of the Railway Companies under Government guarantee, the enormous sum of 28½ millions upon works of public utility in India, and their cognate expenses.

"This sum that we shall spend in two years is considerably more than the annual revenue either of Spain, of Italy, of North Germany, and three times as much as that of Holland.

"Now as to the proportion that these great sums bear to our own revenues. I find that in a calculation which has been kindly made for me by the Secretary of the Financial Department, the amount of nett available revenue of the Government of India for the year 1869-70 can only be counted at £28,900,000. When I say available revenue, I mean those sums placed at the disposal of the Government of India the distribution of which is within their power; that is to say, that in making this calculation I deduct all imperative charges over which we have no control, such as costs of collection, charges, payments of interests, and charges for pensions, any payments made under treaty engagements, &c.

"If after making these deductions we take the nett available revenue of India for this year, we find that it only amounts to about £28,000,000. We shall have spent out of that sum in the year just closed, out of the revenue of the year, as I stated before, a sum of £4,800,000 on public works ordinary, which is nearly 17 per cent. on our nett available revenue. In the year 1870-71 we expect that our nett available revenue will be £28,090,191, and that we shall spend on public works ordinary £3,800,000, which will be nearly 14 per cent. on those resources over which the Government may be said to possess control.

"To look at it in another way, I find that the whole expenditure on public works—that is, the nett expenditure (deducting recoveries)—amounts to £13,800,000 for this year, so that comparing that with our nett available revenue, we shall have spent on works of public utility during the past year something like 47 per cent. The percentage will be increased during the present year, so that in reality we expect to spend within the ensuing year on works of public utility in India a sum nearly equal to half of our entire available revenue, and I believe this is an effort in the direction of public improvement that has hardly ever been attempted by any other nation in the world.

"But I wish now to explain to the Council the different proceedings which are to be undertaken during the ensuing year by the Government of India under various heads in the Public Works Department, and for this purpose I shall place what I have to say under the heads of Military works, Civil works, Agricultural works, Irrigation, &c., and Railways.

"Under the head of Military works, the total sum spent in 1870-71 will be £913,000 for original new works, and £214,000 for repairs, making a grand total of £1,127,400.

"The sums for new works may be classed under the following main heads, *viz.*—

	£
Accommodation for troops generally	654,305
Ordnance factories	147,100
Gas-works	5,500
Water-supply	21,495
Works of defence...	61,000
Roads to important hill stations	19,000
For Port Blair	4,650
Making in all a sum of	£913,051

"Of the total sum assigned for 1870-71 under the heading of 'accommodation of troops,' *viz.*, £654,304, the bulk has been devoted towards carrying on the great scheme of barrack accommodation for the British soldiers that has now been in progress for the last five years.

"It has been necessary to sub-divide the allotment over nearly all the stations at which European troops are quartered, in view to provide for the urgent requirements at each station in the way of shelter; but it has been an object to concentrate the expenditure as much as possible, on the completion of barracks and hospitals now in progress, rather than on the commencement of new buildings, for by so doing, it will be possible to complete a very considerable amount of shelter at each station during the year. The largest assignments have been made for the most unhealthy stations, or for stations at which the accommodation is most backward, thus—

	£
Saugor	29,000
Morar and Gwalior Fortress...	25,000
Mhow	19,000
Nusseerabad	19,000
Belgaum	22,000
Kurrachee	20,000
Peshawur	15,000
Ahmednugger	17,000
Jubbulpore	15,000
Fyzabad	20,000

"At other stations, where the call for accommodation is not so urgent, the allotments are somewhat smaller than the foregoing, thus—

	£
Ambála	11,800
Ráwal Pindí	7,500
Seetapore	9,000
Neemuch	14,000
Nowgong	10,000
Bellary	5,000
St. Thomas' Mount	5,000
Kirkee	10,000

"The allotment for Barrackpore, £7,700, will complete the barracks for both the single and married men of the two companies of artillery at that station.

"The allotment of £8,000 for Allahabad will also complete the accommodation of the regiment of infantry and battery of artillery at that station; so also will the allotment of £5,000 complete the buildings for the single and married men of the regiment of infantry at Cawnpore.

"Liberal provision for extending the accommodation at hill stations has also been made. A sum of £7,500 has been set apart for completing the temporary accommodation of the regiment of infantry at the new hill station at Chakráta.

"An allotment of £10,000 has also been made for proceeding with new barracks at the new hill station, Ráni Khet, and an aggregate sum has also been allotted to the old hill stations at Dugshai, Kussowlie, Subathoo, Baloon and Murree.

"The next item for consideration is that of the ordnance factories. The most important works under this head are the Snider factories and ordnance buildings in Bengal and Bombay,—we do not yet know whether we shall be able to proceed this year with the Madras factory,—and are specified as follow:—

Snider Factory, Dum-Dum,
Ditto Kirkee,
Ditto St. Thomas' Mount, Madras,
Gun Carriage Agency buildings in Allahabad,
Powder Works, Gun Carriage buildings, and Magazine, Kirkee,
Hydraulic Lift, Graving Dock, Bombay, and we hope some progress may be made in the new Gun Foundry at Cossipore.

"Funds are provided for completing the gas-works for lighting the barracks and cantonments at Allahabad and Rawul Pindee. These works are now far advanced, and are expected shortly to be completed.

"The next item is that of the water supply. The important projects under this head are—improved water supply for the large station of Ambála, and also for Trimulgherry, Kirkee, Ulsoos Tank (Bangalore).

"With regard to defence works, the most important of these are the harbour defences of Bombay and the Rangoon pagoda and harbour defences.

"With regard to roads to hill stations, the sum allowed for this work is for opening up communications from the plains to the important hill stations of Ráni Khet and Chakráta.

"This, then, is a description of the works proposed to be undertaken during the ensuing year under the head of Military works.

"Under the head of Civil works, one of the principal grants will be made to Kurrachee Harbour. The grant for these works for 1869-70 was £26,500, which was subsequently reduced to £25,500. The grant for next year is £26,500.

"The estimates for these works aggregate about £130,000, of which it was expected that about £260,500 would be expended up to the 31st March 1870, so that at the present rate it will take many years to carry out the scheme.

"But I wish to say, with regard to these works, that we hope to place them upon a somewhat different footing, and we are already engaged in seeing whether a local trust may not be created by which advances may be made, and therefore it might be possible hereafter that a portion of this expenditure may fall under the head of Extraordinary.

"With regard to the Godavery navigation, the original grant for 1869-70 was £70,000, which was reduced to £50,500. The grant for 1870-71 is £30,500 only; all these figures being exclusive of establishments. The grant for the First Barrier Works will practically complete them, and a good deal of progress may be expected with the anicut and locks at the Second Barrier.

"The construction of the road from the Dharwar Frontier to the Port of Karwár is a very important work.

"The grant for the year 1869-70 was £13,340, and for 1870-71 it is £15,000.

"This will probably complete that line of road.

"A sum of £147,500 has been passed for improvements to the Bombay Harbour, £100,000 of this being for the Moody Bay Reclamation.

"The whole of the expenditure it is proposed to debit against the Port Trust, which, it is hoped, will soon be constituted, on arrangements for the purchase of the property of the Elphinstone Company being concluded.

"With regard to the Madras jails, the great progress made within the past two years with the new central jails in that Presidency has allowed of a considerable reduction in the grant assigned to them in 1870-71, namely, from £32,400 in 1869-70 to £9,768 in 1870-71.

"This latter sum will practically complete the principal jails.

"In Calcutta a sum of £40,000 has been assigned for the new High Court, which sum will complete it if the estimate be reliable.

"It has, however, been found necessary to leave the University and the Imperial Museum without any grant, as it is considered that it is much better to complete one work at a time than to endeavour and only partially to complete four or five.

"Amongst Civil works the reduction in the grant made in 1869-70 was distributed nearly equally between buildings and roads, so that the percentage of the reduction on the latter head was considerably smaller than on the former. The diminished expenditure on ordinary roads is, however, far more than compensated for by the increasing expenditure on Railways.

"I now come to the important item of Agricultural Grants.

"There never was a year in which the benefits of irrigation were more decidedly evidenced than in the last year. The interesting reports from the North-Western Provinces on this subject have attracted the notice of the public, and the statements which have been made are most remarkable and encouraging.

"In the unusually dry season of 1868-69 a great calamity was averted. It is stated on the authority of the Government of the North-Western Provinces and of the Canal Officers engaged there, that in that Province alone 1,125,702 acres were kept in a state of fertility which would otherwise have been unproductive.

"Colonel Brownlow and his officers exerted themselves to the utmost, and the result was that by their influence and constant energy, they persuaded the people to make use of the water principally for this purpose. The result was that in those irrigated districts, there was a considerable increase in the production of the lower class of cereals, and I find that the 2,786 acres of that description of crop, which were under irrigation in 1867-68, have increased in 1868-69 to the amount of 85,281 acres.

"The returns exhibit an increase of the extent of land watered of 665,023 acres over the preceding year, 96 per cent. more than that irrigated in 1860-61, the most recent year of scarcity, and 45 per cent. greater than in 1866-67, the previous maximum of irrigation. In the Meerut Division irrigation reached the extraordinary extent of 308,161 acres, or 30 per cent. of the entire culturable area of the district, exhibiting an increase over the preceding year of 103 per cent. These facts tend completely to show the enormous value of irrigation works.

"The Ordinary grant for Agricultural works for the current year now stands at £478,279, of which £192,199 are for new works, £279,580 for repairs, and £6,500 for State outlay on guaranteed works.

"The Extraordinary grant was originally £1,650,000, but the expenditure is not likely to exceed £900,000.

"For 1870-71 the following amounts are provided:—

Ordinary.	£
New works	169,420
Repairs	322,500
State outlay on guaranteed works	5,380
	£497,300

Extraordinary.	£
New works	1,246,400
Establishment	300,700
Tools and Plant	185,400
	£1,732,500
Grand Total	£2,229,800

making thus £1,415,820 for actual construction of new works, and £322,500 for repairs.

"It will be seen that the greater part of the Ordinary grant will be devoted to 'repairs.' This arises from the necessity of maintaining in good working order the extensive systems of Irrigation works already in operation in different parts of India, particularly in Madras, Scinde, in the Panjáb and the North-Western Provinces. Also, in Bengal, a considerable sum is required for the maintenance of the numerous lines of embankments in the Orissa and other districts.

"The original works to be carried out from the Ordinary grant are numerous, but, with few exceptions, of no great magnitude individually.

"Numerous important works are in progress, and will be continued during the ensuing year from the extraordinary grants in Madras, Bombay, Bengal, North-West Provinces, and Panjáb.

"In Madras the most important work that now engages attention is the completion of the canals in the Godavery and Kistna Delta. The local Government is furnished with such sums as it requires for this object, but owing to the limited supply of labour available, the extension and enlargement of these canals to the standard ultimately required must at best be a slow and gradual operation. During the current year the sum of £52,760 was allotted

for these works, but the expenditure is likely to be somewhat less. Other projects on a smaller scale, but still of considerable importance, have been in progress in the Nellore, Madras, Tanjore and Tinnevelly Districts, and several entirely new schemes are now under investigation. For the latter the allotments proposed by the local Government have been allowed to stand, but as the estimates will have to be submitted to the Secretary of State for approval, it is not likely that much, if any, progress will be made with them in the coming year.

"In Bombay estimates to the amount of £545,494 have been sanctioned as extraordinary, of which £305,898 pertain to a reservoir and canal near Poona.

"Several other large projects are under consideration, of which the most important is a line of canal from Roree on the Indus to Hyderabad, which is likely to cost upwards of two millions sterling. The estimate for this work is, it is understood, nearly ready, and, in the event of its receiving the sanction of Her Majesty's Government, will probably be commenced in the ensuing year.

"In Bengal the extensive works which had been in progress in Orissa under the management of the East India Canal Company, having been transferred to Government, have been vigorously prosecuted, and the new works on the Soane, estimated to cost £2,100,000, have been commenced. Also a canal, which is likely to cost half a million sterling, from the Damoodah at Raneegunge to the Hooghly, has been lined out, preparatory to commencement of work on the estimates receiving approval.

"An extensive system of canals from the Gunduck, at an estimated cost of £1,384,826, for the irrigation of the Tirhoot, Sarun and Champáran Districts, and also for navigation, has been before the Government of India, but information on several important points is required before it can be recommended for approval.

"The works in progress in the North-Western Provinces comprise various additions to the Ganges Canal, and its system of distribution channels; a canal from the Jumna near Delhi to Agra, estimated at £575,000, and several smaller canals in Rohilkhand. The latter form the commencement of a proper system of irrigation and drainage of the Terai Parganas.

"A scheme for a canal from the Ganges for the irrigation of Eastern Rohilkhand, estimated to cost about £1,000,000 sterling, has actually been before Government, and will be proceeded with on the necessary authority being obtained from the Secretary of State, and estimates for canals in Rohilkhand have also been under consideration. It is further proposed to open out a new feeder to the Ganges Canal with a view to intercept the whole of the dry-weather supply of the river above Futtehgurh, and thereby to obtain the means of extending irrigation to the terminus of the Doab at Allahabad.

"In the Panjáb the improvement of the Bárí Doab Canal has been in progress. The Kussoor and Sobraon branches, which formed part of the original project, and which were suspended from want of funds several years ago, have now been re-commenced on an estimate amounting to £270,000. The Sirhind Canal, estimated to cost £2,250,000, and designed to convey the water of the Sutlej to irrigate the tract between that river and the Jumna Canal, including the lands belonging to His Highness the Mahárájá of Puttiala, has also been commenced.

"This will, I believe, be one of the most magnificent works that has ever been designed or carried out in this country, and I am happy to say that the Mahárájá has shown the greatest disposition to assist in the project.

"A general improvement of the Western Jumna Canal and the opening out of two important branches form the subject of another scheme, and a portion of the work has already been commenced.

"A project for a second canal from the Sutlej near Ferozepore, which will intercept the whole cold weather volume of the Beas, and give the means of irrigating the lower portion of the Bárí Doab, comprising an area of about 5,000 square miles, is also under investigation, and an estimate will probably be shortly before Government.

"A scheme for a system of canals from the Sardah, and which is likely to cost nearly five millions sterling, has recently been before the Government of India. The detailed estimates for this great work, which is designed to irrigate the greater part of Oude and portions of the Benares and Jounpore Districts, as well as to afford a navigable communication from the foot of the Himalaya to those places, are now being drawn out.

"If any person who takes an interest in these matters wishes to read a really able and interesting document, he might read the elaborate report of Captain Forbes, who is the best authority with regard to this scheme. We have it in our power to undertake great works in that district which will be as important as any that have ever been conducted in India. This is a slight sketch of what we are endeavouring to do for the furtherance of irrigation.

"I hope I am not detaining the Council, but I wish very briefly to refer to what has been done with regard to Railways during the ensuing year.

"The year 1870-71 will be a notable year in the Railway history of India. On the 31st December 1869, 4,264 miles of Railway were open in this country, and we expect 5,061 miles to be open on the 31st December 1870, or at all events before the close of the financial year, so that if our expectations are realized, as I believe they will be, the average number of miles opened within the year will be 801 miles.

"Of this, the Great Indian Peninsula Railway will open 238½ miles of the north-east extension and 158½ miles of the southern. The north-west extension of the Madras Railway will open 94½ miles, and the Bellary Branch of the same line 32 miles, Khamgaon 7½ miles, Oomraotee 5, and Delhi 32½ miles. The East Indian Railway will open its Chord line of 128½ miles, and the same Company the Kurhurbaree Branch of 24½ miles. The Eastern Bengal Railway will open the Goalundo Extension of 45 miles, and the Oude and Rohilkhand Railway, Byrom Ghât, 40 miles, making, as I said before, a total of 801 miles of Railway to be opened during the present year in India.

"This is the greatest number of miles that has ever been opened in any one single year. In the year 1861, 745 miles were opened, and in 1862, 770 miles. The next largest number opened in one year was in 1864, when 446 miles were opened, but in 1868 we have only opened 80 miles of Railway. However, I hope the honour will be reserved for 1870 to witness within the year by far the greatest number of miles of Railway ever given to public use since Railway construction was first commenced in India.

"The Council are doubtless aware that a great scheme has been laid down which we propose in the matter of Railways, as far as possible, to adhere to, and that is the scheme for the construction of about 15,000 miles of Railway. Of this 4,000 miles are already opened, 1,000 are in progress and 900 are about to be commenced. We are actually at this moment endeavouring to do something more or less on fifteen different lines of new Railways. I should like, therefore, to mention very briefly to the Council what the principal of these undertakings are.

"From Delhi and Agra it is proposed to make a Railway to the Sámbhar Lake, which will, we believe, confer enormous advantages on the people of those districts by carrying corn and grain for their consumption, and bringing back return freights of salt and other productions of the district. Part of this system will also pass through the salt district of Sultánpúr near

Delhi. I am happy to say that the surveys of the Agra and Delhi Districts of these lines are very far advanced, and we have every reason to hope that, on the Delhi section, work will be almost immediately commenced. The estimates for the whole undertaking will be furnished during the ensuing year, and there is no reason why the actual work of this important line both in the Agra and Delhi divisions should not be commenced during the ensuing cold weather.

"On the Panjáb State Railway, very considerable progress is being made. The whole of the line has been surveyed between Jhelum and Lahore. The designs for the three great bridges over the Rávi, Chenáb and Jhelum are in progress, and we hope very soon to send home to the Home Government an estimate of, and the necessary orders for, the iron necessary for the construction of these great bridges.

"Notwithstanding the great expenditure which we shall be obliged to make upon these bridges, we believe that the estimates fully justify us in stating that the whole of that line from Lahore to Jhelum ought to be constructed at a cost of something like £11,500 a mile. The surveys through the South Panjáb for the Indus Valley line have been already commenced, and Major Macleod Innes and a party of officers have been engaged during the cold weather in the surveys of that important line in the direction of Sukkur. An Engineer was sent out from England to survey a most important line of Railway between Karwár and the cotton-producing districts of the Southern Mahratta country. Unfortunately, this gentleman arrived too late to make a satisfactory survey. It has therefore been necessary, before the location was finally determined on, to cause a further investigation of the district to take place, but I am in great hopes that, before very long, the Government will be in a position to decide as to the exact direction the line ought to take. I must say, however, that it is likely to be an expensive line.

"In the north of the Bombay Presidency, considerable Railway extension has been sanctioned.

"The Bombay and Baroda Railway, the length of which is about 73 miles, is already in course of progress, and the construction of the line to Verungaum and Wudwan will be commenced as soon as the estimates are sanctioned.

"Madras also shares very largely in Railway extension.

"The Tramway Company's little line to Conjeveram, of which 19 miles will be re-laid on the standard gauge, is about to be extended 84 miles to Cuddalore. It will be re-named the 'Carnatic Railway,' and in respect to guarantee will be placed in the same position as the other Railways in India.

"It is hoped that a branch of this line will be made to Pondicherry, and the French Government have already expressed their desire to assist in the undertaking.

"Another line, 210 miles in length, from the present line to Tuticorin, is about to be constructed by the Great Southern of India Company. The surveys have been already undertaken, and it is hoped before long that the works will be commenced.

"In Burma surveys have been made from Rangoon to Prome, a distance of 168 miles.

"Investigations have been authorized, and from a communication received from the Chief Commissioner, it is hoped that advantage will be taken of converting the existing road into a line of Railway.

"In Bengal surveys have been authorized under direct Government agency for determining the best lines; but it is distinctly understood that the Government's having authorized these surveys, does not settle the question that they are to be constructed by direct Government agency.

"Much progress has yet to be made in the extension of the Eastern Bengal Railway to Goalunda.

"The delay in the construction of this work has been mainly due to the unfortunate accident at the Gorai Bridge.

"Further north, beyond the Ganges, the Oudh and Rohilkhand Company are pushing on their works.

"The Cawnpore Bridge is rapidly approaching completion, and we hope that before very long the Ganges will be bridged for the first time.

"The designs for the erection of another great bridge across the Ganges at Rájghât have been approved, and the earth-works for nearly the whole of the system of the Oudh and Rohilkhand Railway have been marked out.

"We believe that this system of lines under the able direction of the officers of the Company is likely to be made more cheaply and with greater economy than any Railway that has hitherto been made under guarantee in India, and General Beadle informed me the other day that, including the large bridges over the Ganges, he hoped that the average cost of the Oudh and Rohilkhand Railway would not exceed £11,000 a mile.

"A portion of this system includes the line from Moradabad to Ramnagar and the foot of the Himalayas and running near the Kumaon Iron Works, about 45 miles in length.

"In the Central Provinces orders have been lately issued by the Government for the survey of the line which will convey coal and iron lately discovered in those districts, and we hope during the ensuing year, the work will be actually commenced. The surveys east of the Wurdah have already been completed; we hope before a month or six weeks are over, we shall be in a position to decide with regard to the Oomraottee Branch in the Berars.

"But the two most important of the year in Railway are those connected with the Hyderabad State Railway and the proposed Railway to Indore.

"I am sure the public have heard with the greatest satisfaction that two Native Governments have proposed to come forward and subscribe a million of money each for Railway construction in their respective States.

"Sir Salar Jung has already made financial arrangements to construct a branch line from Goolburga to Hyderabad entirely at the expense of the Hyderabad State, and though it will really be under British management and constructed by British Engineers in a way similar to State-railways, it will be essentially the property of the Nizam's Government, and before three years and a half are over, we may hope that the Hyderabad State will be in possession of a Railway of its own.

"The Mahárájá Holkar has also made a proposition of a different kind, but which will have precisely the same result. He has agreed to lend

the Government at 4½ per cent. a million of money to construct a line which will meet the Great Indian Peninsula system somewhere near Khundwah.

"The financial arrangements in this matter have been perfectly satisfactory, and His Highness has proposed to place at the disposal of the Government of India more than half the amount in the first two years, the remainder being paid by instalments spread over a greater length of time.

"There is therefore no reason to doubt that, before very long, we shall see, in India two great Railways in process of construction entirely by capital supplied by Native States, one of which has determined to do the whole thing itself, and the other to place a sufficient sum in the hands of the Government to carry out the enterprise.

"In many ways the Government are endeavouring to provide materials for the construction of those works which they are about to undertake, with, if possible, much greater expedition and less waste of time than has hitherto attended their action in this respect.

"Attention has also been given to the provision of fuel; various investigations are being made in different directions with regard to coal and petroleum, which has been long known to exist in small quantities in the Panjáb and other parts of India.

"We hope that the Nerbudda Valley and also the Chanda District will before long produce a large supply of coal: we have heard of the existence of a large quantity of coal on the Godavery, and we have every prospect that during the ensuing year, or eighteen months, we shall be in a position to say that there is in this country a supply of coal sufficient to work a very large portion of the Railways at present in existence as well as those about to be constructed.

"Of course some districts will always be so remote that we cannot venture to hope that they will derive any very material benefit from this increase in the supply of coal, and for this reason efforts are about to be made in these cases to increase the supply of wood-fuel as much as possible.

"It is very late, and had I more time I could have brought to your notice many other interesting facts with regard to this important matter; but I am satisfied that, even brief and imperfect as is the statement I have now made, it will attract some attention generally to this subject; and I can truly say that there is nothing the Government of India value more than public support in these gigantic undertakings, which have no other object but the general good of the people of this vast empire."

The Motion was put and agreed to.

The Hon'ble SIR RICHARD TEMPLE having then applied to His Excellency the President to suspend the Rules for the Conduct of Business,

The President declared the Rules suspended.

The Hon'ble SIR RICHARD TEMPLE then introduced the Bill, and moved that it be referred to a Select Committee with instructions to report in a week.

The Motion was put and agreed to.

CUSTOMS DUTIES' BILL.

The Hon'ble SIR RICHARD TEMPLE then moved for leave to introduce a Bill to amend the law relating to Customs Duties.

The Motion was put and agreed to.

The Hon'ble SIR RICHARD TEMPLE then applied to His Excellency the President to suspend the Rules for the Conduct of Business,

The President declared the Rules suspended.

The Hon'ble SIR RICHARD TEMPLE then introduced the Bill, and moved that it be referred to a Select Committee with instructions to report in a week.

The Motion was put and agreed to.

The following Select Committees were named:—

On the Bill for imposing duties on Income and Profits arising from Offices, Property, Professions and Trades—The Hon'ble Messrs. Stephen, Forbes, Cowie, Chapman, Bullen Smith, Cockerell and the Mover.

On the Bill to amend the law relating to Customs' Duties—The Hon'ble Messrs. Stephen, Forbes, Cowie, Chapman, Bullen Smith and the Mover.

The Council adjourned to the 5th April 1870.

WHITLEY STOKES,
Secy. to the Council of the Govr. Genl. for making Laws and Regulations.

CALCUTTA,
The 2nd April 1870.

ENGLAND AND INDIA.

Stores...	294,400	
Miscellaneous	650	
		295,050
Extraordinary—		
Stores	264,000	
Payments on account of Calcutta and South-Eastern Railway ...	10,550	
		274,550
		569,600

The first item appears to be somewhat over-estimated, and may perhaps be reduced to £121,000. On this point the Financial Department have already been addressed in Public Works Department Office Memorandum No. 113 A—G, dated 25th February 1870.

4. Compared with the reduced grants for the current year, the allotment for 1870-71 stands as follows, but it is doubtful if the grant of 1869-70 for Extraordinary works will all be spent :—

	Grant, 1869-70.	Grant, 1870-71.	Difference. Increase.	Difference. Decrease.	Remarks.
Ordinary.	£	£	£	£	
Public Works	A 4,896,800	3,998,400	...	898,400	A. Includes additional grant of £ 22,800 to Bombay, and £ 2,500 to Rajpootana.
State outlay on Guaranteed Railways	159,450	145,360	...	14,090	
Loss by Railway exchange ...	B 237,000	202,000	...	35,000	B. Regular-Estimate.
State outlay on Railways ...	13,000	12,500	...	500	
	5,306,250	4,358,260	...	947,990	
Extraordinary.					
Irrigation Works	1,650,000	1,732,500	82,500	...	
State outlay on Railways ...	253,800	1,229,800	976,000	...	
Bombay Special Fund	500,000	...	...	500,000	
Port Trust Works	45,000	155,000	110,000	...	
East Coast Canal, Madras ..	7,000	...	...	7,000	
	2,455,800	3,117,300	661,500	...	
Grand Total ...	7,762,050	7,475,560	...	282,490	

5. The grant for 1869-70 *excludes* value of stores from London, whereas the grant for 1870-71 includes them. The reduction in the grant under head "Public Works" is really therefore £1,164,000, as follows :—

	£
Reduction as shown in above statement	898,400
Add probable payment in England during 1869-70 for stores for the Public Works Department not provided for in Public Works grant	265,595
Total ...	1,163,995

This reduction is further exclusive of the charges heretofore debited to the Bombay Special Fund, but which have now to be provided for from the Ordinary grant owing to the abolition of that Fund.

Public Works Revenue.

6. The estimated receipts under this head during 1870-71 amount to £ 588,110 as follows, as compared with the revised Regular-Estimate of 1869-70 :—

	1870-71.	1869-70.	Decrease.
	£	£	£
Revenue, Miscellaneous	117,870	130,000	12,130
„ Irrigation	(A) 462,740	522,990	60,250
„ Calcutta and South-Eastern Railway ...	7,500	7,500	...
„ Bombay Special Fund...	...	22,970	22,970
	588,110	683,460	95,350

(A.) Includes £7,400 transferred from the Forest Budget estimate on account of probable receipts from Canal Plantations in N. W. P. and Punjab.

7. The decrease of £12,130 under head "Revenue, Miscellaneous" is due to the exclusion from the estimate of the value of stores supplied by the Secretary of State for Foreign States, Local Funds and Government workshops, which are now to be adjusted, not by a credit to Revenue, but by means of a remittance account. The reduction due to this cause, which is merely nominal, is about £28,200.

8. There is a decrease in Irrigation revenue of £ 60,250. The receipts in 1869-70 have been exceptionally large owing to the drought of the previous year.

9. No receipts are expected during 1870-71 on account of the late Bombay Special Fund.

10. An abstract of the estimated total receipts and disbursements of the Public Works Department on all accounts is also submitted herewith.

Calcutta,
9th March 1870.

G. CHESNEY,
Accountant General.

Note.—In this estimate the credits and debits to London on account of Capital and Revenue Account of Guaranteed Railways have been omitted, the same being shown in the Railway Budget-Estimate.

W

Note by LIEUT.-COL. G. CHESNEY, *Accountant General, Public Works Department, on the Budget-Estimate of Guaranteed Railways for* 1870-71.

I submit herewith the Budget-Estimate of Guaranteed Railways for 1870-71, compared with the Regular and Budget-Estimates of 1869-70, and based on the orders of the Government of India on the several Provincial Budget-Estimates. The following points may be noted:—

STATE EXPENDITURE.

2. The Regular-Estimate for 1869-70, excluding outlay debitable to the Bombay Special Fund, amounts to £375,620 against a Budget-Estimate of £174,050, but the increase of £201,570 is nominal only, being due to the change sanctioned in Financial Department Resolution No. 4378, dated 30th October 1869, under which the exchange account is to be shown in the gross, loss and gain being entered on both sides of the account. This estimate of gain for 1869-70 is £238,000, so that the net Ordinary State charges for Guaranteed Railways, excluding interest, amount to £137,620 against a Budget-Estimate of £174,050.

3. For 1870-71 the State charges amount to £347,360, of which £202,000 is on account of gross loss by exchange, the gross gain being £ 265,630. The balance of charge, £145,360, is for Establishment and Purchase of Land as follows:—

	1870-71. Budget-Estimate.	1869-70. Regular-Estimate.	Increase.
	£	£	£
Establishment	45,980	42,600	3,380
Purchase of land	99,380	96,020	3,360
	145,360	138,620	6,740

4. The increase of £3,380 under Establishment is made up of £1,000 for Military pay of Officers of Engineers seconded; the pay of a Deputy Consulting Engineer for Railways in Oudh; an increase in the pay of the Deputy Consulting Engineer in Punjab; and £1,200 for Establishment for examining and registering lands in possession of Railway Companies in Bombay.

5. The charges from 1864-65 have been as follows:—

	£
1864-65	30,705
1865-66	37,813
1866-67 (11 months)	34,511
1867-68	41,090
1868-69	38,502
1869-70 (Regular-Estimate)	42,600
1870-71 (Budget-Estimate)	45,980

6. Of the estimate of £99,380 for land, £51,500 is for the reclamation of Back Bay, and the purchase of property to give access to the new Railway terminus at Colaba. The abolition of the Bombay Special Fund has thrown this amount as a charge against Ordinary Revenue. Omitting this, the ordinary estimated charge for State expenditure on Railways for 1870-71 would have been only £ 93,860, against an estimated charge of £ 138,620 for 1869-70.

7. The following reductions have been made by the Government of India in the several Provincial Budget-Estimates for 1870-71:—

GOVERNMENTS AND ADMINISTRATIONS.	AMOUNT OF ESTIMATE AS SUBMITTED.	AMOUNT AS PASSED.	DECREASE.
	£	£	£
Madras	20,367	20,470	+ 103
Bombay	156,061	80,700	75,361
Bengal	26,930	14,000	12,930
North-Western Provinces	25,000	15,400	9,600
Punjab	6,350	5,700	650
Central Provinces	55	...	55
Oudh	9,015	9,090	+ 75
	243,778	145,360	98,418

NET ADVANCES IN INDIA ON ACCOUNT OF GUARANTEED RAILWAYS.

8. The Regular-Estimate under this head for 1869-70 amounts to £ 2,936,700, the Budget-Estimate for 1870-71 being £ 2,871,800. If these sums are spent, the aggregate of the Capital Account of the several Railway Companies will be as follows:—

Receipts.

	£
Amounts received from the several Railway Companies on account of Capital and Debentures up to end of 1868-69	82,376,625
Estimated receipts in 1869-70	4,051,000
Ditto ditto in 1870-71	4,624,000
... ...	

Withdrawals.

Amount withdrawn to end of 1868-69, *viz.*—

	£	
In England	31,553,110	
„ India	47,527,412	
		79,080,522
Estimated withdrawals in 1869-70—		
In England	2,370,000	
„ India	2,936,700	
		5,306,700
Estimated withdrawals in 1870-71—		
In England	2,297,000	
„ India	2,871,800	
		5,168,800
		89,556,022
Estimated balance at credit of several Companies on 1st April 1871 ...		1,495,603

9. No information is available as to the items comprising the estimated withdrawals in England during 1869-70 and 1870-71. The expenditure in England amounts to nearly as much as is incurred in India, and I merely draw attention to the circumstance as indicating the necessity for the exercise of as great a check in England as in India, to prevent the undue expansion of the Capital Account.

ESTIMATE OF TRAFFIC EARNINGS.

10. The Regular-Estimate for 1869-70 amounts to £2,539,000, being £65,700 less than the Budget-Estimate, and but for a special credit of £135,000 to the Revenue Account on account of value of stores transferred from debit of Revenue to that of Capital, Sindh Railway, the difference would have been £200,700.

11. This large difference is due to a payment of £81,300 to the East Indian Railway on account of the moiety of the surplus profits for the first half of 1869, and to a general falling off in the traffic earnings in the Railways under the Government of Bombay, in the Jubbulpoor Extension of the East Indian Railway, the Eastern Bengal Railway, the Punjab Railway, and the Oudh and Rohilkhund Railway.

12. For 1870-71 the estimate of traffic earnings, after deduction of a sum of £90,000 on account of moiety of surplus profits East Indian Railway to be paid to shareholders, amounts to £2,840,570. This is on the supposition that the line to Bombay and some further portions of the Delhi Railway will be open for traffic by the 1st April 1870. Strict economy in the working expenses has also been calculated upon.

13. The estimated payments during 1870-71 on account of Guaranteed Interest amount to £4,363,000, so that the net charge on the Indian Revenues under this head amounts to £1,522,430, the estimated charge for 1869-70 being £1,594,870.

14. The following Statement of the probable transactions of the Madras Irrigation and Canal Company is given:—

	Budget-Estimate, 1870-71.	Regular-Estimate, 1869-70.	Budget-Estimate, 1869-70.
	£	£	£
Advances on Construction Account.			
Amount to be obtained in India ...	...	...	5,500
„ „ in England ...	137,500	172,900	214,500
	137,500	172,900	220,000
Revenue Account.			
Gross earnings	9,900	1,630	9,900
Working expenses	2,300	500	2,300
Net Revenue ...	7,600	1,130	7,600

The falling off in the estimated net Revenue of 1869-70 is explained to be due to the main and distributary channels having been in a much less forward condition than was expected.

FORT WILLIAM,
The 25th February, 1870.

G. CHESNEY,
Accountant General.

FINAL ESTIMATE OF GUARANTEED RAILWAYS FOR 1869-70.

Nos. 140—5 A—R, dated 16th March, 1870.

RESOLUTION—By the Government of India, P. W. Dept.

Read the following :—

Note by LIEUT.-COL. G. CHESNEY, *Accountant General, Public Works Department, on the final guaranteed Railway Estimate for* 1869-70.

The Railway regular-estimate for 1869-70 has already been submitted to the Financial Department, but the figures to be finally adopted in the Financial Statement have still to be reported. With this view I beg to submit the following remarks on the subject :—

Advances on Construction Account.

2. The following table shows the probable net advances during 1869-70, compared with the net amount advanced in 1868-69, and the regular estimate for the current year :—

	Amounts advanced up to end of January.		Amounts for February and March.		Total.		
	1868-69.	1869-70.	1868-69.	1869-70 (estimated).	1868-69.	1869-70, present final estimate.	Regular-estimate.
	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.
Madras Railway, North-West Line	18,34,520	14,79,483	4,05,574	4,10,000	22,40,094	19,26,384	20,50,000
Ditto, South-West Line		36,901					
Great Southern of India Railway	3,43,745	3,41,156	68,562	70,000	4,12,307	4,11,156	2,50,000
Great Indian Peninsula Railway ...	81,90,740	60,68,893	24,30,251	25,00,000	1,06,20,991	85,68,893	1,00,00,000
B. B. and C. I. Railway	7,03,502	1,00,086	1,38,165	35,000	8,41,667	1,35,086	6,00,000
Sindh Railway	—15,75,939	10,72,412	83,386	1,00,000	—14,92,553	11,72,412	12,50,000
Indus Flotilla	60,589	1,318	4,63,259	5,000	5,23,848	6,318	—13,000
E. I. Railway, Main Line ...	18,07,964	44,36,405	11,84,628	3,18,595	29,92,592	47,50,000	77,00,000
Ditto, Jubbulpoor Line ...	15,19,621	4,72,639	1,00,000	77,361	16,19,621	5,50,000	3,50,000
Eastern Bengal Railway	13,17,397	12,62,793	2,40,021	1,62,207	15,57,418	14,25,000	15,00,000
Punjab Railway	2,14,182	—2,75,777	1,11,515	...	3,25,697	—2,75,777	—2,50,000
Delhi Railway	54,72,529	36,16,927	11,80,316	8,00,000	66,52,845	44,16,927	50,00,000
Oudh and Rohilkund Railway ...	5,93,877	15,04,668	2,37,646	5,00,000	8,31,523	20,04,668	33,00,000
	2,04,82,727	2,01,17,904	66,43,323	49,73,163	2,71,26,050	2,50,91,067	3,17,37,000

3. With reference to the results shown in this table, the Financial Department may perhaps be informed that the net advances on Construction account for Guaranteed Railways during 1869-70 may be taken at 251 lakhs, *viz.* :—

	Lakhs.
For Railways on which the rate of exchange is calculated at the rate of 1*s.* 10*d.* the rupee	231
For Oudh and Rohilkund Railway	20
Total ...	251

4. The gross loss by exchange will thus be Rs. 19,25,000 instead of Rs. 23,70,000 as entered in the regular estimate.

Net Profits.

5. The following statement shews the probable declared net profits of the several Railways for the year 1869.—

	Declared profits for the half-year ending 30th June 1869.	Estimated by Consulting Engineer for half-year ending 31st December.	Total.	Regular-Estimate.
	Rs.	Rs.	Rs.	Rs.
Madras Railway, North-West Line	3,90,211	5,33,696	9,23,907	10,00,000
Ditto, South-West Line	12,47,980	9,51,748	21,99,728	25,00,000
Great Southern of India Railway	1,39,533	1,41,282	2,80,815	4,00,000

Delhi Railway	3,75,929	A2,50,000	6,25,929	6,00,000
Oudh and Rohilkund Railway	13,018	25,537	38,555	23,000
Indian Tramway	9,175	82	9,257	10,000
Total ...	1,69,69,262	1,15,70,075	2,85,39,337	2,72,33,000

A.—Estimated in this Office.

6. It is however necessary that the amount to be brought to account in the finance accounts as net traffic earnings should consist of the probable declared net profits of the official year ; this is obtainable from the following table :—

	Profits for 1869 as per column 4 of preceding statement.	Less sum included therein as net earnings of the first 3 months of 1869.	Balance for the last 9 months of 1869.	Add net Traffic receipts of January and February as estimated by Consulting Engineer.	Add net receipts as estimated in this Office for March 1870.	Total, Final Estimate, 1869-70.	Regular-Estimate, 1869-70.
	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.
Madras Railway, North-West Line	9,23,907	1,42,613	7,81,294	76,202	38,000	8,95,496	10,00,000
Ditto, South-West Line	21,99,728	5,98,593	16,01,135	3,03,792	1,55,000	20,59,927	25,00,000

Bombay, Baroda and Central India Railway ...	17,38,446	3,35,537	14,02,909	4,73,000	2,36,000	21,11,909	11,00,000
Sindh Railway ...	1,83,891	50,289	1,33,602	30,000	15,000	1,78,602	—1,00,000
Indus Flotilla ...	2,23,174	58,100	1,65,074	14,000	7,000	1,86,074	1,50,000
East Indian Railway, Main Line	1,61,73,908	47,81,515	1,13,92,393	33,72,500	16,00,000	1,63,64,893	1,55,00,000
Ditto, Jubbulpoor Line ...	— 1,11,756	— 64,275	— 47,481	...	...	—47,481	—2,00,000
Eastern Bengal Railway ...	9,04,834	2,34,393	6,70,441	1,50,000	75,000	8,95,441	7,70,000
Punjab Railway ...	1,14,067	81,443	32,624	15,000	7,000	54,624	80,000
Delhi Railway ...	6,25,929	1,18,145	5,07,784	1,00,000	50,000	6,57,784	60,00,000
Oudh and Rohilkund Railway ...	38,555	14,850	23,705	12,712	6,000	42,417	23,000
Indian Tramway ...	9,257	3,383	5,874	361	180	6,415	10,000
Total ...	2,85,39,337	88,10,486	1,97,28,911	58,25,567	28,29,180	2,83,83,658	2,72,33,000

7. On the whole, then, the final estimate of net receipts may be adopted as follows :—

		Rs.
Estimated net profits as per above table	... ...	2,83,84,000
Add value of stores transferred from debit of Revenue to that of Capital Sindh Railway, which having diminished the net receipts on account of traffic earnings of previous years as shown in the Finance and Revenue Accounts may now be fairly brought to credit as Revenue	... ...	13,50,000
Total	... ...	2,97,34,000
Less moiety of surplus profits paid to shareholders, East Indian Railway	... ...	8,13,000
Net receipts	... ...	2,89,21,000
Less gain by exchange on Rs. 2,97,34,000	... ...	24,78,000
Net amount in English currency	... ...	£ 2,644,300
Add amount refunded in England on account of loss in working the Jubbulpoor Line	... ...	„ 10,244
Total	...	£ 2,654,544
The regular-estimate already submitted being	...	„ 2,539,000

RESOLUTION.—With reference to the wide difference between the regular estimate of Construction outlay and the estimate now sent forward, the Governor General in Council desires that it may be recorded that serious notice will be taken in this Department of the inaccuracy of the Provincial regular-estimates if the actuals are hereafter found to confirm the correctness of the figures now recommended by the Accountant General, Public Works Department.

ORDER.—Ordered, that copy of this Note be forwarded to the Financial Department for information, with the remark that the suggestions made in it by the Accountant General, Public Works Department, are concurred in by the Governor General in Council in this Department.

Ordered also, that a copy be forwarded to the several Governments and Administrations in the Railway Branch noted in the margin, for information.

Governments of Madras, Bombay, Bengal, and Punjab, and Chief Commissioner, Oudh.

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

Budget-Estimate of expenditure on State Railways during 1870-71.*

	BUDGET-ESTIMATE, 1870-71.		
	In India.	In England.	Total.
EXTRAORDINARY.	Rs.	Rs.	Rs.
Bombay.			
Hooblee and Carwar Railway	1,50,000	...	1,50,000

Total ...		7,50,000		Net Revenue ...	15,000

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

PUBLIC WORKS BUDGET ORDERS, 1870-71.

MADRAS BUDGET ORDERS, 1870-71.

The Madras Budget-Estimate for 1870-71 has been prepared under the head Ordinary for the original grant of Rs. 60 lakhs assigned in Public Works Department Circular No. 96 of 1869. This was reduced in Public Works Department Circular No. 104 of 1869 to Rs. 55¼ lakhs, and in order to make up the difference, the Government of Madras have since suggested the following reductions in the estimate :—

	Rs.
Under head "Original Works," "Miscellaneous Public Improvement", Rs. 80,000 appropriated for the restoration of the Madras Pier	75,000
Reduction from 14 to 10 lakhs in Repairs, Agricultural ...	4,00,000
Total ...	4,75,000

2. The Ordinary Estimate for 1870-71 will thus stand as follows, as compared with the grant of 1869-70 :—

	1870-71.	1869-70.	Difference. Increase.	Difference. Decrease.
	Rs.	Rs.	Rs.	Rs.
Works and Repairs—				
Military	6,00,000	10,00,000	...	4,00,000
Agricultural	14,50,000	20,00,000	...	5,50,000
Other Services	18,35,810	35,80,720	...	17,44,910
Total ...	38,85,810	65,80,720	...	26,94,910
Tools and Plant ...	1,30,000	55,000	75,000	...
Establishment ... Establishment General...	13,76,360	13,74,990	1,370	...
Establishment ... Conservancy	90,610	87,470	3,140	...
Establishment ... Civil Engineering College	42,220	41,820	400	...
Grand Total ...	55,25,000	81,40,000	...	26,15,000

3. Thus, although there has been a total reduction of Rs. 26¼ lakhs, the charge for Establishment is actually higher than in the current year, and absorbs one-fourth of the total allotment. The Government of India cannot consider this to be a satisfactory arrangement, it being in effect that precisely as much establishment is to be employed as during 1869-70 to do just half as much work.

4. It may be admitted that establishment and work cannot always be maintained in a constant proportion, and that the former may often be of necessity comparatively expensive when the progress of work is diminished, especially if the decrease is made suddenly, but it has to be observed that in every other Province a vigorous effort has been made to bring down the establishment charges into some sort of reasonable harmony with the reduced scale of work, the persons thus set free having been absorbed on the Irrigation and other Extraordinary works, and the Government of India think it quite essential that something of the same kind should be carried out in Madras. In other parts of India the charge on this head does not even now exceed 20 per cent. on the total grant. The exact reduction to be made in Madras cannot be told till the promised report on the re-organization of establishments in that Presidency is received, but the Government of India think that in the meantime a reduction of at least 2 lakhs should be made, and it is now ordered accordingly.

5. The sum thus reduced is here added to the provision for Repairs, Agricultural, because the Government of Madras have heretofore strongly represented

that the sum provided for this purpose was not sufficient to protect the important interests at stake, so that it appears undesirable to allow the reduction of 4¾ lakhs in the total grant to fall chiefly on the allotment for this head of service. But it will of course be open to that Government to propose a different arrangement.

ORIGINAL WORKS.

Military.

6. *Item* 11. *Ulsoor Water Project, Bangalore. Computed expenditure to* 31*st March* 1870, *Rs.* 1,78,465. *Grant for* 1870-71, *Rs.* 30,000.—Passed on the understanding that the revised estimate for this work is furnished to the Government of India without any unnecessary delay.

7. *Item* 15. *Snider Ammunition Factory, Madras. Amount of estimate, Rs.* 71,500. *Grant for* 1870-71, *Rs.* 35,000.—As the factories at Kirkee and Dum-Dum are now in full progress of construction, the construction of this work may be postponed for the present, and the grant applied to the completion of others already in progress.

8. *Item* 16. *Lawrence Asylum Buildings, Ootacamund. Computed outlay to* 31*st March* 1870, *Rs.* 8,08,435. *Grant for* 1870-71, *Rs.* 70,200.—May stand, subject to the condition specified by the Government of Madras, that no outlay is incurred from that allotment until the revised estimate for the work has been sanctioned by the Government of India.

Civil Buildings.

9. It is suggested that, under the present reduced state of the grants, it will be desirable not to commence the undermentioned new buildings at present, and to apply the appropriations made for them to accelerate the progress of others already commenced :—

	Rs.
Item No. 23—Store-shed at Public Works Store Yard, Madras ...	15,000
„ „ 32—Sub-Magistrate's Cutcherry and Subsidiary Jail Maliahs	6,000
Items Nos. 34 to 38.— Ditto ditto, Vizagapatam District ...	17,780
	38,780

10. *Item* 25. *Preservation of Teroomalay Naick's Palace, Madura, Rs.* 10,000.—Under the explanation furnished by the Government of Madras, the grant is passed, but the work should be carried out on a regularly sanctioned estimate.

			Rs.
33.	Police Stations,	Ganjam	3,900
40.	„	„ Vizagapatam	6,000
44-7.	„	„ Kistna, Nellore, Cuddapah and Kurnool	8,600
42.	„	„ Godavery	2,500
50.	„	„ Bellary	8,000
52.	„	„ Madras	1,200
54.	„	„ North Arcot	2,500
55.	„	„ South Arcot	2,000
58.	„	„ Salem	2,000
60.	„	„ Tanjore	1,200
62.	„	„ Trichinopoly	1,700
63.	„	„ Coimbatore	2,800
67.	„	„ Malabar...	2,500
68.	„	„ South Canara	1,000
71 to 73.	„	„ Wynaad, Madura, and Tinnevelly ...	7,100
			58,000

11. *Items as per margin. Police Stations, Rs.* 53,000.—Remarks are made in the Budget-Estimate to the effect that these works are in progress on estimates, which it is understood have been sanctioned by the Government of Madras. The total estimated expenditure on the works is not shown, but it is understood to amount to Rs. 19 lakhs.

		Rs.
31.	Additions and alterations to Zillah Jail, Berhampoor ...	3,120
39.	Subsidiary Jail at Chodavaram	2,880
43.	Improvements to Jail at Guntoor	2,080
48.	Court-house, Bellary	20,000
49.	Improvements to Jail at Bellary	10,000
56.	Talook Cutcherry, Ahtoor	2,220
57.	Tehsildar's Cutcherry and Subsidiary Jail at Vaniembady	3,200
59.	Court-house, Tanjore	13,000
64.	Talook Cutcherry and Subsidiary Jail, Tellichery ...	2,400
65.	„ „ „ Munjerry ...	5,000
69.	Sub-Magistrate's house, Vyherry	2,500
70.	„ „ Goodalore	10,500
		76,900

12. *Items as per margin. Court-houses and Subsidiary Jails.*—It has to be noticed that the general scheme for carrying out these buildings was disapproved by the Government of India, *vide* Public Works Department Resolution Nos. 736—8 A, dated 31st August 1869. It is requested that no new works of this nature may be commenced until the questions raised in that Resolution have been disposed of.

13. *Items* 53 *and* 61. *Central Jails at Vellore and Trichinopoly. Grants for* 1870-71, *Rs.* 40,000 *and Rs.* 17,680, *respectively.*—The revised estimates for these works have not yet been sanctioned by the Government of India, pending reply to references made to the Government of Madras on the subject.

COMMUNICATIONS.

14. *Item* 109. *Constructing roads and clearing jungle in the Jeypoor country. Computed outlay to end of* 1869-70, *Rs.* 45,000. *Grant for* 1870-71, *Rs.* 10,000.—A formal estimate is no doubt impracticable here, but some distinct limit of expenditure should be placed on the Officer concerned in regard to each item of work to be undertaken by him.

15. *Items* 205, 206, *and* 207. *Roads in Wynaad. Computed expenditure to* 31*st March* 1870, *Rs.* 7,84,784. *Grant for* 1870-71, *Rs.* 60,000.—The proceedings of the Madras Government for October 1869 shew that orders have been given for the preparation of complete estimates for the various lines into which the group of roads has been divided. It is hoped that these will shortly be supplied.

MISCELLANEOUS PUBLIC IMPROVEMENT.

16. The grant under this head is reduced to Rs. 23,800 to make the allotment an even sum.

AGRICULTURAL, EXTRAORDINARY.

17. The following works have still to be sanctioned as chargeable to loan :—

	Rs.
Item 75.—Rooshkoolia Project...	50,000
Items 77 to 81.—Works in Godavery Delta	2,25,000
Item 90.—Improvements to Irrigation channels, Northern Delta ...	2,60,000
„ 93.—Chembrumbaukam Tank Project	2,00,000
„ 103.—Peryaur Project	50,000
	6,85,000

18. The estimates for Items 75 and 103 will require the sanction of the Secretary of State before they are commenced upon.

19. The estimates for Items 77 to 81 and 90 are understood to have been under consideration for some time. No expenditure can be authorized on them for the coming year until they are properly sanctioned.

20. The Government of India have not been satisfied that Item 93, Chembrumbaukam Tank Project, ought to be classed as Extraordinary. The Government of Madras should be asked to permit no more delay in sending up the revised estimate, and to state what reasons there may be for inferring that the work will prove remunerative. Meanwhile, no outlay on the work from Loan funds can be allowed to take place in the coming year.

21. *Item* 92. *Madras Water-supply Project. Amount of sanctioned estimate Rs.* 6,11,759. *Computed outlay to end of* 1869-70, *Rs.* 8,25,939. *Grant for* 1870-71, *Rs.* 2,00,000.—The supplementary estimate for this work, called for in Public Works Department letter No. 249 A—I, dated 20th December 1869, is awaited.

83 to 86—Works in the Kistna Delta. Revised estimates for the items noted in the margin should also be asked for at once.

REPAIRS.

22. It is anticipated that the reduction in the grant for Agricultural, Repairs, from 14 to 10 lakhs, may prove injurious to Irrigation works generally. In framing estimates for repair allotments, and comparing them with those of

past years, it has to be considered that a large sum is required for the maintenance of the numerous canals that have recently been opened out in the Deltas along the East Coast. The silt thrown into these canals must be cleared out if the supply of water is to be maintained, and as labour is very scarce, any neglect at the present time cannot be made up for by larger grants in future. In this view, the provision for 1870-71 is increased to Rs. 12 lakhs by transfer of Rs. two lakhs from the allotment for Establishment.

23. As regards the balance of the four lakhs reduced from the estimate, it is taken for granted that in selecting the agricultural works as the class which could easiest bear a reduction, the Government of Madras is quite satisfied that the important interests affected by those works will not suffer, or, otherwise, that it is intended to relieve Imperial revenues by requiring the cultivators to do more for themselves, either directly, or by means of an additional cess, towards the maintenance of the numerous petty tanks and other irrigation works scattered over the Presidency.

24. Under the head Communications, a provision of Rs. 11,019 has been made for repairs to Travellers' Bungalows. Sanction was accorded in Public Works Department letter No. 502A, dated 2nd June 1865, to these buildings being kept in repair from Imperial funds until they become self-supporting. In no other Province of India is this allowed, and with reference to the correspondence with the Government of Madras, terminating with Public Works Department letter No. 401A, dated 1st June 1868, the time appears to have arrived to discontinue grants from Imperial funds, and the Government of Madras should be requested to arrange accordingly with effect from 1871-72.

25. The provision of Rs. 3,960 from Imperial funds for repairs of station roads at Ootacamund, Coonoor and Kotagherry should apparently be paid for by local rates, as is done in all other Hill stations. The opinion of the Government of Madras is invited on this point.

ESTABLISHMENT.

26. The estimate amounts to Rs. 21,25,400, apportioned as follows :—

	Rs.
Imperial Ordinary	15,09,190
„ Extraordinary	3,00,000
Local funds	3,16,210
	21,25,400

The debit to Extraordinary appears reasonable, but the actual charge will of course have to be determined according to the rules laid down on the subject. The Ordinary grant, as already remarked, is reduced to Rs. 13,09,200. Immediate action will be needed to give effect to the reduction. In this view, among other measures which it is left to the Government of Madras to determine upon, it is requested that no promotions should be made until the supernumerary officers borne on the strength of the establishment are absorbed. The charge on the Public Works estimate for a Barrack Master should, if possible, be discontinued, and it should be seen whether the services of the two Mechanical Engineers, the nature of whose employment is not known to the Government of India, might not be dispensed with. Reduction can perhaps be made in the charges for petty and permanent and temporary Office establishments under all heads, as also in the charge for contingencies of the Civil Engineering College which appears high. The Draughtsmen who appear to be allowed for every Range, can hardly be necessary in all cases.

SUMMARY.

27. The following is an abstract of the Madras Budget-Estimate for 1870-71 as modified by the foregoing orders :—

	Original Works.			Repairs.	Establishment.	Tools and Plant.	State outlay on Guaranteed Railways and Irrigation Works.	Total.
	Major.	Minor.	Total.					
Ordinary.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.
Military	3,40,000	60,000	4,00,000	2,00,000	...	...	...	6,00,000
Agricultural.								
Works and Repairs ...	65,200	3,31,000	3,96,200	12,00,000	...	...	...	15,96,200
State outlay on Guaranteed Irrigation Works	...	...	...	...	...	...	53,800	53,800
	65,200	3,31,000	3,96,200	12,00,000	...	...	53,800	16,50,000
Other Services.								
Civil Buildings ...	4,17,000	70,000	4,87,000	1,10,000	...	...	...	5,97,000
Communications ...	2,00,000	70,000	2,70,000	9,30,000	...	...	...	12,00,000
Miscellaneous Public Improvement ...	13,800	10,000	23,800	15,000	...	...	...	38,800
Establishment ...	...	...	...	...	13,09,200	...	...	13,09,200
Tools and Plant ...	...	...	...	...	...	1,30,000	...	1,30,000
	6,30,800	1,50,000	7,80,800	10,55,000	13,09,200	1,30,000	...	32,75,000
	10,36,000	5,41,000	15,77,000	24,55,000	13,09,200	1,30,000	53,800	55,25,000
State outlay on Guaranteed Railways ...	...	...	...	...	...	...	2,05,000	2,05,000
Total Ordinary ...	10,36,000	5,41,000	15,77,000	24,55,000	13,09,200	1,30,000	2,58,800	57,30,000
Extraordinary.								
Irrigation Works ...	18,80,000	...	18,80,000	...	3,00,000	20,000	...	22,00,000
	29,16,000	5,41,000	34,57,000	24,55,000	16,09,200	1,50,000	2,58,800	79,30,000

Add grant from Local Funds to be disbursed by Officers of the Public Works Department—

	Rs.	
Original Works	12,36,020	
Repairs	6,97,780	
Establishment	3,16,210	
Tools and Plant	18,860	
		22,68,870
		1,01,98,870

28. It is observed that no estimates have been sanctioned for many of the works to be defrayed from Local funds. It appears just as objectionable to allow this in the case of Local funds as in the case of Imperial funds, and it is hoped that the Government of Madras will take steps for stopping the practice.

PUBLIC WORKS REVENUE.

29. The estimate amounts to Rs. 1,80,000, including Rs. 30,000 payment for stores supplied to the Workshops, but as under orders about to issue, the value of stores supplied from England for the several Government Workshops will be adjusted by means of a remittance account, and not by a credit to Public Works Revenue, the estimate will be reduced to Rs. 1,50,000.

Fort William ;
February 23, 1870.

R. STRACHEY, *Colonel, R. E.,*
Offg. Secy. to the Govt. of India.

BOMBAY BUDGET ORDERS, 1870-71.

One omission has been made in this otherwise complete and carefully prepared estimate. No references have been given in the column of remarks to the particulars of the authorities by whom estimates have been sanctioned, *vide* para. 13 of Standing Order No. 62 of 1864. Attention is requested to this point for the future, as it cannot be told from the Budget-Estimate for 1870-71 whether, or not, estimates for works have been sanctioned.

2. The final grant assigned for expenditure on Public Works from Imperial funds (excluding State expenditure on Railways) in Bombay during 1870-71 amounted to Rs. 1,07,25,000. The Budget-Estimate now submitted has been prepared for Rs. 1,37,09,820, the balance Rs. 29,84,820 being provided for as follows :—

	Rs.
From Local Funds and Contributions	14,40,520
„ Port Trust Funds	15,44,300
TOTAL ...	29,84,820

3. The provision for Port Trust works has been made in anticipation of arrangements being successfully carried through for the transfer of the Elphinstone property to Government. The Government of Bombay proposes that, in the event of any delay or difficulty occurring in the matter, the expenditure debitable to the Trust should be met by an advance or loan, and in case the transfer of the property is deferred, and negotiations are broken off with the Elphinstone Company, that funds for the works should be defrayed from Extraordinary sources.

4. It will readily be understood that neither of these proposals can be sanctioned until a specific plan has been brought forward and definitively settled. The subject cannot however be followed up in this place, and therefore the Government of Bombay will please to understand that the items which it is proposed to charge to the Port Trust are only allowed provisionally for an even sum of 15½ lakhs, subject to arrangements being definitively made for establishing that Trust, and that, meanwhile, no expenditure can be sanctioned for any of the proposed works.

5. The grant allowed for Extraordinary Irrigation Works was Rs. 27 lakhs. But as Rs. 1¼ lakhs will be available for such works by reason of the refund from the Ordinary grant on account of the expenditure incurred during 1867-68 and 1868-69 from Loan Funds on the Bhatowdee Tank Project, which has not been finally sanctioned as Extraordinary, the grant for next year will be reduced to Rs. 25¾ lakhs, and the ordinary grant to Rs. 79¼ lakhs from 80¼ lakhs, one lakh being taken off on account of the additional sum allowed for expenditure in 1869-70, *vide* Public Works Department telegram dated 21st February 1870. The total grant from Imperial funds for 1870-71, excluding outlay on Railways, will thus amount to Rs. 120½ lakhs, apportioned as follows :—

	Lakhs.	Lakhs.
Ordinary		79¼
Extraordinary—		
Irrigation	25¾	
Port Trust	15½	41¼
		120½

6. Should the Port Trust not be established by 1st April, it will be for the Government of Bombay to consider what arrangements can be made for re-distributing the ordinary expenditure so as to admit of the works provided for in this estimate from that source being carried on.

MILITARY.

7. *Item* 5.—*Improving the road from Sheerwul* viâ *Waee to Panchgunny, Rs.* 25,000.—This work was entered under the head "Military" in the Budget-Estimate for 1869-70; but the grant will be more properly placed under the head "Communications," and is transferred accordingly. By this transfer the provision for Original Works, Military, is reduced to Rs. 23¼ lakhs.

8. Estimates appear to be required for the following :—

	Rs.
Item 1.—Bombay Harbour Defences	3,00,000
„ 26.—Gun-Carriage Buildings, Kirkee ...	1,75,000
„ 27.—Cartridge Factory, Kirkee	1,00,000
„ 31.—Hydraulic Lift Dock, Bombay... ...	1,25,000

The absence of estimates for Nos. 1 and 31 is plainly unavoidable. It is requested that no expenditure may be incurred on Item 26, until the estimates for them have been sanctioned by competent authority.

9. *Item* 25.—*Buildings for Powder-works, Kirkee. Grant for* 1870-71, *Rs.* 1,75,000.—The estimates sanctioned for this work by the Government of India amount to Rs. 16,77,758, but the sum is here set down at Rs. 17,14,771. An explanation of the difference is requested. If it represents a supplementary estimate sanctioned by the Government of Bombay, the circumstance should have been noted in the column of remarks.

	Rs.
Original estimate sanctioned in Public Works Department letter No. 725 M, dated 13th July 1868	16,51,958
Supplementary estimate sanctioned in Public Works Department letter No. 1042 M, dated 17th October 1868	25,800
	16,77,758

CIVIL BUILDINGS.

10. *Item* 39.—*New Post Office, Bombay. Grant for* 1870-71, *Rs.* 1,25,000.—The estimate for this work, amounting to Rs. 5,98,928, was sanctioned in Public Works Department letter No. 113 C, dated 25th February 1869, but a revised estimate is now under the consideration of the Government of India, and early orders may be expected on it.

11. *Item* 50.—*Government House at Guneesh Khind. Computed outlay to end of* 1869-70, *Rs.* 11,22,000. *Grant for* 1870-71, *Rs. one lakh.*—It is requested that the revised estimate for this work may be furnished as early as possible, and that it may include all the subsidiary expenditure connected with the building. In a recent part of the Proceedings of the Bombay Government it has been observed that a very large further outlay has quite recently been proposed in connexion with this House, but that orders have been deferred on the estimates. It seems desirable that the position of the project as a whole should be now reviewed.

12. *Item* 57.—*School-house at Carwar. Amount of estimate and grant for* 1870-71, *Rs.* 19,880.—It is said that the plan for this work will be submitted to the Government of India, but this is not required.

13. *Items* 62 *to* 67.—*Police Stations. Grant for* 1870-71, *Rs.* 78,120.—Attention is drawn to para. 12 of the Budget Orders for 1869-70, and the wish of the Government of India to be informed, with reference to the Circular from the Home Department, No. 43, dated 15th July 1868, whether these buildings are in course of construction according to any general scheme approved of by competent authority.

AGRICULTURAL, EXTRAORDINARY.

ITEM No.	WORKS.	AMOUNT OF ESTIMATE.	COMPUTED OUTLAY TO END OF 1869-70.	GRANT, 1870-71.
		Rs.	Rs.	Rs.
70	Improving Biggaree Canal ...	4,01,699	1,42,000	50,000
71	Canal from Sukkur to Shadadpoor	7,29,820	5,75,000	75,000
86	Lakh Project	2,19,409	2,17,036	15,000
87	Palkbair Project	99,416	70,000	30,000
90	Moota Canal	30,58,984	7,80,000	10,00,000
92	Ekrookh Tank	9,45,613	7,00,000	1,55,000
		54,54,941	24,84,036	13,25,000

14. Of the works entered under this head, those noted in the margin have been specifically sanctioned as Extraordinary. The following have still to be so sanctioned :—

ITEM No.	WORKS.	AMOUNT OF ESTIMATE.	COMPUTED OUTLAY TO END OF 1869-70.	GRANT, 1870-71.
		Rs.		Rs.
77	Canal from Roree to Hyderabad...	2,00,35,691	...	5,00,000
84	Hathmuttee Project	6,42,093	...	2,00,000
91	Neera Canals	35,00,000	...	50,000
98	Gokak Canal	17,26,022	...	1,00,000
	TOTAL ...	2,59,03,806	...	8,50,000

15. The grant for the above four works, with the modification noted in para. 16, are allowed to stand on the condition that no expenditure is incurred on Items 77, 91 and 98, until the estimates for them have been furnished to, and sanctioned by, the Government of India and the Secretary of State. Item 84 has been commenced as a famine relief work. The Governor General in Council requests that as soon as pressure ceases, its progress may be stopped until the estimate for the work has been sanctioned by competent authority.

16. *Item* 85.—*Mooktee Nullah Reservoir. Grant for* 1870-71, *Rs.* 50,000.—**Funds for this work are provided for from the Ordinary grant, but as since the preparation of the Budget-Estimate the work has been sanctioned as Extraordinary, it can now be charged to that head. In this view, the allotment for Item 98 is reduced by Rs. 50,000, which amount is transferred to Item 85.**

	Rs.
Public Works Department letter No. 356 I, dated 26th November 1868	26,31,085
Public Works Department letter No. 207 I, dated 7th July 1869 ...	4,27,899
	30,58,984

17. It has to be noted that the amount of estimates as sanctioned by the Government of India for the Moota Canal, is only Rs. 30,58,984, and not Rs. 37,47,273 as entered in the Budget.

18. *Item* 86. *Lakh Project—Amount of estimate, Rs.* 2,19,409, *of which Rs.* 2,17,036 *has been spent.*—The revised estimate for this work will require the sanction of the Government of India. Meanwhile, the grant for 1870-71, Rs. 15,000, may stand.

AGRICULTURAL, ORDINARY.

19. No provision has been made, as required in Public Works Department letter No. 155 A—I, dated 20th July 1869, for a refund of the

expenditure of 1¼ lakhs incurred from Loan funds on the Bhatowdee Tank Project; in order to admit of this being done, the grants for the following works are reduced or disallowed :—

	Rs.
Item 72. *New mouth and clearance to the Ghar.*—Provision of Rs. 9,000 disallowed, as the funds for the work may be found from the grant for repairs	9,000
Item 76. *Clearance of jungle along the Narra.*—Provision of Rs. 18,000 disallowed, ditto ditto ...	18,000
Item 85. *Mooktee Nullah Reservoir.*—Funds provided from the grant for Extraordinary Irrigation Works	50,000
Item No. 99.—Grant for Minor Works reduced from Rs. 68,000 to Rs. 20,000	48,000
Total ...	1,25,000

By these reductions the grant for Original Works, Agricultural Ordinary, will stand as follows :—

	Rs.
Specific provision for ordinary works	2,75,000
Provision from ordinary grant to make good outlay improperly charged as extraordinary in former years	1,25,000
Total	4,00,000

20. **In making up the accounts of expenditure for 1870-71, the Controller should debit Rs. 1¼ lakhs of the outlay on Extraordinary works to the Ordinary grant; this will be equivalent to writing back to debit of head "Ordinary" the sum charged in 1867-68 and 1868-69 to the head "Extraordinary."**

21. *Item* 75.—*Completing Fordwah sluice, Rs.* 2,700.—It is understood that this work should have been described as *additions* to, and not *completion* of, sluice.

22. *Items* 78 *and* 93.—*Thurr Canal and Yerla Irrigation Project, Rs.* 32,000.—An expenditure of 1,27,215, excluding charges for Establishment and Tools and Plant, has been incurred on these two works from Loan funds, which must now be refunded from the Ordinary grant. The Government of Bombay has already been addressed on this point in Public Works Department letter No. 30A—I, dated 5th February 1870.

23. *Items* 79, 80 *and* 81.—***Cuts and Embankments in the bed of the Narra, Rs.*** 45,000.—**These works are understood to be mainly required to lead the waters to the Thurr Canal and the country beyond, as also to keep the channel within moderate limits, partly in view to reclaim land now liable to be flooded, and partly to prevent its running to waste into low ground. Under this view, it is thought that the expenditure and revenue should be incorporated with those of the Thurr Canal, or of the Narra generally, and that it would be proper to classify the head-works at Roree, the Mitrow Canal, Thurr Canal, and other channels from the Eastern Narra, under one head as Eastern Narra Irrigation Works.**

COMMUNICATIONS.

24. *Item* 101.—*Road from Dharwar Frontier to Carwar,* viâ *Arbyle Ghât. Amount of estimate, Rs.* 9,86,699. *Computed outlay to end of* 1869-70, *Rs.* 10,32,074. *Grant for* 1870-71, *Rs.* 1,50,000.—The grant may stand, but it is hoped that the revised estimate for the work will be soon furnished.

25. *Items* 107, 112, 126 *and* 127, *as per margin. Grant for* 1870-71, *Rs.* 2,22,500, *to be met from contributions by the Kolapoor State.*—The provision of Rs. 40,000 and of 80,000 for Items 112 and 127 respectively is disallowed, until the estimates for the works shall have been submitted to, and sanctioned by, the Government of India. As regards Item 126, information is desired as to the source from which the expenditure of Rs. 1,28,039 up to end of 1869-70 has been incurred. Meanwhile, the Government of India request that all further expenditure on the work may be stopped until the plans and estimate for it, which are said to be under consideration, are sanctioned by the Government of India.

Item No.	Works.	Amount of Estimate.	Grant, 1870-71.
		Rs.	Rs.
107	Improving road from Nepanee to Phoonda Ghât	27,566	27,500
112	Road from Nepanee to Phoonda Ghât	3,05,700	40,000
126	Bridge over the Panchgunga River	2,27,249	75,000
127	Bridge over the Krishna River..	3,63,444	80,000
		...	2,22,500

26. Information is desired also as to whether the contributions for the above works, and the contribution from the Barreah State, for the road from Dohud to Godra, have actually been realized.

27. *Item* 116.—*Road from Gagoda Khind to Campolee. Amount of estimate, Rs.* 1,59,986. *Grant for* 1870-71, *Rs.* 50,000.

Item 129.—*Bridge across the Moota River at Poona. Amount of estimate, Rs.* 1,92,215. *Grant for* 1870-71, *Rs.* 50,000.

Both of these are new works, the construction of which might perhaps be advantageously deferred for the present. It is suggested that the provision for them should be applied to meet the reduction made in para. 5.

28. *Item* 128.—*Bridge over the Quoina River at Kurrar.*—The sum sanctioned for this work, Rs. 3,60,742, has been expended, and a grant of Rs. 75,000 is proposed for 1870-71. This may stand, but the revised estimate for the work, which is said to be under preparation, should be forwarded for the orders of the Government of India as soon as possible.

29. The grant for Original Works, Communications, from Imperial funds will be as follows :—

	Rs.
Amount provided in Budget-Estimate	8,00,000
Add for Item 5—Improving road from Sheerwal to Panchgunny	25,000
	8,25,000
Less reduction in para. 27 above	1,00,000
Net grant for 1870-71 ...	7,25,000

Miscellaneous Public Improvement.

30. The grants passed are Rs. 2,65,000 for the Kurrachee Harbour Works, and Rs. 10,000 for Minor Works. In addition to this, the following sums are provisionally allowed for the Bombay Port Trust :—

	Rs.
Improvements to Apollo Pier	2,34,000
Reclaiming Gun-Carriage premises	35,300
Lighthouse on South-West Prongs	2,00,000
Moody Bay Reclamation	10,05,700
	14,75,000

The revised estimate for the Moody Bay works will require to be sent forward to the Government of India.

Repairs.

31. Under the head Military, a provision of Rs. 45,000 has been made from Imperial funds for repairs to roads in the Civil and Military Lines in the Cantonments of Poona and Kirkee. In Public Works Department letter No. 26A—B, dated 16th October 1869, the grant for this purpose was restricted to Rs. 13,000 per annum; and in Public Works Department letter No. 88A—B, dated 11th December 1869, an opinion was expressed that the sum of Rs. 30,000 proposed for the maintenance of roads in the Military Station was excessive, and that means should be found to reduce the charge against Imperial Revenues. This does not appear to have been done, but the Governor General in Council would request that the charge may be reduced to the sum fixed by the Government of India, the balance of the grant available being applied, at the discretion of the Government of Bombay, to augment the grant for any other sanctioned object under the head "Military".

Establishment.

32. The Budget-Estimate for this head of service amounts to Rs. 21 lakhs, distributed as follows, as compared with the Budget-Estimate of 1869-70 :—

	1870-71. Rs.	1869-70. Rs.
Ordinary grant	15,00,000	17,50,000
Port Trust	75,000	.....
Special Fund	.....	2,00,000
Local Funds	75,000	50,000
Extraordinary grant	4,50,000	4,00,000
	21,00,000	24,00,000

33. This distribution appears suitable, but the actual incidence of the expenditure will have to follow the rules laid down, and the debit to Local funds is subject to such further orders as may be passed on receipt of the Local Fund Public Works Budget-Estimate for 1870-71.

34. A provision of Rs. 1,200 has been made in the estimate for cooly allowance to Executive Engineer, Aden. The nature of this charge should be explained, and whether the provision of Rs. 45,000 for grain compensation to members of the permanent establishment receiving less than Rs. 200 per mensem is now still necessary.

Summary.

35. The following is an abstract of the Bombay Budget-Estimate for 1870-71 as modified by these orders :—

	Original Works.			Repairs.	Establishment.	Tools and Plant.	Railways.	Total.
Ordinary.	Major.	Minor.	Total.					
	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.
Military	21,25,000	2,00,000	23,25,000	4,50,000	...	...	...	27,75,000
Agricultural	3,80,000	20,000	4,00,000	5,00,000	...	...	...	9,00,000
Other Services—								
Civil Buildings	9,02,900	97,100	10,00,000	2,50,000	...	...	...	12,50,000

36. In addition to the above, an expenditure of Rs. 13¼ lakhs, as per margin, is to be debited to Local funds and contributions. This is exclusive of the large expenditure that is to be incurred from Local funds, and provided for in the Local Fund Public Works Budget-Estimate for 1870-71.

	Rs.
Contributions.	
Military	22,260
Civil Buildings	4,66,140
Communications	3,06,820
Total	7,95,520
Local Funds.	
Communications	5,70,000
Establishment	75,000
Total	6,45,000
GRAND TOTAL	14,40,520
Less disallowed in para. 25 of these orders	1,20,000
	13,20,520

37. It has to be noted that no provision has been made in the Budget-Estimate for the items of charge noted in the margin. If it be determined to adjust these charges by a debit to Imperial funds in 1870-71, it will be necessary to provide a re-appropriation of Budget credits for the purpose.

Extinction of debt due by the Back Bay Reclamation Company by purchase of certain land in the city of Bombay.
Extinction in part of Vehar water debt by purchase of Freeland Estate, Bombay, *vide* P. W. D. letter No. 150A.—G., dated 17th December 1869.
Grant-in-aid to Municipality of Surat, *vide* P. W. D. letter No. 781A, dated 10th September 1869.

38. It is noticed that, in the indent for stores submitted to the Secretary of State by the Government of Bombay, a floating landing stage, with two sets of landing-steps and diagonal chains or moorings, has been indented for. This is said to be required for the Apollo Pier, and a Budget provision of Rs. 2 lakhs under head "Port Trust" has been made to meet the charge. But the grant has only been provisionally allowed, and until arrangements are finally settled as to the source from whence funds are to be obtained for the work, the Secretary of State should be requested to defer compliance with this indent.

PUBLIC WORKS REVENUE.

39. The estimate amounts to Rs. 3,07,500 as follows:—

	Rs.
Revenue Miscellaneous	2,72,100
„ Irrigation	35,400
Total ...	3,07,500

FORT WILLIAM; *March* 3, 1870.

R. STRACHEY, *Colonel, R. E.,*
Offg. Secy. to the Govt. of India.

BENGAL BUDGET ORDERS, 1870-71.

The Bengal Public Works Budget-estimate for 1870-71 has been framed for the grant of Rs. 110¼ lakhs assigned in Public Works Department Circular No. 104 of 1869, and is now modified, with reference to the remarks made below, by the transfer of Rs. two lakhs from the grant for Ordinary Agricultural Works, to that of Original Works, Civil Buildings. The following slight alterations are also made in the estimate to bring the grant to even numbers, for which estimates should always be framed:—

	Add. Rs.	Deduct. Rs.
ORDINARY—		
Original Works.		
Civil Buildings	...	611
Communications	2,228	
Miscellaneous Public Improvement	...	369
Repairs.		
Communications	...	500
Establishment	...	748
	2,228	2,228
EXTRAORDINARY—		
Irrigation Works	500	
Establishment	...	500
	500	500

2. These alterations leave the estimate for 1870-71 as follows:—

	Original Works. Major.	Original Works. Minor.	Original Works. Total.	Repairs.	Establishment.	Tools and Plant.	State Outlay on Railways.	Total.
	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.

TOTAL ORDINARY ...	26,21,000	2,94,000	29,15,000	22,68,000	17,52,000	90,000	2,65,000	72,90,000
EXTRAORDINARY.—								
Irrigation Works	28,20,000	...	28,20,000	...	7,30,000	4,50,000	...	40,00,000
State Railways							1,55,000	1,55,000
TOTAL EXTRAORDINARY ...	28,20,000	...	28,20,000	...	7,30,000	4,50,000	1,55,000	41,55,000
GRAND TOTAL ...	4,41,000	2,94,000	57,35,000	22,68,000	24,82,000	5,40,000	4,20,000	1,14,45,000

3. One noticeable feature of this estimate is the large number of appropriations proposed for a variety of works which the amounts provided are quite insufficient to complete. The Government of India cannot think that this is a desirable mode of applying the money available, but beyond indicating this opinion, the Governor General in Council will not interfere with the arrangements which the Government of Bengal have made.

4. The following remarks are called for on the details of the estimate :—

ORIGINAL WORKS.

MILITARY.

5. *Item No.* 1.—*Battery at Chingree Khall. Amount of estimate Rs.* 72,327. *Computed outlay to end of* 1869-70, *Rs.* 85,796. *Grant for* 1870-71 *Rs.* 15,000.—This work ought to be completed within the year. The design in all probability will have to be altered with reference to the remarks lately made by His Excellency the Commander-in-Chief on the subject.

6. *Item No.* 45.—*Constructing building for Railway Cranes and Turntables, Kidderpoor Dock-Yard, Rs.* 12,000.—This work not having been commenced as yet, the grant for it is disallowed. The sum thus set free may be applied to augment the grant for Military Works in progress.

CIVIL BUILDINGS.

7. No provision has been made in the Budget-estimate for continuing the construction of the Museum, the University, and the Telegraph Office at Calcutta. Under present circumstances this may be unavoidable, but the sum provided for the High Court at Calcutta seems insufficient to ensure adequate progress, and the grant for it is therefore increased from Rs. 2½ lakhs to 4 lakhs, which, it is expected, will be sufficient to complete the work. This the Government of India desire to have effected as soon as possible, and that the upper storey of the building may be carried on so as to admit of speedy occupation.

8. It appears not to be proposed to go on with the Museum at Calcutta during the year. By Act XVII of 1866, the Government bound itself to complete this work by the 23rd March 1871.

9. Appropriations as per margin have been made for construction of Central Jails. The Government of Bengal have already been informed that these works must be carried out as far as possible by convict labour; by this arrangement, a considerable portion of this grant will be available for other works.

	Rs.
102.—Hazareebaugh	50,000
103.—Midnapoor	45,000
104.—Bhaugulpoor	50,000

10. *Items* 54 *and* 55. *Gas furnaces, producers, and shed in Mint, Calcutta. Amount of estimate Rs.* 97,871.—The computed outlay to end of 1869-70, Rs. 84,061, thus leaving Rs. 14,000 to complete the works. But no provision whatever is made for so doing, and the necessary funds for the purpose must be got by a re-appropriation of Budget-credits; Rs. 50,000 are available under paras. 1, 7 and 15 of these orders.

AGRICULTURAL, EXTRAORDINARY.

11. Under this head, Items 145 to 151 (Orissa Irrigation Works, Rs. 5,89,621), are for works actually in progress and which must now be completed. Items 152 to 155 are for new sections of the High Level Canal, which have either not been commenced, or on which the expenditure has been quite insignificant. The estimates for the works have not been sanctioned, and no further expenditure should be incurred until regular sanction is given.

12. *Item No.* 180. *Subsidiary Minor Works for the Damoodah Canal Rs.* 48,537.—It is not understood what is meant by this entry, but the amount is added to the grant for the Damoodah Canal. The revised estimate for the canal has still to be sanctioned by the Government of India, and pending specific sanction no work must be put in hand.

13. *Item No.* 181. *Compensation for land for the Orissa and Behar Projects, Rs.* 2,00,000.—This should not be treated as a separate item, but

the outlay should be considered as a portion of the grants for the works for which the land is taken up. It is a well known rule that the cost of lands has to be included in estimates for works.

AGRICULTURAL, ORDINARY.

14. Under this head, expenditure to the extent of Rs. 2,29,000 is proposed for the Gunduck embankments.* It is said that the estimates, which have been repeatedly called for, are now with the Government of Bengal, and will be submitted on receipt of certain information from the Revenue Board.

* Amounting to Rs. 3,25,364 exclusive of Rs. 50,000 for land.

15. No further expenditure should be incurred on this work until the estimates for it have been properly sanctioned, and as there is nothing before the Government of India to show that it is liable for protective works of this class, the appropriation of Rs. 2,29,000 to them is disallowed. Of this amount, Rs. 2 lakhs is transferred to the grant for Civil Buildings, leaving Rs. 29,000 at the disposal of the Government of Bengal for appropriation to Agricultural Works, the total grant for which head of service will thus be Rs. 3 lakhs.

COMMUNICATIONS.

16. The appropriation for this head of service, with the modification made in the 1st para. of these orders, is passed for an even sum of Rs. 5,84,000, but it is suggested that some of the following works might be given up during next year to provide for greater progress on other and more important ones.

Item No. 207, Rs. 30,000.—Trunk Road from Sylhet to Cachar. The proposed appropriation will make no appreciable progress in the construction of the work.

Item No. 225, *Rs.* 15,000.—Metalling Cuttack Trunk Road. The sum proposed will not complete the work.

Item No. 230, *Rs.* 24,541.—Remodelling road from Madras to Cuttack Frontier. As above.

Item No. 242, *Rs.* 20,000.—Remodelling Section VII of the Trunk Road from Debrooghur to Jorehât. The estimate for this work is likely to be largely exceeded, and the propriety of going on with it is extremely doubtful.

Item No. 248, *Rs.* 40,000.—Section III of Assam Trunk Road. The complete estimate for this work is not ready.

Item No. 250, *Rs.* 12,000.—Renewal of road from Debrooghur to Jeypoor. No appreciable progress can be made with a grant of Rs. 12,000.

Item No. 252, *Rs.* 15,000.—Road from Nowgong to Lowkwaghât. As above. The estimate for this work has been already exceeded.

Item No. 255, *Rs.* 45,000.—Bridge over the Burrakur River. The proposed grant will not complete the work.

REPAIRS.

17. Under Military, the proposed grant is Rs. 4 lakhs against a grant of Rs. 4½ lakhs for 1869-70, and an outlay of 3¾ lakhs in 1868-69 and 1867-68. The sum of Rs. 16,500 provided for repairs to Cantonment Roads at Barrackpoor, appears excessive, and must be reduced. On this point attention is invited to the instructions contained in Public Works Department letter No. 271 A, dated 8th April 1868. A specific proposal should be made for fixing a grant for Barrackpoor in the manner usual in other Cantonments.

18. The outlay on repairs to Civil Buildings from 1866-67 to 1868-69, amounted to about 4 lakhs yearly, whereas the grant proposed for 1870-71 is Rs. 5 lakhs.

The following items appear to be very high :—

	Rs.
Repairs to Writers Buildings, Calcutta	29,000
,, to Treasury	16,300

19. Under Communications, the proposed grant is passed for Rs. 9,67,000, the outlay from Imperial Funds during 1868-69 having been Rs. 8,33,000, and in 1867-68 Rs. 7,05,000.

20. An appropriation of Rs. 68,000 is proposed for the maintenance of the Calcutta Maidan roads, the grant for the purpose for 1869-70 having been Rs. 42,000, and the outlay of the three preceding years, Rs. 45,413, Rs. 60,920, and Rs. 52,000 respectively. The Government of Bengal should be asked to state, with reference to the correspondence terminating with Public Works Department letter No. 420 A, dated 11th May 1865, and the reply thereto, whether some arrangement cannot now be made for providing for this charge from other than Imperial funds. The Government of India cannot assent to the further grant of money from the general revenues for the roads of Calcutta, and an early settlement of this matter is desirable, on the basis of fixing some grant for the roads within Fort William, and providing for all other public roads from the Municipal Funds.

ESTABLISHMENT.

21. Under this head the estimate amounts to Rs. 24,82,000 as follows, compared with the grant of 1869-70 :—

	Establishment, 1870-71.	Establishment, 1869-70.	Total Grant for 1870-71.	Percentage which Outlay on Establishment for 1870-71 bears to Total Grant.
	Rs.	Rs.	Rs.	
Ordinary—				
Buildings and Roads	14,89,000	19,12,000	60,62,000	24·5
Agricultural	1,99,000		9,63,000	20·6
Revenue	64,000	...	...	...
	17,52,000	19,12,000	70,25,000	24·9
Extraordinary—				
Irrigation	7,30,000	8,00,000	40,00,000	18·25
Grand Total ...	24,82,000	27,12,000	1,10,25,000	22·51

22. Thus the charges for Establishment under the head "Ordinary" absorb no less than one-fourth of the total grant. This cannot be accepted as a satisfactory arrangement. It may be admitted that the ratio of establishment charge to total outlay cannot always be maintained at a constant figure, and that when work is suddenly reduced, establishment cannot always be brought down commensurately. Still there appears to be a case here for decided and vigorous action, and the Government of India would ask that ahe state of the Bengal establishments may be at once investigated in view to ll possible reductions being made.

23. The Government of Bengal should be requested to supply as early as possible a statement showing the probable expenditure in each Division, during 1870-71, and the charge for establishment attached thereto. It is understood that in some of these Divisions there is little or no work to be done now under the present reduced rate of expenditure.

24. Meanwhile, the following points may be observed :—

The number of Upper Subordinates is exceptionally large in Bengal, as compared with the staff maintained in other Provinces. Vacancies occurring should accordingly not be filled up until receipt of a proposal for fixing a revised establishment in this class.

The number of Accountants in the Office of Account should be limited to that provided in the Budget-estimate of 1869-70. The saving will be Rs. 5,760.

The charges for temporary establishment in that Office should be reduced by Rs. 1,500.

Provision for inferior Medical establishment is larger than seems necessary. The matter is now under consideration, but possibly a reduction of Rs. 2,880, as well as of Rs. 1,092 under Conservancy establishment, might be effected.

The charges for Navigation establishment appear to be over-estimated by Rs. 3,072, the sum sanctioned being only Rs. 7,920.

25. The Government of India request that the full Revenue establishment, costing Rs. 52,000 per annum, may not be entertained until proved to be really necessary. As matters are at present, it appears out of all proportion to the work to be done and the revenue to be realized, *viz.*, Rs. 1,60,000 per annum.

PUBLIC WORKS REVENUE.

26. Under "Revenue Miscellaneous" the estimate amounts to Rs. 2,41,500, but no explanation has been given of the falling off from the receipts of the current year, which are expected to amount to Rs. 2,62,600. Pending the receipt of this, the amount will be taken at Rs. 2,50,000.

27. Under "Revenue Irrigation" the estimate is for Rs. 1,60,000 and under Railway Rs. 75,000.

FORT WILLIAM,
Dated March 14, 1870.

R. STRACHEY, *Colonel, R. E.,*
Offg. Secretary to the Govt. of India.

NORTH-WESTERN PROVINCES BUDGET ORDERS, 1870-71.

The final grant assigned to the North-Western Provinces for expenditure on Imperial Public Works during 1870-71, excluding Railways, amounted to Rs. 85¼ lakhs, as per margin, which the Local Government has distributed as follows :—

	Lakhs.
Ordinary	50¼
Extraordinary	35
Total ...	85¼

Budget Heads.	1870-71.			Grant for 1869-70.
	Ordinary.	Extraordinary.	Total.	
	Rs.	Rs.	Rs.	Rs.

Miscellaneous Public Improvement	12,000	.....	12,000	5.000
Establishment	14,08,640	*6,00,000	20,08,640	19,39,500
Tools and Plant	90,000	2,44,000	3,34,000	3,81,600
Total Other Services ..	30,35,000	8,44,000	38,79,000	49,15,600
Grand Total...	50,25,000	35,00,000	85,25,000	1,19,75,000

* *Excluding Rs.* 20,000 *entered under the head "Railways."*

2. The grant under Ordinary will be increased by Rs. 56,000 to meet the charges for Conservancy and Working of the Canal Plantations in the North-Western Provinces, which have been transferred to the Public Works Budget-Estimate with effect from 1st April 1870, *vide* Financial Department Resolution No. 828, dated 31st January 1870.

3. Referring first to the details of the Budget-Estimate under the head "Ordinary," the following orders are passed :—

ORIGINAL WORKS.

Military.

4. *Item No.* 8. *Hospital for Native Infantry at Agra. Grant for* 1870-71, *Rs.* 15,000 ; *and No.* 19, *Hospital for Goorkahs at Dehra, Rs.* 20,000.—It is probable that the standard plans for these buildings will have to be considerably modified ; the items are accordingly struck out pending further orders, leaving the amounts available for other Military Works.

5. *Item No.* 12. *Dismantling European Infantry and Artillery Barracks at Meerut. Grant for* 1870-71, *Rs.* 14,000.—The dismantlement of these buildings is to be deferred for the present by desire of His Excellency the Commander-in-Chief. The item is accordingly cancelled, leaving the amount available for other Military works.

6. *Item No.* 17. *Road from Kalsi to Chukrata, Rs.* 20,000. *Item No.* 18, *Road from Kalsi to Saharunpoor, Rs.* 50,000. *And Item No.* 23, *Road from Ramnuggur to Raneekhet, Rs.* 1,20,000.—These works should properly be classed as Communications, and they are transferred to that head accordingly.

7. The grant for Original Works, Military, will thus stand at Rs. 10,27,000 as follows :—

	Rs.	Rs.
Amount as per original estimate		11,05,500
Deduct amount transferred to Communications as above		1,90,000
		9,15,500
Add the following items :—		
Reductions under Civil Buildings, as per para. 9 ...	78,860	
Reduction under Establishment (Account), as per para. 19	7,000	
Further reduction to reduce the total grant for Establishment to an even number	640	
Reduction under Tools and Plant, as per para. 20 ...	25,000	
		1,11,500
		10,27,000

8. Under the explanation given in para. 12 of the forwarding letter, the Military works included in the Budget-Estimate without sanctioned estimates are allowed to stand.

Civil Buildings.
