

The Hon'ble SIR RICHARD TEMPLE thought, as he was instrumental some years ago in enforcing the same policy in reference to the King of Oudh, he might say a few words in corroboration of what his hon'ble friend Mr. Hobhouse had said. It was quite true, as Mr. Hobhouse had observed, that the King of Oudh and his family had not felt and did not feel, and were not likely to feel, the slightest practical inconvenience from the disability imposed upon them—the disability being exactly the same as that imposed by clause 3 of this Bill. He also desired to say, having had some experience in the Political Department, that it was perfectly true that, in these kinds of cases, one of two things must happen, either there would be a degree of indebtedness which was very inconvenient politically, and likely to be somewhat scandalous socially—that was to say, politically inconvenient as regarded the British Government, and scandalously inconvenient as regarded the character of the Native chiefs—or else an undue financial obligation must be imposed on the treasury. He said that the character of the Native chiefs and their non-liability for debt was of great consequence to the stability of the Government. If this scandal was to be avoided, it could only be avoided in two ways, either by creating a disability of this kind, or by paying their debts from the general treasury. To pay their debts from the general treasury was not fair to the public at large for whom the British Government was the trustee. There remained only the remedy provided by clause 3. If the Madras Government did not like that clause, then, he submitted, they were not entitled to have this Bill at all. If the Council rejected the amendment or declined to pass this Bill to-day, it would be for the Madras Government to judge whether they would have the Bill with that clause. His belief was that they would not be able to go on without it, and that they must sooner or later be compelled to adopt it.

His Excellency THE PRESIDENT said:—"While the Government of India is anxious to maintain the dignity and consult the interests of the representatives of those Princes of India to whom the British Government has succeeded, it is also our duty to have a due regard for the public interests.

"If we exempt the Princes of Arcot from the jurisdiction of the civil courts, it seems to me that the third clause of the Bill is necessary, in order that people with whom His Highness may deal shall be fully aware of his legal position, as well as to protect the public, as far as possible, from claims which, I am sorry to say, have not unfrequently been made upon the revenues of India, in consequence of the facility with which debts have been incurred by those who have been placed under similar circumstances."

The Hon'ble MR. DALYELL would merely make a few remarks with reference to the observations which had fallen from the different members. His Honour the Lieutenant-Governor alluded to the position of the ancestors of the family and had stated that they could not be described as sovereigns. If His Honour had followed MR. DALYELL, he would have found that he had described them as being Lieutenants of the Subáhdar of the Deccan; but virtually they did exercise sovereign powers, and although nominally, they were dependants of the Nizám and of the Moghul at Dehli, they were to a great extent independent.

Then, his honourable friend, Mr. Hobhouse, had remarked on MR. DALYELL's admission that the section was the logical sequel of the privilege clause. That, MR. DALYELL was prepared to admit. But he had also said that the provision contained in the section was not usual or necessary. He thought he had shown pretty clearly that no such provision was found in any previous enactment conferring privileges on the Carnatic family; nor, on examining the Bill which conferred similar privileges on the family of the Nawáb of Surát, did he find any provision of the kind. Nor did he believe there was any such provision in the first Act relating to the King of Oudh. Nor was he (MR. DALYELL) aware that the privilege of exemption from personal appearance in Court had any corresponding disability attached to it. So far as he was informed, too, the Ambassador of a foreign Prince in England incurred no incapacity from the privilege he enjoyed of freedom from personal arrest. And when the same privilege was possessed by members of Parliament, he had always understood

that they were held to be as capable of entering into contracts as other people.

His hon'ble friend had said that there was nothing degrading in the position in which the head of this family would be placed. MR. DALYELL would submit that if this was his hon'ble friend's present opinion, he must have very considerably changed his views since addressing the Council in regard to the Nawáb Názim's Bill. He then said as regarded the advantage which the public would obtain :—

"And they (the public) will be protected from the risk of future encroachments by the disability under which the Nawáb Názim will labour of incurring fresh debts, a disability which I admit is *dishonourable* to him, but which has become necessary for the public welfare."

After that admission of his hon'ble friend, MR. DALYELL thought the Council must agree that the effect of this clause would be dishonourable to the distinguished family to which it related. That being so, he was still of opinion that clause 3 should be omitted from the Bill.

Then, his hon'ble friend had quoted the position of the King of Oudh as contradicting MR. DALYELL's assertion that the civil disabilities which were involved in this section would be very inconvenient. MR. DALYELL, however, ventured to think that the position which Mr. Hobhouse described as being occupied by the King of Oudh was a complete confirmation of his belief that the section, although calculated to humiliate the members of this family, would have no practical effect in preventing than from incurring liabilities.

Then, his hon'ble friend had also quoted from a letter of the Government of Madras, in which they stated that these Noblemen had been brought up to extravagant habits, and thought that it was therefore necessary to retain section 3. Well, it was possible that these gentlemen might be somewhat extravagant in their habits, as it was natural for persons in their position to be; but still nothing had been shown to the Council regarding their general management of their private affairs which would justify their being placed in the degrading position involved in the third clause of the Bill.

As the amendment had been seconded by the Hon'ble Rájá Ramánáth Tagore, MR. DALYELL would ask His Lordship the President to put it to the vote.

The motion that section 3 be omitted from the Bill was then put and negatived.

The Hon'ble MR. HOBHOUSE's motion was then put and agreed to.

FOREIGN ENLISTMENT BILL.

The Hon'ble MR. HOBHOUSE also introduced the Bill to prohibit recruiting in British India for the service of Foreign States, and moved that it be referred to a Select Committee with instructions to report in a month. He said that, when he had moved for leave to introduce this Bill, he had explained to the Council the circumstances which called for the intervention of the Government, when it was found that they had not the power of preventing a person from hunting up recruits in India for the service of Foreign States. The case which had occurred had caused some embarrassment, and he introduced this short Bill now for the purpose of placing such power in the hands of the Government. The whole pith of the Bill was contained in three or four sections. By section three, we proposed to confer the power to prohibit any particular person from hunting up recruits for Foreign States; and, by the fourth section, a similar power was given to prohibit such recruiting generally, or to impose conditions upon it.

There were penalties fixed for disobedience to prohibitions of recruiting and for violations of the conditions subject to which permission to recruit might have been given. It was not proposed to make recruiting of itself a penal offence; it might be in some cases a perfectly lawful act.

The Bill only applied to recruiting for the service of foreign nations, with regard to whom the Government should have in their hands the power conferred by the Bill. The points of detail would be proper for the consideration of the Committee.

His Honour THE LIEUTENANT GOVERNOR said it had been his duty to suggest the necessity for legislation of this kind, and all that he had seen had since convinced him that it was most necessary. All that the Bill said was to call such recruiting contrary to the orders of the Government unlawful; but, as the hon'ble Mr. Hobhouse had said, questions as to the details of the Bill would be open to the consideration of the Committee.

The Motion was put and agreed to.

BURMA LABOUR CONTRACT BILL.

The Hon'ble MR. HOBHOUSE also moved that the Bill to regulate the transport of Native labourers to British Burma, and their employment therein, be referred to a Select Committee with instructions to report in two months. He was afraid that the Select Committee could not get to work immediately, because the Government of India was still without any communication from the various Governments interested in the subject, and we had only just been informed that we might expect a communication from the Lieutenant Governor of Bengal very shortly. We had not yet had any communication from British Burma, and we had been informed by the Government of Madras that they had a great deal to say on the subject. We were anxious to get on with the matter, but it could not be done very quickly. The Bill was an important one, and we must give full consideration to the suggestions which, no doubt, would come from the various Governments concerned.

His Honour THE LIEUTENANT GOVERNOR only wished to say that it did seem to him extremely desirable that, if any measure of this kind was undertaken, it should be carried out with the least possible delay. The country was suffering from scarcity, and it was probable that emigration would take place to a considerable extent if the circumstances were such as to promote emigration. His Honour thought it very desirable that this Bill should be proceeded with with all possible speed. The communication from the Bengal Government had been sent in, and was already in one of the Secretariats of the Government of India; he would therefore suggest that one month should be substituted for two months, and if it were found necessary the time might hereafter be extended.

The Motion was put and agreed to, "one month" being substituted for "two months."

NATIVE PASSENGER SHIPS AND COASTING STEAMERS AND BURMA MUNICIPAL BILLS.

The Hon'ble MR. HOBHOUSE also moved that the Hon'ble Mr. Sutherland be added to the Select Committee on the following Bills:—

To consolidate and amend the law relating to Native Passenger Ships and Coasting Steamers.

To provide for the appointment of Municipal Committees in towns in British Burma, and for other purposes.

The Motion was put and agreed to.

The following Select Committees were named:—

On the Bill to prohibit recruiting in British India for the service of Foreign States——Major General the Hon'ble Sir H. W. Norman and the Hon'ble Messrs. Inglis and Dalyell and the Mover.

On the Bill to regulate the transport of Native labourers to British Burma, and their employment therein——The Hon'ble Mr. Ellis, Rájá Ramánáth Tagore, and the Hon'ble Messrs. Dalyell and Sutherland and the Mover.

The Council adjourned to Tuesday, the 30th December 1873.

No Official Orders or Notifications, the publication of which in the GAZETTE OF INDIA *is required by Law, or which it has been customary to publish in the* CALCUTTA GAZETTE, *will be included in the* SUPPLEMENT. *For such Orders and Notifications the body of the* GAZETTE *must be looked to.*

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Tuesday, the 30th December 1873.

PRESENT:

His Excellency the Viceroy and Governor General of India, G. M. S. I., *presiding.*
His Honour the Lieutenant-Governor of Bengal.
The Hon'ble B. H. Ellis.
Major General the Hon'ble Sir H. W. Norman, K. C. B.
The Hon'ble A. Hobhouse, Q. C.
The Hon'ble E. C. Bayley, C. S. I.
The Hon'ble J. F. D. Inglis, C. S. I.
The Hon'ble Rájá Ramánáth Tagore.
The Hon'ble R. A. Dalyell.
The Hon'ble H. H. Sutherland.

PRINCE OF ARCOT'S PRIVILEGES BILL.

The Hon'ble MR. HOBHOUSE moved that the Bill to continue certain privileges and immunities now enjoyed by Prince Azím Jah Bahádur, as Prince of Arcot, to his sons on succeeding to the title, as amended, be passed. He had no observations to make excepting that the Madras Government desired the Bill to be passed.

The Hon'ble MR. DALYELL said that, at the last meeting of the Council, he had endeavoured to show that the last clause of the Bill which his hon'ble and learned friend now desired to pass into law, would be an innovation on the policy which had hitherto governed our dealings with the Carnatic Family; that there was nothing in the character of any of the four Noblemen to whom the Act, when passed, would apply, which would justify the Council in placing upon them the restrictions provided by the clause; that those restrictions would have little or no effect in preventing them from incurring liabilities if they were determined to do so; and that the sense of the clause was altogether

opposed to the desire of Her Majesty's Government to enhance the dignity of the family by conferring on the head of it a *British* title of the most exalted rank. The Council, in their wisdom, however, had been pleased to reject MR. DALYELL'S amendment, and he inferred from the remarks which fell from His Excellency the President, and from the hon'ble members 'of the right' that it was the desire of the Government of India to restrict, as much as possible, the grant of privileges of the kind conferred by the Bill, and thereby gradually to induce the representatives of the former rulers of the country to accept the position of ordinary subjects. He did not question the justice or expediency of such a policy as a general rule. But, he did think that the circumstance of Her Majesty having conferred a special title on the Carnatic Family, placed them in an exceptional position, and in a position which would have justified the Council in treating them in an exceptional manner. As, however, the health of the Prince had of late been by no means good, it was desirable that no delay should occur in passing a Bill of some sort which would confer the privilege of exemption from civil process upon his successors in the title; and as the Government of Madras were willing to accept the measure in its present form, rather than that the settlement of the question should be deferred any longer, MR. DALYELL would not oppose the motion to pass the Bill.

The Motion was put and agreed to.

CRIMINAL PROCEDURE CODE AMENDMENT BILL.

The Hon'ble MR. HOBHOUSE also introduced the Bill to amend the Code of Criminal Procedure, and moved that it be referred to a Select Committee with instructions to report in six weeks. He said that when he got leave to introduce this Bill, he had explained that the necessity for it had arisen on account of the practical difficulty which was discovered in cases where a sentence of whipping was passed. And he had also mentioned that the opportunity would be taken to see what decisions or discussions had taken place on other sections of the Code, which might render it desirable to introduce amendments. The result was, that a few clauses had been drawn, which comprised the Bill before the Council; and with the permission of the Council, he would just run through them, to mention their purport very briefly.

The second section of the Bill was for the purpose of enabling the Government to change the venue for the purpose of a trial. It was discovered a short time since either that there was no such power in the hands of Government, or that it was difficult to put it into execution. There would not often be any necessity to change the venue in criminal trials, but cases might arise in which it would be desirable to do so. The present opportunity was a favourable one for putting that most reasonable power into the hands of the Supreme Government.

Section three was for the purpose of amending what, no doubt, was never intended by the Code. The Act gave the Government power of appealing against criminal sentences. That was a new thing. The power to appeal from criminal sentences was limited to ninety days by the General Limitation Act. In the case of the Government that would be an unreasonably short period, and therefore the general limitation was abrogated. But no other was substituted, and so there was now no time appointed after which the Crown could not appeal. That was never meant. No hardship had arisen, because so short a time had elapsed since the passing of the Code; but it was quite possible that hardship might arise, and the opportunity might be taken of putting some limitation on the Crown's power of appeal.

The fourth section provided for the correction of a clerical error, which he need not explain.

The fifth section related also to a matter which was new in the Procedure Code. An Appellate Court had now the power to make a sentence heavier as well as lighter. There were two stages in an appeal. One was the preliminary stage in which the Court merely looked at the papers of the case, and called upon the appellant, without calling upon the other party, and on the appellant's own showing rejected the appeal. The other was after the Court had determined to receive the appeal, and when it came to the formal hearing in order to determine whether the appeal should succeed. The Code was not explicit on a question which arose in the Bombay High Court, whether, in the first of these stages, the Court might enhance a sentence. The High Court held that it could not. This decision seemed to be the most reasonable construction of the Code, and MR. HOBHOUSE thought it would be convenient to extend its authority beyond the Bombay Presidency and to make it the law for British India.

Section six was for this purpose: A Session Judge or Magistrate who considered that a person had been improperly discharged, might still commit him for trial. Here, again, a question arose whether the Court might commit a man for a totally different offence from that for which he was charged, or only for the same offence. It was decided by Mr. Justice Phear that the Magistrate could not take cognizance of a totally new offence. That seemed a reasonable construction of the Act, and worthy of a place in an amending Bill.

Section seven was merely for the purpose of explaining the expression "Subordinate Court" in a particular section. It adopted the principle expressed in a cognate section and, no doubt, intended to operate in this particular section.

Section eight related to the subject of whipping, which had been already explained to the Council.

Section nine was merely for the purpose of providing how a Commission was to go for examining a witness in the Presidency towns. This had been omitted from the Code. There were provisions for examining witnesses by Commission in other places, but not in the Presidency towns, and some difficulty had actually arisen in consequence of this omission.

Section ten dealt with the cases where an issue was raised whether the accused person was sane or insane. The Code contained a provision for the Judge trying that question as a preliminary question. But some doubt was felt whether that preliminary investigation should form a part of the trial. Mr. Justice Phear had decided in the affirmative; that was a very convenient and reasonable decision, and one which we proposed to embody in the Act.

Section eleven provided for a merely verbal omission. Section 464 of the Procedure Code provided that no judgment should be impugned or invalidated for any error or defect. No doubt, only formal errors or defects were intended: otherwise every judgment would be inviolable.

The other provisions of the Bill were merely formal.

His Honour THE LIEUTENANT-GOVERNOR said before this Bill proceeded further, he wished to say a few words. As one of the few survivors, so to express it, of the Legislative Members of this Council of two years ago, he was naturally somewhat jealous lest there should be any unnecessary tampering with or tinkering of the great work which the legislature then brought to completion, and which gave to this country perhaps the most enlightened Code of Criminal Procedure in any part of the world. All Acts of this length, and this complication, must necessarily have some errors and omissions. Nothing can be perfect in this world, and it was not extraordinary that one or two holes should be discovered in this great Code. He thought it was a matter of extreme congratulation to the Council that the holes that had been fairly found should be so few. Considering the vast variety of subjects over which the Code ranged, he thought it was a matter of surprise, that so few practical defects should be discovered in the course of the working of the Act during the past year. The only pressing practical defect that had been found, so far as he knew, was that relating to the mode of carrying out the sentence of whipping. It was found that there had been an omission in making the altered section exactly tally with a section which had not been altered; and the amendment of this matter was therefore necessary and proper. So also might perhaps be one or two verbal alterations which were contained in the Bill. But he must express his belief that this Bill went beyond the absolute necessities of the case. It seemed to him, that when an Act like the Code of Criminal Procedure had been passed by the Council, it should not be altered without absolute necessity, until it had had a fair and good and long trial. Where there was a possibility of doubt, even if our opinion was in favour of some slight change,

he thought it was better that there should be a full trial, so as to diminish as far as possible the inconvenience which must attend the amendment of an Act like this. On general grounds, it was extremely inconvenient that any large Act of this kind should be encumbered by a number of small and petty amendments. Although it was a right and good suggestion which had been made, that after a certain period of time, when the principles of an Act had been well considered by the most eminent Judges of the land; when a certain construction had been placed upon the law by a series of decisions, then those decisions might be consulted, and the law put in a clear form to suit the convenience of the public, and simplify the work of those on whom devolved the administration of the law. But, on the other hand, it was too early to adopt a course of this kind in reference to the Code of Criminal Procedure. It was not meet that every petty decision of particular Judges or Benches should be embodied in a new Bill introduced at so early a stage. Looking cursorily at the clauses of the Bill which his hon'ble and learned friend had just run over, it appeared to HIS HONOUR that some of its provisions seemed to be unnecessary; they seemed to partake of a sort of refined criticism and picking of holes in regard to particular points in which amendment was not really and absolutely necessary; and there were one or two points in which, HIS HONOUR thought, the amendments partook of the nature of substantial changes; and, as at present advised, the changes appeared to him to be bad changes.

Taking some of the clauses by way of example, HIS HONOUR might say, that section three of the Bill embodied an amendment which was not at all necessary. It was a question whether it was desirable that an appeal of this kind should be limited to one year. It was quite possible that, at the end of two, three, four, or five years, evidence of a murder, for instance, might turn up, and in such cases it seemed to him that proceedings should be taken against the murderer. This was not a proceeding in the hands of a private individual; it was in the hands of the Government of India. The existing provision was deliberately made, and HIS HONOUR had not heard any sufficient reason advanced for altering it.

Then section five was also a provision which seemed to him to be unnecessary. As the hon'ble and learned member in charge of the Bill had explained, an appeal consisted of two stages, the first was a stage in which the appellant was heard, the record was looked at, and all that was to be said on the appellant's side was said. The second was a proceeding in which, if the Appellate Court thought there was room for doubt, notice was given to the public prosecutor or other person through whom action was taken against the accused. As far as the appellant was concerned, the first of these processes was complete in itself. It seemed a not unreasonable view that cases might happen, in which the Court might say to the appellant,—"you have chosen to appeal to us; we have considered your appeal, and so far from letting you off, we think your punishment should be doubled." There seemed to HIS HONOUR nothing very unreasonable in that. We were told the High Court of Bombay had on one occasion said, however, that such a proceeding was not lawful. That might be so, but the matter would be finally settled by other Judges and other Courts; and it appeared to him that it would be an unnecessary interference with the Code to provide that the Courts were not to exercise their discretion in regard to this point.

Then, again, section six seemed also a provision which was not absolutely necessary.

Section seven was an amendment which he did not at all like. The only effect of the change proposed was, that the Sessions Courts would have the same power in regard to the Magistrate of the District which they now exercised in regard to other Magistrates. HIS HONOUR was not at all clear that it was intended, or was desirable, that the Sessions Court should have that power in the matter dealt with by this section with regard to the Magistrate of the District, who was an officer, as regards rank and position, of the same standing as the Sessions Judge.

Finally, HIS HONOUR came to section eleven. It was a substantive amendment, and one to which he had a real and decided objection. It proposed to amend

the 464th section of the Code, which was a section of enormous importance. That section was drawn with great deliberation and care by a very competent authority, with the object of putting a stop to the quibbles of lawyers, and the doing of substantial justice. HIS HONOUR had no reason to believe that it was really necessary to alter that section of the Code. The amendment now proposed would open the door to any number of lawyers. It would cut down the benefits of this most important section to a minimum. Therefore, as at present advised, he strongly objected to this amendment.

For the rest, there were some amendments which were necessary, but he regretted that the Bill had been lengthened to an extent beyond that to which it went when his hon'ble and learned friend obtained leave to introduce it.

The Hon'ble MR. HOBHOUSE wished to express his entire concurrence in what His Honour the Lieutenant-Governor had said as to the excellence of that great work, the new Code of Criminal Procedure. It had not occurred to MR. HOBHOUSE to praise the Code; because it carried its own praise with it, and because he did not consider that a Bill of this kind made any reflection or imputation whatever on the excellence of the work.

With respect to the time at which this Bill was introduced, he might mention that the plan of his friend, Mr. Stephen, with reference to Acts of this nature, was to have an amending Act passed every year, with a view to reenactments at convenient periods, until the inevitable imperfections were supplied. He had placed that opinion on formal record besides mentioning it personally to MR. HOBHOUSE. MR. HOBHOUSE himself thought the time rather too short, and would prefer the course of making amendments, from time to time as necessity arose, and of considering, when that necessity had arisen, the propriety of adding to the necessary amendments others that might appear expedient. There was not much practical difference between the two courses. But, so far from having proceeded with great haste to amend the Code, he had not proceeded with quite as much haste as the framer of the Code himself contemplated.

With respect to the particular objections that were made, no doubt they would all be considered carefully by the Committee to whom the Bill would be referred. At the same time, he might say that it was exceedingly useful that, at this stage of the Bill, objections should be brought forward by any body that entertained them; for then the Committee had the advantage of, not a decision of, Council, but a discussion in Council, on those points before they came to deal with them themselves.

With regard to section three, which provided a limitation on the right of the Government to appeal against an acquittal, MR. HOBHOUSE understood that His Honour intimated that the power of the Government in this matter should be absolutely unlimited. In his opinion, fresh evidence might be discovered which would show that a man acquitted in 1870 ought to be convicted on the same charge in 1880. But it was holding a very uneven balance between the Crown and the subject, to say that the subject should be limited to ninety days for the purpose of presenting an appeal against his conviction, and that the Crown should have absolutely no limit of time prescribed within which to present an appeal against his acquittal. He did not believe that the section was intended to do anything more than to relieve the Crown from the short limitation prescribed by the Limitation Act. Public authorities got information slower than those who had private motives to urge them on, and they required more time for consultation and correspondence than private persons. Therefore, it was proper to give the public authorities much longer time to make up their mind than any body else. But he could not think it reasonable or strictly just to say that the Crown might perpetually hold over the head of the accused the terror of being tried again on some fresh evidence, which, in this country, we all knew was not very difficult to get. In point of justice and fair play, MR. HOBHOUSE had no doubt in saying that it was the right thing to place a reasonable limit on the power of the Crown in this matter. Whether the limitation should be one year or more or less than one year, he did not pretend to say. That was a point on which there might very well be a difference of opinion, and it was possible that the Select Committee might see fit to alter the limit of time prescribed in the Bill.

The next section to which His Honour objected was section five. In that case we had a ruling of the High Court at Bombay. His Honour thought that ruling was not in accordance with reason [The Lieutenant-Governor—No.]. MR. HOBHOUSE begged pardon. He thought His Honour's whole argument was addressed to the fact that, in the preliminary stage of an appeal, the whole case, so far as the appellant was concerned, was before the Court, and, therefore, it was reasonable that the Court should have the power of enhancing the sentence, when, having determined, in the preliminary stage, to reject the appeal, it thought the punishment that had been awarded was insufficient. His Honour thought also that it was not reasonable to make the ruling of the High Court of Bombay govern the decision of the High Courts at Calcutta, Madras and Allahabad. It was fairly arguable that the Court should have the power which His Honour would give it, but MR. HOBHOUSE thought it was improbable that the proceedings in this preliminary stage of the appeal would be taken with that degree of formality which would warrant an increase of the sentence. He thought the High Court should not take the initiative in this matter, but should weigh the whole case before taking the important step of enhancing the sentence. But take it either way, should we leave the matter as it stood with this difference of opinion? With the High Court of Bombay thinking one way, and a high officer like the Lieutenant-Governor of Bengal thinking the other, no one could say that there was not a difference of opinion? Should we leave the law in that state, or should we lay down the law by which the High Court should be bound in administering the Code? It would be a matter of inconvenience, if not of scandal, if the High Court of one presidency considered that it could enhance a sentence on the preliminary stage of an appeal, and the High Court of another province considered that it could not. MR. HOBHOUSE thought it was desirable that the law should be authoritatively stated. We must make up our minds which was the reasonable course. If we thought that the course proposed by His Honour was a reasonable course, we should overrule the construction of the High Court of Bombay; but if we were disposed to agree with them, we should embody their decision in the law.

The next section of the Bill to which His Honour objected was section seven. That section referred to section 298 of the Code, which said:—

"The High Court, the Court of Session or the Magistrate of the District may order any Subordinate Court to enquire into any complaint which has been dismissed under section 147."

The question was, what was a "Subordinate Court"? It was proposed to make that clear, and for that purpose we referred back to a section three stages before, namely, section 295, which related to a cognate subject. Section 295 said:—

"Any Court of Session or Magistrate of the district may at all times call for and examine the record of any Court subordinate to such Court or Magistrate for the purpose of satisfying itself or himself as to the legality of any sentence or order passed, and as to the regularity of the proceedings of such subordinate Court."

The subject was almost the same; the two were exact counterparts of one another. Then section 295 went on to say that, for the purposes of that section, every Magistrate in a sessions division should be deemed to be subordinate to the Sessions Judge of the Division. The proposed section of the Bill resolved the doubt in section 298, by referring to a section three stages earlier.

Then, as to section eleven of the Bill, MR. HOBHOUSE could not help thinking that His Honour was quite mistaken as to the meaning of the language which it was proposed to amend. In the first place, our attention had been called to the point by the very best authority, namely, one of the draftsmen of the Code, who said that it was not the intention to cover all errors and defects. In the second place, MR. HOBHOUSE had seen one or two text-books published and commentaries on the Code which particularly referred to the section of the Code which section eleven of this Bill proposed to amend. One said that this was a case in which the general words of the legislature must be taken with some qualification; and another said that all that was meant was that formal errors or defects should not invalidate a judgment. To MR. HOBHOUSE's mind, to say that no defect should invalidate a judgment seemed the same thing as to say that there should be no appeal. He did not see of what use an appeal was if the law said that no defect should invalidate a judgment. He thought they were saying what the legislature had intended to express. He believed that a Court of Justice would decide the question in the same way. But in order to relieve the Subordinate Courts from doubt and uncertainty, in a matter already noticed in text-books, he thought it better to express what was meant. In saying that it was meant, we had the authority of Captain Newbery, who, on a little verbal matter of this kind (of course he was not speaking of the greater features of the Code which had received the express attention of Mr. Stephen or of the legislature) was the best authority that could be found.

These were the special points on which the Lieutenant-Governor had made observations. It would be for the Council to decide whether the Bill should be referred to a Select Committee in its present form. The Committee would carefully consider all these points, and express its opinion on them when they submitted their report to the Council.

His Honour THE LIEUTENANT-GOVERNOR wished to explain that, with the exception of section eleven, in regard to which he had a great objection to the alteration proposed, and in regard to which he must say that he did not think his objection had been met, he had not expressed a decided opinion that, if the matter were considered for the first time, the course taken by the present Bill was wrong. In regard to the other sections of the Bill, he had not the time or opportunity so thoroughly to consider them as to commit himself positively as to their merits. All his argument was that the matter having been settled in one way by the Council which sat in the early part of 1872, the case that had been made out did not clearly show the necessity of change in the law. This was especially so in regard to the point on which the Bombay High Court passed a decision. That was not a case in which there was any defect for the legislature to amend. He was not prepared to say that the High Court at Calcutta, or of the North-Western Provinces, would not decide in the way which this Bill laid down, or differently. If the High Courts agreed in the view there was no need for amendment of the law. But till it was clear that the High Courts were agreed in this view, he did not think the Council should take the first decision that had been passed to make a law for all the other Courts.

The Motion was put and agreed to.

OBSOLETE ENACTMENTS REPEAL BILL.

The Hon'ble MR. HOBHOUSE also moved for leave to introduce a Bill for the repeal of certain obsolete enactments. He had had occasion to address the Council so often on the subject of the repeal of obsolete enactments, that he considered it was not necessary for him again to explain the object or intention of such a Bill as this. The only thing he had to explain was, why, after having recently passed a Bill of that kind, he should come to the Council again with another Bill and ask leave to introduce it. This work of repeal was always going on. He thought that, in the last three or four years, we had passed three Acts for this purpose, besides the various repealing schedules which were attached to Acts, effecting substantial alterations in the law. The fact was that every Act which effected some alteration in the law superseded something which previously existed, and which was not always repealed at that time, and so we were gradually accumulating a dead mass of matter which required to be swept away. The law of the country was very much divided according to localities, and persons might have a good knowledge of the general law without knowing the local laws, or might know one local law very well without knowing another. The occasion for introducing this Bill was a Note written by Mr. Field, which was submitted to us through the Bengal Government. Mr. Field had great knowledge of the Bengal Regulations. Speaking for himself, MR. HOBHOUSE would not venture to touch the Bengal Regulations unless he was guided by a person with special knowledge on the subject. Mr. Field had such knowledge. He had made a list of the existing Regulations of the Bengal Code which were 162 in number. He pointed out that several of these would be repealed by the Bills now under the consideration of the Council, and some of the others he considered might be repealed as obsolete. There were no less than thirty-one Regulations which might be entirely

swept away, and no less than thirty-four of which sections or other portions might be repealed. That was the basis on which MR. HOBHOUSE proposed to ask for leave to introduce this Bill. As in the case of other Bills of this kind, we should take the opportunity of seeing whether we could not prune away other obsolete matter.

His Honour THE LIEUTENANT-GOVERNOR hoped that extreme caution would be used by the gentlemen who would compose the Select Committee on this Bill in accepting the suggestions of the Bengal Government, or any other authority, in regard to the preparation of Bills for the repeal of obsolete enactments. It was perfectly true that several Obsolete Enactments Bills had been passed, but it was also true that great mistakes had been made in some of these Bills which had caused great inconvenience. Some Regulations had been repealed which it was a mistake to call obsolete. He hoped the hon'ble and learned member in charge of the Bill would proceed with extreme caution, and that he would not act until he was quite sure that every safeguard had been used to prevent the recurrence of such mistakes. His hon'ble friend was no doubt aware that there was such a thing as too much pruning; you might prune a tree until you killed it. HIS HONOUR had a great respect for the old Bengal Regulations. He did not wish to see them too much pruned, and with respect especially to the Regulations included in this repealing Bill, he trusted that great caution would be exercised by the Committee before the Bill was passed.

The Hon'ble MR. HOBHOUSE said that he had taken occasion at Simla to explain to the Council the principles upon which enactments were repealed as obsolete, and that one of those principles was to give every enactment or regulation the benefit of the doubt where a doubt existed as to its being obsolete. Unless we were certain that the life was gone out of it, we would not cut it off. That had been our principle in the preparation and passing of these Bills; and he must say, with reference to the suggestion that an Obsolete Enactments Bill had struck out Regulations that were useful, that he should like to have those Regulations named. He believed that His Honour the Lieutenant-Governor would find it exceedingly difficult to specify one such Regulation. MR. HOBHOUSE had indeed seen a controversy on this subject, in which the Bengal Government asserted that an Obsolete Enactments Bill had repealed a useful Regulation (XXVII of 1793); but that assertion was answered by the Legislative Department of the day, which was then presided over by his friend Mr. Stephen. In that controversy, MR. HOBHOUSE thought Mr. Stephen was entirely right, and the Bengal Government mistaken. That only which was really obsolete had been repealed. The enactment of fresh laws was not the only cause of obsoleteness. Another cause was that the circumstances of the country changed, and that the state of things to which a law was intended to apply no longer existed. So that a Regulation might appear to be of some use, but when you came to apply it to the facts, you found that the facts had slipped away, and that the Statute-book was better without it. It was a sham and a deception so long as it was there, and a source of embarrassment and litigation if you attempted to work it. That was one of the cases of repeal to which the Bengal Government objected. But when you came to apply Regulations to a state of things which had grown up perhaps fifty or sixty years after the law had been passed, you found that the world had outgrown the law. In conclusion, he expressed his entire concurrence in the necessity of extreme caution being exercised in reference to these repealing Bills.

His Honour THE LIEUTENANT-GOVERNOR explained that there was one case in which there could be no doubt whatever that there had been an erroneous repeal. It was discovered that the consequence of one of these repealing enactments had been that, for a series of years, men had been hung throughout the country without any law whatever. Sessions Judges had been abolished by a repealing Act.

[The Hon'ble MR. HOBHOUSE observed that he believed that was not correct.]

His Honour THE LIEUTENANT-GOVERNOR resumed—it was the effect of an incautious repealing provision.

Then as regards Regulation XXVII of 1793. Although, there was now a difference of opinion on the subject, that Regulation was repealed without deliberation. The objections of the Bengal Government were not taken into consideration. It was repealed as a mere Obsolete Enactments question at Simla, and no Member of the Council had an opportunity of considering the propriety of its repeal. It was repealed under the disguise of an obsolete Regulation; and several other Regulations also were repealed, by mere inadvertence, to the repeal of which the Bengal Government had a strong objection, but in regard to which it was not heard.

His Excellency THE PRESIDENT said:—"With regard to the several points now raised by His Honour the Lieutenant-Governor, the Council will have full opportunity of discussing them in Select Committee.

"My recollection in reference to the particular case to which His Honour has referred is, that there was some correspondence between the Bengal Government and the Government of India on the subject. That correspondence took place before I arrived in India, and Mr. Stephen then gave such reasons as at any rate were worthy of consideration, showing that the view entertained by the Bengal Government (and now reiterated by His Honour the Lieutenant-Governor) could not be accepted by the Government of India."

The Motion was put and agreed to.

The following Select Committee was named:—

On the Bill to amend the Code of Criminal Procedure.—The Hon'ble Messrs. Bayley, Inglis and Dalyell, and the Mover.

The Council then adjourned to Tuesday, the 13th January 1874.

CALCUTTA;
The 30th December 1873.

WHITLEY STOKES,
Secretary to the Government of India,
Legislative Department.

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

PREPARATION OF IRRIGATION PROJECTS.

No. 22, dated 12th February, 1873.

From—The Government of India,

To—The Secretary of State for India *(extract.)*

We have the honour to acknowledge your Grace's Despatch No. 114 (P. W.), dated 18th December last, in which, * * * your Grace takes occasion to remark generally on the estimates for irrigation works, with reference to the failure to realize immediately the expected returns in the cases of the Moota Project, the Madras water-supply and the Orissa works, and suggests that there must be something wrong in a system under which such results are of such frequent occurrence.

2. We shall * * * * * * circulate to Bombay, and the other Local Governments, your Grace's observations, in view to the exercise of every precaution in submitting projects for irrigation works in future.

3. We desire now to assure your Grace that the subject of the reliability of estimates of the cost, and probable returns from irrigation works, has already engaged our attention very largely. On the occasion of the present Viceroy's recent visit to the Bombay Presidency, including Sindh, His Excellency discussed the matter fully with the Local Authorities, and the result was the abandonment and curtailment of several projects as already reported in our Despatch No. 8, dated 13th January last. The Governor of Madras has lately visited the Viceroy in Calcutta, and the subject has also been discussed between their Excellencies in regard to the works of the Madras Presidency. We believe that your Grace may fully rely on the best exertions of the Governments of Bombay and Madras to support the desire of Her Majesty's Government for the fullest scrutiny and greatest caution being observed in regard to irrigation projects for the future.

4. In regard to the Lieutenant Governorship of Bengal, your Grace is already aware from the correspondence forwarded relating to the Orissa scheme, how careful Mr. Campbell has been to dispel any ideas that may have been entertained of the rapid realization of revenue from those works, and we have no doubt that His Honour will be equally cautious in any other cases in which projects may be submitted to him to obtain the sanction of our Government or of your Grace.

5. In the drier climates of the North-Western Provinces and the Punjab, there is less risk of over-sanguine estimates, and there are reliable examples of more or less successful irrigation works to guide the Local Governments and ourselves. In the Central Provinces and other Local Administrations, we shall take care that whatever works are undertaken shall be so carefully investigated and so limited in expenditure as to risk no sum that may not reasonably be laid out in trying to establish irrigation where it is apparently much wanted.

6. Your Grace will have seen an example of our caution in this matter in the postponement of the Sardah Canal Works reported in our Despatch No. 19, dated 4th instant.

7. We do not think that any change of system in the submission and sanctioning of projects, is called for. We must rely primarily on the care of the Local Governments, and we shall be sorry to do anything to impair their primary responsibility for the correctness of the estimates, both of capital outlay and of revenue, made by their own Officers. We further employ our Inspector General of Irrigation to review engineering details, so as to carry to one province the experience gained in another. Mistakes in carrying out a large series of operations may no doubt occur. All we can do is to enjoin caution, and exercise ourselves the greatest care. We hope that the results of our operations on the whole will not be found otherwise than beneficial both to the Government and the country.

8. Before concluding however, we wish to record one remark as regards the profits of irrigation works. That is, that in no case, even the most favourable, can it be expected that the income realized will pay immediately interest on the capital spent. In every case there must be a period of growth during which charges for interest on capital will accumulate against the work. Where water is scarce, and irrigation well understood by the people, this period may be short; where, on the other hand, irrigation is new to the people, and water comparatively plentiful, the period will be long. The Ganges Canal which on the average of the last 5 years has paid over 5 per cent. on its capital, was 12 years before it began to realize so much as 4 per cent. The Orissa works which, had they been constructed sooner, might have saved half a million of people from death in the famine of 1866, will doubtless take much longer before they will realize even this rate of interest. Lord Mayo's Government saw reason to accept Colonel Rundall's estimate of the probable ultimate returns from those works, but expressed no opinion as to when such returns would begin to come in. But the anxiety of Lord Mayo's Government for legal power to enforce a compulsory rate was an emphatic expression of the belief, that, without such a rate, a long period of slow growth of revenue from irrigation works could not be avoided. We wish that this should be fully understood. For if the result of our expenditure were to be judged of by the immediate returns, the effect might be to deprive the country of extensions of irrigation essential to the prevention of famine and to the progress of prosperity.

9. As an instance of this, we may draw attention to the accompanying copy of papers lately received from the Government of Bengal in regard to the Orissa works. Mr. Campbell forwards, with strong commendation and an expression of concurrence, a memorandum, in

which Colonel Haig shows that, even in a season of very plentiful rain, the use of artificial irrigation in parts of Orissa doubles the produce of the rice-crops. Thus it is clear that as soon as the cultivators realize this fact, irrigation must extend, and the works must pay. The period which will be required for the spread of this knowledge may be long, but its ultimate spread is certain. Meanwhile, the loss of interest is not a heavy price to pay for insurance against a repetition of the calamity of 1866.

No. 51, dated 22nd May 1873.

From—The Secretary of State for India,

To—The Government of India.

I have received your Excellency's letter No. 22 of the 12th February, replying to the comments contained in my Despatch No. 114 of the 18th December last, on the subject of the preparation of estimates for Irrigation works in India.

2. In the remarks which I then made it was by no means my intention to imply that the Local Governments should be relieved from their responsibility for the correctness of the estimates made by their own Officers, but that greater care should be enjoined in their preparation, and that, if deemed necessary, stringent rules should be laid down regarding the submission of new projects for sanction, with the view of avoiding, as far as possible, the recommendation of ill-matured plans and incorrect estimates.

3. I trust that the communications which you have now addressed to the several Local Governments on this subject will have the desired effect.

4. In the 8th and 9th paras. of your Despatch you make some general observations of great interest and importance upon certain facts which must be borne in mind with reference to Irrigation works in India. You observe that in no case, even the most favourable, do such works immediately pay interest on the capital spent; that even the Ganges Canal, now paying 5 per cent., was 12 years in operation before it began to realise so much as 4 per cent.; that the Orissa works, which, had they been constructed sooner, might have saved half a million of people from famine, will doubtless take much longer before they will realise even this rate of interest; that it was this slow growth of revenue from Irrigation works which made Lord Mayo's Government anxious to have legal power to enforce compulsory rates; that, if immediate returns be insisted on, the country would be deprived of irrigation, which is nevertheless essential to the prevention of famine and to the progress of prosperity; that, in Orissa, the use of artificial irrigation, even in a season of plentiful rain, is found to double the produce of the rice-crops; that, under these circumstances, the time must come when the works will pay; and that, in the meantime, the loss of interest is not a very heavy price to pay for insurance against a repetition of the calamity of 1866.

5. I fully recognize the force of these remarks and the important bearing which they have upon some of the gravest questions connected with our Government in India. In confirmation and illustration of them you forward a very able and interesting Report by Colonel Haig on the Orissa Irrigation works, a Report which throws much light upon the whole subject, not only of the effect of irrigation upon the produce of the soil, but also upon the results which it is producing upon the various interests connected with the ownership and occupation of land, as well as upon the ideas not uncommonly entertained as to the principle on which the Government should deal with these.

6. As regards the effect of irrigation on the produce of the soil, Colonel Haig's Report is in the highest degree satisfactory and encouraging. I agree with your Excellency that where there is such conclusive evidence that the produce of rice-crops is largely increased, sometimes even doubled, by irrigation, we may feel confident that sooner or later so great a benefit is certain to be appreciated.

7. On another matter of great importance Colonel Haig's Report is equally decisive, and that is the danger and mischief which would arise in suffering compulsory rating powers in respect to irrigation to be exercised, directly or indirectly, by the irresponsible Agents of a Commercial Company. Where this power was exercised in Orissa, even by the Officers of Government, it appears to have been so exercised as to have left a lasting and injurious effect upon the minds of the people.

8. On the other hand, it appears from Colonel Haig's Report that the appreciation by the people of the benefits of irrigation is being shown in the natural and healthy form of a great rise in the price which cultivators are willing and eager to give for the occupation of land, or in other words, in a great rise of rents. Colonel Haig reports, apparently as a matter of complaint, that Zemindars, whose names he gives, are raising their rents upon the ryots, and he adds that in some instances the ryots "themselves" are raising the rents, by competition, from Re. 1-9 to Rs. 3-8. And such competition, in the present case, appears to be connected with the best results. Colonel Haig reports that the waste lands are everywhere being taken up for cultivation, and that the Zemindars, or owners, almost immediately get for such lands the same rents which they have been accustomed to get for the low lands which are naturally irrigated.

9. Although Colonel Haig mentions these facts in illustration of the valuable effects of irrigation, it is an effect which in itself he treats as a misfortune. He says that it has seemed to him almost a question whether it might not be better to refuse water for the cultivation of waste land during the currency of the present five-years settlement, rather than by giving it at only Re. 1, to sacrifice almost the whole of the profits to the Zemindars; and he adds that the process of conversion is so rapid, and the competition so keen, that, four years hence, he fears t[illegible] greater part of the waste will have been reclaimed and the rents raised to such a [illegible], there leave but a "small margin for a water-rate."

people as a s[illegible]

liable to be called on w[illegible]

time, out of the progres[illegible]

administration.

10. In so far as the feeling here expressed is merely a feeling of regret that the rate charged for the water is below that which the value of its effects would seem to afford, it is a feeling natural and legitimate in itself. The rate charged for water is a low one, because the Government has seen and felt that, unless the rate were kept low, the cultivators would probably refuse to avail themselves of it at all, and consequently that experience of its value would not arise to which alone we can look for the power of realising more profitable rates at a future time. But Colonel Haig is obviously mistaken when he supposes that the possibility of charging such rates will be lost if, in the mean time, the proprietors are allowed to secure the full market value of the irrigated lands. Where rent is determined by competition (which in this case it is expressly stated to be, and in all cases tends to be), any increased rate charged upon the necessary means of cultivation will be paid out of that rent, and not out of the profits of the cultivating ryot, because these profits have already been brought to the minimum level as the necessary effect of an active competition. When, therefore, a general and thorough appreciation of irrigation has been established, the Government will be able to realise a market rate for the water, just as the Zemindar is now able to realize a market value for his land; and the increased rates which the Government may then be able to secure will all the more obviously come out of rent, and out of rent alone, in proportion as that rent is raised in the meantime to the full amount, which leaves little or nothing to the cultivator beyond his average rate of profit.

11. Colonel Haig appears to suppose that the ryots who sit at fixed rents are the only cultivators with whom it is desirable to deal, and the only cultivators who will be able to afford a higher water-rate to the Government. But a ryot who sits at a permanently fixed rent is simply in the position of a part-owner as regards that portion of the value of the land which represents more than the cultivator's profit; and, if he can afford to pay a higher water-rate than he could pay if he sat at a market rent, he can only do so in his character of part-proprietor, and out of that portion of the produce which belongs to him as such. Moreover, it is to be remembered that ryots who possess a partial proprietary right, in virtue of a low fixed rate of occupation, must be frequently disposing of their right either by sale or sub-letting; and in every case in which this takes place, the new occupier necessarily comes in at the market value of the occupation as determined by competition. It is not possible, and it is not desirable, to prevent this process from going on, and therefore it is a delusion to suppose that the actual cultivators of the soil can be maintained for any length of time in the enjoyment of the higher rate of profit from their land than the competition of the market will afford.

12. Out of the surplus beyond that profit, or in other words, out of the rent to whomever it may belong, the Government will be able to realise as much as fairly represents the value of the water supplied, and at the end of the settlement it will be able to realise also such further proportion of the rent as it may be consistent with our promises to exact. In the proclamation, however, issued to the zemindars and ryots by the Commissioner of Cuttack on June 23rd, 1866, we have promised that "any lands receiving irrigation from the Company's canals will in any future settlement or revenue assessment that may be made be treated precisely in the same manner as lands not receiving irrigation," the payment for irrigation water being the sole charge for the same to which those who take the water can be subjected. In my predecessor's Despatch of 26th March 1868, the Secretary of State adopted the interpretation put on this promise by the government of Lord Lawrence, that it was a promise "in no case to place a higher assessment on land irrigated from the works of the East Indian Irrigation Company than it now bears, or than may from time to time be placed on unirrigated land of the same quality." In all probability it is this promise which has produced and accounts for the rapid progress of improvement reported by Colonel Haig; and if so, any apparent sacrifice of possible increments of revenue will be more than compensated by the stimulus given to the prosperity of the country.

13. I observe with much satisfaction that the Lieutenant Governor in his Minute discourages the notion that, whatever is gained by the owners of land in the shape of rent, is so much lost to the State. The best wealth of a Government is to be found in the growing wealth of its people; and the feeling which leads it to grudge all that does not fall into the hands of its tax collector is a very short-sighted feeling, and must lead, if really followed, to a very short-sighted policy.

14. Colonel Haig explains his feeling in respect to the zemindars in an observation which he makes to the effect that they will not return a rupee of their rental to the State, to the ryots, or to the land in any shape whatever. This observation is founded apparently on an impression that in Inda, or at least in Bengal, the proprietors of land do not generally spend any portion of their rental on the improvement of their estates. It is a most important matter of enquiry, *first*, how far, as a matter of fact, this impression is really well founded; and *secondly*, if it be so, how far we can trace the causes of a condition of things so different from that which prevails in Europe.

15. It is, however to be observed that Colonel Haig expressly says that the reclamation of waste lands in Orissa is being actively pursued wherever these lands are rendered valuable by the new irrigation. But reclamation cannot be effected expect by some arrangement between the cultivator and the proprietor. It would be interesting to know what the nature of these arrangements generally is. But whatever it may be, it is certain that the terms allowed to the ryot must be such as will yield him a profit not only on the ordinary labour of cultivation, but on the special labour of reclamation. This in its nature is essentially the arrangement so well known in Europe as an Improvement Holding. The profit which is more than enough to remunerate the labour of reclamation and of cultivation is in the nature of rent, and, as such, belongs to ownership. If the owner contributes nothing else he contributes tenure—that most important of all elements in the cultivation of the soil b[illegible] exclusive right of occupation is acquired, and the profits which belong to it are sec[illegible]

16. If proprietors in India do not very often contribute more directly out of the rents which they receive towards the improvement of the soil, this fact may probably be due to causes which are capable of being traced.

In the first place it is quite certain that proprietors (if there be any such) who have no other tenants than such as sit at fixed rents, will not, and cannot, be expected to improve. They have no inducement to do so. They are mere rent-chargers on their estates, and it is well to remember that, in the case of proprietors in this position, the whole of the fixed rent which they enjoy is absolutely withdrawn from the fund out of which agricultural improvements come. It may be true that even those proprietors who are in a position to enjoy the increased value of their land do not generally in India appreciate their duties, or see their own interest as they ought to do. This is probably the result of long hereditary habits acquired under the discouraging effects of arbitrary exactions levied by conquering and despotic monarchies. If so, we may hope that the progress of education, acting in aid of the motives of self-interest, will lead to a better state of things. But we must take care that this self-interest should really exist, and that it should be rendered obvious. In the case of propietors who have only a fixed and limited interest in their property, there is no such self-interest to appeal to, and therefore there is no hope, and there can be no just expectation that they will ever spend money on improvements.

17. In the next place, the same effect is produced in a less degree upon all owners of land whose rents can only be raised by some difficult and expensive process. The duty of recognizing subordinate shares in the ownership of land wherever they existed is a duty which cannot be denied. But neither can it be denied that, in proportion as those shares are numerous, complicated and difficult of increment, in the same proportion are the motives weakened which can alone induce superior owners to spend their income on improvements.

18. In the third place, there can be no doubt that, when the owners of land know that they are liable to have the proportion of the rental which they pay to the State arbitrarily enhanced at the end of some temporary settlement such as a term of 30 years, a powerful effect is produced in discouraging outlay on permanent improvements. A lease for 30 years is amply sufficient, and more than sufficient, to give complete security to the actual cultivators of the soil in respect to the profits of even the highest cultivation. It is ample also to encourage reclamation of waste lands where this can be effected by ordinary labour. It is sufficient, therefore, and more than sufficient, to induce them to do all that mere cultivators can ever be expected to do. But those more permanent and expensive improvements which owners of land execute in Europe are inseparably connected with the prospect of secure and permanent enjoyment, and with the feeling which identifies a man's own interest with the interests of succeeding generations.

19. Lastly, it is to be remembered that, under the system of Land Revenue which has long prevailed in India, whether the settlement be permanent or only temporary, and whether it be made with zemindars, or with villages, or with individual ryots, the proportion of the total produce of the soil, and consequently, of the rent, which is absorbed by the State, is very large. Proprietors of the smaller class who do not enjoy more, and who generally enjoy less, than one-half the rental, are not in the position which enables proprietors of land in other countries to expend largely out of their income upon the permanent improvement of the soil. The late Marquis of Dalhousie repeatedly complained that in India the people do nothing for themselves, and expect everything to be done for them by the Government. But, where the Government appropriates a large proportion of that surplus produce of the soil which in all countries must be the foundation of individual and of national wealth, it cannot expect the people to have the enterprising and independent spirit which that wealth promotes. It is at least satisfactory to remember that this is a system which we did not establish, but one which we inherited from the Native Governments which preceded us. Indeed, it may be said with truth that we have done much to mitigate its evils. But we ought not to forget that the State, in taking so large a share of the rental, will naturally be expected to take also a more than corresponding share of the proper duties of a landlord, because the portion which remains to proprietors cannot generally be more than sufficient to afford them a living commensurate with their habits and with their social position. It may well be open to question whether it is possible for any Government to discharge such duties really well—as thriftily, as wisely, or as completely, as they can be discharged by individual owners. But this is one of the difficulties of a system which has descended to us. We must meet these difficulties as best we can, taking care not to aggravate them by undermining such rights of property as remain, or have come to be established, in any class of the people.

20. Looking, therefore, at the circumstances in which we thus find ourselves placed, I would not have your Excellency to interpret my anxiety for greater care in the preparation of Irrigation estimates to indicate either any desire to discourage the undertaking of such works where they are really required, or a desire to insist on such immediate returns as can only be secured by arbitrary exactions levied either on the owners or on the occupiers who may be benefitted. There are circumstances in which compulsory rates may be justified and have long prevailed; but, as a rule, we must be content to wait for such appreciation of the benefits conferred as will induce owners and occupiers willingly to give such price for the water as may be remunerative to the State.

21. On the general principles now adopted in respect to local taxation, the growing increase of property and of wealth in all its forms which may be due to such works, or to the security and peace afforded by our Government, will be accessible to taxation in proportion as it may be really required. When this principle comes to be generally acknowledged and understood, there will no longer be any temptation to regard the growing wealth of any class of the people as a subject of regret; and, on the other hand, all classes will understand that they are liable to be called on to respond to such further calls upon them as must arise, from time to time, out of the progress of society, and out of the necessities either of general or of local administration.

Etwah Branch Tail ... 75
" " Escapes ... 286
Cawnpore " Tail ... 254
" " Escapes ... 412
1,027

Balance expended... 2,993

There was little demand for water, except for sugarcane, in the upper part of the Canal as far down as Allygurh, and in Boolundshuhur the Rubbee sowings are reported to be very backward, owing to the flooded state of the country from the heavy rains of September 16th. Below Allygurh, and especially in the Etwah and Cawnpore Divisions, water was more required; and in the latter the area was three times as large as in the corresponding month of last year.

Eastern Jumna Canal.—Sugarcane has received a last watering, and the early sown wheat has taken water: there has been more demand for water throughout the month than in the upper part of the Ganges Canal.

Doon Canal.—Demands fair for grain crops.

Traffic.—The high rates ruling in Bengal have increased the down traffic in grain four-fold over the quantity carried in November, 1872, and the increase over last month's returns is still greater. The boats on the Canal are insufficient to supply the demand, and 12,000 maunds of grain are reported to be awaiting carriage from the Meerut District to Cawnpore. There is also an increase in the carriage of other goods.

ALLAHABAD, *The 10th December* 1873.

Remarks.

a In last month's statement an excess of 16 acres was shown by mistake.

b The details of column 9 are—
At the rate of Re. 1 ... ... 4,576 acres.
Ditto of Rs. 1-8 ... ... 3,782 "
Total ... 8,358 "

c The details of column 12 are—
Sugarcane ... ... 81 acres.
Huldi ... ... 25 "
Garden produce ... ... 14 "
Total ... 120 "

d In addition to this, 373 acres have been assessed at double water-rates under Section 14, Act VIII of 1867, B. C.

f The details are—
At the rate of Rs. 1-8 ... 12,926 acres.
Ditto of Rs. 1-12 ... ... 258 "
Ditto of Rs. 2 ... ... 6,015 "
Ditto of Rs. 2-4 ... ... 13,819 "
Total ... 33,028 "

In addition to this, 3,079 acres have been assessed for illicit irrigation at Rs. 3 per acre.

The 20th December 1873.

A. J. HUGHES, *C. E.,*
Asst. Secretary to the Government of Bengal in the Public Works Department, Irrigation Branch.

GOVERNMENT OF INDIA.

DEPARTMENT OF AGRICULTURE, REVENUE, AND COMMERCE.

REPORTS ON THE STATE OF THE SEASON AND PROSPECTS OF THE CROPS FOR THE FORTNIGHT ENDING THE 10th JANUARY 1874.

GENERAL REMARKS.—The north-east monsoon has ceased in Mádras and Mysore; prospects are reported to be fair, but in some places the rainfall has been insufficient for the dry crops. In Sindh rain has fallen generally, and slightly in Guzerat; elsewhere in the Bombay Presidency none has fallen; reports are fair upon the whole. In Bengal there has been during the fortnight slight rain extending over most of the affected districts; it has benefited the spring crops in most places, though in others too slight to be of much good. From the North-Western Provinces reports of want of rain are general, except in the extreme north-west; severe scarcity is thought to be imminent in parts of the Eastern Districts, and especially in South Mirzapore. In Oudh there has been some rain, but more is much required. In the Punjab the winter rains have been generally favorable, and prospects are excellent. Accounts from the Central Provinces and Hyderabad are good; no rain has fallen. In Rajpootana there have been showers, and prospects are favorable, especially in Ulwur.

Presidency or Province and District.		Rainfall for fortnight preceding.	State of agricultural prospects.
Madras	Jan. 8th		
Kistna	(7th)	*Nil*	Two feet water over anicut; canal supply good; dry crops still sowing; standing dry crops fair, but require rain; wet crops good; sajja, karra, chillies and cholum being reaped; markets well supplied locally; rice still imported into Bapetta; prices generally steady; pasture sufficient; fever worse than usual; small-pox prevalent; cattle healthy in three taluqs.
Kurnool	„	„	Season favorable throughout; dry crops generally good; paddy crops harvested; in some places water and pasture abundant; markets well supplied; prices generally steady; health good, but for dengue and fever; cattle disease in some parts; no water over Sunkesala anicut.
Negapatam	„	„	Rivers low; no fresh supply to tanks; cultivation continued; standing crops not good in parts for want of seasonable and sufficient rain; inferior paddy and some dry grain harvested; yield fair; markets well supplied; prices rising; pasture sufficient; partial small-pox and fever and some cattle disease prevalent.
Trichinopoly	„	„	Water-supply sufficient for wet crops; dry crops failing for want of rain; outturn generally below the average; markets sufficiently supplied; prices steady; pasture becoming scarce; some small-pox; cattle healthy.
Calicut	„	„	Harvesting of second crop begun in some places; supply of grain sufficient; prices steady; pasture withering; slight small-pox; cattle healthy.
Bombay	(Jan. 8th)		General prospects fairly satisfactory.
Sindh.			
Kurrachee	(7th)	...	Rain general on 25th and 31st, and followed by a small flood from Gaj.
Hyderabad	„	·6	On 31st intense cold. Since then agricultural reports good.
Shikarpur	„	...	Rain on nights of 21st and 31st; crops promising; frost occasionally at night.
Upper Frontier	„	...	Slight shower of rain.
Jacobabad and Thul	„	...	On 25th and 26th frost; since second crops healthy.
Gujarat.			
Ahmedabad	(Jan. 7th)	...	Drizzling rain in Duskrohi and Purantej one morning; heavy dews generally; rubbee good; cotton flowers in Dhundooka affected by blight; public health good.
Kaira	„	...	Cotton and rubbee crop well; weather and public health good.
Surat	„	...	Khureef nearly reaped, and other crops and weather generally healthy.
Broach	„	...	Standing crops suffered in some places owing to cloudy weather; public health good.
Khandesh and Nasik.			
Khandesh	(Jan. 7th)	...	Rubbee crops good; outturn of cotton crop estimated at three-fourths.
Nasik	„	...	Crops and public health good; fever continues in some parts of Malligaum, Dindori and Peint.
Thanna	„	...	Nights and mornings cool; days hot; ague in Thanna; fever in almost all the taluqs.
Deccan.			
Poona	(Jan. 7th)	...	No change in the state of rubbee crops; public health good.
Ahmednuggur	„	...	Rubbee crops have suffered slightly in some taluqs from want of rain; cotton picking progressing; public health good.
Sholapur	„	...	Cotton crops indifferent; others as before; public health good.
Sattara	„	...	Early crops reaped, late crops thriving; fever and dysentery in Wulwa; ague and cattle disease in Pattan.
Southern Mahratta Country.			
Belgaum	(Jan. 7th)	...	Late crops, including cotton, progressing well.
Dharwar	„	...	No material change, except in Nawalgund owing to unfavorable season, and scarcity of fodder; emigration has commenced.
Kaladghi	„	...	Khureef crops middling and nearly reaped, rubbee crops parched in places; public health good.
Canara	„	...	Sowing for second crops progressing; fever and cattle disease prevail.
Kattiawar and Gaekwar's territory.			
Rajkote	(Jan. 7th)	...	State of cold weather crops and cotton crops good.
Baroda	„	...	Rubbee and cotton crops good; public health good.
Wudwan	„	...	Weather cold; crops fair; public health good.

Presidency or Province and District.		Rainfall for fortnight preceding.	State of agricultural prospects.
Bengal	(Jan. 7th)		
Burdwan	...	*Nil*	Cold and clear, but occasionally cloudy during the first week. Late rice reaped and nearly gathered in; recent enquiries in the interior show that the outturn would be between 6½ and 7 annas for the whole district; there is great improvement in the look of the cold-weather crops; prospects of sugar-cane fair; boro paddy being transplanted; owing to increased exportation, the price of rice is daily rising.
24-Pergunnahs	...	„	Clear and cold. As regards crops, there has been no change since last report; the harvest of the late rice crop has not been completed; tobacco and other cold-weather crops sown in patches doing fairly well, but they require rain.
Dacca	...	„	Cold and cloudy; slight rain has fallen in places; prospects of crops fair.
Patna	...	0·10	Weather very cold; slight rain fell in the Sudder, Barh, and Behar sub-divisions, but not enough to do much good to the crops. State of crops most promising and satisfactory, though rain is wanted.
Bhaugulpore	...	0·35	Weather very cloudy, with strong and very cold north-westerly wind during the latter part; slight rain has fallen in many parts of the district, but not enough to be of much good, except in the sudder sub-division. Prospects of the cold-weather crops so far are generally very good; koorthi reaped and kalai pulse being gathered in.
Cuttack	...	*Nil*	Weather very cool; crops excellent; late rice being reaped.
Kamroop	...	„	Cool and pleasant and cloudy at times. The late rice is being reaped, the outturn expected to be below average; sugar-cane and mustard crops are also not promising for want of rain.
			Public Health.—Burdwan—fever stationary. 24-Pergunnahs—fever of ordinary kind prevails in Barrackpore, and still continues in Basserhat; it has been abating in Baraipore and Baraset; a few cases of cholera was reported from Diamond Harbour. Dacca—fever abating in Manickgunge and health improving. Patna, Cuttack, and Kamroop—public health generally good. Bhaugulpore—general health unusually good.
			General Remarks:—More or less rain has fallen during the fortnight in most of the districts of Bengal, including all those of the distressed divisions of Rajshahye, Patna, and Bhaugulpore. The cold-weather crops have apparently benefited thereby in some districts, but in others it was too slight to do much good, and rain is still much wanted generally. Some damage has been done to the standing crops in the Julpigoree District by hail. Boro paddy is being extensively cultivated, and with fair prospects as yet. Cold-weather crops, while doing well in some places, are suffering from the drought in others.
N. W. P.	(Jan. 8th)		
Bustee	„	0·20 on night of 21st.	The rain which fell in the south of the district on the night of the 21st December did good; khurreef crop, excepting rice, has been a 14-anna crop; rubbee promises to be 12 annas if rain falls; Collector proposes relief works and stoppage of grain exportation; no indication of more rain.
Ghazeepoor	„	0·20 on 22nd Dec.	Rain fell on the 22nd December and proved useful; rubbee area on high land 250,000 acres much irrigated by wells promising fairly; on Ganges low land over 250,000 acres looking well; rice failed almost completely on 250,000 acres; other khureef on 100,000 acres much injured by Ganges floods; prices unchanged; scarcity, but no despondency; relief works proposed in pergunnah Buhuriabad.
Goruckpoor	...	0·20 on 21st Dec.	Rain fell in south on the night of the 21st December, and did some good; no rain worth having since, and no indication; irrigated rubbee looking well; unirrigated ripening prematurely; urhur crop fair; exportation from west of district eastwards declining.
Benares	...	...	No rain; hitherto much of the rubbee has been irrigated, and looks well.
Azimgurh	...	*Nil*	Same as Benares.
Mirzapoor	...	...	Partial rain; near Mirzapoor too slight to do much good; severe scarcity immediately in the south; rubbee drying up; distress increasing; relief works being extended; about 27,000 maunds of grain were imported from 26th December to 1st January; prices stationary.
Jounpoor	...	...	Prices very little; slight and partial rain on 1st, but not very beneficial; rubbee prospects fair on irrigated land; imports about 6,500 maunds, chiefly oord; from Oudh exports about 1,700 to Azimghur.
Allahabad	...	...	No rain and no indication now; rubbee prospects fair.
Banda	...	...	Slight rain on 1st and 2nd; more rain urgently needed; grain ripening prematurely; prices almost unchanged.
Humeerpoor	...	...	Same as Banda.
Jaloun	...	...	Slight, but partial rain on the 2nd; rubbee looking well, but more rain wanted.
Meerut	...	...	Slightly beneficial rain; rubbee prospects fair.
Cawnpore	...	...	No beneficial rain; rubbee looking well on irrigated land; rain urgently wanted for unirrigated land.
Futtehgurh	...	...	
Agra	...	...	
Saharunpoor	...	0·80	Rubbee area large; crops good.
Moradabad	...	...	Slight rain; heavy dews; rubbee promising; prices unchanged.
Bareilly	...	...	Rubbee fair; rain much wanted.
			General Remarks:—Rubbee prospects have suffered much from want of rain; and, except in extreme north-west, crop will be under average throughout provinces; severe scarcity is imminent in parts of eastern districts.
Punjab	(Jan. 8th)		
Delhi	...	0·50	Agricultural prospects and general state of health good.
Jullundhur	...	1·00	
Lahore	...	1·10	
Mooltan	...	0·50	
Rawalpindi	...	2·33	
Peshawur	...	3·00	

Presidency or Province and District.	Rainfall for fortnight preceding.	State of agricultural prospects.
Oudh (Jan. 8th)		
Lucknow ...	0·10	Prospects favorable, more rain wanted; exports increasing.
Fyzabad ...	*Nil*	
C. Provinces (Jan. 6th)		
Balaghat ...	*Nil*	Occasionally cloudy; rubbee promising, but rain wanted; small pox prevalent in places; prices unchanged.
Upper Godavari (2nd)	„	Cool crops good; health good.
Bhandara (3rd)	...	Partial rain; clear with heavy dew; rubbee well forward; health good; prices easy.
Raipoor ...	*Nil*	Cloudy; prospects good; prices fulling, health good.
Mandla ...	„	Fine khureef harvested; rubbee promising, prices easy; health good.
Belaspoor ...	„	Clear; rubbee require rain; grain cheaper; small pox reported.
Chanda ...	„	Prospects fair; prices stationary; small-pox in Tahsil Brahmapuri.
Sumbulpoor ...	„	Clear; all crops harvested; prices high but steady.
Saugor (7th)	„	Cold; rabi promising; wheat in ear; health good.
Seoni ...	*Nil*	Rabi doing well, but would benefit by more rain; masur slightly injured by frost.
Jubbulpur ...	„	Prospects still favorable, but rain required; prices stationary; health good.
Nursinghpoor ...	„	Rubbee promissing; prices stationary.
Wurdah ...	„	Kharif cotton jowari harvested; prospects rubbee good.
Nimar ...	„	Prospects favorable; prices risen; fever decreasing.
Nagpoor ...	„	Clear, rubbee progressing favorably; prices unchanged; health good.
Hoshangabad ...	„	Prospects rubbee depend on early rainfall.
Baitool ...	„	Some damage to pulses by frost.
Hyderabad Assigned Districts—		
East Berar (Jan. 8th)	...	Jowaree cutting completed; outturn good; rubbee progressing fairly; public health good.
West Berar Ditto	...	Crops favorable; public health good.
Mysore and Coorg—		
Bangalore (Jan. 7th)	*Nil*	Most of the dry and a portion of paddy corps harvested; the outturn of the former somewhat diminshed; prices stationary.
Toomkoor (6th)	„	Staple dry crops harvested; wet crops in good condition; in some parts sugarcane harvested; prices rising.
Mysore (Dec. 31st)	„	Prices fallen slightly.
Hassan (Jan. 4th)	„	Most of the crops harvested; those still standing good.
Shimoga (3rd)	„	Crops generally good; prices stationary.
Chituldroog (5th)	„	Staple dry and wet crops harvested; in some talooks the former are reported infested with insects.
Coorg (7th)	...	Harvesting of paddy and picking of coffee continue. *Remarks*:—Most of the staple crops have been reaped. The outturn of dry crops somewhat diminished owing to deficiency of rain; public health generally good, except in Coorg where small-pox and fever prevail.
Rajpootana (Jan. 8th)		
Sirohee (Dec. 30th)	...	Tanks dry; well supply fair only; health very good; prospects of crops fair only dependent on water supply; weather seasonable.
Meywar (27th)	...	Tanks low in Oodeypore district; water generally plentiful; an average crop may be expected; in many districts a full crop; slight showers in northern districts; on 26th health good.
Harowtee Agency States (21st)	...	Tanks and wells full; health good; prospects of crops unchanged.
Ulwar (Jan. 1st)	...	Water plentiful; prospects of crops very good indeed; showers throughout the State; on 26th weather cloudy and promises rain; heavy dews; health good.
Ajmere (9th)	...	Altogether a favorable season.
Jeypore (9th)	...	Crops progressing admirably; public health excellent.
Central India (Jan. 8th)		
Indore (7th)	...	Weather warmer; no further change since last report.
Gwalior „	...	Rain wanted; fine weather; small-pox prevailing.
Neemuch „	...	Cold bracing weather; crops looking well.
Rutlam „	...	No report.
Bagelkhund (Sutna) ...	...	No report.
British Burmah ...	...	No report.
Nepal (Dec. 31st)	0·05	A slight shower on the 27th; health good; planting of potatoes and sowing of wheat crop going on.

GOVERNMENT OF INDIA.

FOREIGN DEPARTMENT.

REPORT FROM THE POLITICAL AGENT AND CONSUL GENERAL, ZANZIBAR.

No. 78, dated Zanzibar, 6th November 1873.

To—Secretary to the Government of India, Foreign Department.

IN a preliminary report forwarded from Mombassa to Zanzibar, dated the 10th October 1873, I briefly stated the steps taken by me on landing at Mombassa.

2. During my further stay at that place I did not ascertain that any slaves had been concealed, and it is my belief that the Indian community there is now completely freed of the stigma of slave holding.

3. While my agents were actively employed in trying to discover how far the course followed had been effectual, and whether slaves were either secretly kept out of town or had been lately sold in anticipation of my arrival, I occupied the time in daily meeting with the various classes of the community, both Swahili and Indian.

4. Formerly Mombassa and its dependencies, including a great part of the African Coast both North and South and the Island of Pemba, were ruled by the Yarabi family of the Imams of Oman through the Mazruai Chiefs, and at Takaunga, a coast village afterwards visited, I was shown the original deed, written 146 years ago, appointing one of that tribe to the Governorship of Mombassa.

5. On the English evacuating the place, the Mazruai were betrayed by three families of Kilindini, a village on the southern side of the Island, in consideration of which two of their descendants still receive an annual payment of $ 300, the third having lost half of what was stipulated through the murder of a Banian in which he was implicated.

6. Mombassa and part of the coast is still exempt from many dues. In the first place it was stipulated that no dues whatever should be levied, but by degrees the 5 per cent. on imports was taken, then a special tax on ivory and copal, so that now the chief exemption consists in the free export of corn from Mombassa, Takaunga and Gasi.

7. The Indian colony comprises here Bohras, Scindis, and Hindoos, many of whom visit Melindi during the millet and sesame harvest, remaining there

for three months and returning to Mombassa where their wives and families reside. Thus commercially Mombassa, Melindi, and Mambrui form one distinct division of the trading community.

8. The Bohras of Mombassa are not only the most numerous, but the longest established, the first Indian settlers of this caste came from Surat and Cambay, lately they have been recruited entirely from Kutch. The Scindis, of whom we have but few in Zanzibar or elsewhere on the African Coast, form a class with which the Agency has hitherto never come in close contact. They, as I learn from their Chiefs, began to come to Mombassa 20 years ago, there were then, however, only two houses, it is within the last 17 years that the others have arrived, and there are at the present moment 30 houses. Sunni by faith, and calling themselves Meman, they are apart from both Bohras and Khojahs, and worship and hold civil regulations in common with the Swahili. They have fewer sympathies with the English Government than either of the other Indian Moslem sects. Many appeared to be political refugees, and one spoke to me of having fought against us at Mooltan and in Sind, but curiously all are descendants of Scindis born in Kutch. They never allow that they are subjects of the Rao, and seem to have left India for good, as have many of the Khojah and Bohra families. The Hindoos are the least numerous of the Mombassa traders. Khojahs are singularly enough absent, there not being a single representative. From Pangani northward the Bohras take the place of the Khojahs met with to the south. Hindoos are scattered everywhere at the ports, whilst in Zanzibar itself every class is largely represented.

9. At Mombassa all told me that trade was increasing. Ivory caravans set out taking free men of Mombassa and of the Wanika as porters, these visit Togga and the country near Kilimanjaro, also Ukumbani and Kenia, whence they proceed further to Ukeva or Sambevu. None but Mombassa men are employed, as the Masui or warlike Wakwafi must be passed, and those on whom dependence is to be placed are alone engaged.

10. The annual export of ivory, however, does not exceed $ 70,000, and much of this is now shipped direct to Bombay since the Sultan collected a 5 per cent. *ad valorem* duty on its entering the harbor of Zanzibar. On reaching Mombassa from the interior $ 3 per 35 lbs. weight is collected on ivory. Copal here pays when bought by the Natives the heavy tax of 10 per cent. with 5 per cent. in addition on arrival at Zanzibar; in all a duty of 15 per cent., which discourages a valuable industry that might be developed in the Wanika country. Wax pays $ 1 per 35lbs., and Rhinoceros horns the same. Other produce, such as grain and oil seed, pass free, but as a place of direct import Mombassa holds a secondary position, its supplies are all drawn through Zanzibar.

11. With regard to the missions here, I observe that the one under Mr. Rebmaun is completely suspended for the present, that gentleman besides being now quite blind has adopted peculiar views with regard to religion. The other under the conduct of Mr. Wakefield at Ribé seemed to me in a very languishing state, the position is eminently ill chosen, and I should hesitate under existing circumstances in placing freed slaves under the care of either mission. The arrival of one or two active men would at once remove this objection, but in a port remote from Consular aid, and at a distance from even Arab authority, the charge of any body of newly-freed negroes could hardly be committed to the chance of one life.

12. On the 13th October the chief work in hand was satisfactorily concluded, and before leaving I had secured to the side of British influence a body of men who before, under the inducement of being permitted to hold slaves, had steadily worked against us. Now this inducement being swept away, so great a change has ensued that a system of internal inspection of freed slaves and the establishment of direct communication with the Consulate, which I organized, were not only well, but even eagerly received.

13. On the same day I left in a native vessel for Takaunga. The creek on which the town is built being tidal we ran into Kilipe, a bay half way between Mombassa and Melindi, and from there walked back for three miles and visited Sheikh Rashid, the Mazruai Chief, one among the Mazruai who still cherishes the kindest recollections of the English. I found it impossible

33. [illegible] the same night as I had intended, the armed men were turned out from [illegible] old iron cannon fired the proper salute of 11 guns. A letter of Lord [illegible]instone's to a former Chief was placed in my hands, and every kindness and attention shown me, the Sheikh stating that he had not seen an Englishman for so many years, that he must be excused if he detained us a little. From him I gleaned valuable information, which I shall have the honor of bringing before the notice of the Right Hon'ble the Viceroy and Governor-General in another letter on the political position of the Littoral.

14. Takaunga contains about 3,000 inhabitants, depending mainly upon the millet and sesame crop of its neighbouring farms, and a supply of Indian corn grown and brought in for sale by the free Wanika.

15. Here I found about 14 Indians, of whom, however, only two Hindoos and two Bohras were residents, the others having come from Mombassa: from these, however, I freed 19 slaves.

16. Takaunga Creek being tidal must necessarily be of little use except as a means of moving produce in small vessels, but the bay at Kilipe is really of importance and much frequented. The surrounding country is magnificent corn-land, and the Wanika industrious and harmless neighbours.

17. On the 14th we reached Melindi, where 131 slaves were freed, the property of 41 Indians, including slaves held at the village of Mambrui, a village eight miles to the north.

18. The country between Melindi and Mambrui and in their neighbourhood is well cultivated, the plantations extending as far as six hours' march inland: The chief produce is millet and sesame seed, and the annual value of grain produced cannot be under £35,000. Of the old Portuguese town of Melindi nothing remains but a mark erected on a rocky headland consisting of a conical column of concrete surmounted with a cross, with the arms of Portugal in the centre.

19. Twenty years ago there were here neither houses or plantations. The port seems to have been reoccupied by Syud Saeed, but for many years the people bringing fresh water to the town from the River Sabaki, four miles distant, had to be guarded by soldiers, and constant attacks were made by the neighbouring Gallas and Wasania, the latter firing poisoned arrows at any straggler seen without arms about the settlement. These tribes have for the present lost their strength and cause little annoyance, being paid a subsidy of $450 by the Sultan's Government, but a new and formidable annoyance is now springing up in the shape of settlements of run-away slaves, who being attacked by the Arabs retaliate by killing the labourers on the outlying plantations, making it necessary for them to sleep in stockades and keep up stations within signal fire distance the one of the other.

20. Slave labor alone cultivates these plantations producing, as I before stated, not less than £35,000 per annum, neither the Gallas nor any of the adjacent tribes ever working for hire. The average yield of grain and oil seed per slave is 10 measures of corn, worth about $30, and 2½ measures of oil seed, worth about $12, giving a total of $42 per head; the price of a laboring slave varying from $40 to $55, thus between 4 and 5,000 slaves are employed and, adding for supervision, domestics, &c., the number cannot be under 6,000. Facility for desertion and mortality being considered, an annual import of 600 slaves is required to keep up this body.

21. Although the coast lands are dry and sandy the farther plantations are well watered and fertile. Excellent figs and other fruit are grown. The bushland is selected by preference, as when once cleared weeds give no trouble and for 5 to 10 successive years two crops of millet, sesame, or peas may be taken off before the soil becomes impoverished, when it is allowed to lie fallow until the brushwood again springs up, a sign that the land has recovered. Grass lands it is said fail after two years, give trouble in weeding and require constant cultivation, when after a bad year or two, good crops are again harvested, of better quality than of the bushland.

22. It is a singular fact that for several years the old Melindi wells, 20 in number, after being cleared of the rubbish that filled them, were found so brackish as to be undrinkable, but after a heavy wet season the water became

fresh. Now all these wells, even those close to the sea, furnish swmilies excellent water to the town. tinct

23. The River Sabaki, entering the sea four miles north of Malindi, div.. the district of Mambrui under another Governor. This anomaly arises from Mambrui being a colony which has risen up around the plantation of one Hamed bin Saeed, whose son now inherits part of the estate and the honor of government.

24. The Sabaki crossed, a drier country is entered, and here commences the range of sand hills extending north to the Somali coast. The rainfall is not so heavy as, and the seasons more regular than, in Zanzibar. Fevers and dysenteries are rare, the ulcers that are so great a drawback to Mombassa unknown. Arabs, however, complain of mortality amongst the cattle, which they ascribe to a 'larva' found on the grass, further north nearer Lamo I found the Tsetse, here this pest seemed unknown. The regular rainy season is heavy and later than at Zanzibar. The lesser rains, daily showers being known as the "Kihina" or planting rain, which occurs at seed time, and the "Maonli" recently over.

25. Plantations slaves are allowed only one day per week to themselves when their gains are their own, but instead of the second day given at Zanzibar, half a "kibaba" of grain is allowed daily. Clothing and any animal food or fish must be provided out of the proceeds of the one day, but this amounts to $10 or 12, married couples sometimes gaining $30. Estates are of small value, the question is "how many slaves are there on a property?"

26. Although the Indians here knew less of what had recently passed, I found no difficulty so far as domestic slavery was concerned, but it was necessary to punish severely several men who had recently sold slaves in order to avoid the loss by emancipation, which they foresaw. In other cases slaves had been mortgaged to Indians, one came to my notice where such a mortgage was foreclosed and the slaves sold. Where such transactions had taken place subsequent to 5th June, I seized the slaves from the Arab and allowed no compensation, on the principle that the Indians being then by the Sultan's consent unable to hold slaves the sale was invalid and illegal, but where the transaction had taken place some time back I forced the Indian to return the purchase money and get back the slaves.

27. In carrying out this strong measure I had to thank the steady support of the Arab Governor Seif bin Suleiman and the general orders of Syud Burghash, without these and without a single man to support me, placed in an Arab community, my position would have been an unpleasant one.

28. Here I again named an Agent as protector of liberated slaves, a post now looked on as one of consequence and with its local advantages, as the holder will report directly to the Consulate on slave trade matters.

29. On the 24th October I sailed in Her Majesty Ship *Briton* for Lamo, reaching Manda harbour the following day, whence I proceeded in boat through the narrow tidal creek forming the water communication between that place and the northern harbour.

30. As at Melindi the chief trade here is in millet and sesame, the orchella trade being ruined of late and the cowries but little in demand. Hides, rice, and ivory are exported, the latter coming from Kismayo and the Somali country on the north and from Ozi, a town on Formosa Bay, on a river of the same name connecting with the River Dana to the south. The produce is probably under that of Melindi and Mambrui, but a considerable part of the grain and seed crop of these places passes through Lamo in transit.

31. The Indian community consists of 25 houses of Hindus, 14 of Bohras and one barber, a Mussulman; there are here neither Sindis nor Khojahs.

32. Having called a meeting I explained to these men their position as regards slave-holding, lists of slaves were voluntarily declared, and the Kathi drew out papers of freedom which as at the other towns I signed and delivered with my own hand to each individual slave, explaining to him at the same time his altered condition and status.

33. In this I received every assistance from the Governor whose orders from the Sultan were most positive. The public crier by whom Government Orders are notified, proclaimed under my orders that no Indian can hold slaves or advance money on slaves, and that all transactions in slaves between natives and Indians are illegal, both parties concerned being liable to lose their property and to be otherwise punished.

34. As a result several Indians at once placed in my hands papers of mortgage securing debts due by Arabs on their slave property. Some of these were for large sums, but in no case can such or similar bonds be proceeded on in any Court, and even should they be concealed, they become debts of honor, irrecoverable by law. Hereafter all such advances naturally cease and Indian capital becomes unavailable to any Arab whose chief property consists in slaves.

35. I was unable to spare the time to visit the town of Fazi or that of Siu, on the same island, peopled by Wagunia, even had I not been unwilling for political reasons to proceed amongst that tribe before the question of Lieutenant MacCausland's murder is cleared up. On my summons, however, the Indians of both places appeared at Lamo. They include only six Hindu houses and one Bohra house, and collectively gave up 21 slaves, none of whom would return to their masters.

36. Mzee Seif, Chief of the Wagunia, summoned at my request by the Governor of Lamo, also came to the town, but the steps taken with regard to the late murder at Kionga will form the subject of a separate letter.

37. On the return voyage Captain Malcolm anchored off Ras Gomsui to allow us to inspect the country there, only a year ago there were extensive Arab plantations of oil seed and sesame here, now the ruined houses alone remain; the Gallas and Walsania having annoyed and killed the slaves who in consequence fled, the Arabs abandoned this rich locality, better suited for the growth of cotton than any land I have here seen, but lacking in any security for either property or life and possessing no indigenous labor at hand.

38. The harbor of Wasin was also visited south of Mombassa, between the island of that name and the mainland. This has been suggested as a naval depôt. It is superior as a harbor to that of Mombassa, but there is no supply of water on the island and the healthiness of the place requires further enquiry before any steps involving outlay or of a permanent nature are undertaken.

39. Here two Bohras were found who gave up eight slaves in 479 slaves freed between Wasin and Lamo from the hands of Indians.

40. While engaged on the Coast I have been assisted everywhere by Mr. F. Holmwood, who accompanied me on duty and whose services I beg to acknowledge.

GOVERNMENT OF INDIA.

FINANCIAL DEPARTMENT.

TRADE AND NAVIGATION OF BRITISH INDIA IN 1872-73.

No. 435, dated 16th January 1874.

Read—

The Annual Statement of the Trade and Navigation of British India in the year 1872-73.

[NOTE.—It has been found necessary to exclude from the following review imports and exports of stores and treasure on account of Government, as the statistics of these transactions are not forthcoming in a completely authentic shape.

This is much to be regretted, and arrangements are being made to ensure complete statistics for the future. All that can be said meanwhile is that the proportion of the transactions on Government account to the whole trade of the country is not probably large enough materially to disturb the general statistics.]

OBSERVATIONS.—Excluding stores and treasure on Government account, the sea-borne imports and exports of British India amounted in value to £121,012,648 in 1872-73, against £135,376,632 in 1871-72; *viz.*:—

	1872-73.	1871-72.	Increase or decrease in 1872-73.
	£	£	£

Interportal trade ...	29,481,545	28,385,024	+ 1,096,521

FOREIGN TRADE.

2. The total value of the several classes of the foreign trade in each of the years 1871-72 and 1872-73, their average annual value during the five years, 1867-68 to 1871-72, and the differences between the separate periods, were—

		1872-73.	1871-72.	Annual average of the five years, 1867-68 to 1871-72.	VALUE IN 1872-73, MORE OR LESS THAN—	
					1871-72.	The annual average of the five years, 1867-68 to 1871-72.
		£	£	£	£	£
IMPORTS ...	Merchandize...	30,473,069	30,810,775	33,726,872	— 337,706	— 3,253,803
	Treasure ...	4,556,585	11,573,813	11,423,081	— 7,017,228	— 6,866,496
	TOTAL ...	35,029,654	42,384,588	45,149,953	— 7,354,934	—10,120,299
EXPORTS ...	Merchandize...	55,227,495	63,185,847	54,985,054	— 7,958,352	+ 242,441
	Treasure ...	1,273,954	1,421,173	1,167,032	— 147,219	+ 106,922
	TOTAL ...	56,501,449	64,607,020	56,152,086	— 8,105,571	+ 349,363
TOTAL OF FOREIGN TRADE	Merchandize...	85,700,564	93,996,622	88,711,926	— 8,296,058	— 3,011,362
	Treasure ...	5,830,539	12,994,986	12,590,113	— 7,164,447	— 6,759,574
	TOTAL ...	91,531,103	106,991,608	101,302,039	—15,460,505	— 9,770,936 (net.)

3. The value of the exports of merchandize in 1872-73 was considerably below that in 1871-72, but it was slightly above the annual average of the five years 1867-68 to 1871-72, although that average includes the exceptionally large exports of 1871-72, which exceeded the average of the four years 1867-68 to 1870-71 by £10,250,992. The differences under the exports of treasure are not material.

4. The value of merchandize imported in 1872-73 shows a slight decrease below that in 1871-72. The large falling off in 1872-73, below the annual average of the five years 1867-68 to 1871-72, is principally due to the higher tariff values of cotton goods and of metals in the years 1867-68 and

1868-69, and to the greatly diminished imports of materials for the guaranteed railways during the last two years. If the value of those materials for the years 1867-68 to 1872-73 (noted on the margin) be deducted from the total annual values, and if the higher tariff values of the earlier period be allowed for, then the actual import trade of 1872-73 would be less than the quinquennial average by only £801,481, instead of £3,253,803 as shown in the above table.

	£
1867-68 ...	... 2,464,966
1868-69 ...	... 1,591,813
1869-70 ...	... 1,217,334
1870-71 ...	... 1,466,068
1871-72 ...	... 513,246
1872-73 ...	... 327,466

5. The large decrease of £7,164,447 in the net imports of treasure in 1872-73 occurred almost entirely in the imports from the United Kingdom and from China. It corresponds with a large decrease in exports of merchandize, and also indicates that the balance of trade in 1872-73 was settled to a larger extent than in 1871-72 and in the five preceding years otherwise than by payments of the precious metals.

6. The total value of merchandize and treasure, combined, imported from each principal foreign country in the years 1871-72 and 1872-73, respectively, was—

TOTAL ...	42,384,588	35,029,654	—7,354,934 (net.)

7. In 1872-73, seven countries show an aggregate increase of £175,344, and thirteen show an aggregate decrease of £7,530,278, the net result being a decrease of £7,354,934, of which £337,706 occurs in merchandize and £7,017,228 in treasure. The number of countries showing increase or decrease in 1872-73 as compared with 1871-72, is almost the reverse of that resulting from a comparison of the trade of 1871-72 with that of 1870-71, which showed an increase under fourteen countries and a decrease under six.

8. The principal fluctuations in the trade with each country are noted below; but in order to obviate a too frequent repetition of the same remarks which would result from explaining the causes of the fluctuations of trade in the same articles under each country, most of such fluctuations being due to the same cause, explanations thereof will be given, once for all, in a subsequent part of this review when the aggregate trade in the principal imports and exports is being exhibited. (Paras. 41-68.)

9. The falling-off under the United Kingdom and Suez* is entirely due to a decrease of £5,042,365 in treasure, for there was a net increase of £77,655

* Seven-eighths of the trade shown under "Suez" is British.

in merchandize. The chief items of increases and decreases are—

INCREASE.

	Total Value in 1871-72. £	Total Value in 1872-73. £	Increase in 1872-73. £
Apparel	442,451	529,992	87,541

„ Copper	747,973	470,647	277,326
Railway Materials ...	514,996	327,022	187,974
Salt	790,226	711,561	78,665
Treasure	6,901,511	1,859,146	5,042,365

10. The decrease shown against France is from a falling-off in treasure worth £194,847, less an increase in merchandize of £17,928. In spirits and in wines and liqueurs there were decreases of £29,393 and £16,891, respectively; counterbalanced by increases of £29,297 in silk piece goods, of £8,668 in apparel, and of £11,569 in salt. The general trade in merchandize does not show any other noteworthy variations.

11. Mauritius shows the large decrease of £262,379, or 46·6 per cent., almost entirely, of course, under sugar, the diminution in that article being £251,723, owing doubtless to the large quantities imported in 1871-72, which year exhibited an increase of 119,599 cwts., or 37·70 per cent over 1870-71. Sugar is the only important staple imported from Mauritius, the value of the few remaining articles amounting to only a few thousand pounds a year. In 1872-73 the total value of merchandize imported was £288,867, and of this sum sugar stands for £283,545, and in the next preceding year it bore the same proportion to the total trade.

12. The Red Sea trade shows a small increase of £32,045. Salt decreased by £49,088; but this was more than compensated for by an increase of £77,597 in treasure.

13. The Persian Gulf exhibits a net increase of £21,542. Treasure decreased by £107,726, but merchandize increased by £129,268. The articles exhibiting the largest increase were cotton, raw, £32,502; fruits and vegetables £21,208; salt £21,213, and silk, raw, £10,996. The rest of the increase occurs in the general trade.

14. Ceylon shows a decrease of £184,354; but here again treasure fell off by £194,541, while merchandize increased by £10,187.

15. The Straits exhibit a decrease of £117,391, of which treasure stands for £28,421, and merchandize for £88,970. The articles showing the largest decrease are, cocoanuts by £9,938; cotton twist £33,703; gums £9,757; copper £11,500; tin £32,756; and silk, raw, £11,478. On the other hand, spices increased by £28,026.

16. China shows a decrease of the large sum of £1,644,381, of which treasure stands for £1,633,646, and merchandize for the small sum of £10,735. The latter amount is the net result of several fluctuations, the principal of which are as follows: Drugs and medicines increased by £20,500; glass-ware by £22,612; and tea by £38,053; while copper decreased by £62,267, and silk piece goods by £43,734.

17. Australia exhibits a net decrease of £117,967. Treasure increased by £58,347, while merchandize decreased by the large sum of £176,314, or 63·8

per cent. The value of horses shows a decrease of £28,465; chiefly from the average prices having been lower by 30 per cent. in 1872-73, while the number was less by only 180, or 10·84 per cent. The value of copper, cast, fell off by the considerable sum of £112,286, or 87·4 per cent.; this decrease was owing to the high prices which ruled in Europe, and which diverted copper thither from India.

18. The differences in the trade with countries other than those above referred to, being unimportant, do not call for special notice.

19. The value of exports of merchandize and treasure to each principal foreign country was:—

Countries.	1871-72. £	1872-73. £	Increase or Decrease in 1872-73. £
United Kingdom and Suez ...	33,020,521	28,666,818	—4,353,703

Australia ...	104,409	106,728	+ 2,319
Total ...	64,607,020	56,501,449	—8,105,571 (net)

20. There was an increase in 1872-73 under seven countries aggregating £743,751, and a decrease under thirteen countries aggregating £8,849,322, the result being a net decrease of £8,105,571, or 12·55 per cent., of which £7,958,352 occurred in merchandize, and £147,219 in treasure.

21. The United Kingdom and Suez show a net decrease of £4,353,703, the falling-off in raw cotton alone being £4,509,494, while the general trade increased by £155,791. The principal increases and decreases in 1872-73 are as follow:—

INCREASE.

	Total Value in 1871-72. £	Total Value in 1872-73. £	Increase in 1872-73. £
Cutch and Gambier ...	73,632	142,152	68,520

Treasure ...	156,397	1,900	157,494

22. Jute shows a decrease of £31,557 in value; but this was owing to lower prices in 1872-73, as the quantity increased by cwts. 474,916.

23. France shows a net decline of £1,502,233. Coffee increased by £42,737; indigo £92,459; hides and skins £34,268; jute, raw, £44,578; silk, raw, £155,808; and shawls £98,661: while cotton, raw, decreased by £1,676,945; rice £29,122; seeds £249,545; (rape-seed being *nil* in 1872-73 against £153,206 in 1871-72), and spices by £48,647.

24. Germany exhibits a net decrease of £159,135. Cotton, raw, decreased by £158,309; rice £28,564; and jute, raw, £13,996: while coffee increased by £44,968, and oils by £15,346.

25. The Mediterranean Ports show a net decrease of £77,003; but after deducting from the exports of 1872-73 the sum of £19,180, the value of articles intended for the Vienna Exhibition, the decrease on the actual trade amounts to £96,183. Cotton, raw, fell off by £237,708; coffee £16,484; indigo £153,263, and seeds £22,352; rice shows an increase of £32,444; hides of £181,826, and silk, raw, of £88,093.

26. European countries other than those already mentioned show a net decrease of £594,175; cotton, raw, decreased by £675,180, and seeds by £19,920; while dyeing and coloring materials increased by £58,891, and rice by £49,715.

27. America shows a decline of £264,563. Indigo decreased by £134,035; gunny cloths and gunny bags by £52,243; and linseed by £203,497; while rice increased by £19,174; India rubber by £20,679; jute, raw, £34,923; and saltpetre by £50,108. The falling-off under gunny cloths and bags is owing to the Americans now largely manufacturing these articles for their own consumption; but this falling-off is partly compensated for by the increase in the trade in jute, raw.

28. The West Indies show an increase of £69,064, of which sum rice stands for £58,049.

29. Africa shows an increase of £72,714, of which rice accounts for £30,516, and cotton piece goods (foreign) for £17,191. The rest of the increase occurs in the general trade.

30. Mauritius exhibits a net increase of £298,963. Treasure decreased by £93,300. Rice increased by the large sum of £334,555, or 107·2 per cent., gram by £24,086, and provisions, &c., by £46,918. There was a falling-off of £14,429 in teak timber. The exports of rice last year were apparently the highest ever attained, the quantities being cwts. 2,435,035, worth £646,511, against cwts. 1,119,719, worth £311,956, in 1871-72. The above-mentioned large exports of food-grains and provisions to Mauritius were doubtless intended chiefly for the consumption of the Indian labourers in that almost exclusively sugar-producing colony. The rice was sent almost entirely from Bengal.

31. Bourbon shows a falling-off of £31,255, of which rice represents £28,213.

32. The Red Sea trade shows a slight net decrease of £6,094. There was a decrease of £13,303 in merchandise, chiefly in coffee. Treasure increased by £7,209. The general trade was steady.

33. Aden shows a net decrease of £16,846, for which treasure is answerable; for while merchandise increased by £32,542, of which £24,069 occurred in country cotton manufactures, treasure decreased by £49,388.

34. The Persian Gulf shows a net diminution of £36,585. Treasure increased by £38,214, but merchandise decreased by £74,799. Coffee fell off by £14,766, rice by £183,666, and wheat by £87,564. The falling-off in the two last-named articles is only what might have been expected, considering that the trade in them during 1871-72 had been exceptionally large owing to the famine in Persia. On the other hand, indigo increased by £44,428, and cotton goods (foreign) by £160,078.

35. The trade with Sonmeanee and Mekran and with the Laccadive and Maldive Islands does not call for any remark.

36. Ceylon shows an increase of £231,599, of which sum treasure stands for £44,976 and merchandise for £186,623. Rice increased by the large sum of £164,495. Seeds fell off by £31,459. The general trade shows increase.

37. The Straits show a net diminution of £115,360. Treasure increased by £65,204, but merchandise decreased by £180,564. Gunny-bags increased by £21,515, and cotton goods (foreign) by £41,897; while jade stones decreased by £30,514, and in opium there was the large decrease of £204,459.

38. China exhibits a decrease of £1,685,088, of which sum treasure accounts for £12,596 and merchandise for £1,672,492. Opium decreased by the large sum of £1,743,806. Although the exports of opium in 1872-73 show such a large falling-off as compared with those of 1871-72, yet the trade was not much below the average of the five years 1867-68 to 1871-72 (although this average includes the exceptionally large exports of 1871-72), the annual average value of these five years being £10,841,167, against £10,529,674 in 1872-73, the latter year being less by £311,493. This is not a serious difference on such a large and fluctuating trade. The general trade in 1872-73 shows improvement, the principal increases being in cotton, raw, by £26,470, and in saltpetre by £34,806. Rice shows an increase of £8,165; but the rice trade is subject to sudden and considerable fluctuations, as it depends almost entirely upon the out-turn of the crops in China.

39. The trade with other Asiatic countries increased by £63,236. Merchandise increased by £56,455, and treasure by £6,781. Various minor articles show decrease, but rice increased by the large sum of £77,862 net. This increase is accounted for thus: Siam and a few other countries show a small aggregate net decrease of £3,623, while an increase of £81,485 occurred in the trade with Java and Junk-Ceylon, the former country showing £65,304 in 1872-73, against *nil* in 1871-72, and the latter an increase of £16,181, the total value being £33,571 in 1872-73, against £17,390 in 1871-72. The exports to Junk-Ceylon represent a new and annually increasing trade, the figures for the four years, 1869-70 to 1872-73, being as follow:—1869-70, £399; 1870-71, £1,730; 1871-72, £19,020; and 1872-73, £35,169. The trade consists almost entirely of rice exported from British Burma for the consumption of the Chinese tin-miners inhabiting the island.

40. Australia shows a slight increase of £2,319, which sum is the net result of some fluctuations. Rice and gunny-bags are the only articles of any importance. In 1872-73 rice decreased by £13,323, while gunny-bags increased by £19,244, the total value of rice being £45,120 in 1872-73, against £58,443 in 1871-72, and that of gunny-bags being £38,057 in 1872-73, against £18,813 in 1871-72. From these figures it will be seen that these two articles represent about four-fifths of the total exports to Australia.

41. The following table exhibits the quantities and value of the principal articles of import, excluding treasure and Government stores :—.

Total	£	...	...	...		30,810,775	30,473,069	—	337,706 (net)

42. Of the above total values, free goods amounted to £2,248,494 in 1872-73 against £2,107,157 in 1871-72, being an increase in 1872-73 of £141,337 or 6·29 per cent.; and dutiable goods, including salt, amounted to £28,224,575 in 1872-73 against £28,703,618 in 1871-72, being a decrease in 1872-73 of £479,043 or 1·67 per cent. Thus the total value of both free and dutiable articles shows a net decrease in 1872-73 of £337,706 or 1·09 per cent.

43. The articles showing the largest increase are apparel, cotton twist and yarn, drugs and medicines, dyeing and coloring materials, malt liquors, wines and liqueurs, machinery, and woollen goods; those of decrease are cotton piece-goods, metals, railway materials, salt and sugar. The value of cotton goods shows a net decrease of £250,640 as compared with the value in 1871-72, although the trade of the latter year, as compared with that of 1870-71, decreased by the large sum of £1,559,981. It is, however, to be borne in mind that the high figures of 1870-71 were due to excessive importations. But notwithstanding that 1872-73 shows a decrease as compared with the two immediately preceding years, it exceeds the annual average of the five years from 1867-68 to 1871-72; for allowing for the reduction in the tariff values from March 1869, the average of these five years would then be £16,773,822 against £17,234,248

in 1872-73, being an increase in the latter year of £460,426 or 2·75 per cent. Comparing the figures of 1872-73 with those of 1871-72, piece-goods show a falling-off of £463,688, while thread, twist, &c., increased by £213,048 in the former year.

44. In connection with these figures it is interesting to notice the fact that there are now in Bombay and in the neighbourhood of Calcutta, as well as elsewhere in India, a considerable number of mills employed in the weaving and spinning of cotton. These mills produce large quantities of piece-goods and twist, &c. The Commissioner of Customs at Bombay in his trade report for 1871-72 observes :—"The number of spinning mills in Bombay is gradually increasing, and the country twist manufacture is competing with Europe twist." * * * * "The decrease" (in cotton piece-goods) "is chiefly in the importation of T cloth and domestics, which are now manufactured in large quantities at the Bombay mills, and being cheaper meet with a ready sale." And in his report for 1872-73, he refers to "the rapidly increasing production of local mills almost annihilating the trade in low numbers of English yarn and low class English goods." He also reports that "new mills are rapidly springing up. Their production finds at once a ready sale at paying prices, while the value of English goods persistently shows a loss on English quotations with charges added."

45. As regards jute manufactures, the Lieutenant Governor of Bengal, in his Resolution upon the Annual Administration Report of the Presidency Division for 1872-73, observes—"There are large jute factories at Baranagore and Gowripore, both in the 24-Pargannahs, and also at Fort Gloucester, 15 miles down the Hooghly, and several new factories are rising round Calcutta. There can be no doubt that in this district these manufactories are a great success; the people show much aptitude for the work, and it seems that the neighbourhood of Calcutta will become before long a great seat of manufacturing industry."

46. The observations above quoted are very suggestive in regard to the industrial prospects of India.

47. Drugs and medicines and dyeing and coloring materials, respectively, show increase, the former by £78,830, and the latter by £63,089. The trade in these articles was much larger in 1872-73 than in any previous year since 1868-69.

48. The imports of malt liquor show an increase of 212,569 gallons worth £58,177. The trade in wines and spirits does not differ materially from that of 1871-72.

49. The value of machinery shows an increase of £111,481. This is satisfactory, as it may be regarded as an illustration of the spirit of industrial enterprize that is now at work in this country.

50. Metals again show a serious diminution, the total value being less in 1872-73 by the sum of £588,154. As was stated in the review of the trade of 1871-72, the general trade in metals has been declining year by year since 1869-70, but more especially in the years 1871-72 and 1872-73. Of the total falling-off, £457,886 occur in copper. Iron shows a decrease of £75,170, and tin a decrease of £49,800. As has been already mentioned (paras. 9, 16 and 17) the falling-off in copper occurred principally in the trade with the United Kingdom, China and Australia. The large decrease in the copper trade, as well as in the metal trade generally, is no doubt due to the high prices which, owing to the dearness of coal and of labor, have ruled in the English markets during the last two or three years; the prices of the various kinds of metals in England during the above-mentioned period having risen by from 30 to 50 per cent. over those previously realized.

51. Salt shows a decrease of tons 30,092 in quantity and of £85,212 in value. This is no doubt chiefly owing to the large importations in 1871-72, when tons 306,839, valued at £913,915, were imported, against tons 227,610 of the value of £715,892 in 1870-71. The imports of last year were, however, much above that of the annual average of the five years from 1867-68 to 1871-72, that average being in quantity tons 263,824 and in value £757,329.

52. Sugar decreased in quantity by cwts. 220,109 and in value by £269,633. This result is doubtless due to the very large importation from Mauritius in 1871-72, which has been already noticed (paragraph 11).

53. Woollen goods show an increase in value of the large sum of £205,336, or 40 per cent. This increase merely represents a recovery from the depression which this trade had exhibited during the preceding three years, and which, it is said, was owing to high prices in England having restricted exportation to India.

54. The fluctuations under Articles other than those already referred to do not call for special notice.

55. The result of the various differences shown in the above tabular statement is a net decrease of £337,706 on the total value; but after deducting therefrom the decrease of £185,780 in railway materials (which decrease is no doubt due to the approaching completion of the guaranteed railways), the net decrease in the actual import trade amounts to the small sum of £151,926, or 0·50 per cent.

56. The following table shows the quantities and value of the principal and other articles exported, excluding treasure:—

Articles.			Quantities.			Value.		
			1871-72.	1872-73.	Increase or decrease in 1872-73.	1871-72.	1872-73.	Increase or decrease in 1872-73.

57. Of the foregoing total values, free goods represent £42,457,403 in 1872-73, against £50,040,956 in 1871-72, being a decrease in the former year of the considerable sum of £7,583,553, or 15·15 per cent., and dutiable goods represent £12,770,092 in 1872-73, against £13,144,891 in 1871-72, being a decrease of £374,799, or 2·94 per cent.; the total value of exports of merchandise showing a decrease in 1872-73 of £7,958,352, or 12·60 per cent.

58. It will be seen that the largest decreases occurred in raw cotton, opium and seeds, these three great staples taken together representing a decrease in value of the very large sum of £10,409,156; this falling-off being partly met by a net increase of £2,450,804 on the general trade, which reduced the net total decrease to the amount above mentioned, *viz.*, £7,958,352.

59. The falling-off under cotton raw was due no doubt to the competition of American cotton. The diminution in the value of this important staple in 1872-73 amounted to £7,250,322, or 34 per cent. This decrease, it will be observed, nearly corresponds with the falling-off in the value of net treasure imported, *viz.*, £7,164,447.

60. The decrease in opium is mainly due to a deficiency in the poppy crop, and consequently in the quantity sold by Government in Calcutta; prices, too, were lower in 1872-73; the decrease in seeds is due to deficiency of crop, that of rape-seed being almost a total failure last year.

61. The decreases under coffee, lac, oils, spices, and wool, raw, may be, to some extent, owing to the unusually large exportations in 1871-72 which lessened the demand in 1872-73. Nevertheless the trade in most of these articles during last year was much above the average of the preceding five years. The falling-off in indigo was in value only, owing to lower prices, the quantities being nearly the same as in 1871-72.

62. The leading articles showing increase are hides and skins, india-rubber, jute, raw, rice, tea, teak-timber, tobacco, saltpetre, silk, raw, sugar, cotton goods (both country and foreign), and shawls. The trade in the first seven of these articles has steadily and, in most cases, very largely increased, annually, for several years past. Their percentage increase in quantities and value in 1872-73 over 1868-69 was as follows:—

	In Quantities.	In Value.
Hides and skins	107·04	133·17
India-rubber	198·81	355·02
Jute, raw	110·51	118·96
Rice	52·63	35·39
Tea	54·96	65·83
Teak-timber	25·38	37·10
Tobacco	...	199·26

63. It will be seen that under all these articles (except rice) the ratios of increase are, generally, much higher in values than in quantities, still the improvement in quantities is considerable.

64. Saltpetre is fast recovering its former rank as an important article of export. The trade in saltpetre was much greater last year than in any previous year since the close of the American war; and the value in 1872-73 exceeded by £8,217 the value in 1858-59, the year before that in which it was subjected to an export duty of Rs. 2 a maund. (The exportation has been free since 1867.) But it is to be noted that the high value in 1872-73 is largely attributable to enhanced prices, which exceeded by 40·12 per cent. those of 1858-59, the quantities in 1872-73 being less by 27 per cent. than those of 1858-59. From these figures the trade would appear to have been very profitable last year. This trade is, however, specially subject to sudden and violent vicissitudes resulting from political events; and, as might have been expected, its greatest prosperity is found to have occurred in times of war. During the course of the civil war in America, it reached its highest annual value, *viz.*, £896,808 (in 1862-63).

65. The teak-timber trade of British Burma, which continued, generally, in a depressed condition from 1862-63 to 1871-72, has also improved rapidly, its value last year being £353,554 against £224,794, the average annual value of the ten years 1862-63 to 1871-72, or an increase of 57 per cent. in 1872-73. The Chief Commissioner of British Burma, in his Trade Report for 1872-73, observes:—"There would have been a larger export had it not been that the supply of water in the rivers last year was insufficient to float all the timber which had been felled."

66. The revival of trade in the two last mentioned important staples is satisfactory.

67. The rice trade continued to prosper greatly last year, when both quantity and value were the largest on record. The trade in 1871-72 was considered remarkably successful, but that of 1872-73 exceeded it by 35·21 per cent. in quantity and 28·22 per cent. in value. Of the total increase (5,982,907 cwts.) in quantity in 1872-73, British Burma represents 4,397,604 cwts. or 73·5 per cent. Of the total quantity (22,973,797 cwts.) exported in 1872-73, 12,675,005 cwts. were sent to Europe; 2,435,035 cwts. to Mauritius; 2,978,551 cwts. to Ceylon; 1,752,288 cwts. to the Straits; 904,048 cwts. to the Persian Gulf; and the remaining 2,228,870 cwts. to various other countries.

68. Since 1869-70 the rice exports of British Burma have, year by year, strikingly progressed with the normal and healthy growth of a sound and firmly established trade. The value of this trade in 1872-73 exceeded by 202·08 per cent. that of the average of the four years, 1855-56 to 1858-59, during which period the duty was only ½ anna per maund or ¼th of its present rate.

69. The share of each presidency and province in the aggregate value of the foreign trade in 1871-72 and 1872-73, respectively, is exhibited in the subjoined table,—the Bengal Presidency engrossing one-half of the total imports of merchandize and providing more than two-fifths of the total exports of British India :—

		Imports.		Exports.		Total of Imports and Exports.

70. The gross amount of customs duty collected on imports and exports was :—

	1871-72.	1872-73.	Increase in 1872-73.
	£	£	£
On Imports	4,129,155	4,177,102	47,947
„ Exports	687,768	798,975	111,207
Total ...	4,816,923	4,976,077	159,154

71. The gross amount of duty collected on the principal and other dutiable articles of import and export is shown in the following statements. Excluding the duty on salt, one-half of the import duties was derived from cotton goods, which are subject to less than the general rate of import duty, and the other half from all other dutiable imports.

IMPORTS.

Articles.	1871-72.	1872-73.	Increase or Decrease in 1872-73.
	£	£	£

Seeds	84,846	47,172	— 37,674
Other Articles	9,571	5,209	— 4,362
Total ...	687,768	798,975	+111,207(net)

72. Notwithstanding the large falling off in the total trade last year, there was an increase of £159,154 in the amount of duty collected, *viz.*, £47,947 on imports and £111,207 on exports.

73. The differences shown against the various items (except salt) do not call for remark, inasmuch as they correspond for duty with those shown against dutiable imports in para. 41, but with respect to salt it will be observed that while the imports in 1872-73 were much less than those in 1871-72, the duty collected in the former year was more by £51,049. This discrepancy is doubtless to be explained by bonding transactions.

74. The net total increase in export duty is almost entirely due to the augmentation under rice, which largely exceeds the decreases under seeds and the various other articles. Of the total amount collected in 1872-73, British Burma yielded £358,647 against £238,964 in 1871-72.

75. The export duty on wheat was abolished on the 4th January 1873. It is perhaps too soon, as yet, to expect any marked results from the remission.

76. The following statement shows the total number and tonnage of vessels which entered and cleared with cargoes :—

	1871-72.		1872-73.		Increase or Decrease in 1872-73.	
	Vessels.	Tons.	Vessels.	Tons.	Vessels.	Tons.
Entered	3,668	1,762,364	3,509	1,708,339	— 159	— 54,025
Cleared	5,461	2,259,014	5,628	2,287,763	+ 167	+ 28,749
Total ...	9,129	4,021,378	9,237	3,996,102	+8	— 25,276 (net)

77. The value of the trade *viâ* the Suez Canal in 1872-73 shows improvement over that of the preceding year, but the progress is not nearly so marked as that shown by 1871-72 over 1870-71. This result is doubtless chiefly owing to the large diminution in the exports of raw cotton and oil seeds to the United Kingdom and to Continental Europe during 1872-73, as already noticed. Of the total value of the trade of India with Europe and America, about £40 millions or 60 per cent. now passes annually through the canal.

78. The foregoing statements show that, as regards the foreign trade, the diminution in the aggregates for 1872-73 as compared with those for 1871-72 was chiefly due to exceptional circumstances. The falling off in merchandize occurred almost entirely in exports, which in the preceding year were, as respects several of the chief staples, cotton especially, unprecedentedly large. Nevertheless, the exports of merchandize in 1872-73, upon the whole, exceeded by £2,292,640 the annual average of the four years 1867-68 to 1870-71, and, in several of the principal staples, they exhibit large improvement even over those of 1871-72.

INTERPORTAL TRADE.

79. The aggregate value of the interportal trade, as has already been shown (para. 1), amounted to £29,481,545 in 1872-73 against £28,385,024 in 1871-72. The share of each presidency and province in these figures, distinguishing imports and exports, was as follows :—

		Imports.		Exports.		Total of Imports and Exports.	
		1871-72.	1872-73.	1871-72.	1872-73.	1871-72.	1872-73.

	Total ...	13,443,409	14,249,122	14,941,615	15,232,423	28,385,024	29,481,545

Note.—The figures in this Table include the trade from Port to Port of each Province, as shown in Part IV of the Annual Statement.

82. The principal articles concerned in this trade are apparel, cocoanuts, cotton raw, cotton piece-goods, cotton twist and yarn, dyeing and coloring materials, grain and pulse (chiefly rice), jute raw, jute manufactures, metals, oils, provisions, &c., salt, seeds, silk raw, silk manufactures, spices, sugar, &c., teak timber, tobacco, wool raw, woollen manufactures, and treasure.

83. The total shipping employed in carrying on this commerce numbered 36,099 ships conveying 4,066,033 tons in 1872-73 against 34,689 ships conveying 3,689,664 tons in 1871-72.

84. This trade, although it sometimes fluctuates largely under some articles, is, upon the whole, fairly steady. The figures for 1872-73 are slightly above the average of those for the five preceding years.

ORDERED, that a copy of the foregoing Observations be published in the Supplement to the *Gazette of India*.

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

[RAILWAY.]

EARNINGS AND EXPENSES OF INDIAN RAILWAYS DURING THE HALF-YEAR ENDING 30TH JUNE 1873.

a.—This is inclusive of the Patree State Branch Railway, 22 miles.
b.—This is exclusive of the cost of rain damage repairs which amounts to Rs. 10,73,207 for the half-year.
c.—This loss was owing to certain extraordinary charges having been debited in the accounts of the half-year, especially cost of 4 new cylindrical wagons, Rs. 7,494.
d.—These two Branches are worked by the Great Indian Peninsula Railway Co. Pending the settlement of the question of charges relating to the working of the lines, the accounts have not been submitted.

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Tuesday, the 13th January 1874.

PRESENT:

His Excellency the Viceroy and Governor General of India, G. M. S. I., *presiding*.
The Hon'ble Sir Richard Temple, K. C. S. I.
The Hon'ble B. H. Ellis.
Major General the Hon'ble Sir H. W. Norman, K. C. B.
The Hon'ble A. Hobhouse, Q. C.
The Hon'ble E. C. Bayley, C. S. I.
His Highness the Mahárájá of Vizianagram, K. C. S. I.
The Hon'ble J. F. D. Inglis, C. S. I.
The Hon'ble R. A. Dalyell.
The Hon'ble H. H. Sutherland.

OBSOLETE ENACTMENTS REPEAL BILL.

The Hon'ble MR. HOBHOUSE introduced the Bill for the repeal of certain obsolete enactments, and moved that it be referred to a Select Committee with instructions to report in a month. He had explained to the Council at the last meeting the object of the Bill and the circumstances which led to its introduction at this time. Of course in a Bill of this kind the enacting part followed the common course, and there was nothing particular in that part of the Bill to explain to the Council. The principle of the Bill was contained in the schedule, and it was in respect to the schedule that he should have some observations to make. He should wish at the same time to remove some of the erroneous impressions which were entertained at our last meeting, respecting the danger which we incurred by sending a Bill of this kind into Committee, and the risk there was of throwing the law into confusion by the enactment of such laws.

The schedule consisted of two main parts. One part related to the Bengal Regulations, and that, as he had explained before, was chiefly the work of Mr. Field: it was an important work; and if we were to pass Bills of this kind at all, we must deal with the Bengal Regulations in the way in which they were dealt with here. The rest of the schedule was not nearly so important. There were not many items in that part of the schedule which consisted of the total removal of laws from the Statute-book, and not a great many which consisted of the removal of whole sections or parts of Acts. The greatest part of the schedule was concerned with small alterations of the language of the existing Acts, for two purposes. He had taken occasion at a meeting at Simla to explain the two different principles upon which the language of the Acts was altered when the enactments themselves could not be wholly repealed. One principle was as follows: Owing to changes in the law, references to prior Acts and to various extrinsic circumstances became erroneous or senseless. We found repealed enactments spoken of as if in force, or officers named as existing who had ceased to exist. Thus, the reading of Acts was rendered more difficult, and the attention of the reader was apt to be distracted by his meeting with that to which he could not under existing circumstances assign any meaning. So we struck out expressions originally necessary, but now incorrect. The other principle was merely the purpose of abbreviation,—of reducing the bulk of the Statute-book to some extent, and making the labours of the reader somewhat lighter.

With regard to the first of these principles, he did not think there was much, if any, difference of opinion in this Council as to the propriety of applying it. With regard to the second, he had read to the Council on a previous occasion some able remarks of the late Mr. Housman who objected to it. Now, there was a difference of opinion about that. It would be for the Council to decide whether this Bill should go to a Select Committee with the approval, expressed or tacit, of that principle, or whether any modifications should be made in it, or any objections raised to it. He had no reason to assign in its favour except what he had assigned before. If he was approaching this subject *de novo*, and if he personally had to revise the Statute-book, he should have doubts which principle to apply; whether to abbreviate the Statute-book or to leave it as it stood. But the reasons for adopting the principle of abbreviation were, first, that it had been already done on previous occasions, and we were only following the line in which the Council had advanced some distance; and, secondly, that the work of the revision of our Statute-book was committed to the Secretary in the Legislative Department, Mr. Stokes, who entertained a strong opinion on the subject, and who considered that, both as regards the bulk and the reading of the Statute-book, it would be in a much better shape if abbreviations were made, than if they were not made. These were the reasons for which MR. HOBHOUSE, for one, accepted the principle of abbreviation, as well as the other principle of eliding all those expressions which, by change of circumstances, had become unmeaning or misleading.

He would pass now to the second subject which he had mentioned, and he thought that, as regards the past, the Council were concerned to know that their business had not been conducted in a way to produce the disasters that had been supposed; and as regards the future, they were entitled to know that they were incurring no great risk by sending this Bill into Select Committee. It was true that in Bills like this, which were composed wholly of details and mostly of small details, it was the Select Committee who really framed the Bill. It would hardly be possible, and certainly was not usual, for the Council at large to exercise any particular control over what the Select Committee did. It was therefore an act of confidence in the Council to refer this Bill to a Select Committee, and it was proper for him to show that that confidence was not ill bestowed.

At our last meeting, the Lieutenant Governor, whom MR. HOBHOUSE was sorry not to see in his place that day, mentioned as a reason for distrusting a Bill of this kind, that there were two occasions on which it was found that the effect of an Obsolete Enactments Bill was to remove very important provisions from the Statute-book. He mentioned two laws which had been removed in that way. One of those was Regulation XXVII of 1793, and the other was the law by which Sessions Judges exercised their powers in Bengal. As to Regulation XXVII of 1793, His Honour said this:—

"Although, there was now a difference of opinion on the subject, that Regulation was repealed without deliberation. The objections of the Bengal Government were not taken into consideration. It was repealed as a mere Obsolete Enactments question at Simla, and no Member of the Council had an opportunity of considering the propriety of its repeal. It was repealed under the disguise of an obsolete Regulation; and several other Regulations also were repealed, by mere inadvertence, to the repeal of which the Bengal Government had a strong objection, but in regard to which it was not heard."

Now that statement had been made before, and it had been answered before, and MR. HOBHOUSE could not help thinking either that, in the hurry of business, the answer had not reached His Honour, or that speaking from memory he was deceived, as most of us were when speaking from memory, and that he remembered the statement of the Bengal Government and did not remember the answer made to it. MR. HOBHOUSE would mention both to the Council. In a letter written by the Bengal Government to the Government of India on the 13th December 1871 appeared the following statement. Speaking of Act XXIX of 1871, which was an Obsolete Enactments Act, the Bengal Government said:—

"The Draft Act first appeared in a very different form from that in which it is now passed, dealing with a far larger number of enactments. It then, in fact, was designed to expurgate the whole Bengal Code of all provisions deemed to be no longer necessary. At that time, an official reference was made to the government of Sir William Grey. The subject was so large, and Mr. Cockerell so soon pressed for a reply, that it was not possible to give a detailed examination to it. The only officer who did examine it in detail gave a decided adverse opinion, and Sir W. Grey's reply amounted to a protest against passing any such Act in the Governor General's Council, deeming that it could best be dealt with in the Bengal Legislative Council. From that day to this no official communication whatever has been made to this Government. It has never been in any shape intimated that, notwithstanding Sir W. Grey's protest, the Government of India proposed to go on with the measure in an altered form. During the last cold season, when the Council was sitting in Calcutta, and when, if ever, it should naturally have been brought forward, it was never produced but quietly slept."

That letter was answered on the 24th January 1872, and it was answered thus:—

"In paragraph 2 you observe that the draft Act first appeared in a very different form from that in which it is now passed, dealing with a far larger number of enactments; that 'the subject was so large, and Mr. Cockerell so soon pressed for a reply, that it was not possible to give a detailed examination to it; that the only officer who did examine it in detail gave a decidedly adverse opinion, and Sir W. Grey's reply amounted to a protest against passing any such Act in the Governor General's Council, deeming that it could best be dealt with in the Bengal Legislative Council. From that day to this,' you add, 'no official communication has been made to this Government.'

"Upon this I am directed to observe that the Bill was forwarded to the Bengal Government for its opinion in August 1870, and that the opinion of that Government was forwarded to the Government of India in January 1871. The Government of India is of opinion that five months was quite sufficient time for the expression of opinion on the subject. To have given a longer period would have been to postpone the matter indefinitely.

"The Government of India in this Department is unable to accept the account given in your letter under notice of the reply of the Lieutenant Governor of Bengal to its inquiries, or of the Bill itself as originally framed. The Bill originally consisted of two parts. It repealed altogether a large number of obsolete Regulations. It also repealed the obsolete parts of the remaining Regulations. What Sir W. Grey objected to was, not the repeal by the Government of India of the obsolete Regulations, but the partial repeal of the Regulations which were obsolete in part only. His words are—'The Lieutenant Governor would have thought that

the most convenient mode of proceeding might have been to stop short of the separate repeal of those portions selected for repeal,' *i. e.*, to confine the repeal to those Regulations which it was possible to repeal at once as a whole. The rest of his Secretary's letter points out that the re-enactment, in a more convenient shape, of the Regulations which it was proposed to repeal partially might be conveniently left to the Bengal Legislative Council, and that, accordingly, if the second schedule was still to be kept in the Bill, its operation should be confined to the North-Western Provinces. There is not a word in the letter to indicate that the Lieutenant Governor objected in any way to the repeal of the Regulations which it was proposed to repeal altogether. It would obviously have been a very inconvenient course to have them repealed by two separate Acts,—one passed by the Governor General in Council for the North-Western Provinces, the other by the Bengal Legislative Council for the Lower Provinces.

"The Government of India accepted Sir W. Grey's views, omitted the schedule containing the partial repeals from the Bill, and confined its operation to the matter to which Sir W. Grey did not object. The Government of India in this Department is thus of opinion that so far from acting, 'notwithstanding Sir W. Grey's protest,' it adopted and carried out the very course which he suggested."

Then towards the end of the same letter, it was written :—

"In conclusion, I am to observe that Mr. C. D. Field, in his observations on the Bill which has now become Act XXIX of 1871, suggested that so much of Regulation XXVII of 1793 as declared the illegality of the collections, or showed the title of the former owners to compensation, or imposed a penalty for such collections, should be maintained, and that the Committee arrived at the conclusion embodied in the Bill for the reasons given above."

MR. HOBHOUSE thought the Council would see that it was a mistake and an error of memory now to say that the Bengal Government had strong objections to this repeal; that their objections were not taken into consideration; that no member of the Council had had an opportunity of considering the propriety of its repeal.

That brought him to the substance of the Regulation, whether it was obsolete or not. The Regulation was one relating to the collection of sayer duties. If the Council had followed him, they would see that Mr. Field proposed to retain parts of the Regulation, but that the Committee arrived at the conclusion that they ought to repeal the whole "for the reasons given above." Some parts proposed to be retained were those which declared the illegality of the collection of sayer duties by zamíndárs, and those which made compensation to them for the abolition of those duties. And the reason for not retaining these parts was that their repeal did not affect the principle of law which made the collection of sayer duties illegal, nor did it affect the right of any owner of these duties to receive compensation, especially as the time for claiming compensation had expired a great number of years before. The other part of the Regulation which it was proposed to retain was that part which imposed a penalty for the collection of sayer duties, but that penalty was imposed in a way which, owing to changes in procedure, was absolutely unworkable. It was to be imposed by means of a civil suit brought by somebody from whom the collection was illegally levied, in which suit he was first to recover damages from the person who levied the collection, and then the Judge was ordered to impose a fine according to the circumstances of the offender. That was obviously a mixing up of civil and criminal jurisdiction, which might have been quite feasible in 1793, but which, owing to the complete severance of those jurisdictions in the machinery in existence in 1871, was impracticable. Therefore, it appeared on examining the Regulation that, whatever work it had to do, it had done. It declared the illegality of a number of collections which nevertheless had been levied, MR. HOBHOUSE believed, ever since the passing of the Regulation up to the present time; at all events, for the last thirty or forty years they had been collected in increasing quantities year by year, and they had been levied, not only by private zamíndárs, but by Government itself as proprietor of estates. As he had said on the last occasion, it was exactly one of those cases in which the world had outgrown the law. The facts had slipped away; and if you attempted to apply the Regulation to the existing

state of facts, you would find that it would not help you out of difficulties, but rather get you into them. Therefore, it was thought better to repeal the Regulation *in toto*.

Now, looking back and trying to see what the repeal had effected, he could not find that it had effected any change in the law, except possibly—and he said only possibly—this; that, indirectly and in the process of a long time, some prescriptive rights might grow up which, if the Regulation was in the Statute-book, would not prevail. Whether that was a good thing or a bad thing might be disputed. But it was only in that possible, it was only in that indirect, it was only in that future, way that the repeal of the Regulation as obsolete could produce any effect. Obsolete it was, most clearly, as regards any direct, immediate, visible effect: it was only straining our vision into the future, that we could see, or might conjecture, that its repeal might possibly produce some effect.

Now he would pass on to the next question, which was that of the Sessions Judges. Upon that point, the Report of the Council's last Proceedings ran thus :—

"His Honour the Lieutenant Governor explained that there was one case in which there could be no doubt whatever that there had been an erroneous repeal. It was discovered that the consequence of one of these repealing enactments had been that, for a series of years, men had been hung throughout the country without any law whatever. Sessions Judges had been abolished by a repealing Act."

No doubt it was a very serious matter that a repealing Act should cause people to be hung without any law whatever. But that statement also had been made before, and had been answered, and he would again read to the Council what was said on the subject. In the same letter, that of the 13th December 1871, from which he quoted previously, the Government of Bengal said this :

"The Lieutenant Governor believes that most especial care is necessary in regard to the repealing of the old Regulations of that wonderful early Code, which is, in fact, the foundation of our whole system. He has already met with several instances in which great inconvenience is caused by inadvertent repeals, and a more marked instance could hardly be found than was exhibited in the necessity for passing the only other Act specially affecting Bengal, which was this season dealt with at Simla—the Sessions Judges Act already alluded to. That necessity was caused by a former repealing Act, by which the Sessions Judges were inadvertently repealed, and all capital and other sentences were rendered illegal for several years."

The Sessions Judges Act was XIX of 1871; and the answer given to the letter was also in the previously quoted letter of the 24th January 1872. It was there stated that—

"The necessity for the Sessions Judges Act was caused not by any inadvertency in any repealing Act, but by the loose and irregular manner in which the Regulations were drawn, and by the singular intricacy which was produced by the system which their authors adopted, of continually amending and modifying Regulations drawn at different times, and with a view to circumstances subsequently altered, instead of repealing the old enactments in a body and re-enacting them in a convenient and systematic shape. No more marked instance of this could be mentioned than the series of enactments which made 'all capital and other sentences illegal' for nearly forty years. The details will be found in the speeches made, when the Sessions Judges Act was passed, by Mr. Stephen and Mr. Cockerell. If the flaw in question had not been discovered in the course of the investigations required for the consolidation of the Regulations, it might have been suddenly brought to light by any person accused of crime, and might have caused the most serious failure of justice and public scandal. As to the other instances of inconvenience referred to, I am directed to say that none have come under the notice of the Government of India."

Now, the whole story of the change in the law and in the practice, by which it came about that Sessions Judges had not the power that they

had assumed to exercise, was rather a complicated one. It would be all found very fully and clearly explained in Mr. Stephen's speech when he introduced the Sessions Judges Act on the 12th of May 1871, but, for the present purpose, MR. HOBHOUSE could explain it in a very few words to the Council. There were three enactments, Regulation I of 1829, Regulation VII of 1831, and Act VII of 1835. By the combined force of these enactments, the Government of India and the Local Government between them, and by observing certain forms, might perhaps appoint Sessions Judges to administer criminal law distinct from the Commissioners of Divisions who represented the original Criminal Courts. He said "perhaps," because the enactments were so drawn that controversies might be raised on their legal effect. But in point of fact the prescribed forms were never observed, or, at all events, had not been observed for a period of nearly forty years. The Supreme Government had not acted at all in the appointments, for which its intervention was necessary by law. The Local Governments had not followed the forms prescribed, but had assumed the power to appoint Sessions Judges of their own direct authority and to invest them with full criminal jurisdiction. The enactments therefore that he had mentioned were really inoperative and obsolete: when they were repealed they had not been used for years. There was not a single Judge in the whole country who derived title through them, or whom any body thought to derive title through them. They were therefore most properly struck out from the Statute-book as obsolete; and so little were they connected with the existing title of Sessions Judges, that no body had thought from that day to this (excepting the erroneous observation of the Government of Bengal) that the repeal made any difference. Indeed the flaw in the title of Sessions Judges was discovered in a totally different proceeding. It was on a comprehensive review of the Regulations being taken in the Legislative Department for the purpose of further consolidation that this flaw was discovered. And then it was put right, not by any revival of the enactments, which were then completely off the Statute-book, and if put on again would be as useless as they were before, but by passing an entirely new law adapted to modern circumstances and calculated to give the powers required. Therefore, it would be found that this story about the Sessions Judges was a mistake; and he felt sure that if the Lieutenant Governor was here, he would be glad to find that his memory had misled him, that there was not that carelessness which he supposed, and that there was not a tendency in these Acts to so much danger as he apprehended.

MR. HOBHOUSE thought it right that the Council should know what he had stated; he had not spoken in a controversial spirit; because he quite agreed with the Lieutenant Governor that the greatest caution should be exercised in removing from the Statute-book as dead matter that which might still be living matter.

In truth, it was not easy to effect any very large and sweeping repeal without some danger of removing that which was not only alive but useful. That danger, however, was greater when we were passing an Act which professed to make a substantive alteration of the law, than when we were passing one which did not profess to make such alteration. In the former case we were enacting a new body of law, and were supposing that we covered all necessary ground. We then swept away all that we believed we had made unnecessary. In that process there was considerable risk of leaving some of the necessary ground uncovered. And he might say frankly, not only that some disasters might occur, but that, having regard to our human fallibility, they must occasionally occur, in effecting these processes. But when we were passing an Obsolete Enactments Bill we were careful to see that the matter removed was really dead matter. We were not professing to substitute anything for that which was to be removed; and what we had to ascertain was only that nobody

having a knowledge of the subject considered that there was any use in any of the enactments proposed to be removed. On the whole, he thought the Council might fairly send this Bill into the hands of the Select Committee without any great anxiety that the law would be thrown into confusion. Errors there might be: he hoped they would be small ones. And he hoped that the Select Committee would err on the side of caution rather than on the side of incaution.

His Excellency THE PRESIDENT said that His Honour the Lieutenant Governor was so constant and regular an attendant at the meetings of the Legislative Council that he was sure his absence that day was only occasioned by the very onerous nature of the duties which were thrown upon him at this time to meet the wants of those parts of the province which were suffering from scarcity. As a considerable portion of the remarks of his hon'ble friend, Mr. Hobhouse, had been directed to some criticisms which the Lieutenant Governor had made upon this Bill at a former meeting, HIS EXCELLENCY thought that the Lieutenant Governor should have an opportunity of making any further remarks which he might wish to make upon the subject. That, he thought, could be well arranged if on this occasion we referred the Bill to a Select Committee with instructions to report in a month, and postponed the nomination of the members of the Committee to the next meeting.

The Motion was put and agreed to.

KULLU SUB-DIVISION (PANJÁB) BILL.

The Hon'ble MR. HOBHOUSE also moved for leave to introduce a Bill to invest the Assistant Commissioner in charge of the Kullu Sub-division of the Kángra District with certain appellate powers. He said that the circumstances which made this Bill desirable were very simple. By Act IV of 1870, the Assistant Commissioner of the Kullu Sub-division of the Kángra District was invested with appellate powers in civil cases. That was different from the ordinary mode of procedure in the Panjáb. Under the Panjáb Courts Act, appeals would be carried to the Deputy Commissioner of the Kángra District. Act IV of 1870 was one of those measures which were passed to try an experiment, and see whether it worked conveniently or not, and it was passed for only a short term of years. It expired on the 13th April 1873, and since that time appeals had followed the ordinary course of procedure, as settled by the Panjáb Courts Act. Now, it was found that the practice under Act IV of 1870 was more convenient than the ordinary practice under the Panjáb Courts Act, and the Judges of the Chief Court had proposed that the system established under Act IV of 1870 should be re-established. Kullu was a remote district; the cases which were tried there were very simple; and it was a hardship on the inhabitants to have to attend the Courts at the station of Kángra for the purpose of prosecuting appeals. These were the reasons which induced the Chief Court to propose this Bill. The Local Government approved of the measure. On those grounds MR. HOBHOUSE asked for leave to introduce the Bill.

The Motion was put and agreed to.

The Council then adjourned to Tuesday, the 27th January 1874.

CALCUTTA,
The 13th January 1874.

WHITLEY STOKES,
Secretary to the Government of India,
Legislative Department.

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

EXPERIMENTS MADE WITH THE RANEEGUNGE AND KURHURBALLEE COAL IN VIEW OF DETERMINING THEIR COMPARATIVE VALUE.

No. $\frac{A}{1826}$, dated 3rd December 1873.

From—D. W. CAMPBELL, Esq., Locomotive Supdt.,
To—Chief Engineer and Member of Agency, E. I. Railway Co.

Your No. 620 of the 1st September last.

I beg to forward herewith a statement on the trial of Kurhurballee and Raneegunge coal.

You will observe that the load of trains worked by Raneegunge coal is slightly in excess of the others, which will increase its relative value to a very slight degree; but if the experiment had been continued, I am of opinion that the result would have been still more favorable to the Kurhurballee fuel, as the driver who ran the trips had not been used to that coal, and has lessened his consumption each successive trip.

The comparative value of the two classes of coal arrived at from the average of the several trips, as per statement, shows that Kurhurballee coal is superior to Raneegunge by 21·75 per cent.

Return showing the Quantities of Cotton exported from the several Ports of India to British and Foreign Countries, for the month of December 1873.

| Names of Ports of India whence Cotton is exported. | | Quantities of Cotton exported to | | |

Presidency or Province and District.		Rainfall for fortnight preceding.	State of agricultural prospects.
Bombay *—continued.*	(Jan. 22nd)		
Southern Mahratta Country.			
Belgaum	...	...	Early crops reaped; late crops, including cotton, moderately good; public health good.
Dharwar	...	...	Exotic cotton generally blighted; late crops favorable, except in Nawalgund and Dambul; cattle disease has broken out in Hangul also in Kaladghi.
Kaladghi	...	...	Khureef crops reaped and yielded about a third; rubee crops inferior; cotton failed; no disease.
Canara	...	...	Operations for second crop progressing; fever, small-pox and cattle disease prevalent.
Kattyawar and Gackwar's territory.			
Baroda	..	...	Crops and public health good.
Wudwan	...	...	Weather cold; cotton crops slightly injured; public health indifferent.
Bengal	(Jan. 20th)		
Burdwan	...	*Nil*	Weather, cold and bright. Cold weather crops in the east of the district are looking better. Price of new rice little cheaper; exportation continues; total export of grain by rail in December last was 30,293 maunds and total import 12,546 maunds.
24-Pergunnahs	...	*Nil*	Weather fine and cold with heavy dews. The harvest of late rice has been completed in Diamond Harbour, Barrackpore and Dum-Dum; it will shortly be finished in the other sub-divisions. In Barraset the pulses are looking well, and tobacco is stunted, but peas are good wherever irrigated. In Satkhirrah cold weather crops have been doing better than was expected. In other sub-divisions they are, where sown, doing fairly well. General prospects continue unchanged.
Dacca	...	0·38	Weather cold; rain on the 12th January was general. Prospects of crops fair; slight good done by the rain but more wanted.
Patna	...	·39	Weather seasonable but exceedingly cold; a good fall of rain on the night of the 11th January; the crops were benefitted by this fall of rain, and now no more is wanted as it would do harm; the reports regarding the crops were quite satisfactory even before the rain. There is quite an average crop on the ground and doing wonderfully well.
Bhaugulpore	...	·07	Weather clouded on the 12th January with slight showers; very cold with frost; north of the Ganges cold weather crops still promising. No distress.
Cuttack	...	*Nil*	Cold during the first part but afterwards warmer. Late rice almost all reaped; prospects of other crops good.
Kamroop	...	*Nil*	Weather very cold and threatening rain, wind easterly, mornings generally foggy. Late rice still being reaped; about five-eighths of the usual out-turn expected; mustard crops do not look favorable for want of rain; sugar-cane is being cut.
			Public Health.—Burdwan—fever declining. 24-Pergunnahs—fever still continues in Basierhat and small-pox has appeared in parts of Thannah Baduria in that subdivision; fever is abating in Alipore, Bareepore, and Baraset. An outbreak of cholera reported from Nyhatty, no further cases reported either from Bhangore or Dum-Dum. Patna—health of the district good. Bhaugulpore—general health unusually good. Cuttack and Kamroop—public health good.
			General Remarks.—The cold has been severe during the fortnight; more or less injury appears to have been done to the standing crops by frost in some parts of the districts. Rain has fallen in some places by which the cold weather crops have benefitted to some extent, and the ploughing of lands for the ensuing early rice crops has been commenced. Rain is still wanted in some places. The harvesting of the late rice crop is nearly completed; some of the pulses, oil seeds, and sugarcane crops are being reaped. Boro rice is being transplanted with fair prospects. Cold weather crops, while doing well in most places, are suffering in others.
N. W. P.	(Jan. 19th)		
Bustee	,,	...	Prices slightly risen; rubbee doing well, except urhur and peas which have been injured by frost. Exportation nil. Distress reported from the north.
Gbruckpoor	(18th)	...	Prices slightly risen; partial but very slight rain-fall on the 12th; irrigated rubbee doing well, but unirrigated withering and under any circumstances can yield but little; urhur seriously damaged by frost; symptoms of distress among the poorer classes. Exportation less brisk.
Ghazeepoor	(19th)	...	Prices stationary; urhur damaged by frost; irrigated rubbee doing well, but unirrigated out-turn will be light.
Benares	(20th)	...	State of things unchanged; irrigation actively continued; prices of coarse grain rising.
Azimgurh	(19th)	...	Prices slightly higher; frost has in some places much damaged urhur, peas and grain; the high wind of last week has somewhat injured the wheat and barley.
Mirzapoor	(18th)	no rain ...	No change; irrigated rubbee fair, but unirrigated will yield very little; urhur, peas and masoor seriously damaged by frost; importation continues but exportation eastward slightly increased.
Jounpoor	(19th)	light rainfall on the 12th.	Prices stationary; urhur and peas damaged by frost; rubbee generally looking well.
Banda	,,	no rain ...	Frosts and winds have damaged urhur, peas, masoor and gram; but the crop may yet be an average one.
Humeerpoor	(8th)	slight partial rain-fall on the 2nd.	Prices unchanged; rubbee looking well, but needs rain.
Jhansie	(21st)	no rain from 9th to 20th.	Prices stationary; grain partly injured by frost, otherwise rubbee prospects good.
Futtehgurh	,,	no rain ...	Prices rising; great injury done by frost to urhur, gram and potatoes; with rain a good out-turn may be expected from other crops.
Agra	,,	,,	Unirrigated urhur, gram and cane have suffered considerably from frost; rain generally needed, but no great injury done yet.

Presidency or Province and District.		Rainfall for fortnight preceding.	State of agricultural prospects.
N. W. P. *—(continued).*	(Jan. 19th)		
Muttra	(18th)	...	No rain but some signs of it; with rain a good rubbee crop may be obtained; urhur extensively damaged by frost; irrigation continues.
Allygurh	(20th)	no rain ...	Rubbee promises well, but rain is wanted.
Bijnoor	(8th)	...	Some rain which has done much good, and prospect of more.
Moradabad	(21st)	...	Prices risen; urhur seriously damaged by frost; without rain general rubbee yield will be very small. No exports.
Bareilly	(21st)	no rain ...	Prices have risen; rubbee is beginning to suffer from drought; urhur injured by frost.
Saharunpoor	(21st)	...	Rubbee generally very good; more rain is wanted in two tehseels.
Punjab	(Jan. 22nd)		
Lahore	(21st)	0·5	Half inch rain reported in Jullundhur, and slight rain in Lahore, Rawulpindi and a few other places; snow fell in Tullaganj tahsil; agricultural prospects and public health good.
Oudh	(Jan. 21st)		
Lucknow	...	*Nil*	Frost has damaged gram, peas, mustard, urhur, and masur; rain much wanted; instances of rinderpest have occurred in the Fyzabad district; exports increasing.
Fyzabad	...	,,	
C. Provinces	(Jan. 22nd)		
Bhandara	(17th)	...	Seasonable with dew; prospects good; prices easy; health good.
Raipoor	...	...	Cold; crops suffering for want of rain; prices stationary; small-pox prevailing.
Mandla	...	...	Unusually cold; prospects favorable; prices stationary; health good.
Upper Godaveri	...	...	Temperature 55°; crops good; jowari harvesting: prices steady.
Belaspoor	...	...	Clear; no change; rubbee fair; grain cheaper; small-pox reported.
Sumbulpoor	...	...	Seasonable; harvest over; prices stationary.
Balaghat	...	...	Fair; prospects unchanged; small-pox slight.
Saugor	(21st)	...	Very cold, heavy dew; rubbee thriving; small-pox reported; health good.
Wurdah	...	...	Rubbee doing well; small-pox in some villages.
Nagpoor	...	...	Clear; rubbee fair order; prices falling; health good.
Nursinghpoor	...	...	Rubbee promising; prices stationary.
Hoshangabad	...	...	Prospects favorable as yet, but rain sadly wanted.
Baitool	...	,,	
Seoni	...	...	Rubbee doing well; rain wanted.
Jubbulpur	...	...	Crops looking well; rain desirable; prices stationary; health good.
Nimar	...	...	Prospects favorable; prices risen; fever prevalent.
Hyderabad Assigned Districts—			
East Berar	(Jan. 22nd)	...	Rubbee crops in thriving condition.
West Berar	(21st)	...	Prospect of rubbee crops good.
Mysore and Coorg—			
Bangalore	(Jan. (21st))	*Nil*	Dry and paddy crops reaped; some of the remaining existing crops, both wet and dry, parched from want of moisture; public health good; raggy slightly risen.
Toomkoor	(20th)	,,	Some wet crops withered for want of water in the tanks; public health good; prices rising.
Mysore	(14th)	,,	Prices fallen slightly.
Hassan	(18th)	,,	Most of the crops harvested; those standing good; public health good; murrain among cattle in two talooks.
Shimoga	(17th)	,,	Crop and public health good; cattle disease prevails; fodder scarce; prices fallen.
Chituldroog	(15th)	,,	Staple dry; crops harvested; wet crops under wells thriving; public health good, cattle disease in one talook.
Coorg	(21st)	,,	Harvesting of paddy, and picking of coffee completed; crops of grain injured from want of dew or rain; small-pox and fever prevalent.
			Remarks.—Most of the staple crops have been reaped.
Rajpootana—			
Jeypore	...	...	Average crops already promised; rain expected with good results; public health excellent.
Ajmere	(23rd)	...	Health good; prospects of harvest favorable.
Central India	(Jan. 22nd)		
Indore	(21st)	...	No change since last report.
Gwalior	...	...	Cloudy yesterday, clear and windy to-day; rain wanted; few cases of small-pox.
Rutlam	...	...	No report.
Bagelkhund (Sutna)	...	...	Cloudy but no rain; rubbee doing fairly.
British Burmah	...	...	No report received.
Nepal	(Jan. 14th)	*Nil*	Health good; prices rising slightly; rain required for wheat crop.

A. O. HUME,
Secy. to the Govt. of India.

SUPPLEMENT TO

The Gazette of India.

CALCUTTA, SATURDAY, JANUARY 31, 1874.

OFFICIAL PAPERS.

A SUPPLEMENT *to the* GAZETTE OF INDIA *will be published from time to time, containing such Official Papers and information as the Government of India may deem to be of interest to the Public, and such as may usefully be made known.*

Non-Subscribers to the GAZETTE *may receive the* SUPPLEMENT *separately on a payment of six Rupees per annum if delivered in Calcutta, or nine Rupees if sent by Post.*

No Official Orders or Notifications, the publication of which in the GAZETTE OF INDIA *is required by Law, or which it has been customary to publish in the* CALCUTTA GAZETTE, *will be included in the* SUPPLEMENT. *For such Orders and Notifications the body of the* GAZETTE *must be looked to.*

GOVERNMENT OF INDIA.

DEPARTMENT OF AGRICULTURE, REVENUE AND COMMERCE.

CORRESPONDENCE RELATIVE TO THE SCARCITY IN BENGAL.

No. 20, dated India Office, London, the 1st December 1873.

From—Her Majesty's Secretary of State for India,

To—His Excellency the Right Hon'ble the Governor General of India in Council.

MY LORD,—*Para.* 1. It is with much anxiety that I learn from your Despatch of October the 30th last, which reached me by the mail of the 24th November last, and from the previous message by telegraph, that the failure of the crops in a great part of Bengal will occasion severe distress, if not worse results.

2. Repeated experience has sufficiently proved that, when scarcity and the danger of famine arises in India, the ordinary operations of commerce, and the ordinary processes of supply and demand, cannot be relied on for any adequate supply of food to the affected districts, and that, without the active intervention of Government, the worst consequences are liable to ensue.

3. I have, therefore, to intimate to you, in pursuance of former telegraphic communications, that Her Majesty's Government are thoroughly satisfied of this conclusion, and I place unreservedly in your hands my sanction, by anticipation, to any measure which, acting on the spot, and with full knowledge of the facts, you may consider necessary for the saving of human life.

4. You inform me that the Lieutenant-Governor of Bengal has advocated the immediate prohibition of the export of rice from all Indian ports, and you explain some of the reasons which induce you to prefer other methods of action on the part of the Government. In particular, you specify that method of proceeding which consists in the Government entering, either directly or indirectly, as a purchaser into the market, and thus obtaining any supplies of rice which may be necessary.

5. It is obvious that this method of proceeding will of itself have the effect of preventing export to any injurious extent. There can be no doubt that it is a method of operation by Government less violent than the other, and has the additional advantage of tending to turn and invite commercial enterprise in the direction of increased imports of food.

6. Commercial enterprise, though it cannot be entirely trusted to bring sufficient food into the country, and can still less be trusted to bring it to the stricken districts or to distribute it there, must nevertheless be the most

powerful agency in bringing the necessary supplies within reach of the Government, and is certainly an agency which ought not to be unnecessarily discouraged or thwarted in its operations.

7. I approve, therefore, of the preference you have given to the method of purchase. But I would impress on you the necessity of securing, by this method, whatever amount of supply the largest possible estimate of the need may appear to require.

8. Scarcity in India is apt to outurn in its amount and in its effects all previous estimates of the danger, and if your Government is determined to secure in time an amount of food fully equal to the largest deficiency which can be calculated upon, it will be able to draw upon an adequate supply.

9. I entirely concur with your Excellency in placing the utmost reliance on the ability, energy, and special knowledge of the present Lieutenant-Governor of Bengal.

No. 8, dated 30th January, 1874.

From—His Excellency the Right Hon'ble the Governor General of India in Council,

To—Her Majesty's Secretary of State for India.

WE have not before replied to your Grace's Despatch, Revenue, No. 20 of the 1st December last, because we desired, in doing so, to place before Her Majesty's Government, in a concise form, the measures that we have taken for the supply of grain to meet the anticipated scarcity in Behar and parts of Bengal.

2. We have to express our acknowledgments for the unreserved sanction, by anticipation, of any measures which we may consider necessary for the saving of life. We have derived much encouragement, under circumstances of some difficulty, from this mark of the confidence of Her Majesty's Government, as well as from the approval, which your Grace's Despatch conveyed, of our decision not to prohibit the export of rice from Indian ports. Upon this subject we enclose a Minute written by the Viceroy, with which we entirely concur.

3. Your Grace will have observed that although some information has been given in our weekly Despatches and in our correspondence with the Government of Bengal as to the measures we have taken for the provision of supplies of grain to the distressed districts, we have not yet reported the whole of those measures.

4. Obvious reasons affecting the success of large transactions for the purchase of grain induced us to adopt a prudent reserve upon the subject, and our desire to maintain that reserve was rendered stronger, because we received information that a general impression had begun to prevail that the Government proposed to take upon itself the duty of regulating the food-supply of the people, and that there was much danger that such an impression would interfere with the activity of private trade in grain, to which alone we could look for supplies to meet any general deficiency in the markets situated upon the main lines of communication throughout the country.

5. The efforts of the Government of Bengal and of the local officers have, we are glad to say, succeeded in re-assuring the trade that their operations will not be interfered with by the Government, and the latest reports lead us to believe that the measures we have taken have not had an injurious effect upon private trade.

6. This being the case, and as our arrangements for the next three months are completed, there is no longer the same reason for silence, and we shall, therefore, proceed to inform your Grace of the general arrangements which we have made.

7. In the Despatch addressed by the Viceroy to your Grace on the 7th November last, it was observed that—

"Her Majesty's Government may rely upon the Government of India not shrinking from using every available means at whatever cost to prevent, so far as they can, any loss of the lives of Her Majesty's subjects in consequence of the calamity which now threatens Bengal."

In the remarks which the Viceroy made in replying to an address from the Municipality of Agra on the 24th of November, His Excellency, speaking on behalf of the Government of India, observed that—

"the Government is fully impressed with the grave responsibility which rests upon them, and we have taken without delay or hesitation measures in order to anticipate distress. Our aim and object is to prevent, so far as is possible, the loss of the lives of any of Her Majesty's subjects."

8. Your Grace is aware of the measures which were taken to enable the Government of Bengal and the local officers to commence at once public works of various kinds wherever there were people in want of employment; this course of action was indicated by former experience as well suited to preserve the general labouring population from arriving at a stage of distress at which any further relief might prove ineffectual.

9. In addition, however, to this provision, we contemplated from the first that, judging from the experience of the famine in Orissa and in Behar in the years 1865 and 1866, it would be necessary to store grain in the distressed districts for the payment in food of the labourers engaged upon Government works, should any scarcity of supplies exist at the places at which they might be employed. The principles which we laid down for our guidance were expressed in the Resolution of Government of the 7th November. It was stated in that Resolution that, while the Government had confidence that the internal trade of British India would generally meet any deficiencies of grain in different parts of the country, exceptional circumstances might arise in which it would be necessary for Government to supplement private trade; that it was, therefore, proposed to lay in sufficient supplies of food for the sustenance of the labourers who would be employed upon the Government public works; that those supplies would be obtained in such a manner as to interfere as little as possible with the trade in grain; that the Government of India had arranged to obtain supplies from beyond the limits of the territories affected by the failure of the crops; and that purchases had consequently been ordered through the Government of Madras and the Chief Commissioner of British Burma.

10. When that Resolution was issued, it was supposed that the condition of the country would have been such as to require the early assembly of a Central Relief Committee at Calcutta, and our intention was to request the Committee, when constituted, to undertake the purchase of such grain as might be required for gratuitous distribution. As, however, it was not considered desirable to constitute the Central Relief Committee so soon, we took steps to provide supplies of food not only for the labourers employed upon public works, but also for such other relief operations as may be found necessary.

11. In order that no time might be lost in laying down supplies in those districts which are situated furthest from the railroads and rivers, we authorised the Government of Bengal to purchase supplies in the first instance, but subsequently we have considered it desirable to take upon ourselves the main provision of supplies.

12. We will now state shortly the extent of the operations of Government.

The Government of Bengal have purchased 50,341 tons of food-grains.

The purchases and arrangements of the Government of India have been as follows:

	Tons.
Received in Calcutta up to present date	47,000
Arranged for and expected to be received in the next three months, say to the middle of May	244,500
TOTAL ...	291,500

The total provision of food-grains, for which arrangements have been made up to the middle of May, amounts, therefore, to about 342,000 tons. This is exclusive of considerable quantities bought by the Court of Wards, and by Planters, Zemindars, and others with funds advanced by Government.

13. Having thus informed your Grace of our arrangements up to the present time, we will add a few remarks to show by what calculations we have been guided. We have not looked upon the prospects of the food-supplies as indicating a probability that there will be a deficiency in the general food-supply of Bengal which cannot be met from the resources which are obtainable by the trade from other parts of India; and nothing has occurred since the first intimation of the failure of the rice crop to lead us to entertain a different opinion.

14. Prices, no doubt, may be expected to rise to a high rate, and the rise must bring with it severe distress to a great number of people. The measures contemplated by Government are that the distress, wherever it may arise, should be dealt with by relief works for the able-bodied, and by gratuitous relief for those who are unable to work, as well as for certain exceptional classes; but we have always endeavoured to avoid giving any impression that we could undertake the general supply and distribution of food. Such an undertaking on the part of Government is, in our opinion, an impossible task when the food-supply of so vast a population is involved; while to have made the attempt would have paralyzed the exertions of the private traders, who in India, so far as inland trade is concerned, are numerous, and for the most part active and enterprizing, and upon whom the main dependence of the country must always be placed.

15. We had, therefore, to calculate, from the best materials at our command, the probable number of persons who might require assistance from the State. The total population of the districts threatened by the drought was estimated at 25 millions. The largest number of people who, upon former occasions, have been found to come upon relief works, or upon the charitable relief dispensed by Relief Committees and others, is 10 per cent. of the population of the most distressed tracts of country. We applied that propoirton to the whole population of the districts threatened by the drought, and estimated that it would be possible that we should have to provide for the subsistence of 2½ millions of persons for a period of seven months. The food for that number, at the rate of one pound of rice per head a day, gave a requirement of about 240,000 tons of grain.

16. We thought, moreover, that it would be desirable to have in reserve a further quantity of grain, and we have, therefore, secured a supply of 100,000 tons in addition to the above estimate.

17. Such was the foundation upon which the measures of the Government were based; and the demands and estimates sent to us by the Government of Bengal, which were made independently, have strengthened our belief that the provision we have made will, so far as the supplies of food at the command of Government are concerned, be sufficient.

18. The first estimate forwarded to us by the Bengal Government was dated the 2nd of December. The Lieutenant-Governor wished, as a preliminary measure, to have in the distressed districts or ready in depôts before the end of January 1874 a sufficient quantity of grain to supply 5 per cent. of the inhabitants of those districts for three months, and His Honor thought that we should probably then be in a position to prevent starvation and to alleviate keen distress wherever it might occur to the end of April 1874;—before that quantity was consumed, we should know how far the scarcity was likely to deepen into a severe famine, and the Government of India would be able to order as much more rice as might be considered necessary. The Lieutenant-Governor added that his preliminary estimate included all requirements for imperial and local relief works, as well as for relief-houses. In a further letter upon the subject, dated the 11th December, the Lieutenant-Governor remarked that if the quantity which he had demanded were in hand by the end of January, we might be able to bring in much more food during the remaining months, and to distribute it before the rains set in; but that we could hardly hope to distribute supplies beyond a total of 200,000 tons in the then distressed area by Government agency before the rainy season began. It was added that if distress should extend to, and Government grain be required in, Central and Western Bengal, a very much heavier amount might be distributed.

19. This first demand, which, in order to provide for a reserve, was put at 70,000 tons, was sanctioned, and has been obtained by the Government of Bengal and the Government of India well within the time mentioned.

20. On the 5th of January the Government of Bengal submitted a further estimate. The Lieutenant-Governor considered that provision ought to be made, *first*, for the continual flow of food towards distant and inaccessible distressed tracts, and, *secondly*, for a reserve of food for the districts nearer the seaboard, the railway, and the navigable rivers, in case the supply should fail there. His Honor said that supplies received in Calcutta and despatched in February, March, and April would reach the interior before the beginning of the rainy season, and that supplies despatched in May, June, and July might reach many districts before the new crop came in; and he expressed a wish that 75,000 tons more of food-grains might be placed at his disposal, to be forwarded into the less accessible parts of the Patna, Bhaugulpore, and Rajshahye Divisions during the three months following the 1st of February. His Honor also considered that a reserve of 150,000 tons should be in possession of Government, and that it might be desirable to secure a further reserve of 75,000 tons in the months of May, June, and July.

21. We informed the Government of Bengal at once that a further quantity of 75,000 tons would be placed at their disposal; and Your Grace will observe that the additional provision we have made amounts to nearly 200,000 tons up to the middle of May. We anticipate no difficulty in increasing our supplies still further if in the course of the next three months additional necessities should appear to us to require it.

22. We are satisfied that the East Indian and Eastern Bengal Railways can carry ample supplies of grain to their principal stations. Every exertion is being made by the Lieutenant-Governor of Bengal and the local officers to organize sufficient transport arrangements to carry the grain up the country, but the local difficulties which have to be encountered are very great.

23. From the best calculations that we can make, the first cost of these supplies will amount to about Three Millions Sterling—an expenditure which we have not hesitated to incur for the purpose of alleviating the effects of the calamity with which a large tract of country is threatened.

Dated 30th January 1874.

MINUTE—By His Excellency the Viceroy.

When information was first received of the certainty that a portion of the winter rice crop would fail, the Government of Bengal recommended that—

No. 50 T., October 22nd, 1873.

"the export of rice to foreign countries from the Indian dominions should be stopped."

That recommendation was shortly afterwards repeated in the somewhat wider terms—

No. 3300, November 7th, 1873.

"that the exportation of food-grains from British Indian ports might be prohibited,"

and it was urged that if the larger measure was not approved, at any rate the export of common rice from Bengal ports should be prohibited.

At a later period the British Indian Association recommended that the export of food-grains from British India, with the exception of Burma, should be prohibited.

November 21st, 1873.

None of these suggestions have been adopted by the Government of India. As the question is one of great interest, I wish to state the reasons which led me to decide against their adoption during the time when it became my duty to exercise the full powers of the Government.

I do not think it necessary to discuss at length the proposal for the prohibition of the export of all food-grains from Indian ports, including Burma.

The exports of food-grains from India consist chiefly of rice. Setting aside Bengal for the moment, about 700,000 tons of rice are exported annually from British Burma, and 100,000 tons from Madras.

To have prohibited the export of rice would probably have inflicted a fatal blow on the trade of British Burma. This is a sacrifice which I hardly think could have been seriously contemplated, especially as the Burmese rice is not usually consumed by the people of Bengal, and such quantities of it as either the Government might require for the distressed districts, or the trade might wish to purchase, were easily available without having recourse to such a measure.

The export of rice from Madras is almost entirely to Ceylon. I cannot look upon Ceylon as a "foreign country" on account of the accident that it is under the Colonial Office and not under the Secretary of State for India. I think Ceylon is entitled to be treated as an integral part of British India; and we had no hesitation in assuring the Governor of Ceylon, who expressed some anxiety on the subject, that the usual export from India would not be stopped.

There is a small but increasing export of wheat, chiefly from Bombay and Kurrachee; to have stopped this could not have materially affected supplies in Bengal, while it would have inflicted great injury upon the districts from which the trade is supplied.

The practical question appears to me to be whether the export of common rice from Bengal should have been prohibited; and to that proposal alone I will address such further observations as I have to make.

It will be convenient in the first place to state exactly the facts of the case.

In the year 1872-73 there was a larger export of rice from Bengal than in any year since 1864. The figures of the year 1872-73 may, therefore, be taken to show the extreme quantity of rice which is likely to be exported during the coming year.

The total exports of rice from Bengal ports amounted in round numbers in the year 1872-73 to 526,000 tons.

About 80,000 tons of this consists of "table rice," which from its quality and price is not suited to the ordinary consumption of the people. It could hardly have been intended to interfere with the export of this class of rice; for to have done so would have withdrawn from the growers means which they require in order to provide themselves with cheaper descriptions of food.

The total export of common rice was, therefore, in round numbers 446,000 tons; of this, 189,000 tons were sent to British Indian ports, including Ceylon, 160,000 tons to the West Indies, Mauritius, and other places where the consumers are mainly natives of India who have emigrated, and the remaining 97,000 tons to other parts of the world, principally to Great Britain and the Persian Gulf.

For my own part I entertain a strong opinion that it would have been very unwise to have interfered with the inter-portal trade, and that it would have been wrong, at any rate without considerable notice, to have stopped the main supply of the usual food of Bengal coolies in the Colonies; but even if the whole export of common rice had been prohibited, the amount, reduced as it must necessarily be from the rise of prices, would be inconsiderable in comparison with the food-supply for a population of 66,000,000, who require about 30,000 tons of food a day. It may, I think, be assumed that the addition taken by itself could have made no considerable difference in the general price of rice throughout Bengal.

It is said, however, that the action of Government in prohibiting the export of rice would have given confidence to the country, and have had a great effect in reducing prices.

It is very probable that, had the export of rice been prohibited, the action of Government would have had the effect of considerably lowering the price of rice. The confidence, however, that might have been thus produced would not have been justified by the addition which would have been made to the supplies of food.

One of the greatest safeguards against a famine in India, as in every country, lies in the diminution of consumption which naturally results from the rise of prices which the anticipation of scarcity occasions; and I can conceive no interference by Government more unwise than the reduction of prices below their natural level at the beginning of a period of scarcity. This would have been the effect which would probably have followed a prohibition of exports. The addition that would have been made to the general supplies of the country would in that case have been soon absorbed by the increase of consumption which would have been the result of an undue lowering of prices.

I will assume, however, for the purpose of argument, that I may be mistaken in my estimate of the effect which would have been produced upon prices by the prohibition of exports, and that the measure would have produced no undue reduction of prices. Consumption would, upon this assumption, not have been unduly stimulated, and there would have remained a distinct addition to the food-supplies of the people.

Even on this assumption I am of opinion that the advantage which would have been derived for the time would have been dearly purchased by the probable consequences for the future.

It seems to me that an export trade in food-grains is a great advantage to a country in the condition of Bengal, raising its own food-supplies, having no import trade in food, and whose population is poor. The existence of such an export ensures the production, in ordinary years, of more food than is required to meet the demands of the people. The natural rise of prices in times of scarcity must divert a portion of the ordinary export to home consumption, and thus a reserve easily and readily available is habitually maintained.

For example, the years 1865-66 and 1866-67 were years of scarcity, and the exports of rice from Bengal fell from 695,341 tons in 1864-65 to 336,211 tons in 1865-66, and to 222,659 tons in 1866-67. In the three months of October, November and December last the exports were 64,425 tons as compared with 113,277 tons in the corresponding months of 1872.

It follows that any measure that would diminish the export trade in common rice from Bengal would weaken the power of the country to meet any future period of scarcity. Trade is readily diverted from one channel to another. The interference of Government with its free course may easily destroy it. If we refuse to supply our ordinary customers at any price, we oblige them to have recourse to other markets, and it is impossible to assume that when we want them again they will return to us.

Bearing in mind, therefore, the permanent harm that might be done by an interference with the export trade in food-grains, and being satisfied that the Government could without difficulty bring in a larger quantity of rice than is exported even in ordinary years, I had no hesitation in preferring the latter course, and I see no reason to doubt the correctness of the conclusion at which I then arrived.

The British Indian Association, in their argument, which is well and temperately stated, assume that the exports of rice from Bengal in the years 1865 and 1866,

"if they could have been retained in the country, would have gone a great way in saving the famishing millions of Orissa."

The circumstances of the case do not seem to me to bear out this assumption. The loss of life in Orissa was not occasioned by a deficiency in the general food-supplies of the country, but by the difficulty which the isolated position of Orissa presented to bringing supplies to the people who were suffering. In my opinion the same difficulty exists now, although in a less degree. The real difficulty of dealing with the present distress will probably be found not in any general deficiency of food-supplies throughout the country, or in a want of food-supplies at the command of Government in Calcutta or on the main lines of communication by railway or river, but in the transport of those supplies into the interior, and in making arrangements for distributing them.

The Government have gone far beyond the action heretofore taken in times of scarcity, by purchasing and laying in stores of grain for relief operations.

Those stores of grain will, in the six months from November 1873 to May 1874, amount to about 340,000 tons, of which the greater portion will be obtained from beyond the sea; there will thus be an importation by Government about equal to the annual average export of rice to foreign countries from Bengal ports during the last five years.

The supplies purchased by Government will be specially applicable to the distressed districts, and, therefore, I need hardly say, have a far greater effect for the relief of distress than an equal addition to the general food-supplies of the country, obtained by prohibiting exports, could possibly produce; for the rice, the export of which would have been prohibited, would have come, not from the distressed districts, but from other parts, and must have been bought by Government or the trade, and carried to the distressed districts before being of use there.

In these remarks I have purposely abstained from alluding to the objections to an interference with the export trade of India, which depend upon general considerations connected with trade and finance, as I have desired to look upon the question entirely with reference to the present and future food-supplies of the people.

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Tuesday, the 27th January 1874.

PRESENT:

His Excellency the Viceroy and Governor General of India, G. M. S. I., *presiding*.
His Honour the Lieutenant-Governor of Bengal.
The Hon'ble B. H. Ellis.
Major-General the Hon'ble Sir H. W. Norman, K. C. B.
The Hon'ble A. Hobhouse, Q. C.
The Hon'ble E. C. Bayley, C. S. I.
His Highness the Mahárájá of Vizianagram, K. C. S. I.
The Hon'ble J. F. D. Inglis, C. S. I.
The Hon'ble Rajá Ramánáth Tagore.
The Hon'ble R. A. Dalyell.
The Hon'ble H. H. Sutherland.
The Hon'ble B. D. Colvin.

NEW MEMBER.

The Hon'ble MR. COLVIN took his seat as an Additional Member.

OBSOLETE ENACTMENTS REPEAL BILL.

The Hon'ble MR. HOBHOUSE moved that the following Members be appointed to the Select Committee on the Bill for the repeal of certain obsolete enactments:—

The Hon'ble Messrs. Inglis and Dalyell and the Mover.

He observed that the Lieutenant-Governor was not present, and it was doubtless owing to a great pressure of business that His Honour had not been able to attend this meeting. He had authorized MR. HOBHOUSE, in case he was not able to attend, to say that he did not desire to make any further observations so as to continue the controversy which arose on the occasion when leave was asked to introduce the Bill. The matter was indeed one of considerable complication as MR. HOBHOUSE was quite free to admit; and

His Honour did not consider it worth while to take up time with a subject which now related wholly to the past, and which was not of sufficient practical moment to justify further discussion.

The Motion was put and agreed to.

ACT X OF 1859, &c., EXPLANATORY BILL.

The Hon'ble MR. HOBHOUSE also presented the Report of the Select Committee on the Bill to declare the true meaning of Acts X of 1859, XIV of 1863 and XXII of 1872.

BURMA FISHERIES BILL.

The Hon'ble MR. HOBHOUSE also moved for leave to introduce a Bill to regulate Fisheries in British Burma. He thought that a very few observations would be sufficient to induce the Council to give leave to introduce this Bill. Fisheries of considerable extent and importance existed in British Burma. He found, on looking at the papers, that these fisheries brought in a revenue to Government of about six lákhs of rupees. There was no system of law for them to be found in any written document. A few rules were made in 1865 for the guidance of the local officers in dealing with these fisheries. These rules were, MR. HOBHOUSE believed, founded on the old customs of the country, and he had no doubt that they had a perfectly good legal foundation, and in some respects they worked well enough. But in other respects they were not quite sufficient, and as time went on, and the interests in these fisheries became larger and more complicated, it was found necessary to regulate the rights of parties; and therefore the Local Government had come up to ask that the matter be regulated by an Act of this Council. The nature of the proposed Bill he would explain on a future occasion. He thought the Council would be of opinion that the matter was of sufficient magnitude to be dealt with by law.

The Motion was put and agreed to.

ADMINISTRATOR GENERAL'S ACT AMENDMENT BILL.

The Hon'ble MR. HOBHOUSE also presented the Report of the Select Committee on the Bill to amend Act XXIV of 1867 (the Administrator General's Act). He said that this Bill had been before the Council for a considerable time, but the last consideration of it by the Select Committee resulted in several small amendments being made. These were specified in the Report as follows:—

"We have empowered the Government of India to authorize the Administrators General to deal with the effects of British subjects dying in allied Native States.

"We have enabled the Presidency High Courts to grant to the Administrators General letters limited to the purpose of dealing with the effects of military men in accordance with the Regimental Debts' Act. This will save time and expense.

"We have provided (clause 32) that, whenever the Administrator General carries over assets to separate accounts in his books, he shall notify the fact in the Gazette, and we have empowered him, with the consent of the Official Trustee, to appoint the latter functionary to be the trustee of such assets. We have also declared (clause 54) that the carrying of assets to separate accounts when so notified, and the transfer of assets to the Official Trustee, shall each be deemed a 'distribution' for the purpose of entitling the Administrator General to draw the second moiety of his commission.

"We have struck out, as inconsistent with the rest of the section, the words in section 33 of the present Act (XXIV of 1868) providing that the plaintiff in a creditor's suit against the Administrator General shall not be entitled to enforce the decree.

"We have extended the Administrator General's power to grant certificates to cases when all or any of the assets are immoveable. As the law now stands, probate or letters of administration must be obtained in all such cases, however small the value of the property.

"We have empowered the Governor General in Council to decide questions as to the time at which any commission shall be deemed to have been payable, and declared that such decision shall be binding on every Administrator General and the estates held by him in his official capacity.

"We have (clause 64) specified the particulars of which the District Judge is to inform the Administrator General on the occasion of the death of a European in the District.

"We have saved the provisions of the Presidency Towns Police Acts as to petty estates which have been taken charge of by the Police.

"We have omitted as useless the section (64) of Act XXIV of 1868 providing for the appointment of a Deputy Administrator General for the North-Western Provinces, the Panjáb, &c".

The only point that it was necessary to mention was that inasmuch as the Act of 1867 had already been amended twice (by Act XIX of 1869 and Act V of 1870), the Select Committee thought it better to repeal the existing Acts, and re-enact them so as to have the law conveniently within the compass of a single enactment.

KULLU SUB-DIVISION (PANJÁB) APPELLATE POWERS BILL.

The Hon'ble MR. HOBHOUSE also introduced the Bill to invest the Assistant Commissioner in charge of the Kullu Sub-division of the Kángra District with certain appellate powers, and moved that it be referred to a Select Committee with instructions to report in a month. He had explained the object of the Bill when he got leave to introduce it. The Council would see that it was of the simplest possible description. It was intended merely to revive an expired Act which conferred powers which were found by the Local Government to be beneficial.

The Motion was put and agreed to.

The Hon'ble MR. HOBHOUSE also moved that the Bill be published in the *Gazette of India* and also in the *Panjáb Government Gazette* in English and in such other language as the Local Government might think fit.

The Motion was put and agreed to.

ASSAM CHIEF COMMISSIONER'S POWERS BILL.

The Hon'ble MR. HOBHOUSE also moved for leave to introduce a Bill to provide for the exercise of the powers hitherto exercised by the Lieutenant-Governor and Board of Revenue of Bengal in the territories forming the Chief Commissionership of Assam. He said that the nature of the Bill was almost entirely formal. The authority by which the Chief Commissionership of Assam was erected was the executive power. But the same Statute that gave the Government of India power to effect this operation also said that no law or regulation prevailing in territories so dealt with should be repealed except by a law or regulation. It so happened that some of the authorities exercised by the Lieutenant-Governor and some of the authorities exercised by the Board of Revenue of Bengal were derived from laws or regulations, and therefore as regards those authorities, it would be necessary for the Council to pass a law in order to make the proposal complete of erecting a Chief Commissionership of Assam. For that formal purpose he desired to introduce a Bill.

With regard to the subsequent motions on the paper it had been thought desirable to pass this Bill *uno flatu*, because it was supposed that the arrangements were complete. He was informed that they were not complete, and he therefore wished to confine the motion this day to the first upon the paper, namely, to ask for leave to introduce a Bill.

The Motion was put and agreed to.

The following Select Committee was named:—

On the Bill to invest the Assistant Commissioner in charge of the Kullu Sub-division of the Kángra District with certain appellate powers—The Hon'ble Messrs. Inglis and Dalyell and the Mover.

The Council then adjourned to Tuesday, the 10th February 1874.

CALCUTTA,
The 27th January 1874.

WHITLEY STOKES,
Secretary to the Government of India,
Legislative Department.

GOVERNMENT OF INDIA.

FINANCIAL DEPARTMENT.

REPORT BY THE ACTING CONSUL AT NEWCHWANG ON THE CULTIVATION OF NATIVE OPIUM FOR THE YEAR 1873.

No. $\frac{6}{30}$, dated 1st October 1873.

From—A. S. HARVEY, Esq., Acting Consul, Newchwang,

To—The Secretary to the Government of India, FINANCIAL DEPT.

In accordance with standing orders I have the honor to forward a report upon the subject of native opium for the current year in the form of answers to the questions submitted to the Consuls in China through Her Majesty's Minister in Pekin.

1st.—What sort of crop has been gathered in Manchuria?

The crop has been a very poor one. It is estimated that in some places, from the same area under cultivation, 40 per cent., in others 50 to 60 per cent., less has been gathered than last year. Fields of 10 mow (Chinese acres), which during a good season will produce from 120 to 130 Chinese ounces of drug, have this year only yielded from 50 or 60 up to 75 or 80 ounces. In some places *no* crop was gathered at all. The total outturn is thought to be 40 per cent. less than last year.

2nd.—Any particular circumstances that have affected the outturn?

Excessive rain is the cause of the failure of the crop. The rainfall in this province throughout the summer is without a precedent. In the immediate neighbourhood of this town the country for miles around is, or has been, till quite recently, completely under water. It is estimated that between this place and Monkden, the provincial capital, an area of at least 1,000 square miles was during July and August flooded to such an extent that boats could sail across the fields in any direction; while in other parts the country was a marsh, and the roads impassable. All traffic, except by boat, was suspended until within the last fortnight; and the boat traffic was rendered unsafe and irregular by a great increase in brigandage. Trade was at a stand-still, and during a period of six weeks not a bale of goods nor a chest of opium was sent into the interior.

The damage done to the crops is terrible. In some places the water stood higher than the millet at the height of 8 to 10 feet. The smaller kinds of grain were totally destroyed over a large area. The greatest loss has been in the province of T'êngt'ien, especially along the basin of the river Liao; but in Kirin the rain has been sufficient to affect the opium crop in the proportion given above. It would seem that in some of the patches the poppy stems rotted where they stood.

I have referred thus fully to the unprecedented rainfall to account for the very large proportion by which the outturn is said to fall short of last year's.

I know of no other circumstance that has affected the crop. There is a small green grub that occasionally attacks the young poppy; but I have not heard of it this season.

3rd.—Is cultivation of opium generally and especially in the writer's own vicinity extending or the reverse?

There can be no doubt that the cultivation of the poppy is on the increase throughout the whole of Manchuria. The area under cultivation is considered to have been larger than it was last year. The extent to which it is cultivated in the immediate neighbourhood of this port town is still inconsiderable; but the fact that I have information of its cultivation at T'ien chuang t'ai on the Liao river, some 20 miles to the north, and at Kaichow, some 30 miles to the south, of this place, at neither of which places had it been grown before, shows that it is gradually extending from the north southwards.

On the other hand a Chinese informant gives it as his opinion that the increase is in the number of producers; but that the area under cultivation is much the same, as owing to official meddling it has to be grown in smaller and more scattered patches than formerly.

4th.—Any action of the imperial or local authorities affecting opium?

The action of the imperial and local authorities seems to be very irregular and uncertain. Proclamations are issued from time to time forbidding the cultivation of the poppy; on the other hand the existence of the native drug is recognised, and the Lekin or irregular tax upon it is fixed at one-third less than that charged on foreign opium. I enclose one or two extracts from proclamations lying before me, which have been posted on the walls of this town during the last three years, which prove how publicly its existence is recognised. In spite of this, however, no revenue seems to be derived from native opium. It is to all intents and purposes an underhand trade. It cannot be purchased here in larger quantities than a catty (1⅓ lbs.) at a time. It is smuggled in small quantities concealed about the person, or hid in bags containing grain and other produce. The want of uniform action by the authorities may afford the required explanation. Some officials wink at its growth; others are zealous to suppress it. Publicly recognised here, it is forbidden further north; but whether recognised or not it is probable that the petty officials, tax-gatherers, and the like, represent it as illicit and exact bribes to refrain from interference.

In the spring of last year, in consequence of the representations made by Po wang, a Mongol prince, who had on a journey through portions of Mongolia and Manchuria been shocked to find how large an area was under poppy cultivation, a strict prohibition was issued

in the Kirin province; and it has been asserted that during the summer of 1872 portions of the crop were here and there deliberately destroyed. This year nothing of the kind was attempted; but the rain which fell did the work much more effectually than the Mandarins could have done. From the nature of the case such prohibitions must be of little avail. The extent of ground more or less under cultivation in small patches scattered over an immense tract, the fact that the whole agricultural population is more or less concerned, and that the petty officials have a direct interest in what is to them an inexhaustible source of plunder and a standing excuse for the exercise of petty tyranny, render proclamations commanding the destruction of the crop a dead letter, beyond the purely local effect of a first display of vigour.

The sole result of the action taken by the officials has been to render the cultivation and sale of native opium underhand, by which the Government loses what otherwise might be a large source of revenue; while the drug retains an artificial and exceptional price.

5th.—Is the consumption of native opium extending in the interior and in the treaty ports; and now is it affecting the consumption of Indian opium; and whence is the native opium procured which is consumed in the writer's vicinity?

All the native opium consumed here is grown in Mongolia or Manchuria. None is imported from China Proper. In local proclamations I have seen allusions to Sechuen drug being smuggled in by southern junks; but I am assured by opium merchants here that the amount is so small as to be unworthy of notice.

As the cultivation of native opium is increasing, so is the consumption; for there is no export trade in native drug. It is carried about from one producing district to another within the limits of Kirin and Fêngt'ien, but none is known to go south. The number of those who *only* smoke native drug is extremely small, and they are, practically speaking, only to be found amongst the poorest of the population, or in the interior away from towns and the main highways of traffic, in spots where foreign opium may not have penetrated. I am assured that in this town native opium is only used for mixing with foreign, generally in the proportion of seven parts of foreign to three of native, but this varies according to the means and taste of the consumer.

The consumption of Indian opium has been in no way affected. The customs returns, indeed, show a slight decrease in the import for last year; but, as a matter of fact, the consumption was much greater than that of the previous year (1871), as heavy stocks had remained in hand, which were disposed of along with the whole of the fresh import before the close of the business year. Should the returns for 1873 show a decrease, it will be due to the loss of harvest and to the impoverished condition of the people. Up to date, however, there has been no perceptible falling off in the amount of business done by the foreign opium firms.

6th.—What the relative prices are of native and of Indian opium, and whether anything is known that is likely to affect them?

The average retail prices here for native and Indian opium are as follows:—

	Per Tael Weight.
Inferior samples of native tiao...	2·60
Superior native „	3·60
Indian opium (Malwa) „	4·60

The Newchwang tael of silver (3 rupees) contains tiao 11·20; and there are 16 taels by weight to the catty, so that the above prices would represent per chest of one picul or 100 catties:—

	Taels.	*Rs.*
Native inferior	370	1,110
„ superior	515	1,545
Indian (Malwa)	657	1,971

The wholesale price for Malwa here just now is about 520 taels. In Kirin it is about 560 taels, where the best native is about 480 taels.

The scarcity of native drug caused by the rains will tend to keep the price up. As there will be less competition and a greater demand for Indian opium than before, this latter will also continue to sell at a high figure.

7th.—Any facts regarding the position of Persian, Turkish or American opium in the market?

The above kinds of opium are unknown here. Indian is the only foreign opium sold in this province or Kirin.

The following figures giving the total import of Indian opium into Newchwang during the last seven years may be of interest:—

	Piculs.
1866	2,670
1867	2,589
1868	2,685
1869	2,518
1870	2,444
1871	2,279
1872	2,160

These figures might seem to indicate a slow but gradual falling off. I am, however, inclined to think that there is no real decrease of consumption, but that there was an excessive

importation in previous years. There was a good deal of over-trading in 1868 and 1869, and in other articles, besides opium, as for instance in metals and woollen piece goods, and in cottons until last year, there was been a similar decline.

The consumption of Indian opium in 1872 was in reality greater than that of the previous year, as shown by the following figures supplied to me by the firm of Messrs. D. Sassoon, Sons & Co. of this place:—

Imported in 1871	2,100
Consumed in 1871	1,700
Stocks at beginning of 1872	400
Imported in 1872	2,000
Whole of this consumed in 1872	2,400
Consumed in 1871 as above	1,700
Excess of consumption for 1872	700

It is the general opinion that Indian opium is holding its ground and will continue to do so for years to come. There can be no doubt as to its superiority in the estimation of all confirmed smokers. As above stated, few who smoke confine themselves to the native drug. Many *begin* with that, but sooner or later adopt the Indian. It is not merely that native opium is deficient in strength, the flavour is bitter and disagreeable, and some assert that its exclusive use is injurious to health. By a portion of the population it is credited with the production of eruptions of the skin and of small boils or ulcers which the use of Indian opium is supposed to cure in a few days; others assert that it gives rise to diarrhœa or dysentery which, however, disappears when the foreign drug is substituted.

From the enquiries I have made I am sceptical as to these ill effects; but the existence of such a belief, however ill founded, goes to show the degree of esteem in which Indian opium is held.

Again, while a much larger quantity of native opium is required to produce the required stupor, it seems that the general effect is not nearly so pleasurable, and does not satisfy the craving or desire to the same degree as the Indian.

Another point which works powerfully in favor of the latter is that it can be obtained pure. The constant practice of adulterating the native article has contributed to its unpopularity.

On the other hand it has certain points of superiority which have been mentioned in previous reports, *viz.*, that the best kind yields cent. per cent. of prepared drug, and that it can be re-smoked three or four times. The drug prepared from the ash of the first smoking is considered better, *i. e.*, stronger than the fresh drug; but at the same time it gets the credit of possessing the noxious effects above referred to in a more especial degree.

The whole question hinges upon the quality of native opium: it may be that the inferiority ascribed to it is inherent, as being due to soil and climate; but if it can be accounted for by want of skill on the part of the producers or by the practice of adulteration, it is possible that improved cultivation and greater honesty may in time make it a more serious rival of the Indian drug.

Extract from a proclamation by Kuei, Intendant of Circuit, published in Yingtze (the port of Newchwang) in December 1870.

"Whereas Lekin tax was imposed upon foreign opium more than three years ago, when all the merchants came forward with alacrity to pay according to regulation, but whereas very few of them pay either the regular customs dues or the Lekin tax on opium produced in the interior, I have carefully considered what can be the cause, and am convinced that it is because merchants and dealers do not understand the tariff and imagine that native opium has to pay the same duties as foreign. They, therefore, adopt all sorts of subterfuges, and smuggling is still carried on as before.

"But native opium being of a different quality from foreign, it was not expected to pay the same duty, and this difference was brought to your notice in a proclamation by the late Taotai."

Extract from a further proclamation by the same official, dated 22nd July 1871.

"Since the establishment at Yingtze of a Lekin Office on the Tientsin model, the receipts on foreign opium have been increasing; but although the duty on native opium, as it is cheaper than the foreign drug, was fixed at a lower rate, every catty paying one-third less than the Lekin charged on the foreign article; it is nevertheless constantly evaded by merchants and dealers going and coming between inland stations, who devise all sorts of expedients for this purpose."

Extract from proclamation by the same official, dated February 1872, giving publicity to new rules concerning an increase in the Lekin dues.

RULE 1.—"By the old regulations every catty of foreign drug had to pay as follows:—

	Taels. Sycee.
Regular Lekin	0 : 120
Meltage	0 : 016
Compradore's fees	0 : 016
Expenses of Lekin Establishment	0 : 034
TOTAL PER CATTY ...	0 : 186

"It is now proposed to add to the above the following amounts per catty:—

	Taëls.
Regular Lekin	0 : 120
Meltage	0 : 016

making the total to be now charged per catty—

Regular Lekin	0 : 240
Meltage	0 : 032
Compradore's fees (as above)	0 : 016
Expenses of Establishment (as above)	0 : 034
TOTAL PER CATTY BY NEW SCALE ...	0 : 322"

RULE 5.—"To prevent confusion attention is called to the following distinction:—

"The Lekin on opium imported in foreign ships, the regular import duty on which is paid when the ship enters at the foreign Custom House, is not due until after it is sold by the foreign firm when it is paid by the native purchaser. But the Lekin on opium imported by junks has to be paid immediately by the importer."

RULE 7.—"Of late the growth of native opium, known at Tientsin as *Hsi t'u* or western drug, has been largely on the increase in the district beyond the palisade. As it is cheaper than foreign drug, the taxes levied on it under the old regulations were fixed at one-third less than those on the foreign article, and as the rate on the latter has now been raised, a corresponding increase must be levied on the former. But as it is only a very small amount of native opium that pays duty in Yingtze, measures of supervision must be devised to prevent prejudice to the revenue, and I have accordingly requested the authorities at Moukden to instruct the local officials to introduce an efficient system for this purpose."

GOVERNMENT OF INDIA.

FINANCIAL DEPARTMENT.

REPORT ON THE WORKING AND PROGRESS OF DISTRICT SAVINGS BANKS DURING THE YEAR ENDING 31ST MARCH 1873.

No. 65, dated 22nd September 1873.

From—H. A. MANGLES, ESQ., Officiating Comptroller General,

To—The Secretary to the Government of India, Financial Department.

I have the honor to forward for submission to Government my annual report on the working and progress of District Savings Banks during the year ending 31st March last, together with the statements noted on the margin.

1. Transactions of each Bank.
2. Weekly progress of Banks in each province.
3. Classification of depositors.
4. Average statements.

2. Only three new Banks were opened in the past year, which added to the number open on the 1st March 1872, raises the total present number to 113.

3. The following table shows the number of Banks opened in each of the several provinces in the Bengal Presidency, the Central Provinces, British Burmah, the Berars, and in the Treasuries under the Government of India during the past three years, and the proportion which they bear to the number of districts contained in each province:—

PROVINCES.	NUMBER OF BANKS OPEN IN			Number of Sudder Districts in each Province.	Percentage of Districts provided with Savings Banks.
	1870-71.	1871-72.	1872-73.		
Bengal	25	47	50	54	92
North-Western Provinces	12	13	13	33	39
Punjab	8	15	15	32	46
Oudh	2	12	12	12	100
Central Provinces	*5	*5	5	19	26
British Burmah	7	13	13	13	100
Berars	2	2	2	6	33
India	2	3	3	...	...
TOTAL ...	63	110	113	...	...

* Includes the Bank at Balaghat.

4. It will be seen from this table that only 39 per cent. of the districts in the North-Western Provinces, 46 per cent. in the Punjab, 26 per cent. in the Central Provinces and 33 per cent. in the Berars had been supplied with Savings Banks. The progress made during 1872-73 in the number of accounts at the Banks already open shows that the Institutions are valued by some classes of the people at any rate, and the time would seem to have arrived when the Local Governments and Administrations might fairly be asked to extend them generally to all their districts.

5. The progress referred to was—

In the North-Western Provinces	75 per cent.
In the Punjab	45 "
In the Central Provinces	37 "
In the Berars	46 "

6. The total number of depositors at the end of 1870-71 was 1,081, which number rose to 2,399 in 1871-72, and 3,746 in 1872-73, the rate of increase being 121 per cent. in 1871-72, and 56 per cent. in 1872-73. Subjoined is a list of the number of accounts in each Administration, together with columns giving the percentages of increase in the several provinces during the last two years:—

PROVINCES.	NUMBER OF ACCOUNTS IN			Percentage of increase in 1871-72.	Percentage of increase in 1872-73.
	1870-71.	1871-72.	1872-73.		
Bengal	558	1,311	1,965	134·94	49·88
North-Western Provinces	163	317	555	94·47	75·07

* Includes the Bank at Balaghat.

7. It will be seen that notwithstanding the small increase in the number of Banks—three only—1,347 new accounts were opened in the past year. Of this number, 1,024 were opened by native and 323 by European and Eurasian depositors. In this number are included 68 accounts appertaining to local charitable and other institutions, 56 of which are under European and 12 under native management. The following statement gives the same information dating from the commencement of the Institution, together with the balances at credit of each class of depositors on 31st March 1873:—

PROVINCES.	NATIVE DEPOSITORS.		EUROPEAN AND EURASIAN DEPOSITORS.		LOCAL INSTITUTIONS.		TOTAL.	
	Number of Accounts.	Amount.	Number of Accounts.	Amount.	Number of Accounts.	Amount.	Number of Accounts.	Amount.
Bengal	1,708	2,95,079	175	41,778	82	22,887	1,965	3,59,744
North-Western Provinces	400	57,103	151	50,414	4	818	555	1,08,335

8. It will be perceived from the annexed table that the District Savings Banks have attracted all classes of the community, persons having fixed incomes heading the list, while domestics follow at some distance. Next in num-

ber come the non-productive classes. Agriculturists, as hitherto, are last but one in the table :—

		1870-71.	1871-72.	1872-73.
Class I. A.	Having fixed incomes	639	1,309	1,965
„ I. B.	Having variable incomes	180	287	357
„ II.	Domestic	134	341	613
„ III.	Commercial	28	71	118
„ IV.	Agricultural	48	71	72
„ V.	Industrial	40	36	60
„ VI.	Indefinite or non-productive	97	284	561
	TOTAL ...	1,166	2,399	3,746
	Deduct closed accounts ...	85	...	...
		1,081	2,399	3,746

9. As the number of accounts has increased in the past three years, so has the balance of deposits, though in a greater proportion. At the close of the first year of the system, the balance at credit of depositors stood at Rs. 1,52,301; at the end of the second year at Rs. 4,18,462, or an increase of 174 per cent.; and at the end of the third year at Rs. 7,65,559, or an increase of 82 per cent. The following statement shows the progress and percentage of increase in deposits in the several provinces during the past two years :—

PROVINCES.	1870-71.	1871-72.	1872-73.	Percentage of increase in 1871-72.	Percentage of increase in 1872-73.

Prices for week ending 17th January 1874. *a.* In the sub-divisions the price of best rice ranges from 10·21 to 12·99 sers, and of common rice from 12·06 to 13·91 sers per rupee. *b.* New crop of nearest sort of rice in the sudder at 14·08 sers per rupee. *c.* In the interior. *d.* In the interior the price of best rice ranges from 11·13 to 16·70 sers, and of common rice from 9·28 to 12·52 sers per rupee. *e.* In the interior the price of best rice ranges from 7·43 to 10·44, and of common rice from 10·67 to 13·06 sers per rupee. *f.* The price of common rice at the outlying grain marts is from 16·70 to 20·41 sers per rupee. *g.* In the interior the price of best rice ranges from 6·50 to 12·06 sers, and of common rice from 10·21 to 15·77 sers per rupee. *h.* In the interior of the sudder sub-division rice is selling at 10·21 to 12·06, and barley 15·77 to 16·70 sers per rupee. *i.* In the interior the price of best rice ranges from 8·35 to 12·76, and of common rice from 9·28 to 13·91 sers, and of lesser millets from 13·45 to 18·55 sers per rupee; the last mentioned grain is selling in the sudder station. *j.* In the interior the price of best rice ranges from 10·21 to 13·91, and of common rice 7·43 to 14·84 sers per rupee. *k.* Old rice. *l.* Price in the interior. *m.* In the interior the price of best rice ranges from 7·43 to 9·74 sers, and of common rice from 10·21 to 12·99 sers per rupee. *n.* In the interior the price of best rice ranges from 8·35 to 12·99 sers per rupee, and of common rice from 9·28 to 12·06 sers per rupee. *o.* In the interior the price of best rice ranges from 7·43 to 9·28, and of common rice from 8·35 to 10·91 sers per rupee. *p.* In the interior the price of best rice ranges from 10·21 to 13·91, and of common rice 7·43 to 14·84 sers per rupee.

GOVERNMENT OF INDIA.

FOREIGN DEPARTMENT.

REPORT BY HER BRITANNIC MAJESTY'S POLITICAL AGENT AND CONSUL GENERAL OF THE RESULT OF A SURVEY OF THE RIVER WAMI.

No. 101, dated 8th December 1873.

From—JOHN KIRK, Esq., H. B. M.'s Political Agent and Consul General, Zanzibar,

To—C. U. AITCHISON, Esq., C. S. I., Secretary to the Government of India, FOREIGN DEPT.

I have the honor to state that, availing myself of the kindness of Captain Wharton, of H. M.'s S. *Shearwater*, I crossed for two days to the opposite shore with a view to accompany him while surveying the mouths of the river Wami.

2. This river was highly spoken of first by Mr. Stanley as the road of the future by which commerce would enter this part of Africa, and it had been examined by Captain Malcolm and others last year without any definite result.

3. I had before visited the only known two mouths of the river, the Chanungu and Furahanya, and found them useless for navigation, but it had been since suggested that the Uloudwe creek, a little further south, might probably come from the Wami, and that the river higher up was of greater importance than it seemed at either of its known mouths.

4. This creek is marked on the old charts as Port Sam, and off this we anchored, crossing the Bar the same evening at high water in the steam-cutter without trouble. It proved, however, to be a mere tidal creek, running but a short way inland and not forming any communication with the Wami.

5. The following morning we passed north by sea to the Chanungu mouth of the Wami. This we entered with difficulty, although it was near springs and the tide had not fallen very much, the steam cutter drawing only 3 feet, touching several times between the waves.

6. The creek, once entered, was of small size and very shallow, and after a mile and a half we were told by natives engaged cutting wood, that we could pass no further by what seemed the main stream, which only at highest tide united above by a shallow channel with the Wami, but that the real connection was formed by a cross canal, the mouth of which we were then opposite; this was a ditch about fifteen yards wide, quite dry at low tide in great part of its extent, but by which we afterwards got the steam-cutter through into the Furahanya or main mouth of the Wami.

7. This main mouth is, however, itself impassable three miles from the sea, unless when the tide rises, and although this is not the dryest time of the year, and showers had of late been very frequent, the Wami was proved to be wholly impassable beyond three miles to a steam-cutter of 3 feet draft water.

8. At low tide there is not even a passage for a canoe by either of its mouths, and natives pass on foot easily along the sea-beach, crossing the two river mouths and walking through only a few inches of water and mud.

9. The river where we saw it was full of hippopotamus, and higher up these animals live in the deeper reaches and pools. As a trade route this river is, in my opinion, utterly useless; now there is not water enough for a boat, and in the rainy season the current will be very strong and the river subject to sudden rise and fall of level. Compared with the Kingani, a parallel river entering near Bagamoys a few miles further south, and which I have also ascended about twelve miles, the Wami seemed small.

10. There are in fact in the dominions of the Sultan of Zanzibar only two rivers that deserve further exploration, the Lufigi and the Juba; regarding the former we may expect to receive some information through the officer now sent to inspect the villages between Dar-es-Salam and Kilwa, who will cross the Lufigi on his route, and whom I have particularly requested to note the size of the stream and collect what information he can.

11. Should the Lufigi prove navigable in any sense, it possesses an easy entrance without a Bar, into which a vessel of moderate size may easily pass and ascend for several miles.

12. When on the Wami I learned that a caravan of 400 slaves had just crossed at the Wadoe village of Gama, a little above where we turned. This is the largest caravan of slaves that has passed by land from Kilwa; it is now at Saadani, recruiting before marching to Pangani.

Notice of Post Office officials	72—75	

No. 5584, dated Calcutta, 23rd December 1873.

From—F. R. HOGG, Esq., *Officiating Director General of the Post Office of India,*

To—*The Secretary to the Government of India,* FINANCIAL DEPARTMENT.

I have the honor to submit the Annual Report on the administration of the Post Office of India for the year 1872-73.

2. Some of the more important events of the year will be noted before giving statistical information.

REVISION OF INLAND POSTAGE RATES AND CONDITIONS.

3. The most important feature of the year was the revision of the rates and conditions for the transmission of inland correspondence both official and private. As respects official correspondence, it appeared that the existing scale of letter postage, though perhaps reasonable enough for the comparatively light letters posted by private individuals, was wholly disproportionate to the heavy letters sent by officials; that it cost the Post Office less on the average to carry and deliver a large official envelope with a legible direction than to perform this work for a minute native letter crowded as respects address, and that recent railway extensions had rendered the question of weight as affecting correspondence a matter of less importance than formerly. It was also found that the inordinately high charge on official correspondence operated injuriously by promoting on the part of Government officials a disregard of economy in the use of the Post. The imposition of a thoroughly reasonable scale of charge on official covers was therefore determined on. And with this concession was coupled the absolute abolition of the privilege, formerly accorded to every public office in India, but of late restricted to a limited few, of posting covers under frank without paying any postage at all. The revised rates of postage for official letters are given below, side by side with those that previously prevailed :—

OFFICIAL POSTAGE.

Former Letter Post Rates.		*Revised Letter Post Rates.*	
Covers not exceeding ½ tola	... ½ anna.	Covers not exceeding ½ tola	... ½ anna.
„ „ „ 1 „	... 1 „	„ „ „ 10 tolas	... 1 „
„ „ „ 2 tolas	... 2 annas.	„ „ „ 20 „	... 5 annas.
For every additional tola	... 1 anna.	„ „ „ 30 „	... 10 „
		For every additional 10 „	... 5 „

4. Turning now to private correspondence, the revision under notice comprised the following principal changes, *viz.* :—

(1.) The extension to pamphlets, trade circulars, and in fact any article other than a letter, of the privilege of unregistered newspapers, *viz.*, transmission by letter post at the rate of one anna when enclosed in covers open at the ends and not exceeding ten tolas in weight.

(2.) The obliteration of all distinction as regards contents and mode of packing between book-packets, pattern-packets, and parcels, the sole remaining distinction being between those that are registered (parcels) and those which are unregistered (packets).

(3.) A reduction in the charge for parcels (or registered articles) from six annas to four annas for twenty tolas, and in like proportion for heavier weights, the rate for packets (or unregistered articles), prepayment compulsory, being half as much.

These alterations, while simplifying considerably the work of the Post Office, are a great convenience to the public, not only in providing a cheaper rate of charge for the transmission of parcels, but also, in abolishing all restrictions as to contents and mode of packing, including the requirement of open ends, which, especially in the monsoon season, exposes the contents to needless risk.

5. This revision, though arranged in the year under review, did not come into force until the 1st April last, and will therefore form matter for comment in the next Annual Report. One result may now, however, be safely predicted. A measure, like the present one, that radically affects the classification hitherto followed by the department, that transfers one section of Book or Pattern Post articles to the category of newspapers and classes another section as parcels, must obviously disturb the statistics of the department and lessen their value for the purposes of comparison with the returns of previous years. Another probable cause of disturbance in future statistical returns, arises from the change of practice in respect to counting inland correspondence, a change under which the number of covers of each class received for delivery will, as is the case in England, be deduced from periodical returns specially kept for the purpose, instead of being taken from daily reckonings throughout the year.

6. The rule regarding the compulsory registration of covers containing coin, or currency notes, has been extended to covers manifestly containing postage or other stamps, or cheques, hundis, bank notes, and the like.

COMMUNICATIONS WITH PLACES ABROAD.

7. The regulations regarding the transmission of Book Packets and Pattern Packets for places abroad were revised, enlarged limits of weight being allowed for packets of patterns addressed to certain countries in Europe.

8. The rate of postage chargeable on letters sent through Trieste to Austria, Luxemburgh, the German States, and Austrian Post Offices in Turkey, was reduced from 8 annas 8 pie to 8 annas per half ounce; and on letters by the same route for Belgium, Denmark, Netherlands, Switzerland, Moldavia, Wallachia, and Servia, from 9 annas 4 pie to 9 annas per half ounce. The rates of postage on letters addressed to Bermuda were also reduced.

9. Consequent on alterations made by the French Government on the transit rate by French mail packets, the postage chargeable on letters sent by French packet to the "Dutch East Indies" was raised from 5 annas 4 pie to 9 annas 4 pie per half ounce, and prepayment made compulsory.

10. A reduction of postage was effected in respect to letters for Newfoundland, the Sandwich Islands, Bolivia, Chili, Ecuador, and Peru: and arrangements were made under which letters for Greece can be sent *viâ* Bombay through the French Post Office at Alexandria.

11. A line of mail steamers, once every four weeks, was established by the British Post Office under contract with the British India Steam Navigation Company between Aden and Zanzibar, the subsidy payment being £10,000 per annum. By this line, and its continuation to Mozambique, Delagoa Bay, Natal, and the Cape, by steamers belonging to the Union Steam Navigation Company, letters can be sent from India to the places named.

12. The United States Mail Packet "America," with mails from San Francisco destined for India, was destroyed by fire at Yokohama on the 1st August 1872.

LOCAL STEAM SERVICES.

13. At the close of the calendar year 1871, the original periods of the contracts held by the British India Steam Navigation Company for the performance of local steam services having expired, and their continuance being dependent on twelve months' notice on either side, certain preliminary negotiations for a renewed service were undertaken by this office, which received the general approval of the Government. A formal and detailed scheme was then submitted, and, having been approved of by a special committee, was sanctioned by the Government under date the 19th March 1873. A new contract deed, embracing the revised services to be performed, is now in course of preparation, and meanwhile the conditions of the old contracts hold good. The existing contracts with the Company are as follows :—

(1). Calcutta and British Burmah, *weekly*, with a continuation to the Straits, *once every four weeks*, the subsidy being Rs. 21,333 per mensem, of which Rs. 1,083 are paid by the Straits Government.

(2). Bombay and Kurrachee, *weekly*, with a continuation to the Persian Gulf, *once a fortnight*, the subsidy being Rs. 23,111 per mensem.

(3). Calcutta, Bombay, and intermediate ports on the East and West Coasts, *fortnightly*, the subsidy being Rs. 10,000 per mensem.

(4). Madras, Rangoon, and intermediate ports on the East Coast, *once every four weeks*, the subsidy being Rs. 6,000 per mensem.

(5). Calcutta, Port Blair, and Camorta, *monthly*, without any subsidy, but under contract arrangements in respect of the transmission of Government stores, &c.

(6). Akyab to Kyouk Phyoo and back, *fortnightly*, and to Sandoway, *once every four weeks*, except in the monsoon, the subsidy being Rs. 1,000 per mensem.

14. Under the revised scheme now sanctioned, the following service will be performed :—

(1). Direct weekly communication between Calcutta and Rangoon, in addition to the fortnightly communication *viâ* Akyab and the fortnightly communication with Akyab *viâ* Chittagong, and the doubling of the service between Burmah and the Straits.

(2). Semi-weekly communication between Bombay and Kurrachee, and a weekly extension to the Persian Gulf.
(3). Weekly communication between Calcutta, Bombay, and intermediate ports.
(4). Fortnightly communication between Madras, Rangoon, and intermediate ports on the East Coast.
(5). An extension of the Port Blair line to Rangoon and Moulmein, thus uniting the Andamans with Burmah and Calcutta.
(6). The addition of a new monthly coasting line from Calcutta to the Straits, touching at numerous intermediate ports, coupled with the maintenance of the existing Kyouk Phyoo and Sandoway line.
(7). The establishment of a new coasting line from the Persian Gulf to Aden.

15. This new service will double or very nearly double the mileage extent of the services performed, and the tonnage of the fleet which performs them; the contract tariff rates for troops, Government passengers, and stores, will be reduced by about 20 or 30 per cent., and the Government will have the right of chartering for special service any vessel or even the whole fleet of the Company at the rate of Rs. 20 per ton per mensem, Government finding coal. Except in respect to the Calcutta and Port Blair line, which is terminable by six months' notice on either side, the contract will last for a term of ten years. As respects subsidy, existing payments will be reduced from an aggregate of Rs. 7,37,000 to Rs. 7,25,000.

16. I have already detailed the services performed by the British India Steam Navigation Company, and now subjoin a list of additional steam services executed by other Companies; of these, the first two on the list are managed by the Chief Commissioner, British Burmah, the third by this department, and the last by Her Majesty's British Government, though paid for from the Indian revenues.

(1). By the Irrawaddy Flotilla and Burmese Steam Navigation Company for *weekly* communication between Rangoon, Mandalay, and intermediate ports, with a *monthly* extension to Bhamo, the subsidy being Rs. 5,000 per mensem.
(2). By the Burmese Steam Tug Company for a *monthly* communication with Moulmein, Tavoy, and Mergui, the subsidy paid being Rs. 750 per trip.
(3). By Jardine, Matheson and Company (of Hong-Kong), and Apcar and Company (of Calcutta), for the conveyance of mails *monthly* between Calcutta, the Straits, and Hong-Kong, the dates of the starting of the steamers being regulated primarily with reference to the Calcutta opium sales (no subsidy).
(4). By the Euphrates and Tigris Steam Navigation Company for *fortnightly* communication between Busreh and Bagdad, the subsidy being Rs. 4,000 per mensem.

POST OFFICE AND TELEGRAPH AMALGAMATION.

17. The great success that followed the acquisition, by Government, in England of all Telegraph property, and the transfer of the management of this new department to the British Post Office in 1868, led to a consideration of the advantage, or otherwise, of an amalgamation of the Postal and Telegraph Departments in India. A careful examination of the subject shewed the conditions of telegraphic existence in the two countries to differ so widely, that no argument in favor of the extension of the scheme to India could be deduced from the fact of success in England; and while some good might fairly be anticipated from the measure proposed, there were also weighty arguments against it. The Government therefore decided against the contemplated combination of the two departments.

SECURITY FURNISHED BY POST OFFICE EMPLOYÉS.

18. Allusion was made in the last Annual Report to the difficulties which beset the question of security in connection with Post Office employés. It was stated that more than 10,000 servants in the department had to give security for the faithful discharge of their duties; that they could not afford to furnish it by cash deposits or in Government paper, and that the rates of premium charged by the late European Assurance Guarantee Society, whose bonds were recognized by the department, were so excessive as to be almost prohibitive. It was further stated that, on the collapse of the European Assurance Guarantee Society in 1871, a provisional system of mutual assurance was introduced, pending the prescription of some permanent scheme. It has now been determined to substitute for security subscriptions in the shape of trifling deductions from salary. Peons and other servants attached to non-pensionable grades, instead of being subjected to the heavy assessment of Rs. 6 per annum, the minimum charge of the late European Assurance Guarantee Society, only pay the sum of eight annas each half-yearly, and the contributions of no member of the department can exceed Rs. 2 per annum. Arrangements have been made for the return, in certain cases, to a subscriber of the unexpended proportion of his contributions, and suitable provision has been made in the rules against surplus accumulations.

OVERLAND PARCEL POST.

19. In 1871, the British Post Office, declining to have any concern with the parcel traffic that had grown up in connection with the Overland Pattern Post, restricted its use to *bonâ fide* samples. A public demand then arose for some ready means of transmitting parcels between India and England, and it became necessary to employ a purely private agency for their collection and delivery in Great Britain. Thus arose a new organisation by the Indian Post Office of what is termed the "Overland Parcel Post," which really is a mere extension beyond Indian limits of the Inland Banghy Post. Parcels are now received at any Post Office in India, for transmission to the United Kingdom, up to a maximum limit of 50 lbs. in weight, if fully prepaid at the low rate of three annas per ten tolas; this was the rate of charge at which *inland* banghy parcels were conveyed prior to the introduction, on the 1st April last, of the revised rates and conditions for the transmission of inland correspondence. Similarly, parcels can be booked in the United Kingdom by the Peninsular and Oriental Steam Navigation Company and their Agents for transmission to India, either paid or unpaid. The arrangements above described were not introduced until March 1873, and in that, the first month of the experiment, no fewer than 568 parcels were received and despatched, the revenue derived by the Indian Post Office being Rs. 863. Since then this business has largely expanded, and promises to be not only a great convenience to the public but a lucrative source of income to the department.

FORGED POSTAGE STAMPS.

20. In the early part of the year some anxiety was experienced, owing to the detection of counterfeit postage stamps of the value of eight annas and four annas in circulation in Calcutta. The imitations were, however, very clumsy and easy of detection. It was found that the fraud originated, not through any idea of defrauding the postal revenue, but in an enlarged demand for spurious Court Fee Stamps. Sanction was unfortunately given a few years ago to the conversion of service postage labels into Court Fee Stamps; the defacement to which these labels were thus subjected, in the erasure of the word "service," the substitution of the words "Court Fees," and ultimately the punching of the stamp in Court, rendered fraud almost impossible of detection. But genuine service stamps could not be stolen from Government Offices in sufficient quantities, and ordinary postage stamps were thereupon forged for the special purpose of conversion, first, into service stamps and then into Court Fee Stamps. An endeavour to pass off the original unconverted imitation as ordinary postage stamps was immediately detected by the Calcutta Post Office; the police were communicated with, the gang discovered, their apparatus seized, and their leaders prosecuted and sentenced to heavy terms of imprisonment.

POSTAL DETECTIVE AGENCY.

21. Attention was directed in the last Annual Report to an important experiment made in the Punjab for the investigation of crime connected with Post Office work by the provision of a special detective agency. The success of that experiment led to the transfer to this office of Mr. Turton Smith of the Punjab Police for a term of three years, his duty being "to collect, examine, and collate the various complaints of missing covers arriving from all parts of the country, to work out therefrom the probabilities of delinquency against each office, to direct and guide the investigations in all important cases, working partly through the Police, partly through ordinary departmental channels, partly through picked officers of the department, who are known to possess special detective qualifications, and partly also by direct personal investigation." Mr. Smith was invested with the necessary Police powers, and the various local Governments were requested to give him such occasional assistance as might be necessary. An extensive field for the utilisation of his professional services at once presented itself. A very remarkable case occurred in which hundis were abstracted from a posted letter addressed to Bombay. Mr. Turton Smith at once proceeded to the spot, and a patient series of investigations, extending over several months, revealed a complex net work of cases of cheating by personation supported by forgeries, the work of skilled gangs of dishonest men, with the connivance of certain Post Office officials. The area of this fraud was not confined to the Bombay Presidency alone, but spread to the North-Western Provinces, to Central India, and also to Madras, and its victims were mainly native bankers and merchants. I cannot undertake within moderate compass to give even a brief sketch of the many and intricate cases referred to, and I will merely state therefore that they were traced back so far as August 1870, that they contemplated the illicit acquisition of property aggregating in value Rs. 96,300, and that the sum of Rs. 37,000 was actually fraudulently obtained by members of the gangs within the period specified. Seven prosecutions were instituted, referring to sixteen distinct offences, and including eighteen accused persons; and convictions were obtained against eleven of these persons, the remaining seven being acquitted. The convictions included six life sentences, of which one was commuted on account of assistance rendered to the prosecution, one of the life sentences was against a postal official, another was punished by three years' imprisonment, and three more servants of the department having been acquitted by the Court, were dismissed and precluded from further service under Government. Ten persons, including two postal officials, absconded to avoid being brought to trial.

NEED OF REFORM IN THE BENGAL POSTAL CIRCLE.

22. Many instances having come to notice of what was described as "prevailing laxity, slovenly performance of work, and want of discipline," in various parts of the Bengal postal circle, it was determined to depute a special officer to overhaul certain selected localities. Mr. Alpin, an experienced Inspector from the Punjab, was selected for the duty, and the result of his tour exposed a degree of irregularity and imperfect control that exhibited a great need for reform. It was acknowledged, however, that this circle was unwieldy in size, and that to this cause the bad results adverted to might, in a measure, be ascribed. The separation of the province of Assam into a distinct postal circle is a step that will probably soon be called for; but, pending a fuller consideration of this larger measure, an additional supernumerary inspector in the first grade was added to the Bengal establishment. With this additional help it was hoped that a more vigorous administration of the large and important circle of Bengal would ensue.

MYSORE ANCHÉ POST.

23. The Anché is a local post organization confined to the native state of Mysore. The full prepayment of covers destined for delivery by the Anché Post was heretofore compulsory, owing to the refusal of the authorities to collect and account for postage; hence large numbers of unpaid covers found their way to the Dead Letter Office, it being impossible even to attempt delivery. In communication with the present administration of Mysore, an arrangement was made under which covers upon which any postage is due are forwarded to destination through certain selected frontier offices of exchange. The arrangement now concluded will probably form a convenient basis for the conduct of future similar negotiations.

ESTABLISHMENT OF RECORD OFFICES FOR THE TRAVELLING POST OFFICE.

24. One imperfection in the Travelling Post Office consisted in a system under which each set had to maintain their own registers. This duty, which essentially is a stationary work, was performed during intervals of rest by a travelling establishment; the records having to be written up once in three days were necessarily constantly in arrear, and delay occurred in receipting and returning documents, and in replying to references. Record offices were, therefore, established at convenient localities, whose duties were the performance of all purely office work connected with the Travelling Post Office. This system advocated and tried first by Mr. Bedford, an Inspector in Bombay, succeeded so well as an experiment that it has now been extended to every part of India where large Travelling Post Offices exist.

INTRODUCTION OF RAILWAY DETACHING AND PACKING UP APPARATUS.

25. The question of the postal service on the Eastern Bengal line of railway occupied some attention, a difficulty being experienced in the matter of exchanging mails at small road-side stations, where the train was not required to stop for the purposes of ordinary traffic. The difficulty was solved by the introduction of the apparatus in use in England for taking up and discharging mail bags with the train in motion. Although this apparatus was obtained by the Great Indian Peninsula Railway Company several years ago, it has never yet been brought into use, and its introduction in the Bengal line of railway is the first instance of the utilisation of this convenience for postal purposes in India.

SPECIAL TRAIN FOR THE MADRAS OVERLAND MAIL.

26. A lengthy correspondence occurred with the Madras Chamber of Commerce, relative to the provision of a special train on the south-east extension of the Great Indian Peninsula Railway, on occasions when the overland mail reaches Bombay too late for despatch by the ordinary train. It was shown that, while the cost of a special train as far as Poona would amount to Rs. 408, the net revenue yielded by each overland mail deriving benefit from the proposed measure, excluding ordinary expenses connected with transit, inland sorting and delivery, amounted only to Rs. 307-8; the Government, therefore, declined to sanction the expense. A modified proposal was thereupon submitted by the Chamber, asking for the employment of special engines, when necessary, as far as Kurjut only, a distance from Bombay of 62 miles, at a cost of Rs. 186 per trip; and this latter proposal received the sanction of Government.

OCCUPATION OF THE NEW POST OFFICE BUILDING AT BOMBAY.

27. A new and handsome building, for the accommodation of the Post Office at the Presidency Town of Bombay, having been completed and placed at the disposal of this department, occupation was taken in December 1872.

DEAD LETTER OFFICE REVISION AND EXTENSION.

28. The difficulties and importance of Dead Letter Office work formed the subject of comment in the last Annual Report, and it was stated that the matter had separately been reported to Government, in view to the entertainment of more effective establishments on a better scale of pay. The sanction of Government having been received, the Dead Letter Offices at Calcutta, Madras, Bombay, Agra, and Lahore, were all revised at the close of the year under review, and a new Dead Letter Office was opened at Lucknow on the 1st April.

INTERRUPTION OF RAILWAY COMMUNICATION.

29. During the monsoon season of 1872 several important breaks occurred on some of the lines of railway, thus causing interruption of postal communication. On the Great Indian Peninsula Railway line the bank was washed away between Doodner and Goodoor, near Sholapore, and the mails for and from Madras for several days arrived irregularly. On the Bombay, Baroda, and Central India Railway, extensive floods took place, stopping the running of trains for about a fortnight, and necessitating the employment of a special postal establishment. And in the Punjab a portion of the Sutlej Bridge was carried away, the adoption of special measures being called for to cross the mails over the river.

CAMP OF EXERCISE.

30. Excellent arrangements were again made this year by the Postmaster General of the Punjab for the large camp of exercise in the neighbourhood of Hussan Abdal during last December and January. Six special Post Offices were established, and His Excellency the Commander-in-Chief and the principal military authorities were pleased to express their sense of the efficiency of the postal service rendered.

EXTENSION OF RAJPOOTANA POSTAL CIRCLE.

31. The Rajpootana Postal Circle was augmented by the transfer thereto from the North-Western Provinces of the districts of Jeypore, Shekhawuttee, Bhurtpore and Ulwar.

POSTAL GUIDE.

32. The calendar of mail steamer departures from Bombay and the Time Tables of mail steamer services were omitted from the last edition of the Postal Guide, it being found more convenient to publish them separately. A change was also effected in the Foreign Post Schedule by the inclusion therein of detailed references to the Book and Pattern Post rules of each country. The price of the Postal Guide was reduced from Rupees 1-8-0 to Rupee 1-0-0 per copy.

DENGUE FEVER.

33. I cannot conclude this section of my report without adverting briefly to a calamity which for some months interfered seriously with the conduct of Post Office work. I refer to the dengue fever. The Postmaster General of Bengal states that 80 per cent. of the inhabitants of Calcutta suffered from this fever, and that his own office was almost depopulated by it. The Postmaster General of the North-Western Provinces reports as follows:—

> "Almost the entire strength of the establishments were simultaneously prostrated, and special and "extraordinary efforts were made to carry on the work. In the large offices of Benares, Allahabad, "Cawnpore, Agra and Meerut, over 80 per cent. of the establishment were laid up at one time, and "it was only by the devoted exertions of the officials who were not attacked that the work was "kept in hand. The Postmasters of these places deserve great credit for their exertions. In my "own office for some three days only two men were able to attend. When the late Mr. Mackenzie, "Postmaster of Agra, died of this desease, his death was probably hastened by his brave efforts to "perform his work, with his crippled establishment, whilst he himself was laboring under an "attack of the fever.

There can be no doubt that in Post Office work, where each day must see its own duties performed, an epidemic of this kind is attended with more than ordinary difficulties, and it is satisfactory to find evidence of the praiseworthy manner in which the establishments at the localities afflicted met so grave an emergency.

SECTION I.—POST OFFICES, LETTER BOXES AND RURAL MESSENGERS.

34. In Appendix No. 1 will be found the number of Post Offices and Letter Boxes opened in each Postal Circle during the year, of which an abstract appears on the margin. Out of the whole number of 200 new offices no less than 95 or nearly one-half were opened in the Punjab; this was the natural consequence of the transfer in the previous year (1871-72) by the local Government of the district post to the management of the Postmaster General. It was found in some places in Bombay that the multiplication of Post Offices, instead of creating fresh correspondence, had merely diverted the previously existing stream to other channels, and thus the abolition of several Post Offices was called for: therefore we find in that Postal Circle 34 old Post Offices closed and 21 new ones opened. Again in Bengal, where the transfer of the district post to the management of the Postmaster General has not yet even been completely effected, it came to knowledge that Imperial and District Post Offices sometimes co-existed at one place. Measures were taken to put a stop to this unnecessary expense, and the result was that in the Bengal Postal Circle 18 Post Offices were closed against 25 new ones opened.

	Opened in 1871-72.	Opened in 1872-73.
Post Offices	218	200
Letter Boxes	288	332
Total ...	506	532

35. On the whole, there has been a very fair extension of postal facilities; for the total number of Post Offices in all India stood at 3,006 on the 31st March as compared with 2,884 at the close of 1871-72, while the number of Letter Boxes has grown from 1,885 to 2,168. One hundred and eighty-two rural messengers were newly entertained and 31 dismissed, thus giving a net increase of 151 and raising the total number at the close of the year under report from 981 to 1,132.

SECTION II.—POSTAL LINES.

36. The total extent in miles of each class of postal lines is exhibited on the margin in contrast with the returns of the previous year. It will be seen that there has been an increase of railway communication and a decrease in the distance over which the mails are carried by horses or camels and by runners. The increase of mileage under the head of Railway is due mainly to the following extensions of the Oude and Rohilcund Railway:—

Year.	Railway.	Mail Cart Horse and Camel Dâk.	Runners and Boats.	Sea.	Total.
	Miles.	Miles.	Miles.	Miles.	Miles.
1871-72 ...	5,063¾	4,278	35,929	6,367	51,637¾
1872-73 ...	5,368¼	3,915	35,533	6,367	51,183¾
Increase ...	305	...	...	...	...
Decrease ...	...	363	396	...	454

Allygurh to Mooradabad,
Lucknow to Fyzabad;
Barabunki to Byramghat; and
Sundela to Shajehanpore *viâ* Hurdui:

there has also been a 40-mile extension of the Bombay, Baroda and Central India Railway from Veerumgaum to Wudwan, and four miles of line opened between Pothanore and Coimbatore. The decrease in mail cart, horse and camel dâk is mainly caused by the railway extensions in the North-Western Provinces, Oudh, and Bombay, to which I have already adverted; in Bengal the line between Burrakur and Hazareebaugh was abolished. As a set-off against these reductions, which affect 634 miles of road, a mail cart line was established in the North-Western Provinces between Moradabad and Kaladoongee and between Shekoabad and Futtehgurh; in Bombay a Tanga dâk was opened, connecting Dhoolia with the line of rail and a horse dâk between Hooblee and Moondagode; in Madras an arrangement was made for the conveyance of mails under contract between Pallamcottah and Tuticorin. The net result of all these changes is a decrease of mileage to the extent of 363 miles. Under the head of runners and boats 1,667 miles were newly opened and 2,063 closed, giving a net decrease of 396 miles; this result was caused by railway extension, by an extensive revision of lines in Bombay, by the abolition of certain lines temporarily opened in connection with the Lushai campaign, and by a variety of minor changes which it is unnecessary to detail.

SECTION III.—CORRESPONDENCE.

37. The correspondence returns for each circle will be found in Appendix III, and the results for the whole of India have been abstracted on the margin. There is a fair increase under the head of letters of about $3\frac{1}{2}$ per cent., and a very large increase (nearly 16 per cent.) of newspapers. The year under review is the first complete year available for comparative returns since the reduction by one-half in October 1871 of the charge for registered newspapers; and it is satisfactory to find how soon the change has been followed by an increase in respect to this class of correspondence far greater than has ever yet been recorded. Under Government orders, the Post Office refrain from carrying parcels between places connected by rail, where proper arrangements for their transit and delivery have been made by the railway authorities; and, as railway extensions occur, this order operates more and more in restricting the parcel traffic of the department; it has led this year to the decrease which appears under the head of parcels. There is a small increase of about $2\frac{3}{4}$ per cent. of books and patterns.

Year.	Letters.	Newspapers.	Parcels.	Books and Patterns.	TOTAL.
1871-72	80,636,648	6,840,120	675,588	1,409,329	89,561,685
1872-73	83,127,098	7,928,092	653,401	1,448,723	93,157,314
Increase	2,490,450	1,087,972	...	39,394	3,595,629
Decrease	...	...	22,187	...	...
Increase percentage ...	3·08	15·91	...	2·78	4·01
Decrease percentage ...	...	...	3·28	...	...

38. A further analysis of the letter returns is given in the margin, and exhibits what was predicted in last year's report, *viz.*, a still higher rate of increase of registered letters. This result is consequent on the orders of Government extending the scope of compulsory registration and on the introduction of five-rupee currency notes. It is a remarkable fact that the issue of five-rupee currency notes in July 1872 was almost immediately followed by an influx of registered correspondence so large as at first to embarrass the Travelling Post Office working on the East Indian line of railway.

Year.	Paid and service.	Unpaid.	Registered.	TOTAL.
1871-72	50,526,310	28,420,046	1,690,292	80,636,648
1872-73	52,080,653	29,205,293	1,841,152	83,127,098
Increase	1,554,343	785,247	150,860	2,490,450
Increase percentage ...	3·07	2·76	8·93	3·08

39. At the close of the year 1871-72 there were in all 430 registered newspapers in India; since then 48 fresh newspapers have been registered, thus raising the number to 478, of which 255 are published in vernacular languages, 67 in English and vernacular, and the remainder (156) in English. The following analysis exhibits their distribution in the several postal circles:—

	English.	Vernacular.	English and Vernacular.	TOTAL.
Bengal	35	59	5	99
Madras	36	26	22	84
Bombay	34	62	22	118
North-Western Provinces ...	10	58	5	73
Punjab	10	30	1	41
British Burmah	14	5	0	19
Central Provinces	3	4	2	9
Sind	9	3	1	13
Oudh	5	6	8	19
Rajpootana	0	2	1	3
Total 1872-73 ...	156	255	67	478
Total 1871-72 ...	141	223	66	430
Increase ...	15	32	1	48

40 The multiplication even of the worst description of native newspapers is necessarily attended with a certain educating influence and must tend in some measure to form public opinion. How far the expressions of the press can be regarded as a criterion of the views of the masses may roughly be judged by the following calculation. Assuming that each of the 478 newspapers registered in India attains an average circulation of 700, and that each individual paper is read by ten persons, it follows that 3,346,000 people obtain intelligence of some sort through the public press. But the population of British India, as given in the Statesman's year book for 1873, stands at 190,277,654, so that 186,931,654 persons never see a newspaper at all. In other words, the newspaper circulation of India as now developed has not penetrated even two per cent. of the population of the country.

41. The statement given below shows how the correspondence received was disposed of and calls for no special remark:—

Directly delivered (Appendix III), 80 per cent.	66,482,313
Retained for re-issue, 20 per cent.	16,644,785
TOTAL	83,127,098
Detail of re-issue.	
Sent to District Post	4,151,468
Sent to Dead Letter Office	2,519,892
Remainder disposed of by re-direction to other Offices, or sent to Branch Offices, or in deposit at the end of the year	9,973,425
TOTAL	16,644,785

42. I give below a statement showing the estimated number of letters and newspapers sent to and received from the United Kingdom:—

	DETAIL OF CORRESPONDENCE WITH THE UNITED KINGDOM.		
	Route.	Estimated aggregate number of letters.	Estimated aggregate number of newspapers.
Despatched from India to the United Kingdom	*Vid* Southampton.	509,448	57,376
	Vid Brindisi ...	1,471,929	309,317
Received in India from the United Kingdom ...	*Vid* Southampton.	431,422	520,494
	Vid Brindisi ...	1,045,257	1,087,643
TOTAL ...	1872-73 ...	3,458,056	1,974,830
	1871-72 ...	2,754,759	1,973,745

The increase, as compared with 1871-72 as respects letters, is in a large measure due to the inclusion in the returns of the year under report of what is termed transit correspondence, *i. e.*, correspondence between India and those countries the route to which lies through England. Notwithstanding the inclusion of transit correspondence, no appreciable increase has occurred under the head of newspapers. This is the consequence, I believe, not of a diminished influx of newspapers from Europe, but of the more extended use of Indian agencies for their distribution. The adverse rates of exchange in the money market drive the public to vendors in this country, who by packing newspapers together get them out at reduced rates by Book Post and in other ways, and thus render purchase in India more economical to individual members of the public than direct dealings with England. The most striking point connected with the details of the figures given above is the larger use of the Brindisi route for correspondence coming from England; in 1871-72 only 65 per cent. of the overland letters from England travelled *vid* Brindisi, while in the year under report the proportion has risen to 77 per cent. The proportion of newspapers sent from the United Kingdom *vid* England has risen from 56 to 67 per cent., and that sent by India from 77 to 84 per cent. The adoption of the Brindisi French route through the Mont Cenis Tunnel, whereby a saving of two days occurred in the transit of overland mails between England and India, doubtless accounts for the increasing popularity of the Italian route in respect to correspondence. Of the whole number of newspapers received in India from England rather more than half travelled by the Brindisi route. More than three-fourths of the entire correspondence (letters and newspapers) from India to England is sent *vid* Brindisi.

43. The marginal abstract contains interesting statistics in respect to the total number of letters sent by each of the principal routes used for the exchange of foreign mails with India. It should be explained that the routes called *vid* Italy, *vid* Trieste, and *vid* France exhibit only the correspondence exchanged with Foreign Europe to the exclusion of that sent to or received from Great Britain. The ports described as east of Suez include Ceylon, Penang, Singapore, Hong-Kong, Japan, Shanghai, Australia, New Zealand, and other miscellaneous places. Of the three routes for Foreign Europe, the Italian is, as might be expected, the most popular; next in order

		Sent from and received in India.
By British Packet.	Letters exchanged *vid* Italy ...	102,830
	Letters exchanged *vid* France ...	76,050
	Letters exchanged *vid* Trieste ...	19,356
	Letters exchanged with Gibraltar, Malta, and Ports east of Suez ...	231,994
Letters exchanged by French Packets of the Indo-China Line ...		12,622
TOTAL ...		442,852

comes the French route, and lastly that *viâ* Trieste. If to the totals given above be added the gross number of letters exchanged with Great Britain, the foreign correspondence of India, *i. e.*, the number of foreign letters received and despatched in the year, will stand at 3,900,908. Of this as much as 88½ per cent. travels to or through England; of the remaining 11½ per cent. more than half is composed mainly of correspondence with British possessions in Asia and Australia and the Mediterranean and with China and Japan. The Italian route absorbs about 2½ per cent. of the whole correspondence, the French route nearly 2 per cent., and the Trieste route and Indo-China Line French Packets each carry about half per cent.

44. There are Dead Letter Offices at Calcutta, Madras, Bombay, Agra, Lahore, Kurrachee, and Nagpore; details relating to the working of each Dead Letter Office will be found in Appendix IV, and the statement given below presents a comparison of the general result for the last three years:—

	Number.			Proportion of each class to the whole.		
	1870-71.	1871-72.	1872-73.	1870-71.	1871-72.	1872-73.
Letters returned to senders ...	1,100,086	1,407,249	1,619,642	48·66	56·58	64·27
Letters undisposable ...	1,160,403	1,079,963	900,250	51·34	43·42	35·73
Total ...	2,260,489	2,487,212	2,519,892	100	100	100

45. It is satisfactory to notice a continually increasing proportion of covers returned to senders. The total number of covers received in the several Dead Letter Offices, with no addresses or with illegible addresses, amount to 135,836.

46. The gross value of ordinary postage stamps sold has risen from Rs. 30,40,791 to Rs. 31,26,699, being an increase of nearly Rs. 86,000. A return showing the sales of each description of stamp in the several Postal Circles will be found in Appendix V, and an abstract is given below:

	8 pie labels.	½-anna labels.	1-anna labels.	2-anna labels.	4 anna labels.	6 anna 8 pie labels.	8 anna labels.	½ anna note paper.	½-anna envelopes.	1-anna envelopes.
	Increase.	Increase.	Increase.	Increase.	Increase.	Decrease.	Increase.	Decrease.	Decrease.	Decrease.
1870-71 as compared with 1869-70	·71 Decrease.	8·22	3·34 Decrease.	3·58 Decrease.	6·12	43·38	5·74	95·22	9·01	35·54
1871-72 as compared with 1870-71	14·21	13·58	19·64	6·92	2·78	71·91 Increase.	14·35	58·34	11·59	35·36
1872-73 as compared with 1871-72	17·78	12·86	24·83	3·07	·22	3·33	5·34	42·48	7·04	18·47

There have been numerous changes in the rates of postage to the United States of America, to the west coast of Africa, to Alexandria, and other places, the tendency of which has been to supersede eight-pie labels and to bring into use two-anna labels. As explained in last year's report, the reduction of newspaper postage from one anna to one-half anna each has caused a diminution in the sale of one-anna labels and an increase in the sale of half-anna labels. This reduction came into effect from October 1871, so that while it affected only the latter half of 1871-72, it has influenced the whole of the year under report. The growth of overland correspondence *viâ* Brindisi has of course been accompanied by a more extended sale of eight-anna labels. Endeavors have been made to sell off the remaining stock of half-anna note paper, and thus an increase has been produced under this head: no more indents are sent for this paper, as the demand for it is small and the paper soon deteriorates.

47. Appendix VI contains the returns of the sale of service postage stamps, showing an increase in the gross value of stamps sold from Rs. 6,49,324 to Rs. 10,63,847. This increase followed on the new rules for the treatment of official correspondence that came into force on the 1st January 1872, under which the privilege of sending and receiving official correspondence by inland letter or packet post, without actual payment of postage, was withdrawn from a large number of public offices, the use of service postage stamps being substituted. On the whole, however, there has been a very large loss of revenue derived from official correspondence as will be explained in a later section under the head of Financial Results.

OVERLAND MONEY ORDER.

48. A system for the exchange of money orders between India and England was introduced during the last half of the year under report. In this period 4,444 orders were drawn on the United Kingdom, aggregating in value £28,734-18-6. The following statement shows the average remittances per mail, both as respects number and value, in each

month, and gives on the whole six months' transactions a weekly average of 170 orders, aggregating slightly over £1,100 per week:—

Money orders drawn by India on the United Kingdom during the six months ending 31st March 1873.

Month.	Average number of orders drawn per week.	Average aggregate amount per week. £.	s.	d.
October	97	612	3	7
November	218	1,414	17	2½
December	175	1,147	7	11
January	168	1,139	13	5
February	178	1,156	13	5¼
March	184	1,140	17	8

Each order averaged in amount £6-9-3½.

49. There can be no doubt that a public demand existed in India for some ready means of transmitting small sums of money to the United Kingdom, and that the introduction of the overland money order system at once supplied that demand. A limited amount of business in the transactions of the first month is naturally found, but so soon as the measure became known, the call for orders, in the second month of the experiment, rose suddenly to its maximum and then declined to a level which was afterwards maintained with tolerable steadiness. The present demand in India for small money remittances to England may, I think, fairly be represented in the aggregate as about £1,100 per week, and there is but little prospect, for the present at least, of any material expansion in this class of business.

50. The orders drawn by the United Kingdom on India during the six months were only 332 in number, aggregating in value £1,325-13-4, and yielding a weekly average of about 14 orders to the gross value of £57-12-8 per week.

51. The financial result of the overland money order system is exhibited below, and shows a profit of Rs. 10,418 on the six months' transactions:—

Receipts.	Rs. A. P.	Charges.		Rs. A. P.
Value of orders sold in India at 1s. 10¾d.	3,03,137 0 0	Actual gross payments on account of drawals by the United Kingdom ...	£ s. d.	13,256 0 0
Commission at one per cent. on orders sent and received ...	3,005 0 0	Remittance to the British Post Office. Aggregate drawals by India ...	28,734 0 0	
		Aggregate drawals by United Kingdom	1,325 0 0	
		Net ...	27,409 0 0	
		@ ...	0 1 11½	2,79,924 0 0
		Establishment and contingencies ...		2,544 0 0
Total ...	3,06,142 0 0	Total ...		2,95,724 0 0
Deduct charges ...	2,95,724 0 0			
Net Receipts ...	10,418 0 0			

52. It should be explained, however, that this statement gives the profit and loss at the rate of exchange (1s. 11½d. the rupee) fixed by the Secretary of State for the adjustment of financial transactions during the year 1872-73, and represents the actual state of accounts adjusted thereunder. In point of fact, however, the rate of exchange fluctuated during the six months in question between 1s. 10¾d. and 1s. 10·62d. the rupee, the average rate being 1s. 10·7d. An application to the transaction of each mail of the ruling rate of exchange reduces the real profit to Rs. 363-3-7.

SECTION IV.—DISTRICT POST.

53. The district post, as has been explained in former reports, is designed primarily to provide means of inter-communication between the principal revenue, magisterial and police authorities at the head-quater stations and their subordinates in the interior of the district. In Madras and Bombay it is entirely supported by grants from the imperial revenues; in Bengal it is maintained by a local cess levied for the purpose; in the North-Western Provinces, the Punjab, the Central Provinces and Oude, the cost of the district dâk is defrayed from special local cesses supplemented by contributions from the imperial revenue. These charges upon the imperial revenue for district dâk maintenance have heretofore been regarded as grants for specific establishments; but, with the object of giving local Governments greater latitude in the disposal of the money, the grants as noted in the margin were added to the several provincial assignments, with a stipulation that this addition would only be continued so long as it was really required to supplement the local cess income.

	£
Government of India	540
Oude	1,074
Central Provinces	1,400
North-Western Provinces	6,000
Punjab	4,500
Madras	10,800
Bombay	8,940
	33,254

54. The district post is always managed under the direction of the local Government, sometimes through the Collector and Magistrate or other district officer, sometimes through the Postmaster General acting as an Agent for the local Government; this latter system whenever tried has always proved successful, and is therefore gradually superseding the older but less efficient plan. In Bombay, in the North-Western Provinces, the Punjab, Oude, and the Central Provinces, the transfer of district dâk management to the Postmaster General or officer exercising the powers of a Postmaster General has been complete. Omitting those districts which contain no special district post organization, the Bengal Postal Circle contains 42 districts, of which 27 have come under the management of the Postmaster General, the remaining 15 still resting in the hands of the Magistrate. The transfer of management of the district post from the Magistrate to the Postmaster General was suddenly stopped by order of His Honor the Lieutenant-Governor in the early part of the year under review, and one effect of the measure is thus described by the Postmaster General of Bengal:—

"Of village letter boxes again, a much smaller amount were opened in 1872-73 than in 1871-72, the "numbers in the last year being 290, and in the year before 828. This is explained by the fact that, in "1871-72, many of the district dâks were made over to the Postal Department, and in these a large "number of letter boxes were at once opened, whereas any further transfer of these dâks was stopped "in 1871-72 (10th July) by an order of the Government of Bengal."

I have reason to believe that this order has recently been relaxed; for in October last the Post Master General was directed by His Honor the Lieutenant-Governor to assume charge of the zemindary dâk in the Purneah district.

55. In Madras, the district of Coimbatore came on the 1st April 1873 under the management of the Post Master General, who now controls six districts out of a total of twenty-one, and Major Bourke reports an expressed desire on the part of many Collectors to make over to him the conduct of their district post arrangements.

56. The operation of the district post, as affecting the correspondence passing between it and the imperial post, will be found in appendix VII, and an abstract is given below:—

	Number.	Percentage.
Sent to district post for delivery ...	4,498,358	Being 4·94 per cent. of the total number of covers received for delivery.
Portion of the above received back ...	416,430	Being 9·25 per cent. on the number sent to district post.
Received from district post	2,761,707	Being 3·03 per cent. on the total number received by General Post Office for delivery.

This exhibits a continued improvement in the proportion of covers received back undelivered.

SECTION V.—MISCELLANEOUS.

57. It is satisfactory to find that the number of well-grounded complaints made by the public against the Calcutta Post Office, which in 1871-72 had risen to the high figure of 365, fell to 119 in the year under report. Much yet remains to be done to improve the working of the Calcutta Post Office, but it is well to find evidence of success in respect to efforts already made.

Postal Circles.	1871-72. British territory.	1871-72. Foreign territory.	1871-72. Total.	1872-73. British territory.	1872-73. Foreign territory.	1872-73. Total.

Central Provinces ...	1	1	2	0	1	1
Rajpootana ...	...	...	...	1	3	4
	24	12	36	13	12	25

58. From the abstract given on the margin, it will be seen that the number of highway robberies of the mail has fallen again from 36 to 25, the decrease having occurred entirely in British territory. In three cases the highway-men were apprehended and convicted, in seven instances the mails were wholly recovered, and in eleven cases partially recovered. The localities in which the robberies occurred are given below:—

British Territory.			Foreign Territory.	
Bengal ...	Champarun	1		
	Rajshahye	1		
		2		
Madras ...	Salem	1		
	Masulipatam	1		
		2

Postal Officials.	1871-72.	1872-73.
Inspectors	141	154
Postmasters and Deputy Postmasters	2,365	2,376
Clerks	1,970	2,069
Peons, &c.	6,021	6,220
Road Establishment ...	14,228	14,401
TOTAL ...	24,734	25,220

59. The marginal abstract gives the total number of persons permanently serving in the Post Office Department of a grade below that of a Postmaster General. Details for each circle will be found in Appendix IX.

SECTION VI.—NON-POSTAL BRANCHES OF THE DEPARTMENT.

60. The Government bullock train is an organization for the conveyance of box and bale goods; formerly its traffic was very large, but, owing to railway extension, the business is fast disappearing, and even now is limited to a few localities. In the year under report one new office only was opened at Moradabad, and twelve offices were closed, *viz.*, Caragola, Purneah, Kissengunge, Titalya, Silligori, Kurseong, Hope Town, Jore Bungalow, Darjeeling, Dholepore, Lucknow and Fyzabad. The branch lines from Caragola to Darjeeling and from Lucknow to Fyzabad were also abolished, it being found that they were maintained at a loss. Thus, on the 1st April 1873, there were in all 52 bullock train offices, consisting of a main line from Calcutta to Peshawur, with branches to Jubbulpore, Futtehgurh, Gwalior, Landour, Simla, Ferozepore, Bhawulpore, (through Mooltan), Sealkote and Murree. With the solitary exception of the Calcutta office, the Government bullock train has now ceased to exist in Lower Bengal.

61. The Punjab Military Van Dâk is a service for the conveyance of passengers by means of horsed conveyances. Its lines of traffic have not been modified since last year, and are as follows, *viz.*:—

Mean Meer to Peshawur.
Wazeerabad to Sealkote.
Rawul Pindee to Murree (during the summer months only).
Umritsur to Pathankote (during the summer months only).

62. A passenger service is also maintained on the Simla road between Umballa and Kalka, on the Darjeeling road between Caragola and Silligori, on the Nynee Tal line from Moradabad to Kaladoongee, and in Central India between Indore and Khundwa.

SECTION VII.—FINANCIAL RESULTS.

63. In paragraph 66 of the last annual report, it was explained that the new official correspondence rules, introduced with effect from the 1st January 1872, excluded altogether from account the correspondence received by or sent to the largest Government offices of the country, and it was shown that the operation of this change was the nominal reduction of the receipt of the Post Office Department under the head of official postage to the extent of Rs. 7,14,178. This change of system, while it influenced only the last quarter of the year 1871-72, has of course affected the whole of the following year, and the natural result therefore a still further a nominal reduction of official postage to the extent of Rs. 24,31,721.

64. The revenue derived from private correspondence shows an increase of Rs. 1,13,499. In point of fact, however, the increase has been no less than Rs. 2,13,499,

the receipts of the year 1871-72 having been swelled to the extent of one lakh of rupees by the re-adjustment of a special account with the English Post Office, the causes and effect of which have fully been detailed in the last two annual reports. The year under review is the first complete year affected by the reduction of newspaper postage, and if the receipts of that year, obtained from private correspondence only, are compared with those of the last complete year (1870-71), during which the former newspaper rates operated, the result is an improvement to the extent of more than four lakhs of rupees as given below :—

1870-71 ...	Rs. 40,43,771	... Newspaper postage rate	one anna per ten tolas.
1872-73 ...	„ 44,52,262	... „ „	„ half anna per ten tolas.
Excess ...	„ 4,08,491.		

65. Under the head of disbursements an increase of Rs. 1,34,994 is found; of this about half a lakh of rupees is nominal, being composed of items that heretofore have not appeared as charges against the department. I allude to district dâk charges which formerly were debited against the Bullock Train, a non-postal branch of the Post Office, and the invalid pay and allowances of Major Fanshawe, Chief Inspector of Post Offices, British Burma, which now for the first time have, under Government orders, been exhibited as a civil charge. Nearly half a lakh of the increase was caused by departmental expansion in the opening of new Post Offices and lines, and the remainder (about Rs. 39,000) mainly by the revision of some large offices. Nevertheless, if the expenditure of the department during the year under review be contrasted with the average disbursements of the preceding four years, the result is a saving as shown below :—

	Rs.
Aggregate average expenditure of the Post Office Department for the four years ending 1871-72	53,10,560
Aggregate expenditure of the Post Office Department during the year 1872-73	52,32,689
Saving	77,871

66. I now subjoin the financial results in the usual abstract form :—

Review of Financial Results.

	1871-72. Rs. A. P.	1872-73. Rs. A. P.
Purely Postal Service.		
Receipts, including official postage and sale of service postage stamps	78,34,331 11 11	55,16,110 7 4

	Deficit. 4,469 9 4	Surplus. 66,066 1 11
Passenger Services on Mail Cart Lines.		
Receipts	1,30,982 11 8	1,26,393 4 10
Disbursements	1,30,982 11 8	1,26,393 4 10
Contract subsidies to Local Steamers engaged primarily for Non-Postal Services.		
Disbursements	7,68,694 6 9	6,48,686 9 10

	1871-72. Rs. A. P.	1872-73. Rs. A. P.
* Purely Bullock Train	8,03,603 12 11	7,16,198 6 4
Road steamer charges debited to Bullock Train ...	8,705 8 0	40,867 15 4
District Dâk ditto ditto (a) ...	1,00,000 0 0	... ...
Postal ditto ditto	42,029 10 11	25,503 13 8
Camp of exercise	.....	836 4 1
	9,54,338 15 10	7,83,406 7 5

(a). District Dâk Establishments in 1869-70 contributed from Bullock Train Fund of 1871-72.

Briefly stated, these results show—

	Rs.	
(1).—A net revenue in the purely Postal Department of ...	2,83,421	If sale of service postage stamps be included.
(2).—A net deficit in the purely Postal Department of ...	7,80,426	If the sale of service postage stamps be excluded.
(3).—A net surplus in the Bullock Train Department of ...	27,743	Including charges not purely bullock train.
(4).—A net surplus in the Punjab Military Van Dâk of ...	66,066	

67. The working of the non-postal branches of the service has been eminently successful.

68. In the Bullock Train Department, notwithstanding a heavy drain for road steamer charges, the deficit of Rs. 1,17,725 of the year 1871-72 has been changed to a surplus of Rs. 27,743. In the Punjab Military Van Dâk, in place of a small deficit, a large surplus of Rs. 66,066 is exhibited.

	Rs.
Railway free service (estimated value) ...	1,90,000
English stores { Post Office ...	34
English stores { Road steamer charges...	1,27,689
Value of service rendered to the Post Office by the Government Press ...	32,034
Rent of Government buildings occupied by Post Office (estimate) ...	1,15,362
TOTAL ...	4,65,119

69. I give on the margin the usual abstract of items not included in the regular accounts. The purchase of road steamers has largely swelled the item of English stores; the issue of the new Post Office Manual has increased press expenses, and new buildings placed at the disposal of the department, more especially the Bombay Post Office, has of course raised the value of the estimated rent of Government buildings used by the Post Office.

SECTION VIII.—GENERAL REVIEW OF PROGRESS SINCE 1854.

Progress of Correspondence since 1854.

Number of letters and newspapers received for delivery in the year under report, as compared with the numbers received in the year prior to the introduction of the Post Office Act of 1854.

A year before the Act XVII of 1854 came into operation ...	19,082,676 = 100
1869-70	83,082,957 = 435
1870-71	88,868,397 = 439
1871-72	87,476,768 = 458
1872-73	91,055,190 = 477

70. Appendix XII shows the progress of correspondence since 1854 in each Postal Circle, and the general result of all India is given in abstract on the margin.

Year.	Percentage.
1853-54, last complete year of former rates	128
1855-56, first complete year	100
1867-68, thirteenth ditto	237
1868-69, fourteenth ditto	258
1869-70, fifteenth ditto	246
1870-71, sixteenth ditto	235
1871-72, seventeenth ditto	272
1872-73, eighteenth ditto	279

71. The marginal abstract shows the progress from 1853-54 of revenue derived from private correspondence, that of 1855-56 (the first complete year after the reduction of postage rates in 1854) being represented by 100, and the revenue of the last six years in like proportion. The apparent decline in 1870-71 is explained by a large arrear adjustment with the British Post Office which fell for payment in that year. Further details will be found in Appendix XIII.

SECTION IX.—NOTICE OF POST OFFICE OFFICIALS.

72. From the commencement of the year under review up to the 10th February, the Post Office was administered by Mr. A. M. Monteath; for the brief remaining portion of the year I officiated as Director General of the Post Office.

73. In March last, Mr. J. Tweedie, Officiating Postmaster General of Bengal, took leave, and was succeeded by Mr. T. W. Gribble of the Bengal Civil Service. Major the Hon'ble E. R. Bourke assumed charge of his new appointment as Postmaster General of Madras in May 1872. In November 1872, Colonel Battye, having returned from leave, resumed charge of his substantive appointment as Postmaster General of Bombay. In March 1873, he was deputed to the Punjab to act for Major Lane who had obtained leave, and Mr. J. MacFarlan again reverted to his officiating appointment as Postmaster General of Bombay. On the 31st March last, Major R. W. H. Fanshawe, Chief Inspector of Post Offices, British Burmah, retired from Government service, after a long and honorable connection with the department of nearly 20 years, and was succeeded by Mr. J. W. Barwise. Mr. W. H. McGowan was transferred in March last from the Calcutta Post Office to the Chief Inspectorship of the Central Provinces, and Mr. W. A. Hoghton assumed charge of the Sind and Persian Gulf Postal Circle. Mr. P. Sheridan was appointed in June to the Travelling Post Office to officiate for Mr. E. C. George, who had been transferred to Bombay as Acting Postmaster.

74. The acknowledgments of this office are due to the following chief officers of the Department:—Major Lane, Postmaster General of the Punjab; Mr. C. W. Hutchinson, Postmaster General of the North-Western Provinces; Mr. J. MacFarlan, Officiating Postmaster General of Bombay; Major the Hon'ble E. R. Bouke, Postmaster General of Madras; Mr. J. Dillon, Chief Inspector of Post Offices in Oude; Mr. P. Sheridan, Acting Chief Superintendent of the Travelling Post Office, and to Mr. Tupton Smith, the Police Officer attached to this department.

75. Among the officers not directly under the control of this office, I would name Messrs. Douglas and Roussac for their exertions in improving the Calcutta Post Office; Mr. Alpin for the thorough way in which he performed the special duty entrusted to him in Bengal; Mr. Bedford for improvements effected in the Travelling Post Office in Bombay; Rai Saligram Bahadoor, an Inspector in the North-Western Provinces, for special service in connection with certain robberies of the bangly mail at Neemuch; Mr. Faichnie for efficiency of postal arrangements at the Hussan Abdal camp of exercise; and Mr. Mackenzie, who has been specially noticed by his immediate superior for industry and tact in his management of the Travelling Post Office in Bengal.

APPENDIX No. I.

Statement showing the number of Post Offices and Letter Boxes which were opened during the years 1871-72 *and* 1872-73, *and the total number that stood at the end of those Official years.*

Names of Postal Circles.	Opened in 1871-72.		Existing on the 31st March 1872.		Opened in 1872-73.		Total of 1872-73.		Closed or Discontinued.		Balance on the 31st March 1873.

(*a*) Including sale of Service Postage Stamps.
(*b*) The apparent reduction is to a large extent nominal, owing to the introduction of a new system of accounting for official postage, under which a portion of the official correspondence between Government Officers in the same District is not brought to account.
(*c*) These amounts are less by Rs. 1,38,429-2-2 than they would have been under the former mode of calculation, owing to the deduction for the first time in 1869-70 of the discount on sale of Stamps.
(*d*) Exclusive of Rs. 1,46,639-14-7, being the discount on sale of Stamps.
(*e*) Ditto „ 1,46,164-2-1 ditto ditto.
(*f*) Including Rs. 5,411 on account of Indian share of postage on covers conveyed by Indian Post to and from Ceylon.
(*g*) Excluding the sum of Rs. 29,378-2 an erroneous excess credit on account of official postage in the year 1871-72.
(*h*) Only sale proceeds of Service Stamps.
(*i*) Including Rs. 4,434-7-9 on account of Indian share of postage on covers conveyed by Indian Post to and from Ceylon.

No. 913, dated 4th February 1874.

OBSERVATIONS—By the Government of India, FINANCIAL DEPT.

Read—

The annual report of the Director General of the Post Office on the operations of the department during the year 1872-73.

OBSERVATIONS.—PARA. 3.—The new rates of official postage and the final abolition of the privilege of franking have worked well. The nominal charge for official postage has been largely reduced, and though this has necessarily caused an apparent reduction of postal revenue, the net effect has been a real saving of public expenditure.

Formerly, official correspondence was sent almost indiscriminately by letter mail at a considerable real cost. Now, heavy packages are usually sent by packet or parcel post.

PARAS. 4 & 5.—The Governor General in Council will defer any remarks upon the revision of the rates on private correspondence till he receives the report upon the current year. They affect exclusively what used to be called the book and banghy posts, and are now known as the parcel and packet posts.

PARA. 6.—The complaints that were made upon the introduction of the rule for the compulsory registration of covers containing postage labels, cheques, hundis, bank-notes, and the like, appear to have ceased, and were based probably upon a misunderstanding. Clearly, the rule can only be enforced when these valuable articles are so carelessly covered that the contents are apparent to the officers of the department. It is improper that these officers should be exposed to temptation.

PARAS. 7-12.—The several changes in the regulations relating to communication with places abroad do not require particular notice. The most important of them is the establishment by the British Post Office of a new contract line between Aden and Zanzibar, opening quick postal communication with Southern Africa.

PARAS. 13-15.—The general results of the new contract now about to be completed with the British India Steam Navigation Company are as follows:—

The subsidy is to be reduced from Rs. 7,37,000 to Rs. 7,25,000 a year, of which the Straits Settlements will contribute Rs. 12,996. The mileage run and the tonnage employed is to be nearly doubled. The contract rates payable by Government for troops, passengers and stores are to be reduced by 20 or 30 per cent.; and the Government may take up at the fixed monthly rate of Rs. 20 per ton, plus the cost of coal, all or any of the ships of the Company's fleet, which is estimated to amount, when completed, to, at least, 40,000 tons of shipping. Credit is due to Mr. Monteath for the negotiation of this contract.

PARA. 17.—The arrangements made for the mutual guarantee of the officers of the Post Office appear to be working well. With future annual reports an account should be given of the receipts and expenditure on this account.

PARA. 19.—The success of the overland parcel post is satisfactory. It is a convenience for which the European community in India is indebted to Mr. Monteath.

PARA. 20.—The postage labels now in use have never been so forged as to escape detection in the Post Office.

PARA. 21.—The proceedings of Mr. Turton Smith, the officer at the head of the special detective service of the Post Office, have been separately reported in detail. Mr. Smith's continued success is creditable to him.

PARAS. 34 & 35.—The number of post offices increased during the year from 2,884 to 3,006, or by 122, and the number of letter-boxes from 1,885 to 2,168, or by 283.

PARA. 36.—There has been a further increase of railway mileage which, with other reforms, has made it possible to effect a considerable reduction in the more costly methods of conveyance.

PARAS. 37 & 38.—The business of the department has again increased, and now exceeds 93 millions of articles. The increase in the number of newspapers carried from 6,840,120 to 7,928,092 or by 1,087,972 (15·91 per cent.) is an important response to the cheap newspaper postage conceded last year.

The increase of registered letters from 1,690,292 to 1,841,152, or by 150,860 (8·92 per cent.) is attributed to the extension of compulsory registration and to the issue of 5-rupee currency notes.

PARA. 39. The number of newspapers registered increased from 430 to 478, or by 48, of which 15 are English and 32 Vernacular, and 1 is Anglo-Vernacular. The Director General does not mention the discontinuance of any newspaper, though it is hardly likely that all the 430 in existence at the beginning of the year survived to its end. Measures should be taken yearly for ascertaining whether any of the registered newspapers no longer exist. Doubtless, as shown by the Director General, there is great scope for the expansion of the newspaper press in India. A complete list of the newspapers registered at the beginning of the year should be supplied for publication in the *Gazette of India*, and a like return should be appended to future annual reports.

PARAS. 42 & 43.—India received from the United Kingdom 1,476,679 letters and 1,608,137 newspapers, and sent to the United Kingdom 1,981,377 letters and 366,693 newspapers. The gross increase of letters from 2,754,759 to 3,458,056, or by 703,297, is due to the inclusion, for the first time, of correspondence passing *through* England to countries beyond. The Director General does not explain the reason why the homeward letters so greatly exceeded the outward letters. Last year the excess was the other way, and there seems no *primâ facie* reason, such as produces the excess of outward newspapers, for any excess of letters either way. The newspapers sent home show a slight increase from 361,211 to 366,693. But the outward newspapers have decreased from 1,612,538 to 1,608,137. The Director General attributes this to the increased despatch of newspapers in parcels for distribution by Indian agencies.

PARAS. 44 & 45.—There is again a satisfactory improvement in the transactions of the dead letter offices. The establishments of these offices have been revised during the year at a considerable expense, and the Government looks for still better results.

PARAS. 46 & 47.—Rupees 86,000 more than last year were yielded by the sale of ordinary postage labels and Rs. 414,523 more by the sale of service labels. This last increase was due to the withdrawal of the privilege of franking.

PARAS. 48-52.—The overland money orders appear to have answered the purpose; about £1,150 is sent home in this way weekly. The table given in para. 51 shows a net apparent profit of Rs. 10,418 on the remittance of £30,059 both ways, but, as explained in para. 52, this profit is nominal only, being obtained by the adoption of the artificially fixed rate of exchange of 1*s.* 11½*d.*: the actual rate was only 1*s.* 10·7*d.*, and the real profit only Rs. 363. If account be taken of interest on the capital employed, it is evident, in fact, that the transactions have resulted in a slight loss, and that the rates charged have been too low. In future, the actual average rate of exchange obtained for the Secretary of State's bills should be used in working out the profit or loss upon these orders. The management of this business has now been made over to the Comptroller General, and it will hereafter be reported upon together with the inland money order department.

PARAS. 53-56.—The gradual extension of the management of the district post by the imperial postal department is satisfactory. The Governor General in Council has no doubt that in time the local Governments will all recognise the advantage of the trained management that the imperial department can alone supply. The Director General should report separately the amounts received by the department from the several local Governments for the management of the district post.

PARA. 57.—The diminution of complaints affecting the Calcutta office is satisfactory.

PARAS. 63-69.—The prominent financial feature of the year is the nominal loss of Rs. 24,31,721 revenue derived from official covers. The loss is balanced by a corresponding diminution of the expenditure of the public offices for postage, and has actually enabled the Post Office to effect some saving of expenditure. The increase of revenue from private correspondence is shewn to be really Rs. 2,13,499. This increase and the increase of Rs. 4,08,491 received from newspapers in 1872-73 as compared with 1870-71 are gratifying.

As regards expenditure, the department appears to have been administered with economy.

Including the official postage, the department, as a whole, shows a net surplus of Rs. 3,77,230. Excluding official postage, there is a net deficit of Rs. 6,86,617.

In paragraph 69, there is an estimate of Rs. 4,65,119 for charges not included in the accounts upon which these balances are struck, to which at least Rs. 5,00,000 must be added to cover the cost of pensions and of leave allowances paid in Europe.

Adding the sums thus obtained to the disbursements shown in the accounts, there is a real deficit of Rs. 5,87,889, including official postage, or Rs. 16,51,736 excluding official postage. And these deficits are exclusive of the sum of Rs. 6,48,686 paid in subsidies to steam navigation companies, only a small portion of which can properly be debited as a charge of the Post Office.

PARAS. 70-71.—Compared with the system in force before 1854, the correspondence has now multiplied $4\frac{3}{4}$ times, and compared with the first complete year of the present system (1855-56) the revenue from private correspondence has multiplied $2\frac{3}{4}$ times.

Major Lane.
Mr. C. W. Hutchinson.
Mr. J. MacFarlan.
Major the Hon'ble E. R. Bourke.
Mr. J. Dillon.
Mr. P. Sheridan.
Mr. Turton Smith.

The Governor General in Council is glad to read the testimony borne to the good service of the officers named in the margin and of the other officers mentioned in paras. 73 and 75 of the report, and he desires to acknowledge the efficiency of the administration of the department by Messrs. Monteath and Hogg.

ORDERED, that these Observations be communicated to the Director General of the Post Office of India, and that the report, with these Observations upon it, be forwarded to the Home Department for publication in the Supplement to the *Gazette of India*, for general information.

a. The price of best rice in the several sub-divisions ranges from 12 to 14 seers, and of common rice from 12-12 to 13 seers per rupee. *b.* In the sub-division ranges from 12-8 to 16 seers per rupee. *c.* Exclusive of dieting allowance. *d.* The price of best rice in the interior ranges from 9 to 12-8 seers and of common rice from 11 to 14 seers per rupee. *e.* In the interior ranges from 13 to 22 seers per rupee. *f.* Coarse kind at 15 seers consumed by the poorest class, but not generally sold at [illegible] *g.* In the interior from 10-12 to 17 seers, and of common rice from 13 to 22 seers per rupee. *h.* The price of best rice in the interior ranges from 7 to 16 seers per rupee, and common rice at 21 seers per rupee. *i.* In the interior ranges from 16 to 20, and of common rice from 17 to 22 seers per rupee. *k.* The price of common rice at outlying grain marts is from 16 to 26 seers per rupee. *l.* In the interior the price of best rice ranges from 8-8 to 14, and of common rice from 10 to 15 seers, and of lesser millets from 13 to 18 seers per rupee. *m.* In the interior the price of best rice ranges from 9 to 10, and of common rice from 9 to 13 seers per rupee. *n.* In the interior the price of best rice ranges from 8 to 10, and of common rice from 9 to 12 seers per rupee. *o.* In the interior the price of best rice ranges from 13 to 18, and of common rice from 14 to 21-8 per rupee. *p.* In the interior the price of best rice ranges from 9 to 10, and of common rice from 9 to 13 seers per rupee. *q.* In the interior the price of best rice ranges from 13 to 18, and of common rice from 14 to 21-8 per rupee. *r.* Labor is exchanged for labor. Blacksmiths generally do work in jobs. *s.* Price of agricultural labour with 2 meals Rs. 1 to 1-4; price of agricultural labour with 3 meals [illegible] *t.* Exclusive of dieting allowance. *u.* Without food Rs. 3-8. *v.* These labourers are [illegible] in calculating their pay.

Week ending 24th January 1874.

GOVERNMENT OF INDIA.

DEPARTMENT OF AGRICULTURE, REVENUE AND COMMERCE.

REPORTS ON THE STATE OF THE SEASON AND PROSPECTS OF THE CROPS FOR THE FORTNIGHT ENDING THE 5th FEBRUARY 1874.

GENERAL REMARKS.—In Madras no rain has fallen except a little in Negapatam; prospects are not altogether satisfactory, especially in the south, where the want of rain has caused damage to the crops. There has been a good fall of rain in Sindh, where the *rubbee* is thriving; none elsewhere in the Bombay Presidency; prospects however are generally favorable, except in some parts of the Deccan and Southern Mahratta Districts, where a deficient outturn is reported. In Bengal there has been general and beneficial rain; it has done good to the *rubbee* crops (except, in some places, to the pulses, oil-seeds and tobacco) and has started operations for the *aus* sowings. In the distressed districts the *rubbee* is now mostly doing well; prices and the condition of the people remain generally unchanged. In the North-Western Provinces there has been rain in the trans-Ghogra Districts, Mirzapoor and Ghazeepoor, all the districts of the Rohilcund and Meerut Divisions, where great good has been done, and the prospects of the *rubbee* in some districts assured: it is much wanted in the Lower Doab and the districts south of the Jumna, and in the Agra Division apprehensions of blight from the cloudy weather are felt; relief works in Bustee and Goruckpoor are being largely resorted to. In Oudh there has been a general fall, and the prospects of the *rubbee* are on the whole fair. In the Punjab rain is reported from every station, except Jhelum, and the crops are promising. In the Central Provinces there has also been general rain, except in the Upper Godaveri District, Nimar, Hoshungabad and Baitool; prospects are generally favorable. The same is the case in Berar and Central India. From Rajpootana reports are fairly good, except from parts of Meywar, where there is great scarcity of water. In Mysore prospects are reported to be fair.

Presidency or Province and District.	Rain-fall for fortnight preceding.	State of agricultural prospects.
Madras (Feb 5th)		
Kistna (4th)	*Nil*	Ten inches water over anicut; canal supply tolerable; standing crops on the whole fair; dry crops still sowing in parts; paddy, grain, tobacco, being reaped in places; markets well supplied locally; prices steady, with a tendency to fall; pasture insufficient in some taluqs; fever and small-pox general; cattle healthy in six taluqs.
Kurnool ,,	,,	Season generally favorable; dry crops good, except in Cumbum and Markapur; second crop paddy cultivation under canal irrigation just commenced; water and pasture abundant; prices steady, except in two taluqs, where they are high; high fever and small-pox in parts of Ramulkotta, Markapur and Cumbum; cattle disease in all taluqs, except in Koilkoontla; no water over Sunkesala anicut.
Negapatam ,,	,, at Negapatam.	Rain-fall scarce elsewhere; water in tanks scarty; cultivation of some dry grain continues; some of the standing crops withering; others not thriving in several parts for want of rain; Sambapishanum harvest in progress; yield fair; markets well supplied; prices rising; pasture indifferent; small-pox and fever in some places; cattle disease in parts of Negapatam and Tritrapundy.
Trichinopoly ,,	*Nil*	Water for cultivation falling short, except in the best irrigated parts of the district; corps tolerably good in the river-irrigated portion and under the best tanks; sufferirg elsewhere from want of rain; outturn of wet and dry crops everywhere below the average, except in Perambalur and Mooseri; markets sufficiently supplied; prices rising; pasture sufficient; health good, but for fever and small-pox; condition of cattle good.
Calicut ,,	,,	Harvesting of second crops in progress; yield low for want of rain; markets wellsupplied; prices increasing; pasture withering; fever slight in hilly parts; cattle healthy. *General Remarks.*—General prospects not altogether satisfactory; want of rain destructive to crops in some quarters.
Bombay (Feb. 5th)		
Sindh.		
Kurrachee (4th)	...	Heavy rain on 28th and 31st January, expected to be beneficial to rubbee crops.
Hyderabad ...	0·40 on 2nd	Weather unsettled and warmer; agricultural reports good; district healthy.
Shikarpur ...	0·55	Weather cloudy; crops promising; no sickness; frosts of 11th and 13th January blasted hopes of mango crop and greatly damaged garden produce.
Upper Frontier ...	0·33	Hail at Kushmore on 21st January; weather cloudy; rubbee crops healthy; fever and cough prevalent.
Gujarat.		
Ahmedabad ...	...	Rubbee and public health continue good.
Kaira ...	...	Weather, crops and public health good; cotton-picking commenced.
Surat ...	...	Cotton and other crops as well as public health good.
Broach ...	...	Standing crops, weather and public health good.
Khandesh and Nasik.		
Khandesh ...	...	Reaping of wheat and gram commenced; cotton steady.
Nasik ...	...	Crops good; public health good, except in Dindori and Veint where fever continues.
Thanna ...	...	Weather fine; prevailing disease ague and cough in the town; fever generally in the district; cattle disease in Shapur taluq.
Deccan.		
Poona ...	...	No change for the better has taken place in regard to rubbee crops which have been nearly reaped; weather and public health generally good.
Ahmednuggur ...	...	Harvesting of rubbee progressing; cattle disease prevalent in some villages of the Aukola taluq; public health good.
Sholapur ...	...	Rubbee fair in Barsi; middling in Kurmulla; inferior in other taluqs; weather and public health good.
Satara ...	...	Khureef crops reaped; rubbee good; fever in Walwa; ague and cattle disease partially in Patun.

Presidency or Province and District.	Rainfall for fortnight preceding.	State of agricultural prospects.
Bombay (Feb. 5th) —*continued.*		
Southern Mahratta Country.		
Belgaum ...	...	Late crops nearly gathered in, excepting cotton which is middling in northern taluqs.
Dharwar ...	...	No change except the appearance of cattle disease in Nawalgund.
Kaladghi ...	...	Khureef as before; rubbee reaping commenced; anticipated outturn low; no disease.
Canara ...	...	Sowing for second crops completed; fever and cattle disease prevalent.
Kattyawar and Gackwar's territory.		
Rajkot ...	...	Cold weather crops and cotton progressing.
Wudwan ...	...	Weather cold; state of crops same; health indifferent.
Baroda ...	...	Crops and public health good.
Bengal (Feb. 3rd)		
Burdwan ...	3·06	Foggy during the first part, afterwards damp, all over the district. The rainfall has enabled the cultivators to plough a large area of land for the next early rice sowings and has improved the prospects of the cold weather crops.
24-Pergunnahs ...	2·64	Weather seasonable at the beginning of the first week, but there was a sudden change, and it became warmer with foggy mornings; a steady down-pour on the 25th January, after which cool and clear; again it became warmer and cloudy with showers of rain on the 31st idem and 1st February. Rain has fallen throughout the district. The harvest of the late rice is over; the rain was too late to do any appreciable good to the cold weather crops on the ground; it will do some harm to the pulses and tobacco, but it will benefit the sugarcane and vegetable crops. Ploughing for the early rice sowings has already commenced.
Dacca ...	1·41	Cold and foggy mornings; rain general in the district. Prospects of crops greatly improved by the rain both for the present and future.
Patna ...	0·52	Weather threatening up to the 26th January, when it cleared off; strong easterly wind attended with occasional showers of rain from the night of 31st idem till the morning of the 1st February. The prospects of the spring crops continue good; but the rain is said to have done some injury to pulses and oil seeds.
Bhaugulpore ...	1·23	Rainfall in Banka, Colgong, Soopool and Paintee; on the night of the 31st January, there was a very heavy storm about 12 miles north of the Ganges. The rain must immensely benefit the cold weather crops which promise well, though some damage may have been caused here and there.
Cuttack ...	1·20	No alteration in the state of the crops.
Kamroop ...	1·13	Weather perceptibly warmer and hazy; north-east wind. Late rice gathered in; sugarcane is being cut, but a fair outturn is not expected; mustard being reaped; ground being ploughed for the next early rice crops.
		PUBLIC HEALTH.—Burdwan,—fever decreasing except at Panaghur, 24-Pergunnahs,—fever decreasing in Basseerhat, Barrackpore and Dum-Dum; there are no new cases at Bariepore; some cases of cholera at Baraset, Basseerhat, Barrackpore and the North Suburban Town. Patna, Cuttack and Kamroop,—health of these districts good. Bhaugulpore,—general health unusually good. Cholera and small pox reported from a few other districts.
		General remarks:—Rain has fallen in almost all the districts, and in some heavily. The cold weather and spring crops will be benefited by the fall, and ploughing for the next aús or early rice crop has been commenced. In some places sowings are already being made. Injury to some of the pulses oilseeds and tobacco has resulted in a few places. In Behar the fall was too scanty to be of much use.* The harvesting of the late rice is now almost completed, and some of the pulses, oilseeds and sugarcane are being reaped. Boro paddy has benefited considerably by the rain, and promises well; cold weather crops generally, though injured by previous frost and drought, are on the whole doing well in most places. Cattle disease is reported from Pergunnah Rohtas in Shahabad.
		* News has since arrived from Gya Head Quarters, dated 2nd February, of a rainfall of 1·75 inches on the 31st January and 1st February; and at Aurungabad Sub-Division of 1·35; also from Sarun of a fall of 0·67 inches on the night of the 31st January. The rain in each case will generally have done good.
N. W. P. (Feb. 5th)		
Bustee (2nd)	...	Prices not rising materially; in some instances slightly cheapened by importation; cloudy during the week, ending in a good and very general fall of rain on the 31st January; on the 1st heavy thunder storm all across south of the district; rubbee prospering and should now do well; damage to urhur overestimated; relief works crowded.
Goruckpoor (1st)	...	Prices risen considerably, especially rice; rainfall of ·1 in the middle and south of the district on the 23rd, and again ·1 in Hatta tahsil on the 31st; reports from other tahsils not yet received; distress among the poorer classes increasing; relief work opened near the city and in north of the district; others held ready; private subscriptions collected for the relief of the sick and the infirm.
Ghazeepoor (2nd)	·6 in the north on 31st.	Prices slightly higher; reports from other parts not yet received; prospects of the rubbee good; one relief work in operation and two others held ready; demand for labor increasing.
Mirzapoor (4th)	From ·1 to ·7	General rainfall of from ·1 to ·3 in the valley of the Ganges on the 31st and 1st; south of the hills rainfall about ·7 and heavy dews since the 24th, all which have done much good; prices not higher owing to imports from the south; importation into Mirzapoor rather larger than last week; continued cloudy weather might cause blight.
Benares ...	...	No reportisreceived.
Azimgurh (1st)	·10 (on 1st & 2nd)	Prices rising; wheat and barley estimated nearly average; damage to urhur, peas and gram about 15 per cent.; distress confined to infirm persons; agricultural work sufficient for labourers.

Presidency or Province and District.		Rainfall for *fortnight* preceding.	State of agricultural prospects.
N. W. P. —*(continued)*.	(Feb. 5th)		
Jounpore	(2nd)	...	Prices generally risen; slight but general rainfall on the 31st; damage to peas and urhur from frost, estimated at 25 per cent.; some apprehensions of scarcity, and demand for relief works probable; import from Benares increased.
Allahabad	...	...	Cloudy weather; no rain; unirrigated crops poor; much damage from frost.
Banda	...	...	No rains; crops looking well; some distress from want of labour which will continue till harvest begins; small relief works set on foot.
Cawnpore	(4th)	...	Prices much as before; slight fall in barley and peas; partial slight rain; some damage by frost; prospects unchanged.
Futtehgurh	,,	...	General rain benefited crops, but more rain wanted; damage by frost heavy; rubbee will at the worst be a fair crop.
Agra	,,	...	Cloudy weather producing blight; in some parts *slight rain, hardly enough to do* good; prospects of rubbee still favourable; want of fodder felt.
Muttra	(1st)	...	Cloudy weather with little rain gives fear of blight; urhur, gram and sirsow badly damaged by frost; prospects of rubbee not so good.
Meerut	...	...	No report received.
Saharunpoor	(4th)	1 to 2	General heavy rain on 31st from 1 to 2 inches, very beneficial; prospects good.
Bijnoor	(2nd)	1·5 to 4	General rainfall from 1½ to 4 inches, doing much good; prospects favorable.
Moradabad	(4th)	1	General rainfall of about an inch, which will secure average crop.
Bareilly	,,	...	General rainfall doing much good; prices slightly lower.
Shahjehanpore	,,	nearly 1	Rain nearly an inch on 1st and 2nd; urhur and gram destroyed by frost; prospects otherwise excellent.
Benares	,,	0·2 to 0·5	Prospects improved.
Meerut	(5th)	1·1	Rain will do great good to crops.
Jaloun	(2nd)	*Nil*	Rubbee crop promises well.
Allygurh	(3rd)	1·2 in places.	Unirrigated crops poor; irrigated rubbee promises well.
Bustee	(4th)	1	Over an inch of rain on 1st instant; crops generally thriving.
Punjab	(Feb. 5th)		
Delhi	(4th)	0·6	A little rain in Hissar and Sirsa.
Umballa	,,	0·6	
Jullundhur	,,	1·0	
Umritsur	,,	1·4	
Lahore	,,	1·2	
Mooltan	,,	0·6	
Jhelum	,,	*Nil*	Cloudy.
Rawul Pindee	,,	1·5	
Peshawur	,,	2·4	Agricultural prospects good; public health generally good.
Oudh—			
Lucknow	(Feb. 5th)	0·3	District returns up to Monday record fall of rain more or less throughout the province except in Roy Bareilly and Pertabgurh. The average fall in each of the *Seetapore, Kheri* and Gonda districts has been a little more than an inch; in Sultanpore 0·4, and in the others from 0·2 to 0·3. No return from Hurdui; some injury to crops reported from Onao, Sultanpore and Pertabgurh. Rain has generally benefited the rubbee crops, the prospects of which are favorable.
Fyzabad	(3rd)	0·7	
Hardui	(5th)	...	In tahsils Sandila and Bilgram 9·1 rain fell on the 31st January which has done some good to the crops; heavy rain has fallen in Bharaitch; in the Sadi tahsil 3·0, and in Nanpara 1·6, and is reported to have been most beneficial.
C. Provinces	(Feb. 5th)		
Upper Godaveri	(Jan. 30th)	*Nil*	*Cool, cloudy; crops* good; jowari above average; health good.
Bhandara	(31st)	1·44 (on 28th Dec. with hail).	Rubbee promising well; early sowing cutting; some smallpox; health generally good; prices easy.
Raipoor	...	·73	Cloudy; if wet weather continues, damage to rubbee crops expected; fever increasing; smallpox in many villages; prices falling.
Belaspoor	...	1·40	Rubbee partially benefited by rain; smallpox reported; prices easy.
Sumbulpoor	...	·72	Crops all harvested; prices high but steady; health good.
Saugor	(Feb. 4th)	1·40	Rubbee thriving; smallpox in places; health good.
Jubbulpur	...	·36	
Mandla	...	·85	Prospects good; prices stationary; health good.
Dumoh	...	1·15	
Wurdah	...	...	Slight rain; rubbee prospects favorable; smallpox increasing.
Nursinghpoor	...	...	Slight rain; rubbee promising; prices stationary.
Nagpoor	...	·79	*Hail damaged crops in* fifty villages in Umrer tahsil, otherwise rubbee progressing well; prices unchanged; health good.
Nimar	...	*Nil*	Prospects favorable; prices slightly risen.
Hoshangabad	...	*Nil*	Present prospects favorable; rain wanted.
Baitul	...		
Hyderabad Assigned Districts—			
East Berar	(Feb. 5th)	...	Rubbee crops nearly ready for sickle; expected outturn good.
West Berar	(4th)	...	Rubbee crops in good condition, and are being reaped in some places.
Mysore & Coorg	(Feb. 5th)		
Bangalore	(Feb. 4th)	...	Wet crops thriving; dry crops suffered from want of rain; public health good.
Toomkoor	(3rd)		
Kolar	(Jan. 30th)		
Mysore	(28th)	...	Crops mostly harvested; prices slightly fluctuating; paddy crops good; public health good; cattle disease in two taluqs.
Hassan	(Feb. 2nd)		
Shimoga	(Jan. 31st)	...	Standing crops thriving; sugarcane harvested; public health good; cattle disease prevails in parts; paddy and certain food-grains in good condition; cotton crops in two taluqs unhealthy; scarcity of water and forage in parts.
Chituldroog	(Feb. 2nd)		
Kadoor	,,		
Coorg	(4th)	...	Rice crops being thrashed; health still bad.
			General Remarks.—Agricultural prospects tolerable, but cattle disease more or less prevalent in parts of province.

Presidency or Province and District.		Rainfall for fortnight preceding.	State of agricultural prospects.
Rajpootana—			
Ajmere	(Feb. 5th)	...	Clouds hovering; weather fine; health good.
Serohi	(Jan. 26th)	...	Tanks dry; well supply short; general health very good; prospects of crops good; weather seasonable.
Meywar	(,, 24th)	...	Water plentiful; in Oodeypore and western districts very low; great scarcity of water expected there in hot weather; general health very good, smallpox in some localities; crops very deficient in Oodeypore and western districts, no rain having fallen; in other districts a good crop expected; intense cold has killed most of sugar-cane.
Harowtee	(,, 17th)	...	Tanks and wells full; health good; prospects unchanged.
Ulwur	(,, 22nd)	...	Tanks and wells satisfactory; health good; prospects of crops average owing to the damage done to urhur and gram by frost and to the failure of Christmas rain.
Central India—			
Indore	(Feb. 4th)	...	Weather fine; health good; prospects favorable.
Gwalior	,,	...	Cloudy and threatening rain for some days; rain much wanted; small-pox continues.
Neemuch	,,	...	No change since last report.
Rutlam	,,	...	Health good; prospects of crops favorable.
Bagelkhund (Satna)	...	...	No report.
British Burmah	...	...	No report.
Nepal	(Jan. 29th)	...	Health good; rain much required for spring crops.

GOVERNMENT OF INDIA.

HOME DEPARTMENT.

TREATMENT OF CHOLERA BY THE HYPODERMIC INJECTION OF CHLORAL HYDRATE.

Report dated 10*th October* 1873, *from Civil Surgeon, Kheri in Oudh, to Deputy Commissioner, Kheri.*

In compliance with the request of the Commissioner, I have the honor to submit a brief report concerning the nineteen cases of cholera, which I treated by the Hypodermic Injection of Chloral Hydrate; the solution used was of an uniform strength throughout and contained one part of the medicine to ten of water.

2. On the 9th of last month, news was received that cholera had broken out in the village Chaoneh about a mile from the Sadr; two deaths had already occurred; I arrived at the village at 5 o'clock P. M. and found five persons ill, one of whom, a Bhargin, died just as I entered her house; of the others, two were in severe and two in mild collapse when the treatment was begun—*all were cured.* On the 11th one case occurred, an old man, Durzi caste, in mild collapse when first seen—*cured.* On the 12th two cases occurred, one a boy in severe collapse when seen; the other a woman, collapse impending—*both cured.* On the 16th a Kúrmin was attacked in mild collapse when treatment was commenced—*cured.* On the 19th a Kúrmin was attacked in severe collapse when seen—*cured.* On the 21st a Durzin was attacked in severe collapse when treatment was commenced—*cured*; this was an exceedingly bad case. On the 22nd three cases occurred, collapse impending in each when treatment was begun—*all cured.* On the 24th three cases occurred, two in mild collapse and collapse impending in the third when treatment was begun—*all cured.* On the 25th a Kúrmin was attacked in intense collapse; an hour and a half after the injections were made the pulse could be felt again at the wrist; I then had to leave; directions were given to the Native Doctor to repeat the injections if the pulse did not improve in an hour, the directions were not fully carried out, the woman *died* about four hours after. On the 28th a Brahman was attacked in intense collapse when treatment was commenced; *died* an hour and a half after; this was the only case in which the treament had no effect whatever; it was a terribly rapid one. On the 29th a Barhai was attacked in mild collapse when treatment was commenced—*cured*; this man since died from exhaustion, he was about 70 years old and very feeble. No cases have occurred since the 29th September.

3. In the Hardui district last year, cases of cholera were treated with Chloral Hydrate, but the remedy was given by the mouth in almost all the cases. Dr. McReddie had not a favorable experience of the hypodermic method; the solution he used was treble the strength of mine and caused sloughing and irritation; nothing of this kind followed in any one of my cases beyond a very slight hardness at point of puncture and a little pain; there was no local evidence twenty-four hours after that the injections had been made. Dr. McReddie was very successful; 82 per cent. of his cases recovered, but taking his very bad cases alone he lost nearly 50 per cent.; 89 per cent. of the above cases recovered and 72 per cent. of the very bad ones.

The injections were made in the arms and thighs, the Camula of the Syringe being plunged pretty deeply into the flesh; the greatest quantity of Chloral used in any of my cases was sixteen grains or eight injections; if the case was a bad one four injections were made at once, then nothing was done for an hour, when the treatment was repeated if necessary; as a rule, sleep was induced within two hours, nothing else was done except mulling the limbs and giving occasionally some cold boiled water.

4. There is no necessity for me to say much as to the rationale of the treatment. Surgeon Hall, R. A., the originator, has made it public. Chloral Hydrate being a powerful sedative soothes the irritated nerves, and so relaxes the contracted vessels, the blood is once more uniformly distributed, and consequently the pulse re-appears at the wrist, the cramps and burning abdominal pains subside, sleep is induced, the respiration becomes regular, the discharges lessen, the face fills out, the voice becomes stronger and the natural secretions are restored.

I sincerely hope that this form of treatment of cholera will be given an extensive trial.

Letter from Doctor Hall, dated 18th October 1873, to Commissioner of Sitápur.

In compliance with your request I have the honor to make the following statement, on the subject of the treatment of Cholera by the Hypodermic Injection of Chloral Hydrate.

1. In May 1869 I wrote a paper, entitled "Thoughts about Cholera," which was published in "The Indian Annals of Medical Science" for March 1870, No. XXVI. In that paper I advanced a theory, that in the cold stage, or collapse of cholera, instead of exhaustion of the nervous system (as was generally supposed) there is *intense irritation* of certain sets of nerves; and I suggested that the principle which should guide us in the treatment of this condition, was the endeavour to get the nervous system quieted by the action of *pure sedatives; not* to give stimulants, as was very frequently done. I pointed out that it was of little use giving medicines by the mouth, on account of the frequent vomiting; and I recommended the practice of the hypodermic injection of sedatives *in the state of collapse.*

2. When I wrote, Chloral Hydrate had only recently been discovered in Germany, I had never used it, and was not aware of its true action on the nervous system. Last August twelve months, Surgeon Major Collis of the Buffs and myself conducted a series of experiments on large bull frogs, to ascertain the action of numerous drugs, on the heart and nerves. We found that Chloral Hydrate is one of the most powerful sedatives that we possess.

3. On the 21st August last a soldier of "the Buffs" was admitted into Hospital at this station suffering from cholera. Surgeon Major Collis kindly placed him under my care, as he knew that I was anxious to treat a case not having had an opportunity of doing so for nearly four years. When I saw the patient he was in collapse. I dissolved (10) ten grains of Chloral Hydrate in (100) one hundred drops of water and injected this quantity subcutaneously in four different places in the arms. The effect was most satisfactory, reaction being completely established in about 5 hours. The man recovered without any bad symptoms, and there were no signs of ulceration where the solution had been injected.

4. I mentioned the result to Dr. Higginson, Civil Surgeon of Kheri, Oudh, (among others), and he said he would try this plan if he had an opportunity. He has done so, and the report he has furnished shews the success of it. Statistics will show that no other plan of treatment hitherto adopted has been followed by so many cures.

5. I attach great importance to the strength of the solution used (1 part in 10 of water) if it is too strong, it probably will not be absorbed into the blood, and only cause ulceration or sloughing.

6. The following is the plan of treatment that I recommend for the three stages of cholera. During the premonitory diarrhœa (which is almost always *painless*), (30) thirty drops of Dilute Sulphuric Acid in a large wine glassful of strong Camphor Water every hour. If this does not stop it and vomiting comes on, commence the hypodermic injection *at once.* If the patient is first seen in collapse inject 10 grains dissolved in 100 drops of water in 4 or 5 different places according to the size of the Syringe. This will probably be enough, but if reaction does not commence within an hour, inject again. There is generally a great craving for cold water, which may be given in any quantity; never mind if the patient vomits, as reaction proceeds he will retain it. *But no opium or stimulants are to be given in collapse.*

After reaction if *secondary fever* supervenes, quinine in varying doses, every one or two hours, may be given with milk, beef-tea and mild stimulants.

Letter from the Deputy Surgeon General, Indian Medical Service, Lucknow Circle, to the Junior Secretary to the Chief Commissioner of Oudh, dated Lucknow, the 10th November 1873, No. $\frac{130}{C.C.}$

In reply to your letter No. 5166, dated the 31st ultimo, calling for my opinion on the subject of Hypodermic Injection of Chloral Hydrate.

Doctors Higginson's and Hall's reports are so satisfactory as to the results of their experiments and to the cures effected, and the description of the mode of application and the strength of the remedy employed so clearly laid down, that I think it very advisable the report should be printed in its entirety for distribution to the various Medical Officers, Civil and Military, within the Circle.

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

IRRIGATION IN TIRHOOT AND OTHER DISTRICTS IN BENGAL SUFFERING FROM SCARCITY.

Nos. 78—82 I, dated 12th February 1874.

OBSERVATIONS—By the Government of India, P. W. DEPT.

Read:—

Resolution by the Government of India, Public Works Department, dated Simla, 28th October 1873, Nos. 431—9 B—C.

Letter No. 803 I, from Deputy Secretary to Government of India, Public Works Department, to Joint Secretary to Government of Bengal, Public Works Department, Irrigation Branch, dated 31st October 1873.

Letter No. 3329, from Secretary to Government of Bengal, to Secretary to Government of India, dated 8th November 1873.

Letter No. 2981 of 14th November 1873, from Secretary to Government of India, Financial Department, to Secretary to Government of Bengal, Financial Department.

Letter No. 1631 I, dated 17th December 1873, from Secretary to Government of Bengal, Public Works Department, Irrigation Branch, to Secretary to Government of India, Public Works Department, and enclosures.

Extract from a Note by the Inspector General of Irrigation Works, No. 52 of 31st December 1873.

Letter No. 18 A—I of 21st January 1874, from Secretary to Government of India, Public Works Department, to Joint Secretary to Government of Bengal, Public Works Department, Irrigation Branch.

OBSERVATIONS.—On learning that the Government of Bengal anticipated a scarcity in the Patna Division during the present dry season, the Government of India, in a Resolution dated Simla, 28th October 1873, drew attention to the project for completing the Gunduck Embankments as one source of relief by employment of the people. Subsequently in a letter dated the 31st October, the attention of the Bengal Government was called to the scheme for irrigation in Chumparun, Sarun, and Western Tirhoot, which had been prepared in 1869 and 1870.

2. The embankment project has already been set in hand under the orders of the Local Government pursuant to the general sanction given by the Government of India in October, and a grant of funds has been made accordingly on the application of the Local Government.

3. At the time of making the application for funds for the embankment scheme, His Honour the Lieutenant Governor forwarded a note by Colonel Gulliver, the Officiating Chief Engineer for Irrigation in Bengal, on the two irrigation projects, of which one, deriving its source from the Lower Gunduck was submitted to the Government of India in 1869, and the other, from the Upper Gunduck, is now for the first time laid before the Government of India.

4. The lower scheme, originating at about 85 miles above the confluence of the Gunduck with the Ganges, consists of a proposed weir across the Gunduck with 369 miles of irrigation and navigation channels on the east or left bank, extending north of the Ganges between that river and the Boor Gunduck, as far east as Monghyr, and 156 miles of similar channels on the west or right bank of the Gunduck extending over the eastern half of the district of Sarun. Major Jeffreys, R. E., who prepared the project estimated the whole cost at 138½ lakhs, or £ 1,384,826, and the nett maximum returns at £ 197,594. The scheme was referred again to the Local Government for further consideration of the financial prospects by the local Revenue authorities. These authorities were not satisfied that the water would be freely used, and the scheme therefore not promising early financial success, it has not till now been re-submitted by the Local Government.

5. The upper scheme, having its origin at a second proposed weir 80 miles higher up the Gunduck and about 20 miles from the point of debouchure of the Gunduck River from the lower Himalayas, has been estimated by Mr. Stoney who prepared the project under Mr. Levinge's general

directions to cost 107½ lakhs, or £1,072,643, and to yield a possible nett income of £ 62,100.

6. This scheme contemplates navigable and irrigation channels in Chumparun on the east or left bank of the river, and it was intended that the canals should join those of the lower scheme before mentioned. It terminates, eastwards on reaching the banks of the Bagmuttee River at a point nearly due north of Mozufferpoor.

7. Neither of these projects therefore provides for the irrigation of that part of Tirhoot most severely affected by drought during the current and former years. And as the embankment scheme with the local works which have been set in hand will afford sufficient work for the relief of the distress, it seems desirable that further investigation should be made in view to such modification of the projects above described as may be deemed proper to meet the more pressing wants of the country now and recently affected by drought.

8. But in order to prevent the tract immediately behind the new embankments now in progress suffering from possible want of water, the proposal for a small canal, submitted by Colonel Haig, may be carried out as soon as the Local Government is satisfied that it can conveniently be done. This proposal is so far in course of execution that the Local Government has decided to take advantage of the construction of the embankments, to excavate the earth required for them so as to permit of an irrigation channel being formed immediately behind them, with a discharging capacity of 400 cubic feet per second. An estimate for the completion of the canal, prepared quite independently of the larger project discussed in this Resolution, should be submitted at an early date for sanction.

9. Meanwhile, the Governor General in Council desires that immediate steps may be taken to complete the further investigation of the means of meeting best the most pressing wants of Tirhoot, Sarun and Chumparun and of the northern parts of the districts of Monghyr and Bhaugulpoor in regard to irrigation. The points to which His Excellency in Council desires especially to direct attention are the following.

10. Without losing sight of the advantages of navigable canals as a means of cheap transport, His Excellency in Council is disposed to think that a more easily provided and convenient means of meeting at once some portion of the wants of the country as regards the transport of passengers, grain and merchandise will be afforded by railways. The provision of railways for parts of the tract north of the Ganges and Gogra is already under the consideration of the Governor General in Council, and will be separately dealt with. It is only noticed here to indicate that the canal scheme need not at the present stage in view to navigation be rendered more expensive than is necessary to afford the irrigation which is its primary object.

11. In the next place, it has to be remembered that the almost unanimous testimony of local authorities is that canal irrigation in Tirhoot and Sarun is not required in ordinary seasons. It appears also that even in seasons of scarcity the want of irrigation though by no means absent in the southern tracts is principally felt in northern Tirhoot and Chumparun. It is probable that a wide-spread system of irrigation, affording a large supply of water to the lower parts of the tract in question, would not for very many years be brought into general use. It seems, therefore, neither necessary nor expedient to lay out capital largely in constructing such a system, at least until the demand for water from less expensive works has shown that the people have learned to appreciate, and are likely to be willing to pay for it.

12. For the first introduction of irrigation for the rice crops in seasons of deficient rains in Sarun and the southern part of Tirhoot, simple works of the nature of what are called inundation canals in Sindh and the Punjab may probably suffice. These may be useful too to prepare the ground for sowing spring crops. And it seems likely that these may be easily constructed by making the necessary short connecting channels to lead the waters of the Gunduck into natural drainage channels. For western Sarun in this case the water would probably have to be obtained from sources in Goruckpoor. This subject

will require early attention, but the immediate object now for consideration is the more distressed tract to the north.

13. Thus limited the immediate requirement is such a scheme of irrigation as shall convey an unfailing supply of water to those parts of the country which suffer most severely from drought, thereby providing a sufficiency of water to save a proportion of the rice crops and afford the means of sowing and moderate irrigation for wheat and barley in bad seasons.

14. It seems desirable, therefore, to confine the investigation now to be undertaken to one head-work, if possible without a weir, on the Upper Gunduck, following the general direction of the projected High Level Canal in the Upper Gunduck Project submitted,—but to carry this channel across the Bagmuttee River, with a view to introducing irrigation in the neighbourhood of Seetamurhee and Mudhobunnee, and that, if possible, it should be extended so far as to meet a similar canal from the Kosi River to the east of those places.

15. The opportunity afforded by a detailed examination of the country for this project should be taken advantage of to ascertain the capabilities of the Bagmuttee, Kumla and Muchee Rivers to aid in the supply of irrigation for the tract of country lying between the Bagmuttee on the west, and the Kosi on the east.

16. The Local Government should be requested to put forward any modification of the scheme sketched in the preceding paras. that an examination of the country may suggest.

17. The financial arrangements connected with the project will be separately considered hereafter.

18. What is immediately necessary is to set on foot the further investigation of the engineering features of the case, and to determine in the first place the best means of meeting the wants of the country in the limited sense now explained, and in the second place the possibility of extension hereafter. It will be arranged in communication with the Government of Bengal that Engineers and Surveyors shall be deputed at once to carry out this inquiry under proper instructions from the Chief Engineer of Irrigation.

19. But the interest of the western part of the district of Goruckpoor in the waters of the Gunduck should not be overlooked, and the Government of the North Western Provinces will be asked to report on this point.

ORDER.—Ordered, that a copy of this Resolution, and the extract from Colonel Rundall's Note, be forwarded to the Government of Bengal for consideration and necessary action.

Ordered also, that copies of these papers and of the previous correspondence be forwarded to the Government of the North Western Provinces, with reference to para. 19.

Ordered further, that copies be furnished to the Financial, and Agriculture, Revenue and Commerce Departments, and that a report be made to the Secretary of State.

a. Price of best rice in the several sub-divisions ranges from 11 to 13-10 seers and of common rice from 12-8 to 14-2 seers per rupee.

b. Coarse rice is sold at 14-8 seers per rupee.

c. The price of best rice in the interior ranges from 10-8 to 13-8 seers, and of common rice from 12 to 14 seers per rupee.

d. In the interior.

e. Price of best rice in the interior ranges from 8 to 13-8 seers, and of common rice from 10 to 14 seers per rupee.

f. Price of common rice in the sub-divisions ranges from 12 to 16 seers per rupee.

g. Price of best rice in the interior ranges from 12 to 17 seers, and of common rice from 13-4 to 20 seers per rupee.

h. Price of best rice in the interior ranges from 8 to 11-8, and of common rice from 12 to 13-8 seers per rupee.

i. Price of common rice in the interior ranges from 9-8 to 12-4 seers per rupee.

j. The price of best rice in the interior ranges from 7 to 10, and of common from 8 to 16 seers per rupee.

k. The price of best rice in the interior ranges from 18 to 20, and of common from 21 to 22 seers per rupee.

l. The price of best rice in the interior ranges from 16-8 to 18, and of common from 18 to 20-12 seers per rupee.

m. The price of common rice at outlying marts ranges from 18 to 22 seers per rupee.

n. In the interior the price of best rice ranges from 9 to 9-12, and of common from 10 to 13-8 seers per rupee.

o. The price of best rice in the interior ranges from 8-8 to 10-8, and of common from 10-8 to 21-8 seers per rupee.

p. The price of best rice in the interior ranges from 8-8 to 14, and of common from 9-4 to 14-12 seers per rupee, and of lesser millets from 11-8 to 16 per rupee.

q. In the interior the price of best rice ranges from 8 to 10, and of common from 10 to 12 seers per rupee.

r. In the interior the price of best rice ranges from 10 to 13, and of common from 11 to 15 seers per rupee.

s. In the interior the price of best rice ranges from 12-8 to 16, and of common from 13 to 18-8 seers per rupee.

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

CONSTRUCTION OF DOCKS ON THE ELPHINSTONE ESTATE IN BOMBAY.

No. 1218, dated 8th December 1873.

From—The Secretary to the Government of Bombay,

To—The Secretary to the Government of India, Marine Department.

I am directed to submit to the Government of India the accompanying copy of a Resolution by this Government, No. 1218, dated 8th December 1873, and of the papers noted in the heading thereof, on the subject of the construction of a dock or docks on the Elphinstone Estate in Bombay.

2. It will be seen that three different proposals have been submitted, one, by a majority of the Trustees of the Port of Bombay, for the conversion of both the Elphinstone and Musjid Basins into docks, at a cost of £974,490; the other, by a minority of the Trustees, for the conversion into a dock of the Musjid Basin only, at a cost of £328,000; and the third, by Mr. Kittredge, who has recently been appointed a Trustee, for converting the Elphinstone Basin only into a dock, at a cost of £678,000.

3. In inviting the attention of the Government of India to the remarks made by this Government in the Resolution No. 1218 on the several proposals, I am desired to state that His Excellency the Governor in Council must decline to incur the responsibility of recommending to the Government of India the immediate prosecution of more than the smaller project recommended by the minority of the Trustees. His Excellency will not offer any opposition to the larger project proposed by Mr. Kittredge if the Government of India should be disposed to give it the preference. But it must be distinctly understood that, under any circumstances, this Government will not be prepared to impose any higher rates of charges on the trade of the port than Re. 1-4 on every ton of goods passing through the dock, and four annas per ton on the registered tonnage of every vessel entering the dock.

No. 1218, dated 8th December 1873.

RESOLUTION—By the Government of Bombay.

Letter from the Secretary to the Board of Trustees, Bombay Port Trust, No. 585, dated 17th October 1873.
Forwards report of the Committee on wet docks, with a dissent therefrom by Colonel Ballard, C. B., R. E., and Colonel Hancock, R. E., and copy of a Resolution by the Trustees, requesting Government to grant the money required to carry out the entire scheme for the Elphinstone Dock and the Musjid Basin, free of interest, until the works are completed.

Letter from the Secretary to the Board of Trustees, Bombay Port Trust, No. 586, dated 17th October 1873.
Forwards a protest by the Honorable Mr. Ravenscroft against the decision arrived at by a majority of the Trustees on the question of Wet Docks and Tidal Basins.

Letter from the Secretary to the Board of Trustees, Bombay Port Trust, No. 698, dated 7th November 1873.
Forwards a letter from Messrs. Henry, Bythell, LeMesurier and Hall, on the subject of the Honorable Mr. Ravenscroft's protest as regards the effect of closed docks on the health of the town and shipping.

Letter from the Secretary to the Board of Trustees, Bombay Port Trust, No. 711, dated 11th November 1873.
Forwards the report of the Medical Committee, Drs. Smith, Weir and Blaney, on the sanitary aspect of the proposed Docks.

Letter from the Secretary to the Board of Trustees, Bombay Port Trust, No. 720, dated 12th November 1873.
Forwards a memorandum by Mr. Kittredge on the subject of the proposed docks.

Two memoranda by the Secretary to Government in the Public Works Department, dated 12th November 1873.

RESOLUTION.—The Government of India in their letter in the Public Works Department, No. 2C of the 2nd December last, relative to proposals submitted by Mr. Ormiston for the improvement of the Elphinstone Estate, stated—"These proposals will of course require very careful examination before they are forwarded for the sanction of the Government of India. But assuming that Mr. Ormiston's views are declared to be sound, and that on enquiry there is good reason for believing that the works when completed will ensure an income sufficient to meet all working expenses and the interest on the cost of construction, and of the additional capital involved in the postponement of interest during the construction, His Excellency the Governor of Bombay has expressed his readiness, with the concurrence of his colleagues in Council, to propose the introduction into the Port Trust Bill, of a clause binding the Government of Bombay to impose on the shipping and trade such charges for the use of the docks, not exceeding a maximum to be stated in the clause, as will ensure an income sufficient to provide for the working expenses, and for all interest;" and again, by Resolution passed on the 1st July last, declared—"The Government of India now reiterate the assurance contained in Mr. Aitchison's letter No. 2C of 2nd December 1872, that this Government will favorably entertain any well considered proposals for the extension of the works of accommodation for shipping that may be submitted by the Port Trust Committee, and supported by the Bombay Government. It is at the same time here suggested that it would be desirable, if possible, to execute at first a portion of a large scheme, so as to judge of the probable results before the whole outlay has been incurred. But if this be not possible, and if it be requisite to commit the Trust to a large outlay at once, it will

be needful to show, by carefully prepared estimates of the probable returns, that the risk of the interest not being covered is so small that the undertaking may be safely sanctioned. It cannot be expected that certainty will be attained, but it is important, at any rate, to be approximately safe."

2. The result of these instructions is that His Excellency the Governor in Council is now called upon to take into consideration three several proposals for the further conduct of the works, and to convey to the Government of India his opinion as to the selection to be made of one of them for immediate execution. One of these proposals, submitted by a majority of the Trustees of the Port, is for the conversion of both the Elphinstone and Musjid Basins into docks, at a cost of £974,490.

3. Another proposal, submitted by a minority of the Trustees, is for the conversion into a dock of the Musjid Basin only, at a cost of £328,000; and the Government are in possession of a third proposal, submitted by Mr. Kittredge, who has recently been appointed a Trustee, which it will be convenient to consider with the other two, for converting the Elphinstone Basin only into a dock, at a cost of £678,000.

4. In all these proposals the sums named include the interest falling due during the progress of the work, and in all three the sums named may, for present purposes, be assumed to be correct.

5. The execution of the first and third schemes will occupy seven years. The second may be completed in four years.

6. In proceeding to determine which of these projects shall be recommended to the Government of India for adoption, His Excellency in Council is bound to bear in mind the very heavy burthen already entailed upon the trade of Bombay by the acquisition of the Elphinstone Estate, and also the responsibility imposed upon him by the Government of India of ascertaining that the work to be recommended holds out a reasonable prospect of its repaying the cost of its execution, and, guided by these considerations, His Excellency has come to the conclusion that the first of the three projects is not one which he can with propriety support. The outlay to be incurred is so large, the differences of opinion as to the revenue likely to accrue from it are so great, and the possibilities of ultimate failure are such, that this Government must decline to be a party to its adoption.

7. The choice, therefore, lies between the two remaining projects, and in examining the merits of each, it will be convenient to assume that the maximum rates of charges which the Government of Bombay will consent to impose on the trade of the Port will be Re. 1-4-0 on every ton of goods passing through the docks, and four annas per ton on the registered tonnage of every vessel entering the docks.

8. It may also be assumed that after deduction of vessels not likely to avail themselves of the dock accommodation provided by the Trust, the number of vessels for which the rates could be levied in each year will be equal to 336 vessels of an average registered tonnage of 1,000 tons, importing and exporting a cargo of 700 tons, and yielding for each a revenue of Rs. 2,000 or £200, and a total of £67,200.

9. The whole number of vessels that are likely at first to make use of the docks could probably be accommodated, and the whole revenue realized by the execution of either of the two projects.

10. In the case of the Elphinstone Basin the charge for interest at 4½ per cent. would amount to £30,510, leaving a balance of £36,690.

11. For the Musjid Basin alone the charge for interest would amount to £14,760, leaving a balance of £52,440.

12. It has been assumed that the working expenses will amount to 40 per cent., or £26,880, which, in the case of the Elphinstone Basin, will leave a balance of £9,810, and in the case of the Musjid Basin will leave a balance of £25,560.

13. The proportion which the working expenses will bear to the gross revenue will, however, depend greatly on the outlay to be incurred for dredging, and His Excellency in Council learns that the conversion of the Elphinstone Basin will involve the formation and maintenance of a northern channel, not required for the Musjid Basin, and the success of which is by some held to be very doubtful.

14. In some quarters, again, grave apprehensions are entertained as to the consequences in a sanitary point of view of the construction of any enclosed dock, and although the Government hope that no mischief will ensue in this respect, they are not warranted in putting out of sight the possibility that after a dock has been constructed it may become necessary, for the health of the crews and of the population of Bombay, to remove the dock gates, and to convert the dock into a comparatively shallow Tidal Basin, at a serious sacrifice of the revenue on which the whole project is based.

15. Such are the main considerations applicable to both projects. The Government fully recognize the possibility of their estimate of the number of vessels requiring dock accommodation being challenged in some quarters as being too low; and Mr. Kittredge is of opinion that the accommodation afforded by the Musjid Basin when completed will not be sufficient to ensure even all Canal steamers a certainty of being able to find room in the dock; and although to this extent the selection of the smaller project may operate injuriously on the interests of the Trust, by encouraging the construction of other docks, intended to compete with those of the Government, it must be remembered that by confining themselves, in the first instance, to the conversion of the Musjid Basin, the Government will be in no degree debarred from entering on the larger undertaking if at any time there should

appear to be good reason for so doing. The advantages of a tentative course are that the trade will derive the benefit of the smaller undertaking in little more than half the time required for the larger, that experience of the practicability of dredging in such a bottom as that of the Bombay harbour will be gained, and that in the event of failure the loss will be much less serious.

16. On these grounds, His Excellency the Governor in Council must decline to incur the responsibility of recommending to the Government of India the immediate prosecution of more than the smaller project recommended by the minority of the Trustees. His Excellency will not offer any opposition to the larger project proposed by Mr. Kittredge, if the Government of India should be disposed to give it the preference. But it should be clearly understood that, when the Dock becomes available for use, the Government of Bombay will not be prepared to impose any higher rates than those mentioned above, *viz.*, Re. 1-4 per ton on goods, and four annas per ton on vessels.

BOMBAY PORT TRUST.

REPORT OF THE COMMITTEE ON WET DOCKS.

As requested by the Trustees at their Meeting of the 3rd July, we have taken into consideration the various proposals for providing deep-water berthage for vessels by means of docks or Piers.

2. We consider that dock* would be preferable to piers. The latter have the advantage of being more easily constructed, and are not open to the objections on sanitary grounds which have been raised against wet docks; but they are, in various respects, less suitable for the requirements of this harbour. We have especially considered the alternative designs for a deep-water pier running into the harbour from the Apollo Reclamation, which were submitted to Government by Mr. Ormiston in 1871, and the lighter and cheaper piers designed by Mr. Mathew, the Chief Engineer of the B. B. and C. I. Railway Company, for the same part of the harbour. We are of opinion that, at the lower end of the harbour, the water is too rough during the monsoon for vessels to lie alongside any open pier in comfort; and that there would be considerable risk of serious damage to a pier of light construction, such as those suggested by Mr. Mathew, from the collision of vessels, however carefully moored, except in calm weather. The distance of ware-houses and of the trading centre of the native town is, except in regard to cotton, an objection to any site for a pier south of the dock-yard.

3. The most advantageous position for a pier would be one connecting Cross Island with the Elphinstone Estate. There is deep water close to the eastern side of the Island, and on the south and western sides are several acres of rock uncovered at low water, which could be reclaimed and turned to account as a site for warehouses. All goods, however, intended for the town would have to be conveyed for a distance of half a mile by land carriage, and a pier in this or any other eligible position would impede the inshore navigation of the harbour by country craft.

4. We are satisfied that, on the whole, deep-water berthage can best be provided by means of docks, and that both steamers and sailing vessels would use them if enabled to do so at a moderate cost.

5. On two previous occasions committees have been appointed to consider the question now before us, and in both instances they recommended that docks, if constructed, should be placed in Mody Bay. We are of opinion that the circumstance of the Elphinstone Reclamation being completed gives the sites reserved there for docks, a preference over every other. To place the docks in Mody Bay would involve great expense in the reclamation of land, for which there is not likely to be any demand for many years to come. Moreover, it is only by the establishment of docks on the Elphinstone property that we can see our way to the early utilization of the extensive land estate, the cost of which is, at present, so heavy a burden on the finances of the Port administration.

6. In calculating the returns to be obtained from a dock, we have assumed the following basis:—we reckon the saving to a merchant in landing charges would be Re. 1-4 per ton weight; this includes the saving of time, of loss by pilfering, and of charges incidental to the present system of transhipment into cargo-boats. We further reckon that vessels would be willing to pay dock dues of 4 annas per ton register for the sake of despatch, and because there would be a probable saving in their insurance charges. There would be the further consideration of the greater security which the ship would enjoy.

7. It is found from the general trade returns that the number of tons weight of cargo imported and exported does not amount to much more than two-thirds of the whole registered tonnage of vessels which arrive and depart. The register tonnage of square-rigged vessels that arrived in the Port in 1872-73 was 715,138 as per Appendix A; and the weight of cargo imported and exported in square-rigged vessels is shown in Appendix B to have been 855,649 tons, calculating 20 cwts. to the ton. We assume therefore, for the purposes of calculation, that the average number of tons weight of cargo carried would be two-thirds of the registered tonnage.

8. Forty per cent. is deducted from gross revenue for working charges, including steam towage.

* NOTE.—The term docks is used with reference to such works generally. Wet docks is used in contradistinction to tidal basins.

9. A vessel of 1,000 tons would bring (say) 700 tons *weight* of cargo, calculating weight as before, and would take the same outwards.

1,400 Tons at Re. 1-4	Rs.	1,750
Dock-dues at 4 annas per ton register	„	250
	Rs.	2,000
Deduct working expenses 40 per cent.	„	800
Net revenue from each vessel	Rs.	1,200

10. We consider that the probable period of a vessel's detention in dock may be reckoned at 30 days for a sailing vessel, and 21 days for a steamer—and for the purposes of calculation it may be assumed that an equal number of ships and of steamers would use docks.

11. To turn now to the work to be undertaken. Two channels of approach have been suggested, each of which has its peculiar advantages and disadvantages. One called the lateral or Mody channel, lies between Cross Island and the shore, and is described in Mr. Ormiston's letter No. $\frac{5}{6}$ of 23rd August 1873. This channel has 12 feet at low-water springs. It is not in all respects a satisfactory approach, narrowing to 92 feet between rocks, and having a current of about a mile for an hour before high water, which is the time vessels would prefer to approach the dock gates. The navigation will require caution, but the channel is a perfectly feasible one, and can be safely used by pilots familiar with its current and course.

12. The other channel has been called the Elphinstone channel, and runs eastward from the docks to the north of Cross Island. It would require to be dredged to the extent of 4′ 6″ below the present level. Apart from maintenance, this channel is preferable.

13. The question of which channel is to be opened may remain for subsequent decision after some experience has been gained from the dredging operations in front of the proposed docks. The cost of clearing the lateral approach, with 12 feet of water, does not form a large figure in the estimates, and, as explained above, it will afford a fair approach to the docks though not such a good approach as the Elphinstone channel.

14. Lastly, the extent of dock accommodation required for the trade of the Port remains to be considered. Mr. Ormiston has submitted 11 comparative estimates of the cost of completing or partially completing the Elphinstone Dock Estate with wet docks or tidal basins. The question we have considered is whether it is desirable to proceed with the entire scheme, including two wet docks or basins, the Musjid and the Elphinstone, and the whole harbour frontage between them, at once, or to undertake only a portion of the scheme, to commence with. We may premise that, with a view to afford some dock accommodation at the earliest possible date, we are all agreed that the smaller, or Musjid Dock, must, in any case, be constructed, as it is likely to be completed in three years less time than the Elphinstone Dock.

15. The Musjid Basin and its frontage would, with the Elphinstone frontage but without the Elphinstone basin, give berth space for only 19 vessels. The P. & O. Company, who intend to use docks or basins, state that they would require constant berthage for four vessels, equal to about half of the Musjid Basin. The British India Company would also, it is understood, be glad to use the docks, and they would require a like frontage. Say that these two Companies alone will constantly require wharf space for nine 250-feet vessels; if the Musjid Basin and Elphinstone frontage alone were undertaken, there would remain only ten berths available for the remainder of the shipping.

16. The Master Attendant has furnished a statement of the arrivals of square-rigged vessels in the two years ended 31st March last. These show that 749 vessels arrived in 1871-72 and 713 in 1872-73 (see Appendix A). It is considered that ten berths, representing 140 vessels per annum, would be wholly inadequate to meet the wants of the general trade.

17. It is our opinion that if sufficient accommodation be provided, and if the charge be moderate, every ship and steamer will come into a dock in preference to discharging and taking in cargo in the stream, and we therefore recommend that the whole scheme, including the Elphinstone Dock, be carried out, while, of the alternative schemes submitted by Mr. Ormiston, we, on the whole, prefer that which provides a wet dock on the Elphinstone site and a tidal basin on the Musjid site,—both to be 14 feet deep at low water, and the dock to impound 25 feet at neaps, and the channels to be 12 feet at low water.

18. The estimated cost of these works, omitting the Elphinstone channel, is £852,064. This sum includes 7 per cent. for establishment, which is the rate recommended by Mr. Ormiston to be added to his estimates to meet this charge. These works would give 10,440 lineal feet of wharf walls, which would suffice for the accommodation at one time of 41 vessels, each 250 feet long.

19. On the assumption that half the number of vessels using the docks would be ships and half steamers, and that the former would remain 30 and the latter 21 days in dock, 50 vessels could be accommodated each month, or 600 vessels in each year.

20. Some deduction would have to be made from this number for those months of the year in which fewer vessels enter the Port than the proposed dock and basin would accommodate. The returns before alluded to shew that, taking the average of the past two years, the deduction will be 15 vessels.

21. A further deduction should be made on account of vessels that may use Messrs. Sassoon's Dock, now in course of construction. This dock will accommodate six vessels at once, or say 80 vessels (steamers and sailing vessels alternately) per annum. Its position is not, we consider, so favorable as the Elphinstone Dock, because of its distance from the native town,

and because of the difficulty of making the entrance during the south-west monsoon. On the other hand, it has the advantage of being close to the Colaba Presses, and some vessels during the busy months might use it in preference to the Elphinstone Docks. But seeing that the proposed Elphinstone Docks will *not* accommodate the whole of the square-rigged vessels entering the Port, if they demand inside berths, it is considered that half of the vessels that the Cobala Dock can find berthage for, say 40, is a sufficient deduction to make from the number calculated upon at the Elphinstone Docks.

22. There would thus remain 545 vessels of 1,000 tons each to be dealt with in the Elphinstone Docks.

23. Taking the net revenue from each vessel, as shewn in para. 9, at Rs. 1,200 each, the annual revenue would be Rs. 6,54,000, which, calculating interest at 4½ per cent., represents a capital of Rs. 1,45,33,333—a sum Rs. 60,12,693 in excess of the estimated cost of the docks. This is considered ample security to cover any error in the estimate of tonnage or in the cost of the work.

24. In the calculation of tonnage that would use the docks, no account has been taken of large native-built vessels. At present these load and unload in the stream. The weight of cargo which they carry is shewn by Appendix B to be 233,781 tons, and it is anticipated that a considerable portion of this cargo will come to the open Musjid basin. It forms an additional inducement, if such be needed, for the completion of these works in their entirety.

25. The effect of the closed docks on the health of sailors and others frequenting them, and on the health of the native town, is dealt with by Mr. Ormiston in his letter No. $\frac{99}{6}$, dated 19th September 1873, and need not therefore be referred to here.

DISSENT.

1. In recording our dissent from the course of action proposed by the Committee, we do not wish to be understood as expressing the opinion that the system of wet docks, which they recommend, may not ultimately be found well suited for the requirements of the harbour. We consider, however, that a wet dock of moderate size should be constructed in the first instance, and that the future extension of dock accommodation should proceed in accordance with the ascertained wants of trade, guided by the experience which cannot fail to be acquired during the execution of the first undertaking.

2. Doubts have been expressed by men, whose opinion is entitled to respect, as to the financial success of a large system of docks, and objections have also been raised to wet docks (with impounded water) on sanitary considerations; we do not altogether endorse these opinions, but we think it would be imprudent to ignore them.

3. As regards the financial question, the first point to be considered is the estimate of cost. This has been carefully worked out by Mr. Ormiston, who has much experience of the Bombay rates for work. He believes the rates adopted by him are such as would be accepted by a contractor. The estimate of cost appears to us a part of the scheme which may be accepted with full confidence.

4. The second financial consideration is how far the docks will prove remunerative. Here we find the greatest difference of opinion. Some authorities believe all vessels will use docks, and others that vessels would rather remain in the stream. The balance of argument appears to us to be in favour of the supposition that, after most voyages, vessels would be willing to pay the dock-dues which it is proposed to levy, but that not unfrequently, when laden with special cargoes, such as coal and timber, or when likely to be detained in port, they would prefer the open harbour.

5. At present there are seven boat-basins on the Elphinstone Estate. Commencing from the south, there are the Carnac and Nicol basins, usually crowded with boats and lighters bringing miscellaneous cargoes; the Musjid basin, in which an immense grain trade is carried on; and the Elphinstone basin, set aside chiefly for coal, hay, and building materials.

6. The two last named are the site of the proposed docks, and when the docks are commenced, we must make arrangements for accommodating in the other basins and at Mody Bay the three hundred thousand tons of goods and materials for which they now form the entrepot.

7. We recommend the Trustees not to attach too much importance to the supposed increase of value which the construction of docks would give to the Elphinstone Land Estate. It is on the boat-basins bordering this estate that the largest portion of the trade of Bombay is at present carried on, and we see no adequate reason for assuming that to turn the Elphinstone and Musjid boat-basins into docks will have any *extraordinary* effect on the value of the land.

8. Captain Methven of the P. & O. service, in one of the best minutes on the subject of wet docks which has been published, says:—"Warehousing will not be used as in England; the conditions of the trade of the Port are different, and goods will continue to be largely stored throughout the native town in the homes of the people."

9. The experience of the Traffic Department of the Elphinstone Estate during the six years which have elapsed since Captain Methven wrote, fully confirms his opinions. It is, we

think, principally from the sale of land for house building purposes, and not for warehouses, that we must expect to realize a return. The land required for warehouses has, to a considerable extent, been already taken up.

10. The wharves of the Nicol and Carnac basins are occupied by the Port Trust warehouses and sheds. A branch custom house has just been finished on the Carnac wharf. If docks were made, these warehouses and sheds might require shifting, but a very moderate addition to their extent would probably suffice. There is a large trade in pressed cotton now carried on at Colaba, which may be diverted to the docks; but these bales are detained a very short time on the wharf, and do not require to be warehoused. The bonded warehouse at the custom house basin in the Fort, which cost five lakhs of rupees, and brings the Trustees a good revenue, may become useless, and a new bonded warehouse be required at the docks.

11. These, we think, are the principal changes which can be accurately foreseen.

12. The records of the Dock Committee of 1867 shew that the Commodore commanding the station, three experienced Commanders of P. & O. steamers, and all the medical officers consulted, were opposed to wet docks on sanitary grounds.

13. Captain Graham says:—"I have known Bombay for ten years. An objection to docks is their unhealthiness from stagnation of the enclosed water. The London docks are very offensive." Wet docks, according to Captain Methven, would turn the foreshore into an intolerable nuisance, and the Elphinstone Estate into a "veritable Wapping."

14. Mr. Ure, Resident Engineer of the Clyde Trust, in a passage quoted by Mr. Ormiston, recommends tidal basins at Glasgow, because among other reasons, "the water in a basin being frequently changed will not be likely to be so offensive as that in the more stagnant condition of a dock."

15. We do not wish to be understood as accepting these opinions; on the contrary, we believe that, with the measures and precautions detailed in Mr. Ormiston's report, dated 19th September 1873, the sanitary objections would disappear; but it seems desirable that we should obtain more full information regarding the sanitary precautions found requisite for docks in Europe. There are officers now in England well acquainted with this harbour, to whom such an enquiry might be entrusted, and the best possible practical test would, we think, be the construction of the Musjid Wet Dock, with the channel as proposed by the Committee.

16. In estimating the extent of berthage which this dock would supply, we do not see why we should only reckon on the inside berths being filled. Mr. Ormiston said to the Committee of 1867 regarding the Elphinstone Dock:—"There would be inside berths for 22 ships, but of course there would be more than that in the dock at a time; the dock would be able to accommodate 10 ships to the acre, that is, 300 altogether."

17. Allowing only two ships to one acre, the Musjid Dock would give berths for 16, and 8 could lie on the frontage, or 24 in all.

18. We think that a dock of this size could not fail to answer financially, as it would probably be almost entirely taken up by steamers.

19. If the Musjid Wet Dock does not answer on sanitary grounds, it can be turned into a tidal basin, with 12 feet at low water springs by removing the gates and a portion of the head walls. The amount of shipping of moderate draft which frequents this harbour would be sufficient to occupy such a tidal basin.

20. If the Elphinstone Wet Docks were constructed and hereafter found open to the above objection, it could also be turned into a tidal basin; but there is no demand for such an extent of *shallow* basin for square-rigged craft. Ships drawing 20 feet of water would not be satisfied with only 12 to 14 feet of water at low tide, and a less expensive system would answer equally well for native craft; the latter would certainly not pay the proposed dock-dues.

21. Mr. Ormiston's original scheme provided deep tidal basins with 20 feet at low-water springs, and a channel of the same depth running to the north of Cross Island. As this channel might be difficult to open, and expensive to maintain, it has been considered by all the Engineers who have seen the project that an experimental channel should be dredged before undertaking works which would be dependent on this line of approach.

22. It may be that the objections to wet docks are well founded, though we do not think they are; and it is not improbable that the experience acquired in dredging in front of the Musjid Dock (to which, as before stated, we would at first limit operations) may prove that Mr. Ormiston is right in the opinion he confidently maintains, that the opening of a deep channel to the north of Cross Island is not difficult. In such circumstances we may find that a deep tidal basin on the Elphinstone site, with its corresponding channel, is not merely a practicable scheme, but the only method by which large vessels can be accommodated with deep-water berthage, under conditions not prejudicial to the health of the crews and of the neighbourhood.

23. On these various grounds, therefore, we recommend the Trustees to construct a moderate-sized wet dock only at present, and to reserve the site of the present Elphinstone boat-basin for a dock or basin of such shape, size, and depth as subsequent experience may indicate. The cost of the Musjid Dock, including the Musjid frontage, would be about 30 lakhs.

24. We are of opinion that, were the works to be undertaken by a private company, this is the course they would pursue.

W. L. SEARLE,
Deputy Conservator and Master Attendant.

APPENDIX B.

Statement showing the tonnage of goods imported by square-rigged vessels, steamers, country craft in the stream, and small coasting country craft, from 1st April 1872 *to 31st March* 1873.

DESCRIPTION OF GOODS.	Goods imported by square-rigged Vessels and Steamers.	Goods imported by Country Craft in the Stream.	Goods imported by small Coasting Country Craft.	TOTAL.	REMARKS.
ELPHINSTONE ESTATE.					
Jagree	2,000	...	9,250		Totals arrived at from wharfage fees. Division is made according to opinion of Traffic Manager.
Cotton	1,313	2,700	2,000		Ditto.
Grain	85,034	17,000	23,000		All square-rigged vessels' cargo is taken to Carnac Bunder, and by country craft to Musjid Bunder; fees at each bunder taken separately, and quantities calculated accordingly.
Wool	2,379	5,000	...		Totals arrived at from wharfage fees. Division is made according to opinion of Traffic Manager.
Sugar	16,820	...	...		Totals arrived at from wharfage fee collections
Sundries, Coffee, Copra, Dates, Munjit, &c.	77,619	43,000	59,000		Totals arrived at from wharfage fees. Division is made according to opinion of Traffic Manager.
Ghee	232	...	300		Ditto.
Iron and Metals ...	10,383	...	...		Totals arrived at from wharfage fee collections.
Machinery ...	12,559	...	...		Ditto.
Timber	309	65	4,416		Ditto.
Commissariat Stores ...	6,590	...	200		Totals arrived at from wharfage fees. Division is made according to opinion of Traffic Manager.
Coal	33,831	...	...		Totals arrived at from wharfage fee collections.
Laddy Stones and Chunam ...	...	8,000	26,921		Totals arrived at from wharfage fees. Division is made according to opinion of Traffic Manager.

J. RYAN,

Traffic Manager, Port Trust Bunders.

BOMBAY PORT TRUST.

MEMORANDUM ON WET DOCKS.

Having joined the Port Trust too late to take part in the discussions on the subject of docks, and having, after considering the papers on the subject, including the reports of the majority and minority of the Committee, been unable to agree fully with either, I take the liberty of putting my views before my Co-Trustees.

2. I differ from the Committee as to the scheme of improvement which should be recommended to Government for adoption, though with the general views, on which a further expenditure of money is recommended to make the property of the Trust remunerative, I fully concur.

3. On reading over the two reports I at first decidedly favoured the conclusions come to by the minority of the Committee, as it promised to furnish a fair amount of dock accommodation at a minimum of expense. On going into the figures, however, it seems to me that the minority have much over-estimated the accommodation to be afforded by the Musjid Dock. This is given in the report as furnishing berths for 24 vessels. The dock, however, will be but 1,000 feet long* and 340 feet wide; it will therefore give accommodation for only nine vessels of 250 feet, or seven steamers of an average length; indeed there may be at times

* The Musjid Basin would be 1,140 feet long, but if a dock be made there, space will be required for the gates, and the dock, Mr. Ormiston tells me, will be 1,000 feet long.

seven steamers in port which could not be accommodated, as they might average over 330 feet in length. The minority had depended on outside berths being occupied, but with so small a dock this would be, I think, impossible; a steamer's deck is so filled with her machinery and its coverings, donkey engines, &c., besides her usual ship's-hamper, that I do not think it would be possible to work on a staging over it. Were there space enough to allow the vessels in the inside berths to lie at a short distance from each other, then another lying outside might be discharged over a staging running between the inner ships, but the length of the Musjid Dock will frequently allow only three steamers to lie on a side if placed close together; and furthermore, the discharging in this way would be comparatively slow, and a great portion of the advantage of the dock lost to the vessel. Then, again, the length of the vessels is taken by the Committee at an average of 250 feet, but in these calculations it will not do to take an average; if the general opinion be correct, that steamers will be the first to make use of the docks, we shall, if we base our calculations on 250 feet to a vessel, find ourselves very much out. The average length of the Canal Steamers in port and now on the way to Bombay is 290 feet, the average length of the P. and O. Ships in harbour and bound to this port is 373 feet, of the B. I. S. N. Company 264 feet, making an average in all of 308 feet. Throwing out the small Kurrachee Steamers of the B. I. S. N. Company we have an average of 317 feet*, not counting the troop-ships, which are 360 feet long. Seven berths seems, therefore, the largest number which can be depended on inside. There remains, therefore, only the berths in the frontage of 1,000 feet, which would accommodate three to four vessels; the minority of the Committee had allowed for inside and outside berths being taken here too; the channel is, however, so narrow, and the current so strong, that I think only inside berths would be safe at any time, and, as at some seasons there will be a swell of two feet, I think that even these three or four berths cannot be depended on.

4. The result of my calculations is that the Musjid Dock will be only large enough to accommodate the P. and O. and the B. I. S. N. Companies, and that it would only be used by those Companies on the understanding that they had all the inside berths allowed them, and that no vessels were discharged over them. There would remain, therefore, for the general trade of the port, the outside berths, where discharging and loading would necessarily be slow, and the three or four berths in the frontage, which would not be safe berths for vessels during a portion of the year. This cannot be called *accommodation* for the trade of the port, nor could it be any test of the willingness of ship-owners or masters to use docks. We cannot expect docks to be used here unless we have sufficient accommodation to enable ship-owners and charterers to depend on getting their vessels into dock; if there be much uncertainty about it, charters and engagements will necessarily be made at home for vessels to be discharged and loaded here in the stream. Again, to draw the steam traffic, it is necessary to have a dock of sufficient size for a steamer to enter at once on arrival, even though she waits a day or two for an inside berth. A steamer needs all her time when in port for cleaning and repairing her engines and boilers; and immediately on dropping her anchor the fires are drawn and the machinery taken to pieces; the cases would be very rare when a steamer would lie even 24 hours to enter a dock if she must use her own steam; and yet with the narrow channels, the strong currents, and the fresh breeze off the land generally blowing near the docks, it would be awkward handling a long steamer with tugs. Accidents for which the Trust would be liable would not be improbable.

5. There are further objections to so small a dock:—

1.—It will be too small to allow a steamer to turn, and she must back in or out; this is not a vital point, but with a strong current running at the mouth of the dock, and a narrow channel, it is objectionable.

2.—It will be too small to allow division of the dock space into places for special sorts of cargo. Coal would need to be discharged by the side of articles which might be much damaged by coal dust.

3.—It will be so small as to increase the danger in case of fire on account of the difficulty there will be of handling long vessels in so narrow a space.

6. It seems to me therefore that if anything be done to furnish the trade with dock facilities it must be by building the Elphinstone Dock. This would furnish ample facilities for the trade of the port and that without unnecessary expense; and here I would call attention to the long time named by the Committee in the calculation for the number of days to be allowed steamers and ships to lie at the dock side, viz., 21 days and 30 days respectively. Colonel Frazer, in his "Second Memorandum on the Bombay Reclamations," states that in consultation with the Committee of the Chamber last year, it was decided that 15 days was a fair average for a vessel to lie at her berth in dock, and I think this quite long enough—it certainly is for an inside berth. The Elphinstone Dock will have lineal length of inside wall of 5,700 feet, and it will give facilities for 22 inside berths for vessels of 250 feet; we should not count, however, on more than 20 of the ordinary sizes or 40 per month; by leaving space between the steamers outside berths would be available, and 60 might be accommodated though not well; we have then the frontage, which would accommodate 14 per month more at certain seasons of the year. This would supply accommodation for all our present trade which can be expected to use the docks, except perhaps for a month or two just before the monsoon. As ships with timber, with coal for the P. and O. and B. I. S. N. Companies, with coal and material for the B. B. and C. I. Railway, in all about

* All these lengths are "over-all," that is, the lengths of the berths the steamers will require in the dock.

100,000 tons will not use the dock—certainly not at first—the whole of the trade wishing to use the docks would probably be accomodated.

7. The large dock has other advantages:—

1.—It will allow ample room for cargoes of different goods to be landed at different parts of the dock, so that one will not injure the other.

2.—It will allow ample room to handle a ship in time of fire, and thus allow a more favourable rate of insurance.

3.—It will be large enough to receive steamers immediately on arrival, letting them lie in the middle of the dock, if necessary, until a berth be ready.

4.—It leaves the present trade in Musjid Bunder uninterfered with while the dock is being built.

5.—It will tend to bring the land estate of the Trust into demand, and greatly increase its value.

8. These advantages seem to me conclusive in its favour, if it can be shown that the interest on the expenditure to build the Elphinstone Dock will be covered. I think there can be no doubt of this.

The cost of the Elphinstone Dock, with its frontage and its channels, will be Rs. 55,00,000,* the interest on which at 4% will be	Rs.	2,20,000

Taking as a basis the low data on which the figures of the Committee are based—

500 ships out of a total of 713 entered the ports in 1872 will give an income of	Rs.	6,00,000
350 ships or half the total number will give	„	4,20,000
350 ships (half the number) at Re. 1 instead of Rs. 1½ per ton for cargo will give	„	3,50,000
350 ships (half the number) at 10 annas (half the rate calculated on by the Committee) will give ...	„	2,36,000
200 ships (a little more than one-fourth our shipping) at the proposed rate of 1½	„	2,40,000
The P. and O. and B. I. S. N. Companies alone will pay an income of	„	3,18,000

If we take the Steam Trade alone, we have the following figures:—

Taking arrivals of canal steamers on basis of last year we shall have a total of 391 steamers. On the Committee's data, which is very low for steam alone, we should have an income from steamers:		
391 (or all) will pay	Rs.	4,69,200
195 (or half) will pay	„	2,34,600
But the cargo of steamers in and out ought to be placed at 2,000 tons at the very least; many will bring and take double that; on this basis 391 steamers will pay	„	6,45,000
Throwing out the P. and O. Company and the B. I. S. N. Company, and taking only the canal steamers at 1,200 tons register and 2,000 tons cargo—a low estimate for both out and in, we have 131 steamers† paying ...	„	2,20,000
If we take the P. and O. and the B. I. S. N. Companies alone, leaving out from the latter their small steamers running to Kurrachee and the Persian Gulf, and putting the cargoes on actual amounts carried, we shall have an income of	„	2,47,575

All the above figures are net 40 per cent. for expenses having been deducted.

9. When the income from our two large Mail Companies, the representatives of both of which have expressed a wish for docks, and a determination to use them if made, will be more than enough to pay the interest on the cost, and in addition we have a large fleet of steamers coming to the port, whose interest it must be to use the docks; it seems to me as sure as anything in this world can be, that an income sufficient to cover interest on the expenditure can be depended on.

10. As compared with the proposal of the minority, this scheme gives ample facilities for the trade which that does not. It further gives a better promise of an income on the cost of 55 lakhs than the Musjid Dock scheme gives of an income on 30 lakhs, while the former, if a success, will pay a very handsome profit; the latter can never bring in much more than a fair interest. Again, if the small dock be made and proves a benefit to trade, we must wait seven years longer for the completion of the Elphinstone Dock, or 11 to 12 years from the present time before the trade can be accommodated, whereas by the present proposal the trade in seven years will have full accomodation.

11. As compared with the proposal of the majority, it gives all the facilities of that, excepting as regards the native craft, while it saves 30 lakhs in expenditure; it gives too the same advantage to the value of the land estate of the Trust, which the execution of the full scheme would do and without any unnecessary expense. It seems unwise to ask Government for the whole 87 lakhs unless it is necessary, or unless the return on the larger sum will be greater than on the 55. The reverse will, in my opinion, be the case.

* I have deducted from Mr. Ormiston's estimate Rs. 3,00,000 for sheds and Rs. 50,000 for shears, both of which should pay for themselves and not be a charge on the dock—3,50,000 + 10% + 7% = 4,11,950. Rs. 58,64,530—4,11,950 = Rs. 54,52,580, say 55 lakhs. It must be remembered too that of the 55 lakhs 10 will be spent in cranes, &c., which will not be wanted till the dock is completed, when we shall pay interest; only 45 lakhs, therefore, will be asked of the Government of India as a loan without interest.

† That is three per month less than the Musjid Dock would accommodate.

12. The Government of India in its Resolution of 1st July 1873 states that it does not expect a certainty of the interest being covered, but it wishes to be approximately safe; I cannot help believing that the above figures will be more than satisfactory. It further expresses a preference to not carrying out the whole scheme at first; here too the proposal I make will accord, I think, with its views; to be sure we shall be spending nearly two-thirds of the cost of the whole scheme, but surely it is better to spend two-thirds with a certainty of payment of interest and a probability of a handsome increase than one-third with only the probability of the interest being paid and no opportunity of development, except by waiting seven years longer for the construction of the whole work at a further expenditure of the whole balance of the original sum.

13. I do not therefore agree with the minority or the majority of the Trustees; in the one case we should spend 30 lakhs for what will not begin to accomodate the trade, and we shall be under the necessity of taking seven years more and of spending 55 lakhs more to give proper dock accommodation, and when the 85 lakhs and eleven years are spent, we shall be no better off than we shall be at the end of seven years if we spend 55 lakhs now. Furthermore, the probability of the Elphinstone Dock paying interest on its cost is greater than of the Musjid paying on the smaller cost, as the very limited accommodation of the latter will prevent owners and charterers from calculating on dock accommodation.

14. The scheme proposed by the majority of the Committee if carried out will probably pay interest, but it will not, in my opinion, pay so well as the Elphinstone Dock alone, as the Musjid Basin will only be used by coasting steamers and large native craft; in regard to the former we shall have the Sassoon Dock competing with us, and in regard to the latter we shall have a great deal of prejudice to overcome besides competition to meet. I think the native craft can well afford to wait for basin accommodation, which will cost 30 lakhs, especially as they will probably keep the basin waiting many years before they abandon the ways of their ancestors and make use of it, however great the advantage which may be demonstrated to them. It seems therefore unwise to spend 87 lakhs if an expenditure of 55 will accommodate the foreign trade of the port, which is the trade to which we must chiefly look for an income. Furthermore, there are objections to a basin where there is such a rise and fall of the tide as in this harbour. The continual changing of the position of the ship and the increased labour of raising the goods at low tide are strong arguments against basins where docks can be made.

15. On the sanitary question I fully concur with the views of the majority of the Committee, and I do not fear the channel, especially as with half the vessels using the dock we have a large margin for extensive dredging if it should prove necessary. Further, remembering that two crores have already been spent on the Elphinstone property, the interest of which is a very heavy burden on the trade, for which it has received no equivalent, I would risk the loss of the whole 55 lakhs rather than do nothing to improve the property, or rather than spend 30 lakhs in building a little dock to hold a few vessels only, and which will not improve the land estate to any considerable extent. The risk is a minimum, the probability is a large income from the dock, and a vast increase to the value of the land estate; and if the worst happens, and the dock is a nuisance, and the channel a failure, we shall have only thrown away 55 lakhs in honest efforts to improve a property on which two crores had already been thrown away.

16. We cannot spend any money to make the estate remunerative without some risk, but the minimum of risk and the maximum of promise is gained, I think, by the building of the Elphinstone Dock.

GEO. A. KITTREDGE.

Bombay, 7th November 1873.

Memorandum on the Financial aspect of the Dock question by Colonel M. K. Kennedy, R. E., Secretary to the Government of Bombay, Public Works Department.

FINANCIAL.

I pass over the question of Piers. While such constructions have the merit of cheapness and comparative rapidity of construction, there are counterbalancing disadvantages which, I think, put them out of the calculation as the means of dealing with a large trade in this harbour.

2. It remains, therefore, to consider wet docks and tidal basins, and the proposals for such works put forward by the Port Trust.

3. These proposals are to construct a wet dock with a water area of 29 acres and a tidal basin with an arrea of 9 acres, the former to impound a column of water of 24 feet and the latter to be dredged to 14 feet under low water. The channels to be dredged to 12 feet under low water extreme springs, or to the level of the dock sill.

4. It is not proposed, at present, to undertake the larger or Elphinstone channel, but to depend on the smaller, Moody or lateral, channel for access to the dock and basin, and this coupled with the fact that the channel and basins will not be placed so low, by 8 feet, as in the first scheme that was discussed (*i. e.*, that for tidal basins), is so far satisfactory that it will do away, in a great measure, with objections that have been raised in regard to the difficulty of forming and of maintaining deep depressions in soft mud bottom of this harbour.

5. The cost of this scheme is estimated at £852,064; £796,322 for the works, and 7 per cent. on this amount, *i. e.*, £55,742. for establishments.

6. This sum does not, however, include interest during construction, which, in the terms of letter No. 2C., dated 2nd December 1872, must be added. Correcting this omission, the total capital amount on which interest would have to be paid on the completion of the works, would be £974,490*; and it is, therefore, on this sum that in the terms of the above quoted letter from the Government of India the Port Trust would have to pay interest at 4½ per cent., and for the provision of which the Government of Bombay would be required to bind itself, "to impose on the shipping and trade such charges for the use of the docks not exceeding "a maximum as will ensure an income sufficient to provide for the working expenses, and for "all interest."

7. It may be assumed, for the purposes of these calculations, that the estimate framed is a correct one, though, if the financial results obtained on this basis are considered provisionally satisfactory, it will be necessary that Government, who will, in point of fact, take up on itself all responsibility for these extensive works, should for its own protection take steps to examine very carefully the professional details of the designs and estimate with a view to satisfying itself that the calculations are neither in excess or deficit of what is really needed.

8. Working with these figures, the Port Trust, by a simple and short calculation, arrive at a result that shows a net revenue earning sufficient to pay 4½ per cent. on a capital sum of £1,453,333, that is, on a sum, £601, 269, in excess of the capital they estimate will be required for the works they propose; in other words they calculate that about 7⅔ per cent. will be earned by these works instead of 4½ per cent., the minimum return required.

9. In the first place I am somewhat doubtful whether the estimate for establishment is sufficient at 7 per cent. Colonel O'Connel, R. E., in his memoraudum to the Government of India, dated 12th May 1873, calculates this item at 25 per cent. This is no doubt greatly too much, but perhaps it would not be safe to take less than 10 per cent.; this would increase the estimate to £875,954, and adding interest during construction, the capital sum would be raised to £998,380, or, in round numbers, to a million sterling.

10. The revenue earnings are calculated on the assumption that 545 vessels, of one thousand tons each, will be dealt with annually in the docks, and that each vessel will pay £120 dock charges. The sum of £120 is arrived at by a charge of 2*s.* 6*d.* on each ton of cargo landed and shipped on the dock wharves, calculating 700 tons to each 1,000 tons of register, and 6*d.* on each ton of register in addition as dock dues.

11. There appears to be no objection to these rates, but as regards the deduction of 40 per cent. for working expenses, I think it will be found insufficient if, as I believe to be the case, and as I shall endeavour to show is probable, so many ships as the Port Trust calculate on will not use the docks. I shall allude to this point further on.

12. 545 thousand ton vessels, the number calculated on by the Trust, represent very nearly the whole export and import trade of the Port in square-rigged vessels, except the tonnage due to forty such vessels, which, it is estimated, will use the Sassoon's Dock, and 15 deducted "for those months in the year in which fewer vessels enter the Port than the proposed "dock and basin would accommodate" (*vide* para. 20 of the Report).

13. The total tonnage of the Port, exports and imports, carried in square-rigged vessels, amounts, according to the Port Trust Committee's report, to 855,649 tons, and I think it is an error to assume that very nearly the whole of this will make use of docks. A large deduction must, I believe, be made for certain classes of cargo.

14. Of the tonnage above mentioned, 178,477 consisted of coal imports, very little of which will probably be landed in dock.

15. The Great Indian Peninsula Railway alone imported 97,610 tons of coal. They have their own basins, wharves, and storage ground, and as they could reckon on landing and stacking their coal on their own premises for 12 annas per ton (the charge at present is only 10 annas exclusive of an allowance for wastage), it is not likely they would, if they could avoid it, incur loss by paying Rs. 1-4-0 per ton for landing their coal in the dock, from whence they would have to incur additional outlay for conveying it to their own premises.

16. The same argument applies with even greater force to the Bombay, Baroda, and Central India Railway Company, which imported 5,679 tons of coal, their wharves being at a greater distance.

17. The Government coal, which amounted to 6,357 tons, could not be landed in dock, and from thence conveyed to the depôt on the Apollo Reclamation without considerable loss; and the large quantity of coal which goes to the Frere Land Company's wharves, 30,000 tons, and which is required chiefly for the spinning mills in the northern part of the island, would still go there direct from the ship's side, and would not be landed in dock at a clear loss.

18. Coal is not, moreover, a desirable article to deal with on wharves used for general cargoes, and objections to large quantities of it might be raised on that score.

19. Taking all these circumstances into consideration, it would be a very liberal estimate to calculate on half the total imports of coal being landed in dock, or say 89,238 tons.

20. The timber imports amounted to 22,507 tons, and none of it would obviously be landed in dock.

---

* The sum that would be due for interest at 4½ per cent. has been kindly calculated for me by Mr. Ormiston, on the basis that the Elphinstone Dock will take 7 years to complete, and the Musjeed Basin 4 years, and that the latter will earn revenue as soon as finished; the sum amounts to £122,426.

21. The grain (rice) imports amount to 85,000 tons, and I have reason to believe that very little of this would use the docks.

22. The rice is brought from Calcutta, Burmah, &c., in sailing ships, under insurance against total loss only, and not against any risk short of that, either on the voyage or in landing. It is a description of cargo easily handled, and is consigned almost exclusively to native merchants, who have their own arrangements for landing and shipping. The vessels that bring it either fill up with salt, which they can do with facility in the stream, or "go seeking" in ballast, and in the majority of cases there would be no inducement, but the contrary, to docking.

23. A good deal of grain is also transhipped in the harbour, and the only vessels carrying grain that could be at all depended on to use the dock are such steam vessels as arrive with general cargoes through the Canal, and which might make a trip to fetch grain while a cargo of cotton is being got ready for them. These cases are not frequent, but, as in the case of coal, I will suppose that half the imports, or 42,500 tons of grain, will be landed on the dock wharves.

24. The same remarks will apply to sugar imported from the Mauritius, &c., according to the return, 16,820 tons, and I will take the same proportion, or 8,410 tons.

25. Even if ships carrying this class of goods, *i. e.*, coal, grain, and sugar should be compelled to go into dock, it is probable that it would be found that consignees would prefer to land the cargoes in boats to putting them on the dock wharves, and the same remarks would apply to cotton exports. If all the cotton, or the great bulk of it, is pressed at Colaba, it would be more to the advantage of the shippers to convey it by water to the dock, rather than to cart it by land.

26. It is the custom in London and elsewhere not to charge dock-rates on goods landed or shipped in boats or lighters, and if a contrary course were pursued here the portion of the trade so dealt with would have to bear a burden which ought not to be put upon it, and which it would not willingly or contentedly endure. The result of any attempt to levy charges on goods not landed or shipped over the dock wharves would probably be to keep a good deal of the shipping out of the dock.

27. Another point that bears upon the question of the use of docks by the entire trade is the delay that frequently occurs in filling up with cotton, the staple article of export. A ship has often to wait a long time for cargo, and the stowage is a slow process, as the bales have to be carefully packed and pressed into the vessel, and ships, independent of other circumstances, might, and I believe often would, prefer to lie in the stream rather than undergo a long detention in dock.

28. Applying the above deductions, the following result is obtained:—

Deduct—

	Tons.
For Coal imports	89,238
„ Timber „	22,507
„ Grain „	42,500
„ Sugar „	8,410
Total Tons ...	162,655

Representing about 230 ships of 1,000 tons register each that would not, in all probability, go into dock to unload, and would not be likely, therefore, to go into dock to load. Deducting this number from 600, the total number of vessels calculated on by the Trust Committee, there will remain 370 that would use docks, and reducing this number for the shipping that would resort to the Sassoon Docks, &c. (*vide* paragraph 20 of the report), the number of ships that would be dealt with in the Port Trust's docks would be 336, which, at £120 each, would represent a revenue of £40,320, while the sum required to pay interest at 4½ per cent. on £974,490 is £43,832. I calculate, therefore, that if the Dock Committee's scheme be carried out, there would be, *at least*, a deficit of £3,512.

29. I say at least because, looking to the low rates of boat charges that prevail, and are likely to prevail, as compared with the proposed dock rates, I believe that the number of vessels I have taken is a maximum, and because I think a still further deduction on account of working expenses must be made. A very large portion of such expenses would be on account of dredging basins and channels, and would remain the same, whatever the number of ships using the docks might be. If, then, 40 per cent. is a right calculation, when 545 ships are dealt with, it must be too small when the calculation only affects 336 ships.

30. In dealing with a question of this important character involving an outlay of nearly one million sterling, for which the Government would be alone responsible, caution is, I think, necessary in considering propositions which emanate from those who have all to gain, in many ways, and nothing to lose. It is right in such a matter to take full estimates of outlay and safe estimates of returns, and, adopting this principle, the conclusion that I have come to is, that the scheme put forward by the Trust will not fulfil the condition imposed by the Government of India in their letter of the 2nd December 1872; that there should be good reason to believe "that the works, when completed, will ensure a sufficient income to meet all working expenses and interest on the cost of construction, and of the additional capital involved in the postponement of interest during construction."

31. I have thus far been dealing with the proposals made by the majority of the Port Trust Committee on Wet Docks, such proposals having been endorsed by a small majority of the whole body of the Trustees.

32. Of this Committee, however, the two official members, one of whom is the Chairman of the Trust, have recorded their dissent from the course of action proposed; and the Honorable Mr. Revenscroft, a Trustee, has put in a strong protest against the conclusion arrived at by the Trust.

33. This Protest is chiefly directed to the sanitary aspect of the question, which I shall notice in greater detail in another memorandum, but it also expresses a strong doubt as to the soundness of calculations of the majority of the Dock Committee as regards the estimated revenue of the works; this doubt I have, I think, above shown to be well founded.

34. Mr. Ravenscroft does not, however, raise such strong objections to the plan proposed by the minority of the Dock Committee, and his reasons appear to be that, should the measure they suggest be attended with any sanitary evils a remedy could be applied without financial ruin.

35. It now, therefore, remains to consider the modifications of the whole scheme advocated by the dissentients—Colonels Ballard and Hancock.

36. These gentlemen propose that the Elphinstone Dock shall not be undertaken at all at present, and that the Musjid Basin shall be converted into a wet dock,—the cost of the work, including channels, is stated to be about £300,000.

37. This dock would accommodate 24 ships at the same time, and as it is calculated in the Committee's Report that the detention of a ship in dock would vary from 21 to 30 days, the accommodation would be sufficient for the number of ships, 336, which I have estimated above would annually use a dock.

38. If, as was done in the case of the larger scheme, interest on capital during construction be added to the £300,000 the Musjid Dock is calculated to cost, the capital on which interest would be payable would be raised to £328,000. To pay this, the dock would have to earn a revenue of £14,760, and I have shown above that it is probable that a maximum revenue of £40,320 would be available. The work that the Members of the Committee who dissent propose would be likely, therefore, to be a financial success.

39. The result on the basis I have calculated would probably be still more favorable, as the working expenses in a smaller dock, and with a shorter channel, ought to be less than those estimated for the more extensive work at 40 per cent.

40. The course advocated by the minority of the Dock Committee is very much in accord with that suggested by the Government of India in their Resolution No. 279—83 B. C. of the 1st July 1873, in the following words:—

> "It is at the same time here suggested that it would be desirable, if possible, to execute at first a portion of a large scheme so as to judge of the probable results before the outlay has been incurred,"

and I fully endorse the opinion expressed in the last paragraph of the dissent, that were these works projected by a private Company, the prudent course suggested by the dissentients is that which would probably be adopted.

41. It is a very strong point in favor of the dissent that if it were hereafter found that closed docks were objectionable on sanitary grounds, the smaller, or Musjid Dock, could be conveniently converted into a tidal basin, while it would not be so in the case of the Elphinstone Dock, as so great an area of shallow basin as the latter would afford is not needed by the trade. As Mr. Ravenscroft puts it in the case of the Musjid Dock, the remedy for any sanitary failure could be applied without financial ruin, and a like change could not be applied in the case of the Elphinstone Dock without financial ruin.

42. There is, however, another very serious practical objection to proceeding with the larger scheme at once, which demands the most careful consideration. What is to become of the large trade now transacted at the Elphinstone Bunder while the work is in progress? This trade would either be driven away to other competing wharves, those of the Colaba, Mazagon, Frere Companies, &c., involving an immediate loss of revenue, or a large preliminary outlay would have to be incurred in adapting Moody Bay to receive it, thus adding to the capital involved in the project.

43. I think, too, that the project, as it stands, is incomplete in two essential particulars:—

1*st*.—A sufficient provison for sheds and warehouses has not been made; and

2*nd*.—There is no provision for seamen's barracks or hulks.

44. On the first point, I believe, it would greatly contribute to the success of docks, if it is not essential to their extensive use by the trade, that there should be ample storage room, so that the docks might be able to compete, as they would certainly have to do, with the vested interests in landing and shipping, by means of boats which would endeavour in every way to underbid the docks in dealing with the trade. And on the 2nd point the weight of opinion goes to show that the crews of vessels ought not to be kept for so long a period as from 21 to 30 days living on board ships in a closed dock.

45. What the addition to the cost of the scheme would be in respect to these two arrangements I am not prepared, at present, to say, but it would be considerable.

46. The conclusions to which I arrive, therefore, are:—

1*st*.—That a case has not been made out for the entire scheme endorsed by the Port Trust, and that that scheme ought not, therefore, to be encouraged by Government.

2*nd*.—That setting aside the idea of sanitary risk, which I will refer to in another paper, to which I solicit particular attention, the smaller scheme proposed in the dissent might be undertaken without financial risk. The true and most prudent policy in this, and in similar cases, I believe to be to proceed tentatively, to provide only for certain and well-ascertained demands, and not for wants which have not fully developed themselves, and which may never arise.

M. K. KENNEDY, *Colonel*, R. E.,
Secretary to Government.

12*th November* 1873.

Report as to whether the construction of a Wet Dock on the Elphinstone Estate will injuriously affect the health of Sailors, and others frequenting it, and whether it will affect the Town generally.

Writing upon the proposed Elphinstone Dock, Mr. Ravenscroft says: "I have carefully read and considered much that has been recorded on this subject, and have discussed the matter with those on whose judgment I place reliance. After fully weighing all that can be urged on both sides, I desire to place on record that if the scheme as sanctioned by the Trustees yesterday be carried out, the results will, in my opinion, be most disastrous to the health, not only of the sailors and others frequenting the Dock, but to the health of the Town, and Island of Bombay generally."

Letter dated October 17th, 1873, to Officiating Secretary of Port Trust.

2. The points here raised are—

a.—Will the Dock affect injuriously those who frequent it?
b.—Will it affect the Town generally?
c.—Will it be affected by the Town?

3. As Mr. Ravenscroft's conclusions are in part based upon what is recorded in the papers forwarded with your memo. No. 645-A., dated 6th November 1873, I must deal with them in detail. I too have read them very carefully, and very carefully have I thought over the matter in its sanitary bearings. I have not discussed it, because those with whom I would discuss it are already committed to their respective opinions, and what these opinions are I gather from the records.

1. Report of the Committee appointed by Government to consider the subject of Wet Docks for Bombay, 1867.
2. Copy of the Report of the Committee appointed to consider the various proposals for providing deep water berthing for vessels by means of Docks or Piers, dated 29th September 1873.
3. Copy of dissent from the report signed by Colonels Ballard and Hancock, dated 2nd October 1873.
4. Copy of letter from the Officiating Chief Engineer addressed to the Trustees, No. 55-6, dated 23rd August, and No. 92-6, dated 19th September 1873.
5. Report of the Medical Committee, dated 7th November 1873.

4. In 1867 there was a project for wet docks at Mody Bay, and Government then appointed a Committee to report upon it. Of the eleven members five were in favour of it, whilst six were against it. The subject was exhaustively treated, a mass of evidence was taken, and both advocates and dissentients submitted their report.

For.	*Against.*
Mr. Bellasis.	Colonel DeLisle, R. E.
Major-General Rivers, R. E.	Mr. Bogie.
Captain Henry.	Captain Methven.
Mr. A. D. Grant.	Mr. Currey.
Mr. Russel Aitken, C. E.	Mr. Browne.
	Mr. Adams.

5. As the Mody Bay estate is only separated from the Elphinstone estate by an ordinary boat basin, it may fairly be granted that, as regards sanitation, what has been said of the one will apply to the other, and the first record to be examined is the Report of 1867.

6. In this double report, and in the evidence then taken, there are many conjectures as to how the crews of vessels would be affected by the dock, and how the dock would be affected by the town, but nowhere do any of the witnesses hint, even remotely, that the town would be affected by the dock.

7. In para. 44 of the report by the dissentients, it is said that when the land breezes blow, the dock would be to windward of the native town (formerly in the Fort), and that consequently the inhabitants would "be affected by any bad smells that would probably arise from the still water in the dock."

8. This is the one allusion, and I only quote it as touching the question, but not affecting it, for it is not at all clear that the water will be "*still*," nor is it a necessary consequence that there should be bad smells, and that they should affect the inhabitants of the native town. Time was when they were affected, and very grievously. Time was when the whole of the eastern foreshore was a public necessary, when night-soil was brought to it, when drains discharged on it. At each receding tide there were exposed hundreds of thousands of square yards of foul and fœtid mud, and one can understand how, under a burning sun, this became a very hotbed of disease, and how towards early morning there was an established intake to replace the warmer air of pent up streets and gullies.

9. But now how great is the change. Practically there is no foreshore—it has been reclaimed, and where all was filth there is now a well-ordered well-drained estate of 328 acres.

The proposed site for a dock of some 30 acres is on the farther side of this estate; it will be about half a mile from the town, here bounded by the railway. The direction is one from which the wind but blows for a minimum period, and very special arrangements are to be made for its conservancy; so, under these circumstances, I am of opinion that *it will not in any way affect the health of the town generally.*

10. Will it be affected by the town? On this point Mr. Hewlett says: "I do not think it would be advisable for seamen to live in barracks on the sea wall of the proposed dock. The site is too near the native town, and the prevailing wind, which blows over both, would bring the fever poison from the latter into the proposed barracks."

Committee Proceedings for 1867, p. 19.

11. The site here spoken of is one about half a mile to the south of that now proposed, and presumably the "*fever poison*" is that specific something which is associated with our REMITTENTS. In 1867, both within and without the town there were real and unmistakeable sources of danger. Without there was still unreclaimed a wide expanse of filthy foreshore, and within there were conditions which would almost seem to be constant, for now, in 1873, they are but little changed. They are cited by Mr. Hewlett at page 72 of his last annual report as causes of our endemic fever—"*excessive overcrowding * * * in badly constructed houses without any proper ventilation,*" and almost in the same words Dr. Buchanan gives precisely similar conditions—the same except in temperature—as causes of typhus: "*overcrowding of dwelling houses on too limited area—overcrowding of rooms by too many occupants—bad ventilation of streets and houses—domestic and personal dirtiness.*"

Reynold's vol. 1, p. 528.

12. Typhus is happily a disease of the colder climates, but have we not its analogue, and have we not a yet worse evil—Typhoid? We have our poisons, but whatever their nature—whether paludal—or from over-crowding—or from sewage—are we warranted in saying they are influenced by the prevailing wind? The eastern and leeward limit is now one of the busiest quarters—perhaps the busiest, and yet there is no hint that it is touched by fever poison from the town, nor do its denizens suffer in any marked degree, whilst at intermediate points there has been a lower death-rate from fever than on the extreme west where the sea breeze first strikes the land.

13. Although within the native town there are many and great elements of danger, *there are not, in my opinion, any grounds for apprehending that they will in any way affect the proposed dock.*

14. The last question is—Will the dock affect the health of the sailors and others frequenting it? As regards this point, very much depends upon those to whom will be entrusted the management of detailed arrangements. With the medical evidence I am singularly unfortunate, for, to almost the whole of it, I am in opposition, but perhaps after all the difference is more nominal than real. Mr. Hewlett says: "There would necessarily be impurities from the enclosed water which would be injurious to health * * * and it stands to reason that, as the sewage and kitchen refuse would be deposited in the mud at the bottom of the dock, the enclosed water would inevitably be rendered offensive. Even if arrangements could be made to prevent night-soil and other refuse from passing into the dock by providing the men with cooking and other accommodation on shore, I think the impounded water would still be detrimental to health, for no precautions would suffice to keep out organic matter which would drop in on the removal of cargo, and otherwise."

Committee Proceedings for 1867, p. 18.

15. Now here it is *assumed* that "*necessarily*" there would be impurities, and that they would be detrimental to health—but why *necessarily?* and at what stage of impurity is dock water detrimental? It is said that the water will be offensive *because* sewage and kitchen refuse will be deposited on the mud cushion, but will they be so deposited? Any one, or all, of these things *may* happen; they are possibilities, but not probabilities if ordinary precautions be observed.

16. In the same way Dr. Broughton says it would be prejudicial to the health of the seamen to live on boardships in the proposed docks, because ventilation would be interfered with, and the salt water would *necessarily* become impure, and give rise to pestilence in a hot climate. He goes on to say "if the water remained unchanged for more than five days it would be offensive. I found my opinion on experience acquired in keeping marine aquaria both at home and here. It would be necessary to provide for the entire removal of the water every fifth day; it would be of no use allowing a portion of the stagnant water to run out daily, its place being supplied with fresh; that would I think do more harm than good."

Page 22.

17. It is here *assumed* that ventilation will be interfered with, but will it? If the purity of the water be an object, it is not at all clear how the lessening its impurity by the daily admixture of fresh, and presumably cleaner water, would "do more harm than good." In marine aquaria even it is hard to see how this can be, but if it is so, it by no means follows that there would be a like result in a dock of 30 acres.

18. Dr. Reynolds, too, *assumes* that the surface drainage will, "of course, be emptied into the dock, and the organic matter and other filth thus deposited would rot and be a fruitful source of sickness.

Page 28.

In Dr. Dymock's evidence he instances the case of the "Endymion" in the Government dry dock. Amongst the crew of this one vessel there were 136 cases of fever, and he says: It could not have been due to exposure, because the men who stayed in the dock at night got fever, and those who

Page 33.

worked in the dock in the day only did not suffer." This is so far important, that it seems to establish the proposition that men are not likely to suffer from ordinary exposure during working hours, for if there were no untoward consequences in the pent-up Government dock—shut in by high walls and lofty buildings—it follows *a fortiori*, that there will be none at the comparatively open site now proposed. Had those who slept in the dock escaped scot-free it would have been a marvel, but that they were struck down will surprise no one who knows what are the local conditions. It is a fact that the Dockyard has been reported over and over again as a very hot bed of fever, and without a doubt the cause is the want of ventilation—impeded by the western wall and buildings—and the inconceivably filthy condition of the Custom House basin. This plague spot is almost the last remnant of the old offensive foreshore, and as though its natural and acquired impurities were not sufficient, a portion of the Fort sewage is discharged on to it. It is this basin to which the dissentients allude in paragraph 44 of their report when they say: "Have these gentlemen (the advocates) ever visited the Custom House basin at low tide when the mud is exposed? Mud of precisely the same kind will be found at the bottom of their dock, and will certainly not conduce to sweeten the still water above it." Now, seeing that that basin is exposed at low tide, that it is then used very largely as a public necessary, and that no inconsiderable portion of the Fort sewage is run on to it, it is palpably unfair to say that the bottom of the dock would be in the same disgusting condition.

19. I have asked why *necessarily* there should be impurities in the dock water, and this leads to a consideration of the provisions for changing it. The evidence quoted is that on Mr. Russell Aitkin's scheme, and he says—"For changing the water there would be sluices. About eighteen inches would be changed at every tide, except at dead neap tides, when about half that quantity only could be changed. A body of water equal to that withdrawn would be let in daily. The water would be totally changed in about ten days." Now dividing the dock into horizontal strata, each 18 inches deep, it is obvious that, by this arrangement, the two lowermost strata would have been changed every day. There would have come in a fresh supply of 3 feet of water per diem over a surface of 26 acres, in addition there would have been constant movement by haulage, and yet the term "stagnant" has been used. In saying that the water would have been totally changed in about ten days, it was never meant that for ten days a given amount was to have been impounded, and that then it was all to have been replaced all at once. Within 12 hours of the dock gates having been closed the change would have commenced, and it would have gone on *de die in diem* until it was complete. This was Mr. Aitkin's scheme, and I really cannot see that it would have proved injurious to health.

Page 28.

20. Mr. Ormiston's scheme is that about which Mr. Ravenscroft has expressed his misgivings, but, with all deference, I can see in it neither risk nor danger. It is full early yet to think of what will be the shore arrangements, but very certain is it that, long before the dock is ready, they will have been elaborated, and up to date, so all we need look to now is the provision for changing the impounded water. Obviously the first requirement is a pure source of supply from without, and fortunately the general purity of the harbour water admits of absolute and direct proof. It is a fact, that, in Bombay Harbour, in addition to the ordinary semi-diurnal tides, there is one which is diurnal, and its influence is special and peculiar. It is a fact that here there are constant differences in the respective heights of the two morning and evening tides, and, as Mr. Ormiston has pointed out, "there is a total change of about 10 per cent. of the whole contents of the harbour every day." He gives the following "day's action of the tide taken almost at random:—

1871. 10th January.	L. W. 4·53 A. M.	3 feet 4	under M. S. L.
	H. W. 10 32 A. M.	5 feet	above M. S. L.
	L. W. 4·56 P. M.	8 feet 1	under M. S. L.
	H. W. 11·42 P. M.	7 feet 9	above M. S. L.

Suppose we take the average depth of the harbour to be 30 feet at mean sea level, and the bottom as zero, the column of water would have been at

L. W. 4·53 A. M.	26′ 8″	
		rise 8′ 4″
H. W. 10·32 A. M.	35′ 0″	
		fall 14′ 1″
L. W. 4·56 P. M.	20′ 11″	
		rise 16′ 10″
H. W. 11·42 P. M.	37′ 9″	

This table shows that all the water that came in on the morning's flood went out on the ebb, and 5 feet 9 inches more of what was previously in the harbour, so that one-fifth of the whole was sent clean out to sea. Again, the afternoon flood brought in 2 feet 9 inches of fresh water from the sea beyond what went out on the previous ebb."

21. Here is absolute proof of complete interchange between the sea and the harbour—and what is Mr. Ormiston's provision for interchange between the harbour and the dock? With every tide there will be some change—varying from a few inches to 8 feet or more—and it will be total and complete every third or sixth day. Taking the very worst month in all the year, the whole of the water will have been changed eleven times over.

Very clearly is this explained by Mr. Ormiston where he says: "The depth of water required to be impounded will seldom exceed 24 feet, and generally 22 feet will be sufficient. The difference between the level of the tide of the day and of the dock level will change the contents of the dock to the extent described in the next para."

Letter No. 92-6 to Port Trust, dated 19th September 1873.

17. "I will, in the first place, speak of the tide at the equinoxes, and take the month of March as an example. If the gates be closed so as to impound 24 feet, the heights to which the tides of that month rise above the dock water level would, if accumulated, be 152 feet, a quantity of water which would replace the whole quantity in the dock six times over, or an average of once every five days; on the springs, moreover, a complete change would be effected in three and half days. If the tide was allowed to ebb to mean water level before the gates were closed, the depth of water impounded would be 22 feet. This would increase the surplus tidal column to 267 feet; the dock would be changed 12 times in the month, and at springs in less than two days.

"As an example of the tides between the equinoxes, I take the month of July 1872: Taking 24 feet as the depth impounded, the surplus column of tidal water would be 131 feet, which would fill the dock five times over, and change the whole every six days; moreover, at the springs the change would be effected in three days. If the depth impounded in the dock be 22 feet, the surplus column would be increased to 247 feet. The change would be effected eleven times in the month, and at the springs, in four successive days, the contents would be changed twice.

18. "It must be remembered that it is not the surface water only, but the whole column which is on the move right down to the bottom. The current in the dock will be a slow one no doubt, insufficient to scour the bottom, but sufficiently on the move to prevent the water becoming stagnant."

It is also pointed out that, by impounding a high spring tide, two or three hundred thousand tons of water would be available for flushing the drains on the Elphinstone estate, there being a sufficient head at low water to clear them out thoroughly. Mr. Hewlett says in his evidence that Dr. Leith interdicted the use of salt water for the flushing of drains; but upon this point let me mention that some time ago I sent to one of the highest sanitary authorities at Home the following question—"From a purely sanitary point of view is there any objection to the use of sea water for street watering, and if there is, why is it objectionable?" The answer was "There is no objection whatever to the use of sea water, or still better brackish water, for street wattering. There may be risk if sea water is discharged on putrescing organic matter, from the more rapid decomposition, but where streets or roads are cleansed properly, there is no danger." Evidently the risk is in allowing putrescing organic matter to remain *in situ* after having been wetted with sea water, and without a doubt it would be wrong to pass driblets of salt water into badly constructed drains to lodge and permeate, but the drains on the Elphinstone estate are recent and well laid, so the mass of water sent through them would perforce carry all before it. In Mr. Ormiston's proposals there is no theory but all is hard incontrovertible fact, and in addition to the certainty of interchange, there is also the certainty that, long before the dock is ready, there will be ready for it a well-devised scheme of sanitation.

Page 19.

The medical opinions expressed in the report submitted on the 7th of last month have my entire concurrence, so I need not here go through them, and, so far from sharing Mr. Ravenscroft's forebodings, my firm conviction is, that,—

1. The dock will, in no way, injuriously affect the health of the sailors and others frequenting it.
2. It will, in no way, affect the town generally.
3. It will not, under ordinary conditions, be affected by the town.

JOHN LUMSDAINE,
Sanitary Commissioner.

Bombay, 19*th December* 1873.

No. 41 C-B, dated 28th January 1874.

From—The Secretary to the Government of India, P. W. DEPT.
To—The Secretary to the Government of Bombay, Marine Dept.

I am directed to acknowledge receipt of your letter No. 1218 of the 8th December 1873, submitting a Resolution by the Government of Bombay and other papers on the subject of the construction of docks on the Elphinstone estate in Bombay, and to reply as follows.

2. His Excellency the Viceroy and some of the Members of the Government of India had the advantage of fully discussing at Agra the proposals of the Port Trust Commissioners with His Excellency the Governor of Bombay and some of the Commissioners and their Engineer. The conclusion then arrived at by His Excellency the Viceroy was that there was a risk, which the Bombay Government did not seem to apprehend, in starting the dock scheme with inadequate accommodation.

3. The majority of the Port Trust Commissioners and especially the mercantile members, who must have the best means of judging on this point, are satisfied that the smaller dock, which the minority of the Trust and the Bombay Government advocate, would not provide sufficient accommodation to

the trade even at first. It seems probable that the majority are right on this point, and, if so, a very serious mistake may be made in adopting an inadequate scheme in the beginning.

4. On considering the matter as submitted by the Bombay Government with their Resolution forwarded with your letter under reply, I am directed to state that the Governor-General in Council, for the resons above stated, considers that the most prudent course to adopt will be to take up the larger of the two schemes contemplated by the Government of Bombay in the concluding paragraph of its Resolution, namely, that suggested by Mr. Kettridge. The Government of India does not apprehend that it will be necessary to increase the Port and dock dues in consequence beyond the maximum provided in the Port Trust Act, as is apparently feared by the Government of Bombay.

5. I am accordingly to request that the Port Trust Commissioners may be authorized to proceed as soon as possible with the Elphinstone basin project at an estimated cost of about £700,000.

6. Instructions will be issued in the Financial Department to provide the necessary funds on loan as promised in Mr. Aitchison's letter of the 2nd December 1872, in such portions as may be required for the due progress of the works; applications should be made from time to time accordingly, the amount of the loan required for this project being shown separately in the annual budget estimates of the Port Trust.

7. To prevent misconception, I am to say that the interest on the loan, while the work is under construction, will not be levied as it falls due, but will be added to the capital debt. To prevent confusion, the account of this special loan of £700,000 should be kept quite distinct from the other loans for works connected with the Port Trust.

Balance expended... 4,640

There was a steady demand for irrigation for sugar-cane and grain crops throughout the canal, except in the Northern Division, where the demand was checked by a fall of rain on the 19th.

Eastern Jumna Canal.—Irrigation is backward in the Meerut District, owing to the ground having retained the moisture of September rains. Elsewhere a good demand prevailed to the end of the month.

Doon Canal.—Demands fair for grain crops.

Traffic.—A steady demand for carriage of grain and cotton to Cawnpore existed throughout the month from Ghats above Allygurh.

The bulk of the grain traffic is from the Meerut District—where 6,000 maunds of grain are reported as awaiting carriage to Cawnpore.

The number of boats on the canal has increased, and more are coming in daily.

The returns show an advance on those for the corresponding month of last year.

Allahabad, The 22nd January 1874.

GOVERNMENT OF INDIA.

DEPARTMENT OF AGRICULTURE, REVENUE AND COMMERCE.

THE FAMINE APPREHENDED IN BENGAL.

Dated India Office, London, the 23rd January 1874.

From—Her Majesty's Secretary of State for India,

To—His Excellency the Right Hon'ble the Governor General of India in Council.

Para. 1. I have had under my consideration in Council your Lordship's further despatches noted in the margin, on the failure of the crops in certain districts of Bengal, on the amount of distress likely to arise in consequence, and on the measures you have been taking to meet it.

No. A, dated 7th Nov. 1873.
„ B, „ 12th „ „
„ 1 C, „ 21st „ „
„ 534 (Financial), 5th Dec. 1873.
„ 2 C, dated 6th Dec. 1873.
„ 15 (Agricultural and Horticultural), 12th Dec. 1873.
„ 17 (ditto), 19th „ „

2. The estimates you have formed of the extent of failure have been founded on very careful inquiry by the officers best acquainted with the affected districts, on personal inspection by your Excellency, and on the able analyses and summaries of evidence which have been furnished by the Lieutenant-Governor of Bengal.

3. The measures you have taken for the mitigation of anticipated distress have been not less carefully concerted with the same authorities, after a minute comparison of the circumstances with those attending other periods of scarcity, and an anxious reference to the special causes which have led to former failures in averting the worst calamities of famine.

4. You inform me in the despatches now under reply that you are taking every precaution which has suggested itself to you and to your officers after this review of the position of affairs, and that, with one exception, you have sanctioned every measure which has been recommended, and have authorized every demand which has been made by the Government of Bengal.

5. The one exceptional measure which you have declined to sanction is that of prohibiting the export of food from the ports of Bengal.

6. In my despatch of December 1st I conveyed to you the approval of Her Majesty's Government of your resolution to abstain from that measure. It seems indeed to have one recommendation not unimportant,—that it would satisfy a considerable amount of Native opinion. I am far from undervaluing this inducement, and it is one which may well prevail in many cases where less serious considerations are involved. But after again weighing carefully the whole case, and the grounds on which you came to your decision, Her Majesty's Government desire to intimate their entire concurrence with you, that the objections to this measure far outweigh any recommendation in its favour.

7. These objections are so many and so grave that nothing in the opinion of Her Majesty's Government could justify having recourse to such a measure, unless it were a certainty, or a reasonable probability, that exports of food will so exhaust the resources of India as to render them incapable of affording the supplies which may be required for the affected districts.

8. Her Majesty's Government rejoice to believe that there is every reason to be confident of the sufficiency of the supplies of food which must remain available in the country. In many of the Provinces surrounding the affected districts there has been no failure of the crops, and in some there has been an abundant harvest. The same observation applies generally to almost the whole of the rest of India, and to the important field of Burmah. Moreover, other markets are accessible to the Government if it should find itself under any necessity of resorting to them.

9. Although, therefore, your Excellency and the Lieutenant-Governor of Bengal have agreed in the general conclusion that the failure of the rains and the consequent amount of failure in the crops have been in this season very much the same as in the season of 1865-66, which resulted in the Orissa famine, there are three circumstances affecting the present case which establish an important difference. The first of these is the amount of careful provision and forecast to meet all probable contingencies which, from the experience gained in the Orissa famine, the Government has been able to employ; the second is the abundance of food supplies which must exist in India; the third is the facility for making that supply available which is afforded by the geographical position of the districts affected in 1873-74 as compared with the districts affected in 1865-66.

10. One of the main causes of the suffering in Orissa was the position of the Province—remote—comparatively inaccessible—out of the way of all the ordinary channels of trade and of the ordinary lines of communication.

11. Behar and the other districts now affected are, on the contrary, among the most accessible districts of British India,—traversed by all the great leading lines of communication, of river, of railway, and of road, whilst the active and timely exertions of the Lieutenant-Governor have been for some time specially directed to organizing a detailed system of land carriage.

12. Under the worst circumstances of scarcity in India a large part of the people have always been able to supply themselves with food at the enhanced prices of the time. It is only a certain proportion of the population who are in danger of suffering distress, and for whom therefore it is necessary by special measures to provide.

13. You have proceeded on the principle that if the Government were to assume, or appear to assume, the duty of providing for the total commissariat of a population of 24 millions of people, it would undertake an operation which no executive machinery could accomplish, and which is certain to end in disastrous failure. You have therefore given it to be understood that you would not supersede or interfere with the functions of the trader in grain as regards that part of the population which is able to purchase, and that you would confine yourself to provide work and wages in food, as well as more direct relief where such may be required for that other portion of the people who are too poor to purchase at the enhanced prices likely to prevail, and whose wants therefore the ordinary grain trade could not be expected to supply.

14. Her Majesty's Government entirely approve of this principle of policy. They have not the means which you possesss of estimating the percentage of the population for whom, in accordance with that principle, it has been requisite for you to purchase and to store, and to distribute an adequate supply of food. But Her Majesty's Government know that this estimate has been made by you after inquiries more systematic and complete than have ever been made before, and they place complete confidence in the means you have taken, in conjunction with the Lieutenant-Governor of Bengal, to measure and to anticipate the necessities which may arise.

15. In the exercise of this confidence, I have again to assure your Excellency of the support of Her Majesty's Government in any measures you may think necessary for the saving of life and for the mitigation of distress. You wisely commenced a system of relief works at a very early date, with a view to save the labouring population from even the beginnings of distress, and from the debility which would render their labour valueless. You have also so selected and so distributed those works as to prevent as much as possible any necessity for large movements of the population. In the extensive employment of labour for the sake of charity there is generally much waste; but in India there is this great advantage that many public works, both large and small, of the greatest permanent value, have already been projected and sanctioned, and have been made the subject of careful estimate. The more immediate and rapid execution of these works, whilst it will serve the immediate purpose of providing food as wages for the people who are in want, will also be a sure and lasting gain to the resources of the country.

GOVERNMENT OF INDIA.

DEPARTMENT OF AGRICULTURE, REVENUE AND COMMERCE.

REPORTS ON THE STATE OF THE SEASON AND PROSPECTS OF THE CROPS FOR THE FORTNIGHT ENDING THE 19th FEBRUARY 1874.

GENERAL REMARKS.—In Madras there has been a slight rainfall in the southern districts; in these prospects are not altogether satisfactory, and the water-supply is very deficient; in the north prospects appear to be better, but no rain has fallen. Reports from Sindh and the Bombay Presidency generally are favourable; no more rain has fallen. In Bengal general and in many places plentiful rain has fallen during the fortnight throughout the Province; it has much benefited the bulk of the cold-weather crops, renewed the water-supply, restored the grazing, and started ploughing for the early rain crops; in Tirhoot alone is the fall stated to have come too late to produce material benefit. In Oudh there has been a little rain, and the prospects of the rubbee are generally favourable. In the Punjab the crops are excellent; rain has fallen only in the northern districts. Accounts from the Central Provinces show a slight rainfall in some districts; the harvest is generally in progress, with good results; prospects of the standing crops are good. The same is the case in Berar. Reports from Mysore are tolerably good, and favourable from Rajpootana and Central India. In Nepal rain has fallen, and the prospects of the wheat and potato crops are favourable. No reports have been received from the North-Western Provinces and British Burmah.

Presidency or Province and District.		Rainfall for fortnight preceding.	State of agricultural prospects.
Madras	(Feb. 19th)	*Nil*	Two inches water over anicut; canal supply moderate; castor, maize, black gram sown in a few taluqs; standing crops good but suffer from drought in parts; black gram, green gram, tobacco, chillies reaped in Palnad; paddy in Bunder; markets well supplied locally; prices stationary; pasture scarce; fever and small-pox general, but abating; guineaworm in Palnad; cattle healthy.
Kistna	(18th)		
Kurnool	„	„	Season tolerable; outturn of dry crops fair; markets well supplied; prices steady but dear in Cumbum and Markapur; water and dry fodder plentiful; second crop paddy under canal thriving; no water over Sunkesala anicut.
Negapatam	„	·15 *Nil* elsewhere.	Rivers dry; water in tanks scarce; cultivation very little; standing crops, some not thriving, others withering from want of rain; sambapishanum harvest continues; markets sufficiently supplied; pasture moderate; prices rising; health good, but some small-pox more or less severe; cattle generally healthy.
Trichinopoly	„	...	Steady light rain today from 8 A. M., which seems general, and slight showers yesterday, beneficial only to pasture lands, water-supply beginning to fail even for drinking purposes in dry villages; wet crops under good irrigation moderate; in other localities they have failed to a considerable extent; dry crops universally bad; outturn in most cases far below average; markets sufficiently supplied in most places, some slight difficulty in parts of Perambulur and Udayarpolliem; prices much higher and rising; pasture procurable; health generally good; condition of cattle good.
Calicut	„	*Nil*	Second crop harvested; markets well supplied; prices rising; pasture withering; small-pox prevalent, fever slight in hilly parts; cattle healthy. *General Remarks.*—General prospects not altogether satisfactory.

Presidency or Province and District.	Rainfall for fortnight preceding.	State of agricultural prospects.
Bombay (Feb. 19th)		
Sindh.		
Kurrachee ...	...	Rubbee crops well.
Hyderabad ...	...	Weather warmer; crops promising; district healthy.
Shikarpur ...	...	Weather brighter; rubbee crops very promising everywhere; no sickness.
Upper Frontier ...	...	Weather mild; crops thriving; remittent fever.
Gujarat.		
Ahmedabad ...	...	Rubbee and public health continue good.
Kaira ...	...	Weather, crops and public health good; cotton picking commenced.
Surat ...	...	Cotton picking progressing; crops and public health good.
Broach ...	...	Crops, weather and public health good.
Khandesh and Nasik.		
Khandesh ...	...	Reaping of wheat progressing; state of cotton market unchanged.
Nasik ...	...	Late crops being harvested; public health generally good; cattle disease in Nandgaum, Peint and Nasik taluqs.
Thanna ...	...	Ague continues in the districts; small-pox prevails slightly in Thanna.
Deccan.		
Poona ...	...	Rubbee crops have now been wholly reaped; weather cold; public health good.
Ahmednuggur ...	...	Harvesting of rubbee mostly finished; cattle disease prevalent in some villages of Ankolla taluq; public health good.
Sholapur ...	...	Rubbee being reaped; weather and public health good.
Sattara ...	...	Early crops nearly harvested; late ones favorable and partly reaped; public health generally good.
Southern Mahratta Country.		
Belgaum ...	...	Fever prevails in Bidi taluq; cotton crops poor and still suffering from bad weather.
Dharwar ...	...	Late crops harvest nearly over; picking of American cotton commenced.
Canara ...	...	Prospects of second crop satisfactory; fever in small-pox in some parts.
Kattyawar and Gaekwar's territory.		
Rajkot ...	...	Cold weather crops good and being harvested; cotton good.
Wudwan ...	...	No change.
Baroda ...	...	Crops and public health good.
Bengal (Feb. 19th)		
Burdwan (17th)	2·11	Weather cold, cloudy and foggy, with more or less rain; the rain has done good to most of the cold-weather crops, which are doing well, besides filling the tanks and softening the ground for ploughing for the next crops and causing grass to grow freely.
24-Pergunnahs "	3·90	Weather warm at the beginning of both the weeks and cloudy at the end of the second week; rain has fallen throughout the district; crops, sugarcane and vegetable crops have improved; the rain has rendered possible early sowings of the aus or early rice crop; it has caused some injury to tobacco and paddy cut and drying in the fields; land is being fast prepared for the ensuing crops.
Dacca "	0·60	Weather, alternate rain and sunshine; rain general thoughout the district; prospects of the crops good.
Cuttack ...	1·26	Weather cool, but getting warmer; rain has fallen in the district; spring crops promising well; mangoes in blossom.
Kamroop (9th)	0·75	Weather cool with occasional heavy showers of rain; land is being ploughed for early rice crops.
Distressed Districts.		
Moorshedabad ...	1·98	Weather misty, cloudy and somewhat close; rain fell on the 1st, 2nd, 5th and 6th February in all parts of the district, and slightly on the 13th at the sudder station; the cold-weather crops continue to improve in consequence of the rain except in a small tract, where damaged by hail; ploughing still affords employment to many of the laboring classes; from Nowada it is reported that holders of paddy are opening their stores and lending grain to the people; prices have accordingly fallen slightly in that place.
Dinagepore ...	1·26	Weather cloudy with rain throughout the district; the rain has done immense good to the standing crops of wheat, &c.; planting of boro paddy nearly completed; this crop will be earlier than usual; preparations for the aus or early rice sowing being pushed on; mustard has nearly all been reaped with a fair result on the whole.
Maldah ...	1·22	Weather cold, coudy and rainy and sunny alternately; slight rain with thunder and lightning on the night of the 13th and threatening at the end of the fortnight; the rain has done immense good to the cold-weather crops, which are expected to turn out excellent; the area under cultivation of these crops is considerably larger than usual; boro paddy is flourishing; mustard reaped and yielded a fair average; ploughing for the early rice sowings going on, on all sides.
Rajshahye ...	2·54	There was ample rain throughout the district; in some places it was plentiful; a sharp storm with thunder and lightning on the night of the 13th at Beauleah; the cold-weather crops have been generally much improved, but some little injury has been caused to khesaree and orhar pulses and peas; boro paddy is doing well; ploughing for the next early rice crop is going on vigorously somewhat earlier; price of rice falling in several parts of the district.
Rungpore ...	1·55	Weather cold and stormy, with much rain during the first week, but much heat during the last week, and cloudy with storm threatening; mustard, potatoes, wheat, cheena and kaun millets extensively cultivated this year; they had suffered some damage by the continued drought at the beginning, but the subsequent rains have done a great deal of good, and they are doing well; more rain would probably injure them; a large area is prepared for the spring sowings; in some parts the sowings of early rice have sprung up, but rain has retarded the general sowings; tobacco has in some places been cut up by hail and excess of rain, but it is generally good.
Bogra ...	5·66	Weather fair and cloudy; sufficient rain has fallen in the district; the rain has done great good to mulberry, peas, khesaree and mussoor pulses; grain getting on fairly; cutting of sugarcane and mustard continues; yield may be about 13 annas; the spring crops have benefited by the rain, but no more is wanted for some time; hemp in Sereakandy is being reaped; ploughing going on.

Presidency or Province and District.	Rainfall for fortnight preceding.	State of agricultural prospects.
Bengal,—*continued.*		
Patna ...	·11	Weather seasonable; rain fell in the first week, unaccompanied with strong wind; the rain has done much good to the cold weather crops, especially to wheat, barley and oats, which may be considered as secure if there be no hail or heavy storms; some of the crops, such as mussoor pulse, peas and grain, are being harvested, which afford labour to the poor.
Gya ...	1·52	Weather cold and cloudy during the first week, and afterwards cool; the cold weather crops have generally improved by the rain; peas and musoor pulses, which were in flower, have suffered slightly; in some places, the poppy which was lanced, has also suffered; ploughing actively going; cheena, millet being sown.
Shahabad ...	1·18	Weather, rain general throughout the district during the first part, and clear during the rest, with strong west winds; as a whole the cold weather crops have been much benefited by the rains, especially wheat and barley; on the low dearah lands, close to the Ganges, the grain has been injured; the boro paddy in some places was flooded.
Tirhoot ...	·80	Weather, cloudy during the first part, with more or less rain throughout the district, the rest clear with west winds; in the Seetamarhee Sub-division about 2 inches of rain fell; it has improved the cold weather crops and enabled the cultivators to plough lands for sowing cheena, millet, &c.; people have been emigrating in small numbers from the northern pergunnahs. In Durbhangah ·69 inches of rain at head-quarters, but heavier to the east and south; mustard has ripened in some places, and ripening in others; it is expected to be a good crop; arhar and pulses fair; cold weather crops though improved by the rain, will afford no material aid to the people; cheena millet is being sown. In Madhubani Sub-division the rain-fall was ·56; it is feared it has come too late for any crops but cheena millet and moong pulse, of which a good deal is being sown; arhar pulse is not so promising as it was. In Hajeepore Sub-division the rain-fall was ·40; the cold weather crops have been materially benefited by the rain; if there be no frost, these will be safe for at least a 10-anna crop. In Tajpore Sub-division the cold weather crops have been greatly benefited by rain, especially the late sown wheat and barley; the early wheat and barley having got into ears before the rains, have not been so much benefited, but will yield more fodder, which is an important consideration; first cuttings of tobacco commenced, but buyers are not coming in as in ordinary years; much land has been sown with moong pulse, cheena and kawnee millets, and everywhere cultivation is going on. In the Sudder Sub-division the rain has benefited the cold weather crops; but by the frost of previous weeks, arhar pulse was much damaged in certain tracts; more rain is still required in many parts to sow cheena millet and moong pulse.
Sarun ...	·87	Weather at the beginning cold and cloudy, but afterwards dry, with east and west winds; rain has fallen throughout the district; the late rain which has been general, has been of immense benefit to the crops on the ground; they have improved so wonderfully, that an outturn of 8 annas all round may be now possibly obtained; wheat, grain, barley, indigo and poppy have specially benefited; sowings of cheena millet are also being largely undertaken; on unirrigated lands, however, without more rain, cheena cannot come to any thing; damage by frost previously reported appears to have been exaggerated; peas and mustard being harvested; indigo seed being sown.
Chumparun ...	1·20	Weather, cold with west winds; rain general throughout the district; that portion of the cold weather crops which survived the drought has been much benefited by the rain; the average outturn will, it is anticipated, be about 6 annas, where a 2-anna crop would scarcely have been expected; this timely rainfall has also enabled the ryots to sow cheena millet, early rice, moong pulse, shama grass seed (substitute for rice), and other spring corps.
Mor pore ...	·44	Rain throughout the district during the first week, afterwards unusually warm; crops much benefited, and are most promising.
Purnea ...	1·52	Plentiful fall of rain during the first part and slight during the latter part, with strong west wind, and sensibly warmer; the rain has done a great deal of good; the prospects of the cold weather crops are now very favorable; an intermediate crop of Bysakhi Janera (millet) may be sown on high lands.
ah ...	1·57	Weather, stormy during the first week, the rest fair; the prospects of the cold weather crops, during which a double quantity of land appears to have been cultivated than ordinary years, are excellent every where; grain is looking particularly well; the rain has enabled the ryots to sow cheena and kowni millets and early rice; ploughing for spring crops is everywhere being pushed on.
Lohardagga ...	...	Palamow Sub-division, heavy rain has fallen; a small portion of the more advanced crops has suffered to some extent, but the less advanced ones, which form a great area, will benefit largely, provided there be no more rain.
		Public health.—Burdwan, fever as before; 24-Pergunnahs, fever abating; Basseerhat, Barripur, and Barrackpore; a few cases of cholera in thannahs Nabad, Bhaugor, Areadah, Kobgunge, Bankipore and Muthoorapur. Some small-pox in Nowabgunge and north suburban town. Moorshedabad, small-pox on the increase. Patna, Cuttack and Kamroop, public health good; Bhangulpore, a few cases of small-pox.
		General Remarks.—Rain has fallen all over the districts and in some places heavily. In some parts it has injured to a small extent a few of the standing crops, which were in flower, the remnant of the late low land paddy and tobacco which had been reaped but not housed, as well as pulses fit for being gathered. It has decidedly benefited the generality of the cold whether crops, most of which were sown late in the season. It has also renewed the grazing lands. Ploughing for the ensuing crops is actively going on. Boro paddy has also considerably benefited by the rains. In some places more rain would retard the sowing of the early rice and injure pulses. Certain of the pulses, oil-seeds and indigo are being reaped. The rain has also replenished the water-supply in the tanks, the scarcity of which was being felt in several places.

GOVERNMENT OF INDIA.

FINANCIAL DEPARTMENT.

REPORT ON THE CULTIVATION OF THE POPPY IN CHINA.

No. 24 D, dated 19th November 1873.

From—W. H. MEDHURST, Esq., Her Majesty's Consul, Shangai,
To—The Secy. to the Govt. of India, Financial Department.

Referring to a memorandum on the subject of opium cultivation in China, prepared in the Financial Department and published by order of the Government in Council, under date the 23rd September 1871, a copy of which was forwarded to me by Her Majesty's Minister at Peking, I have the honor to submit herewith a copy of a letter which I have addressed to Her Majesty's Minister giving cover to a report upon opium cultivation, prepared by Mr. M. S. Gubboy, of the Firm of David Sassoon, Sons, & Co.

Dated 19th November 1873.

From—W. H. MEDHURST, Esq., Her Majesty's Consul, Shangai,
To—Her Majesty's Minister, Peking.

Adverting to your circular dated the 1st September last, I have the honor to forward herewith an interesting report which has been courteously handed me by Mr. Gubboy, of the firm of David Sassoon, Sons, & Co., upon the subject of opium cultivation in China.

I am sending a copy of this report to the Financial Secretary to the Government of India, and as the enclosures are all published documents which are accessible in China, but not necessarily so in India, I have sent the only set which I can get made up as an annex to the copy forwarded there.

The extent to which opium is now, and may further be cultivated in this country, and the effect which its production here is having upon the importation of the Indian product, are both subjects on which reliable statistics are much needed, and if I may venture to make the proposition, I would suggest the advisability of appointing a commission of enquiry, composed partly of functionaries conversant with opium cultivation in India, and partly of officers familiar with the people and language of China, who might be delegated to make researches throughout the Chinese provinces with a view to establishing the actual truth as regards the cultivation and its effects. Such a commission might likewise be successful in eliciting much valuable information upon the vexed question as to the extent to which the drug is consumed in various parts of the country, and its influence upon the nation at large.

Enclosure 1.

OPIUM CULTIVATION IN CHINA.

There can be no doubt that the cultivation of opium in China has enormously increased within the last ten years. The consumption of the drug has also increased, and apparently in a like proportion, so that, as yet, the market for the Indian drug has been slightly affected.

The most notable increase in the production of the drug has taken place north of the river Yangtze, the provinces south of that river, with the exception of Yünnan and Kweichow, never having affected the market to any considerable extent. Opium is known indeed to be grown in Kwangsi, Hunan, Kwangtung and Fuhkien, and even in the fertile and prosperous province of Chenkiang about Wanchow and elsewhere. Of the quantities produced we have no means of forming an estimate, but at the ports the native article has come little, if at all, into consumption in the way of competing with the Indian.

To the north of the Yangtze, the state of affairs is different, and the cultivation of the poppy is now, we believe, to be met with in all the northern provinces of China Proper, as well as in Mongolia and Manchuria. As yet Szechuen seems to be the greatest producer. The Delegates of the Shanghai Chamber of Commerce* describe the industry as of large importance, and as sanctioned by the levy of local taxes. The ordinary price of the native opium in the province was about Tls. 270 (= Rs. 820) per pecul of 133⅓ lbs. avoirdupois, and this price had increased at Hankow to Tls. 300 (= Rs. 930). Baron von Richthofen† describes the cultivation as very general in the eastern portion of the province, and as having there probably attained its highest limit. He calculates that not one-fiftieth part of the soil is taken up with the crop, and remarks that this proportion is reduced to less than one hundredth part by the fact that the poppy only occupies the soil for half the year. As none of the best soils are in this province devoted to the growth of opium, the proportion of the value of the land occupied by the crop is much less than one per cent.

The *Peking Gazette* of October 15th, 1871, contains a remarkable memorial‡ from Wu Chen, Censor of the Chekkiang Circuit, but himself a native of Szechuen. The Censor speaks of the extension of the growth of opium in the province, and the practical legalisation of the production by the Mandarins, who levy regular taxes in addition to the regular rates on land where the cultivation is carried on. It is not easy to make out the drift of the Censor's remarks, but it is noteworthy that he refers to the policy of encouraging agriculture and keeping the trader down as one worthy of commendation, and recommends that taxes should only be levied on the article when in the trader's hands. In reply, the Imperial Government seems to uphold this view of the case; and, somewhat inconsistently, while forbidding the growth of the drug, directs that the taxes accruing therefrom shall, in future, be levied on the trader and not on the cultivator. We append the remarks of the *North China Herald*§ on this important subject.

Of the more northern provinces‖ Baron von Richthofen remarks that the Shensi opium is a serious rival to the foreign drug, as, although much inferior to Indian, the Chinese smoker likes its flavour. At Singan-foo, the capital of the province, the price per tael weight was Tls. 0·20 (= 7½ annas per oz. avoirdupois) for Szechuen, Tls. 0·28 (= 10½ annas) for Shensi, and Tls. 0·40 (= 15 annas) for Kansu. Indian opium (prepared) was imported from Canton in tins and sold at Tls. 10 per tael¶ weight (=Rs. 22-14-0** per oz.) but was little used; the price at which the opium was raised in the various provinces was stated by the writer to be, in Kansu Tls. 0-3-8 per tael, in Shansi Tls. 0-3-3, in Shensi Tls. 0-2-8, and in Szechuen Tls. 0-1-2; in portions of the province of Shensi the opium poppy formed the most conspicuous winter crop next to wheat. "In this case," the writer adds, "the poppy takes the place of the ordinary and uncertain crops of wheat, beans, or rape seed; and as the opium is a much more valuable crop than these and is largely exported, its planting is perfectly justified from the stand-point of common economy."

Attempts to increase the land tax on ground planted with the poppy have proved unsuccessful, the people threatening to rise in insurrection if the charge were insisted on. In provinces the use of opium has only prevailed for twenty years, and the cultivation was scarcely have been introduced within the last twelve.

In Mongolia the growth of native opium has increased of late years, and the article forms a staple product.

†† The Powang, son of San-ko-lin-sin and Prince of the Karchin tribe of Mongolia, observing on a recent visit to Peking, that the cultivation of opium north of the Great Wall and the palisades was largely increasing, memorialised the Emperor and succeeded in obtaining an edict ordering the destruction of the entire crop. This order seems to have been carried out to some extent at least. The fact of its being issued certainly affected favorably the market at Tientsin for foreign opium during the year, showing how intimate has become the connection between the home and imported drug.

In Manchuria a very similar state of affairs exists. So close to the open port of Newchwang as Kaichow and Tienchwang-tai opium has usurped the place of corn as a crop. During the past year this crop was a partial failure, owing to the unusual amount of rain that fell during the season; the loss thus occasioned was, however, partially made up by the increased area

†† *Customs Quarterly Gazette*, April—June, 1872.

under cultivation. No opium other than Indian is imported into Newchwang, the supply being sufficient for the demand.

The large increase in the amount of native grown drug has affected the Indian in price, though apparently not in the amount imported.

Prices at Newchwang may be quoted as follows:—Kaichow inferior and mixed with mud, Teaon 2$\frac{600}{}$ per tael weight, or per oz. say 8¾ annas; Mongolian, Teaon 3$\frac{600}{}$ per tael, or 12 annas per oz.; Indian, Teaon 4 per tael, or per oz. 13½ annas:

At Chefoo a marked decline in the import has to be noticed. This, however, is partly due to the fact that certain of the districts formerly supplied from Chefoo now find it more convenient to obtain what they require from Chinkiang.

The recent development of the import trade at that port has, owing to the energetic measures taken to enforce the transit clauses of the treaty of Tientsin, opened up new channels of communication with the interior, and opium has naturally followed in the track of piece goods.

The increase of the import at Chinkiang does not, however, seem to explain altogether the general dulness of the market at Cheefoo, which seems to be mainly attributable to the introduction of opium culture into Shantung within the last three years. On this subject we adduce the testimony of the Rev. Dr. Legge who, in company with the Rev. Mr. Edkins of Tientsin, traversed the opium-producing country in the spring of the present year. "The fact* is," Dr. Legge relates, "that from Taengnan-foo down to Tsingkiangfoo opium is extensively cultivated, and the temptation to its production is very great. One man told me he could make six times as much from a *mow* of poppies as of wheat; four times, said another; three times, a third, and one said twice as much, but that was the lowest estimate." The production had only commenced two years previously, but had taken a firm hold. In 1870 Mr. Ney Elias found that the growth of opium, along the line of the old Yellow River in Honan, was steadily increasing; wheat and opium were, in fact, the only winter crops to be noticed in the districts of Kwei-tieh-foo and Sui-chow.

Tsingkiangfoo, mentioned by Dr. Legge, as the limit of opium cultivation towards the south, it is important to observe, is situated where the Grand Canal meets the bed of the old Yellow River, but now occupied by the Hwei. It is the key of communication between Chinkiang and the northern provinces, and through it passes all the foreign trade of that port with the north and north-west. It is, moreover, only about 100 miles from the Yangtze River, and is within the province of Kiangsu, in which both Chinkiang and Shanghai are situated.

Formerly foreign goods made their way from Chefoo to Western Shantung, but since the settlement on a proper basis of the inland transit pass system at Chinkiang, that port has competed successfully for a portion of the trade.

It will be thus seen that in all the northern provinces, at least, of China, Indian opium has to enter in close competition with the native drug, and that this competition extends almost up to the ports, and occupies the points of vantage on the roads to the interior.

A leading article from a well informed local paper† will explain as succinctly as possible the present state of affairs.

Practically, it may be said that the Chinese Government has no policy with regard to opium. There exists a settled conviction that the extension of opium cultivation is hurtful to the empire, but the Government has no power to prevent it. It has, moreover, not even the ability to regulate where it cannot effectually prevent, and had it even all the desire and ability to create a definite policy, its own officials could not be depended on to carry it out.

Hence the curious result that the very measures into which it plunges to prevent the cultivation of opium in its territories have really proved the protection of the native as against the foreign drug.

It must always be remembered in discussing any economic question in which the empire of China is concerned, that the fiscal arrangements of the country are of such a nature as to prevent, by cumulative taxation, the free interchange of trade commodities between different districts. Except in the solitary case where the commutation of inland dues on staples of foreign trade was forced on the Chinese Government, there does not exist any means by which commodities travelling along long lines of traffic can escape from this vicious system.

The trader is at the mercy of the official in charge of each duty station, and these duty stations are often placed at intervals of a few miles apart. Each of these officials has practically purchased his post, and has to look to his own takings to recoup him for money out of pocket, as well as to pile up a store for future service. Each is practically independent of the others, and the fact of an extra toll having been paid at our barrier by no means enables the trader to plead a reduction at another.

It is the prevalence of this system which rendered the passage of goods to the interior so difficult, and which called for the commutation clause in the treaty of Tientsin before any reform in the method of conducting foreign trade could be hoped for. Since 1860 these clauses have constituted the main battle ground between British merchants and the Chinese authorities. It is only within the last few years that the opposition of some of the local Mandarins at some of the open ports has been put down, and, even at the present moment, that opposition has been effectual in most of the southern ports and even in the province of Kiangsi in preventing the proper working of the system. Every official was, more or less, directly interested in the continuance of a system which placed no practical restrain on the amount of

* *North China Herald*, June 7th, 1873.
† *North China Herald*, September 21st, 1872.

his own exactions and, in consequence, every instance of relaxation or apathy on the part of foreign officials has made the occasion for further violation of the principle on the part of Mandarins.

The advantage of the stipulations of the treaty has been proved by the great development of the import trade in foreign manufactures, which has marked the period since the conclusion of the treaties, and it may be generally said that, although in some instances the receipts of the local barriers (which are the curse of the country) have fallen off, the commutation system has worked well for the legitimate revenue of the Empire, and for the interests of the people at large.

From participation in the advantages of this system of commutation foreign-grown opium has been specially excluded. Once out of the foreign importer's hands, it has been liable to an amount of taxation only limited by the powers of collection. Before leaving any of the open ports it has to pay a likin tax of thirty to sixty taels (Rs. 90 to 180 per chest), varying according to the convenience of the provincial authorities at the various ports. On proceeding to the interior, it is stopped at every barrier, and a greater or less contribution wrung out as circumstances at the moment permit. In consequence, as an article of open trade, it ceases to be carried at a comparatively short distance from the open ports. Its ready portability and the want of any system of mutual action between the barrier officials opens the way largely to a clandestine trade.

Secret arrangements are made even at the open ports, and, with a great deal of difficulty and in small quantities, the foreign opium finally contrives to reach the great cities of the interior.

Since 1855 the importation of foreign opium has been stationary, while, on every side, the use of the drug has been continually increasing. The native article has been driving the foreign within an ever-narrowing limit, and this has been done, it is acknowledged by the Chinese, at the expense of devoting enormous tracts of arable land to the cultivation of the poppy plant.

The Chinese people within the same period have increased ten-fold, their consumption of other articles of foreign import showing that some powerful cause has been at work to interfere with the natural development of the opium trade.

Indian opium is allowed on all hands to be superior to native, so much so indeed that a Chinaman will not willingly make use of the latter if the imported drug be within his reach. He is willing even to give a considerably higher price for the imported article, the effects of which are more adapted to his requirements.

The peculiar circumstances of the Chinese people, probably the nature of the climate and certainly the listless and objectless manner in which the system of Government forces them to pass their lives, have caused the use of the opium pipe to become a matter of necessity to a large portion of the nation. Practically, no check is placed on the production or use of opium. At the present moment more than one individual province probably rivals, in the amount of opium annually produced, the whole of British India. However, therefore, the moral argument may formerly have been allowed to enter into the discussion, it has now become a simple economic question. Were the entire supply of opium from British India cut off, there would not be one smoker the less in China. This may seem a startling statement, but it is more than borne out by the statistics we have given above. The ill-considered efforts of the Chinese Government to interfere with the Indian opium trade have resulted in this [illegible] except in a of affairs. It is not for us to moralise on the situation. We simply state facts with [illegible]nt to many knowledge. [illegible] paddy are [illegible]gly fallen

At the present time some 45,000 chests of Patna opium are annually put on the [illegible] at Calcutta, and above 40,000 chests of Malwa opium are exported from Bombay, th[illegible] and [illegible] good paying an export duty of 600 per chest. Three years ago Szechuen alone was estimat[illegible]losed; [illegible] produce annually * some 50,000 chests (1 pecul each) and Shensi nearly, if not quite as mu[illegible]or after Within that period the cultivation has extended rather. [illegible]le,

On importation again into China, the Indian opium pays an import duty of taels 30 (Rs. 92) per pecul, and before it leaves the port to enter into native consumption, a further tax, under the name of likin and not mentioned in the treaties, is levied, amounting on the average to nearly double the import duty.

Indian opium is, therefore, burdened with duties alone to the extent of above 6 annas an oz., before it can enter into competition with native opium selling at from 7½ to 11 annas per oz. In India the ryot receives for Patna opium the sum of Rs. 400 per chest, or 3 annas per oz., proving thereby the superior adaptability of the climate and soil for the growth of the drug. At this rate the ryot can produce an article which, brought fairly into competition with Chinese opium, has hitherto, even when weighted with the enormous duties to which it is subjected, held its own in the market.

So irregular and so oppressive are, however, the inland taxes of the Chinese Empire, and so opposed to all interchange of commodities from a distance, that practically it has been found that, under existing circumstances, Indian opium, except as an expensive luxury indulged in by a few rich men or high officials, is not to be met with in the interior of the empire.

For this peculiar state of affairs two remedies suggest themselves. *First*, that in China, as far at least as certain well known marts or large cities in each province, the present likin tax paid on the article at the open ports should free it of all further taxation. These taxes, it

* *Vide* Letters on Chili, see page 52, notes by Baron von Richthofen.

will be observed, are sufficiently high to secure a large revenue to the Government, and are, moreover, in excess of the import duty fixed by treaty. Assuming, for instance, that on a moderate calculation, 40,000 chests would be thus cleared annually at the rate of taels 50 per chest, the Chinese Government would derive a direct revenue, with no extra expense of collection, of some two million taels, or say £ 600,000 sterling per annum. *Secondly*, that the Government of India, in place of restricting the quantity of opium produced, should use its influence to increase the amount. If, instead of 45,000 chests of Patna opium, 90,000 chests were annually produced at a lower rate, there would be a more certain market for the crop in China. It is true that the Government would not realize the same prices per chest at auction as at present, but it is improbable that any eventual loss would be made, as a smaller profit would be spread over a larger quantity, and a more certain and livelier market arrived at in China. The increase in the production of Patna and the consequent reduction in the market value would necessitate a change in the export duty levied on Malwa opium in Bombay.

Malwa is, however, the favorite drug in the north of China, and it has, even more than Patna, to bear the brunt of the competition with the native-grown opium. The reduction of the duty on Malwa by one half would reduce the price laid down in China by some taels 100 per pecul, or say 2¼ annas per oz., and there is no doubt that the reduction would largely stimulate the demand.

At such rates, if assisted by a fair scheme for the commutation of barrier tolls, it would readily meet with a market in the interior of China, and, eventually, would be found in a great measure to supplant the native-grown and inferior drug. The high price at which opium is at present produced in China goes to prove two things, both of importance in the consideration of the above proposition: *first*, the comparative unsuitability of the climate and soil of China to the growth of the poppy; and *secondly*, that its cultivation must be displacing a valuable crop; neither of these considerations can be held to apply in India, where the Government and people would profit largely by the increase in the production.

SHANGHAI,
October 23rd, 1873.

Enclosure 2.

Extract from a Letter No. VII by Baron Richthofen on the Provinces of Chili, Shansi, Shensi, Sz'chwan, Shanghai, 1872.

NORTHERN SHENSI.

Opium is foremost among them (the articles of foreign commerce), because in the product of Shensi the foreign opium has a dangerous rival. Although much inferior to Indian, as all Chinese opium is, its properties are much esteemed by the smokers. At Si-ngau-fu, the price of one tael's weight of opium is, of "Szchwan" Tls. 0-2-0, of "Kansu," Tls. 0-4-0, and of "Shensi" Tls. 0-2-8. Indian opium is imported in tins of 1 tael's* weight from Canton, and sold at Tls. 10 per tin, but is very little used. Opium from Honan and Shansi is not sold at Si-ngau-fu. The former ranges in value between "Szchwan" and "Shansi," while "Shansi" is only inferior to that from Kansu. The most correct idea of the relative value of the opium grown in different provinces is probably formed, if the first price at the place of production alone is considered. From this point of view we arrive at the following order:—

Original price of opium is	Kansu	about	...	...	... Tls.	0	3	8 per tael.
Ditto	ditto	Shansi	...	...	... „	0	3	3 „
Ditto	ditto	Shensi	...	...	... „	0	2	8 „
Ditto	ditto	Szchwan	...	...	... „	0	1	2 „

Considering the relative prices of equal weights alone, and not the weight of opium yielded on an equal area of ground (of which it is very difficult to get correct figures), the cultivation of the poppy would appear to be far more remunerative in the north than in the south. But another item must be considered, which is the relative value of the crop which the poppy replaces. In the cold climate of Shansi, the poppy does only thrive on the best fields, on those which are level and can be irrigated. It occupies probably the larger portion of the best garden-land, where it replaces a certain and prolific wheat crop or the more valuable vegetables. No opium is exported from the province, and the drug is furnished to the smokers at three times the price at which those of Szchwan get it. In addition, a considerable amount of opium is imported from the neighbouring provinces. The planting of the poppy must therefore, be considered, in Shansi, as highly injurious for the economy of the province, and as impoverishing the population. I will show, when speaking of Szchwan, that there and in Yünnan, the poppy replaces crops of inferior value. Kansu shares the climate and soil of Shansi. Under equal circumstances the cultivation of the poppy should be there just as injurious as in Shansi. But the population being small and the arable land extensive, Kansu does not consume all the opium it produces, but exports considerable quantities of it both west and east and imports none; the poppy is, therefore, probably a valuable and beneficial crop. In both provinces the cultivation is not likely to increase much beyond its present state. Shensi is much more favourably situated in this respect,

* Query by Financial Department, Calcutta—Catty?

because the poppy thrives on loess-fields which are not irrigated. In the departments of Kienchan and Fungtsiangfu, the lower portion of the loess-basin consists of rolling ground, which is interrupted by a few deep gullies. The poppy is not cultivated on the top of the swelling ground, which is too dry. But every slope, however gentle its inclination, is terraced. Those terraces which are well shut in on two or three sides are selected for the poppy. I saw extensive fields cultivated with it, and in some portions of the country it formed the most conspicuous winter crop next to wheat. In this case, the poppy takes the place of an ordinary and uncertain crop of wheat, peas, beans, or rapeseed, and as the opium is a much more valuable crop than these, and is largely exported, its planting is perfectly justified from the stand-point of common economy. The area of the field planted with poppy will rather increase than decrease. As regards the attempts on the part of the Governmeut to check its cultivation, it appears that no power would be able to stop now the production of a narcotic for which the people have attained a craving. They are unanimous in the accusation, that the Mandarins were the first, in every province, to smoke opium, and that the greatest relative number of smokers is still found in the Yamens. If the higher authorities were earnest in their efforts to suppress the cultivation, they would still be impotent to check the venality of their subordinates. And if that could be encountered, the people would revolt. An instance of this kind was related to me in a district of Ping-yang-fu, which produces much opium. An extra tax of 400 cash is there levied from every mow planted with the poppy. In 1870, the money was not paid. Before harvest time, the district Mandarin sent out his men and had the pods of all the poppy plants cut off. In the following year, the tax remaining unpaid, the men of the Yamên returned, to repeat the destruction. But the people of the whole district made armed resistance and drove them off. They collected then their opium, without paying any duties :—

* * * *

SZCHWAN.

Opium.—The cultivation of the poppy is very generally diffused throughout eastern Szchwan. But it has probably attained its highest limit. It is nowhere so conspicuous as between Chungchan and Fuchan on the Yangtse, where it occupies probably one-third of all cultivated sloping ground. The country thereabouts is mountainous and wild, thinly inhabited, and not fertile. The more favorable the conditions for agriculture, and the more fertile the ground, the smaller is the ratio in which the poppy is planted. Quite unlike the mode of its cultivation in the North, it is rarely seen on level ground, such as the plain of Ching-tu-fu, or the rich bottom land near Kia-ting-fu. The reason is this, that wheat is there more remunerative. In the hills, there are two kinds of fields, those which are made level by artificial terracing, and those which participate in the inclination of the slopes. The first are favorable for wheat, and therefore little used for the poppy. On sloping ground the crops of wheat are less prolific and more uncertain, it is these fields on which the poppy is chiefly planted, because it is a sure crop and more advantageous than wheat in a pecuniary way. The profits derived from its cultivation are, however, not large even on that kind of ground. In the east the farmer gets a better price for his opium than in the west, and this slight difference in the profits is probably the reason why the poppy is planted much more extensively below than above Chungking. From the extent of my own observations, I estimated, that the poppy does not occupy one-fiftieth part of the arable land of eastern Szchwan, and the ratio is reduced to less than one-hundredth, if it is considered that it occupies the fields only during one-half of the year (from November to May) and to still less if the ground is put down, acre by acre, at its relative value.

The growing of the poppy, considered from an economical point of view, does probably no more harm, in Szchwan and Yünnan, than the planting of tobacco. It has given origin to a valuable article of export, and to a source of revenue derived from ground which would be otherwise of little use. Under the present circumstances, it must be considered as a blessing to the country that the opium is of inferior quality. In the first place, people who would be otherwise induced to use a strong and high-priced opium, are provided with a weak drug and at a low price. In no other province, with the exception of Hunan, did I find the effects of the use of opium so little perceptible as in Szchwan, among the lower classes, probably because the weakness of the drug diminishes its deleterious effects upon the constitution. Then, if it were of a better quality and paid for as high as the opium from Shensi, the poppy would at once drive from the fields those crops which are essential for the sustenance of the people, and cause immense suffering and, probably, a reduction of the number of the population.*

It is for the same reasons that it is probable that the cultivation of the poppy has attained its highest limit. Since several years no impediment has been put upon it, and experience has now fairly shown where the poppy can compete most favorably with other crops. While certain places were found too good for it, it did not thrive at all under certain other conditions. It occupies now probably that portion of the ground which is most adapted for its profitable

* In explanation of this remark, which may appear to contradict the ordinary laws of political economy, it must be observed, that Szchwan is unfortunately situated, as regards the making up of a deficiency in the quantity of food by importation from abroad. The freight on rice and wheat from Hupe or Hunan to various places in Szchwan would, according to their distance from Chung-king-fu, amount to between one and three times the prime cost of those articles in ordinary years. Besides from the time a famine is really felt in Szchwan, it would require from three to six months to provide various portions of the province with imported grain, even if a sufficient number of boats were immediately on hand, and with the whole required stock of grain lay ready for shipment at Sha-Sz and Chang-te-fu.

growth. Besides, the produce of Shensi had much decreased for a number of years during its occupation by the Mohomedans. That province and Shansi were, therefore, supplied to a considerable extent from Sze-chwan. Henceforth Shansi will provide its own wants and supply Shansi. Yünnan may, too, become before long a more dangerous competitor in the production of opium than it is now. On the other hand, however, the Government may, at some time or other, remove or reduce the very heavy restrictions put on the free circulation of native opium. If then Sze-chwan opium should be able to command at Hankan its present price, the consequence would be a larger price paid to the grower, and an immediate increase of the area planted with the poppy.*

Around Ching-tu-fu the houg price of opium in the cities is, at the time of its collection, Tls. 9 to 10 per 100 taels; it rises in spring to Tls. 12 and 12-5. At Sü-chan-fu it is nearly the same, but rises to Tls. 13 in spring. Near Fu-chan on the Yangtse, below Chung-king-fu, the opium was being collected when I passed through the country in April. The growers sold it at 180 to 200 cash per tael or Tls. 10-6 to 11-8 per 100 taels. The houg price in the cities was Tls. 15 to 16. Much of the opium of that region is shipped to Hankan. The duties between Fu-chan and Hankan are no more than 22 cash per tael.

* * *

YÜNNAN.

Opium.—The Nan-tu, or opium from Yünnan, ranks in the opinion of the Chinese next above that from Sze-chwan and Kwei-chan, which as I have said is unanimously declared the lowest in quality of all kinds. The cultivation of the poppy on a large scale is said to have commenced in Yünnan at least sixty years ago, and in Sze-chwan about 25 years later. The best is raised in Ta-lifu and near Hwui-li-chan, that from the latter place being comprised in the denomination *Nan-tu*. It is "dry and of yellow colour," which are considered desirable properties. The Nan-tu costs at present Tls. 14 per 100 taels weight at the places of production. An aggregate li-kin of Tls. 1-6-0 is paid on the various customs stations on the road. It is sold at Suchan-fu at Tls. 16 to 17, but sometimes the price is as low as Tls. 13. The amount of annual importation is large, and stated to be considerably over one million taels in value. The Yünnan drug is chiefly consumed in the cities next to Western Sze-chwan, ranging from Süchan-fu to the plain of Ching-tu-fu. It is said that the poppy is a remunerative crop in the mountainous regions of Yünnan, because grain crops are apt to fail, while the poppy succeeds almost invariably.

Enclosure 3.

Extract from "North China Herald," 15th November 1871.

The *Peking Gazette* of 15th October contains the following representation by one of the Censors with reference to the growth of the poppy :—

Memorial by Wu Chên, Superintending Censor of the Chenkiang Circuit.

Your servant, kneeling, memorializes requesting that the practice of assessing the levy (of opium-duty on growers of the poppy) may be forbidden, in order to further the execution of the laws.

He humbly observes that what should be aimed at in Government is uniformity of practice. With uniformity, the confidence of the people is gained and obedience may be looked for;

* It is difficult to estimate the amount of opium raised in Sze-chwan within a year. In recently published and otherwise very able work it is given as 6,000 piculs, without further commentary. The additional statement is made that fully one-half of the best arable land of the province is planted with poppy. If 24 taels weight is taken as the product of one mow of ground, 94 square miles would be required to raise 6,000 piculs of opium, and the "best land" of the province would comprise no more than 200 square miles. It is also stated by the same author, that more than one-half of the country people and probably seven-tenths of the dwellers in towns are habitual smokers. If 6,000 piculs are divided among one-half of the population as it was in 1812, each smoker would be put on the rather short allowance of less than one tael's weight a year.

To arrive at a more probable calculation of the *minimum* of the present production of opium in Sze-chwan, we may start from the following suppositions,—1st, that the amount of Yünnan opium imported in a year to Sze-chwan is equal to the amount of Sze-chwan opium exported from the province in the same length of time (the export is in reality much larger than the import); 2nd, that the population of Sze-chwan is 21,000,000 souls, and of these one-half are male individuals, that one-half of the male population are over twenty years of age, and that among these there are fifty percentum, or in all 2,600,000 of smokers; 3rd, that one man smokes on an average for twenty copper cash (Tls. 0-0-125) daily, or for Tls. 4-5-0 in a year (this is the amount smoked by coolies, the average is much higher); 4th, that the smoker purchases the opium at an average of Tls. 12-5 for 100 taels. According to these figures, each smoker consumes 225 catties a year, and 2,600,000 smokers consume 60,000 piculs. This is the probable minimum. If it is considered that the population is probably larger than here assumed, that the average amount of opium consumed by a smoker in a day is more than 20 cash in value, that the proportion of smokers is probably considerably above what I have taken for a basis, and that the exports to Siangtan, Hankan, and other places are not by any means counterbalanced by the imports from Yünnan, it will not appear improbable that the actual amount of opium produce in Sze-chwan is 100,000 piculs a year, representing a value of about 20 million taels.

If 24 taels weight of opium are gained from one *mow* planted with poppy (666 mow = 1 English acre), then an area of 937 square miles is required for raising 60,000 piculs, and 1,562 square miles for 100,000 piculs. It is, however, probable that the average yield per mow is about 30 taels or nearly two catties, and the area set apart for the poppy therefore not so large.

The figures will appear excessive, if compared with the amount of Indian opium imported every year and consumed throughout the coast provinces and extensive regions in the interior. But it must be borne in mind that an individual who smokes the Sze-chwan drug consumes more than double in weight of the quantity which is sufficient for the smoker of Indian opium.

without it, suspicions prevail, and obstructions easily arise. Of late years, imperial edicts have repeatedly been issued, prohibiting the cultivation of the poppy, and commanding that any officials who should show themselves remiss in carrying out these orders should be stringently impeached upon statement of the facts of their case. In this it is impossible not to recognize the true method for giving due protection to agriculture, and a far-reaching system of administrative policy. Nevertheless, in despite of the reiterated issue of imperial exhortations, the growth of the poppy goes on as before. On inquiring into the cause of this, it is found that the people have an excuse to rely upon, in the fact of the legalization of the duty on opium. The establishment of the duty on opium, however, was but a concession to temporary exigencies, and even although it may be said that it is a question affecting foreign relations and involves a large amount of revenue, it would seem at least that the levy should take place nowhere except at the ports and customs barriers. Granting, even, that no inconsiderable number of Chinese subjects are engaged in the carriage of the drug, still whatever impost is levied should fall only upon merchants and traders; to assess farmers with the levy of a duty which should be collected only from the trading class, is wholly unwarrantable. Your servant, being a native of the province of Sze-chwan, has learnt that not only is the illegal cultivation of the poppy not prevented by the District Magistrates, but that actually an opium duty is assessed and levied by them in proportion to the amount of land tax paid. Their idea is, that it is by this means easy to obtain the full amount of revenue which they are bound to collect, whilst the method of levying the tax is extremely convenient to them. They pay no attention to the fact that traders on the other hand manage to escape taxation, whilst the farmer alone is burdened with difficulties. The policy of encouraging agriculture, and keeping the trader down, is thus wholly lost sight of; and the action taken is, moreover, not in accordance with the imperial mandates prohibiting the cultivation of the poppy. It is obvious that when the officials of Government levy a duty of this kind upon the farming class, they cannot but be conscious that they are directly conniving at the practice; whilst the farmers, in paying such an impost to Government, are naturally emboldened openly to continue the cultivation. Hence it follows that the laws remain unexecuted. Your servant feels it incumbent upon him to request that a decree be issued, laying injunctions upon the Viceroy that stringent orders be given to his subordinates to the effect that in so far as the duty in question is concerned, steps should only be taken to maintain supervision over mercantile traffic, and forbidding the imposition of a duty in proportion to the land tax, to the detriment of the agricultural class.

Thus it will be plainly impressed upon the mind of the people that husbandry is one of the highest interests of the State. Should there still be any who are regardless of evil in their greed of gain, and who continued the illegal cultivation in despite of prohibitions, the local authorities should be required to keep a strict eye upon them and inflict the punishment which their offence deserves. If officials themselves wilfully continue to levy the impost, it should be permitted to the farmers to denounce them, and they also should have due punishment meted out to them. By this means, both officials and people being mutually on their guard, it may be hoped that exhortations and punishments will be duly regarded, and the laws will be carried into effect. Your servant submits the expression of his humble views, and entreats the sacred glance of your Majesty thereupon.

To the foregoing memorial the following imperial reply was issued on the 5th October:—

With reference to the memorial by the Censor Wu Chên, stating that he has learnt that the District Magistrates of the province of Sze-chwan have not yet prevented the illegal cultivation of the poppy, and on the other hand levy a duty in proportion to the land tax, which practices he proposes shall be forbidden; it is the duty of the local authorities strenuously to prevent the cultivation of the poppy where carried on among the people. With respect to the duty on opium, this impost is collected from the trading class, and no right exists to assess it upon the cultivators of the soil. It the facts be as stated by the Censor, obedience is rightly yielded in the province of Sze-chwan, whence it arises that the abuses cited by him have come into existence; and it is to be feared that a similar state of affairs may likewise prevail in other provinces. Let stringent orders be issued by all the Viceroys and Governors concerned, directing their subordinates to take cognizance only of traders in the levy of the opium duty, and forbidding them to assess the impost proportionately to the land tax, in order that oppression may be guarded against. Notifications must also be issued from time to time warning farmers against the violation of the enactments they would commit by illegally cultivating the poppy.

Respect this!

Enclosure 4.

Extract from "North China Herald," 29th November 1871.

Wu Chêñ, Superintending Censor of the Chênkiang Circuit, has given us one of those peculiarly Chinese memorials which naively let us into the spirit of Chinese administration, and which, if they do no other good, at least point out how little way has been made, notwithstanding the promises of the self-constituted sponsors of Chinese progress. Wu Chên, then, memorialises the throne on the subject of opium cultivation in Sze-chwan, which he prays to have suppressed. Now although differing *in toto* from Wu Chên's conclusions, this is a subject on which many able and philanthropic men will agree with him, and so for the present we shall not

discuss the moral or economic question of the growth of opium, but proceed to the more general one of the relative position, in Chinese eyes, of the two classes of traders and cultivators. That one is supplementary to the other, is an idea at once so apparent to Western intellects that it seems almost too trite for discussion, yet we find in China a traditional policy of quite a different nature. Necessity and reason, both combined, led the authorities of Sze-chwan to increase the tax on what experience proved to be the article of cultivation most profitable for the agriculturist—in other words—opium. It at once afforded a ready means of meeting imperial expenses or exactions, and to a certain extent placed a check on the general cultivation of the drug. It was thus at once fair and politic.

Against this tax, however, the Censor indignantly inveighs, and as his reasons afford a plain statement of the domestic policy of the empire, they may be quoted with advantage: "The policy of encouraging agriculture," says the Censor, "and keeping the trader down is thus wholly lost sight of." This is the goal at which the political science of the Chinese has arrived! It has been our aim, and it ought to have been the aim of all those who were brought into intimate connection with the Chinese, to point out the extreme fallacy of such a proposition, yet we fear the lesson has made but little impression. We have more than once pointed out the advantage, to producers and consumers alike, of free intercommunication. Wu Chên himself would not have had far to go to learn the lesson, as the cotton fields of Yuyao might have shown how useful, nay necessary, to the agriculturist are the services of the trader. What, may we ask Chên, is the advantage to the husbandman of a fertile soil and abundant harvest if he can thereby derive no profit? And whence is his profit to come, but from the trader? His fellow agriculturists will not buy off his hands his surplus crop; it is useless to hoard it up, for it occupies space and rapidly deteriorates, and moreover would only accumulate on his hands till it became unmanageable. What is the consequence? The agriculturist becomes lazy and careless; he knows he can raise enough to support his own and his family's lives out of a small portion of his grounds, so he ceases to dig or plough the remainder; and once become lazy, he soon becomes careless as to the quality of that he does raise. This is what the Censor calls encouraging agriculture.

But let us look to the trader and ask what his business is, and how he would desire to act were he allowed? He would tell us that farmer Wong has so many piculs of rice, and that some friends of his, one hundred *li* away, had had a bad harvest. And he wants to go to farmer Wong and get from him his rice, which he can then sell to his friends. Of course, he wishes to do this for the sake of profit, but the Censor Wu Chên will not pretend that he rose to his present position merely from motives of good towards the people. He studied the four books, passed his examinations, and waited in the hope of gaining some reward for his labours, which reward he obtained in his appointment to office and its emoluments. Now it is indisputable that were the trader we spoke of above allowed to carry out his intentions, he would have advantaged both parties. Farmer Wong would have got money for the rice he did not require, and would have become thereby better able to pay his taxes; he would pay more for the education of his children, and he could buy better clothes and thereby help his neighbour on the hills, whose soil would not grow rice, but produced mulberries and silk-worms. Again, the trader's friends would have had more to eat; they would not have been forced to dig herbs, or sell their children, or go about the country as beggars,—any one of which would have had a tendency to make of them bad men and discontented subjects. The trader himself would have made a profit; but he is entitled to his reward, for has not he made farmer Wong and his own friends happy and contented; and what more could Censor Wu Chên do in return for the emoluments of his office, were he even as great a sage as Confucius himself? But Censor Wu Chên will perhaps say:—Farmer Wong has indeed enriched himself, but he has sent away the rice from the country, and when a time of scarcity comes he will have to starve. But the Censor in this forgets the leading point of the illustration. Farmer Wong is now in turn placed in the position of the trader's friends who wanted rice, but he is much better off in one respect; instead of hoarding up rice which every year became more and more valueless, and which, moreover, convenience reduced to the smallest amount, he is now in possession of money which he has saved during many years of prosperity. Not only has the money not suffered loss by being kept so long, but, if he were a wise man, he has been making it grow also by lending it to the trader, or by buying better tools or more ground, so that he is either in possession of enough of money to support himself or his family without inconvenience, or else he has so improved his farm or added to its size that now, if of his crop seven *pur* were to be destroyed, he would still have enough to live as well as before. The illustration we have given above affords convincing proof of the usefulness, in the economy of the State, of the trader. Every year a like event happens; some portion of the empire produces food in abundance while another lacks it; the trader's business is to bring the two into harmony. He supplies the one with food, the other with money,—both good things in their way, and both having a tendency to tranquilize the people. Such ought to have been the answer of the throne to Wu Chên's well meant, though ill stated, memorial. Instead of this, it does not touch the main point, shrugs its shoulders at the mention of opium cultivation, and directs the officials to issue more proclamations forbidding it, as if the issue of a proclamation could stay the sun in its course, and finally forbids the imposition of heavier taxes on lands producing opium than on those made use of for corn. Is it any wonder that intelligent men have lost all belief in the hope of progress in China?

Enclosure No. 5.

Extracts from "Shanghai Customs Gazette" No. XIV, April—June, 1872.

TRADE STATISTICS OF THE PORT OF TIENTSIN, DATED 20TH JULY 1872.

First in importance, in my estimation, comes a falling off of no less than 1,900 chests of opium of all descriptions. Of Malwa alone the deficit amounts to 1,370 chests, whilst of Persian there is the large number of 340 chests. The latter indicates very clearly the cause of so unsatisfactory an aspect of this branch of the trade of the port, *viz.*, the increasing consumption of the native drug. Throughout the season prices have been low and unremunerative, still the result is as above.

As I have had occasion to point out before, consumers of the native opium, when the supply falls short, turn to Persian opium. When, therefore, so serious a falling off in the import as that now under notice occurs, it may be taken as a certain index as to the abundance of the former.

The fluctuations in the import of piece-goods occurring from time to time are natural and comparatively unimportant, seeing that the result of the past few years' trade has been a steady increase, till in 1871, we have an import more than double that of 1867. Not so with regard to opium, which is at all times threatened most seriously by the competition with the native drug, which, by the present return, would appear to have made the greatest stride towards the expulsion of its rival from the field that the records of the trade show.

Extract from Trade Statistics of the Chinkiang Port, dated 6th July 1872.

There is a general increase in opium, specially in Malwa which shows 1,837 chests against 1,502 during corresponding quarter of last year.

VII.—Special Tables.—The following Tables give the quantity of Opium imported, landed, and re-shipped from the ports in Shanghai to other Chinese Ports during the second quarter, 1872.

TRADE STATISTICS OF THE PORT OF AMOY, DATED 24TH JULY 1872.

Opium.—The importation of all kinds of drug has fallen off, being for Patna and Benares peculs 877, against peculs 1,069 for same quarter in 1871. Prices declined between February and May to the extent at least of $ 60 to $ 70 per pecul.

* * * *

TRADE STATISTICS OF THE PORT OF SWATAW, DATED 1ST JULY 1872.

The considerable increase of 352 chests in the importation of opium against the same period last year is easily explained. The opium for our neighbouring districts was formerly received by a different route, namely, overland from almost directly opposite to Hong-Kong *viâ* Hwei-Chowfu and up to Tung Keang river to Kia-Ying-Chow, &c. An increase of inland taxation, or perhaps only a better adjustment, and as strict a collection of it as takes place here, which dates from about June last year, have brought about a change and made the channel through this port the more advantageous of the two routes.

Enclosure No. 6.

Extract from Report No. III by BARON VON RICHTHOFEN *on the Provinces of Honan and Shansi,—Shanghai,* 1870.

The cultivation of the poppy is spread throughout all the regions which I traversed. In Honan and Shansi, people date the commencement of the use of opium 25 years back, that of the cultivation of the poppy twelve years. Since that time, the progress in both respects has been astonishing, and on the whole route from Fanching to Peking, I found scarcely any but native opium in use. Wealthy people only continue to smoke the foreign or "Kwangtung" opium, and acknowledge that it is superior in flavour to the Chinese. It appears that a great deal of it is adulterated by the Canton merchants, in order to put it within reach of the common people. No wonder, therefore, that the inhabitants of small towns and villages are generally of the opinion that Indian opium is inferior in quality to the better descriptions of their own produce.

The general classification of opium from different countries, in regard to quality, is as follows:—1st, Indian or "Kwangtung;" 2nd, Kansu; 3rd, Shensi; 4th, Honan and Shansi; 5th, Szechuen and Kweichau. There is only one opinion as to the superiority of the Kansu and Shensi opium, and the inferiority of that from Szechuen and Kweichau, to that produced in all other provinces of China. The gradations in price are in perfect accordance with these distinctions. Szechuen opium is everywhere the cheapest, and therefore extensively consumed by the common people. Its price varies between 400 and 500 cash a tael; Hupe, Honan, Shansi, sell at 600 to 700 cash; Shensi at 800; Kansu from 900 to 1,000; foreign at 800 to 1,600 cash. All these prices are for prepared opium. From all I could learn, it may be said that the foreign drug is nearly driven out of the market; or at least, that it is almost only in use with those classes of people who can afford to pay for the flavour of the unadulterated article. This is probably due in some measure to adulteration; but it is quite certain that even the better descriptions of Indian opium have to compete with a dangerous rival in that raised in the provinces of Kansu and Shensi.

* * * *

The only noteworthy articles of export, from Shensi and Kansu to other provinces, appear to be medicines and opium, both of the articles which, on account of their high commercial value, are almost independent of the State of the means of inter-communication. There is nothing which would so much counterbalance the injury done to foreign commerce by the sale of a highly esteemed quality of opium, than to put foreign manufactures and other imports within easy reach of the growers of that opium.

* * * *

It is scarcely possible, as yet, to estimate at its true value the effects of the use and growth of opium by the Chinese. It appears to me that the inhabitants of the northern provinces, chiefly those of Shansi and Honan, are more addicted to its use than those of the south, for instance, of Honan. It may be, that the inactivity during winter, chiefly during the long evenings, causes the promulgation of the evil. It was asserted to me in several places in Shansi, that ninety per centum of the adult male population are given to that vice, and that it is not uncommon among women. It is equally found in cities and villages, and spreads even largely among the labouring classes, which are still free from it in the south and in Manchuria. The population of whole towns are disfigured by the haggard faces and staring eyes, consequent on the use of opium. Without taking here into account its moral effects, it must not be overlooked, from an economical point of view, that opium-smoking consumes a great deal of time, which would otherwise be devoted to labour, and weakens the system for the rest of the time actually employed in work. The aggregate amount of physical force and mechanical work, by which the population is impoverished every year, would sum up terribly if it could be calculated. From the consequences of the use of opium must be distinguished those which attend its growth. I did not ascertain what proportion of arable ground is occupied by the cultivation of the poppy. Since its introduction, twelve years ago, the area planted with it has been constantly increasing. Unlike the south-western provinces where copious rains appear to allow the growth of the poppy in nearly every place that would be

adapted to other crops, it is the best fields which are reserved for it in the north, chiefly the irrigable land; and its cultivation requires the same care as that of garden vegetables. If the same fields were applied to raising wheat, and the same extra labour to other purposes, the population would be better off. On the other hand, it must not be forgotten that this consideration applies to the Chinese Empire at large, but, if we descend into details, is only true in those instances where the opium raised is consumed at home, as is the case in Honan and Shansi, while material benefits can accrue where it is exported, as is the case with Shensi and Kansu. As these provinces produce, besides medicine, no other article of export, and as the opium raised there commands a high price, its direct injurious effects upon the growers may be more than counterbalanced by the material welfare consequent on the sale of the drug; and, though injuring one branch of foreign commerce, that sale may also be the best means to enable the inhabitants of Shensi and Kansu to buy other foreign imports. I have already said, that Indian opium is consumed in very little quantity in the north-western province, although the native growth of the poppy is strictly prohibited by law. This prohibition is among the most prolific sources of income of the officials. Poppy is grown as openly and publicly as wheat; but for every acre planted with it, the tacit connivance of the authorities has been secured by bribery, otherwise the law would be enforced.

Enclosure 7.

Extract from "North China Herald," June 7th, 1873.

Dr. Legge loquitur "Let me commence the statement of my impressions with that point at which Mr. Edkins commenced his paper, *i. e.*, the cultivation of opium. All along the great tract of country over which we travelled from the time we left Fae-yan down nearly to Tsing-Keang-p'oo, it was with the deepest regret that I looked on fields of poppies. At the village to which Mr. Edkins has referred, some old people, with whom we entered into conversation on the subject, expressed their regret, saying the cultivation had commenced the previous year, and that they considered it was a thing very much to be deplored, because the coming generation were all likely to grow up opium-smokers. Just after we passed out of Chihli into Shantung Province, we came to the Tsing-ho, in which flows a considerable portion of the current of the old Yellow River, and crossed it at the foot of the district city of Ts'e-ho. It occurred to me there might be an inlet here for foreign commerce, from the mouth of the Tsing-ho, and that this city of Ts'e-ho would compete with Tientsin, and become a centre for foreign goods for Chihli and Shantung. And I thought if I got down to Shanghai and had such an opportunity as the present, I would tell you of it, and suggest that, in a revision of the treaty, Tsing-ho should be opened to commerce; the junction of the two rivers, the Clear and the Yellow, could be kept open by dredging machines—(laughter)—and foreign nations otherwise do their utmost to encourage commercial activity. Only from this and all other freshly opened ports we should cease to introduce our opium. I know I shall be laughed at, but still it would be a good thing, and if we cannot make a root and branch in the matter, and put an end to the consumption, we had better, at any rate, do no more harm. That is my own opinion, and I would like to have sympathy in it from those engaged in commerce with China, and from the foreign representatives at Peking. The fact is, that from Tae-ugan-foo down to Tsing-Këang-foo opium is extensively cultivated, and the temptation to its production is very great. One man told us he could make six times as much from a *mow* of poppies as of wheat; four times said another; three times, a third; and one said, twice as much, but that was the lowest. On the lowest estimate it is twice as profitable as the growth of wheat; and in that fact I see the utmost temptation to its cultivation, and the probability of its rapidly extending all over the country; and this result I regret as much as, perhaps it is more to be regretted than, the introduction of opium into China from our own British territories of India.

Enclosure 8.

Extract from "North China Herald," September, 21*st* 1872.

The customs statistics of the open ports show such curious fluctuations in the import of opium, that it is by no means easy to reduce these to a settled rule. A general decrease in the amount imported seems, however, to have been established, and this decrease also seems progressive. But it is not by any means constant; at one port the import increases while at another it diminishes, without apparent cause. It may be roughly said that while at the northern ports generally there seems a marked decrease, those in the south appear to remain on the whole pretty constant in their consumption of the drug. The Yangtsze may be taken as the boundary line between the two districts, for although Chinkeang shows a considerable increase in the amount of opium imported, it is more than covered by a decrease elsewhere, especially at Chefoo, and is apparently due not to increased consumption, but to increased facilities for carriage inland. Looking at the opium question from another point, this result is only one that might be anticipated. The drug is grown in comparatively small quantities in the southern provinces where rice and other edible crops bear a higher price and meet with a readier market, while over the provinces north of the river and in Mongolia and Manchuria, where the population does not press so closely on the means of subsistence, it is grown

widely and profitably. Heavy *likin* taxes act as a protection for this native-grown opium, which, weighted with less taxation, and having fewer hands to pass through, comes to the consumer at a rate so much lower than the Indian drug, that despite its inferior quality he elects to use it, or a mixture of the two, in preference to the better but more expensive foreign drug. If it were the policy of the Chinese Government to foster the growth of the native article, it could scarcely take more effective measures. All the while it continues the cry that opium is ruining the Empire. The reason is, perhaps, that the Government has really no policy whatever, and what it does towards keeping out foreign opium, or practically encouraging home-grown, is the result of chance, or the local exigencies of the moment, rather than of any settled rule. In the *North China Herald* of November 15th last, we published a very remarkable memorial from Wu Chien, the Superintending Censor of the Cheh Kiang Circuit, with reference to this matter of the growth of opium. The acknowledgment of the extent to which the poppy is cultivated in Szechuen agrees well with what we have learnt from the Baron von Richthofen and other travellers in that province. Both the memorial and the reply exhibit a strange ignorance of the rudiments of the laws of supply and demand. The Censor complained, first, of the growth of opium to a large extent in Szechuen, and secondly, with some degree of inconsistency, of the provincial officers raising a heavier tax on land devoted to opium than on that under grain. In a reply, somewhat akin to the old legal practise of special pleading, the Government first forbids the growth of opium altogether, secondly, says that lands under opium cultivation must not be more highly taxed than those under grain, and thirdly, that the provincial officers shall take cognizance only of *traders* in their levy of the opium duty! It is difficult to see how even a Chinese official could obey so self-contradictory a document. In consequence, while proclamations forbid the cultivation of the drug, the farmer is allowed to blind the eyes of the officials, and levies are made on the drug in transit and apparently at random, for the trader is the only class in China to whom neither law nor practise allows redress. We have not such definite information of the growth of opium elsewhere, but the venality of the Mandarins, if no higher motive, will always allow it to be grown in greater or less quantities when a demand exists for it. Exceptional raids, like that of the Po-wang, may now and then be put in practice, over a greater or less extent of country, but, though inflicting unmerited loss on the individuals affected, they will have little or no effect on the body of cultivators, who are rich enough to buy off the local officials, or powerful enough to enlist on their side such sticklers for precedent as Wu-Chên, and the advisers of the reply to his memorial. Under those circumstances we see no probability of any recovery of the import trade to the north of China. It would probably be inadvisable, it would certainly be unpopular, to attempt to interfere with the internal taxes on the imported drug so long as Chinese Mandarins remain Chinese, there is, however, no fear of those imports being raised to such an extent as practically to prevent the sale of the article. The duty is at once too profitable and too easily collected, to admit of the success of any measure resulting from a settled policy of exclusion. However dear, the foreign drug will, for long years to come, remain in demand, if not for use by itself, at least to mix with the native article, and the higher the levies placed on the one, *pari passu* will be the squeezes wrung out of the other. As a general rule, Mandarins are not discriminating. All is apt to be fish that comes to their net, and the few instances of discriminating hostility to the foreign import are more than overborne by the general greed which leads the body to get the last *cash* out of everything passing within its clutches. As a Government, the Court at Peking is now too late to seriously check either the import or growth of opium. No British statesman, so long as the growth of native opium is practically permitted, would be justified in allowing the import duty to be raised to a prohibitory degree. The want of system which renders abortive attempts, however well meant, to stop the native growth of the drug, will, we believe, continue to let the imported article gain access to the interior, so long as no practically prohibitory import tariff stands in the way.

Extract from a letter from Baron Richthofen *on the Province of Hunan, dated 20th to 26th February* 1870.

It is noteworthy that, notwithstanding an exceedingly favorable climate, Hunan produces no silk, very little sugar and no opium, excepting a very small quantity grown near the frontier of Kwei-chau. It lacks, therefore, some of the chief sources of wealth which neighbouring provinces, though to all appearance no more advantageously situated, possess. It is difficult to understand the causes of this deficiency. It may be that the climate is unfavorable for the cultivation of the poppy and the level ground may be too limited in extent to admit of planting much beyond what is needed for the daily food of the people. Chinese like to be safe in regard to this, and will generally prefer to supply first their rice and other grain, before they seek to plant those crops which are not for their direct use, but by the sale of which they may acquire the funds for purchasing their food.

* * *

Opium is chiefly imported from Hankau. That from Szechuen is not liked and little used, while Kwei-chau opium is preferred, and said to figure a little more largely in the trade. I saw less of opium-smoking in Hunan than I did in the northern provinces. I was told that all retainers of Mandarins who were in the habit of smoking opium have been dismissed throughout the province. None is said to be used by the imperial soldiers.

No. 965, dated 6th February 1874.

From—R. B. CHAPMAN, Esq., Secy. to the Govt. of India, FINANCIAL DEPT.,
To—W. H. MEDHURST, Esq., Her Britannic Majesty's Consul, Shanghai.

I am directed by His Excellency the Viceroy and Governor General of India in Council to acknowledge the receipt of your letter No. 24 D, dated 9th November 1873, and its enclosures, on the subject of the cultivation of the poppy in China.

The Government of India has read Mr. Gubboy's memorandum with much interest, and considers that all those who are interested in the subject are indebted to that gentleman for the intelligent labour that he has devoted to the preparation of his paper.

I am, however, to point out that there is probably some misprint in the passage at the bottom of page 38 of Baron Richthofen's valuable letter, No. VII, where it is stated that Indian opium is retailed at Si-ngan-fu at taels 10 per tael's weight, which is shown by Mr. Gubboy to be equivalent to no less than Rs. 22-14 per oz. avoirdupois. The rate should probably have been given as Rs. 10 a catty = Re. 1-1-2 an oz. avoirdupois, which is a high price.

The Government of India hesitates to assent to the estimate made by Baron Richthofen of 100,000 piculs of opium as the produce of Sz'-chwan alone. Previous estimates have never made the produce more than about 10,000 piculs.

In conclusion, I am to convey to you the thanks of the Governor General in Council for the trouble you have taken in connection with the subject of the cultivation of opium in China.

GOVERNMENT OF INDIA,

PUBLIC WORKS DEPARTMENT.

J. F. STODDARD, *Colonel, M. S. C.,*
Offg. Asst. Secretary to the Government of Bengal,
Public Works Department, Irrigation Branch.

The 23rd February 1874.

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Tuesday, the 24th February 1874.

PRESENT:

His Excellency the Viceroy and Governor General of India, G. M. S. I., *presiding*.
The Hon'ble B. H. Ellis.
Major-General the Hon'ble Sir H. W. Norman, K. C. B.
The Hon'ble A. Hobhouse, Q. C.
The Hon'ble E. C. Bayley, C. S. I.
His Highness the Mahárájá of Vizianagram, K. C. S. I.
The Hon'ble Rájá Ramánáth Tagore.
The Hon'ble R. A. Dalyell.
The Hon'ble H. H. Sutherland.
The Hon'ble B. D. Colvin.

MARRIED WOMEN'S PROPERTY BILL.

The Hon'ble MR. HOBHOUSE moved that the Report of the Select Committee on the Bill to explain and amend the law relating to certain Married Women, and for other purposes, be taken into consideration. He said that the Council would observe by the Report that there was very little alteration in the Bill as it now stood from what it was when it was first introduced. He had, therefore, little to explain to the Council. He had shown on a previous occasion that the Bill did not introduce any new principle. The broad principle of the separation of interests as between husband and wife was affirmed by the Indian Succession Act, and the object of this Bill was only to extend that principle to certain details, and to make it apply in one particular class of transactions, namely, policies of insurance, to persons who were married before the Indian Succession Act came into force.

There were only three alterations of any importance introduced by the Select Committee in the Bill. The first was in section 5, where the power of the wife to effect policies of insurance had been made indefinite and not confined to her own life or the life of her husband—it might be on that of a parent, a sister, or any one else. There was no reason why the power should not be extended.

By section 7, married women who were sued would be subject to such suits, processes and orders in respect of their property as they would be liable to if they were unmarried. It gave them, with the power, the responsibility of having separate property. Whether that would have been the law without this enactment, he could not say. His impression was that it would. We had an intimation of judicial opinion in that direction. He had said that the matter would be taken into consideration by the Select Committee. They did consider it, and proposed to declare the law as it stood in the Bill.

The only other alteration was that section 9 had been made to extend to persons who were married before the 1st January 1866 when they had separate property. It could not possibly matter when the separate property was acquired: whether the property was acquired by special contract before the 1st January 1866, or by the general provisions of the law subsequent to that date, did not signify at all with respect to the liabilities of the wife under that enactment.

Those were all the points he had to mention.

The Motion was put and agreed to.

The Hon'ble MR. HOBHOUSE also moved that the Bill as amended be passed. In doing so he might state that, as far as suggestions had come in, there had been a remarkable unanimity expressed that the Bill was a useful one, and there was every reason to believe that, though its operation would not be extensive, it would operate well.

The Motion was put and agreed to.

FOREIGN ENLISTMENT BILL.

The Hon'ble MR. HOBHOUSE also moved that the Report of the Select Committee on the Bill to prohibit recruiting in British India for the service of Foreign States, be taken into consideration. He said that the only point which he thought it at all necessary to observe upon was as to the form of the Bill, by which we did not positively prohibit in the Act itself the recruiting which it was desired to control, but only gave to the Government a power of interfering whenever they thought it necessary. That point he had mentioned before, and His Honour the Lieutenant-Governor of Bengal then expressed some doubt which was the better principle to go upon, and MR. HOBHOUSE then stated that the Select Committee would take the matter into consideration. The question had been discussed, and it seemed to them that it might be inconvenient to have a positive law which might prevent a perfectly innocent operation. On the other hand, they believed that a proceeding of this sort could not go on to any injurious extent or for any length of time without the Government becoming aware of it, and the moment that was so they could move in the matter. It was therefore thought the Bill, as it at present stood, was calculated to preserve to the Government all the necessary powers.

The Motion was put and agreed to.

The Hon'ble MR. HOBHOUSE also moved that the Bill as amended be passed.

The Motion was put and agreed to.

KULLU SUB-DIVISION (PANJAB) APPELLATE POWERS BILL.

The Hon'ble MR. HOBHOUSE also presented the Report of the Select Committee on the Bill to invest the Assistant Commissioner in charge of the Kullu Sub-division of the Kángrá District with certain appellate powers.

ASSAM CHIEF COMMISSIONER'S POWERS BILL.

The Hon'ble MR. HOBHOUSE also introduced the Bill to provide for the exercise of the powers hitherto exercised by the Lieutenant-Governor and Board of Revenue of Bengal in the territories forming the Chief Commissionership of Assam, and moved that it be referred to a Select Committee with instructions to report in a fortnight. He said that the Council would observe that the Bill was exactly what he had said it would be. It was merely a formal transfer of the powers vested by Statute in the Lieutenant-Governor and the Board of Revenue of Bengal, for the purpose of their being exercised under the direction of the Governor General in Council by the new Chief Commissioner of Assam. MR. HOBHOUSE thought a fortnight would be found quite sufficient time for the Select Committee to make their report.

The Motion was put and agreed to.

BOMBAY REVENUE JURISDICTION BILL.

The Hon'ble MR. HOBHOUSE moved that, in the room of the Hon'ble Mr. Inglis, the Hon'ble Mr. Dalyell be appointed a Member of the Select Committee on the Bill to limit the jurisdiction of the Civil Courts throughout the Bombay Presidency in matters relating to the land-revenue.

The Motion was put and agreed to.

The following Select Committee was named :—

On the Bill to provide for the exercise of the powers hitherto exercised by the Lieutenant-Governor and Board of Revenue of Bengal in the territories forming the Chief Commissionership of Assam——The Hon'ble Messrs. Bayley, Dalyell and the Mover.

The Council then adjourned to Tuesday, the 10th March 1874.

CALCUTTA; *The 24th February* 1874.

WHITLEY STOKES,
Secretary to the Government of India,

GOVERNMENT OF INDIA.

DEPARTMENT OF AGRICULTURE, REVENUE AND COMMERCE.

REPORTS ON THE STATE OF THE SEASON AND PROSPECTS OF THE CROPS FOR THE FORTNIGHT ENDING THE 5th MARCH 1874.

GENERAL REMARKS.—In the northern districts of Madras there has been no rain, but prospects appear to be tolerably good; in the south there has been a fall of about an inch in some places; want of water is still, however, complained of, and prospects are said to be not altogether satisfactory. There has been slight rain in parts of Sindh, where rats are said to threaten damage; more in the Deccan districts, and none elsewhere in Bombay; reports from the Presidency generally are good. In Bengal there has been slight rain during the fortnight in many districts, and the weather has been generally most favorable to the progress of the crops; standing crops are said to be prospering in most places; preparations for the early rice sowings are actively going on. The northern sub-divisions of Tirhoot are as before the tract where the condition of the crops and people is worst. There is no increase of distress in the eastern districts of the North-Western Provinces, where the wheat and barley harvest has begun; prices have fallen in Bustee, Mirzapore, Jounpore and Azimgurh. Elsewhere in the province prospects are good, except in parts of Bundelkund, and especially Banda, where relief works are being carried on. Reports from Oudh are favorable. There has been no rain in the Punjab during the fortnight; the prospects of the harvest continue good. In the Central Provinces there has been a little rain in some districts; prospects are generally favorable, the *rubbee* harvest is in progress. In Berar the *rubbee* has been reaped with a fair out-turn. Reports from Rajpootana and Central India state that the crops are generally promising. Prospects in Mysore are fair.

Presidency or Province and District.	Rainfall for fortnight preceding.	State of agricultural prospects.
Madras (Mar. 5th)		
Kistna (4th)	...	No rain at Masulipatam or elsewhere; one inch water below anicut; canal supply scanty; jowra, raggy and onions sown in Palnad; cotton, paddy and chillies suffer from drought and grub in two taluqs; the rest fair on the whole; gram, black gram, chillies, tobacco and castor being reaped in places; markets well supplied locally; prices steady; pasture scarce; small-pox and fever general, except in Sattanapulli; guinea-worm in Palnad; cattle healthy in two taluqs.
Kurnool "	...	Season favorable throughout; outturn of later crops fair; markets well supplied; grain is being largely exported into Nellore from Markapur taluq; prices rising in Koilkoontla, Markapur and Ramulkota, but stationary elsewhere; water and dry fodder plentiful; fever in Cumbum and Ramulkota; cattle disease in four taluqs.
Negapatam "	...	Rainfall at Negapatam 0·5, elsewhere tolerably good; rivers dry; water in tanks scanty; cultivation of some dry grain continues; standing crops somewhat benefited by late rains; Saonbapishamun harvest continues—yield below average; markets sufficiently supplied; prices slightly declining; pasture moderate; health generally good, but for small-pox in some places; cattle healthy.
Trichinopoly "	...	Rainfall one inch in the Cauvery Valley; on the 18th slight showers elsewhere; nowhere of material advantage to the crops; water even for drinking is failing in some villages; wet crops have entirely failed in the badly irrigated parts of the district, but have been tolerably good under channel irrigation; dry crops generally bad; outturn of rice below average; markets generally sufficiently supplied; prices slightly lower than last fortnight; pasture beginning to fail; men and cattle healthy.
Calicut (4th)	0·15	Second crop harvested; yield low; supply of grain from local sources not ample; prices increasing; pasture scanty; small-pox prevalent; fever slightly in hilly parts; cattle healthy.
Bombay (Mar. 4th)		*General Remarks.*—General prospects not altogether satisfactory.
Sindh.		
Kurrachee ...	...	Rain much wanted to get rid of rats; in Shahbandur districts, injury to next khureef crops apprehended from them.
Hyderabad ...	...	Weather warmer; crops ripening and promising.
Shikarpur ...	...	Weather cloudy; slight rain on 1st instant; crops very promising, no sickness.
Upper Frontier ...	...	Rubbee crops extensive; early sowings very promising; public health improving.
Gujarat.		
Ahmedabad ...	...	Rubbee and public health continue good.
Kaira ...	...	Cotton and other rubbee crops good; weather getting warm; public health good.
Surat ...	....	Crops good; fever in some taluqs.
Broach ...	...	Crops picked, excepting cotton in some places; weather good.
Khandesh and Nasik.		
Khandesh ...	...	Cotton market brisk; about ten annas exported; reserves of better quality; reaping of wheat and gram progressing.
Nasik ...	...	Harvesting of late crops continues; public health good; cattle disease continues in Nandgaum, Peint and Nasik.
Thana ...	...	In town ague prevails; public health good; fever and cattle disease in some talqs.
Deccan.		
Poona ...	·30	Hot season commenced; public health good.
Ahmednuggur ...	·18	Harvesting of rubbee finished; slight cattle disease in taluq Aukola; public health good.
Sholapur ...	...	No change.
Satara ...	·80	Crops slightly damaged by rain at Malghiras; ague and cattle disease at Patan.
Southern Mahratta Country.		
Belgaum ...	...	Cotton crops indifferent; public health good.
Dharwar ...	...	No important change.
Canara ...	...	Prospects of second crop good; slight rain at Moondgode and Halial; fever and small-pox prevail slightly in some places.

Presidency or Province and District.	Rainfall for fortnight preceding.	State of agricultural prospects.
Bombay—*continued.*		
Kattyawar and Gaekwar's territory.		
Rajkot ...	...	Wheat mostly harvested and brought to market; cotton-picking progressing.
Wudwan ...	...	Weather moderate; state of crops same as before; public health good.
Baroda	...	Cotton-picking commenced; crops and public health good.
Bengal (Mar. 3rd)		
Burdwan ...	·60	There have been slight showers of rain at Cutwa, Bood-Bood and Raneegunge; the weather has been warmer all over the district; the prospects of the cold weather crops are good, especially potatoes; sugarcane is being reaped; price of rice a little cheaper.
24-Pergunnahs ...	.06	Weather getting hotter; cloudy on the 26th and 27th February, with slight rain in parts of the district; crops, a few vegetables on the ground; tobacco injured by the late rains; barley looks flourishing; ploughing for the early rice sowings going on extensively.
Dacca ...	·35	Weather cloudy and foggy during the first part, the remaining days fair, sunny and warm; prospects of the crops good; boro paddy will be a very full crop; also cheena (millet) of which there is a large extent; early rice being sown; ploughing nearly finished.
Cuttack ...	*Nil*	Weather cloudy and warm during the first part but afterwards warm; prospects of the dalua rice good; cold weather crops yielding a good outturn; prices stationary.
Distressed Districts.		
Moorshedabad ...	*Nil*	The heat increases daily; nights pretty cool recently; there was a drizzle at Ramporehat and Jungypore on the 22nd February; crops progressing favorably and approaching maturity; some, as peas, lentils and khesaree (pulse), are being gathered; boro paddy looks well; the outturn of mulberry is expected to be very good; cultivators of the plant will derive much benefit from the sales for the next silk bund; prices have not varied much, except at Lallbaugh, where they have fallen.
Dinagepore ...	*Nil*	A little rain in one or two places in the early part of the fortnight; otherwise bright and sunny; west wind, rather warm, commenced blowing during the latter part, but has stopped since the 27th February; boro rice getting on well; some of the earlier planted rice has suffered from the cold, but should recover from the warm weather; preparations for sowing the early rice are actively going on and in a few places it has been actually sown.
Maldah ...	·03	Weather fair during the first week; cloudy during the first two days of the second week and threatening on the 23rd February, with slight rain; the state of the cold weather crops and boro paddy continues favorable, all of which promise a favorable yield, if nothing unforeseen occurs to injure them; prices are generally stationary, but in some places in the interior have fallen.
Rajshahye ...	*Nil.*	In the first week, the mornings were generally foggy; slight rain reported from all thannahs; a little hail fell in Buraigon, Nattore and Pootea; no rain during the second week, except a few drops in Singra, Bagmara and Nattore, and the weather was clear and hot; the cold weather crops, wheat, barley, millet, &c., continue to improve; urhur and khesaree pulses and gram and peas have suffered from the rain, and some damage has been done by hail in Pootea, but the extent of injury is not great; transplanting of boro rice continues favorably; ploughing for the next early and late rice sowings are going on; paddy is being sown in Pootea; prices are stationary, except at Singra, where the price of rice and paddy has fallen slightly.
Rungpore ...	*Nil.*	Weather during the first part was rather warm for the time of the year; slight showers at Bhowanigunge; in the latter part the weather was fair and on the whole cool; all the winter crops are doing well; wheat in the south of the district is particularly flourishing; early rice being sown more extensively than usual; rice is selling at Rs. 2-8 to 3-8 per maund, except at Kallygunge, where the price is Rs. 4-8.
Bogra ...	*Nil.*	Weather getting hot gradually; cold weather crops are getting on well; mustard has been reaped in some places and the yield good; sugarcane being cut and a good yield expected.
Patna ...	*Nil.*	On the 23rd February a very slight shower of rain, afterwards clear and bright; prospects of the cold weather crops continue to be favorable; rahur, kerai and mussoor pulses and rai oilseed are being harvested.
Gya ...	·01	Weather, seasonable; very slight on the 21st and 23rd February at the Sudder; the prospects of the cold weather crops continue good; poppy excellent; mussoor pulse, mustard and peas are being harvested; prices have fallen slightly.
Shahabad ...	*Nil*	Weather clear, with moderate west wind; days hot; mornings and evenings cool; no rain; prospects of the crops good, wheat, peas and khesaree pulses are being gathered; the weather has been very favorable for bringing the remaining cold weather crops to maturity; peas, rahur and mussoor pulses have suffered both from frost and rain, and will not give such a full outturn as was expected; cheena (millet) being sown; the greater part of the peas and sugarcane has been gathered, while isolated patches of other crops are also being harvested.
Tirhoot ...	*Nil*	Weather cloudy, with westerly wind during the first part; getting warmer during the latter part. In the Hajeepore sub-division there is no change since last report; the rahur pulse and other crops in the Mohowah Elaka, which the sub-divisional officer has seen, are remarkably fine. In the Tajpore sub-division the late rains are said to have done more good than it was expected they would to the crops on the ground; it has also benefited the moong (pulse) and kowni and cheena (millets), freshening what has sprouted and making what had been sown on the chance of rain without sufficient moisture, germinate; it is impossible yet to estimate the extent of the recent sowings of these crops; mustard and tobacco are being cut; everything promises well in the Dearahs. In the Madhoobani sub-division some

Presidency or Province and District.	Rainfall for fortnight preceding.	State of agricultural prospects.
Bengal,—*continued.*		
		but very little cheena (*millet*) and moong (pulse) has been sown; the mustard crop is ripe and the rahur (pulse) as well on; the other crops are mostly very poor, and even if they are all reaped will not give more than one-anna return. In the Durbhangah sub-division mustard is being gathered in places and is a good crop, being nowhere less than ten annas, and in some localities fully twelve annas; peas and wheat except in isolated localities are very poor, and oats still worse. The prospects of the cold weather crops cannot now be improved with the exception of rahur (pulse) and mustard; no reliance can be placed with cold weather crops; there has been a good deal of cheena (*millet*) sown; tobacco looks fair, but it will be under an average crop. In the Seetamarhee sub-division a shower of rain fell on the 21st February; reports from all sides show that wheat, barley, rahur and moong (pulses), gram, mustard and cheena (millet) are doing well; the timely fall of rain in the first week of February has enabled the ryots to sow millets and pulses. In the sudder sub-division the prospects of crops remain much the same as last reported.
Sarun ...	*Nil*	Weather fair and seasonable; cloudy on the 21st February; west wind prevailing; the weather during the past fortnight has been all that could be desired for the crops; the fine weather following the rains has done the crops an immense amount of good; the crops are now ripening fast, and if the weather continues favorable, the outturn of the crops will, on the whole, be very fair, averaging probably eight annas all round. Peas, mustard, gram and massoor (pulse) are being harvested; wheat, barley, and rahur (pulse) doing well, and are fast ripening; poppy heads are being tapped; people are briskly engaged in sowing the spring crops, such as cheena (millet), moong (pulse), and melons; sugarcane is being planted for the next year's crop; indigo sowings going on; mangoe in blossom and promises a fair harvest if nothing unforeseen occurs to injure the blossoms; new rahur, massoor and khesaree (pulses) are coming into the market; prices on the whole have fallen.
Chumparun ...	*Nil*	East and west winds; crops—the prospects of the cold weather crops continue good, blight is reported from some parts, but no great damage is believed to have taken place; peas, massoor and kerai (*pulses*) are being harvested; the poppy in the southern part of Bettiah sub-division and north and north-east of the sudder division is very promising; cheena (millet) is very largely sown, and should rain fall again much assistance from this crop may be expected.
Monghyr ...	·02	Weather set fair; the prospects of the cold weather crops continue favorable; the wheat is an average crop; if no unforeseen calamity occurs, a 12-anna crop will be cut.
Bhaugulpoor ...	·1	Weather reported favorable, slight rain at Banka, which proved beneficial to crops; cold weather crops generally doing well.
Purneah ...	·02	Weather getting hot, cold at night and in the mornings; high west wind by day. The prospects of the cold weather crops continue good; wheat is in ear, kowni (millet) and early rice (jamera and jully) are being sown. Ploughing for the Bhadad or early rice going on; mustard crop is nearly all cut and in the south being exchanged for rice.
Lohardugga ...	...	Palamow sub-division—The reports of the prospects of the crop show that it has been doubled owing to the late rain, and that a 10 or 12-anna outturn may be expected, but unfortunately the area under cultivation is very small; ploughing and cultivation still going on; there has been slight rain in this sub-division, but not enough to do any damage.
		Public health.—Burdwan, fever as before. 24-Pergunnahs, fever has disappeared from Barroeepore and abated in Barroeepore and Dum-Dum; a few cases of cholera reported from thannahs Bankipore, Baduria and Protabgunge; two cases of small pox from Nawabgunge and one from Satkera. Cuttack, public health good. Patna, health of the district good, except a few cases of small-pox in the sudder sub-divisions, Bhaugulpore, health good. Moorshedabad, small-pox decreasing.
		General Remarks.—Cold weather crops are doing well in almost all places as well as the spring sowings. Preparations for the ensuing rice sowings are actively progressing; in some places it has already commenced.
N. W. P. (Mar. 5th)		
Bustee (2nd)	...	Prices rather lower; rubbee generally successful and nearly ripe; new wheat coming into market; no increase of distress.
Goruckpoor (1st)	...	No change; crops ripening well; pea crop harvested; cuttings of cereals about to begin; a twelve-anna crop expected; six relief works and 8,500 labourers, chiefly women and children; relief given daily to about 1,000 aged and infirm poor at head quarters, and to smaller numbers in other places.
Ghazeepoor (2nd)	...	Prices unchanged; barley cutting begun; ten relief works open; distribution of food at head quarters and tahsil towns to poor unable to work; expenditure on this account about Rs. 200 a week.
Mirzapoor (2nd)	...	Prices on the whole fallen; rubbee ripening well, and will differ from that of an average year only by smaller area sown, and damage done by frost; peas and mussoor cutting begun and barley cutting south of the hills; distress not increasing; imports continue to increase.
Benares (4th)	...	No change of importance; harvest begun; applicants for labor still very few.
Azimgurh (1st)	...	Prices lower; new peas in the market; wheat and barley beginning to be cut; no relief works, the works so called in last two reports were not carried on at relief rates.
Cawnpoor (3rd)	.....	Prices of better grains unchanged; crops ripening and ready for reaping; export of grain eastward continues.
Bijnour (4th)	*Nil*	Crops as good as they promised to be; prices somewhat higher.
Agra (4th)	.....	Occasional clouds and a few drops of rain; rubbee prospects still generally favorable.
Aligarh (4th)	*Nil*	Rubbee promises well.
Jounpoor (2nd)	...	Fall in prices continues, though imports from Oudh only half as much as last week; some new peas, barley and gram in the market; labour not obtainable at 1½ annas the day; no relief works needed.

Presidency or Province and District.	Rainfall for fortnight preceding.	State of agricultural prospects.
N. W. P.—*continued.*		
Allahabad (Mar. 4th)	...	Slight rise in prices; appearance of crop healthy; rubbee cutting begun in some parts of the district.
Banda (3rd)	...	Rubbee promising and uninjured; gram and mussoor cutting begun; mohwa crop on which much depends looks well; distress appears to be general among the lower classes, especially in the villages; town relief works on which between 7,000 and 8,000 labourers are employed have been started; additional relief works will be opened where necessary; poor houses have been established at several places and food is distributed at tehsils and police stations to persons unable to work; relief committees appointed in the towns.
Humeerpoor (3rd)	...	Prices mostly a little higher; rubbee ripening; gram and linseed cutting begun; relief works open in three places.
Jaloun (3rd)	...	Prices higher owing to large export to Gwalior and neighbouring Native States; rubbee ripening; an average crop; relief works about to open.
Futtehghur (4th)	No rain ...	Strong west wind last week; average prospects.
Agra (4th)	...	Clouds and a few drops of rain; rubbee prospects good.
Meerut (5th)	...	Wind variable; weather cloudy; slight rain at Meerut; prospects of more.
Saharunpoor (4th)	...	Prospects good; crops in some parts very fine.
Moradabad (4th)	...	Prices tending downwards; rubbee slightly injured by strong west wind for two or three nights.
Jhansie (4th)	...	Rubbee prospects continue good; prices still high; considerable distress in pergunnah Mow; emigration going on.
Bareilly (4th)	No rain ...	Prices stationary.
		General Remarks.—Prospects on the whole favourable in the eastern districts, but not so in parts of the Banda district and Jhansie division.
Punjab—		No rain reported during fortnight ending 4th instant; harvest prospects everywhere reported good; saving small-pox in parts of Hissar and Sirsa districts, public health reported good.
Oudh—		
Lucknow (Mar. 5th)	*Nil.*	Prospects of wheat, barley and of such portion of orhar and peas as escaped the frost continue good; peas are being cut; weather somewhat unsettled.
Fyzabad (4th)	*Nil.*	
C. Provinces—		
Upper Godaveri (Feb. 27th)	..	Warm; second paddy crop promises well; few cases of small-pox.
Chanda (28th)	...	Clear; prospects good; prices rising; small-pox lingering.
Sumbulpoor ...	·07	Clear; cool; crops harvested; prices stationary; health good.
Bhandara ...	·15	Rubbee gathered; wheat outturn average; pulses above average; small-pox prevalent.
Mandla ...	·05	Prospects good; slight damage by hail storms; prices stationary; health good.
Saugor (Mar. 4th)	...	Clear; pleasant; rubbee being reaped; small-pox in places; health good.
Wurdah ...	·4	Reaping rubbee nearly completed; fever prevalent; small-pox increasing.
Jubbulpur ...	...	Clear; prospects good; prices stationary; health good.
Dumoh ...		
Nursinghpoor ...	...	Clear; reaping rubbee in progress.
Nimar ...	...	Clear; prices stationary; prospects favorable.
Hoshangabad ...	...	Clear; prospects and general health good; few cases of small-pox.
Baitul ...	...	Prospects and general health good.
Seoni ...	...	Rubbee being reaped.
Nagpoor ...	·02	Cloudy; rubbee being threshed; small-pox prevalent.
Raipoor (Feb. 28th)	·07	Heavy storms on 26th; prospects good; prices falling; small-pox prevalent; cattle disease decreasing.
Balaghat ...	·03	Prospects fair; prices stationary; small-pox prevalent.
Hyderabad Assigned Districts—		
East Berar (Mar. 5th)	...	Reaping of rubbee completed; outturn fair.
West Berar (4th)	...	Rubbee crops almost harvested; outturn fair; health good.
Mysore & Coorg (Mar. 5th)		
Bangalore (3rd & 4th)	...	Wet crops in good condition; public health good; prices stationary.
Toomkoor "		
Kolar "		
Mysore (2nd)	...	Paddy, sugarcane, and Bengal gram thriving; public health generally good; cattle disease in four taluqs.
Hassan "		
Shimoga (Feb. 28th)	...	Standing crops good; wheat and Bengal gram harvested; wet crops suffering for want of water in tanks in one taluq; public health generally good; cattle disease is prevalent throughout the Chituldoorg district, and forage is scarce.
Chituldroog "		
Coorg (Mar. 4th)	...	Coffee blossom in the Bamboo district very forward; fever and small-pox prevalent in certain localities.
		General Remarks.—Agricultural prospects tolerable; cattle disease continues.
Rajpootana—		
Serohi (Feb. 16th)	·02	Tanks dry, well supply short; crops fair; health very good; weather seasonable.
Meywar (21st)	...	Water plentiful in eastern districts, in western it is low; crops average in the former and deficient in latter; health very good; small-pox prevalent.
Harowtee ...	...	Tanks and wells moderately full; crops fair and health good.
(Agency States)		
Ulwur (Feb. 26th)	...	Water-supply satisfactory; crops good; the yield will probably be above the average; health good.
Ajmere (Mar. 5th)	...	Harvest prospects good; weather seasonable.
Shurtpoor (Feb. 28th)	...	Health good; three-fourths of the spring crops in the Eastern States have escaped the frost and promise fairly.
[illegible] (Mar. 5th)	...	Agricultural prospects excellent; public health good.

Presidency or Province and District.	Rainfall for fortnight preceding.	State of agricultural prospects.
Central India—		
Indore (March 5th)	...	Weather cloudy and hot; health good; prospects unaltered.
Gwalior "	...	Slight rain; weather cloudy; crops fair; small-pox continues.
Neemuch "	...	Fine weather; harvest prospects are promising.
Rutlam "	...	No rain; health good; prospects favorable.
Bagelkhund (Sutna) ...	...	Prospects much improved; public health good.
British Burmah— ...	...	No report received.
Nepal (Feb. 25th)	*Nil.*	Spring crops are looking very well; health good.
Assam (Feb. 19th)		
Cachar (14th)	3·78	The weather during the week has been most unusual and cold; the winter crops are doing well; the unusual rain has caused the growth of a fine crop of grass in the paddy fields from which the late crop had been cut, forming excellent pasturage for the cattle.
Gowalpara ...	·19	Weather cloudy with high wind generally; rubbee crops are getting on well; the ploughing of land for ouse crop is progressing steadily, and in some places sowing has commenced.
Kamroop ...	·44	Cloudy in early part and fairly clear during the latter part of the week; there were some showers of rain, and the land is being ploughed for ouse crop; public health good.
Durrung ...	·73	Weather unsettled; temperature and direction of wind very changeable, especially from south-west to north-east; the spring crops are being sown in many parts of the districts, and preparations for sowing are going on in other places; the mustard crop turns out well; much sickness among cattle reported from the extreme east of the district.
Nowgong	·85	Rain nearly all the week; the agriculturists are busy ploughing their lands for the spring crops; the rain has done immense good; general health good.
Sibsagar	·47	Weather cloudy for the most part of the week; no change in the prospects of the crops since last report.
Luckimpore	·83	Weather getting perceptibly warmer; days generally cloudy; mustard crop good on the churs and middling on the main land; preparation of land for *aus* crop has been commenced; public health good.
Khasi Hills	·60	Weather unseasonable, boisterous, with rain daily at intervals; the preparation of land for the spring cultivation is progressing steadily.

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

[IRRIGATION.]

REVENUE REPORT OF IRRIGATION WORKS IN THE PUNJAB FOR THE YEAR 1872-73.

No. 110—24 I, dated 3rd March 1874.

OBSERVATIONS—By the Government of India, PUBLIC WORKS DEPT.

Read—

Letter from Punjab Government, No. 4874 I, dated the 15th November 1873, and accompaniment.

OBSERVATIONS.—The Government of India is gratified to observe the punctual submission of this report, and His Excellency in Council trusts that the improvement effected in this respect will be maintained.

GENERAL RESULTS.

2. After carrying out certain corrections in the report, the financial state of the canals in the Punjab appears to be as follows. Including those which are only in course of construction, as well as those which are in actual operation, the aggregate capital invested to the 31st March 1873, exclusive of that debited to Native States, amounted to Rs. 2,29,96,184, or, including the sum debitable to Native States for expenditure on the Sirhind Canal, to Rs. 2,50,51,653; of this sum, Rs. 23,98,390 were expended during the year under review, but though Rs. 4,11,712 thereof are debited to canals in operation, only Rs. 43,020 can be considered to be invested in such a manner as to yield an immediate return, the larger portion of the outlay, Rs. 23,55,370, having been incurred on works from which no returns can be expected until their completion.

3. It would have facilitated comparison had the Chief Engineer at page 20, para. 89 of his report, added a column to show the outlay from "Contri-

butions" on the Sirhind Canal. The total outlay would then have been seen at a glance without having to add thereto the further figures given in paras. 91 and 92, in order to obtain agreement with the Finance Accounts.

4. The area irrigated during the year amounted to 1,154,150 acres, against 1,163,204 in the previous year; there was, therefore, a falling off in the irrigated area of 9,054 acres. Notwithstanding that the rainfall was generally more abundant and better distributed than for many years previously, the area is within 8,800 acres of that irrigated in the year of drought, 1868-69. The falling off of 150,839 acres in the irrigation from Perennial Canals was mostly compensated for by an almost corresponding increase in the irrigated area of the Inundation Canals.

5. The nett returns of the year show a decrease as compared with that obtained in the previous year, the percentage of profits being 3·89 against 4·99 from direct income, and 9·09 against 10·65 if the increase of land revenue due to irrigation is included.

6. There is a decrease of nearly half a lakh of rupees in the working expenses as compared with the two previous years, which is very satisfactory, and His Excellency in Council is glad to perceive that the Local Government is endeavouring to effect improvement in this direction.

7. The Establishment charges debited to the Capital Accounts of the Western Jumna and Baree Doab Canals amount to over 150 and 100 per cent., respectively, of the outlay during the year; this has been caused by the large proportion of establishment employed on surveys for suggested improvements.

8. Excluding the works which are under construction, and dealing only with such as are in actual operation, the accumulated charge for interest aggregates Rs. 1,14,12,781, exceeding the accumulated total of the nett direct income by Rs. 21,74,828. But if the indirect returns, *i. e.*, the increase of land revenue due to irrigation, be taken into calculation, there appears a nett profit of Rs. 23,01,503 in excess of the total capital expenditure at the close of the year. The greater portion of this is due to the Western Jumna Canal.

9. The following table shows the maximum and minimum rainfall and irrigated areas under the several canals for the past seven years:—

	1866-67.	1867-68.	1868-69.	1869-70.	1870-71.	1871-72.	1872-73.

10. The general financial results for the year 1872-73 are exhibited in the table below. It is to be noted that the entries under the head "Income" are not the actual receipts during the year, and therefore do not agree with the figures of the Finance Accounts. They are the assessments made in the year; but the periods in which they are earned and collected do not correspond, the latter being later than the official year.

Abstract of General Financial Results of Canals in operation for 1872-73.

(*a*).—Does not include the revenue and working expenses of the Hasli Canal, which up to end of 1869-60 amounted, respectively, to Rs. 8,49,849 and 2,91,528.

(*b*).—Includes an outlay of Rs. 20,55,469 to end of 1872-73 debited to Native States.

11A. The mode in which the "indirect" revenue, that is, the increase of *land* revenue due to irrigation, has been arrived at is not clear, and the Governor General in Council desires that a special report may be submitted, showing in detail for each district how the various sums credited under this head have been calculated.

12. The subjoined table shows the proportion of flow to lift irrigation on the principal canals for the past three years :—

		1870-71.	1871-72.	1872-73.
Western Jumna Canal	Flow ...	90·79	90·73	88·08

Indus Inundation Canals	Flow ...	90·00	89·24	91·60
	Lift ...	10·00	10·76	8·40

13. The foregoing paragraphs apply to the Irrigation works of the entire Province. The working of each separate project will now be reviewed.

Western Jumna Canal.

14. The area irrigated on this Canal in 1872-73 was 351,821 acres, which is less than that of the previous year by 92,564 acres. The rainfall, though below that of the past two years, was timely and well distributed, favouring the cultivators considerably in the watering season. The results of the year's operation contrast favourably with those of 1867-68, a year of somewhat similar rainfall.

15. In the subjoined table the operations of the past eight years are compared—

Year.	Acres.	Gross revenue.	Nett profits.	Percentage on Capital outlay.	Rainfall. Maximum and minimum.
		Rs.	Rs.		Inches.
1865-66	397,963	4,90,468	2,37,319	...	...
1866-67	447,171	7,50,497	5,10,451	...	37·53 to ·73
1867-68	331,037	8,66,963	5,42,973	23·5	68·4 to 22·9
1868-69	486,878	12,21,072	8,65,966	37·51	15·30 to 8·7
1869-70	496,542	12,53,012	8,75,994	35·82	30·97 to 6·5
1870-71	462,707	12,02,848	8,40,718	32·36	47·77 to 14·5
1871-72	444,385	11,30,957	7,24,084	26·22	70·17 to 10·7
1872-73	351,821	9,53,618	5,52,440	18·53	46·56 to 20·2

16. The following table shows the progress of irrigation in regard to the principal crops :—

	1867-68.	1868-69.	1869-70.	1870-71.	1871-72.	1872-73.
	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.
Sugar-cane ...	27,209	38,435	45,126	39,877	31,325	40,566
Rice	39,455	33,491	46,705	45,863	32,974	43,144
Cotton	98,800	74,875	80,093	98,446	100,951	96,131
Total autumn crops	165,464	146,801	161,924	184,186	165,250	179,841
Wheat	100,937	209,980	177,000	182,072	181,573	93,600
Rainfall	53·56	15·30	30·97	47·77	70·17	46·56

17. The proportion of autumn to spring crops is shown in statement below—

Year.	Autumn.	Spring.	Percentage of autumn to spring.		Rainfall.
1869-70	2,34,465	2,62,078	47·3	52·7	30·97
1870-71	2,18,535	2,44,172	47·3	52·7	47·77
1871-72	1,87,647	2,56,738	42·	58·	70·17
1872-73	2,02,371	1,49,450	57·5	42·5	46·56

18. The great falling off in the area of the spring crops is attributed to the rainfall having been greater than in the two previous years in the lower districts where the irrigation mostly lies.

19. Of the whole area irrigated (351,821 acres), 39,302 acres were cultivated a second time against 60,014 acres in the previous years, and the percentage has thus decreased from 15·61 in 1871-72 to 12·57 in 1872-73; the decrease is evidently due to the same cause which led to diminution in the area of the spring irrigation.

20. The average water-rate per acre amounted to Rs. 2·92 during the autumn, and Rs. 2·09 during the spring irrigation, giving an average for the year of Rs. 2·5. The figures for the previous year were Rs. 2·46 and Rs. 2·17 per acre, respectively; thus showing an appreciable increase in the autumn, and a slight decrease in the spring percentage. In consequence of the more valuable crops being assessed in the autumn, the average rate per acre in that season must necessarily be higher than that obtained in the spring.

21. The water duty obtained during the year was for the autumn 105 acres, and for the spring 85 acres per cubic foot per second of *utilized* supply. The figures for the previous year were 102 and 114 acres, respectively, from which the Chief Engineer concludes that water must have been wasted in addition to that passing off at the escapes. The Superintending Engineer attributes much of the wastage to absorption in the upper reaches of the canal, where it passes over *khadir* land, while in the lower portions, water-courses, often ending in a jheel, lead to considerable waste. No material improvement can be expected until the completion of the new distributary system, the general estimates for which are now under the consideration of the Government of India.

22. The gross direct income (assessment) of the canal according to the Chief Engineer amounts to Rs. 9,53,618, against Rs. 11,30,957 for the previous year, or a decrease of Rs. 1,77,339. Turning to Form No. III, page 14 of Superintending Engineer's Report, it is observed that the demands (assessments) for the year amount to Rs. 11,27,343. Similar discrepancies were noticed in the review of the last report, and explanations requested, which have not yet been received, and in their absence it is difficult to understand the cause of discrepancy in so important an item. From Form No. III it appears that the "demands" are for the rubbee of 1871-72, and khurreef of 1872, *i. e.*, the odd halves of two official years, while the Superintending Engineer probably gives the results of the two seasons of the year 1872-73, of which the report purports to treat.

23. There is a decrease in the water-rate per cubic foot of supply utilized in both the spring and autumn seasons, as compared with the two immediately preceding years; the figures being—

	1870-71.	1871-72.	1872-73.
	Rs.	Rs.	Rs.
Autumn	345	316	306
Spring	274	279	177

The unavoidable wastage of water already noticed is no doubt the chief cause of this decrease.

24. Out of a total demand of Rs. 13,02,892, including Rs. 1,75,548, the balance from previous years, a sum of Rs. 9,72,498 has been realized, leaving an unrecovered balance of Rs. 3,30,394 at the close of the official year, which cannot be regarded as satisfactory.

Delhi and Goorgaon Works.

25. The Revenue Account shows a nett loss of Rs. 5,304, or 2·89 per cent. on a Capital outlay of Rs. 1,83,385, the expenditure in maintenance, repairs, &c., being Rs. 10,963, and the income Rs. 5,659. If, however, the enhancement of land revenue due to irrigation, which is calculated at Rs. 24,528, be taken into account, there is a profit of Rs. 19,224, equivalent to a return of Rs. 10·48 on the Capital account.

The percentage of returns is better than that obtained in the two previous years, when they were 5·5 and 9·89 per cent., respectively. This is due, not only to an increase in the revenue, but also to a diminution in the cost for repairs.

No addition was made during the year to the capital of this work.

Upper Baree Doab Canal.

26. The area irrigated in the year under review amounted to 228,796 acres, against 287,069 acres in the previous year, showing a decrease of 58,273 acres. The decrease occurred altogether in the spring crop, as shown in the subjoined table, while the area of the autumn crop was higher than in the two previous years :—

Year.	Autumn.	Spring.	Total.
1870-71	88,643	190,567	279,210
1871-72	76,412	210,657	287,069
1872-73	96,718	132,078	228,796

27. The principal crops irrigated during the past eight years are compared in the following table :—

	1865-66.	1866-67.	1867-68.	1868-69.	1869-70.	1870-71.	1871-72.	1872-73.
	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.
Rice ...	53,564	57,615	63,961	41,256	76,709	24,535	11,598	29,100
Cotton ...	5,236	12,511	21,101	8,205	11,671	10,640	20,387	24,879
Sugar-cane	9,181	9,156	10,600	9,811	11,623	6,994	6,287	9,170
Wheat ...	59,827	108,707	122,720	175,619	87,399	156,375	167,214	99,417

28. There is a marked increase in the rice area over that of the two previous years. In the previous year's report the decrease in the irrigation of this crop was ascribed by the Superintending Engineer to the introduction of a higher scale of water-rates for rice, and was looked upon as a matter of congratulation, on the ground that it would enable a larger area of other cultivation to be brought under irrigation in the lower reaches, where water is much more needed and is capable of performing a higher duty; it would now seem that the cultivators find it profitable to irrigate rice notwithstanding the increased water-rates. Cotton shows an upward tendency. Sugar-cane shows an increase over the two previous years; wheat has fallen off much as compared with 1870-71 and 1871-72, but is still higher than the area of 1869-70. The decrease is due to the heavy rainfall in August and September.

29. The irrigated area, gross and nett revenue for the past eight years, are given in the following table :—

Year.	Acres.	Gross revenue.	Nett revenue.
		Rs.	Rs.
1865-66	175,979	4,25,256	1,12,535
1866-67	228,427	5,54,910	2,67,646
1867-68	262,128	6,24,654	2,69,166
1868-69	299,834	7,06,234	3,73,527
1869-70	233,927	6,85,439	3,36,863
1870-71	279,210	7,34,090	3,13,124
1871-72	287,069	7,10,279	3,37,172
1872-73	228,796	6,34,685	3,18,983

From which it appears that the nett revenue during the year has not fallen off at all in the proportion of the reduced area of irrigation.

30. The gross revenue as shown above amounts to Rs. 6,34,685, and the nett revenue to Rs. 3,18,983, or 2·42 per cent. on the capital invested to the beginning of the year. If the water-advantage rate be included, which is calculated at Rs. 1,83,177, the percentage of profits is increased to Rs. 5,02,160, or 3·8 per cent.

31. Under Revenue Miscellaneous receipts there is an advance in the item of mill rents (Rs. 10,224), which seems to show the increasing appreciation of water-power. Expectations are entertained that a further considerable increase will take place when the remodelling works of the canal have been carried out.

32. It is satisfactory to find that the Maintenance charges* both for works and establishment are considerably below those of the two former years.

* Expenditure.	1870-71.	1871-72.	1872-73.
	Rs.	Rs.	Rs.
Works, including Repairs and Profit and Loss ...	1,96,736	1,38,146	1,13,244
Ex. Establishment ...	1,85,319	1,66,587	1,65,052
Direction	41,316	43,250	37,406
	4,23,371	3,47,983	3,15,702

33. It was noticed in the last year's Resolution that, in the course of seven years, the jaghirdars had benefited from remissions of "water-advantage" assessment to the extent of Rs. 2,98,503. During one season only of the present year it appears they have profited by a further sum of Rs. 5,627. Owing to the remissions for the spring crop season not being brought to book till the ensuing year, the amount for the whole year cannot be given.

34. The duty obtained from the utilized supply was 79·7 acres per cubic foot during the autumn, and 110·43 acres during the spring, the figures for the previous year, 41·42 and 111·28 acres, respectively. Though these results are higher than those obtained prior to the year 1871-72, yet there appears to be room for further improvement.

35. With a view to utilizing as far as practicable the surplus water passing down the canal, a proposal has recently been made for the irrigation of Government forest lands when convenient. This suggestion is approved by the Governor General in Council.

36. The water-rate per cubic foot of utilized supply amounted to Rs. 250·9 in the autumn, and Rs. 239·9 in the spring, showing an increase of Rs. 41·6 in the former, and a decrease of Rs. 8·1 in the latter, as compared with the previous year. Considering the somewhat unfavourable nature of the season, the result is satisfactory.

37. The water-rate per acre irrigated amounted to Rs. 3·16 and Rs. 2·17 for the autumn and spring crops, respectively; the figures for the corresponding seasons in the previous year being Rs. 2·64 and 2·06 per acre. There is an improvement in the water-rates for the autumn crops as compared with the corresponding seasons of the two previous years.

38. The Maintenance charges per acre irrigated show a slight increase over those of the previous year, the figures being Rs. 1·45 and Rs. 1·43, respectively; the aggregate of the maintenance charges, however, has been considerably reduced, so that this result is due solely to the diminished area of spring crop.

39. The demands for the year, together with previous outstanding balances, amounted to Rs. 2,88,071, of which, Rs. 2,21,304 were realized during the year, leaving an unrecovered balance on the 1st April 1873 of Rs. 66,767; the larger portion of this sum, *viz.*, Rs. 56,038, being the balance of assessment unrealized from 1865-66 to 1867-68.

40. The amount of remissions made as shown in table at para. 44, page 11, is very large; out of a total demand of Rs. 1,92,000, as much as Rs. 68,472 were remitted in the spring, and in the autumn, out of a demand of Rs. 87,775, a sum of Rs. 32,259 was similarly treated. Explanation should be afforded of the reasons for these heavy remissions.

INUNDATION CANALS.

41. *Lower Sutlej and Chenab Series.*—The financial results of the year's operations show a loss of Rs. 34,207 on direct income, or 33·01 on the capital invested at the commencement of the year. But if the estimated amount of enhanced land revenue due to irrigation, *viz.*, Rs. 2,13,299, be taken into calculation, the result shows a profit of Rs. 1,79,092, or 172·84 per cent. of the outlay.

42. The area irrigated was 242,504 acres, the largest yet obtained, with the exception of the year 1869-70, when it was slightly higher. The decrease as compared with that year is due to the larger rainfall and the more favourable conditions of the supply from the river. The increase is apparent in both crops. The attendance of statute laborers continues better than in previous years.

43. *Upper Sutlej Series.*—There is an increase in the irrigated area of 48,317 acres, the area being 135,360 acres, against 87,043 in the previous year. The Revenue Account shows a loss on the operations of the year of Rs. 57,891, or 12·21 per cent; but if the estimated value of enhanced land revenue due to irrigation, amounting to Rs. 27,912, be added, the loss will be reduced to Rs. 29,979, or 6·32 per cent.

44. The total receipts exhibited at para. 60 of the Chief Engineer's Report do not agree with the amount shown in the Finance Accounts. This is due to a write-back having been made for previous years, and which have been necessarily omitted by the Chief Engineer in order to show correctly the results for the year under review.

45. *Indus Series.*—The year's operations show a loss on direct income of Rs. 1,01,806, or 26·03 per cent., on the capital at beginning of the year. If the indirect returns, *i. e.*, the increase of land revenue due to irrigation, amounting to Rs. 80,938, be taken into account, the loss will be reduced to Rs. 20,868, or 5·46 per cent.

The area irrigated was 180,137 acres, the largest area yet obtained, and is evidently due to the favourable conditions of the year.

SHAHPOOR CANAL.

46. The year's operations of this canal show a profit from direct income of Rs. 12·43 per cent. against Rs. 3·13 per cent., cleared by it in the previous year, and the irrigated area has increased from 4,113 acres in 1871-72, to 4,445 acres in the year under review, and the average water-rate from 1·17 to 1·57 per acre.

ORDER.—Ordered, that copies of this Resolution, and of the Report reviewed, be forwarded to the Secretary of State, and to the Department of Agriculture, Revenue and Commerce, and Financial Department for information.

Ordered also, that copies of the Resolution be forwarded to the Government of the Punjab and the several other Local Governments and Administrations, in the Public Works Department, Irrigation Branch, for information, and further that the Resolution be published in the *Gazette of India*.

GOVERNMENT OF INDIA.

DEPARTMENT OF AGRICULTURE, REVENUE AND COMMERCE.

TRAMWAY AND SLEEPER SLIDES CONSTRUCTED IN THE JOUNSAR FOREST DIVISION.

No. 300, dated 14th November 1873.

From—J. M. BRAIDWOOD, Esq., Asst. Conservator in charge, for Offg. Conservator, N. W. Provinces,

To—The Secretary to the Government of the N. W. Provinces in the P. W. Dept.

In continuation of my No. 180, dated 19th July 1873, I have now the honor to forward a report on the Lambatach export works. Mr. Bagshawe, the officer in charge of the Jounsar Division, has explained the tramway and slide systems very clearly, and Mr. Braidwood has drawn very good plans of them.

2. Mr. Bagshawe mentions that the rate the sleepers go down the slide is about three per minute; but I saw them coming down much faster than that when at Lambatach a few weeks ago; they might be sent down at the rate of ten per minute quite easily.

3. At the bottom of the slide a pool has been formed by damming up a breach of the Pabar river; this pool is about five feet deep at the spot, the sleepers come into it, and a very simple arrangement brings all the sleepers handy to the bank. It is as follows: The waste water is all taken down a small channel about 2½ feet wide formed just on the edge of the water-course on the opposite side to the shoal. All the stream from the pool runs through this channel and carries the sleepers with it. A few yards down some boulder stones are placed, which stop them at a certain point, and they are then lifted out and stacked on dry land ready to hand over to the floating contractor. Mr. Bagshawe has forgotten to mention this.

4. In conclusion, I would beg to impress on any one making a timber slide the advisability of *very careful* construction; it should be made as accurate and smooth as possible; this will cost a little extra at first, but will be fully recouped afterwards in the saving of repairs and breakages. We commenced by making our slides rather rough, but soon found out the mistake. I doubt if any better means of getting timber from our steep hill sides to the river could be devised than these wooden trough slides; they are adapted to any slope, the steeper it is the less water required, and *vice versâ*, and if properly constructed, the timber is not damaged in the least.

5. Tramways are suitable only in certain situations. I am not much in favor of them. The preparation and laying down of the rails, and the cost of the trucks, is considerable, and I think that a rough wooden road, and something in the style of railway porters' trucks, would answer the purpose equally well, and be far cheaper and simpler. If I am ever called on to work another Deodar forest, I should try this plan instead of tramways.

REPORT ON THE SLEEPER SLIDES, &c., IN THE JOUNSAR DIVISION.

Tramway and Slide at Lambatach.

General sketch of the Lambatach forests.

Lambatach forms the end of the range of hills situated between the Tonse and Pabar river, and lies immediately above their confluence.

The forest is one of those leased by Government from the Rajah of Tibri; it lies on the eastern and southern slopes of the Lambatach hill, at an elevation varying from 6,000 to 9,000 feet above the level of the sea.

The northern portions of the forest, known as "Thanwar and Dámti," grow mainly in a series of steep khuds; the central division, "Charkora," on a series of plateaux sloping towards the Pabar and terminating in a precipitous descent to the same. The southern section of the forest known as "Lahasee and Kimari" grow in steep khuds interspersed with small plateaux. The stretch of the forest from "Kimari" to "Thanwar" is about nine miles.

The average distance from the centre of the Deodar zone to the Pabar, the nearest river available for water carriage, is about five miles.

General characteristics of the Lambatach sleeper works.

The remarks made on the Mandhol sleeper export works, regarding the labor, difficulty, and the necessity of mechanical aid in transporting the sleepers to the river, apply equally to Lambatach, and it is therefore needless to repeat them.

General description of the export works.

It was first proposed to convey the sleepers at Lambatach to the river as follows:—

First scheme.

By constructing a line of tramway about 3½ miles in length below "Charkora and Lahasee" to a ravine which runs in nearly a straight line to the Tonse, close to the junction of that river with the Pabar; this tramway would have run close to the lower edge of the Deodar zone, at a level varying from 8,000 feet above the sea, at its commencement, to 7,500, at its terminus. Down the ravine alluded to above a wooden slide was to have been made to the Tonse.

Early in 1871, when the first mile only of the proposed tramway had been put in hand,

Amended scheme.

Mr. Greig, Officiating Conservator of Forests, decided to amend the plan as follows, *viz.*, only to lay down the tramway below the "Charkora" section of the forest and to construct a slide to the Pabar through the precipitous ground previously described as lying between "Charkora" and the river.

The reasons for these alterations were, the difficulties that would have been experienced in constructing and working the tramway, owing to the steep and rocky nature of the ground, and the sharp curve that would have been inevitable; also to the discovery that a shorter route was feasible.

Reasons for the emendations.

The details of the amended plan were, to make a wooden slide to the Pabar from a point about half a mile below the old tramway level, to carry the sleepers in the "Kimari and Lahasee" section to the head of the slide by manual labour, to collect, by the same means, the Charkora and Dámti sleepers, at the head of and along the line of the tramway, and then run them along the line to its terminus.

Detailed working of the new scheme.

The Thanwar sleepers were separated from the bulk of the sleepers by a long stretch of bad ground and had to be arranged for separately.

The tramway was to be constructed of wooden rails and sleepers, of a two-feet gauge, and to be worked with either two or four-wheeled trucks.

From the end of the tramway the sleepers were to be carried on men's backs to the head of the slide.

The slide proposed by Mr. Greig was a dry slide (*i. e.*, the moving power was the momentum given to the sleeper by the fall in the gradient of the slide, not water-power, as at Mandhol), and was to be formed of three kurries 18′ × 12″ × 5″ wedged in block sleepers (short logs) with a nick cut in them to form a bed for the kurries. A small quantity of water was to be introduced at intervals to remove the danger of fire from the friction between the sleepers and the bed of the slide.

One more point in the general plan requires notice, *viz.*, the reason for not making the tramway and slide a continuous line of work, which would undoubtedly have been the neatest plan. The reason was this, the first mile of tramway was already in hand, when the plan for the export work was changed, and a careful consideration of the question proved that it would cost more in time and money to abandon the old road and construct a new one than to carry the sleepers past the break on men's backs.

Reason for the break between the tramway and slide.

Construction and working of the Lambatach tramway.

Description of the ground.

The tramway was laid down along the hill side, the line twisting round small ridges, and again running across small plateaux. As a rule, the cuttings were small and mainly through earth. It will be seen from the annexed section of the tramway that the line was nearly level.

Construction of the tramway.

The annexed drawing No. 1 clearly explains the construction of the tramway, and nothing requires notice except the rough nature of the Lambatach tramway as contrasted with the one at Mandhol. The Lambatach tramway was *made first*, and a rough roadway, combined with cheapness, was the object sought; further, as the line was a level one, there was less wear and tear, so that a less pucca work answered all the calls made on it.

Use of two-wheeled trucks in preference to four-wheeled.

When the tramway was first made, the use of four-wheeled trucks similar to those at Mandhol was proposed, but experiment showed that on a line with so many sharp curves on it this mode of carriage would be both slow and expensive. The two-wheeled truck (see drawing No. 1, figures Nos. 2 and 3), capable of carrying twelve sleepers at a journey, was therefore devised by Mr. Greig as a substitute, and answered admirably throughout.

Time occupied in the carriage of the sleepers.

The length of the tramway, it will be seen, is 5,188 feet. During the working season ten trucks were used, each truck made four journeys per diem, twelve sleepers being carried by each truck, which was worked by one man; 92,468 sleepers in all were run along the tramway, the working of which was regularly started in June 1872 and completed in March 1873.

Rate given for carrying the sleepers.

The price paid for running the sleepers along the tramway was at first 4 pie per sleeper and later on 3 pie per sleeper, 5 per cent. on the total price paid to the coolies being paid to the headman of the gang employed; this rate is apparently slightly higher,—judging it by the distance the sleepers were carried,—than the Mandhol rate; but the idea is fallacious, as a slight addition or decrease in length of carriage does not affect a rate appreciably, as the difference does not permit a man to load up and unload many more sleepers per diem.

Cost of tramway.

The cost of the tramway, &c., will be treated of under the head financial results.

Construction and working of the Lambatach slide.

Line adopted in description of country and detailed construction of slide.

The line adopted for the slide is fully shown in the annexed survey and section of the slide; also the details of construction and the difficulties sustained in laying the slide on anything like an even gradient. It will be noted that in the Lambatach slide the joints were broken through-out, and that the method of joining the kurries forming the bottom of the slide is different from that adopted on the Mandhol canal slide, but similar to that used later on in the Mandhol shoal; the reason was the same,

viz., in a steep slide to give greater coherence to the component parts of the slide. The length of the slide is 1 mile and 1,052 feet.

Difficulties experienced in working the slide.

When the line for the slide was first selected, it was at once foreseen that two great difficulties had to be overcome, (1), to prevent the sleepers leaving the bed of the slide, (2), to check their velocity while in transit.

Contrivances tried to overcome these difficulties.

The depth of the slide was at first seven inches, and it was thought that the use of brakes placed at intervals would overcome both difficulties. Trial brakes were at first put up, with light one-inch planks hanging down at intervals of 100 feet, but no successful results attained. The distance between the trial brakes was then shortened and two and three-inch planks used, but still the velocity of the sleepers remained unchecked; finally, brakes were tried 15 feet apart, but still, wonderful to say, the sleepers flew down and about the slide unchecked.

It was then resolved to divide the slide into two sections, cut down the depth to 5½ inches and cover it throughout by fixing planks to the top, and the drawings of the slide attached to this report show it in this state.

The covered-in slide has proved an entire success, although care is required in working it.

The speed of the sleepers can be slightly regulated by the amount of water admitted, the sleepers going slowest when there is least water.

Time occupied in sliding sleepers.

The sleepers reach the half-way station at the rate of about three per minute or 1,000 per diem when no hitch occurs.

Cost of sending sleepers down slide.

The cost of sending the sleepers down the slide is 12 annas per cent. per stage, *i. e.*, Rs. 1-8 per cent. to the river.

Number of breakages.

The number of sleepers damaged in transit is from 2 to 3 per cent.; this figure is high, compared with the breakages at Mandhol; but when the nature of the slide is taken into consideration it is not the case. Most of the damaged sleepers can be utilized as half-sleepers or small kurries. So that there will be little loss sustained on them. It is probable too that these breakages are favorable to the Railway Department, as only perfectly sound sleepers stand the ordeal of the slide, any that are cracked or shaken being broken in transit.

Cost of the slide.

The cost of, and returns from, the slide will be shown under the head financial results.

Financial results of the Lambatach export works.

Cost of the tramway.

A memorandum is annexed showing the cost of constructing the Lambatach tramway and of working down all the sleepers that had to pass over it.

The details of this memorandum require no explanation, as a memorandum drawn up on similar principles was attached to the report on the Mandhol sleeper export works and therein fully explained, 92,468 sleepers were conveyed over the tramway at a gross cost of Rs. 3,152-9; these sleepers were carried by about 25 men in about seven months.

Utilization of the tramway.

Had they been carried on men's backs, each man would have taken 8 or 9 sleepers per diem, and the rate at a low estimate would have been 9 pie per sleeper.

Net saving on the tramway.

The total cost therefore stood thus:—

	Rs.	A.	P.
12,468 by tramway	3,152	9	0
92,468 on men's backs @ 9 pie per sleeper plus 5 per cent. to head of gang	4,551	2	6
Net saving ...	1,398	9	6

Cost of the slide.

A memorandum giving the detailed cost of constructing the slide is annexed to the report, which it is trusted will give all the information required on this point. The cost of working down the sleepers is also shown under different heads.

Utilization of the slide.

Up to the present time 120,082 sleepers have been sent down the slide to the half-way station. Out of this number 42,168 sleepers have been sent on the second stage to the river, and the remainder of the sleepers (7,914) are going down daily. I may note here that for convenience of reference the cost of sending the remainder of the sleepers down the slide has been included in the table of cost (see heads XIV and XV).

As regards the utilization of the slide for the whole forest, the following figures may be useful:—158,224 sleepers were altogether sawn up in Lambatach, of these 38,142 sleepers were in Thanwar, the most northern part of the forest; these sleepers were collected in a depôt on the top of the final descent to the river and thence carried on men's backs down to the river

@ 2 annas 6 pie each. The remainder of the sleepers, 120,082, went, or are going down the slide

Net saving on the slide.

It will be seen that the gross cost of taking the sleepers down the slide was Rs. 10,928-8-2; had they been carried on men's backs they would not have cost less than the Thanwar sleepers, *viz.*, 2 annas 6 pie each, and, with other miscellaneous expenses, the account would have stood somewhat thus:—

	Rs.	A.	P.
Cost of carrying 120,082 @ 2 annas 6 pie each ...	18,762	13	0
5 per cent. to head of gang	938	2	0
Cost of road to river	500	0	0
Cost of collecting coolies, say	500	0	0
Total cost of carriage on men's backs ...	20,700	15	0
Total cost by slide ...	10,928	8	2
Net saving Rs. ...	9,772	6	10

General saving on the Lambatach export works.

The subject of the saving of labor by tramways and slides being thoroughly recognised, it is needless to dwell on it here, and all that remains to be said is that, as shown in the details previously given, there is an actual money saving:—

	Rs.	A.	P.
I. On the tramway	1,398	9	6
II. On the slide	9,772	6	10
Total on the export works ...	11,171	0	4

It will be noticed that the savings at Lambatach are much smaller than at Mandhol; but this is explained by the fact that the Mandhol export works carried the sleepers about 5½ miles, whereas at Lambatach the export works were only about 2½ miles in length, the saving therefore is in nearly the same proportion; and had Thanwar not been so far from the centre of the forest, and had the sleepers from thence come along the tramway and slide, the saving would have been enhanced by one-fourth.

C. BAGSHAWE,

Assistant Conservator, Jounsar Division.

Balance expended... 4,249

The demand for water varied in different divisions, and was not very great anywhere. In the Bolundshuhur Division the cultivators were *holding off* in expectation of rain, and it is reported that crops will suffer in consequence. On lands which were much flooded in September no irrigation has yet been required.

Eastern Jumna Canal.—Demand has been general but irrigation is backward owing to the ground having retained moisture from the late September rains.

Doon Canals.—No remarks.

Rohilkhund Canals.—No remarks.

Traffic.—There is an increase of 66,900 maunds of grain over the quantity carried in January last year, and nearly 14,000 over that in last month. The demand for carriage of food grains is steady. The stock on canal banks in the Meerut Division awaiting carriage is about the same as last month.

ALLAHABAD, The 21st February 1874.

GOVERNMENT OF INDIA.

DEPARTMENT OF AGRICULTURE, REVENUE AND COMMERCE.

EMIGRATION.

PURCHASE BY FIVE COOLIES OF A SUGAR ESTATE IN TRINIDAD.

[*In continuation of papers published in the Supplement to the "Gazette of India," dated 30th August 1873, pp. 856 and 857.*]

Dated 6th January 1874.

From—ROBERT W. S. MITCHELL, ESQ., Acting Agent General of Immigrants,

To—The Honorable the Colonial Secretary, &c., &c., &c.

I have the honor to submit, for the information of the Indian Government, in answer to the communication dated 6th October 1873, the following particulars relative to the purchase of the Corial Estate :—

1. In the Agent General's last annual report mention was made of the purchase of the Corial Estate by several Indian immigrants; it has since been ascertained, however, that this property was bought by one Indian known as Barathsing. He is also in treaty for the purchase of another estate in the Cedros District (for some years abandoned), and has made application for 25 immigrants for next season to work under indenture on the Corial Estate. Subjoined is Barathsing's history taken down from his own lips by one of the Inspectors of Immigrants.

2 Barathsing came from Gazeepore where his father had a small sugar plantation; his caste is Chetree. He went down to Calcutta to see the place, and there, under the name of Bhuroo, embarked on board the "Agincourt" (which arrived in this colony on the 16th March 1856), and was indentured to the Champs Elysees Estate at Maraval, where he worked six months as a laborer, and the remaining two and half years as a foreman or superintendent of other laborers. At the end of the third year he purchased the remaining two years of industrial residence. In partnership with his two brothers, he set up a small retail shop in Port of Spain with a capital of $300 (£62-10), half of which they had borrowed. They also possessed Rs. 160 which they brought with them from India. At the end of one year they failed, but saved from the wreck $97 (£20-1-2); with this diminished capital they again started in business in a small way in Port of Spain, and this time succeeded. Shortly afterwards they established a branch shop in another part of the town; these two shops succeeded so well that they were in a position to open a third at Chagnanas where a wholesale business was done; subsequently several other shops were opened in the country districts. Eventually Barathsing dissolved partnership with his brothers (who now keep a wholesale store in San Fernando, and several retail shops in the country districts) and purchased the Corial Estate (240 acres) for which he agreed to pay $18,400 (£3,833-6-8) in annual instalments of $2,400 (£500) each. He has already paid £1,000 and spent $20,000 (£4,166-13-4) more in erecting a new boiling house, machinery and dwelling houses for his laborers. The crop of the estate was 100 tons of sugar last year; this year it is estimated at 200 tons, and that of 1875 at about 350 tons.

Besides the Corial Estate, Barathsing has a mortgage on an adjoining property of $12,000 (£2,500) for which he receives interest at 20 per cent., and in the town of San Fernando he owns house property worth $4,000 (£833-6-8), besides several other small properties which he says "are not worth mentioning." On the Corial Estate from 100 to 120 laborers are employed (coolies and creoles), 50 of whom are resident on the estate in occupation of the new barracks already alluded to.

Barathsing speaks English very fairly, and can read and write Devanagrie; he has no family of his own, but has always had a good many people more or less dependent on him.

3. Four months ago an Indian immigrant (a day laborer) and his wife purchased 32 acres of Crown Land for which they paid £39, including fees of survey and grant. They have now erected a simple but efficient set of sugar works, planted an extensive cane cultivation, and last month purchased 90 acres more to add to their little sugar plantation.

I have reason to believe that a large number of coolies have already invested in Crown Land which they cultivate in canes, cocoa, and provisions. No less than 1,002 acres have been purchased by them during the past three years.

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Tuesday, the 10th March 1874.

PRESENT:

His Excellency the Viceroy and Governor General of India, G. M. S., *presiding*.
The Hon'ble B. H. Ellis.
Major-General the Hon'ble Sir H. W. Norman, K. C. B.
The Hon'ble A. Hobhouse, Q. C.
The Hon'ble E. C. Bayley, C. S. I.
His Highness the Mahárájá of Vizianagram, K. C. S. I.
The Hon'ble Rájá Ramánáth Tagore.
The Hon'ble R. A. Dalyell.
The Hon'ble B. D. Colvin.

KULLU SUB-DIVISION (PANJAB) APPELLATE POWERS BILL.

The Hon'ble MR. HOBHOUSE moved that the Report of the Select Committee on the Bill to invest the Assistant Commissioner in charge of the Kullu Sub-division of the Kángra District with certain appellate powers, be taken into consideration.

The Motion was put and agreed to.

The Hon'ble MR. HOBHOUSE also moved that the Bill be passed.

The Motion was put and agreed to.

PRIVY COUNCIL APPEALS BILL.

The Hon'ble MR. HOBHOUSE also presented the final Report of the Select Committee on the Bill to consolidate and amend the law relating to the admission of appeals to Her Majesty in Council from judgments and orders of the Civil Courts. He said this was a matter which had been once or twice before the Council, both in the time of his predecessor and in his own time. The Bill was now put into a shape which was acceptable to the Judicial Committee of the Privy Council. The Secretary of State had been in correspondence with the Judicial Committee at our desire, and they had approved of the Bill as it stood, except that the Committee had since made one or two small alterations in matters on which the Judicial Committee would not think it necessary to form any opinion.

The small alterations since made were these. We had provided that the appealable value of the suit must be rupees 10,000, both as tested by the matter in dispute in the appeal and as tested by the matter in dispute in the original suit. As the law stood, it was doubtful whether a person having an appealable claim for less than rupees 10,000 might add the costs of suit so as to bring it within the amount, and so get the appeal as of right. We thought it better that there should not be that element of uncertainty in the appealable value.

Another alteration which had been since made was for the purpose of giving further freedom to the High Courts in moulding the proceedings upon appeal. The Bill contained some rules of practice which had been laid down for the Non-Regulation Provinces. They were, in fact, very much the same as those which prevailed in the High Courts. There were however various small matters, such as the preparation of the copy of the record, which might be usefully moulded from time to time by each High Court for itself according as convenience dictated. We had, therefore, thought it better to give the High Courts some discretion in the framing of this copy and in other such matters.

The only other alteration made was a verbal alteration which MR. HOBHOUSE need not mention to the Council.

BURMA MUNICIPAL BILL.

The Hon'ble MR. HOBHOUSE also presented the Report of the Select Committee on the Bill to provide for the appointment of Municipal Committees in Towns in British Burma, and for other purposes. He would call attention to the principal additions made by the Select Committee. The Bill, when before the Council on the last occasion, provided that the Act might be extended to any town, the population of which exceeded five thousand. It was thought better not to have a hard and fast line of that sort, but to leave it to the discretion of the Local Government. The Local Government contended that it was wise to give such a discretion, and after discussion the Committee came to that opinion, and the Bill was framed as it now stood. The principal alteration made by the Committee regarded the maximum of taxation fixed by section 12 of the Bill. We found that the maximum rates proposed by the Bill were fifty per cent higher than the rates which now prevailed, and besides the maximum provided by clause 12, the Bill provided for some additional taxation on certain events. For instance, if the Committee desired to light the town, they might charge lands and buildings a two per cent. rate: if they decided to carry water to the town, they might charge a rate to the extent of two per cent. more. That was four per cent. for light and water. The prevailing maximum was five per cent., and therefore where rates for light and water were added, it might nearly double the taxation. Then there was a general clause at the end providing that a higher rate of taxation might be imposed with the consent of the Governor General in Council. That was a clause similar to those put in other Municipal Acts, for the reason that it was impossible to say what was the best mode of imposing taxation in every place, and that it was desirable to have an elastic provision which might be adjusted from time to time according to the wants of the people. Considering also that the invariable tendency of a maximum was to become the minimum, the Committee though it more appropriate to fix the maximum of ordinary taxation at the rate which a Municipal Committee could impose at the present ruling maximum, instead of making it fifty per cent. higher than the present rate. Our attention was called by a petition from Maulmain (and one or two official gentlemen expressed the same opinion) to the fact that there would be danger of over-taxation if we put the rate as it stood before. We therefore thought it better to proceed as we had done.

We were also pressed by the Local Government to insert a clause in the Bill, giving the Municipality greater control over private markets. In looking into the reasons assigned for that proposal, we found that the principal reasons resolved themselves into this, that the vendors at some markets exposed for sale food which was not fit for human consumption. We thought that the Penal Code provided sufficiently for offences of that kind, and that it was not desirable to put into the hands of Municipal Committees any further and arbitrary powers of control which might have the effect of altogether superseding private markets.

Another matter which we were asked to introduce in the Bill, was to impose liabilities on the shipping for the purpose of making them properly contribute to the support of their seamen taken into the hospitals of the town, a difficulty having been felt in adjusting charges incurred on account of the treatment and support of sick seamen. We thought it better not to put such a provision into a Municipal Bill, but rather to introduce a Bill for the amendment of the Port-dues Act, which would be the subject of a subsequent motion. Those were the principal points upon which the Bill had been altered.

ASSAM CHIEF COMMISSIONER'S POWERS BILL.

The Hon'ble MR. HOBHOUSE also presented the Report of the Select Committee on the Bill to provide for the exercise of the powers hitherto exercised by the Lieutenant-Governor and Board of Revenue of Bengal in the territories forming the Chief Commissionership of Assam.

INDIAN LAW REPORTS BILL.

The Hon'ble MR. HOBHOUSE, in moving for leave to introduce a Bill to diminish the multitude and improve the quality of Law Reports, and to extend the area of their authority, said:—

"The quantity of new law which I have to propose to the Council is exceedingly small: so small that I expect to be laughed at when the magnitude of the proposal is compared with that of the subject we have to deal with. Yet it is a necessary part of a plan for dealing with a subject of much importance and difficulty. And in order to give the Council a clear understanding of the subject they are asked to handle, I must say something about Law Reports in general and Indian Law Reports in particular.

"As to the nature of a Law Report, everybody knows thus much: that it is an account of a decision by a judicial tribunal; but I suppose that, beyond those who are professionally concerned in the matter, very few have set themselves to know accurately what is the office of such a Report, or how it should be constructed.

"Now, a Law Report may be looked on in two wholly different aspects, according to the object at which it aims. You may have a matter of public interest, such for instance as the Tichborne case, where people like to know what is going on. There are a great many cases which the readers of newspapers like to see reported in greater or less detail. Or, for the purpose of ulterior proceedings, the parties interested may wish to have a full account of what has taken place in Court. There is no case which may not properly be the subject of such Reports as these; and all that is required of them is that they shall be accurate enough for their purpose. But with reports for these purposes we have at present nothing whatever to do.

"We are concerned only with the other aspect of Law Reports, that is to say, so far as their object is to show how the decision bears upon the general body of law. This is what I may call the legislative aspect of the case. Every judicial decision is an authoritative declaration of the legal result of the facts before the Court. If the facts are such as to call for some new application of principle, if former applications of principle are disturbed by the decision, or if having been seriously questioned they are re-affirmed, in such cases some addition has been made to the body of the law, which may be of little or may be of great importance. Little or great, all Courts subordinate to that which uttered the judgment are bound to follow it in similar cases.

"I will give an instance which will be familiar to a large number of Indian officials. The well-known Act X of 1859 provided that occupancy-rights should not be acquired if there was a written contract containing an express stipulation contrary thereto. The question then arose whether a lease for a definite term of years was such a contract. One High Court said yes; another said no. During this conflict each had added a gloss to the text of the statute, which materially affected its operation, and which all their subordinate Courts were bound to obey. After some discussion the two Courts came into agreement, and so the law was settled one way.

"It will be seen then that the law is in a continual state of growth and flux by the accretion of judicial decisions. Such a decision may affect one way or another a great number of the transactions of mankind. And so far as this effect of a decision goes, the Judge does something more than settle the dispute between the parties; he lays down law for the whole country and decides in anticipation cases for other and future litigants.

"Now for the settlement of the particular dispute there is no need of a report; the Judge's opinion is equally conclusive whether it is reported well or ill, or not at all. But as regards its effect on the law, everything depends on the report. If not reported at all the decision is usually forgotten. Unreported decisions are like the heroes who lived before Agamemnon, of whom we are told that they lived indeed, but are unwept, unknown, sunk in eternal darkness, for lack of a sacred bard. If a decision is reported, and reported badly, it may hold out false lights for many years, and so cause mischief to innocent wayfarers. In short, the Judge in his capacity of lawgiver speaks to the world through his Reporter, and he affects the law nearly in proportion as his cases

are well or ill selected for report, and as the reports of them are well or ill executed.

"To illustrate the power which has fallen into the hands of Reporters, I will refer to a statement made by the late Lord Campbell. At one time of his life he was a Law Reporter, and he then kept a separate drawer labelled 'Bad Law,' into which he put the decisions he disapproved. So that we have as the outcome of Lord Ellenborough's decisions, not what he decided, but what his Reporter selected. If in one case he laid down a broad principle, and in the next case qualified it, his Reporter may have thought the qualification wrong, and have given to the world the principle as stamped with Lord Ellenborough's authority, but without the qualification which the same authority would have added.

"In Lord Campbell's hands both Lord Ellenborough and the public have probably fared well enough. In other cases, results have not been so happy; for example, the decisions of one of the greatest of Equity Judges, Lord Eldon, have lost much of their value from the slovenly mode in which his principal Reporter did his work.

"It has been alleged of the Reporter Vernon, that he had a spite against a Chancellor whose decisions he reported, and so adjusted his reports as to exhibit the judgments in a bad light. I remember on one occasion a case being cited from Vernon's reports, when Lord Justice Turner, admitting that it had been received as law for a century and a half, thought it so wrong that there must be some mistake. He stopped the argument, sent for the record, and found that the facts were misreported and the case was not any authority for the proposition indicated by the Reporter. So people found that, instead of a true divinity, they had been worshipping a stock or a stone, and that, under the guise of a divine afflatus from the oracle, they had only been listening to the uninspired utterance of its priest.

"Now if all these things are borne in mind; the power of the Reporter; the binding authority of the reported decision over subordinate Courts; its influence with co-ordinate Courts; if also we remember that a very large portion of the law of the country will be found not in written statutes, but in judicial decisions, we shall feel the great importance of having our reporting done well. And the Council will probably agree with the spokesman of the Council of the Bengal Law Reports, Mr. Pitt Kennedy, when he says that 'it is hardly a less important part of the duty of Government to publish that part of the law which is enunciated by its tribunals than to promulgate its legislation,' and with my predecessor, Mr. Stephen, when he says that reporting should be regarded as a branch of legislation.

"Such being the importance of the work, how has it been performed?

"In this country, indeed, the Government did, previously to the establishment of High Courts, publish and distribute reports of the decisions of the Sadr Díwání Adálat; and many of those reports are exceedingly well done. In England the matter has gone very much at haphazard. In earlier times no reports could be published, except such as were approved by the Judges. Afterwards it got to be considered that there was some magic in reports published by a Barrister, and the principle was accepted, indeed is said to have been openly enunciated by a Judge of great eminence, that 'every gentleman at the Bar is entitled to report a case, and to have it cited as authority as reported by him.' At the same time, it has been considered that the excellence of reports may be subjected to a commercial test, like that of wine or piece goods, and that those which sell best are best. In India the Government has interfered to the extent of subsidizing certain reports, but has not, at least of late years, assumed any responsibility for them. We have slid into the loose English practice, and have allowed reports published by anybody and in any way to be scattered broadcast about the country, each just as authentic as another, and all alike claiming the implicit obedience of the subordinate Courts.

"Now the consequences of the principles I have mentioned are obvious enough, and we have reaped a full harvest of them both in England and in India. If all reports are to carry authority with them, reporting may be made a very easy business, and a lucrative one as well. A volume may

be published, half full of rubbish, half full of inaccuracies, yet the profession must buy it, because it can be cited as binding authority, and no one in ignorance of its contents can be sure that he is advising his client rightly, or arguing his case efficiently, or, if he is a Judge, deciding the case before him soundly. So it becomes an object with a Reporter to publish a great quantity of cases; if he gets some which his rivals have not got, then his volume has more law in it than theirs, and so it must be bought. That is called free-trade. It has been forgotten that in this matter free-trade could not possibly supply what was wanted; for, in the first place, the very foundation of free-trade is wanting, the freedom of the purchaser to take or to refuse the wares offered to him; and, in the second place, the vendor is under the strongest temptation to select the cases which give him the least trouble, and which fill up the greatest space.

"I will now show by other evidence than my own how this system, if system it can be called, has operated on the quantity and quality of our Indian Reports. I quote from Mr. Stephen's elaborate Minute on the Administration of Justice, and the Council will easily pardon me if I read at some length what is there stated in a more forcible and interesting way than is attainable by me. Mr. Stephen has just mentioned the proceedings of the four High Courts and the Chief Court of the Panjáb. He then speaks thus—

"'The decisions thus continually pronounced by five independent Courts are carefully collected and re-published in the form of reports. These reports are of very different degrees of merit: some are very good, others very bad indeed, consisting merely of reprints of the written judgments of the Judges, with no statement of the facts of the case, or of the arguments of the advocates. These reports, however, are now increasing in number so rapidly that a complete set of them at the present moment would consist of upwards of 60 thick volumes, which are growing at the rate of four volumes a year at least.

"'No one who is acquainted with the course which has been run by English law under the English system of reporting, will be surprised by the course which the matter has taken, and is taking, in India. Law books on the regular English pattern are numerous. Such a law book is usually a mere repertory of cases tacked on to some Act or set of Acts, and as incapable of being read or remembered as a dictionary or any other book of reference. Such books, in fact, are mere indices, and, in my opinion, do more to prevent people from gaining rational or general notions of the law than all other causes put together. For instance, a Magistrate wishes to acquaint himself with the Code of Civil Procedure. The Act is a long one, containing 388 sections; but, by carefully reading it through, a good general knowledge of the whole system may be obtained. The published editions, however, are not intended to give any sort of general notion of the subject, still less are they meant to state the principles on which the Code is founded, or to point out the objects which it is intended to effect. Their one purpose is to serve as arsenals of precedents by which the parties to a suit may attack each other and embarrass the Judge, and that purpose they effectually carry out. Mr. Wilkinson's edition of Mr. Broughton's edition of the Code of Civil Procedure and of the Acts which amend it, quotes about 2,500 cases on that subject alone. The Indian Digest published last year, and containing notes of the cases decided by the four High Courts down to the time of its publication, is asserted by its editors to be a summary of 37 volumes of reports of cases decided in eight or nine years. It contains 808 large octavo pages printed in small type and in double columns. The mere names of the cases fill 90 such pages. There are about 100 cases in each page, so that at least 9,000 cases would appear to have been decided upon various matters in the course of the eight or nine years over which the work extends. It may, indeed, be said, speaking roughly, that the additions which the Courts make annually to the law are about four volumes containing about 1,000 decisions. I do not know what a complete set of cases on Indian Law would cost, but I am informed that it would cost about Rs. 250 a year to keep it up.

"'This can hardly be regarded as otherwise than a most mischievous state of things, and one which ought not to be permitted to continue. I believe that most of the Judges of the High Courts share in this opinion. Some of the most distinguished of them have expressed themselves to me most strongly as to the mischief which is done by the enormous multiplication of reports, the indiscriminating manner in which they are accepted as of authority co-ordinate with that of Acts of the legislature, and the very poor quality of many of the reports. They have told me in particular that the effect of this state of things upon the Native bar is peculiarly bad. The Native pleaders and vakíls are said to have plenty of quickness and excellent memories, but to be wanting in power and grasp of understanding. On persons of this temper a vast mass of precedents is apt to produce a most injurious effect. It diverts their minds from the object of obtaining any real comprehensive knowledge of law to that of amassing a number of isolated unconnected rulings with which they can pelt their antagonists.'

"He then distinguishes between cases which are worth reporting and those which are not, and continues—

"'If reporting is taken up as a mere private commercial speculation, every case is worth reporting because there is no case which may not, under some circumstances or other, be used as a precedent useful to some one or other in some argument or other. The Reporter's object, if the reports are allowed to be a mere private commercial enterprise, is to sell his reports; and, on the one hand, he naturally wishes to make them as complete as possible, in order that others which are more complete may not supersede or compete with them; whilst, on the other hand, as the purchaser is practically obliged to buy the reports for fear his knowledge should fall behindhand, it is the obvious interest of the Reporter to bring out as much matter as he can.

"'A vast number of these reports are of such a nature that their publication is in the highest degree mischievous, as tending to overload the law with needless precedents, and so to confuse and hamper the whole administration of justice. In many cases no really new point of law is decided, but merely a question of fact between two or more parties. In other instances, points of law are decided or remarked upon incidentally and hastily, and in such a manner as not to express the careful and deliberate opinions of the Court. Thus, the High Court of Calcutta is divided into division Courts of two Judges each. All their judgments are published just as they are delivered (generally without any proper statement of facts to render them intelligible). Without any disrespect to the Court, it is surely clear that to aonvert every judgment so delivered into a binding precedent, that is to say, into a law, is to cttach to them a degree of importance which they are very far from deserving.

"'In other cases the point decided is so minute, so peculiar, or so much dependent upon the particular facts of the case, that it is not worth recording.

"'In almost every case the length of the report is out of all proportion to its importance. To print everything at full length, and to leave the reader to pick out what he wants, is always the easiest of all ways of reporting a case, is the most profitable to the publisher, and the most expensive to the public.

"'Reports published as a private speculation must appear at stated intervals, and the customer is apt to think that, if he has not good measure, he is defrauded. A really careful report ought to mention no one fact that is not essential to the full understanding of the judgment, and to omit no one fact that is essential to it.

"'If this rule were carefully observed, I believe that all reports might be reduced to a small fraction of their present bulk.

"'There are numerous cases, too, which, however important and however well-decided they may be, ought not to form precedents. Cases on the construction of written documents should never be reported unless they decide some broad principle. Can there be a more unsatisfactory argument than this? A and B must be held to have meant so and so by such an agreement, because C and D were held to have meant something like it by a somewhat similar agreement. In nearly every instance such cases should be decided on their individual merits.'

"Now that is a forcible picture of the state of things which results from holding at the same time that Law Reports are fit subjects for commercial speculation and are also to be treated as binding authorities. Nor is it easy by any private efforts to get out of the false system thus established. If a publication is started on the principle of careful selection and skilful exhibition of decisions, it is easily undersold by another which gives a greater quantity of unselected and undigested matter; for it is all equally law. If buyers could choose, they would choose only that which was really instructive; but under the supposed system of free-trade, they have no choice. The result is that the bad Reports drag good ones down to their own level; those who would gladly supply good and useful Reports are forced to follow the bad example set them, and to insert a quantity of useless matter, merely because others do the same.

"That such is actually the case here and now, I will show by the evidence of Mr. Pitt Kennedy. I quote from a letter written by him on behalf of the Council of Law Reporting to the Government of Bengal in the year 1872.

"'The practical effects of the system are in evidence before the Government of India. In the first place as to mere pecuniary cost, the Advocate General of Madras, in his recent pamphlet on Law Reporting, says 'that the cost of obtaining a single set of the ordinary current Reports is at least Rs. 300 per annum.' As regards the far more important effect on the quality of the Reports, and on the practice of those who use them, Mr. Pitt Kennedy, in 1872, wrote thus:—He is speaking of the publication called *The Weekly Reporter*:—

"'Mr. Sutherland's publication is a mere reprint of judgments, never containing any statement of the facts of the cases, or any summary of the arguments of Counsel, and including many cases, illustrative of no principle and wholly unfit to be reported. Unfortunately few of the legal practitioners, in this country, save the Advocates in the Presidency High Courts, appreciate these defects, and an indiscriminate insertion of cases is to too many of these practitioners rather an attraction than a fault. In consequence of this, and in order to obtain subscribers amongst the mofussil practitioners, the Bengal Law Reports were obliged to publish many cases, which on strict principles of selection ought to have been excluded.

"'This, of course, has considerably increased the expense of publication of the Bengal Law Reports, which, in the competition with Mr. Sutherland's series, is placed at great disadvantage; the latter, as before observed, consists merely of reprints of judgments with placita prefixed, thus avoiding all labour, save that of copying, and saving the space required for a statement of the case and of the arguments of Counsel.'

"And again he says—

"'The average number of subscribers to the Bengal Law Reports is 310, and the large number of these (exclusive of those in Calcutta itself) are in places outside Bengal, for these reasons, that the officials in Bengal who might otherwise be subscribers are already supplied by the Bengal Government, and that the mofussil practitioners usually prefer Sutherland's Weekly Reporter *as containing more cases at a lower price.*'

"We have also the evidence of a firm of Law Booksellers who are eminently qualified to speak on the commercial aspect of this question. I quote from another letter written by Mr. Pitt Kennedy:—

"'But Messrs. Thacker Spink and Co. state that *if the number of cases reported be considerably reduced, there will be a great falling off in the number of subscribers;* and we are bound to admit that we have frequently heard complaints on account of their having omitted to report many cases which had been decided. These complaints, it is true, prove rather the incapacity of the persons making them to form a judgment, but many of the subscribers hold that opinion. Messrs. Thacker, Spink and Co. think that the reduction in the cost of printing would be trifling in comparison with the amount likely to be lost by the discontinuance of subscriptions.'

"I will only add that precisely the same thing has happened in England, and, indeed, it seems to me the inevitable result of the combined principles I have referred to.

"Now, I don't wish to say an unnecessary word against the Weekly Reporter. It is a very respectable publication, and I believe has been and is very useful in its proper place. Taken on its own merits, it will probably find many purchasers, and I wish it, as I wish all deserving publications, a fair measure of success. My only object is to show that it ought not to possess that factitious quality of binding authority, which, as we are destitute of authorized reports, we have attributed to all reports. A little while ago the Government, who spend money on the Bengal Reports, forbad the expenditure of public money on the Weekly Reporter, which Mr. Sutherland its proprietor thought very hard upon him. And he now considers that we shall do him a further injustice if we succeed in attaching the quality of authority to those Reports which alone ought to have it. Mr. Sutherland piques himself, I believe quite justly, on giving correct transcripts of the judgments of the High Court, and he contends that whatever the High Court have thought fit to utter is fit to be embodied in reports that are to govern the law of the country. He forgets, I think, that a Judge's primary duty is to decide the dispute between the parties, and that a judgment may be an excellent settlement of a dispute, and yet throw no light on the law. I will, however, give a few instances of the sort of case which this gentleman finds it useful to insert in his Reports, and the Council will judge for themselves whether they are useful additions to the law or not.

"Here is a case. A Principal Sadr Amín decided for the plaintiff. The District Judge reversed him, and assigned as the only reason that the plaintiff ought to have produced a specified document. On special appeal by the plaintiff, the High Court found that the reason was absurd, for no such document existed; still they said, there might be reasons for the reversal, and they remitted the case in order that the District Judge might state what his reasons were. When the case got back to the District Judge he conceived that the High Court intended him to alter his judgment: and so he confirmed that of the Principal Sadr Amín, assigning no reason at all. Of course there was another appeal, this time by the defendant, and of course the High Court again remitted the case to the District Judge for a statement of his reasons.

"The whole history of this struggle of the High Court to make a stupid or perverse man do his duty is given in the Weekly Reporter. It is a most proper subject for publication, and may well find a place in a newspaper, or in any other vehicle for the information of the day. But I need hardly insist on its utter uselessness in a work intended to form part of the general body of law.

"Take another case. A decree awards to the plaintiff, in satisfaction of a money claim, a portion of the defendant's land called Plot 2, and goes on to say that if the claim is not satisfied by Plot 2, the plaintiff may enforce the remainder against Plot 1. The plaintiff took a portion only of Plot 2, and then tried to get possession of Plot 1. On application to the High Court, it was declared that he could not do so. But why should we have among our laws a declaration of the meaning of a very special decree, of no sort of interest to anybody but the parties, and on a point so plain that nothing but the bias of self-interest could have caused a dispute about it? A great number of cases come before the Courts, not because there is any difficulty in them, but because one side or the other is bent upon doing wrong. The authority of the Court is wanted to get justice. But we do not want the history of such cases in our permanent Reports.

"In a third case, Mr. Justice Phear opens his judgment thus:—'The question in this case is a very simple alternative question of fact, namely, whether certain land belongs' to one person or to another person. He then reviews the evidence in detail and decides the case in favour of one or the other. Now what possible light can it throw on the law, to know how a very simple alternative question of fact was decided on a particular occasion? The opening sentence of the judgment is enough to show that, however useful it may be to publish it, it should find no place in a work of authority.

"I will give the Council one more specimen. This is a headnote of a case. 'An indivisible tenure cannot be split up into parts with a view to the institution of different suits against the tenants for arrears of rent.' The proposition is intelligible, and commands assent, but one looks with some curiosity to see on what grounds it was disputed. Well, on looking into the report, I find that it never was disputed at all. The sole dispute was one of fact, whether the particular tenure was or was not indivisible. Having found that it was indivisible, the Court experienced no further difficulty in applying the law to the facts.

"There are a great many cases of the same kind, but I should only weary the Council by giving further specimens. Probably, more than half the reported cases might be omitted on the ground that, considered as moulding the law, they are unimportant or wholly inoperative. It may be useful to the parties or agreeable to some sections of the public that they should be published. Ephemeral publications for this temporary purpose may, if they do their work well, be worthy of praise and encouragement. But to let them take their place among the laws of the land can only be embarrassing. To treat them in such a manner as practically to compel a whole profession to buy them is oppressive. And it is from such an embarrassment and such an oppression that we wish to give relief.

"There is also another great fallacy about reports of this kind; the supposition namely that if only you have a true account of what the Judges said, you have a true account of the decision. Now, there are very few occasions on which a Judge thinks it necessary to make such a statement of the facts and the arguments as to make his judgment a full exposition of the case. He would usually waste much time if he did so. But a judgment without the facts, like a Counsel's opinion without the case laid before him, is apt to be very misleading. If I were asked what is the most essential part of a good report of any decision, I should say without hesitation a full and accurate statement of the facts. Next to that generally comes the reasoning of the Judge, but that depends upon circumstances; the arguments of Counsel are often of great importance for a due understanding of the case.

"The Council will remember a recent discussion at this table as to the meaning of a passage in a judgment, which was only to be explained by reference to the frame of the suit. On turning to the report, we found nothing said about the frame of the suit, or indeed about any other fact; so that the badness of the report made the judgment worse than useless, actually misleading on that point.

"But I can show you by illustration from the columns of the Weekly Reporter what mere heaps of rubbish are reports of judgments without the facts.

"In an early volume is the report of a case (we may call it case A) in which Counsel cited another case (case B) from another publication framed on the same principle of giving copies of judgments without the facts. Upon this the Court says, 'The facts of the case are not given: and we are by no means sure that the marginal note correctly represents the ruling of the Judges.' And so they pay no attention to case B. Well, time runs on, and in its turn case A comes to be cited to the High Court. The only observation they make is 'We do not know the facts of the case,' and again they pay no attention to case A.

"I ask then why such reports, only cited to be treated as useless, should enter into our system of law making, and whether it is wise or fair to anybody to let them swell the mass of our law, if we can prevent it.

"Of course the cases that I have cited are mere illustrations; their number, as I am informed by gentlemen who have the best means of judging, can be multiplied indefinitely. I hope the Council will be of opinion that I have said enough to show that it is worth our while to make an effort to prevent publications such as these, useful as they may be in their own way, from becoming part and parcel of the law of the land.

"I ought not, however, to quit this part of the subject without reading to the Council a passage from a letter with which Mr. Sutherland has favoured me, and which gives his own view of the status of the Weekly Reporter:—

"'The fundamental principle on which the Weekly Reporter has been conducted ever since it was commenced in 1864, is to publish no case in which there was no principle of law. No one has ever contended on behalf of the Weekly Reporter that all the cases therein published were meant to serve as precedents. The great merit of the Weekly Reporter, and the reason why it has met with so much favour in the Mofussil, not from the practitioners there merely, but from the Government officials who have subscribed to it privately when they have been prevented from subscribing to it publicly, is that it contains cases which, though they may not answer as precedents to be judicially cited, supply the want, so greatly felt by inexperienced administrators of the law of Guides or Text-books available to English lawyers.'

"Well, but if it be the case that this publication is taken not for the sake of quoting precedents out of it, but for the sake of instruction, in the first place I am glad it should be so; and, in the second place, nothing that I shall ask the Council to do will in the slightest degree interfere with its sale as a work of instruction.

"Such then being the state of affairs, what is the remedy? I dare say that Hon'ble Members have seen a pamphlet, I need hardly say an ably written one, lately published on this subject by the Advocate General of Madras. After stating his view of the condition of things he says—

"'The remedy which I venture to suggest for this state of things is three-fold—(1), a single set of reports for the whole country, edited by a Central authority; (2), increased participation by the Judges in the work of legislation; (3), the substitution of legislative enactment for reports in all cases in which the decision turns on the interpretation of the written law.'

"Now, as regards the second of these proposals, I do not think that either the Government or the Judges see their way to accomplish it. As regards the third, it is in some degree put in action, as, for instance, by the Act for the amendment of the Criminal Procedure Code, which is now pending before this Council. There we propose to take a few judicial decisions and embody them in the Code. But this remedy can only be partially applied. In the first place, you will observe that Mr. Cunningham only proposes it for the written, that is the statute, law. And even as regards this branch of law, there are considerations which would prevent any but a limited reliance on it. There are many cases very useful in Reports, where all their proper qualifications and shades of meaning can be developed, yet which hardly admit of condensation into propositions of law. It would be difficult to keep so well abreast of judicial decision as to dispense with reports, unless it were by such speed as would carry with it great risk of error, and by such incessant fidgetting and patching as would lead other people to vote us, if indeed we did not vote ourselves, a public nuisance. Moreover, we cannot overlook the ingrained tendencies of English lawyers, and I may add of English Statesmen and Englishmen generally. We are always anxious to make every step onward square with the past, and to decide everything by authority and example rather than by pure reasoning.

Accordingly, in all departments of life our tendency is to hunt for precedents. I do not discuss here whether this habit is bad or good, but, having English lawyers at the head of our legal system, we must take its existence into account. As for supplying the innumerable applications of rules to ever varying facts by short propositions or even by illustrations, the task would, I think, be impracticable. And if we attempt to cut off our lawyers from the comfort of precedents to be found in reported cases, I believe we shall fail, and that the law will more than ever fall under the dominion of irresponsible Reporters and bad Reports.

"The first of the three remedies is what we are proposing to try. The Government purposes to establish a system of reporting on such principle as may give both to it and to the Judges their due share of responsibility and of control. We hope thereby to increase the usefulness of Reports by bringing a greater amount of skill and care to bear upon their construction, and to diminish their number by rejecting unimportant cases. If so, we shall also decrease expense to their buyers, which I see that the Advocate General of Madras states to be at least rupees 300 per annum.

"I have seen objections made to a Central Editor on the ground that many cases have a local character. Indeed, a friend of mine, an able and eminent Judge on the Bombay side of India, has written to me on this subject, and in this sense. He says there is probably not a subordinate Judge in all his Presidency who takes the Bengal Law Reports, and perhaps but two who takes the Calcutta Weekly Reporter. And he fears that, with a Central Editor, Bombay lawyers will be saddled with the expense and bother of decisions on the Bengal Rent Law, or something equally useless. Now, all these considerations seem to me to supply arguments, not against, but in favour of a central authority. Under the present system, a Bombay lawyer must either forego what is useful to him (as it seems they do), or take what is useless. It cannot be expected that a Bengal Law Reporter shall publish one volume for general use, and another for provincial use. But if you have an authority acting for all India, he will of course carefully distinguish between cases which have a general bearing, and those which have only a local bearing, and he will publish them in separate volumes; so that the Bombay lawyer will have an advantage which he has not now; for he will be able to get the Bengal decisions which have a general application, and be freed from those which do not apply to Bombay.

"It is not for the purpose of establishing this system, but to aid the system, that the action of the legislature is asked for. We can aid it in two ways.

"First, with respect to the binding authority of Reports. When we get a set of Reports under authorized and responsible management, it will be fair to say that no others shall be of such authority that the Courts shall be bound to hear them cited or treat them as binding. And the practice of so treating all Reports is so inveterate, that though perhaps a declaration of the legislature is not absolutely necessary for its abandonment, it is very unlikely to be abandoned without such a declaration.

"The other point is one on which practical inconvenience is now felt. From historical causes a decision of a High Court in one Presidency is not obligatory on subordinate Courts in another. The result is that you may have an important gloss upon the law in Madras, such an one as would be inexpedient to attempt to embody in a Statute, and yet be left quite uncertain how the same point would be treated by a District Judge in Bengal. We propose as a portion of the more general and national system of reporting, to say that the reported decisions shall carry the same authority in British India as they now do in their own Presidency.

"For these two purposes I ask leave to introduce a Bill. The exact mode by which they shall be effected will be subject for comment when the Bill is introduced."

The Motion was put and agreed to.

PORT-DUES ACT AMENDMENT BILL.

The Hon'ble MR. HOBHOUSE also moved for leave to introduce a Bill to amend Act No. XXII of 1855 (for the regulation of Ports and Port-dues). He said that the occasion for amending that Act was this. Act XXII of 1855 drew a distinction between the port itself and the navigable channels which led up to the port; and some of the provisions applied to the port itself, and others to these navigable channels; while some applied to both. Under section twelve of the Act, there were provisions which forbade vessels above a certain burden from moving, excepting they had a pilot on board, or they were authorized by some authority mentioned in the section. But that applied to the port, and not to the navigable channels leading to the port. It was found desirable to have the same provision with regard to the navigable channels. He was not in a position to say why those provisions had not been made to apply to these channels; but he thought it was more likely to have been by accident than by design. At all events, it was now found convenient to extend the power of the Port authorities in that respect.

Another matter in which the Act would require amendment was mentioned by him when he was calling attention to the report of the Select Committee on the Burma Municipalities Bill. The authorities in a Port town were in the habit of giving assistance to sick sailors on board ships, and they generally made a collection by way of contribution from the owners of ships. Some difficulty had been found in enforcing that arrangement; and it was proposed that these charges should, like other charges, be recovered before the ship got its port-clearance. A similar difficulty was found in Calcutta a few years ago and had been amended by Act III of 1869 of the Bengal Council which we were told had worked very well. The same difficulty had now arisen in Burma, and the Local Government of British Burma asked for a law equivalent to the law passed in Bengal. It was found that the matter was clearly of more general concern, and did not only regard the ports in Burma or the port of Calcutta. There must be the same difficulty arising in other ports, and it was desirable to amend the general law in that respect. At the same time as the matter of ports was the subject of a good many scattered Acts, the opportunity would be taken to see if we could not usefully consolidate the law on the subject.

The Motion was put and agreed to.

The Council then adjourned to Tuesday, the 24th March 1874.

† Returns for week ending 7th March received after the publication of the last *Gazette*.

A Price of best rice in the interior ranges from 11-8 to 12-11 seers, and of common rice from 12-8 to 13-9 seers per rupee, except in some parts of Hood-hood, where it is sold at 10 seers.

B Coarse rice at 14-6 seers per rupee.

C Price of best rice in the interior ranges from 11 to 13 seers, and of common rice from 12-12 to 14-8 seers per rupee.

D In the interior only.

E Price of best rice in the interior ranges from 8 to 12-8 seers, and of common rice from 12 to 14-8 seers per rupee.

F The price of common rice in the sub-divisions ranges from 13 to 16 seers per rupee.

G Coarse rice at [illegible] seers per rupee.

H Price of best rice in the interior ranges from 11-4 to 16 seers, and of common rice 14-4 to 21-5 seers per rupee.

I Price of best rice in the sub-divisions ranges from 10-8 to 11-8 seers, and of common rice from 12-8 to 13-8 seers per rupee.

J Common rice in the interior from 9-8 to 12-8 seers per rupee.

K Highest price at Dhanat 10-8 seers, lowest at Adamdighee 15 seers per rupee.

L Price of best rice in the interior ranges from 8 to 12 seers, and of common rice from 10 to 14 seers per rupee.

M In the interior the price of best rice ranges from 12 to 14 seers, and of common rice from 14-8 to 17-8 seers per rupee. The rise is due to large exportations.

N In the interior the price of best rice ranges from 11 to 16 seers, and of common rice from 12 to 18 seers per rupee.

O In the interior the price of best rice ranges from 12 to 14 seers, and of common rice from 13 to 16 seers per rupee.

PRICES-CURRENT of Food-grains and Salt in the undermentioned Districts of Bengal on the 14th March 1874.—(Continued.)

GOVERNMENT OF INDIA.

DEPARTMENT OF AGRICULTURE, REVENUE AND COMMERCE.

REPORTS ON THE STATE OF THE SEASON AND PROSPECTS OF THE CROPS FOR THE FORTNIGHT ENDING THE 19th MARCH 1874.

General Remarks.—No rain has fallen in Madras, where prospects, especially in the south, are reported to be unsatisfactory. In Bombay also none has fallen; the harvest is in progress in most parts of the Presidency, and the out-turn appears to be generally fair. In Bengal there has been rain in most districts during the fortnight, with great benefit to the operations for the early rice sowings; hail has fallen in some places, but without doing damage except to the mango crop. The out-turn of the *rubbee* in Behar is generally reported fair, although the area is deficient; much millet has been sown, and is being forwarded by the rain. The worst reports as to the condition of the people continue to be from the northern sub-divisions of Tirhoot.

The harvest is progressing in Oudh, where the new grain has caused a slight fall in prices. Accounts from the Punjab (where rain has fallen generally) are favourable. In the Central Provinces the harvest has nearly come to an end; the out-turn has been tolerably good. It has also been reaped in Berar. There has been slight rain in some parts of Rajpootana and Central India; the prospects of the harvest are generally favourable. In Mysore prospects are fair, though want of water is felt in some places.

No report has been received from the North-Western Provinces, British Burmah, or Assam, in time for inclusion in the general statement.

Presidency or Province and District.	Rainfall for fortnight preceding.	State of agricultural prospects.
Madras (Mar. 19th)		
Kistna (18th)	*Nil*	No water over Anicut; canal supply scanty; Bezwada and Ellore canals closed for navigation; maize, black gram, cumboo and raggi sown in Bunder; few standing crops fair, suffering from drought in places; out-turn of gram, castor, cotton, black gram, maize and chillies half to three-quarters; markets well supplied locally; prices generally steady; pasture scarce; small-pox and slight fever prevailing, except in Suttunapulli; guinea worm in Palnad; cattle healthy in two taluqs.
Kurnool ...	...	No report received.
Negapatam (Mar. 18th)	*Nil.*	Rivers dry; water in tanks scanty; some dry grains in cultivation; standing crops, some not thriving, others withering in some parts for want of rain; Sambapishanum harvest almost over; yield below the average; markets well supplied; prices slightly declining; pasture moderate; health generally good; small-pox in several places; cattle disease here and there.

Presidency or Province and District.	Rainfall for fortnight preceding.	State of agricultural prospects.
Madras—*contd.*		
Trichinopoly (Mar. 18th)	*Nil.*	Water supply sufficient in irrigated villages, failing elsewhere; drinking water scarce in many villages; condition of crops in river irrigated villages tolerably good; elsewhere generally failing; out-turn of wet crops generally below the average and of dry crops 75 per cent. below the average in one taluq; markets sufficiently supplied in northern parts of the district from foreign sources; price of rice fallen slightly; that of dry grain is stationary; pasture sufficient for the present; health good, but for small-pox in some villages; condition of cattle generally good.
Calicut (Mar. 18th)	*Nil*	Ploughing operations for first crop begun; supply of grain from local sources not ample; prices increasing; pasture scanty; small-pox prevalent; fever slight in hilly parts: cattle disease reported in Ernad taluq.
		General prospects not satisfactory.
Bombay—		
Sindh. (Mar. 18th.)		
Kurrachee ...	...	Rubbee crop in ear; ordinary crop expected.
Hyderabad ...	...	No change.
Shikarpur ...	...	Nights cold; no other changes.
Gujarat.		
Ahmedabad ...	...	Rubbee and public health good.
Kaira ...	...	Cotton picking in progress; weather and public health good.
Surat ...	...	Cotton picking nearly finished; rubbee crops and public health good.
Broach ...	...	Crops all picked; weather good.
Khandesh and Nasik.		
Khandesh ...	...	Harvesting of wheat and gram completed; cotton market improved; public health good.
Nasik ...	...	Harvesting of late crops nearly completed; public health good, except in part of Dindori, where fever prevails; cattle disease disappeared in Nundgaum, diminished in Peint and Nasik.
Thanna ...	...	Prevailing diseases ague, measles and cough; weather sultry and dry; fever prevalent in taluq Shapur, and cattle disease in Salsette, Moorbar and Bassim taluqs.
Deccan.		
Poona ...	...	Hot weather continues; public health good; cattle disease prevailed in Judapur and slightly in Mawul and Moolshi.
Ahmednuggur ...	...	Slight cattle disease in taluq Aukola; public health good.
Sholapur ...	...	Weather warm; ague in Pandhurpur; public health good in other taluqs.
Sattara ...	...	Crops almost all harvested; fever in Walwa; ague and cattle disease slightly in Patan.
Southern Mahratta Country.		
Belgaum ...	...	Cotton crops indifferent; scarcity of water in Chikadee taluq; health good.
Dharwar ...	...	No change; cotton picking and ginning general.
Kaladghi ...	...	Rubbee crops except cotton nearly reaped; foot and mouth disease in Bijapur.
Canara ...	...	Progress of second crop satisfactory; slight fever prevails in some parts.
Kattyawar and Gaekwar's territory.		
Rajkot ...	...	Cotton picking nearly over; out-turn of wheat good.
Wudwan ...	...	Weather moderate; state of corps as before; health good.
Baroda ...	...	Cotton picking continues; other crops reaped; public health good.
Bengal (Mar. 17th)		
Burdwan ...	1·81	Weather much warmer; showers of rain have fallen in the Sudder, Boodbood, Culna, Cutna and Raneegunge sub-divisions. Nearly all the cold weather crops are reaped and the out turn is reported to be fair. The yield of potatoes has been very large. Grain is being imported from the Sunderbans, Cuttack, Midnapore, and Bancoorah and exported by rail. Common rice is selling at all the large marts at about 13 seers per rupee, but in some villages in the interior of Boodbood only 10 seers are obtainable for a rupee.
24-Pergunnahs ...	1·61	Days hot, night cool; the weather has been cooler than at first, owing to the fall of occasional showers of rain and hail storms. A few vegitable crops on the ground; boro rice sowings progressing in Busseerhat; mango blossoms have suffered from hailstorms. Preparation of land continues for the next early rice-sowings on a large scale. Prices have fallen.
Dacca ...	1·27	Weather cool, with showers of rain, thunderstorms and sunshine. Prospects of crops good.
Cuttack ...	·48	Light showers and warm weather in the beginning, but afterwards cool and cloudy weather. Prospects of crops good. Dulwa rice crops promising well.
Distressed Districts.		
Moorshedabad ...	·22	Very warm in the day time during the first week; cloudy on the night of the 6th March, and it has been cloudy for the greater part of the second week; on the 8th and 9th idem, there were showers of rain, and on the latter date the rain was followed by a heavy hailstorm traversing the district from north-west to the south-east; some damage, not of a serious nature, was done to the standing crops of grain and wheat and mangoblossoms by the hail. The rain has enabled the cultivators to renew ploughing operations for the early rice sowings. Prices are on the whole slightly better.
Dinagepore ...	·91	No rain during the first week, but the weather was close and cloudy; some rain has fallen in the early part of the second week throughout the district; in some places, however, the cold weather crops have nearly all been gathered; mustard and rape crop has been quite up to average; sugarcane has also been good; grain and barley in many places look well; the boro rice already sown has benefited much by the rains, which has also enabled the breaking up of land to be pushed on with.
Maldah ...	1·55	Weather getting warmer; fair and occasionally cloudy during the early part; it was close and cloudy for several days, and rain, thunder, lightening and hailstorm on Saturday (7th) and Monday (9th) nights; strong west wind throughout; the rain has been most beneficial to the lands under cultivation, and has assisted ploughing to go in on all sides. No injury is reported to the cold weather crops row ripening and which promise in most places a full average out-turn; wheat and cheena (millet) especially look heavier crops; boro paddy is also in a promising state; the mango blossom is most abundant, but the late rains are said to have done considerable injury to this crop.

Presidency or Province and District.	Rainfall for fortnight preceding.	State of agricultural prospects.
Bengal,—*continued.*		
Rajshahye ...	·22	Cloudy on several days, but there has been no rain throughout the district during the first week; in most parts there was slight rain during the second week. The state of the cold weather crops is favorable, and in some places the wheat and barley are fast getting ripe; khesaree and mossoree (pulses) however have suffered somewhat from the late rain; peas and khesaree (pulse) are being cut, also urhur (pulse) in some places; ploughing for rice and teel (oil seed) sowings is going on, and a good deal of both has already been sown; boro paddy has been cultivated to an unusual extent, and much of it has been transplanted for the last time. Prices are almost stationary, though there is a general tendency to a fall in prices of rice and paddy.
Rungpore ...	1·40	Weather cool and fine; slight showers in parts of the district; all the crops on the ground look well; wheat and pulses especially good; wheat is being harvested to the east; cheena and kowni (millets) promise well; aus or early rice is being sown very extensively, and is sprouting and look well.
Bogra ...	·10	Getting hotter in the day; morning and evening fine; a shower of rain on the night of the 7th March. Mustard, mulberry, sugarcane and urhur pulse are being cut, and a fair out-turn is expected; other pulses, such as motar, khesaree, &c., are getting on fairly well.
Patna ...	·02	During the early part of the fortnight, the weather was all that could be desired; but on the 7th March there was rain mixed with hail, and the weather looked threatening; though there was no rain at the head-quarters in the latter part, both rain and hail have fallen in different parts of the district, varying from 0·025 to 1·07 inches; the hail was very partial, and has not done any harm to speak of. The harvesting of the cold weather crops of every description is going on, and they are yielding much better than was expected.
Gya ...	0·07	Weather unsettled during the first week; afterwards mornings and evenings cool. Cold weather crops are being harvested; out-turn not yet ascertained, apparently heavy; the quantity will not however make up for the quantity unsown.
Shahabad ...	*Nil*	Weather unsettled, and threatening during the latter part of the first week, and cool with high west winds afterwards. Crops favorably reported on; wheat, barley, gram, peas and mussoor (pulse) being harvested; sugarcane being planted; weather, all that could be desired for the crops.
Tirhoot ...	0·21	Dry and getting warm; cold nights. In the Hajeepore sub-division there is no change in the prospects of the crops; the thunder and slight rain which fell on 5th March cannot affect any thing except mangoes, and even them not much, as it was too light; the cold weather crops are expected to be reaped in a fortnight, and the out-turn is expected to be 10 to 12 annas. In the Seetamarhee Sub-division there was a slight fall of rain on the morning of the 5th March, which lasted for half an hour, and one-tenth inch of rain fell on the 9th idem; there was a little hail with rain at Bongwan, but not sufficient to do good or harm; with a little more rain a full cheena (millet) and moong (pulse) crop may be expected; peas, mustard and musoor and keras (pulses) are being reaped; grain and wheat will be cut after 10 days. There is no change for the worse perceptible among the pauper classes of the people; some cultivators have become famine-stricken; the sub-divisional officer has himself noticed this in Mahind to the north, in Jallah, Charaut and Mussa, near Ramtoul to the east; he states that he has heard it on good authority, and his own impression is that some of the poorer classes are showing symptoms of sinking. It is believed that there would have been thousands of deaths had not Government relief measures been so early taken, and happily no deaths from actual starvation were reported. In the Mudhoobani sub-division crops are much the same as before; the little rain which has fallen, gives a greater promise of the moong (pulse) and cheena (millet) lately sown, which would not have come to anything except when watered. There is no material change in the prospects of the Sudder and the rest of the Sub-divisions.
Sarun ...	A few drops on the 5th March.	In the beginning of the fortnight the weather was cloudy; and afterwards clear, dry and getting warm, west wind prevailing. The state and prospects of the cold weather crops continue good, and now the harvest is commencing, the prospect of two-thirds of an average crop on the area sown may be considered assured. In 11 villages in the Roghoonathpore outpost in Thannah Durowbe, peas, barley and ruhur (pulse) from 4 to 8 annas have been injured by hailstones which fell on the night of the 7th March. Indigo seed is being put in the ground, and early sowings have germinated; poppy heads are being tapped; people are busy in sowing the spring crops; new peas and other pulses are coming into the markets; lands are being ploughed for next sowings; prices steady.
Chumparun ...	0·5	East and west winds; weather much warmer; a slight sprinkling of rain on the night of the 6th March; hail reported from towards Bagaha and Lowriah, also from towards Gobindgunge; no great damage done, it is believed. The prospects of the cold weather crops continue good; mango crop very promising; indigo being sown; new pulses coming into the markets.
Monghyr ...	0·14	Weather set fair; the cold weather crops are being cut and will yield twelve annas all round; cheena (millet) has been exclusively sown and is coming on well; the mohwa and mango crops are promising.
Bhaugulpoor ...	0·08	Weather favorable; slight rain at Banka; a severe hail storm reported over an area of 33 square miles on extreme north of the district, causing some damage; prospects of the cold weather crops excellent; crops ripening fast; reaping commenced in places.
Purneah ...	*Nil*	Seasonable, much warmer than before; west wind beginning; a severe hail storm in Arrareah caused considerable damage in some villages. The prospects of the cold weather crops continue excellent; the reaping of barley has begun, and peas have been gathered in many places; the rains early in the second week have done much good to the kowni and cheena (millets); lands are being everywhere prepared for the early rice sowings; private trade is busy everywhere, and prices falling in consequence.
		Public health.—Burdwan, fever as before; 24-Pergunnahs, 13 cases of and 4 deaths from smallpox reported from thannah Kalaroa. A few cases of cholera in thannahs Bankipore, Diamond Harbour, Busseerhat, and Kaligunge; it has abated in thannah Canning. Dacca, cholera reported at Manickgunge; Cuttack, public health good. Moorshedabad, smallpox still prevalent; Rajshahye, a few cases of smallpox and cholera; Patna, with the exception of a few cases of smallpox in the city the health of the district is good. Gya, health good. Shahabad, smallpox prevalent. Tirhoot, a few cases of smallpox at Majongunge, Jalleh, and Seetamarhee; otherwise, general health good. Bhaugulpore, general health very good.
		General Remarks.—More or less rain has fallen during the fortnight in almost all the districts and hail in some. Cold weather crops are doing well in most parts and are being reaped in some places with fair result; very little injury appears to have been done by the hail. Preparations for the ensuing rice sowings are actually progressing, and in some places the seed has germinated and is doing well. Baropaddy is doing well everywhere.
Oudh		
Lucknow (Mar. 19th)	·2	Wheat, barley, peas and gram, are being cut, and sugarcane planted; new grain coming into the market, and prices are slightly falling.
Fyzabad (18th)	*Nil*	
N. W. P.	...	No report received.
Punjab		
Delhi (Mar. 18th)	·9	
Hissar „	...	A little rain.
Umballa „	1·7	
Jullundhur „	1·3	
Amritsur „	...	Heavy rain, quantity not stated.
Lahore „	1·0	
Mooltan „	0·6	
Rawalpindi „	2·5	
Peshawar „	1·	Hail at Pind-dadon Khan and parts of Mooltan districts; no injury to crops; smallpox in Hissar and Sirsa districts, some fever in Lahore; otherwise health of province good; agricultural prospects generally favourable.
C. Provinces— (Mar. 19th)		
Chanda (14th)	...	Weather clear; prospects good; prices stationary.
Mandla ...	...	Prospects favorable; health good; prices stationary.
Bhandara ...	...	Clear whether; rubbee harvest average; no epidemic.
Upper Godaveri ...	...	Warm; few cases of small-pox.
Sumbulpoor ...	...	Clear; no standing corps; prices stationary; no epidemic.
Belaspoor ...	·20	Weather cloudy; rubbee harvest progressing; measles and smallpox prevailing; prices easy.
Balaghat (16th)	...	Fair; slight rain; prices steady; fever and smallpox about.
Wurdha (18th)	...	Crops harvested; smallpox prevalent.
Seoni ...	...	Rubbee being reaped and thrashed.
Nursinghpoor ...	...	Rubbee harvest good.
Nagpoor ...	...	Cloudy; no standing crops; some cattle disease, and small-pox.
Saugor ...	...	Clear; rubbee being reaped; with the exception of some small-pox, health good.
Nimar ...	...	Prospects favorable; prices stationary.
Jubbulpur ...	...	Prospects good; prices slightly fallen; small-pox in the city.
Hoshangabad ...	...	Rubbee harvest good; small-pox in places.
Hyderabad Assigned Districts—		
East Berar (Mar. 19th)	...	Khurreef and rubbee crops brought to market; prices falling; public health good.
West Berar (18th)	...	Rubbee gathered; weather getting warm.
Rajpootana—		
Serohi (Mar. 16th)	...	Well-supply drying up; health very good; crops being cut; prospects very good.
Meywar (14th)	...	Same as last.
Harowtee (Agency States) (Mar. 12th)	...	Tanks and wells moderately full; health very good; prospects of crops fair.
Ulwur ...	...	Showers on the 6th; water-supply satisfactory; health good; prospects of crops most satisfactory; but cloudy and cool weather cause apprehensions of hail storms and blight.
Jeypoor (19th)	1·0	Rainfall during fortnight somewhat damaged ripening crops in some localities; prospects good; public health excellent.
Ajmere ...	...	Health good; harvest hopeful; reaping commenced; clouds hovering about.
Central India(19th March)		
Indore (Mar. 18th)	...	Weather fine and cool; public health good; agricultural prospects favourable.
Gwalior ...	...	Slight rain and hail; crops fair; small-pox decreasing.
Neemuch ...	...	Fine weather; agricultural prospects continue favourable.
Rutlam ...	...	No report received.
Bagelkhund (Sutna) ...	...	Heavy shower; crops being cut; prospects fair; a few cases of small-pox at Nagode.
British Burmah— ...	...	No report received.
Nepal ...	...	No report received.
Mysore & Coorg-(Mar.5th)		
Bangalore ...	...	Agricultural prospects fair, but wet crops suffering in some places for want of water; cattle disease apparently abating.

Return showing the Quantities of Cotton exported from the several Ports of India to British and Foreign Countries for the month of February 1874.

| Names of Ports in India where Cotton is exported. | | Quantities of Cotton exported to | | |

In fact, I failed altogether to elicit any information or excite any sympathy on this interesting subject amongst the more civilised portion of the community, so turned to the slave population and instituted an enquiry on the Seyyids' plantation outside the town. Here I soon discovered not only that several isolated trees and small groups existed within reach, but also that the slaves employed in clearing land had arrived at an extensive belt of them, where the India-rubber Uiana was also abundantly found, and which spread for a considerable distance inland.

On the 16th I left Dar-es-Salam in company with Lieutenant T. F. Pullen, Her Majesty's S. *Shearwater*, and we proceeded with a guide in a westerly direction by narrow winding paths through broad fields of "Mhogo" and long well tended rows of cocoa-nuts for some two miles until we reached a "clearing" of the customary east coast description. Charred stumps of trees and felled and blackened trunks entangled with the tough half burned ropes of the India-rubber climber strewed the ground and obstructed rapid progress over the ankle deep layers of wood ashes and treacherous "stubbing" holes on the one side, as far as the long "straw" grass and thick brushwood bordering the cultivated lands, and in the other direction up to the outskirts of a dense African forest stretching far away towards the Marni Hills and Uzaramo.

Past this clearing we found slaves busily at work hacking down trees recklessly, and from amongst these people our guide chose two slaves, one a Miao and the other a Muinde who led the way over the wrecks of some hundreds of fallen trunks until we at last reached the borders of the wood and found ourselves amongst the "Niti Sandarusi."

We were not long in endorsing Dr. Kirk's report published in the Linnœan Society's Journal (Botany Vol. XI, paper on Copal of Zanzibar and the "*Trachylobium Mozambicense,*") for both of us were astonished at the immense number and size of these trees, far exceeding anything we had before imagined. Here almost every tree around us represented the striking characteristics which will be easily noted by the annexed sketch and the following carefully measured dimensions which may be taken as representing an average tree, but by no means one of the largest of the group:—

	Ft.	*In.*
Height (top branches lopped off)	60	0
Girth at ground	4	3
„ at 5 feet above ground	3	2
Height to 1st branch	21	6
Girth at „	2	10

The trunk, which is covered with a moderately thick bark, 3-16th of an inch, resembling that of the Birch, grows perpendicularly in the larger proportion of trees to a height of about 20 to 25 feet. At this point the main limbs fork out, and from the extremities of the branches the foliage spreads into that flat-crowned appearance so common to many African trees. The fruit is of a brown color and an irregular almond shape, studded with small excrescences, the leaves glossy and of a vivid green, as the specimens forwarded will show.

On stripping off the bark we found the gum deposited in many places, between it and the wood, in a liquid form. This was also observable to a greater extent when sawing off sections of branches; where the tree was injured a resinous gum had collected in considerable quantities, and was also seen on several trees on the lower sides of the branches; on the upper sides none was seen.

The Muinde climbed up and stripped off several specimens with a knife, but none of these run to a large size. The larger pieces, we were told, are found at the foot of the tree where, falling, they become buried in the sand. The Miao told us his wife received a dollar altogether for what she had dug at the foot of the tree in the sketch, a rotten branch of which had fallen.

Marks of digging were observed in all the surrounding soil; however I am not inclined to think the gum falls in a liquid state, for no extensive deposit is noticed except where a state of decay exists; hence it is probable that where trees have been left to fall to pieces from sheer old age, large quantities may with reason be expected to be found buried and to have survived all traces of the tree itself on the ancient site.

Insects innumerable live on the Niti Sandarusi. One branch was cut down in which a family of ants had formed a large nest behined a wall of the gum, and were rapidly undermining the heart of the wood. Between the bark and the wood, on stripping the former covering, legions of ants and wood-lice were seen, and a small green lizard with a yellow head, stripped longitudinally with black lines, was pointed out to us as peculiar to the tree.

Indeed one can readily understand that it must be a mere question of sufficient time to produce gum which must necessarily contain imbedded specimens of the various insects common to the Sandarusi, and in a half decayed tree one would expect to meet with many such evidences of the former inhabitants, but not with the leaves or fruit which are only found growing as I before noted, at the extremities of the branches and remote from the situations in which the gradual formation of the copal commences.

The conclusion, then, which both Lieutenant Pullen and myself arrived at, is that the attacks of the swarms of ants and other insects lead invariably to the slow but sure destruction of these trees, piece after piece, branch after branch; as the heart of the wood becomes undermined, the tree throws out the resinous gum in considerable quantities; almost it would seem in an effort to arrest the process of decay, which occasions finally its fall, after which but a few years would be necessary to bury the wreck in the shifting sand which covers the surface of the sienna colored sub-soil rich in vegetable remains in which the copal tree is found.

Almost all these trees were festooned with the long intertwined ropes of the India-rubber Uiana, the thickly matted cords of which pendant from the main limbs and knotted into a sort of rigging become an easy means of ascent to the natives looking for the resinous deposits on the branches. This India rubber was worked rather extensively here at one time, but was soon given up as unprofitable in consequence of the number of slave lads carried off by leopards; now, however, it does not appear to strike the Sultan's overseers that it would be more lucrative to collect it as they move on with the clearing, than to cut down and burn the Uiana by hundreds.

Our guides easily worked up two large balls of India rubber for us. After making deep longitudinal incisions in the main ropes of the Uiana, the milky substances which exuded profusely, they smeared on the fore part of the left arm. When enough had been procured, this was stripped off in flakes and rolled up in the hands until it assumed the shape of a small dumpling. At Dar-es-Salam this article of commerce commands a price of from $9 to $10 per frasilah of 35lbs. weight.

The slaves told us that you could travel for two days into the interior before losing the "Niti Sandarusi," and that during the whole of that distance the India rubber was commonly parasitic to the trees. At the rate the clearing progresses, however, it will not be long before this copal tree-wood becomes a thing of the past.

At a second visit, when we worked along and into the wood, all we saw only confirmed the conclusion we had already come to; however, I trust, after inspecting the principal diggings, to be able to give a more detailed account of the situations in which the tree is found, and its relation to the fossil Animé.

F. ELTON,
1st Asstt. to Political Agent and Vice-Consul.

No. 549 G., dated 10th March 1874.

Endorsed by the FOREIGN DEPT.

Copy, together with the box of specimens, forwarded to the Department of Agriculture, Revenue and Commerce, for such action as may be considered necessary, and with a suggestion that the report should be published in the *Gazette of India.*

ROYAL BOTANICAL GARDENS;
Calcutta, the 16th March 1874.

I have read with much interest Captain Elton's report on the African gum copal tree. I think he and Dr. Kirk are quite right in their conclusions of the origin of this gum.

It struck me much that this tree and also the caoutchouc climber *Landolphia sp.* might advantageously be introduced into Southern India (Malabar and Travancore), and also into Burma, where they would flourish in the laterite grounds if not too rocky. The stunted growth of the Zanzibar forests points to physical relations similar to those existing in the British Burmese forests. It would be really a great gain if also the ripe fruits of the African caoutchouc climber could be obtained for trial. I have retained also several fruits of the copal tree for sowing. These contain apparently quite sound seeds, and I have good hope that they will come up. If so, it might be arranged to send some of the young plants to Burma and Southern India, for I fear they will not succeed well in Calcutta.

S. KURZ.

O In the interior the prices range as follows :—Wheat from 11-8 to 15 seers, barley from 15 to 20 seers, and of best rice from 8 to 9-12 seers, and common rice from 10 to 13-8 seers, lesser millet 14 to 17 seers, maize from 13 to 15 seers, and gram 15 to 17 seers per rupee. The fall in the price of wheat, barley and gram is owing to the new crops.

P Price of best rice in the interior ranges from 8-8 to 9-12 seers, and of common rice from 10 to 13 seers per rupee.

Q In the interior prices range as follows :—Wheat from 9 to 14 seers, best rice from 8 to 12 seers, and of common rice from 8-12 to 12-8 seers, and maize from 10-8 to 15-4 seers per rupee.

R In the interior prices range as follows :—wheat from 11 to 12 seers, and of best rice from 8 to 11 seers, and of common rice from 10 to 11-8 seers, and maize from 12 to 16-4 seers, gram from 10 to 15 seers per rupee.

S Price of best rice in the interior ranges from 8 to 10-8, and of common rice from 8-8 to 12-8 seers per rupee.

T Price of best rice in the interior ranges from 8 to 13-5 seers and of common rice from 10 to 15 seers, wheat from 12 to 14 seers, and bulrush millet from 16 to 29-8 seers, and maize from 14 to 21 seers per rupee.

U In the interior the price of rice ranges from 23 seers to one maund per rupee in different places.

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Tuesday, the 24th March 1874.

PRESENT:

His Excellency the Viceroy and Governor General of India, G. M. S. I., *presiding*.
His Honour the Lieutenant-Governor of Bengal.
Major-General the Hon'ble Sir H. W. Norman, K. C. B.
The Hon'ble A. Hobhouse, Q. C.
The Hon'ble E. C. Bayley, C. S. I.
His Highness the Mahárájá of Vizianagram, K. C. S. I.
The Hon'ble Rájá Ramánáth Tagore.
The Hon'ble R. A. Dalyell.
The Hon'ble B. D. Colvin.

PRIVY COUNCIL APPEALS BILL.

The Hon'ble MR. HOBHOUSE moved that the final Report of the Select Committee on the Bill to consolidate and amend the law relating to the admission of appeals to Her Majesty in Council from judgments and orders of the Civil Courts, be taken into consideration.

The Motion was put and agreed to.

The Hon'ble MR. HOBHOUSE also moved that the Bill as finally amended be passed.

The Motion was put and agreed to.

BURMA MUNICIPAL BILL.

The Hon'ble MR. HOBHOUSE also moved that the Report of the Select Committee on the Bill to provide for the appointment of Municipal Committees in Towns in British Burma, and for other purposes, be taken into consideration. He had explained on the last occasion the only points which seemed to him to be of importance, and which the Select Committee considered it necessary to bring to the attention of the Council in their report of the alterations made in the Bill.

The Hon'ble MR. DALYELL said when his hon'ble and learned friend presented the Report of the Select Committee on this Bill, he explained the circumstances under which it had been deemed advisable to restrict the amount of taxation for the general purposes prescribed by the Bill to the actual amount of town taxation now levied in British Burma. On that occasion, he (Mr. Hobhouse) gave several good and valid reasons in favour of the course adopted, but he did not, so far as MR. DALYELL could recollect, mention a statement which had been made by the Chief Commissioner in a letter which he had addressed to the Committee on the subject of the Bill. In that letter, Mr. Eden stated that no fresh taxation was intended or desired, but merely the regulation of the existing taxation and the bestowal on the people of some share in the administration of the affairs of their towns which now rested in the hands of the Government officials. When MR. DALYELL told the Council that the present town taxation of British Burma, which apparently was levied entirely at the will of the executive and without any express legal sanction, had been raised in ten years from two to five lákhs, he thought they would agree that there were strong reasons for Mr. Eden's moderation, and that the Select Committee had exercised a wise discretion in limiting the amount of taxation for general purposes to the amount at present actually collected in the towns. He also found by reference to a valuable report on the taxation of British Burma from the pen of Colonel Duncan, the Secretary to the Chief Commissioner, which was circulated to the Council last year, that as regards the incidence of local and imperial taxation, the inhabitants of British Burma were at a disadvantage with other parts of the empire. Colonel Duncan also stated that the well-to-do people in most towns now paid a tax of from seven to ten rupees according to the size of the town, and that in Rangoon a petty shopkeeper paid as much as eighteen and a half rupees as municipal taxation: and there were additional grounds for the course which had been taken with regard to this Bill. Further, the Council would recollect that at a recent meeting of the Council, an hon'ble member, who was not in his place to-day, when alluding to the Bill in its original form and to the Burma Fisheries Bill, stated it as his opinion that neither of those measures were such as were likely to foster or encourage the advancement of a young province like British Burma which had, he thought, a great future before it, and he indulged the hope that nothing like legislation of a repressive or discouraging character would be carried out. MR. DALYELL then expressed his general concurrence with the opinions expressed by his hon'ble friend, and if the Bill now about to be passed had involved an increase of taxation in Burma, he would not have supported it. As the Bill now stood, he would have much pleasure in seeing it take its place in the Statute-book.

His Highness THE MAHÁRÁJÁ OF VIZIANAGRAM said the Council had heard from his hon'ble and learned friend, Mr. Hobhouse, the objects and reasons of this Bill. No doubt any new taxation was very distasteful to the Natives of India in general. But as the Bill now proposed did not in any way increase the burden of taxation in British Burma, but was only intended to legalize and regulate the existing taxation, as had hitherto been done by the laws designed for other parts of India .by the hon'ble Mr. Hobhouse and his

predecessors, he had much pleasure in giving his assent to the motion before the Council.

The Motion was put and agreed to.

The Hon'ble MR. HOBHOUSE then moved that the Bill as amended be passed.

The Motion was put and agreed to.

ASSAM CHIEF COMMISSIONER'S POWERS BILL.

The Hon'ble MR. HOBHOUSE also moved that the Report of the Select Committee on the Bill to provide for the exercise of the powers hitherto exercised by the Lieutenant-Governor and Board of Revenue of Bengal in the territories forming the Chief Commissionership of Assam, be taken into consideration.

His Honour THE LIEUTENANT-GOVERNOR said that, as he had not had an opportunity of discussing or carefully considering this Bill, he was not in a position to speak of it in detail. As regards the form of the Bill, he was inclined to doubt whether a change made in Committee was expedient. He believed that the Bill as originally introduced provided that it should be in the power of the Governor General in Council to decide by what authority, whether by the Lieutenant-Governor of Bengal, the Government of India, or the new Chief Commissioner of Assam, any matter pending at the time of the transfer should be decided. Apparently, as the Bill now stood, that power of enabling either authority to decide pending questions had been restricted to questions arising under the Gáro Hills' Jurisdiction Act. He had only to suggest that a doubt arose in his mind whether other questions of a similar character might not occur; but he felt he might safely leave the matter in the hands of his hon'ble friend Mr. Hobhouse. HIS HONOUR had no doubt that Mr. Hobhouse had taken good care that there should be no practical difficulty hereafter.

There was only one other point to which he would wish to refer, and that was this. He would submit to the Government of India and to the Council that, in matters of spelling, some uniform course should be adopted. The districts which were the subject of the present Bill were lately the subject of a notification of the Governor General in Council in the Home or some other Department, which he could not well recollect, but it was certainly some other than the Legislative Department, and in that notification they were spelled quite differently from the spelling in the Bill. He would only say that whichever might be right or wrong, it was almost, he might say, indecent that the Government of India in the different Departments should ostentatiously spell the names of well-known places in so many different ways; that one Department should adopt the well-known spelling which was adopted by people in general, and another should enter into the elaborate system by which these names were very much disguised. He was glad to learn that the long-suffering of the Members of the Committee of this Council, who had submitted to a good deal in this respect, was at last exhausted. He was glad to observe the spelling of the word "Cachar", which was formerly spelt "Kachhár" in the Bill, was now restored to its original shape, C-a-c-h-a-r. That "K-a-c-h-h-á-r was too much for the Select Committee, and it was restored to its original spelling. But apparently a compromise was made in respect to the spelling of other districts in regard to which the change was not so flagrant, and which were left to the mercy of the Legislative Department, as to the regulation of the spelling. Now, in this matter of spelling, a considerable latitude had been left to the Local Governments, and by what he might call a sort of consensus of those Governments, the spelling of well-known districts had been preserved; the old well-established spelling had been retained. That had been done in the North-Western Provinces and in Bengal, and he had no hesitation in saying that if Assam still belonged to Bengal, that would have been done in Assam. The Chief Commissioner now established by the Government of India had not had full opportunity of considering the matter

He would submit that it was not desirable that in this interregnum the Legislative Department should step in and alter the names of places which were not only the names of well-known districts, but also the names of a large number of Tea and other Companies well-known in the London Stock Exchange. Such a course might, amongst other things, cause a depreciation of shares in such well-known Companies as the Nowgong, Durrung, and several other Tea Companies. Were the names of those Companies to be severed from the names of the well-known districts with which they were associated, such a course might create a panic in the money-market, and it seemed most undesirable that we should depart from the well-recognized spelling of the names of those districts.

The Hon'ble MR. BAYLEY said there was only one point in regard to which he wished to make a few remarks, namely, the notification from the Home Department to which the Lieutenant-Governor had referred. He believed that notification had carefully kept to the exact spelling which the Government of India had authorized. Without the notification before him, he did not remember what that spelling precisely was. In the Bill some compromise had certainly been made as to the spelling of the names "Durang" and "Naugáon," and he believed that, whatever the change from the authorized spelling might be, it was very slight. So far as the new Province was concerned, he did not see why they should be left to make this not very important reform.

The Hon'ble MR. HOBHOUSE said that, with regard to the first point which was mentioned by His Honour the Lieutenant-Governor, the Bill was introduced in the form in which sections 1 and 2 stood now. It was an earlier draft to which the Lieutenant-Governor referred. It was afterwards found that some arrangements were pending for making compensation to zamíndárs under Act XXII of 1869. That was the only point in which the Bill as it now stood varied from the Bill as introduced. What was new in the Bill was the power given to the Lieutenant-Governor of Bengal to carry out the arrangements made with the zamíndárs and others in the Gáro Hills. Some arrangements were actually pending, and it would be very inconvenient to take them out of the Lieutenant-Governor's hands. He thought His Honour might rely on it that the matter had been carefully considered both before and since the introduction of the Bill.

With regard to the matter of spelling, the Lieutenant-Governor could not attack any one more willing to be defeated than MR. HOBHOUSE. As far as he was concerned, his sympathies were with the Lieutenant-Governor. The citadel had a traitor inside. But he (MR. HOBHOUSE) really knew very little of the matter. What he did know was his mother-tongue, and he had a great prejudice against seeing English letters used to represent sounds which they never by any chance represented to the English eye; for instance, he did not like to see a tub spelt "t-a-b." He must leave the matter to be fought over by those who were more learned than himself. All that he could say was that if the exertions of the Lieutenant-Governor did result in putting oriental names and words into a more familiar occidental shape; if he did succeed in bringing them into a shape more intelligible to English ears and eyes, it would be a very good thing.

Major-General the Hon'ble SIR H. W. NORMAN concurred in the observations of the Lieutenant-Governor in regard to the matter of spelling. He would observe that it was quite contrary to the Resolution of the Government of India that any alteration should be made in the spelling of the names of Cantonments from the ordinary spelling which had prevailed for years past. He thought that one or two of the names in this Bill were the names of Cantonments. They were spelt quite differently from the usual practice: perhaps the Legislative Department would bear that in mind.

His Excellency THE PRESIDENT observed that it would be inconvenient to pass this Bill if there was any doubt as to the proper way in which the names of the several districts were spelt. It would therefore be advisable to postpone the passing of the Bill in order that the spelling might, if necessary, be altered in accordance with the views of the Government of India.

The consideration of the Bill was then postponed.

EUROPEAN VAGRANCY BILL.

The Hon'ble MR. BAYLEY presented the Report of the Select Committee on the Bill to consolidate and amend the law relating to European Vagrancy. He said the Select Committee had made some changes in the details of the Bill which had almost all been made in accordance with the suggestions of the Local Governments. None of these changes materially affected the general principle of the Bill. There were one or two matters which needed explanation, although they did not refer to the amendments introduced by the Select Committee, but related rather to the general principle of the Bill and the plan upon which it was framed. It would be better, however, to defer his remarks as to these until the time when the Report of the Select Committee would be taken into consideration.

BOMBAY REVENUE JURISDICTION BILL.

The Hon'ble MR. HOBHOUSE, in the absence of the Hon'ble Mr. Ellis, asked leave to postpone the presentation of the preliminary Report of the Select Committee on the Bill to limit the jurisdiction of the Civil Courts throughout the Bombay Presidency in matters relating to the Land-Revenue.

Leave was granted.

INDIAN LAW REPORTS BILL.

The Hon'ble MR. HOBHOUSE introduced the Bill to diminish the multitude and improve the quality of Law Reports, and to extend the area of their authority, and moved that it be referred to a Select Committee with instructions to report in two months. He said that he had explained to the Council on the last occasion that the quantity of legislation required on this subject was small, and they would be glad to see that the Bill was a short one. He must now explain to them the lines upon which the Bill was laid down. In the first place, they would observe that a late day was fixed for the Bill to come into operation, namely, the 1st January 1875. The object of that was to give those who were now engaged in the publication of reports time to wind up their affairs, such as the Bengal Law Reporters. If they were allowed to the end of this year, they would be able to place their affairs in a satisfactory footing. Then, coming to the substance of the Bill, he should like, in the first place, to read a few remarks which had been furnished to him by a learned Judge of the High Court, Mr. Justice Markby, respecting the operation upon which we were engaged, remarks which conveyed a very useful warning and caution to us. He said:—

"The *authority* of a judicial decision has never been recognized, as far as I am aware, by the legislature in any country except in a very limited degree, and under peculiar circumstances. The *responsa prudentum* were not judicial decisions, but resolutions upon doubtful points by certain persons *quibus condere jura permissum erat*. The *arrêts* of the *Cour de Cassation* are confined to the corrections of faulty procedure and of any contravention *expresse du texte de la loi*, i. e., of the Code; and the *Cour de Cassation* is established *auprès du Corps Legislatif*, and may correct erroneous decisions, whether the parties choose to appeal or not. The Sadr Díwání Adálat could issue 'constructions' upon the Regulations (our *texte de la loi*) which were final and conclusive (Regulation 10 of 1796, s. 3), but when this Regulation was passed and until long after, the Sadr Court was presided over by the Governor General or by a Member of Council, and was in close relation to the legislature."

Then after referring to some other opinions he continued:—

"A consideration of all this leads me to doubt whether more good than harm would be done by legislating on this subject. The Mofussil Judges are no doubt far too prone to see in every dictum of a High Court Judge a rule for future guidance, and your proposition would, it is true, separate off and reject a number of decisions or expressions of opinion which they ought not to be bound by. But will not the actual authority of cases selected for publication be too much increased? Increased to some extent it will be I cannot doubt; and I am not prepared to see too much rigidity given to the decisions of even a Full Bench."

These remarks appeared to MR. HOBHOUSE to have a great deal of truth and wisdom in them. It was quite true that it was a new thing, as far as he was aware, for the legislature to recognize in terms the authority of judicial decisions; and he agreed that it would be a bad thing if we were to take away from judicial decisions that quality of flexibility and adaptibility which they

now had and to give them the same rigidity as Statutes, so that every word of them must be weighed by Judges before they could decide a case. But there remained the fact, and a very important fact, in our constitution, it was, that the law was being constantly moulded by judicial decisions, which operated very much as they were reported, and we should hardly err if we recognized that fact and treated it as established without endeavouring to alter its nature. Now the Bill endeavoured to follow that principle, and not only was language used in the early part of it which merely referred to judicial decisions and their authority as existing facts, but section 4 contained an express caution that "save as provided by section 2, nothing herein contained shall be construed to give any judicial decision any further or other authority than it would have had if this Act had not been passed." Then, what was done by section 2? It was not a long one, and he would read it to the Council :—

"Every judgment delivered on or after the said day by any of the said High Courts (whether by a Judge sitting alone, or by a Division Court, or by a Full Bench) and reported in the said Indian Authorized Law Reports, shall have the same authority in all subordinate Courts beyond the limits of the appellate jurisdiction of such High Court as independently of this Act it would have within such limits."

So that the Council would see that the authority of decisions was, as regards its quality or nature, left it as it stood before, and the Bill only extended the geographical area of its operation. He thought we might feel confident that, in the hands of an intelligent man, a law framed as this was would not be construed amiss, that the Judges would render an intelligent and loyal obedience to the decisions of the superior Courts according to the essence and spirit of those decisions when applicable to the cases before them, and would not, any more than now, be slaves to the letter, and regard every by-word which fell from a superior Court as sacred, or as intended to express the full and deliberate mind of the Court and to operate as a guide to the rest of the world.

The Council would also observe that in that section the Bill only mentioned subordinate Courts as those to be bound by the authority of judicial decisions. The reason was that there was considerable nicety of distinction in the various phases of the High Courts, and in the amount of authority to be attributed to the decisions of a single Judge, a Division Court, or a Full Bench; and it was better that the High Courts should settle these things for themselves. Moreover, it was not the case, as he had seen it supposed in several communications upon this subject, that we aimed at binding any one High Court to follow the decisions of any other High Court. At the present moment, the High Court might change its mind and differ from itself: it had a degree of freedom which, in MR. HOBHOUSE's opinion, was quite necessary for the due working of our judicial system, and which he did not wish to encroach upon. The main and primary object of the section was to give a more efficient and regular guide to the subordinate Judges, so that when we got a valuable decision in one Province, it might be used to guide the Judges in another. He thought that this system might safely be left to be worked out to its proper result by the High Courts themselves. Practically, though indirectly, it would secure greater uniformity in the decisions of the High Courts, because it would, if only for the purpose of testing what subordinate Judges had done, compel the High Courts to give adequate consideration to one another's decisions; and this would lead to greater uniformity, and also to the prevalence of those decisions which were found on discussion to be most reasonable and expedient.

The remaining section of the Bill, section 3, was as follows :—

"No Court shall be bound to hear cited or shall receive or treat as an authority binding on it the report of any case decided by any of the said High Courts on or after the said day, other than a report published under the authority of the Governor General in Council."

He knew that there were many who would say that this section was not stringent enough, but that we ought to prohibit the citation or even the publication of any unauthorized reports. As regards publication, MR. HOBHOUSE had already given his reasons for thinking that the publication of reports was an excellent object, and for wishing well to all such publications as the public could be induced to read. With regard to citation, it seemed impossible to prohibit the citation of voluntary reports any more than the citation of any other work which did not carry with it binding authority. It was impossible to say beforehand what might or what might not be suitably cited in the course of a forensic argument; and if any work not professing to have authority might be cited, so might volunteer reports. It was easy to conceive cases in which such reports might be exceedingly useful to illustrate a position or to point an argument. The utmost we could do was to free the subordinate Courts from the shackles which practice and custom now imposed upon them, and to say that as a Judge might listen to a passage from Hamlet or Paradise Lost, or Hallam's Constitutional History, or Preston on Abstracts, or any other work, technical or not technical, and as if he listened to it, he might either adopt or reject the conclusion which was pressed upon him, so he might deal with a volunteer report. The objection might be raised that this was only what the Judges might do now, and that the Bill was idly telling them no more than they knew without it. Of the superior Courts that might be true in terms. Of the subordinate Courts it was not true even in terms, for a subordinate Court would find itself in a very false position if it refused to hear, or be bound by a work which its appellate Court was in the habit of receiving as authority. We could therefore relieve a subordinate Court from the terror of being held wrong and having its judgment reversed, because some obscure case was cited before it which it refused to receive as binding authority. Even as regards the superior Courts, the proposition was not practically true. It required much more effort and unanimity than had ever been found in a large body of men not guided or supported by any declaration of the legislature or act of the State, to treat unauthorized reports uniformly and persistently as being without authority, and put their citation on the same footing as the citation of other general matter. If, however, we gave them that which was published under proper authority, we might hope with a reasonable amount of skill and care, and at the same time told them they were not bound to receive anything else as of authority, we might hope for good results. MR. HOBHOUSE acknowledged that in this matter we were in the hands of those who might and ought to regulate the conduct of legal business, but by doing what we proposed, we might hope for the assent of all reasonable men, and he did hope they would, in the course of time, settle the practice on a more reasonable and satisfactory footing than that upon which it was now.

These were the three objects of the Bill. They were to give the reports a larger area of authority than they now possessed; to prevent unauthorized reports being brought forward in such a way as to constitute binding authority on the Judges, and at the same time to provide a caution against the Courts attributing undue weight to those reports which were authorized reports. It would be for the Council to consider whether a measure with these objects should pass into Committee.

The Hon'ble RÁJÁ RAMÁNÁTH TAGORE said he had gone over this Bill very carefully, and he thought that a law of this kind was absolutely necessary for the purpose of placing the Indian Law Reports on a proper footing. After the able and lucid manner in which the Hon'ble Mr. Hobhouse had explained to the meeting his reasons for introducing the Bill, RÁJÁ RAMÁNÁTH TAGORE had very little to say on this important question. But in looking over the Bill, he observed that there was no provision or scheme laid down to enable the Government to confer the necessary authority upon any particular reports. If the omission to which he had referred was a defect, which he hoped it was not, it would no doubt be supplied by the Select Committee. In all other respects, he entirely approved of the Bill.

The Hon'ble MR. DALYELL said the difficulty which had been adverted to by his hon'ble friend, Rájá Ramánáth Tagore, had occurred to him when looking over the Bill this morning. He did not see who was to be the authority to decide as to what were to be authorized reports. For instance, who was to decide between the High Courts of Calcutta and Madras on a ruling which possibly might not be precisely the same, though upon the same subject? Which of those

rulings was to be reported? He did not think the Madras High Court would be satisfied to agree to every ruling of the Calcutta High Court, and similarly the Calcutta Court might not agree to every ruling of the Madras Court. Yet whichever of these was accepted in the authorized report, would be binding upon the subordinate Courts of both provinces. If a ruling of the Calcutta Court in which the Madras Court did not agree became an authorized report, then all the Madras subordinate Courts would be obliged to attend to that ruling, although their own High Court might not concur in the propriety of the decision. That seemed to MR. DALYELL to be a difficulty, but possibly the hon'ble member in charge of the Bill might have some means of disposing of it. He merely threw it out as a point for the consideration of the Select Committee: he thought it advisable that the authority to whom the task of selection was to be entrusted should be laid down in the Bill.

His Honour THE LIEUTENANT-GOVERNOR said it was perfectly true that, as the hon'ble and learned member had said, this was a short Bill, but it was not an innocent Bill. The importance and effect of the Bill was in inverse ratio to its length. A short Bill might make a very radical change in the law without providing any safe-guards, and as he should not have the opportunity of considering this Bill in its later stages, he would wish now to express his opinion that the Bill was not a satisfactory Bill, and was not such a one as he could agree to. The great blot in this Bill was that which had been stated by the hon'ble members who spoke before him. No safe-guard was provided; no machinery was provided: we were told nothing as to the manner in which the decisions were to be selected, or the process by which some decisions were to be converted into authorized decisions, and others were to be rejected. Therefore, it seemed to him that the Bill in the shape in which it was put was a Bill not only of enormous importance, but that it was a radically unconstitutional and revolutionary Bill. It placed nominally in the hands of the Government of India, but really in those of some one else, the power of selecting from the very numerous decisions of all the High and other Courts, and declaring which should be reported as authorized reports and should be cited and be binding upon the subordinate Courts, and which should be rejected, and, as it were, snuffed out, put aside, and put out of Court altogether. He believed the effect would be, that not only nine out of every ten but ninety-nine out of every hundred decisions would be put out of Court altogether, and that by an authority altogether unknown to the Court and the public, so far as we yet saw. The reporter would have the power of sitting in judgment on the Judges and of saying which should be taken as good and binding decisions, and of snuffing out and making altogether uncitable ninety-nine-hundredths of the decisions which were passed. To understand the enormous effect of a Bill of this kind, we must consider the nature of the superior Courts of this country. If they consisted, as in most civilized countries, of well-recognized and concentrated Courts of the highest authority, whose decisions were of very great weight, we might delegate to the Reporters the power of selecting what were important and what were unimportant decisions. But that was not the case here. Not only had we a great variety of High Courts, but they were not single Courts of themselves. The High Court of Calcutta was half a dozen Courts, each sitting and deciding independently of one another; for many purposes as many Judges as there were, so many Courts were there. Moreover, there were a good many Judicial Commissioners and Financial Commissioners, all of whom exercised the authority of a High Court. The consequence was, that we should have at least twenty or thirty, probably more, High Courts of co-ordinate authority, all deciding each in their own way: and we had unfortunately in this country no Court where those decisions could be brought under review and revised by a full and sufficient tribunal. Such being the fact, if you put into the hands of any one authority the power of deciding which of these decisions should be treated as authoritative, and which were to be rejected and snuffed out, you gave that authority an enormous power over the superior Courts of the country: you made him in fact Judge over the Judges, and so far as His Honour could see, the authority exercising this enormous power was to be irresponsible. His Honour had always held that, in

this country, a very large power should be exercised by the supreme executive authority of India; and he would be quite willing to accept the dogma set forth in the Statement of Objects and Reasons accompanying the Bill, that law-reporting should be regarded as a branch of legislation, and that judicial decisions should be reported by sufficient authority. If the law was really to be settled by the Government of India he should not object. But it seemed to him that, practically, this Bill in no degree moved in that direction. If the Government, acting in its executive capacity, might set forth the interpretation of the law, he should be perfectly ready to accept a system of that kind; but in reality, although this Bill proposed to give that power to the Government of India, it was not to be exercised by the responsible Government, but, as he gathered from one of the papers bearing on this Bill, by an individual who was to be called "the Chief Law Reporter," and His Honour understood that some very able and estimable lawyer was to be provided with that place. As far as the Bill was concerned, all that the Council knew was, that the Government would create the man and would do nothing more, and having created him, he would be the person who was to sit in judgment over the Judges, and who was to decide what was good and what was bad law. His Honour should like to give an illustration of the manner in which a system of this kind was likely to work. He would take a case which had been already in many occasions referred to as being a case to which a system of this kind might be applied. He alluded to what was known as the great Rent Case. Let us take the history of that case. It was a case in which the questions involved were of enormous importance, affecting the whole agricultural population of great Provinces, and upon which depended the decision of a large mass of cases. A decision was arrived at by one very eminent Judge, one of the most eminent Judges in fact who had sat in the High Court. That decision startled people: it went a long way in one direction; it was a clear authority and apparently settled the law. Presently, cropped up other decisions of other co-ordinate Courts, and they decided in a different manner. Consequently, it became apparent that there was a great variety and difference of opinion amongst the Judges of co-ordinate Courts: a case was then taken up, and all the fifteen Judges of the High Court sat. The result was that fourteen Judges came to a decision adverse to the opinion of that one eminent Judge, who still retained his own opinion. Now, what must have happened if this Bill had been law? Either the decision of the eminent Judge who first passed a decision on the point would have been accepted by the Law Reporter, and would have been promulgated as binding authority, and other decisions which were opposed to it would have been put out altogether; or the Law Reporter would have selected any other of those decisions, and put it in the place of the other, and we should have had no opportunity of this great question being thoroughly discussed, and coming to the decision which eventually settled the matter. The settlement which we should have had of this great question would have been a settlement by the Law Reporter, and not by the fifteen Judges sitting in solemn conclave on the whole matter.

On one point he entirely agreed with the Hon'ble Mr. Hobhouse in the view which he had taken. It was most undesirable that the lower Courts should be burdened with too many authoritative decisions. It was not desirable that the Judges should act by a mere *memoria technica*. So far, something was necessary to be done in regard to the present system of law-reporting. But he also said that the latter part of the Bill which gave binding authority to the authorized reports as distinguished from other reports, was most dangerous, inasmuch as it indirectly placed these authorized reports in a much higher position than that which any reports now held. It even went to the length of providing that the decision of one High Court should be binding upon the subordinate Judges of the other provinces. He altogether denied that the decisions of the High Court at Calcutta were binding even on the subordinate Courts of the Lower Provinces. At present the decisions of a High Court were binding upon the subordinate Judges of its province, merely so far as they affected the reason of the Court below. The Court might properly look at the decisions of the higher and more experienced Courts for their guidance. But the deci-

sions of the High Court had no absolute authority to bind the decisions of the Courts below, and they had the same authority in the North-Western Provinces, or Madras or Bombay as they had in the Courts of the provinces subject to its control. Inasmuch, however, as the subordinate Judges might look for promotion to the Judges of the High Court and might consequently pay more respect to those decisions than they would otherwise do, in that respect, of course, the decisions of the High Court might be of more binding authority. But otherwise they would have no greater authority in the Lower Provinces of Bengal than in any of the other Provinces of India. The effect of the Bill, although not directly expressed, would indirectly be that the authorized reports would have complete and absolute authority to bind the subordinate Courts all over India and would, in fact, regulate the whole administration of justice. Section 3 was the section which shut off and disposed of the whole of the decisions which were not accepted by the Law Reporter, that was the section which, whilst it gave undue authority to the authorized reports, took away all authority from unauthorized reports. HIS HONOUR must express his own view that this Bill ought not to be referred to a Select Committee in the form in which it was put before the Council. He would have the consideration of the Bill postponed, in order that the hon'ble member in charge should deprive it of the character it now bore; that it should be made more distinct, and that he should declare what his views really were, and then the Council would be in a better position to judge whether the system should or should not be carried out.

The Hon'ble MR. HOBHOUSE said he would take the objections which had been raised in the order in which they had been made. First, the Hon'ble Rájá Ramánáth Tagore, as MR. HOBHOUSE understood him, objected that the Bill made no provision for giving the Executive Government authority to institute a system of law-reporting. The answer to that was that no such provision was necessary. It was perfectly within the competency of the Executive Government to do that either with or without this Bill. MR. HOBHOUSE had explained on the last occasion that the Bill was only in aid of a system proposed to be established by virtue of the authority of the Government. That system would have no authority of itself. The authority given to the reports was not given by this Bill, nor by any executive action of the Government. It was given by the constitutional action of the Judges which would be left entire and untouched by the Bill. As for the proposed system of reporting it would not affect the essential authority of the Judges. It was only for the purpose of giving to the public in a proper shape so much as of judicial decision as materially affected the law.

Then the Hon'ble Mr. Dalyell seemed to think that some difficulty might arise in the case of contradictory rulings. But in truth there would be no more difficulty than there was now. It was a mistake of the whole plan to suppose that the Reporter was to judge for himself of the goodness or badness of the law contained in each decision, and to take the good and reject the bad. He must report it if it was of sufficient importance; and that was exactly what Reporters did now. Supposing he got two adverse decisions on an important question, he would report both. In the very case put by the Lieutenant-Governor, where he said there was a great difference of opinion amongst competent authorities, it would be the duty of a good Reporter to report the decisions on both sides; and unless the case was one in which the legislature thought proper to interfere, the Judges must take that which they thought was best or most binding on them. MR. HOBHOUSE would illustrate that by a matter with which some present might have been concerned. We were most of us old enough to remember the time when a great number of joint stock companies were started by means of what were called provisional Committees. It was an entirely new thing in the history of England, and raised a great number of new problems of law. The result was a variety of decisions—decisions in the Queen's Bench, in the Court of Exchequer, in the Common Pleas, in the Court of Chancery, conflicting with one another on a variety of important points, and for some time no one could tell with any certainty how the law stood. The legislature did not interfere, and very rightly, if they had, they would certainly have made

a hash of it and created greater confusion than ever. It was necessary to place the law on a reasonable footing, such as would satisfy men's sense of justice, and prevent continual struggles to escape from bad rules. But no man was wise enough to see what that footing was. It required many discussions, conducted with reference to concrete cases, and under all the responsibility of having to decide those cases before it was seen on what lines the law should be laid down. Well, the decisions on all sides were reported. Reporters did not refuse to report what they might happen to think was bad law, but reported all important cases, and gradually by means of appeals and the exercise of the judicial powers of the House of Lords, the law became settled. There were some years of controversy and confusion during which no man was wise enough to see how the law ought to stand. It wanted a great deal of discussion, and when that had occurred often enough, the law got settled on a reasonable and satisfactory footing, and has remained so ever since. The same thing would be done under any good system of reporting. The object of a report was simply to tell people what judicial decisions there had been on any subject; and if any Reporter chose to take it upon himself to say of any decision otherwise fit to be reported that it was bad law and that he would not report it, MR. HOBHOUSE thought, notwithstanding the anecdote of a great man he quoted on the last occasion, that he would not be doing his duty as a Reporter.

The Lieutenant-Governor said we were making a great and a radical change. Where did he find that change? Not in the Bill, not in the Statement of Objects and Reasons, not in the documents connected with the Bill, amongst which there was a letter circulated to the Local Governments containing the views of the Government of India on this matter. The Lieutenant-Governor indeed said that the decisions of the High Courts had no authority in the Lower Provinces, but were only entitled to be received with respect. If that were so, MR. HOBHOUSE thought the Lower Provinces of Bengal differed from the rest of India and from England in that respect. But suppose it was the case that the decisions of the High Court at Calcutta were not binding on its subordinate Judges, the Bill would only continue that practice, and such respect as those decisions were received with would be rendered to them in the North-Western Provinces, in Bombay, and in the other provinces. For the Bill distinctly provided that except as to geographical area, no judicial decision should have any further or other authority that it would have had without the Bill. If, therefore, it were true that the decisions of the High Courts had no authority, then the Bill was a sham and ought not to pass, because it would be of no use whatever. But he would take issue with His Honour in this matter, and he said that it was just an integral part of our constitution, as any other unwritten part of that constitution, that the subordinate Courts were bound to obey the decisions of their superior Courts, and the subordinate Judges would commit a grave error if they refused such obedience and would expose themselves to censure.

What did the Lieutenant-Governor suppose was done under the present system? He said we were taking a great deal of power into our hands. If he had been able to be in his place on the last occasion, he would probably have been convinced that we were only dealing with a power already existing in the hands of irresponsible persons. MR. HOBHOUSE was then at great pains to show the power actually in the hands of the Reporters, and how a Judge might be, as His Honour said, snuffed out by a bad, or a malicious, or an inefficient Reporter, and how unimportant judgments which ought never to have been reported might be brought into undue prominence. Now, the question was whether, finding that system existing, we should leave it where it was, or entrust it to hands which were likely to conduct it better, with more skill and under greater responsibility. Now, the work of law-reporting was conducted with a view to sale, on a commercial system. The reports were made to sell, and the result was a very large number of bad reports. Under the Government system, it certainly ought to be, he believed would be, conducted with a view to provide the Courts and the profession with the best reports of the most important decisions. That alone was the difference between the two systems, and he must put it to the Council which of those two was the better system.

a hash of it and created greater confusion than ever. It was necessary to place the law on a reasonable footing, such as would satisfy men's sense of justice, and prevent continual struggles to escape from bad rules. But no man was wise enough to see what that footing was. It required many discussions, conducted with reference to concrete cases, and under all the responsibility of having to decide those cases before it was seen on what lines the law should be laid down. Well, the decisions on all sides were reported. Reporters did not refuse to report what they might happen to think was bad law, but reported all important cases, and gradually, by means of appeals and the exercise of the judicial powers of the House of Lords, the law became settled. There were some years of controversy and confusion during which no man was wise enough to see how the law ought to stand. It wanted a great deal of discussion, and when that had occurred often enough, the law got settled on a reasonable and satisfactory footing, and has remained so ever since. The same thing would be done under any good system of reporting. The object of a report was simply to tell people what judicial decisions there had been on any subject; and if any Reporter chose to take it upon himself to say of any decision otherwise fit to be reported that it was bad law and that he would not report it, MR. HOBHOUSE thought, notwithstanding the anecdote of a great man he quoted on the last occasion, that he would not be doing his duty as a Reporter.

The Lieutenant-Governor said we were making a great and a radical change. Where did he find that change? Not in the Bill, not in the Statement of Objects and Reasons, not in the documents connected with the Bill, amongst which there was a letter circulated to the Local Governments containing the views of the Goverment of India on this matter. The Lieutenant-Governor indeed said that the decisions of the High Courts had no authority in the Lower Provinces, but were only entitled to be received with respect. If that were so, MR. HOBHOUSE thought the Lower Provinces of Bengal differed from the rest of India and from England in that respect. But suppose it was the case that the decisions of the High Court at Calcutta were not binding on its Subordinate Judges, the Bill would only continue that practice, and such respect as those decisions were received with would be rendered to them in the North-Western Provinces, in Bombay, and in the other provinces. For the Bill distinctly provided that, except as to geographical area, no judicial decision should have any further or other authority that it would have had without the Bill. If, therefore, it were true that the decisions of the High Courts had no authority, then the Bill was a sham and ought not to pass, because it would be of no use whatever. But he would take issue with His Honor in this matter, and he said that it was just an integral part of our constitution, as any other unwritten part of that constitution, that the subordinate Courts were bound to obey the decisions of their Superior Courts, and the Subordinate Judges would commit a grave error if they refused such obedience and would expose themselves to censure.

What did the Lieutenant-Governor suppose was done under the present system? He said we were taking a great deal of power into our hands. If he had been able to be in his place on the last occasion, he would probably have been convinced that we were only dealing with a power already existing in the hands of irresponsible persons. MR. HOBHOUSE was then at great pains to show the power actually in the hands of the Reporters, and how a Judge might be, as His Honour said, snuffed out by a bad, or a malicious, or an inefficient Reporter, and how unimportant judgments which ought never to have been reported might be brought into undue prominence. Now, the question was whether, finding that system existing, we should leave it where it was, or entrust it to hands which were likely to conduct it better, with more skill and under greater responsibility. Now, the work of law-reporting was conducted with a view to sale on a commercial system. The reports were made to sell, and the result was a very large number of bad reports. Under the Government system, it certainly ought to be, he believed would be, conducted with a view to provide the Courts and the profession with the best reports of the most important decisions. That alone was the difference between the two systems, and he must put it to the Council which of those two was the better system.

No doubt the Lieutenant-Governor was entitled to argue that, however much we tried to avoid giving an additional quality of authority to the authorized reports, we could not avoid it. It was a perfectly legitimate argument to contend that though we should not be doing it directly, we should be doing it by a side wind. MR. HOBHOUSE admitted the reality of the danger, and he had commenced to-day by laying before the Council a weighty opinion and warning on the subject. That, however, was the opinion of a gentleman who had not seen this Bill which indeed was not then in existence. What MR. HOBHOUSE did not admit was that the danger was sufficient to deter us from action, or that it could not be sufficiently guarded against. He himself thought the Bill would avoid that danger, which he fully admitted, would, if it really occurred, cause some mischief. He thought the Bill provided against the danger, and that we might trust intelligent men to understand the matter aright. It was for the Council to decide whether they would accept the risk of that one danger of giving too great rigidity to judicial decisions, or would allow the present system to continue of heaps of reports being thrown upon the subordinate Courts and oppressing the subordinate Judges with a pretence of authority which they were never intended to have. The Bill was intended to help the establishment of a better system of law-reporting than the commercial system which was now in vogue, and as such, he thought it ought to go to the Select Committee on the lines upon which it was based.

His Excellency THE PRESIDENT said, "I think the Council can have no doubt of the importance of this Bill, although a short one. It seems to me that the points raised to-day form a subject both for consideration by the Select Committee, and probably for future discussion in Council. They are both points of some consequence. I should be sorry at the present time to express any decided opinion upon them, without hearing more from those who have taken pains to go carefully and accurately into the whole of the details. In regard to the first point, I believe that the Bill does not attempt in any way to choose between conflicting judicial decisions, or to give any authority to one as against the other. Both would, I presume, retain whatever value they would have if the Bill were not passed.

"The second point, which was raised by His Honour the Lieutenant-Governor, is one, no doubt, of great consequence, namely, whether any steps should be taken to guard against want of judgment in selecting the cases which ought to be reported, whether it is advisable that any special provision to meet the case should be introduced in the Bill, or whether it is possible to provide for it in any other way.

"That point may, I think, be left to the Select Committee to consider, and it can afterwards be discussed by this Council.

"Any idea which might be entertained that the Bill was intended by the Government to provide for any selection, on their behalf, between the different decisions of different Judges upon matters of law, on account of any opinion which might be entertained by the Government as to the merits of those decisions, would be entirely erroneous. Mr. Hobhouse has already sufficiently explained that no intention whatever of the kind is contemplated by the Bill. I believe that the objection which the Bill has in view is of very great utility, and I entertain a confident expectation that the result of its consideration by the Select Committee and of our further proceedings in Council will be successful in making a salutary change in the present system of law-reporting."

The Motion was put and agreed to.

The following Select Committee was named:—

On the Bill to diminish the multitude and improve the quality of Law Reports, and to extend the area of their authority——The Hon'ble Mr. Bayley, the Hon'ble Rájá Ramánáth Tagore and the Hon'ble Mr. Dalyell and the Mover.

The Council then adjourned to Tuesday, the 7th April 1874.

Offg. Joint Secretary to the Government of Bengal,
Public Works Department, Irrigation Branch.

The 20th March 1874.

GOVERNMENT OF INDIA.

DEPARTMENT OF REVENUE, AGRICULTURE, AND COMMERCE.

BENGAL FAMINE.

FOURTEENTH SPECIAL NARRATIVE OF THE DROUGHT IN BENGAL, FROM THE 20TH MARCH TO THE 2ND APRIL 1874.

The weather of the fortnight has been singularly favorable. There has been rain* over a great part of Bengal Proper, where it was wanted for the early rice and for other early crops, and where it has enabled the people to occupy themselves in preparing the ground for the later crops. If, as is often the case in seasons like the present, rain continues to fall in Bengal from time to time during the next three months, all these early crops will do very well, and the early rice (September crop) will make a fair start. In Behar, where heavy rain would have done harm to the spring crops, very little has fallen, and the hail which fell in certain limited tracts did but little damage. The spring crops have thus been for the most part successfully harvested, and the little rain that fell did some good to the cheena (early millet) now in the ground. Now that the wheat, barley, and other spring crops have been nearly reaped, much will depend in Behar on whether we get good rain during April. The unfortunate tracts in Tirhoot which most suffered from the failure of the rice crops having little other crops to reap, still suffer from the continued want of rain, and their water-supply is beginning to fail. The people are now anxiously looking out for rain, not only for the petty crops on the ground, but also for a supply of water and grass, and to enable them to plough the land and sow indigo and some other crops. In Tirhoot the land has been so parched by continuous drought, that without copious rain during the next few weeks preparations for the next crop will be difficult and early sowings impossible.

* Rainfall of the fortnight, in inches, at some of the principal district head-quarters:—

Price of grain.

2. In Western Bengal there has been little change of prices during the fortnight; in Calcutta, and over the greater part of Eastern Bengal, prices are somewhat easier than they were at the time of last narrative; but there has been a general rise of prices over the Rajshahye Division; in North Behar also common rice has become somewhat dearer during the fortnight. In Monghyr an abundant spring crop has brought prices down. The price of wheat, barley, maize, and other staples has not grown dearer during the fortnight, and the comparative steadiness of the price of these grains is some makeweight against the rise in the price of rice. The returns furnished by the Chamber of Commerce show that, on the 27th March, the price of rice had fallen about 3 per cent. in Calcutta; but for the rest of the fortnight prices were steady though the demand was limited. The price-currents for the two weeks will be found at enclosure No. 2. The present quotations for some of the principal districts compare with the prices of rice shown in preceding narratives as follows:—

	Number of seers of common rice sold for a rupee.			
	On 31st Jan.	On 28th Feb.	On 14th March.	On 28th March.
Burdwan	14	13½	13	13¼
Beerbhoom	12⅜	12⅝	13½	13⅛
Hooghly	11 to 12	11½ to 12½	11½ to 12½	12 to 13
Calcutta	12½	12¼	12½	13
Dinagepore	13¼	14	12¾	10¾
Maldah	11¾	12	12	9½
Rungpore	11¼	11¼	11⅛	11⅓
Dacca	16	14	12	13
Backergunge	16½	15	16	16
Chittagong	18	16½	13	16½
Noakhally	17⅓	13	13	15
Patna	12	13½	13	12
Shahabad	13	12½	12¼	12¾
Tirhoot	10	10	9½	8½
Chumparun	11¾	11	12	10½
Bhagulpore	12⅝	11⅝	13¾	11¼
Lohardugga	15½	16	15	14
Maunbhoom	15	14½	14	14½

Other grains, maize, pulses, commonly used in Behar, were selling by the latest returns, at from 13 to 14 seers per rupee in Tirhoot, 13 seers in Chumparun, 16 to 17 seers in Sarun and 18 to 20 seers in Patna.

State of the crops.

3. There is little to add to what was said in last narrative regarding the outturn of the spring crops. The harvest has been very good so far as it goes, and from more than one district it has been reported that the ears of wheat and barley are fuller than was expected. The early spring rice is doing well, and so also is the early millet (cheena) up to the present date. The reports of

the last fortnight unfortunately give no ground for hoping that the spring crops of North Tirhoot will be fuller than was expected at the time of the last narrative. North Tirhoot and a small strip of North Chumparun are the only Behar tracts wherein the spring crops have not contributed largely to help the people through the difficulties of the present season. From two districts of east Bengal report was received that the heavy rain of the 23rd March had, to some extent, retarded agriculture. But subsequent open weather has remedied any temporary difficulty of this kind, and the early crops all promise well. The April crop of mulberry leaves, and the outturn of silk during that month, promise to be unusually good. In parts of Midnapore, Rajshahye, Moorshedabad, Beerbhoom, and some other districts, the April silk crop is of much importance to the ryots. The crop of mhowa flower, which in the wilder parts of the country to the west forms a large part of the food of the poor during April and May, promises to be good everywhere except in a part of the Sonthal Pergunnahs.

Supply of grain.

4. The supply of grain in the principal local markets at the prices quoted is sufficient, except in parts of Tirhoot, Chumparun, Purneah, Rungpore, and Palamow; from one or two places it is reported that people who went to buy their weekly supply of rice at the nearest bazar had to come back without it. But, on the whole, the local supplies of grain are maintained wonderfully well. Even in part of Tirhoot, where there was not more than one-eighth of an average autumn crop, and where there has been hardly any spring harvest at all, the chief entrepôts had plenty of grain, and the local markets are fairly well supplied, an active petty trade having been hitherto maintained, and supplies brought up from the Ganges and the railway. In several places where the Government grain stores were opened to the work-people or to the public, comparatively little of the Government grain was purchased; indeed, it is only in North Chumparun and a part of Purneah and in Tirhoot on the works that any considerable quantities of Government grain are being sold, either to work-people or to the public, through the local dealers. From some of the tracts in Tirhoot through which Government grain is being most largely carried, fears have been expressed lest the private supplies in the bazars should run short, because dealers are unable to replenish their stores from outside owing to want of carriage. The Sub-divisional Officer of Tajpore, through whose jurisdiction are carried the supplies of grain for North Tirhoot, writes:—"I am anxious about the bazar supplies; the contractors from Chumpta Ghat have lately taken to using pack animals. * * * I do not know how this great importing sub-division has been hitherto supplied with nearly all its carts drawn off to feed those tracts which usually export to it; but of this I am certain, that, if pack-bullocks are also taken up, the bazar supplies must fail." Results like this cannot, in view of the great operations Government have undertaken, be altogether avoided; but the local officers have been desired to do all they can to mitigate the evil, and they have been especially prohibited from using any sort of compulsion to bring into Government service the pack animals employed on the private trade.

Private importations of grain.

5. There is still no considerable import of grain on private account from beyond sea. But into some of the distressed districts grain still flows briskly from other parts of India. The Sarun district continues to receive supplies from outside, much of which comes down the Ghogra river from Oudh. Rungpore, Bogra, Rajshahye and Maldah are supplied to a considerable extent from East Bengal, but of the amount of these supplies Government has no precise statistics. The import of private grain by railway into Behar was—

From the North-Western Provinces and Punjab ...	17,928 tons,	for the fortnight ending the 21st March;
From Calcutta and places in Bengal	7,737	ditto ditto.
Total ..	25,665 tons	during the fortnight, or a daily importation of 1,833 tons of private grain into Behar.

The greater part of this large quantity is consigned to Patna Station, where there was a considerable block of the traffic during the fortnight, the railway stations being insufficiently provided with the necessary facilities for so large a traffic. Active steps have been taken to remedy this difficulty, and it is hoped that it has been met.

The grain thus imported has hitherto found its way by various petty channels into many parts of Behar both north and south of the river.

Grain trade from the Punjab.

6. In last narrative it was stated that there was much grain waiting in the Punjab to come down into the famine districts. During the fortnight under report the railway officer deputed to inquire into the matter by the Government of India has furnished his report. He finds that 23,580 tons of grain are waiting on the station premises of the Punjab Railway for means of transport to Benares and Behar. The chief adviser of the Punjab Government in railway matters believes that four times as much more grain is stored in bazars and serais, waiting for waggons to carry it down to the distressed tracts. The Consulting Engineer to the Government of India reports that, before the end of March a fixed and uniform despatch of 1,250 tons of grain from the Punjab to the famine districts ought to be considered a certainty. The difference between the prices of grain in the Punjab and Behar is so great that the profits on the traffic are large; and the Railway officer who conducted the enquiry reports that, under present circumstances, "it is absolutely certain that the supply of private grain to the railway will continue fully equal to its carrying power;" while it is clear that no "room can be found for Government grain transport without interfering with private trade."

Export of grain by sea.

7. The usual note on the movement of food-grains will be found at Appendix A, in which will be found a statement furnished by the Collector of Customs putting the total export of food-grain from Bengal by sea for the five months from October to end of February (and this figure may be finally accepted as correct,) at 173,161 tons.

The authorised figures for the exports of the month of March have not yet been received. But, it is certain that the exports from Calcutta and Chittagong have much diminished. From the Orissa ports the exports continue to be moderate. So far as advices have been received, the exports of food-grains from Bengal for the month of March amount in round numbers to about 16,500 tons; so that the total export of food from Bengal during the six months ending on the 31st March will be about 190,000 tons. The Lieutenant-Governor some time back expressed his belief that the exports up to April would be from 150,000 to 200,000 tons. A recent report states that a fresh demand for the Mauritius is shortly expected in Calcutta, while something more may go from Orissa, so that it is not unlikely that the total will not fall far short of the larger figure named by the Lieutenant-Governor.

Condition of the people.

8. The district narratives (enclosures Nos. 3, 4, 5, 6, 7, and 8) show that, with the one exception of Tirhoot, to be noticed more fully below, the condition of the people is decidedly good and hopeful, indeed, this feature is so prominent in the narratives that it may well be the subject of much thankfulness. The accounts of North Chumparun, where, next after North Tirhoot, the famine is worst, show that by relief works, by selling Government grain, by advancing grain, and by means of a thorough system of charitable and medical relief, distress is being arrested and relieved; and, for the present at any rate, the Lieutenant-Governor feels confident that the Government agency and means on the spot will suffice to meet the famine. In other districts where distress had threatened actual famine has not yet appeared, and the local officers seem quite confident that their preparations are sufficiently advanced to meet distress when it comes; and it seems also that the people, though they expect scarcity and very high prices, believe that with the help of Government they will get through their difficulties. From Dinagepore the Magistrate writes that "prices are rising," and "the supply of grain is becoming exhausted;" but "there is wonderfully little distress among the people," * * * "and it is beyond question that the commencement of relief operations and consequent diffusion of money throughout the country, as soon as there was any apprehension of scarcity, has enabled the people to meet it with confidence and vigour." From Maldah and Bogra it is reported that the condition of the people has not changed for the worse. From all parts of Sarun it is reported that there is no general distress, as all the poorer classes are on the relief works, while professional beggars and persons unable to work are receiving charitable relief. From Monghyr it is reported "that the condition of the people has improved since the rubbee harvest commenced." No general distress has been reported from North Bhagulpore; and the latest telegraphic report from that tract is, "condition of general population satisfactory." The Purneah Magistrate writes: "I have not seen or heard of any cases of actual starvation, but the number of cases of distress is increasing, and would have been much larger but for the relief afforded by the Government road and by relief committees." In South Behar there is at present no distress. The latest report from the Sonthal Pergunnahs is that "the people look well everywhere," though in parts the supply of grain is expected soon to fall short. Some days back alarming reports were received about a small tract in Hazareebagh; but subsequent reports written after the District Officer had visited the spot are reassuring, and it is stated that the local distress which had appeared has been met. In West Bengal, regarding which densely-peopled and to some extent poverty-stricken tract the Lieutenant-Governor has all along been anxious, there are no present signs of probable general distress.

Tirhoot.

9. There is one large exception to the general condition of affairs described in the next foregoing paragraph, and that is the north-eastern portion of the Tirhoot district, where the poorer classes have, in the last month, come upon the relief works in enormous numbers, now, it is believed, approaching to half a million in all, who are receiving relief in some shape.

At the time when the last narrative was despatched, the Lieutenant-Governor was in Tirhoot personally superintending the organisation of relief measures there. He subsequently visited some more of the distressed circles, and saw the circle officers posted and at work personally instructing them. He then crossed to Patna, where he again consulted with the Commissioner and settled some points with Sir Richard Temple, whom he had asked to meet him there. He saw and instructed some more of the officers sent down from the North-Western Provinces, and completed the arrangements for officering the distressed circles of North Behar, after which he returned to Calcutta.

Position of affairs when the Lieutenant-Governor left Tirhoot.

10. The result of the Lieutenant-Governor's further inquiries in Tirhoot do not materially differ from those stated in the last narrative. As there stated, it is feared that some cases of starvation to a greater or less degree have occurred among a few old people who did

not come to relief works or relief centres in time, and perhaps in greater numbers among young children who have suffered from bad and deficient nourishment, while the parents were living on scanty food, though not starving. But all accounts agree that nowhere has distress been so great as in the Behera thana of Durbhunga, to which allusion has already been made—there only have the symptoms of severe distrees been prominent, elsewhere the cases have been very rare and isolated. The Lieutenant-Governor repeats his hope and belief that the progress of distress has now been stayed. Very few deaths have been reported as directly due to starvation, not more than ten or twelve in all. The Government of India having asked the Lieutenant-Governor's personal opinion on this point, it was given as follows:—

Deaths from starvation.

"In times of scarcity and the early stages of famine it is totally impossible to distinguish deaths accelerated by scarcity and bad food from natural deaths. He has not the least doubt that among a very poor and helpless population, such as exists in North Tirhoot, many people die when food is dear, who would not die, or would not die so soon, if it were cheap. He believes that there have not been deaths from direct starvation among healthy adults; but, from what he saw of the people about Bahera and some of those on the works near Durbhunga, he fears that among such a population a good many old, weakly, and sick people must have succumbed to insufficient nourishment. Similarly, as before mentioned, many young children are much emaciated, even when their parents are not so. The Lieutenant-Governor does not believe that the parents starve the children to feed themselves, but only that the children are first affected by scanty and bad fare. This result is much aggravated by the native habit of nursing children for two or three years. A child so nursed suffers much when the mother fares indifferently, and the food for the child fails. The Lieutenant-Governor has already explained the extreme difficulty of saving such children, owing to the unwillingness of the parents to bring them to our hospitals and poor-houses. He himself saw the emaciated children carefully fed with milk at the temporary hospital which he arranged at Bahera, but the mothers strongly resisted staying there in spite of every concession and arrangement that could be made. **Under such circumstances the Lieutenant-Governor cannot but fear that many children of a weak and sickly character die. Similarly, he believes that some old and infirm people die on account of scanty food. He is happy, however, to say that so far as he saw and can learn, it is only in the part near Bahera that want has reached the point that many people are emaciated and the weakly must in some numbers die. Every attention is now being given to improve matters there.**"

11. The view expressed in the foregoing extract is much borne out by the narratives received since this expression of opinion was submitted. In the Tirhoot narrative (enclosure No. 3) will be found mention of reported cases of starvation, into which inquiry was made by European officers, *e. g.*, the body of an old man in the Hatti relief circle of Durbhanga, who was said to have died from starvation, "was in a state of extreme emaciation;" yet "the son of the deceased did not show any signs of suffering from want of food." In a village of Mudhoobunnee three males were reported to have died from starvation, but inquiry on the spot showed that two of the deceased "were children of a widower who was himself in a state of rude and well-nourished health." In the Rungpore narrative (enclosure No. 5) the Magistrate writes: "There was a report received of a death from starvation in one part of this thannah, and I went to the spot two days ago, but the case was that of an old woman of 80 years of age who died from disease." It is, the Lieutenant-Governor fears, a fact that occasionally poor creatures come on to the relief works in Tirhoot in a very reduced state; but on all the works except perhaps in Bahera the great majority of the people are in tolerably good condition; and when deaths occur, it is not possible always to say whether they are due, in whole or in part, to starvation. It may be confidently stated as a fact that up to this time the mortality from any causes among the great number of people collected on the roads, &c., in Tirhoot, is singularly small. Indeed, seeing the great numbers and the wretched physical character of many of the old and weakly collected together, the wonder is that there are not more deaths. Among such a population in the best of times there must be deaths of old and reduced people. The district narratives (enclosures Nos. 3-8) sufficiently show that all Government officers in the distressed districts are very keenly alive to the obligation which lies upon them to save life and to arrest famine however and whenever they can.

Recent reports of deaths.

12. While it is hoped that actual starvation has been stayed (unless it be in rare instances which escape all our care), our difficulties in regard to the employment of the people have been much increased in Tirhoot since the last narrative, that is to say, there has been a rush of people to the works in the Mudhoobunnee sub-division in enormous numbers, still greater than that which the Lieutenant-Governor found in Durbungha; so much so, that the total numbers have approached a quarter of a million in the Mudhoobunnee sub-division according to the last statements received. It is feared, however, that there has been a good deal of peculation and misstatement in regard to the numbers, which are certainly so large that, coming so suddenly, it is most difficult to deal with them. Mr. Metcalfe has energetically undertaken this task, and it is believed successfully. A large addition has been made to the Public Works staff of the locality,—the very best officers being selected and taken from other duties. While the people who come to the works in Mudhoobunnee are so numerous, they are not at all so reduced as some of those who come to Durbhunga from the neighbourhood of

Measures taken in North Tirhoot.

Bahera, but are generally still strong and healthy, cases of great want and emaciation being very exceptional indeed. It appears that while the population now in the northern tracts of the sub-division are comparatively well off, the whole of the poorer population of those tracts have left their homes and flocked, together with those of the southern portion, to the network of roads near Mudhoobunnee, so that some 130,000 are collected in a small circumference. Mr. Metcalfe found some of them who were in perfectly good condition, but who had tasted of the lax state of things, inevitable when a few among them were in great want, were somewhat inclined to resist any strict counting and due apportionment of work. But he has brought them to order, and done all that can be done meantime. When the Public Works staff is complete as it will be immediately, and the able-bodied are put on great works under proper discipline, while the weaker are provided for in their own villages, it is hoped that things will settle down into good shape.

13. Having made immediate arrangements for Mudhoobunnee, Mr. Metcalfe has returned to the Durbhunga sub-division, where he reports that the southern relief circles are now working well and in good order, while the other circles are also being put in good order. Mr. Metcalfe telegraphs on the 31st March, thus:—"In a ride from Bahera through the worst parts, and in a circuit of twenty miles, I did not find a person without a ticket for relief or uncared for." In a letter just received, Mr. Metcalfe says: "Lists of all persons on charity have been made out, and as far as I can judge most honestly, by the village Putwarries. Grain has been placed in the hands of the Jeyt ryots, and in the scores of villages where I went, the most wretched are being fed at their homes by their headmen. We have also hit off a solution of the labour difficulty, *viz.*, that the weak and incapable have been formed into small gangs. and each gang is required to do the same amount as one able-bodied man. The villagers have taken to this piece-work arrangement, and it will save Government much loss from cheating. I am working almost entirely through local men, with here and there an exception. The Bahera road is still the difficulty. Many of the villagers have returned to their homes, of the others some are going; others adhere to the earth-work on the roads. The gangs have been organised into numbers of 1,200, and several gangs placed under a Jemadar of one of the Cavalry Regiments, and this arrangement enables us to count the men with little or no difficulty. There is a great improvement in the appearance of the classes, and I can see nowhere famished persons who are not in some way receiving charitable relief. As regards food the villagers now have no fear, water is their chief anxiety. I see but little water in the wells. The tanks are dry save the very largest, and unless we have rain, there will be a great scarcity of water. Your instructions regarding relief in the town through native residents have been carried out."

Latest intelligence from the spot.

The Lieutenant-Governor trusts he may believe that the difficulties in Durbhunga and Mudhoobunnee have been met, and that we are now well ahead of the famine there as elsewhere. Already upwards of 12,000 persons are returned as receiving charitable relief in the Durbhunga sub-division.

Mrs. Metcalfe has taken charge of the poor people and orphans in a large enclosure fitted up for them at Durbhunga, and most of these poor people are said to be getting quite fat.

In Seetamurhee things continue to be more favorably situated, and the numbers on our hands are not excessive, about 40,000 in all.

In the three northern sub-divisions, Mr. Metcalfe states that the whole number on the works, or otherwise receiving relief, is about 400,000, and he hopes that we have reached nearly the maximum that we may expect on our hands in that part of the country. It seems hardly possible that the number in Mudhoobunnee can be very greatly increased (one-third of the population are already on the roads), but it is impossible to be confident that in other sub-divisions the number may not much increase. In tracts where the spring harvest now occupies the people, we must expect, not improbably, a large addition to the number on the works between the completion of the harvest and the commencement of the rains.

The Tirhoot narrative (enclosure No. 3) speaks as if general distress might be imminent in parts of the head-quarter sub-division of Tirhoot. A subsequent letter, however, from the Magistrate of the district, written after visiting the villages named in the narrative, says that the description there given was "exaggerated, and no extreme distress is apparent or expected."

14. The Lieutenant-Governor issued various orders in brief form during his visit to Tirhoot. Since his return to Calcutta he has embodied these in a Note, setting forth the order which he gave and the views which he formed during his visit. This Note is attached (Appendix C), and to it the Lieutenant-Governor begs to refer for an explanation of his proceedings and the measures which he has adopted.

Orders issued by the Lieutenant-Governor on Tirhoot affairs.

15. At paragraph 17 of the last narrative it was mentioned that Sir Richard Temple had visited the Purneah and Dinagepore districts, and his report on Purneah was then submitted, as also his estimate of the grain requirements of Dinagepore. His final minute No. 50 regarding Dinagepore was not received till after the despatch of the last narrative. It is now appended (Appendix D). The Lieutenant-Governor is happy to find that Sir Richard Temple's report, after inspecting the local arrangements, is altogether favorable, and justifies the belief that the arrangements, both to transport the grain and to give relief wherever it may appear, are very good and satisfactory. Sir Richard Temple has done all that was necessary to complete and

Sir Richard Temple's tour.

systematise these arrangements, both for the Dinagepore district and for the Rajshahye Division generally. In company with the Relief Commissioner and the local officers, he marched through the districts of Rungpore and Bogra; he again visited Dinagepore; he has been to Maldah; and, before concluding his review of affairs in the Rajshahye Division, he conferred with the Commissioner, Mr. Molony, at Rajmehal. His minutes regarding Rungpore, Bogra, and Maldah, and the Rajshahye Division generally, Nos. 47, 48, 51, 53, 54, and 52, with his second letter on the subject, and the Government orders issued thereupon, will be found in Appendix E. Sir Richard recommended some additions to the grain allotments of these districts, but it may be said that in regard to the Rajshahye Division as a whole, his reports are very favorable and creditable to the Commissioner and Additional Commissioner, to Mr. Lowis, Magistrate of Dinagepore, and to the local officers generally. It is matter for congratulation that Sir Richard was able to express himself as thoroughly satisfied with the conduct of the Rajshahye officers and with the forwardness of their preparations.

Sir Richard Temple, after meeting the Lieutenant-Governor at Patna and visiting Allahabad to arrange further about reserve carriage, conferred with the Commissioner and the Magistrates of Shahabad and Gya, and settled the allotment of grain for those districts. On his way down he again visited Bhagulpore and settled the grain allotment for the Sonthal Pergunnahs and Monghyr. Sir Richard Temple's Minutes on these subjects, and also those regarding the organization of a reserve transport train, will be found in Appendices F and G.

It will have been seen from previous narratives that the Lieutenant-Governor has warmly acknowledged the good service which Sir R. Temple has done for the Government of Bengal by visiting the distressed districts, by conferring with local officers of all grades, by ascertaining what was required, by informing the local Government, by giving the necessary orders, and by seeing that both his orders and those of Government were obeyed. Sir George Campbell would again repeat his most cordial acknowledgments of Sir Richard Temple's services.

16. Sir Richard Temple has now submitted minutes clearly summarising the present transport and relief arrangements in the three distressed divisions, Patna, Bhagulpore, and Rajshahye. These will be separately submitted to the Government of India, with a note showing the whole of the allotments of grain, and giving a general review of the transport arrangements and their working. Here it will suffice to say that the total allotment of grain to the distressed districts amount up to date to 381,819 tons. It only remains to consider whether any further allotments must be made to the western districts of the Burdwan and Chota Nagpore Divisions, but it is not expected that the demands for these districts will be very large. The distressed parts of Chota Nagpore are those which are most accessible, and Burdwan is very accessible. Seeing how favorably the season promises so far, the Lieutenant-Governor has no doubt that with these large allotments, and a certain reserve in case of surprise in any quarter, a very ample provision has been made.

Transport arrangements.

The carriage arrangements are now, as a whole, working very well indeed, and there is every prospect that the full quantities allotted will be conveyed to, and stored in, the distressed districts in very good time. It was at one time feared that the local carriage would scarcely keep pace with the supply sent up by the railway. Now the difficulty is the other way, *i. e.*, we can hardly send by railway enough to supply the local carriage. It is hoped, however, that arrangements now made will suffice to get up the whole supply in time. The only serious difficulty is in regard to the supply of North-Easten Tirhoot, to which so much as 32 lakhs of maunds, or 117,000 tons, have been allotted, and where the carriage has, so far, fallen short of our expectations. But the Durbungah Railway is progressing admirably, and most opportunely comes to aid us in carrying grain to Durbungah, to which a temporary line of rail will be open this month. The Government is now sanguine that if the traffic lines are not interrupted before 15th June, the supply for Tirhoot will be completed by that time. If the rains come in prematurely, the distress will, it may be hoped, be so much curtailed, and the water routes will be opened. The latest figures and facts regarding grain transport seem to make it certain that if no very unforeseen mischance occur, the allotments to all the other districts will be stored some time before the dates mentioned for the completion of the Tirhoot allotment, many of them long before. Only a portion of the additional allotment lately made to the Rajshahye Division may be stored in the waterside depôts for distribution when the rains clear the channels.

At Appendix K will be found copies of the Lieutenant-Governor's instructions to Commissioners regarding the distribution of grain during the rains, and his orders, deputing a special officer, Mr. Wickes, C. E., to enquire into the best means of utilising the water-ways of the distressed districts from the 1st July.

The transport arrangements of Purneah and North Bhagulpore have been organised by Mr. Hankey with remarkable ability and success, and are working exceedingly well. In Appendix H will be found two reports showing what Mr. Hankey has done.

17. The despatches of Government grain from Calcutta to the famine districts amounted (see Appendix B) during the fortnight under review to 10,80,936 maunds (38,705 tons). The total despatches of Government grain to, and receipts in, the distressed districts up to the 31st March amount to 209,913 tons out of which 131,765 tons had reached their final destination up to the date of the latest returns. The daily despatches

Despatches of Government grain.

by the East Indian Railway fell, owing to the insufficiency of railway wagons, as low as 1,437 tons and 1,185 tons during the beginning of the fortnight. In consequence of these short despatches, inconvenience was caused at the Purneah and North Bhagulpore river-side depôts, where a powerful stream of carts had been arranged, and where the reserves of grain were very soon exhausted. Since the 26th March, however, the average rate of despatches has been kept as high as 2,479 tons per day, a quantity very little below the maximum which the Government of India desires should be sent daily. The Railway Company have allotted a sufficient number of wagons to work the Government grain traffic only; these wagons, if unloaded promptly at the Behar stations, will come back empty, and thus maintain a constant steady traffic of Government grain. The East Indian Railway have also promised to give the Government grain at Howrah priority of despatch over ordinary goods; the ground for such a concession is that a regular stream of Government grain to Behar is necessary to enable the Government to transport its full allotment into the interior before the rainy season, and to be in a position to save the lives of the people who may be expected to be on its hands. The Lieutenant-Governor only trusts that these arrangements will not interfere with the despatch of private grain, remembering as he does that after all that Government has done for the worst districts, there still remain many districts where there has been much failure of crops which must greatly rely on private importation.

The Eastern Bengal Railway has been able to send away daily to Kooshtea and Goalundo all the grain which the Government required to send; the average despatches by that line during the fortnight have been somewhat over 1,000 tons per day.

18. The fortnightly returns of persons employed on relief works under officers of the Public Works Department will be found at enclosure No. 10. But this return does not always show the numbers employed on works under the Court of Wards or on works under local agency of many kinds. As has been already said, the number of people employed, or perhaps, more strictly, relieved, on the works in North Tirhoot has increased enormously. Compared with the figures given in last narrative (paragraph 28) the figures stand thus, and even the figures given had been somewhat exceeded by the last accounts:—

Relief works.

	Last fortnight.	Fortnight under report.
Patna Division	234,249	539,353
Soane Canal works	29,589	31,289
Gunduk embankments	25,615	28,834
Bhagulpore Division (inclusive of Kurruckpore works) ...	22,800	51,430
Rajshahye Division	54,832	82,586
Burdwan Division, Nuddea, Chota Nagpore and Cooch Behar ..	19,219	22,000
Northern Bengal Railway	7,000	12,000
Total ...	393,304	767,492

It will be seen that the numbers employed have increased considerably in other parts of the country besides Tirhoot. In regard to the management of these enormous numbers of work-people, the utilization of their labor, and in regard to their punctual payment, the Lieutenant-Governor would invite attention to paragraphs 11-24 of his note on Tirhoot affairs (Appendix C). Effort has been made, and will still be made, to disperse them to their homes as soon as possible, and to relieve them there. Meanwhile, every nerve is strained to supply professional supervision of all grades, to send up competent clerks of works, to educe local agency for supervision, and to manage the pay-disbursement business to the best interests both of the Government and of the work-people. Since the last narrative was submitted four additional Engineer Officers, and as many as forty additional subordinates, have been ordered to, or have arrived in, the famine districts. Major Trevor, R. E., has been deputed as Additional Chief Engineer to inspect, direct, and advise upon relief works, in concert with local Engineers and civil officers, with instructions, for which see Appendix K.

19. In the Mudhoobunnee division, where nearly a quarter of a million were on the works by last accounts, the present relief works can hardly last more than four weeks, for the people seem to dislike tank work, and to rush upon the road works. In this direction the Railway Engineers were already prospecting for the best alignment for a North Behar Railway, to run from Durbhunga eastwards; and the Government of India, in view of the enormous quantity of available labor, has been pleased to sanction the Engineers beginning the railway on the best line which they can, in communication with the local civil officers, finally agree upon. If the survey or reconnoisance is far enough advanced to make such beginning practicable, very excellent and useful work will have been provided for the famine-stricken laborers of Mudhoobunnee. Happily, Mr. Stevens, the Superintending Engineer of the Durbhunga Raj property, knows the country well, and has surveyed most of it for the roads now under construction. The selection of a line for a railway in a hurry will therefore be less hazardous than it might otherwise be in a country where the maps are nearly thirty years old.

North Behar Railway works.

20. The average daily number of laborers on the Soane Canal works has risen during the fortnight to 31,282, as compared with 29,589, as shown in last narrative. The Executive Engineers report that, at the present season, they cannot procure as many local laborers as they require, inasmuch as people can earn from 3½ to 4 annas a day in harvesting. People on the works consume, for the most, the cheaper grains, which they buy locally. Coarse rice can be had from

Irrigation Department relief works.

local dealers on the works at 12 seers per rupee. At one place only was there a demand for Government grain, and there one bag of Burmah rice was issued and was taken readily. The number of work-people on the Gunduk Embankments has risen to 28,834, as against 25,615 shown in the last narrative. Most of the people are doing petty task-work; they draw their supplies of maize mainly from the local markets. The people are strong and able to work; only a few come to the works in a reduced state, and receive gratuitous relief for a time from the Engineers.

Northern Bengal Railway.

21. The numbers of work-people on the Northern Bengal Railway are increasing; about the 15th March there were 9,000 laborers on the railway bank, besides about 3,000 on the feeder roads. The earth-work completed was equal to a bank, 24 miles long and 4 feet high. On the southern section, where the bank is heaviest, but few laborers had yet applied for work, but they were beginning to come in larger numbers. The Engineer-in-Chief is very anxious to complete the railway bank from Julpigoree down to the Ganges this season, and he is arranging to import laborers from other distressed districts. The Magistrate of Bogra also has been instructed to send over for work upon the railway any distressed people of his district who may be willing to take work away from their homes.

Durbhunga Railway.

22. The railway from Chumpta Ghât, on the Ganges, to Durbhunga is not exactly a relief work, but it was undertaken, and is being rapidly pressed through, in order to carry grain into the most distressed tracts of North Tirhoot. The length of the line at present sanctioned from the Ganges to Durbhunga is 44 miles; on 28½ miles of this length the rails had been laid, and the principal bridge was expected to be completed at once. The Engineer-in-Chief expected to lay two miles of rails a day, to complete the remaining bridges, and to be able to run an engine into Durbhunga by the middle of April. From the first of the present month the railway was to carry a certain amount of grain daily as far as Nagurbustee, two-thirds of the distance from the Ganges to Durbhunga, and soon after the 15th the railway will, it is expected, carry 800 tons of grain daily into Durbhunga. The Government of India has provided that rolling stock shall be ready on the new line in sufficient quantity to carry 800 tons a day, and arrangements are in train for unloading the wagons at stations and starting it off to the depôts on carts.

Charitable relief.

23. It has been explained in previous narratives that, in order to carry out the relief system contemplated by the "instructions" issued by the Government of India, the larger sub-divisions have been sub-divided, and each relief sub-division is parcelled out into circles. Over each circle is placed a competent officer who has to direct and control charitable relief at each village of his circle. The circle officer is aided by one, two, or more assistants. Attached to each circle is a famine hospital and a native doctor; and it is the duty of the circle officer and his assistant to visit every village in the circle at least once a week, to prepare lists of the people who require relief in every village, and to see that relief is given in one form or another to every person who requires it. The worst districts, Tirhoot, Champarun, Dinagepore, Maldah, and Rungpore and parts of Bhagulpore, Purneah, and Monghyr, have been thus parcelled out into circles; and every circle in each of these districts is manned, and the relief system has been thoroughly and systematically begun. Below the circle officers are employed the indigenous village agency of village headmen, village accountants, and village police, as explained in the Lieutenant-Governor's note (Appendix C, paragraphs 2-7). As has been stated in a previous paragraph (13) the Additional Commissioner of North Behar, writing from the worst part of Durbhunga, says that in a circuit of twenty miles he did not find a person unrelieved or uncared for. Mr. Howe's account (see the last paper in enclosure No. 3) of the relief arrangements in North Champarun shows that throughout Ramnuggur the administration of charitable relief in the relief circles is now in good working order, and the people are kept from starving,

Numbers in receipt of charitable relief.

24. The numbers of people in receipt of daily charitable relief in one form or another are, according to the latest information—

Name of district.	Name of sub-division.	Numbers receiving relief.	
Champarun ...	Bettiah ...	4,350	
	Ramnuggur ...	1,400	
	Head-quarters ...	333	
Tirhoot ...	Durbhunga ...	12,082	
	Seetamurhee ...	5,221	
	Mudhubunnee ...	570	
	Head-quarters ...	265	
Sarun ...	...	36	
Gya ...	...	192	
Shahabad ...	...	13	
Bhaugulpore ...	Soopool ...	1,300	
	Muddehpoora ...		
Monghyr ...	...	1,603	
Purneah ...	...	2,554	(besides 1,500 privately relieved)
Maldah ...	...	240	
Bogra ...	...	660	
Rungpore ...	...	4,000	
Dinagepore ...	...	458	
	TOTAL ...	35,345	

Sales of Government grain.

25. In North Chumparun, Dinagepore, and parts of Purneah, only has Government grain been sold to the public to any considerable extent. To the people on the works the grain has been sold in Tirhoot and also in parts of Bhagulpore. From Ramnugger, in North Chumparun, only have full accounts of these sales and their results been received. Mr. Howe, the Sub-Divisional Officer, writes thus:—"Since the 12th March sales of Government grain to the public have rice to "the public have commenced, and by the 21st, the date up to which this report extends, 365 "maunds, 25 seers, 12 chittacks had been disposed of, and Rs. 1,269-10 realized. The precautions "taken to prevent its getting into the hands of monopolists were these: 1st, the rice was sold in "small quantities, the smallest that could be considered wholesale, generally 3 bags, and to as "many petty traders as possible. A few of the more substantial dealers, four in number, "received 7 bags (about 14 maunds each). A proclamation was issued several times (espe-"cially on market days) informing the public that Government rice would be retailed by "certain dealers at 11½ seers per rupee, and every opportunity of making this widely "known was taken. I also took an agreement from each dealer writing to the effect "that he should only sell retail in the town of, and at the bazars round, Ramnuggur at "11½ seers per rupee, and in not larger quantities than 5 seers to any one person. A few "also agreed to retail on our roads around Ramnuggur to our coolies. Finally, I took the "greatest care, through my establishment and in person, to watch the working of the "measure and prevent abuses. I feel convinced that the grain thus sold has circulated freely "among the people in the manner intended by Government. Every shop where Govern-"ment rice is sold is surrounded by eager purchasers, and no measure we have taken (not "even the advances to ryots; which was very popular) has tended so completely to restore "the confidence of the people. Villagers from 8 to 10 miles come in on bazar days, and the "rice is rapidly sold." Sales conducted after this fashion through the local dealers will, it is hoped, not restrain trade, or prevent such private importations as may be coming in. In the Lieutenant-Governor's Note (Appendix C) it is sufficiently explained that private trade was active, and private supplies were tolerably abundant, even in the worst parts of Tirhoot.

Advances to ryots.

26. In the Chumparun and Purneah districts advances of money and grain to substantial ryots have been begun. In Sarun, Tirhoot, Rungpore, Maldah, Bhagulpore, and Monghyr, very considerable sums have been advanced to zemindars in order that they may help their ryots. The advances of grain made direct to ryots, have been made by the relief circle officers on the security of the ryot's holding or other security. At paragraphs 41-46 of the Lieutenant-Governor's Note on Tirhoot affairs (Appendix C) the subject of advances to ryots is discussed, and it is pointed out that there are considerable classes of ryots who will not work on roads, and who yet will require advances of grain to carry them through the coming season. Sir George Campbell has desired all officers to make advances to ryots as far as possible on the security of zemindars, middlemen, or head ryots; and looking to the very great importance of this advance question, he has suggested that villages in the worst tracts be classified according to the manner in which it will be necessary to make advances to ryots. Now that the Relief Circle Agency is getting into full working order, the Lieutenant-Governor has good hope that this business of advancing grain to ryots on the best available security will be properly dealt with during the next two months.

Medical staff for the famine districts.

27. During his recent tour Sir Richard Temple had recommended that application be made to the Madras and Bombay Governments for twenty additional Native Doctors to help in the medical relief required in the famine districts. The orders of the Bengal Government on that Minute show that, up to the present date, 102 Native Doctors have been indented for on behalf of the famine districts; and the Surgeon-General has made available 105 Native Doctors for the duty from the Bengal Presidency. Out of this number from 50 to 70 Native Doctors had reached the famine districts before the end of March, and the rest were on their way. Sufficient stocks of medicines and other necessaries packed in small boxes have been sent to each famine district, so that the Relief Circle hospitals may be found with all fitting drugs and appliances. In case further indents should be made for medical aid, the offer of the Government of India to send for additional native doctors from Madras and Bombay has been accepted. For the surpervision of the relief hospitals an additional European medical officer has been sent to each of the sub-divisions in North Tirhoot, and another for North Champarun. Preparations are thus being made to meet and relieve disease among the famine-stricken people. Up to the present date there has most providentially been no epidemic among the people on the relief works or at the chief grain routes, or at the great depôts. There was a little cholera at one time on the grain route to Ghoraghat in Dinagepore through Bogra; but it lasted only for a few days and has disappeared. Diarrhœa is said to be prevalent among the people on one length of the Champarun embankment. If immunity from epidemic continues among the enormous crowds on the relief works till they are dispersed, it will be a very great blessing.

By order of the Lieutenant-Governor of Bengal.

C. BERNARD,
Officiating Secretary to the Government of Bengal.

CALCUTTA,
The 2nd April 1874.

NOTE OF THE RESULT OF THE LIEUTENANT-GOVERNOR'S VISIT TO TIRHOOT.

Since I have visited the country about Durbhunga where distress has first assumed a severe type, have discussed matters thoroughly with the local officers, and have instructed them both verbally and by rough notes. I think it well to summarise the views which I have formed, and the instructions which I have given on this occasion. In case, unhappily, distress should, at any time, gain on us in other quarters, we must profit by the experience of the places where it has first appeared.

Distress cannot be met without using indigenous and voluntary agency.

2. It is unnecessary to repeat the advantage of being prepared in time, and meeting the influx of distress in such a way as to avoid confusion and abuse when it comes on us with a rush. I trust that this is everywhere felt, and that whether serious distress already exists or not, no officers of districts where it may be reasonably apprehended are wanting in zealous preparations. But I am farther much impressed, by what I have seen in Durbhunga, with this, that distress on a large scale may, and often or generally does, come at last somewhat suddenly, and that the Government organization which we can supply will not suffice to meet it in this state unless we also avail ourselves to the utmost of all the indigenous and voluntary agency which the country affords. Our executive machinery is still very deficient in these provinces; the beginning of such machinery which has been recently made being quite unequal to bear in its very infancy the strain of a great crisis such as this which has arrived. The assistance which we obtain from other provinces is not in a moment adapted to a country and a system entirely different. Our anxieties have been spread over so wide a surface that it has not been possible to concentrate all our power on the points where the worst distress has actually occurred, till the facts have solved all doubt. Moreover, there is this special difficulty, that we have the smallest machinery in the tracts inhabited by a quiet, poor, long-suffering race, who give little trouble in ordinary times. North Behar is probably the most under-governed country in India; one young man as sub-divisional officer has there ruled and judged a population which would elsewhere have been provided with a full district machinery. (Of the Durbhunga Sub-division, for instance, the population is 867,409.) Yet here is the very population which comes on us in a body in the most helpless state. I am not surprised, then, that in such a sub-division as Durbhunga, notwithstanding the official aid which we have sent, there should have been some failure to meet the rush of the famine when reliance was placed too exclusively on official agency, and there was delay in attempting to work roughly with indigenous agency till the Government agency should be complete. I must strongly impress on all officers, that whenever and however distress may come upon them, and to whatever extent they may and do properly apply for Government aid, they must not omit to do the very utmost that is possible by the means which their districts afford.

3. It has been already arranged to portion each sub-division into relief circles under competent Government officers; what is most wanting is inferior machinery reaching down to each village.

Village agency required.

It is certainly true that indigenous agency of one kind is very much wanting in North Behar. The active and intelligent middle class found in many districts of Bengal is scarce. Many zemindars have been too much in the habit of letting their villages to mere rent-farmers, and there is often difficulty in getting efficient aid from either zemindars or farmers. But on the other hand, when we go lower down, there is more of the old village machinery than in Bengal. Almost every village has its headman or jeyt ryot, and putwari, and there are a good many,—Brahmins, Mahomedans and others,—who have a certain amount of native education.

Headmen and putwaris.

The census of Behar was almost entirely taken, and well taken, by the putwaris and headmen, and it seems to me that the machinery which could take the general census may well be used to census the poverty-stricken in each village, make lists of them, keep relief accounts, and work the village system of relief which the Government desires to adopt.

Zemindars and their agents, and European planters.

4. The utmost use must be made of the zemindars and their agents and dependents. Every possible pressure must be put on those who are at all backward to induce and compel them to do their duty. In North Behar we have the very great advantage of the assistance of a very active and energetic body of European indigo planters. The aid which they have most willingly given has been almost everywhere fully used and should be so everywhere.

Local committees and individual members of such should undertake specific duties.

5. The orders for local committees must be carried out in good faith. It may be true, as some officers assert, that committees are sometimes a sham; but either acting in committee or, still more, acting separately as individuals, every good resident should be utilised. The best way of beginning is to bring them together in committees, to portion off duties, and let it be settled in the presence of the body of the committee that each man capable of aiding is to undertake some specific function in a specific place, or in a specific area.

Superintendents of groups of villages.

6. A very good plan had been formed of appointing to the charge of groups of villages paid superintendents, selected from the people of the country; the only drawback was the delay in effecting this, pending the completion of a large superior establishment for which European officers were thought to be indispensable. In Mudhubunnee and Hattee about Rs. 15 per mensem or less was allowed to these group superintendents. The Durbhunga plan which was circulated contemplated a uniform rate of Rs. 30 per mensem. I do not know that paying high and uniformly secures

efficiency, and sometimes volunteers will do the work better than paid men. I would allow a discretion in regard to pay according to the circumstances and the class of people obtainable in each locality; but subject to this caution, I entirely approve of carrying out the system of group superintendents. I trust it has now been nearly completed in North Tirhoot.

Village organisation.

7. But beyond this, the point on which I have most dwelt is that we must not stop short with the group superintendents, paid or unpaid. We must have a proper organisation in each village. The moment we go beyond the stage of great public works, it is totally impossible to deal with the people in detail unless we have them localised and individualised, village by village and name by name. We cannot send them away from the roads till the village machinery is ready to receive them; we cannot distinguish people receiving relief by labor, charitable relief, and relief by advances, or prevent the same persons from receiving relief in different shapes till we have all those receiving relief registered, name by name, according to their villages by some person who knows them, and who can be made responsible for their coming and going. Above all, it will be totally impossible to deal with the people on our hands and wean them eventually from dependence on Government unless we have an individual knowledge of them in their villages. I have occupied myself then in impressing on the local officers the necessity of carrying out a village organisation. This should be done as much as possible through the zemindars. No man in the position of a landholder should be absolved from his duties and responsibilities if it be possible to obtain assistance from him. Finally, the headman and putwari must be utilised in each village. They will keep a nominal roll of all persons in the village receiving relief either on works or gratuitously. Through them the village management may be conducted, and they will be responsible to check abuses. Small rewards according to work done may be promised and given to such headmen and putwaris. I authorize the Commissioner to arrange details of their remuneration.

Sirdars and mates of laborers.

8. It is generally desirable to allow the laborers to choose their own headmen, through whom they are paid, and through whom they deal with Government officers.

The circle officers may however both make use of and give relief to a certain number of persons unaccustomed to manual labor by appointing them to be petty overseers of charitable relief, watchmen over the grain stores, and so on.

Utilisation of local police.

9. All the local police are to be subordinate to the circle officers for relief purposes, and may be utilised freely.

Famine of money and famine of food. Effect of the former.

10. The above arrangements are best carried out before severe distress has actually come on us; but in Durbhunga (partly on account of insufficient action in the direction above indicated) and in Madhubunnee we have experience of another and farther phase of the subject, *viz.*, that in which very large numbers of people come on our hands for relief in great masses congregated together. I myself saw vast assemblages of this kind near Durbhunga, and by the last accounts still greater numbers were on relief works in the Madhubunnee Sub-division, though not so much reduced in condition as the Durbhunga people. It may be said that famines are of two kinds, or at least there are two stages of famine—famine of money or labor famine, and famine of food-supply. It may, in rare cases of isolated districts, happen, as it did in Orissa, that the two stages become one, or that the famine is from the beginning an absolute deficiency of food-supply, the case being, as was stated in regard to Orissa, like that of a ship at sea which is suddenly found to be short of provisions. But with rare exceptions a money or labor famine precedes a food-famine, that is, food is to be had for money but it is dear, and the poorer classes, being thrown out of work, have no money to buy it. Very often the famine never goes beyond this stage; it has almost always been so in the North-Western Provinces, where there are abundant means of communication. Some of our stricken districts being very isolated, we have feared and guarded against a food famine. But so far this has not come upon us. I have seen that even in North Tirhoot the bazars are still supplied; an active private import (by driblets in bullock-loads) is still going on, and food though dear has not reached what can be called extreme famine prices. Notwithstanding, however, the existence of supplies in the bazars* up to date, there is certainly what we must consider wide-spread famine; in some limited tracts some people have suffered from want of food before coming to our relief works, and in very considereble tracts the people have come to the relief works with a rush in very large numbers. Although these simple people very much follow one another like a flock of sheep, they are at first slow to move; and, even when they have not actually starved, I do think that when they very suddenly come to us in this unusual way in very large numbers, it is a sure indication that what must be called famine is on them, that is, that they have reached the point when they would starve if not relieved.

---

* From what I saw of the activity of petty private trade, my impression is that for some time to come the bazars would be supplied in this way if it were not that the pressure on carriage for the transport of Government grain is beginning to interfere very seriously with the means of private traffic. Much complaint is now made that private people cannot obtain carriage, and that the bullocks and donkeys which hitherto supplied the bazars are taken up by the contractors. This is no doubt a great evil, and the local officers should do all that is possible to avoid it.

11. The first mode of relief for the Government to undertake is clearly (and this has always been recognised) giving work to the poorer classes who are without work and without means. The better classes who do not work on the roads generally do not starve till a later stage; they have some credit if not some property. While the producing and wages-earning classes maintain themselves, most of those dependent on them, even the beggars, are for the most part in some sort maintained also. Rich natives do a good deal in this way, and I saw two or three faqueers living on a gang of relief laborers in Tirhoot. At any rate, the beggars and helpless people who come on mere charity, and are not supported by private liberality, may well be provided for in the early stages of scarcity by the relief committees without a very large Government organisation.

Provision of work.

In the present stage then the public works have been our most active care. Under previous instructions a good deal had been done in most districts to prepare plans of such works for emergencies, and more has been done since the present famine threatened. In those districts where the numbers seeking relief are not very excessive, I believe that our preparations have been sufficient; but in some districts where no very large special works are available, and enormous numbers have suddenly come on us, it cannot be said that either the plans of our works or our establishments are sufficient to enable us to obtain full money's worth from the labor of a needy multitude, among whom little organisation is, in the first instance, possible. In fact, there is no denying that in some of these cases our organisation has not been such as to prevent the occurrence of what must be called great abuses, judged by the standard of ordinary times.

12. In Behar, at any rate, women and children come on the works quite as readily as men; and it is because the whole family works, or pretends to work, that somewhat low wages with dear food are not incompatible with an almost liberal measure of relief, measured by the fare to which these poor people are accustomed—a very low one. Wherever some of the people have begun to starve, or nearly to starve, it is impossible to refuse work to all applicants, whether really capable of real work or not. The result of the suddenness of the rush upon us in some places, and the necessity of being on the safe side where famine has threatened, has been that we certainly have, and to some extent must still have, great multitudes on our works doing very little real work and very imperfectly supervised. But I have felt that this is better than letting the people starve, and that it must continue till we can sift them out and deal with them in detail: we cannot send them away till this is done. At the same time, I am clear that this cannot continue, and the first work which I have set Mr. Metcalfe (the Additional Commissioner) and the local officers to do is to make arrangements for dispersing these multitudes. Fortunately, the climate at this season is favorable; the people seem not to dislike the assemblages in which they are gathered, and I hope no great harm beyond a somewhat prodigal expenditure of money will result for a short time. But beyond this it must not go. To begin with, although, as I have said, I believe that these sudden rushes indicate real want and rapidly-approaching famine, still, when under pressure of such necessity, a lax system is established, and every one, down to the smallest child, gets paid for the merest pretence of work (with probably a good many abuses besides), the thing becomes too attractive, the whole country tends to come on the works, the numbers threaten to be *absolutely* overwhelming. The people, too, become demoralised; works where real work is exacted are deserted, and many evils follow. If disease or climate do not disperse such multitudes with possible calamitous results, the case might be still more impossible to deal with when the rains and cultivating season approach. It would be very difficult to get back to their homes and to regular labor people accustomed to such a system, while it would be impossible to continue it in the rainy season.

Mode of dealing with a sudden rush of population to works.

13. A vast multitude, treated in the gross, through mates and other headmen, cannot be individualised and dealt with according to their position and needs; we cannot deal with them till we know who they are. In all such cases of unmanageable multitudes on the roads, the first thing to do is what I have ordered to be done in Durbhunga and Madhubunnee, *viz.*, to sift them out according to their families, villages, and tracts of country; to separate those who wish to do, and are capable of doing real work on the large works from those who wish to go home or are not fit for work; to put the former on regular works on a regular system, where good wages are paid but a reasonable tale of work is exacted (less than in ordinary times, but still a fair quantity), and to put the latter either on light work or on charitable relief.

Arrangements for distributing laboring masses.

Division of works into two classes.

14. The better to carry out this system, I have directed that the works should be divided into two classes, thus—

(1) Works under Public Works or other competent officers, on which real labor shall be exacted and full wages paid.

(2) Works under circle officers, on which the labor given is less effective, and for which superior professional supervision is not required. The rates of wages on these would be mere subsistence rates, unless easy piece-work is given for liberal terms.

The large roads now going on under Public Works officers, and other large works, irrigation works, and the like, should be put under the first head.

Even on the regular works it is right that, besides the hard work for the able-bodied men, work of a lighter character, but still real, should be provided, so that the families of the laborers and others who wish for regular work should be provided for. This is generally done, and I rely on the Public Works and other officers to arrange it discreetly.

15. Although on the regular works we cannot prevent a considerable fluctuation and coming and going, it will be desirable, as much as possible, to note the names and residence of the laborers, and to classify them under fixed and recognised headmen as persons regularly employed and paid. Besides making it much more easy to deal with them and prevent abuses in the present, this will greatly facilitate our operations when we come to send home at the proper season, with a sufficient store, those who have well worked on the roads, at the season when there is nothing else to be done.

Proper registry of laborers on large works.

16. The mode of payment to be adopted is a matter of extreme difficulty, regarding which much local latitude must be allowed. Various modes have been tried with varying success. *Primâ facie*, in the case of very poor people, it seems most desirable to pay daily; but when the multitude is very large it is physically impossible to pay, by trustworthy agency, each individual daily—either the laborers are grouped in gangs, and payment made to each gang, or payment is really made to the headmen of large numbers of mates, who distribute to the mates, and the mates to the laborers, in a way which admits of little check. As soon as the people are regularly classified and put into permament gangs, it will not be so difficult to pay each gang daily; and when they have worked some time and are not living quite from hand-to-mouth, it will much facilitate matters if they are found to be well content with payment every two or three days. One great and increasing difficulty about daily payments to each individual laborer is the enormous number of copper pice required. Where these run short it may be permitted to pay in grain; but from all I have seen, I have no doubt that, as long as money can be had, it is far best for all parties to pay in money and let the laborers buy either from the Government shops or privately as they prefer.

Mode of payment on large works.

Care should be taken that payment is not made in such a manner as to make it the interest of mates and headmen to tout for and bring together an unnecessary multitude. I fear that when we are oppressed by too great numbers, the tendency of such a system is to increase the numbers and bring the whole population on our hands. When we are not able to reject people or to exact real work, every creature that can be mustered passes for so much profit to the mate and headmen, and if they can pass muster two or three times over so much the better for these men. Effort should be made to pay if not individually at least in small squads, and not to distribute money in a wholesale way.

17. It is to be thoroughly understood that not only are the officers of the Public Works Department employed in districts where scarcity prevails wholly and absolutely under the Commissioners and superior civil officers of districts on all points in which they may think it desirable to interfere, but that everywhere the local sub-divisional officers and their assistants are directly responsible to see that payments are properly made and work given in the manner most conducive to relief. It is expected that in this respect they and the Public Works officers will work in thorough accord. The Commissioner or Additional Commissioner on the spot will lay down general rules on which the Public Works officers will act subject to the orders of the Magistrate of the district. The Public Works officers will ordinarily arrange for payment of the men employed under them; but the local civil officers will inspect the works, test the payments of the Public Works subordinates, and see that all is right. If not right, they will at once communicate with the Public Works officers, and if necessary, with their own official superiors. I have given full authority to the Commissioners to authorize the entertainment of any local establishments for the proper management and payment of the laborers that may be necessary to supplement the Public Works establishments.

Responsibility of civil officers in connection with large works.

18. It is most necessary that efficient sanitary arrangements should be made on all large works; and particular attention should be given to this.

Sanitary arrangements.

19. The village works under circle officers must necessarily be conducted, for the most part, by non-professional people; but I have arranged that in each relief circle an officer should be specially charged to look after the works in the circle. There has been much correspondence regarding these village works. The result is that, by aiding zemindars and otherwise, we must promote the employment of the people to the very utmost; but that in the last resort in very distressed tracts, where the people are likely to starve and no one can be induced to undertake works for his own benefit or from public spirit, the Government must employ the people by undertaking such works (excavating tanks and the like) as are most beneficial to the general community. I rely much on the tact and energy of the local officers to make these arrangements for the best. Even when Government pays for the works they may advantageously be placed under village headmen and others locally interested; we want to give the people work near their homes, and, if the headmen are interested, they will carry the work out all the more readily.

Village and minor works under circle officers.

Strangers coming to village works are to be registered in the village where they labor and live for the time.

20. To the distressed poor of both sexes the task-work system cannot be generally applied. As much work must be obtained for them as they can fairly do, and no more. Any stringent enforcement of a labor test may repel these people and cause ultimate danger to life. But it is better to obtain a little, even the smallest amount of work from those who can work, than to give gratuitous relief. The offering of piece-work is very good whenever the people will accept it, the terms offered being, as has been said, liberal.

Limitations on task-work system.

21. Returns of laborers on works in each circle are to be made by the circle officer, the number on each class of work being distinguished. This is to be separate from the Public Works Department returns. The Public Works officers are to return the number of their laborers to sub-divisional officers, who will combine the whole in one return.

Returns of laborers.

22. With respect to Public Works establishments, it is evident that, with the enormous number of people now coming on the roads and other works, even after a large proportion of them have been sifted out and put to village works under the civil officers, the labor and responsibilities of the Public Works officers must be very great, and the staff of officers must be increased as much as possible. I have arranged that a separate Executive Engineer is to be provided for each of the sub-divisions in Tirhoot in which distress is very great, especially that Durbhunga and Madhubunnee should each have an officer of the rank and powers of Executive Engineer, the very best available. As many Assistant Engineers as possible have been, and are being, supplied; also a number of subordinate officers; but I agree with an opinion which I have seen expressed that the famine country is hardly the place for a European overseer with a large family and imperfect acquaintance with the language. We are sending all the fit men we can, and they should be sent as unincumbered as possible, but for the rest I continue to repeat what I have all along said, that much inferior agency must be extemporised in the country itself, and made the best of by the utmost tact and discretion in selecting and using it. There is one kind of subordinate agency which is much wanted, clerks of the works, that is intelligent men acquainted with accounts, who can make up and check the returns. For this purpose Bengallees are very well suited. I have instructed the Chief Engineer to do his utmost to send up good men of this class. I fear that there must be much laxness and peculation in many places, and as we get things into order and establish some system, it is of the first importance that the executive officer should be assisted by competent men capable of keeping their offices and testing statements of numbers, payments, &c.

Public Works establishments.

23. Superintending Engineers have been appointed to the several districts in which large relief work is going on, but they are comparatively new to the duty, and in order to advise and assist them, to see that the utmost that is possible is done to render the great amount of labor now in our hands as beneficial as possible by selecting the best large works, and to introduce on the works the best system possible under the circumstances, it has been arranged, in communication with the Government of India, that (since the Chief Engineer of this Government, Colonel Nicolls, has his hands more than full) an Engineer Officer of experience and tact, Major W. B. Trevor, should be deputed for the general inspection and regulation of the various relief works. He will proceed to the different distressed divisions with the powers of a Chief Engineer, to be exercised in communication with Colonel Nicolls, will confer with the Commissioners and Superintending Engineers, will give them the best advice and assistance he can, and will direct operations in concurrence with the Commissioners.

Deputation of Major Trevor.

The difficulty of finding sufficient work for the enormous number of laborers in Tirhoot and some other districts, is much pressing on us. It turns out that in many places the laborers dislike tank-work and insist on flocking to the roads. We must reduce them to order and discipline, and make them do the work most fitting for them to do; but still it is a great object to maintain large works sufficient for the employment of all the laborers who legitimately seek regular work and submit to regular discipline, while at the same time the opportunity of permanently benefiting the country should not be neglected. A chief duty of Major Trevor will be to inquire whether any additional great works can be undertaken with advantage in the districts where we have hundreds of thousands of laborers.

24. It has been suggested that as a continuation of the Railway from Champta Ghat to Durbhunga will certainly be much wanted to the north-east through the great rice-countries where famine is now so severe, and to the north-west through North-western Tirhoot into Chumparun, it would be most desirable if these lines could be settled and the earth-work executed now. This is under consideration, and immediate steps are being taken to lay out the line, if it be possible, in time to employ the famine laborers upon it.

Railway extension.

25. The best attention is also given to irrigation works, those connected with the Gunduk embankments and others. One canal behind the embankment has been begun, and the Government of India has determined to begin the line of the proposed large Gunduk canal through the Chumparun district as far as the Bagmattee river. Further inquiries are being made to ascertain whether some further local irrigation channels can be undertaken in Western Tirhoot, Sarun, and Chumparun.

Irrigation works.

26. While I believe that our employment of the people on works of various kinds to the extent that they are now coming upon us, will lead to embarrassing results in the end unless we individualise them, I am sure that the two other main forms of relief—charitable allowances and advances to enable cultivators to maintain themselves—are impossible to carry out as it is intended without a good system of dealing with individuals through responsible village heads.

Individualization essential to management of charitable relief and advances to ryots.

The only form of gratuitous relief which can be given somewhat indiscriminately, without leading to great abuse and future difficulty, is cooked-food. It is clear that the people of Behar will not accept this form of relief in any numbers till they are very much straitened. It is not that the lower orders have much caste—many of them will eat almost anything;—but they are curiously timid, afraid that we will ship them off beyond seas and what not, and very averse to altering their habits. At any rate, the Government has resolved that the cooked-food test shall not be very largely applied; that assistance shall be given in other shapes, for which a great organization is necessary. Before going further then, I revert to the arrangements made for organizing relief down to the village and the individual.

27. Sir Richard Temple, when he visited Behar, arranged the circles into which the sub-divisions were to be divided, and the Behar officers have been since engaged in manning these circles. But it seems to me that there is among some of the local officers in Behar a somewhat unreasoning prejudice in favor of European, and against native, agency; and that the harm which has resulted from delay in Durbhunga, and perhaps some other places, has been caused by too much keeping everything waiting for European officers, both as regards general relief arrangements and public works. It is really quite impossible that a properly efficient European Superintendent can be supplied for each circle and each work—I mean efficient at all points; combining sufficient experience, knowledge of the country, tact, and judgment. So many of our Bengal districts are more or less pressed or threatened that we cannot supply very large numbers of competent European officers. We sent to the famine districts all we could, and I believe as many as the local officers asked for. We have denuded all our districts not threatened to I may almost say the last man. The note in the margin shows the number of officers of different classes sent to Behar for relief work. The Government of India most readily acceded to all that we asked in the way of assistance. A large number of military officers were placed at our disposal for both transport and relief work; and, in addition to some competent civil officers previously obtained from the North-Western Provinces, some civil officers were ordered from the Punjab, the Central Provinces and Bombay. Authority was also given to the local officers to engage all the competent Europeans to be obtained among the resident European community of planters and others, and several gentlemen who offered themselves in Calcutta were engaged and sent up. The total number of superior officers specially employed on relief is as follows:—

Agency available.

Covenanted civil servants ...	39
Military officers ...	44
Uncovenanted officers ...	59
Officers locally engaged ...	39
Total ...	181

Covenanted civil servants	54
Military officers	60
Uncovenanted officers	92
Officers specially engaged	54
Total ...	260

Many of the officers assigned had, however, a long way to come; and when they arrived it cannot be said that all the circles were efficiently filled. The fact is that, for such a system as is proposed, we want not only energetic and painstaking officers, but also an intimate knowledge of the people and of agrarian affairs, land tenures, rent, and revenue. It is only exceptional military officers and experienced civil officers who are well fitted to deal with such matters. In Behar the grain transport operations are of enormous magnitude and importance. These operations, including the putting and maintaining in order the roads used for the grain traffic, are in charge of a staff of officers under Colonel Macgregor, a most excellent and energetic officer; and to complete his arrangements about all the most effective military officers who arrived were required and absorbed. Some of these officers are rendering extraordinary service: Major deKantzow for instance. Some of the unemployed officers of superior rank proved to be hardly well fitted for duties of a civil character, and have charge of the less important ghats and changing stations. Altogether, it happened that though this Government had, in its distribution list, assigned a good many military officers for relief work, I found not one so employed in Tirhoot, and I believe only one in the whole Patna Division; while only one more seemed to be available. Of the gentlemen casually entertained, some proved well qualified in their degree, others not so well. The civil officers from the Punjab, Central Provinces, and Bombay, proved to be generally very young men, and they had much to learn of a new country and language. In fact, I may almost say that the only officers of sufficient experience and knowledge available in Behar were the civil servants belonging to Bengal and the North-Western Provinces, and a few uncovenanted sub-divisional officers. I have placed in charge of circles, all civil servants who are of more than a few months' standing; but I very soon felt strongly that a good and efficient native officer would be far more fitted for our purposes than a very

Necessity of revenue and other experience among relief officers.

inexperienced European, and that both to fill circles not provided for and to assist the European officers, we must get as many good natives as possible. I am sure the Commissioner of Patna does not share the prejudice I have alluded to regarding the exclusive employment of European agency in places of trust; but all the districts of his division having suffered, few of the existing officials could be spared for extra and special work; and the tehsildaree system not being in vogue, it is very difficult to extemporise an efficient native agency. The Bengallees are very different in language and habits from the Hindustanees of Behar.

Aid given by Sir W. Muir.

28. In the dilemma in which I was placed, besides ordering up a few selected Bengallee Deputy Collectors and authorizing the Commissioners of the Presidency and Burdwan Divisions to entertain and send up a few temporary men for famine service, I appealed to Sir William Muir for the loan of some native officers fitted for the work. Sir William responded most promptly and handsomely. Sixteen selected men were at once placed at my disposal, more than half of whom arrived and were posted by myself while I was on the spot.

Assistants to circle officers.

29. I was thus enabled to complete or nearly to complete the circle officers required for *Northern Behar*. Under them assistance was necessary, especially under the less experienced European officers. Some of the native officers from the North-Western Provinces, some temporary Bengallee assistants, and others, were posted for this purpose, and Sir Richard Temple, who was going to Allahabad about the reserve carriage, promised to try to get a few more men from thence. A selection is being made from the ranks of candidates for the Native Civil Service at Hooghly and Calcutta. A number of native officers of the army had been promised by the Commander-in-Chief, and their despatch arranged in communication with Sir Richard Temple. Though not ordinarily fitted for independent civil duties, these officers may be most useful assistants, and they are being distributed accordingly.

Above all, full authority has been given to entertain every man capable of rendering good service whom the country itself affords. Without a good proportion of men possessed of local knowledge, foreigners must be at a great disadvantage.

Agency in each circle.

30. By means of these arrangements it is my desire that in each important circle the officer in charge should have (1) a capable assistant, generally a good native or occasionally a junior European officer; (2) an officer specially charged with those local works which are not put under the Public Works Department, and whose duty it will be to see that the jeyt ryots and others in charge of these carry them out honestly; that people are paid regularly; that they do not get relief twice over, and generally to see that the system works: and (3) an inferior native assistant.

Deputy Collectors and full tehsildars from the North-Western Provinces should generally be put at the head of circles. Where experienced officers become available, they may be placed over junior officers hitherto in charge without any disparagement to the latter.

Group superintendents.

31. Under the circle officers come the superintendents of village groups already alluded to, that is to say, over each group of villages there will be some one in charge to look after the relief operations generally in the group, to manage the operations at the grain stores, and to keep the circle officer informed of what goes on. Where a local man, a zemindar, or planter, or zemindar's tehsildar, will undertake this personally, or through his agents, such may be employed, but it must be clearly understood what each undertakes to do.

Village organisation.

32. Finally, each village will have its own organisation. Lists of zemindars, headmen, and patwarees of each village are to be prepared; it is to be ascertained whether each will do something, and each is to be pressed to do so either personally or through agents. I cannot too much impress on all officers, as I have impressed on those at Durbhanga, the necessity of attending to this, of not acting as if they were in a strange or hostile country, but of utilising those whose duty it is to assist the people, and finally through them, or in the last resort without them, to get at the headmen and representatives of the people themselves.

I am very glad to see that Mr. Howe, a very efficient North-Western Provinces officer, in charge of the worst part of Chumparun, has already organised this system without waiting for the completion of a large paid establishment. He says: "The sub-divisional committee of Ramnuggur, with the two sub-committees at Bulthur under Colonel Boulderson and at Bagaha, are now in full working order. The tuppah (Bulthur) has been divided into halkas (circles), and each member is to take charge of one. Lists of all the poor requiring relief are prepared by the putwarees (village accountants) and tested by the member-in-charge of the halkas, who is also responsible for the distribution of food to those in the lists, whom he, after examining, finds unfit for work. I think it is better at first to do what is absolutely necessary, *viz.*, to support those who otherwise must starve, and gradually to perfect the system in introducing the various rules laid down for committees. An organized village-to-village relief system has been formed, which will effectually relieve those who most require it. I am much assisted in this tuppah by Sheik Salamut Ally, an influential and public-spirited zemindar. In this tuppah the headmen of each village and the putwarees receive a certain amount of food sufficient to last the poor of his village of whom he receives a list (an extract from my register), and whom he is bound to supply twice a week. The greatest safe-guard against abuse is the fact that the poor themselves know how much they are entitled to; and secondly, there is constant inspection both by Sheik Salamut Ally, who is a member of the committee, and myself. In this way this important tuppah is provided for, and similar steps for the others are also being taken." Mr. Howe seems really to be meeting the famine under very difficult circumstances. In Seetamurhee also, the sub-divisional officer, Mr. O'Reilly, by availing himself of the help of indigo planters, zemindars, and others, seems to have done very much, and to have kept pace with famine. But in Durbhunga, under a very energetic and meritorious sub-divisional officer—but where committees and committee men and indigenous agency were practically not used—while European officers were expected in order to start a system admirable in theory, the famine got ahead of us. I am sure that voluntary and indigenous agency may and should be drawn out. The efficiency of an officer in a difficult position, especially under such circumstances as those which now surround us, depends quite as much on tact in drawing out assistance as on individual effort.

Aid given to Patna Commissioner.

33. No one could and would more efficiently superintend the relief operations than Mr. Bayley, the Commissioner of the Patna Division; but his charge is an enormous one. He has upwards of 13 millions of people under him, some suffering from famine and all from scarcity. He is responsible for all the enormous transport and other operations. Clearly he requires assistance. The Tirhoot District, too, is quite unmanageably large, and the mass of office detail thrown on the Magistrate-Collector makes it impossible to look to him for a sufficient active superintendence all over his district in times like these. I have then appointed Mr. C. Metcalfe, an officer in whose great energy and executive efficiency I have much confidence, to be Additional Commissioner of the Patna Division under Mr. Bayley, who will delegate to him any portion of the Commissioner's duties from time to time. It is arranged that Mr. Metcalfe is for the present to devote all his energies to getting into order the northern sub-divisions of Tirhoot, where wide famine most threatens us and hundreds of thousands of people are already on our hands. Mr. Bayley met me and thoroughly discussed with me the state of affairs. I entirely rely on his judgment and knowledge. Mr. Metcalfe went with me to Durbhunga and through the worst circles. I have explained to him my views and wishes, and left him to carry them out. While the circle establishments are being completed and getting into order, he is dealing with the multitudes collected on the roads. As soon as they are sifted and classed, and the circle establishments are ready to receive them, all, except the able-bodied fit to earn good wages on the roads, will be drafted to their villages, and there the scheme of relief, prescribed by the Government of India and this Government will be worked out. For all famine and executive matters the sub-divisional officers of the distressed sub-divisions of North Tirhoot will be directly under Mr. Metcalfe. Their formal reports and returns will be sent to the Magistrate of Tirhoot for embodiment in the district returns (so long as Durbhunga remains a part of Tirhoot,) but the whole active control will rest with Mr. Metcalfe, exercising the full powers of a Commissioner, but subject to the general control of the Commissioner of the division, who will be fully informed of his proceedings. Mr. Metcalfe will ordinarily report to the Commissioner—to Government direct on emergencies only.

Mr. Metcalfe's duties.

Aim of the organisation as a whole.

34. When the arrangements we are now making in the most distressed districts are complete, I trust that we shall be able to lay our hand on each person requiring relief according to his residence and circumstances. We shall be able to say in each village—here are so many persons found to be fit objects for relief; so many are doing work of some sort; so many are receiving a charitable allowance of food; so many have received or will receive advances to enable them to continue their cultivation; so many residents of this village are absent working on such a public work. On the public works again, I hope we shall be able to say—here is a gang from such a pergunnah and a gang from such another pergunnah; so many (name by name) from such a village, and so many from such another. It is only when things are so arranged that we shall be able to deal with the needs of the people in detail, and to supply their wants without the great abuses which must attend indiscriminate liberality to great multitudes whom we cannot distinguish.

Mode of working charitable relief.

35. Supposing then the system to be fully carried out, the various forms of charitable relief are indicated in the relief rules published by the Government of India. employment on works I have already dealt with. Employment in the way of spinning, weaving, &c., is as before arranged to be given as much as possible to those who cannot go on the road. If we have sufficient information and sufficient machinery, charitable relief is only a question of discretion and honesty. Cooked food being reserved for special cases, it remains to give a fair allowance of food gratuitously or at a reduced price, and so much money as may be necessary to supplement it, to those really in need of such assistance. This will be done through the local committees as much as possible, every possible use being made of individual knowledge and public spirit. As I said to the Durbhunga Committee, "The Lieutenant-Governor wished to urge on them the propriety of their taking an active share in the relief measures now in operation. He did not want them to give money merely, but to undertake, each according to his ability, the specific duty of looking after a certain defined portion of the town, and managing the distribution of the Government relief, so that no poor person should perish for want. He wished this not only for the direct good, but as an example to others. Those who could not themselves personally supervise could appoint responsible relatives or subordinates to work for them, and could see that these did the work efficiently.

Uses of committee men.

If each member undertook the charge of a muhulla of the town, it would be a great relief to the Government officers, and would, he felt sure, secure an efficient and adequate administration of the funds and stores. Those of the committee who had lands in the interior would, he hoped, also heartily assist the circle officers by themselves acting and giving instructions to their gomastahs, patwarees, head ryots, &c., so that they might help by every means in their power. The committee should be made really and practically operative—the town divided among working members, and the distribution of town relief undertaken by them, with any necessary subordinate agency working under their supervision."

Cooked food and special diet.

36. Although the use of cooked food is no longer prescribed as a general test of necessity, it is still an important thing to have food in this shape ready for those who are actually starving, especially on their first arrival at the depôts.

And it is especially necessary to nurse and feed on careful and nutritious diet people who are already reduced by scanty food. Many children have so suffered, and every inducement should be offered to their parents to bring them to be tended in comfortable poor-houses, where every concession is made to them. With respect to the food, I gave the following directions at Durbhunga:—

(*a*) Cooked food is always to be given *at once* to all starving people who desire to have it, till at least other arrangements can be made for them. This to be done without waiting for inquiries.

(*b*) Special food is to be given, under superintendence of the native doctor, to starved infants and other persons in a very reduced stage. Milk and other luxuries to be provided for such cases.

(*c*) In case of people much reduced, it is not enough to keep body and soul together. For the next two months arrangements must be made to issue to the more feeble once a week, or occasionally, a little ghee, or, failing that, oil and such like strengthening luxuries.

(*d*) One pice per diem for salt, &c., is to be given with the allowance of grain to very poor people who receive uncooked food to take home.

Proportion of nitrogenous grain essential.

37. I may add that the cooked food given should not be rice only; a fair proportion of dhal or similar nitrogenous food should be given, and salt of course.

To the every poor, who depend solely on public charity, a proportion of nitrogenous grain, *i. e.*, pulses, &c., should as much as possible be given with three parts of rice. But as regards the population not reduced to the lowest stage of pauperism, I found so comparative an abundance of the nitrogenous grains in the bazars, the famine is so much, as regards food, a rice famine (the little rice produced being probably reserved for seed) that I hope if Government supplies rice the people will find the rest for themselves.

Feeding hospitals.

38. Reverting to the feeding hospitals for the reduced and weakly, I was much impressed with the necessity of organising these efficiently wherever there is actual starvation, or something approaching to it; and quite as much for this purpose as for sanitary supervision I telegraphed emergently for a very efficient Civil Surgeon to be sent to Durbhunga. The Surgeon-General very promptly arranged to send Dr. Birch. That officer arrived without delay, took up his duties most zealously, and I believe that much will be effected by his active devotion to the subject. At every circle where the distress is severe, feeding hospitals should be established under a good native doctor, and his proceedings should be well watched. Dr. Birch quite understands my views, and I hope he will make arrangements which will serve as a model. He will also of course much look to sanitary arrangements.

Sanitary inspection.

39. The Government of India has suggested that a superior officer should be deputed for sanitary inspection of the various distressed districts. At this moment a change is taking place in the office of Sanitary Commissioner for Bengal, but as soon as the new Sanitary Commissioner, Dr. Coates, arrives, he will be deputed on this duty.

Difficulties when the rains set in.

40. If our arrangements as above described are effective, we may hope to carry the people over the dry season. But in case they remain on our hands after the rains commence, it may be much more difficult to deal with them. In a moderate famine when, according to former practice, Government has given moderate relief hedged in by tolerably severe tests, it has usually happened that as soon as the active agricultural season commences, most of the able-bodied laborers disperse of their own accord, and only the helpless paupers are left on our hands. But I believe that on this occasion, in the pure rice countries north of the Ganges, the failure of the crops has been complete to a degree very seldom equalled. We are now undertaking relief on a much more liberal scale, and on much more indulgent principles, less hedged in by strict tests, than ever was attempted before. There seems much reason to expect that, in North Tirhoot at any rate, a very large proportion of the population will come (I may say have already come) on our hands, and the difficulty of returning them to self-support will no doubt be proportionately greater than on former occasions. It will certainly be quite impossible to continue in the rains large public works capable of employing vast numbers, and it would be most inexpedient if it were possible. Above all things, we must not wean the people from self-supporting agricultural labour. In truth, for the labour we now employ we get a very sufficient money's worth; and from a financial point of view it would be no very overwhelming addition

to our burdens if for a portion of the time that we must support the people who come to our works we get no return at all. It is the demoralisation of the people likely to result from supporting them without work that is to be feared. I still hope that very many will go off when the rain falls and they can cultivate, but it is impossible precisely to predict what will happen in a phase of things which is new. It is some consolation for any abuses (receipt of relief twice over and the like) which may occur that it is so much money thrown among the poorer classes and may the better enable them to support themselves when the time for self-support comes.

Suggestions as to advances of money or food.

41. To establish a system of advances to ryots sufficient to ensure their both supporting themselves and employing the labouring population would be a work attended with very great difficulties. To some extent this must and will be attempted; but we are only at the beginning of our difficulties in that respect. I am inclined to think that a suggestion on this subject of Mr. Lowis of Dinagepore, adopted by Sir Richard Temple, contains the germ of a plan which may be applied not only to some ryots, but to all other labourers. Mr. Lowis says, in effect, "make advances to those ryots who, by labouring on our roads show their necessity. When they have thus worked for us, advance them wages for the time they must be absent carrying on their cultivation." I would not confine this to ryots. If the individualizing system is carried out fully, and if we know who our labourers are, where they reside, and where they work, we may be able to say to a poor man when the rains commence, we now know that you are no impostor, but a person willing to work for your bread; we can't employ you longer, it would ruin the country if we could; here is a couple of months' supply of food; we give you that, take it home, but now you must support yourself; we have done with you. Seeing the amount of grain we are storing, and the scale on which our establishments are now being formed, I think this might be done in some parts of the country. In fact, all our proceedings for the next few months would be not only to give immediate relief, but a sifting and sorting of the people with a view to a final distribution of assistance and concluding with them at the commencement of the rains. In the eastern districts, where cultivation commences early, the system of advancing wages to ryots who have been working for a time to enable them to go home and start their cultivation, should be tried at once as Sir Richard Temple has authorised. In the case of substantial ryots so receiving advances, it may be stipulated, as Mr. Lowis proposes, that the advances are to be repaid when the recipients get a crop. From the poorer labourers repayment cannot be expected.

Advances to ryots who will not work on roads.

42. In North Behar, at any rate, it appears that there are many of the higher caste ryots too proud to work, and too poor to carry on efficiently the work of another season without assistance and to employ the laborers who ordinarily work for them and who can only be absorbed by such employment. The subject of advances to ryots of the higher class who are, it is hoped, likely to repay, has been very prominent in all our famine discussions. For these classes of ryots Mr. Lowis' labor-test will not suffice; and something more is required, not only for their own sake, but for that of the poor laboring population dependent on them. I am much inclined to agree with the officers of the Durbhunga Raj, who say that it is better not to call an advance what we are not likely to get back. A laxness in regard to promised repayments would have a most demoralising effect on the country, and would shake the whole credit system on which so much depends. I, therefore, strongly think that where there is not good and reasonable prospect of repayment, it is far better avowedly to give something than nominally to advance what will probable not be repaid. Government will be at a great disadvantage in such transactions; it will not have the many means of enforcing repayment that private persons accustomed to such transactions have, and borrowers will much more readily make excuses to a Government whose resources they think unlimited. People who can give really good security may get the advances they require from private sources, and will generally prefer so to get loans in this way, if they really mean to repay. In spite of all that is said of exorbitant interest, &c., I have found that natives generally prefer their own mahajuns to Government. If this be so, Government will have for the most part as applicants for advances only those who offer bad security or no security.

43. With the best and largest Government machinery a great system of advances by Government to the ryots would be difficult in the extreme; with our want of revenue machinery I fear that on a large scale it would really be impossible to conduct such operations in any way that would not entail very serious evils.

Advances through zemindars and mahajuns.

I have, therefore, strongly urged on all officers that advances should be made by or through zemindars and mahajuns to the utmost possible extent, and only by Government direct in the very last resort. As I have said, I believe that if the money is really to be repaid, the people themselves would rather get it in their own way than come to us, and so long as those who usually lend to them do not themselves run dry, it is better that it should be so. I have directed that every possible pressure should be put on the zemindars to induce them to do their duty. Their estates are good security, and we may well advance to them the money they require to keep their ryots afloat, care being taken, through the large establishments we are forming, that the money is really devoted to the purpose for which it is intended.

44. I am also inclined to think that there is much in a plan which Mr. Metcalfe greatly urges, *viz.*, that Government should make advances to mahajuns whose capital may be unequal to all that falls on them in a year when no one repays and every one is ready to borrow, but

who are trustworthy and reliable men and are willing on receiving Government advances on reasonable terms, to engage to carry their clients, through this bad year. If this is discreetly and well done, I think it may be of very great advantage and involve little or no loss to Government, and I have authorised Mr. Metcalfe to try it. For the ryot it is sometimes better that he should owe money to his banker than be too much in the power of his zemindar. If the zemindar does his duty nothing can be better, but it may not in all cases be desirable that a harsh landlord should have very large famine debts standing on his books when Government really gives the money.

It is when we go into the question of security, on which the Government has so much dwelt, that the real difficulty of dealing otherwise than through those whose business it is to conduct the money dealings of the country becomes apparent. There are few under-tenures in Behar; occupancy rights are ill-defined; the titles to trees and tanks and such like, and to rent-free lands which ryots proffer as security, are very liable to be called in question. On going into the matter narrowly, I find it to be the general opinion that the real security most largely available consists chiefly of the silver ornaments, &c., in which natives so much indulge. Would it be possible for Government to open a vast pawnbroker's shop to lend on ornaments? I hardly think so. But if the mahajun's funds are maintained they will very readily do so.

45. The instructions which I issued at Durbhungah were then as follows:—

Classification of villages for purpose of advances.

Every starving village or estate should be classed as one in which—

(1) The zemindar has the means to assist his ryots, and must by every means be induced to do so; or

(2) In which he has not the means, but has or can be induced to develop the will to do so, and in which he is to have tuccavee advances for the purpose, to the proper use of which our officers must see; or

(3). In which it is found absolutely impossible to work through the zemindars, and to save the people alive Government must undertake the work, trusting to recover the amount by legislation or otherwise.

But I trust that if our officers work with the natives—as I think they may—the villages of this last class will be comparatively few.

To this should be added, with reference to what has been said above, that when a village must come under class 3, it will be better that the work should be done through a good mahajun, to whom the people of the village have always looked, than directly by Government, and that advances may be made to the mahajun for the purpose.

To arrange all that is required with zemindars and mahajuns, and finally to deal direct with the residue, which may be left directly in our hands, very great skill and knowledge of the people and their affairs will be required. For this work the experienced native officers now lent us from the North-Western Provinces will be of infinite use, and I trust our officers will not be above learning from them. I have throughout had it much in view that as soon as we can disperse to village works the masses of people collected and still collecting on our roads, the knowledge of the native officers should be especially utilised for the purpose of managing advances to ryots through zemindars or otherwise.

46. As regards security for the advances, I am inclined to think, after much discussion, that in the absence of real material security a good deal may be done in the way of personal security by getting the people who know one another to stand security one for the other. Where the zemindar cannot or will not do his duty, perhaps a substantial jeyt ryot may stand security for those whom he represents, or a body of good ryots may take a loan going security for one another, which would be far better than dealing with each individual. The indigenous putwaris should be used to the utmost in these transactions.

Joint security for advances.

47. A good deal of anxiety has lately been expressed regarding the supply of unhusked rice for seed. I did not press this matter prominently in the first instance, because I think historical experience shows that in no known Indian famine has seed ever run short. It is a fact shown by official records that the year after the great Bengal famine of 1769-70, the revenue rose higher than ever, showing that the fields had not been left uncultivated for want of seed. In Orissa, in the very height of the famine, the fields were fully sown. Cultivators keep their seed-grain with a tenacity which we cannot call superstitious; and for principal the rice-sowings, on account of the practice of planting out by hand from seed-beds, instead of sowing broadcast, I believe comparatively little seed is required. I am in hopes that in our worst districts it will prove that much seed has been retained.

Seed-grain.

I do not know if the unhusked grains scattered among the Burmah and Saigon rice would germinate when separated, and whether the cultivators would be satisfied to use a seed so different from their own. If they want this in the unhusked state, it will be available. But for Government to undertake to import a supply of seed, would involve a fresh operation in addition to the great burdens which we have undertaken. I am not prepared to recommend this. Of course, if seed is to be had for money the advance of money to ryots includes the purchase of seed as a primary object.

48. In regard to estates managed by the Court of Wards, it was necessary to decide the question what is to be done by Government at its own charge, and what charged to the estates, of which the great Durbhungah estate extending over so much of the famine country, is the most conspicuous instance. In the case of a very rich and solvent estate, such as that of Durbhungah, there can be no question that the manager should do all that we can fairly urge the best zemindars to do, and I am happy to say that this has been arranged throughout the Durbhungah Raj. I think it fair, however, that when Government does so much elsewhere, we should not throw absolutely the whole burden on the Raj. The following are the arrangements which I made at Durbhungah regarding the Durbhungah Raj Estate:—

Arrangements on Wards' Estates.

"The Lieutenant-Governor pressed on the manager the importance of taking early steps to give effect to the orders regarding advances to ryots. It was admitted that in villages at present let in farm where the farms are shortly to expire, the question was involved in some difficulty, but the Raj officers were urged not to let minor difficulties stand in the way of making this species of aid really general and effective. Sanction has been given to expending a lakh of rupees in advances, but the Lieutenant-Governor, referring to the Viceroy's reiterated desire to assist good ryots as much as possible, said that Colonel Burn was not to consider himself tied down to that sum. Caution was of course to be exercised in a reasonable way, but a certain margin of ultimate loss must be accepted as probable, and the Raj agency was such as to make it quite feasible to institute inquiry in every village belonging to the estate. The Lieutenant-Governor did not wish advances to be made to ryots who were absolutely insolvent; *they* must be treated as fit subjects for charitable relief; but it was better to err on the side of doing too much than too little.

"It was arranged that the Government circle officers should be relieved of all responsibility for making advances to ryots in Raj villages. That duty would be left entirely to be Raj officers.

"Colonel Burn and Mr. Llewhellin undertook to do their very utmost to give immediate effect to the above."

The relative position of the Raj and the Government agency was also discussed and settled as follows:—

"The Raj pays for and manages all works on the property, also all advances to ryots. The Government agency will relieve the Raj officers of the cost of charitable relief as soon as the agency is in sufficient working order, the Raj officers rendering all the assistance they can. Till the Government officers can take over the charitable relief, the Raj officers will continue it.

"When the charitable relief operations are amalgamated, any Raj grain not needed for Raj works will be made over to the Government, who will supply grain for the needy from the common stock.

"The Raj officers in their degree will, as much as possible, undertake the duties of group superintendents in villages belonging to them, and arrange effectively for the village headmen and putwaris to make lists of the needy and carry out the details. Where of sufficient standing, they will be active members of committees and sub-committees.

"If the manager finds that the circle officer's calls leave no time to the Raj establishment for their regular work, they can either be seconded and taken over by Government, or some other arrangements can be made to suit the particular case. Care must be taken that no charitable relief now being given by the Raj is stopped until the circle officer orders it, after making other arrangements as above indicated.

"The *large Raj works* under the charge of the Executive Engineer will be dealt with in the same way as works under the Department of Public Works, where real labour is exacted and full wages paid.

"The village Raj works will be managed by the ordinary Raj establishment, as the minor relief works elsewhere are managed by the relief officers."

49. In regard to all other solvent Wards' Estates, similar principles should be followed as nearly as possible. In one district a question has been raised regarding Wards' Estates which are embarrassed and without ready money. The *primâ facie* view is, that the money necessary to do what is the duty of the estate should be advanced and charged as a debt against it; but one officer has urged that, as practically we cannot do this in all other estates, we should not charge advances against Wards' Estates, but do what is necessary at Government expense, and leave the Wards' Estates in the same position as others who fail to do their duty, subject to the question whether Government will, by legislation, recoup itself for expenditure which ought properly to have been borne by the landholders. I think that, for the present at any rate, necessary advances must be charged against the estates. The merits of the matter may be re-opened hereafter, if circumstances seem to give equitable grounds for re-opening the question.

Case of insolvent Wards' Estates.

50. All our arrangements depend on our possessing a sufficient supply of grain to feed the people where it is necessary to do so, and in case of what I have called a food-famine, as distinguished from a money-famine, we contemplate largely supplementing more charitable relief by selling grain

Transport of Government grain.

to those who have money to buy in the places which private trade does not reach. The quantity of grain to be provided for each district has been, for the most part, settled by the Government of India on the reports of Sir Richard Temple's local inquiries submitted by this Government. The supply thus provided is a very liberal one, and its transport is a great operation. The transport arrangements of the Patna Division were finally arranged by Sir Richard Temple (principally on a large contract system), and those made by the local officers under the instructions of this Government in the Bhaugulpore and Rajshahye Divisions have since been seen and approved by him. The Patna carriage contracts having been so completely arranged, I have wished to interfere with them as little as possible, and have avoided all disturbance of existing arrangements. The only pressing difficulty was the failure of the contract for the supply of Eastern Tirhoot from Barh and Chumpta Ghat, where I found that the southern contractors had not carried half what they engaged to carry, while the northern contractors, who were to receive it and carry it on, had carts standing unsupplied. The consequence of this state of things was that almost everything that arrived was sent on to the Madhubunnee subdivision, and hardly any addition was made to the small supply stored in the very populous and necessitous sub-division of Durbhunga. There is also this difficulty about the contract arrangements, that the carters are not wholly under the control of the contractors; they go very willingly to places where forage abounds, but very unwillingly to places where it is scarce; and while the despatches from the western side of Tirhoot were very large (even more, I believe, than was contracted for) there was a tendency to send too much to Seetamurhee, where it was least wanted, and none to Durbhunga, where it was much wanted. It has been arranged that for the Eastern Tirhoot contracts, two new lines of transport are opened out, where a fresh supply of carts will be available, by Mokameh and by Monghyr, while the changing stations have been shifted so as to give the southern carts a shorter lead and the northern carts a longer lead than before. Major deKantzow has arranged that the promised despatches to Durbhunga from the western ghat are really carried out. I have directed that grain in excess of the proportional requirements of the western portion of the district (according to contract) shall not be despatched; the contractors must be restricted to the fair weekly allotment for that line, and the rest must be sent the other way in the proportion in which the contracts stipulated.

Orders given as to Eastern Tirhoot contracts.

51. The most important supplement to our carrying powers is the railway from Chumpa to Durbhunga, which is fortunately just in the transport line where the failure occurs, and where it is most wanted. It is progressing admirably without interfering in any way with the other traffic. It is carried at present across the fields as a temporary line, but in this way it gets on very rapidly, and there seems to be no doubt that it will be ready to carry much grain before the rainy season, after which it will be lifted and put on a more permanent line. But this latter, I fear, will hardly be maintained in working order through the rains. Under the circumstances, then, it is clear that all our efforts must be directed to use the rail as much as possible before the rains disturb it. All depends on a sufficient supply of rolling stock. I have represented this strongly to the Government of India, who have at once taken means to supply stock to the very utmost. It is expected that some 200 tons of grain may be carried daily half way to Durbhunga in April, and that from the middle or latter part of April, 800 tons a day will be carried into Durbhunga. Instructions have been issued to make the necessary arrangements for the receipt and despatch of this grain.

The Durbhunga Railway.

I believe that this line of railway from opposite Barh to Durbhunga is an admirable one, eminently suited for a permanent line,—that it will not be expensive, and that it should pay well.

52. It seemed to me that it was not sufficiently understood who was to direct all the various despatches and deliveries of grain, to arrange with the various contractors the questions in which one depends on the other, and so on. I therefore arranged clearly what I understood to be intended from the first, that Colonel Macgregor and his staff should undertake all these functions. Mr. Metcalfe should (subject to the Commissioner's general direction) keep Colonel Macgregor informed in what parts of the stricken sub-divisions grain is most wanted, and should be in constant communication and understanding with Colonel Macgregor. Colonel Macgregor, understanding what is wanted, will arrange with the contractors and others accordingly; that will be in his hands, and there will not be risk of contradictory orders by various local officers, each acting for himself. Mr. Metcalfe should see that this is thoroughly understood. He should come to a clear understanding with his sub-divisional officers as to the relative urgency of their requirements. Seeing that the Durbhunga Sub-division is nearer to the base, and that it will be supplied by the railway and by North-West Provinces reserved carriage, it is settled that for the present, only enough to secure us against a sudden surprise is to be kept in Durbhunga, all the rest will be allowed to go into the Madhubanee Subdivision till that is quite secured. Colonel Macgregor is to arrange a good system, by which full information of the despatches from one end of a line is punctually and promptly conveyed to those who are to take up or receive the grain at the other end.

Definition of Col. Macgregor's functions.

The reserve carriage, as it arrives, will also be put under Colonel Macgregor's directions.

53. It is proposed to prepare a note showing the whole of our transport arrangements as now matured, and I do not here touch on more than those partial re-arrangements made during my visit to Tirhoot.

54. I have remarked that, up to the time of my visit, the bazars seemed to be generally well supplied with grain, principally pulses, &c., rice being comparatively scarce and dear. The time for general sales to the public had evidently not come, though I was satisfied that it would be a great convenience and aid to our labourers to sell rice on the works to those who wanted rice. I directed that this should be generally done; these instructions should be carefully carried out. With respect to price, it had been proposed to sell at 12 seers per rupee, but I found that while the price of rice is not cheaper than 12 seers in the great marts on the line of rail, and in the Tirhoot bazars is from 9 to 10 seers or less, to sell at 12 would have an embarrassing effect. The instructions which I issued on this subject for North Tirhoot were, then, as follows:—

Sale of Government grain.

"I am satisfied that good rice cannot at present be sold at 12 seers, as was at one time proposed, without greatly deranging a still active private trade. We must, in the present circumstances, continue to encourage that trade to the utmost, and I trust I shall not hear again of the seizure by the police of the bullocks engaged in it, as I have to-day found to have been done. It is remarkable that, while other grains are still very plentiful in the bazar, selling at 11 to 13 seers of 88 tolahs, say, 12 to 14½ Government seers, rice is extremely scarce and very little to be seen. In ordinary times, rice is the main food of the people in this part of the country, and the coolies now much run upon our rice stocks. I therefore think that rice should be offered for sale on all our works at 10 Government seers per rupee for ordinary cleaned rice, other rice being sold cheaper in proportion. If at any time, in any of the bazars, rice is selling cheaper than the above, the Government rice may also be sold on the works as cheap as private rice in the bazars.

"As regards the price of inferior or uncleaned rice, the qualities vary so much, that it is impossible to lay down a rule, I must leave this to the discretion of the local officers. They are to sell all kinds of rice at the rate which they find in practice makes each kind as popular with the people as cleaned country rice at 10 seers. I believe there is no objection on the part of the people to clean Burmah rice; if so, it should be sold at the same rate as country rice. If it is found that the people avoid it by comparison, it may be made a little cheaper. I have found here that the people crowded very much to get uncleaned Burmah or Saigon rice (good of its kind) at 13 seers.

"As rice is sold retail by pice per seer, and not by seers per rupee, I authorise officers to adopt for sale on the works, the nearest rate in pice to the seer rates above ordered, although there may be some fractional differences.

"When our rice is stored in large quantities, I shall be glad to sell it on our works at a somewhat cheaper rate, say 12 seers for ordinary rice if this can be done without inconvenience and disturbance.

"To the general public, rice must only be sold at present where there is really an absence of the article in the bazars. The sales to the people will much depend on the quantity of rice we have in store. While we have little and private trade is active, we must not interfere; when we have abundance, and private trade ceases to operate, we may sell freely, using the bunneahs, and village traders, and giving them a small margin of profit.

"Seeing the abundance of other grains in the bazars and scarcity of rice, I think it better that all the mixed grains, wheat, &c., should be kept till later, so long as they are sound and good to keep. Even Indian-corn, properly kept, shows no tendency to spoil so far. But whenever weevils appear, or other injury is commencing, the grain should be used.

"Much of the grain has come up unclassed, and spare labour might be used at the granaries to sift it, mark it, and place it where it can be most conveniently got out as it is wanted. This should certainly be done as far as possible. Sufficient doors and other arrangements should be provided in the golahs: great care must be taken to provide against fire; and people who have reasonable objection to hard road-work may be employed to guard and look after the granaries."

When the time comes for selling rice to the public, the price will, as directed in Government orders, be regulated by the price in the nearest large marts where food is abundant; but I hope that we shall be able to sell at not less than 10 seers per rupee. Eventually, if it proves that we have larger stocks than we require for relief purposes and for necessary sales, at a season when private trade is almost stopped, it may be both a great relief to the people and a legitimate mode of disposing of our stocks to sell at a cheaper rate; but this must depend on subsequent orders.

In any case, when we come to sell to the public, I am sure that we shall do so most conveniently and effect the minor distribution throughout the country far better than we could do it ourselves by selling in a small wholesale way, at a somewhat profitable rate, to the petty traders who abound and carry grain about the country in bullock-loads in every direction. Even in the rains, I hope that a good deal may be done by these petty traders in this way, whether they use pack-bullocks, small boats, or head-loads.

55. This question of distribution in the rains is one to which the Government of India have recently drawn our special attention. I had already attended to the matter in Tirhoot, and issued instructions to the Commissioner to do all that is possible towards clearing and opening out

Distribution of food in the rains.

the internal water channels and securing both regular boats for the rivers and canoes for the watery tracts where land carriage becomes almost impossible during the rains. I trust that full attention will be paid to these points.

Arrangements have also been made for a comprehensive inquiry into the whole subject of the means of communication during the rains to be made beforehand, so as to secure us against doubt and difficulty when the time comes. I had previously for other purposes obtained full reports of the water communications of the two parts of the country most affected, North Bengal and Tirhoot; these will be collated by a selected officer who has special knowledge of the subject, and any additional information necessary will be locally obtained. Major Trevor may well give attention to this among other subjects.

56. The following orders on matters of secondary importance were issued during my visit to Tirhoot, and are generally applicable to distressed districts—

Miscellaneous subsidiary orders.

"All Circle officers should have magisterial powers if they are fit for it. It will be desirable that all fit for summary powers should have such. It will be understood that relief officers need not devote themselves to investigating difficult cases, but it will be convenient that petty and clear cases, or cases connected with their work, should be disposed of promptly on the spot. A large supply of the forms used for record of summary trial should be sent up at once to all the districts.

"While bungalows have been built for European officers, nothing has been done for native officers; arrangements should be made to protect them as well as possible. The Lieutenant-Governor has promised Sir W. Muir to take care of those sent down from the North-Western Provinces, and wishes to have this done. If good native buildings can be had on hire or made, they may be hired or put up. If not, proper allowances must be given to enable these officers to house themselves with the least possible delay."

And the following, which, though specially issued for one line only, is in principle applicable to all cases in which land is taken up for roads or other purposes, as is so often the case in connection with our relief works:—

"The Lieutenant-Governor has observed with regret that where the Durbhunga State Railway runs through standing crops, compensation has not yet been given to the ryots. This must be done at once. The Commissioners of Patna and Bhagulpore are desired to issue immediate orders that the sub-divisional officers, through whose jurisdiction the line passes, shall at once, without any very formal proceedings, assess on the spot the value of crops destroyed, giving the cultivators the benefit of any doubt. As the lands are at present only temporarily occupied, no question of compensation for the land need be taken up. Only payment for crops to the ryots concerned must be settled, and paid forthwith by a summary and rule-of-thumb enquiry."

57. Whether the land is occupied permanently or temporarily, compensation for loss of crop should be given summarily and liberally on the spot without any delay, leaving the value of the land permanently taken to be settled separately. But this also should be done as soon as possible, unless, as has happened in many cases, the zemindars give the land for relief purposes free of cost, an example which it is hoped many others will follow.

58. While things are in so critical a position it seems most necessary that Government should have more speedy information than that which it obtains by the roundabout official channels. Orders have been issued for a brief weekly return to Government direct from every distressed sub-division, showing numbers of persons on works and otherwise receiving relief, and grain stored, with an explanation of any remarkable changes. And such information is to be telegraphed from the most important sub-divisions both weekly, and whenever there is anything specially remarkable to report.

CALCUTTA,
The 28th March 1874.

G. CAMPBELL.

GOVERNMENT OF INDIA.

DEPARTMENT OF REVENUE, AGRICULTURE AND COMMERCE.

REPORTS ON THE STATE OF THE SEASON AND PROSPECTS OF THE CROPS FOR THE FORTNIGHT ENDING THE 2nd APRIL 1874.

GENERAL REMARKS.—There has been slight rain in the northern districts of Madras; none in the southern; prospects are said not to be generally satisfactory. In the Bombay Presidency the harvest is either finished or rapidly drawing to a close; the out-turn appears to be generally good. There has been slight rain in most districts of Central Bengal and Behar during the fortnight, and heavy showers in the eastern districts; the cold weather crops are being harvested, with a better out-turn in many places than was expected. Preparations for the *aus* rice crop are being actively pushed forward, and promise well. The harvest has nearly ended in the districts of the Benares Division of the North-Western Provinces. Relief works are not largely attended, except in Bustee, where the number of applicants is increasing; (no report has been received from Goruckpoor); elsewhere they will probably be soon closed, except in South Mirzapore. In Banda there is no increase of distress, and the harvest is in progress; reports from all other districts are favourable. In Oudh also the harvest is going on, and new grain is plentiful. Prospects in the Punjab are good. In the Central Provinces the harvest has been gathered or is in progress; the out-turn is fair. In Berar the new grain has come in, and ploughing for rain crops is going on. In Rajputana and Central India the crops are being cut, and prospects are good. Reports from Mysore are fair, though there is some deficiency of water.

Presidency or Province and District.		Rainfall for fortnight preceding.	State of agricultural prospects.
Madras	(April 2nd)		
Kistna	(1st)	·30 in Nandigama.	No rain in Musulipatam; no water over anicut; canals closed; crops fair on the whole; black gram, cumboo, Bengal gram, maize, chillies and indigo being reaped in parts; market well supplied locally; prices steady; pasture scarce; small-pox and fever prevalent except in Suttunapalli; guinea-worm in Palnad; cattle healthy in three taluqs.
Kurnool	...	...	Season favourable; slight showers in Nondikotta; later dry crops being harvested; outturn moderate; market well supplied; prices steady; fever in all taluqs, except in Pattikonda and Ramulkotta; cattle disease in five taluqs; pasture and water sufficient; no water over Sunkesala anicut.
Negapatam	...	*Nil.*	Rivers dry; water in tanks scanty; a few dry grains in cultivation; standing crops not thriving in some places; nunjat harvest nearly completed; some dry crops harvested; yield below the average; market well supplied; prices almost steady; pasture procurable; health generally good; small-pox in several places; cattle healthy.
Trichinopoly	...	*Nil.*	Drinking water getting scarcer; condition of crops and outturn much the same as before; market fairly supplied; prices falling in some taluqs, stationary in others; pasture failing; health generally good; condition of cattle good.
Calicut	...	*Nil.*	Ploughing operations for first crop begun; supply of grain from local sources not ample; prices steady; pasture scanty; small-pox prevalent; slight fever in hilly parts; cattle disease in Calicut.
			General prospects not satisfactory.
Bombay—	(April 1st)		
Sindh.			
Kurrachee	...	...	River at Kotree on 23rd March 5 feet and 7 inches; reaping of rubbee crop in progress; crops poor; measles in Tatta town: prices of grain risen.
Hyderabad	...	...	High winds with dust during first week of past fortnight greatly damaged mango blossoms; violent gale on 30th March from south-west with dust; rubbee crops being reaped; public health good.
Shikarpur	...	...	Weather much warmer; fall of rain on the 18th March over the Rohree division, and now threatening.
Upper Frontier	...	...	Crops ripening; nights cool; dust storms.
Gujarat.			
Ahmedabad	...	...	Rubbee harvest commenced and favourable; public health good.
Kaira	...	...	Cotton being picked; weather and public heath good.
Surat	...	...	Cotton healthy; other crops nearly reaped; weather and public health generally good.
Broach	...	...	Crops all picked; weather and public health good.
Khandesh and Nasik.			
Khandesh	...	...	Cotton market dropping; best cotton 47 to 49 pulla; public health good.
Nasik	...	...	Harvest completed; public health good.
Thanna	...	...	Ague and small-pox to a slight extent; slight cattle disease in Moorbar and Bassim taluqs.
Deccan.			
Poona	...	...	Hot weather continues; public health good, except in Indapoor where fever prevails; cattle disease slightly exists in Mawal and Harally.
Ahmednuggur	...	...	Slight cattle disease in taluq Aukola; public health good.
Sholapur	...	...	Ague continues at Pandhurpur; no change.
Sattara	...	...	Crops harvested; fever in Walwa and Mann.
Southern Mahratta Country.			
Belgaum	...	...	Cotton crops indifferent; scarcity of water in Chickadee taluq.
Dharwar	...	...	No change since last report.
Kaladghi	...	...	Cotton nearly reaped; scarcity of water at Moodehipal, Bagamadi and Indee; health good.
Canara	...	...	Second crop satisfactory; slight fever and small-pox prevail; cattle disease also prevalent.

Presidency or Province and District.	Rainfall for fortnight preceding.	State of agricultural prospects.
Bombay—*contd.*		
Kattyawar and Gaekwar's territory.		
Wudwan ...	...	Weather moderate; state of crop as before; health good.
Baroda ...	...	Cotton-picking completed; health good.
Bengal (Mar. 31st)		
Burdwan ...	1·14	In the first part of the fortnight, showers of rain have fallen at Bood-Bood, Calna, and Raneegunge, but not in Jehanabad or Cutwa Sub-Divisions. Weather getting warmer. Condition of crops fair. Distress increasing in Bood-Bood, in which quarter fever prevails more than elsewhere.
24-Pergunnahs ...	0·15	During the early part, the weather continued cool with occasional small showers of rain; but heat is increasing during the latter part, with occasional foggy mornings. Strong southerly breeze throughout the last week. There are scarcely any crops on the ground. Preparation of ground for the next early rice crop continues on a very large scale.
Dacca ...	3·43	Fine weather, heavy rains on the 23rd March and some on the 24th; warm with sunshine till the 31st, when it became cloudy and looked like rain. Prospects of crops good; a little damage from hail, but sunshine has done much good. More rain at present is likely to do harm.
Cuttack ...	*Nil*	Weather dry and hot. Dalna paddy growing luxuriantly but not extensively.
Distressed Districts.		
Moorshedabad ...	0·01	There have been slight showers of rain in different parts of the district in the course of the first week. On the 17th March there was a fall of hail but not so severe as that of the 9th idem. Slight rain has also fallen in the second week in thannahs Bharutpore, Jellingi and Nowda; days very hot but nights cool. The harvesting of the cold weather crops continues, and affords employment to a great number of people. Wheat and grain promise a very fair outturn. Boro rice progressing favorably and has been benefited by rains. Early rice is being sown on alluvial lands in the eastern parts of the district. At Huriharpurah, Nowda, and Jellingi, the prices of wheat, barley and grain have fallen considerably. Rice is also cheaper at Jungypore and Ramporehat, but stationary at head-quarters.
Dinagepore ...	*Nil.*	Clear weather with high west wind; a few clouds seemed gathering up in the latter part of the first week. In the second week a little rain at Nowabgunge and dry west winds blowing continually. Good outturn of boro rice is expected; Bhadar or early rice sowing continues, and prospects are very good. Every promise of a good mango crop.
Maldah ...	*Nil.*	Cloudy with dust storm and occasional drizzling in the first week; hot and dry with strong westerly wind afterwards; wheat, barley, and other cold weather crops are being harvested and the outturn is turning out an average one as expected. Cheena (millet), also promises a fair yield. Boro paddy and mango crop still promise well. New wheat is being sold at 13 to 14 sers per rupee. Imports of rice and paddy at local markets decreasing and markets rising.
Rajshahye ...	0·02	There was very slight rain in parts of the district; chiefly to the westward on the 17th March; also hail at Tanner, but not enough to do material damage. Khesared and masoor (pulses) and linseed, barley, wheat and grain are being reaped, and the out-turn is a fair average one. Prices have been stationary except at Singrah where rice is dearer.
Rungpore ...	*Nil*	Weather was cool with westerly winds, but there has been a considerable increase of heat latterly, which has however been tempered by steady breeze from the west and north-west. The weather has been pleasant for the time of the year. No rain has been reported; sugarcane and tobacco being reaped, the latter though partially damaged by hail, are good; wheat, and barley and pulses are very good; cheena and kawni (millets) promise equally well. The early rice has been very extensively sown, and the crop is now considered secure; there will be also further sowings of early rice in the south western parts of the district. In a comparatively small tract in that quarter between Gobindgunge and Kamdiyarhat, the sowings of early rice have been embarrassed by the bad circumstances of the petty cultivators.
Bograh ...	*Nil*	Dry and warm in the day time. The cutting of mustard has been completed; a 12 or 13 annas outturn is estimated, and a similar outturn of sugarcane; cold weather crops, such as mater (pulse) &c., are being gathered in; a fair average is expected.
Patna ...	0·32	Weather seasonable, with strong west winds, but a little cooler than usual at this time of the year. The cold weather crops are now fast being cut and will soon be stored; they have yielded better than was at first expected.
Gya ...	*Nil*	Stormy weather at the beginning; afterwards fine with cool mornings and evenings. The weather for the harvest has been all that could be desired, and the gathering of the cold weather crops may now be said approaching completion; ears of wheat are full and a paying crop anticipated. In the Aurungabad sub-division the outturn is reported to be still better than was anticipated.
Shahabad ...	0·22	Cloudy and unsettled at the commencement; on the night of the 16th March there was a thunderstorm accompanied by rain which appears to have fallen generally; weather clear afterwards with west wind and all that could be desired for the harvest, though it was variable during the latter end. Cold weather crops are being gathered in and promise an average outturn; cheena (millet) promising, rain and wind of the 16th slightly injured the mango crop but benefited the sugarcane. The rain was not heavy enough to do any material harm to the crops cut and stored in the farms.
Tirhoot ...	*Nil.*	Getting warmer; westerly wind prevailing. In the Madoobani Sub-division, the cold-weather crops are being harvested; some damage done to crops by storm in the first week. In a few places moong (pulse) and cheena (millet) have been sown and plants are thriving; want of rain is much felt; moong (pulse) will yield a good harvest and to some extent mitigate the pressure of famine. In the Hajeepore Sub-Division, the harvesting of the cold-weather crops has commenced, and as far as Hajeepore and Lalgunge go, a good crop is expected. Towards the north of the Sub-Division, especially about Shahpoor and parts of Mohowah, the outturn has disappointed every one. The crop looked much thicker before it was reaped, than it has proved to be. In this part, the sub-divisional officer has commenced relieving isolated cases of distress, chiefly old people and children. There is abundance of work as yet for the agricultural and coolie classes. In the Seetamarhi Sub-division, no rain has fallen since last report, but a strong westerly wind prevailed, injuring the crops being reaped. Rahur and keras (pulses) and the cold-weather crops are being reaped, but the fields will not, the collector fears, yield as much as has been anticipated; the crops looked well in parts, but the yield is disappointing. In the Durbhunga Sub-division, mustard is being gathered, and also in places rahur (pulse), other crops are backward, save in the south of the Sub-division, the remaining crops are insignificant. There was a heavy fall of rain in several parts of the sub-division in the first week, which must have benefited the cheena (millet). The rainfall at head-quarter was very slight. In the Tajpore sub-division, the cutting of the cold weather crops is going on. The sub-divisional officer sees no reason to alter his previous estimate of the outturn. There was some rain in this part of the district of benefit to moong (pulse) and cheena (millet); but mango blossom has been somewhat injured; tobacco being prepared. In the sudder sub-division there is no change in prospects of crops.
Bengal—*continued.*		
Sarun ...	·39	Cloudy with slight showers in the early part of the fortnight; weather afterwards dry and fine, and west wind prevailing. A fall of rain on the 16th March accompanied by hail in several villages within the jurisdiction of Thannahs Chuprah, Manjhee and Masbrak, causing considerable damage to wheat, barley, poppy and mango blossoms. The bulk of the cold weather crops has been gathered, the yield turning out better than was anticipated; spring crop and indigo coming on well; mango crop still promising; sugarcane being planted; moong (pulse) and paddy are being sown in low lands; opium weighment has commenced; new pulse and grain are coming into markets; prices steady.
Chumparun ...	0·10	East and west winds; hail on the 9th March reported towards Bagaha and Lowriah, also Gobindgunge. Prospects of the crops continue good; the hail did little damage except in the neighbourhood of Gobindgunge; cold weather crops being harvested; high west wind causing some damage to the cheena (millet) crops.
Monghyr ...	0·19	Seasonable weather; the harvest of the cold weather crops is general and every available person is in the field; the outturn in Dearahs, as was expected, is quite up to the average; in some favored tracts an unusually good crop has been reaped. Taking high and low lands together, the outturn of the cold weather crops may be calculated at 12 annas crop, and between six and eight million maunds of grain will be secured to the districts; mango and mohwa crops unusually good.
Bhaugulpoor ...	*Nil* ...	No rain has fallen. Harvesting of the cold weather crops in full operation; return very good; mango and mohwa very promising.
Purneah ...	*Nil* ...	Seasonable and warm; wheat and grain being harvested; sowings for early and late rice are going on; the harvest of the cold weather crops is a good one; sugarcane is being planted largely in parts of Arrareah sub-division; price of rice is stationery.
		Public health.—Burdwan, fever as before; some cholera in the town of Culna. 24-Pergunnahs, a few cases of cholera reported from Basseerhaut, Barripore, Diamond Harbour and Satkhera; also seven cases of small-pox from the latter sub-division. Cholera has disappeared from Nyehatty. Cuttack, public heath good. Moorshedabad, small-pox still prevails. Dinagepore, cholera reported at Goraghat, and native doctor ordered there. Malda, health of the district generally good. Rajshahye, cholera is prevalent in many villages, particularly in the north-western part of the district, cases of small-pox also reported. Rungpore, general health very good. Bogra, there has been a severe outbreak of cholera in the village of Jora in Bogra Thannah. Patna, with the exception of a few cases of small-pox in the city, the health of the district continues good. Gya, health generally good. Some sporadic cases of small-pox reported. Shahabad, small-pox somewhat prevalent. Tirhoot, public health good, a few cases of small-pox. Bhaugulpore, general health unusually good.
		General Remarks.—Rain has fallen in most of the districts during the fortnight under notice, and in some of the eastern districts, so heavily, as to retard agricultural operations. Hail has done injury in a few places. Cold weather crops are doing well in most parts. Harvesting has commenced, and the result in some is distinctly better than was anticipated. Preparations for the ensuing rice cultivation are actively progressing, and the early sowings are doing well. Boro paddy doing well everywhere, and has benefited by the rains. In parts of Jessore it is ripening. In one sub-division it is attacked by insects, but no serious injury has been done. Cotton, mulberry, indigo, &c., are favorably reported on. Cheena and kowni (millets) are doing well.
N. W. P.—		
Bustee (March 30th)	...	Harvest nearly completed; mango and mohwa fruits promise well; numbers on relief works over 21,000 and increasing; two poor-houses with 87.
Goruckpoor ...	...	No report received.
Ghazeepoor (31st)	...	Prices unchanged; threshing going on; numbers on works under 1,000; daily relief continued to 1,064 persons; relief twice a week to about 1,500.
Benares (31st)	...	Prices unchanged; crops nearly harvested; no relief needed.
Azimgurh (30th)	...	Prices little changed; crops nearly reaped, except gram; outturn average; charitable relief to 285, will diminish next week.

Presidency or Province and District.		Rainfall for fortnight preceding.	State of agricultural prospects.
N. W. P.—*continued.*			
Mirzapoor	(31st)	...	Weather favourable; outturn north of Ganges good; in Ganges Valley very good; in hilly tracts north of Soane, some distress anticipated but not severe; in Doodhee south of Soane, distress greater; some emigration to Sirgoojah; population scattered and averse to going far to relief works.
Jounpoor	(31st)	...	Prices slightly fallen; crops nearly all reaped; no applicants for charitable relief; import from Oudh continues.
Allahabad	...	...	No report received.
Banda	(31st)	...	Rubbee generally reaped: outturn good; mohwa crop late but promising; distress not increasing; labour and charitable relief provided.
Humeerpoor	...	...	No report received.
Jaloun	(31st)	...	Crops all reaped; in general above average; no distress.
Cawnpoor	(April 1st)	...	Prices steady; weather fair; prospects unchanged.
Futteghurh	(1st)	...	Prices slightly fallen; harvest going on; prospects fair.
Agra	(1st)	...	Prices fallen; new barley and gram coming in; wheat will follow; food prospects good.
Allygurh	(Mar 31st)	...	Harvest going on; health good; prices easy; wheat 16½ seers, barley 26 seers.
Meerut and	Saharunpoor (April 1st)		
Bijnour	...	...	Prospects good.
Moradabad	(1st)	...	No report received.
Bareilly	(1st)	...	Prices unchanged; harvest begun; some export northward.
Punjab	**(Apl. 2nd)**	...	Prices slightly falling; prospects favorable; health good.
Rawalpindi	(Apl. 1st)	1·0	
Peshawar	...	·2	
			Harvest prospect of the province good; general health good; small-pox in some villages of Hissar and Sirsa districts.
Oudh			
Lucknow	(Apl. 1st)	*Nil*	The rubbee harvest is being reaped, and new grain is coming plentifully into the market; sugarcane is being planted.
Fyzabad	"	*Nil*	
C. Provinces—			
Chanda	(Mar. 28th)	0·30	Weather clear and cool; prospects good; prices stationary.
Raipur	...	...	Weather clear; prospects good; small-pox and cattle disease still slightly prevalent.
Mandla	...	0·75	Prospects favorable; health good; prices stationary.
Bilaspoor	...	1·00	Rubbee harvesting; measles and small-pox about; prices easy.
Bhandara	...	0·50	Weather clear; rubbee harvested; out-turn average; small-pox slight; prices easy.
Sumbulpoor	...	0·45	Weather hot; sugarcane being planted; prices high but easy.
Balaghat	(31st)	...	Weather fair; crops promising; fever and small-pox prevalent; prices slightly fluctuating.
Wurdha	(Apl. 1st)	...	Rubbee harvested; small-pox prevalent.
Nursinghpoor	...	...	Good rubbee harvest.
Saugor	...	...	Reaping rubbee progressing favorably; small-pox in places; health good.
Jubbulpur	...	...	Prospects good; small-pox in city.
Dumoh	...	0·20	
Seoni	...	...	Rubbee harvest being threshed; fever prevails.
Nagpoor	...	...	Weather clear; no standing crops; small-pox and cattle disease prevalent; prices stationary.
Hoshangabad	...	...	Prospects fair; small-pox prevailing; doubtful report of cholera.
Betul	...	...	Prospects fair.
Nimar	...	...	Prospects favorable; prices stationary.
Mysore & Coorg	**(Apl. 1st)**		
Bangalore	...	...	Agricultural prospects fair, but wet crops suffering for want of water in some places; public health generally good; cattle disease diminishing.
Assam—			
Gowhatty	(Apl. 2nd)	2·38 at Gowhatty.	Weather clear with occasional storms and rain; aus crop is still being sown; public health good.
British Burmah—		...	No report received.
Hyderabad Districts—	**Assigned**		
East Berar	(Apl. 2nd)	...	New grain brought to market; ground under plough for ensuing cultivation; public health good.
West Berar	...	...	No report received.
Rajpootana—			
Serohi	(Mar. 23rd)	·02	Tanks dry; wells running dry; crops being cut; prospects good; health very good.
Meywar	(28th)	...	Same as last report.
Harowtee (Agency States)	(21st)	...	Wells moderately full; tanks drying up; health good; harvest fair.
Ulwur	(19th)	...	State of tanks and wells satisfactory; health good; the yield will be much above the average.
Jeypoor	(Apl. 2nd)	*Nil*	Rubbee crops ripened; commenced gathering; public health good.
Bhurtpoor	...	...	Cutting crops; harvest moderate; health good.
Central India—			
Indore	(Apl. 1st)	...	Weather fine; health good.
Gwalior	...	*Nil*	Crops fair; small-pox decreasing.
Neemuch	...	...	No important change since last report.
Rutlam	...	...	Health good; crops favorable, being gathered.
Bagelkhund (Sutna)		...	No report.
Nepal	**(March 25th)**	...	The crops look most promising, and a heavy return is expected from wheat, potatoes, peas, &c. Health good.

GOVERNMENT OF INDIA.

DEPARTMENT OF REVENUE, AGRICULTURE, AND COMMERCE.

No. 1200 A.

Extract from the Proceedings of the Government of India in the Department of Revenue, Agriculture, and Commerce,—dated Calcutta, the 8th April 1874.

RESOLUTION.

The Governor General in Council has considered the 14th Special Narrative, submitted on the 2nd instant, of the drought in Behar and parts of Bengal, and the letter from the Government of Bengal, No. 2088 S. R. of the 6th instant, forwarding a Note reviewing the allotment of grain to each district and the arrangements for its transport, together with Minutes by Sir Richard Temple, summarising the present relief arrangements in the distressed divisions of Behar and Rajshahye.

The Narrative, with the Lieutenant-Governor's observations and instructions, has been published in the *Gazette of India*. The same publicity will now be given to these subsequent communications.

Sir George Campbell has been obliged, on account of the state of his health, to resign the office of Lieutenant-Governor of Bengal, and it is the gratifying duty of the Government of India to acknowledge the zeal and ability with which His Honor has from the first devoted himself to the arduous task of conducting the operations for the relief of distress. The Governor General in Council desires particularly to record his high appreciation of the manner in which Sir George Campbell personally directed and supervised the relief organization on the occasion of his recent visit to North Behar.

The Governor General in Council further desires to take this opportunity of expressing his entire concurrence in Sir George Campbell's acknowledgment of the obligation of the Government to Sir Richard Temple for the great energy and administrative power which he has shewn in co-operating with the Lieutenant-Governor for the purpose of completing the arrangements to meet the famine.

The Government of India have also to record their cordial recognition of the zealous and efficient services of the Commissioners of the Patna, Bhaugulpore, and Rajshaye Divisions, and of the other officers mentioned by the Lieutenant Governor and Sir Richard Temple.

It is not impossible that contingencies may arise which will place still greater strain upon the resources of the State, and call for additional exertions on the part of the officers of Government. But His Excellency confidently relies upon every officer doing his duty under a strong sense of the responsibility devolving upon him during the period of increasing distress which, it is to be feared, must, be anticipated.

(True Extract.)

ARTHUR HOWELL,

Depy. Secy. to the Govt. of India.

No. 2088 S-R, dated 6th April, 1874.

From—C. BERNARD, Esq., Acting Secretary to the Government of Bengal,

To—The Depy. Secy. to the Govt. of India, REVENUE, AGRICULTURAL, AND COMMERCE DEPT.

WITH reference to paragraph 16 of the last special Narrative, which contained a promise to submit a note showing the whole allotments of grain to the distressed districts, and reviewing the transport arrangements and their working, and also to submit Minutes by Sir Richard Temple, summarising the present relief arrangements of the three very distressed divisions, I am now directed to submit these papers.

They consist of—

(*a*) Summary of allotments and transport arrangements with a Minute by Sir Richard Temple on the carrying power of the railway, written with reference to the above.

(*b*) The letter of Sir Richard Temple's Secretary, No. 121, dated 31st March, with Sir Richard's Minutes, Nos. 52, 63, 64, 65 and 66, reviewing the relief arrangements of the Dinagepore, Patna, and Bhagulpore Divisions, and of the country generally, with a reply, No. 2060, dated the 2nd April, conveying to Sir Richard Temple the Lieutenant Governor's warm acknowledgments for the assistance which he has rendered to the Government of Bengal during Sir George Campbell's incumbency.

2. The last Narrative has placed the Government of India in possession of the most recent information regarding the state of the country and the progress of relief arrangements, and the instructions issued by the Lieutenant Governor afer seeing for himself the worst parts of the country.

Nothing has since occurred to alter the views given in the Narrative. We have still reason to hope that, so far, our greatest difficulties are confined to the Tirhoot district, and the more recent accounts from thence are favourable. In a telegram just received, Mr. Metcalfe says:—"Nothing like starvation is

apparent. Village relief in hands of headmen. Working number on Bahera road twenty-six thousand* only, on Mudhoobunnee works two lakhs†. Employing Resaldars in disciplining mobs (*i e.* of laborers). Public health good. Baiparees increasing imports. Water-supply everywhere deficient. Village after village searched for hungry people. Mudhoobunnee, Nareya, Durbhunga circles all formed. Can honestly say famine well in hand."

* When the measures for sifting and distributing the people on this road were undertaken, they were over fifty thousand.

† This is a decrease and not an increase on numbers previously stated.

3. The Lieutenant-Governor hopes that the enclosed transport note will satisfy the Government of India that the local transport arrangements as a whole are now extremely efficient, and that the carrying power is only limited by the carrying power of the railway. The Government of India will probably consider that question in connection with Sir Richard Temple's note on the subject and my letter No. 2089S-R of this date, submitting the question whether certain further quantities of grain are to be procured from the North-Western Provinces.

4. Sir Richard Temple's Minutes, attached to his Secretary's letter No. 121, set forth very clearly in precise and statistical form the various arrangements made for supply of grain transport and relief machinery. Sir Richard Temple very justly praises the judgment, discrimination, and assiduity displayed by Mr. S. Bayley, Commissioner of the Patna Division, in the discharge of the extraordinarily difficult duties which have devolved on him; and he commends the Deputy Commissioner, Mr. J. Hewitt. He cordially acknowledges the services of Mr. G. N. Barlow, Officiating Commissioner of Bhagulpore, and brings specially to the notice of Government the very valuable services rendered by Mr. H. Hankey, as Special Superintendent of Transport. He speaks in terms of high commendation of Mr. W. LeF. Robinson, in special relief charge of the four northern districts of the Rajshahye Division. In all the above praises the Lieutenant-Governor entirely concurs.

5. The time has now come when the present Lieutenant Governor must shortly surrender his office. He is compelled to do so at a time when the country is unhappily placed in a very critical position; but he hopes that the papers submitted with the last Narrative and with the present letter will show that, under the direction and control of the Government of India, the Government of Bengal has made very large, and generally successful, provision to meet the calamity which has befallen the country; and Sir George Campbell trusts that in handing over the administration to a successor who has already so largely and so ably assisted him, he does so under circumstances which give fair hope that this Government, administered by the energetic and competent hands of his successor, and supported by the large means which the Government of India has so freely afforded, may be able successfully to carry the people through the time of trial, with no greater suffering than is inevitable under such a dispensation of Providence.

6. It has been explained that the present season so far promises very favourably. Accounts have just been received of a very beneficial fall of rain in the North Bengal Districts, and at this moment the appearance of the weather gives hopes of a further fall, which would be peculiarly opportune and beneficial after much land has been prepared and some crops sown in Bengal, and the rubbee harvest has been reaped and garnered in Behar.

7. If the season in Bengal should be favourable, the ensuing months being showery, as a season so commenced often is in Bengal, the Lieutenant Governor would hope that, after the provision which has been made for supplying the distressed districts and maintaining a reserve, the condition of the people in the greater part of Bengal Proper may not be greatly changed for the worse.

In the parts of Behar where the rubbee harvest has for some weeks given employment to the people, we must expect a large accession to the numbers for whom employment and relief provision must be made between the end of the rubbee harvest and the rains. But if the unusual drought is followed by early rains, as is frequently the case, that period will not be very long; and when good rains commence, we may expect that, in all districts not reduced in an extreme degree, the people will of their own accord betake themselves to agricultural pursuits.

There remain the large tracts of North Tirhoot, and other more limited tracts, where, there being little or no rubbee, the people have come on our hands at a comparatively early period in very large numbers. It is the Lieutenant Governor's earnest hope that the measures which have been adopted will suffice to meet the vast amount of distress existing in those tracts; but he does not doubt that this distress can only be met by very earnest and sustained effort, which he surely believes will not be wanting.

Sir George Campbell trusts, then, that, by the mercy of God, the people, whom he leaves in very good hands, will be saved from starvation.

8. Sir George Campbell is under very great obligations to many of the officers who have assisted him in the efforts which for the last six months he has made to meet the threatened famine; but at a time when the work is unfinished, he feels that he cannot ask for them the acknowledgments of the Government of India. He will, therefore, not here attempt to specify those who have in his opinion so far done well, beyond the concurrence in Sir Richard Temple's praises of certain officers which he has above recorded, but he will leave a note on the subject with his successor, who will hereafter be in a position to estimate the services of the various officers as a whole.

Summary of allotments and arrangements for transport of Government grain to distressed districts, brought up to latest intelligence received to end of March.

1. The allotments of grain to the distressed districts according to the latest revisions are:—

	Mds.	Mds.
Patna	67,500	
Gya	2,20,000	
Shahabad and Soane Circle	3,17,000	
Tirhoot	42,00,000	
Sarun	5,30,000	
Chumparun	10,00,000	
Monghyr	3,78,000	
Bhagulpore	7,30,000	
Purneah	6,50,000	
Sonthalia	1,35,000	
		82,27,500
Hazareebagh	25,000	
Manbhoom	28,000	
Palamow	10,000	
		63,000
Moorshedabad	5,000	
Dinagepore	12,00,000	
Maldah	1,50,000	
Rajshahye...	1,00,000	
Northern Bengal Railway	1,00,000	
Rungpore	3,00,000	
Bogra	2,40,000	
		20,95,000

2. If we include the Chota Nagpore in what may be called the western group of districts, the total allotment for them is 82,90,500 maunds or (converted at 27·2 maunds per ton) 304,797 tons. The total allotments for the eastern districts is in maunds 20,95,000 or tons 77,022.

The grand total of the allotment for all districts, as at present fixed, is therefore 381,819 tons.

3. The total quantity of grain despatched from Calcutta up to the 31st March is returned as follows:—

	Maunds.		Tons.
To the western districts	36,99,928	or	136,026
To the eastern districts	14,54,775	or	53,483

If we add to this 17,463 tons, purchased locally and in the North-West Provinces for the western districts, and 2,941 tons purchased locally for the Rajshahye Division, the total despatch of grain up to date stands—

	Tons.
For the western districts	153,489
For the eastern districts	56,424
Total	209,913

This leaves 171,906 tons yet to be supplied, of which 151,308 tons are due to the western and 20,598 tons to the eastern districts.

In the western districts of the Burdwan and Chota Nagpore Division, some further allotments may be required, but it is not expected that the quantity will be very large.

4. The statements of amounts actually received in the districts are mostly dated 28th March, but they are always considerably in arrear of the actual facts, depending on previous returns from out-stations, while the despatches from Calcutta are given up to date. The following statement of the amounts received in the districts, based upon the last transport returns and the district narratives, shows a greater difference than the amount in transit would account for. Difference in date must account for the remaining difference.*

The amounts received at the main receiving depôts of the districts appear to stand thus:—

	Mds.
Sarun	3,79,690
Chumparun...	6,23,275
Tirhoot	16,41,000
Shahabad and Soane Circle	1,79,000
Gya	1,40,000
Patna	58,822
Bhagulpore...	4,57,491
Monghyr	2,15,933
Sonthalia	15,000
Purneah	4,56,645
Total for Patna and Bhagulpore Divisions ...	41,66,856
Rajshahye Division	9,64,186
Chota Nagpore	12,492
Total ...	51,43,534

or 189,100 tons in all.

It will be remembered, however, that this includes some considerable quantities stacked at receiving stations and not yet sent off to the interior; and, in the case of Tirhoot, this will make a good deal of difference, a considerable quantity of grain stated as received into that district being still at Champta and some other ghâts.

5. The following paragraphs examine the state of the transport question in detail district by district:—

SARUN.

6. The allotment is discussed in Sir Richard Temple's Minute No. 18, dated 12th February. It was there settled that 5,00,000 maunds were to be supplied for the district plus 30,000 to be advanced from Government stores for the Hutwa estate, *i. e.*, 5,30,000 maunds in all, exclusive of a further supply of 1,50,000 maunds to be obtained direct by the Hutwa estate; all to be stored by the 15th June. It was further settled that all grain for Sarun

* The difference between the total amount despatched and the amount shown as received is 20,813 tons. But it must be remembered, as stated generally in the text, that the returns of receipts are by no means up to date. In the Rajshahye Division, again, consignments are by water routes, some weeks upon the road, also there are often considerable quantities accumulated at Futwa, Kooshtea, Goalundo, and other ghâts on the south side of the river. Again, the railway despatches are made up for three days beyond even the nominal date of the district returns, and we may allow 3,500 tons a day by the two railways on that account.

should be consigned to Arrah, and be sent across the river in native boats. Up to the present date the grain has been steadily carried into the interior without fail. The Sarun cart power could carry much more if necessity arose. The district transport return dated 29th March shows that 3,65,971 maunds had been thus received. Even this figure is not quite correct up to date, as the Collector's returns from the receiving ghâts could not give actual figures up to the 28th inclusive. We may safely assume that at least two more days' despatches had been received on the north bank of the Ganges by the 28th March, and that a third day's despatches were *en route* from Arrah. We know that there is no balance of Sarun grain lying at Arrah, and that the average daily despatch by cart and boat from Arrah is 4,573 maunds daily. According to the Collector's figures, then, Sarun had yet to receive 1,64,029 maunds of its allotment. But according to the above estimate it must have received 3,79,690, leaving 1,50,310 maunds still to be sent up. If the present orders to send daily 5,000 maunds to Arrah for Sarun hold good, the whole balance due would arrive by the 28th of April. Even at the average rate of despatch hitherto (4,573 maunds), the balance would have reached the district by the beginning of May, and might all be stored by the 15th May. In case of necessity the despatches might, after due notice, be reduced to 3,000 maunds per diem, and it is proposed to do this next week.

CHUMPARUN.

7. Coming now to Chumparun, according to Sir Richard Temple's Minute No. 13, dated 8th February, the allotment for this district was to be one million of maunds, to be imported by the 15th June. European contractors, Messrs. Lethbridge and Gibbon, undertook to cart from Bunkur Ghât opposite Patna 50,000 maunds a week, or 2,00,000 maunds a month from 15th February, say 7,00,000 maunds in all up to the 15th June. The Collector was to receive by 15th February, under previous arrangements, 2,15,000, and 50,000 maunds were then expected by the Gunduck for the embankment works. Besides all this, 1,50,000 maunds were being brought in by river on account of the Bettiah Raj and planters. No further arrangements for transport were, therefore, deemed necessary, as the Gunduck was expected to rise after the middle of May, and boat carriage become feasible, should further supplies of grain be required.

8. The only change in the Chumparun programme has been that, in order to relieve the extreme pressure at Bunkur Ghât, the contractors have, since the 9th March, taken from 7,000 to 14,000 a week of the Chumparun grain *viâ* Arrah. No information as to the actual total despatches by the Gunduck is available, but it is understood that the district is relying now entirely on its land carriage.

9. By the transport returns for the fortnight ending 28th March, the district had received 5,97,907 maunds, leaving it 4,02,093 to receive. If we may assume, as we certainly may, that here too the Collector's figures are two or three days in arrear of the facts at the time of his writing, this balance due would be reduced by about 8,456 maunds for each day: the average actual daily despatches from Arrah to Chumparun being 1,088 maunds, and from Bunkur to Chumparun 7,368 maunds. This would make the receipts in all 6,23,275 maunds. In round numbers, however, we may say that Chumparun had, on the 28th March, something under four lakhs of its allotment to receive. At 50,000 maunds a week (the contract rate), this would be cleared off in eight weeks or less. At present, the contractors are carrying off, by the two routes of Arrah and Bunkur alone, an average of 59,196 maunds a week. But the combined despatches for Chumparun *viâ* Bunkur and *viâ* Arrah need not exceed 50,000 maunds a week, say 15,000 *viâ* Arrah and 35,000 *viâ* Bunkur.

TIRHOOT.

10. Sir Richard Temple's Minute No. 35 of the 26th February abstracts the arrangements for Tirhoot thus: 42 lakhs of maunds were to be conveyed before the rainy season, thus distributed—to Seetamurhee (10), Mudhoobunnee (16), and Durbhunga (16). The contracts made were as follow:—

	Lakhs.
A.—The *Western Contractors* were to take—	
From Bunkur to Seetamurhee *viâ* Mozufferpore ...	... 6
„ to Contai for Seetamurhee	... 4
„ to Attrai and Poosa for Mudhoobunnee ...	... 5
„ to Durbhunga	... 5
Total ...	... 20
B.—The *Alliance Company* were to take—	
From Chumpta to Durbhunga	... 18
C.—A North-Western Contractor, Nilcomul and Co., was to take—	
From Mokameh to Durbhunga	... 4

The above provided for the cartage of 42 lakhs of maunds away from the river ghâts.

The Seetamurhee grain was to be taken up at Contai and Seetamurhee, and distributed in that sub-division by a separate company, Messrs. Tripe, Begg and Company.

The 5 lakhs delivered at Attrai and Poosa were to be carted on by Messrs. Studd and Wilson to Kamtoul, and thence by Mr. Llewhellin to Mudhoobunnee.

Of the total quantity of grain delivered in Durbhunga (5+18+4=27) 11 lakhs were to be taken on by Mr. Llewhellin to Mudhoobunnee.

In this way each sub-division was to get its quantum.

11. Minute No. 57 has assigned 67,000 maunds to Tajpore Sub-division, and directs that this supply shall be deducted from the allotment for such of the other sub-divisions as the Commissioner sees fit. The allotment for the Sudder Sub-division has not yet been fixed. Whatever may be required for this or Hajeepore, will for the present come out of the allotment for the rest of the district.

12. In Mr. Hewitt's report for the fortnight ending 14th February, he explains the routes and the quantities expected to be carried by each as follows:—

	Weekly quantity in maunds.
From Bunkur by Lalgunj to Contai ...	... 15,000
„ „ by Rusoolpore to Seetamurhee ...	... 50,000 to 70,000
„ „ to Athar and Poosa ...	... 35,000
Total weekly from Bunkur	... 1,00,000 to 1,20,000
From Chumpta to Durbhunga	... 75,000
„ Jamattia to Durbhunga (Singhia and Hatta)	... 35,000
Total from Chumpta	... 1,10,000

This arrangement, however, omits the despatches from Bunkur to Durbhunga subsequently arranged. To supply 5 lakhs by that route, which was not commenced to work till after the Lieutenant-Governor went up in beginning of March, a despatch of upwards of 35,000 maunds a week, or 5,000 maunds per diem, is necessary.

13. The quantities despatched from Bunkur for Tirhoot have averaged 15,843 maunds a day, or 1,10,901 maunds a week, from 8th to 25th March, and are improving steadily. Those from Chumpta by the Alliance Company have been very short, averaging only 6,092 maunds a day from 5th to 27th March. In consequence, however, of the failure of this Company to supply enough cartage at Chumpta, they have tried another route from Monghyr, and also a route by Mokameh, which it was proposed to use simultaneously by the North-West contractor, Nilcomul Mitter. Up to the 29th March the Company had, however, only sent 5,486 maunds by the Mokameh route. The rate of despatch by the Monghyr route, to a point on the lesser Gunduck, is stated at over 22,000 maunds a week, but this is only despatched by boat. We do not know yet what has been landed and carried off.

14. The arrangements as last reported stand thus: The Alliance Company is to work from Barh *viâ* Chumpta, and also from Monghyr and Mokameh. They are to take three lakhs in all to Poorani Ghât south of Singhia by boat, and stock the Bahera and Singhia golahs of Durbhunga. The Chumpta grain is to be delivered at Hya Ghât for Mudhoobunnee. Nilcomul, the North-West contractor, is to carry from Simeria Ghât opposite Mokameh, and deliver at Pahuddee for Muddehpoora and other circles in Mudhoobunnee; but as yet this contractor has not begun active operations. The grain from Bunkur *viâ* Poosa goes to the western parts of Mudhoobunnee, while the grain from Bunkur to Durbhunga goes direct to the latter place.

15. The review of the transport appliances for Tirhoot would not be complete without a reference to the Durbhunga railway, which will almost immediately carry from Chumpta to Nagurbustee (28 miles on the road to Durbhunga) 200 tons or 5,600 maunds a day; and which is to carry from Chumpta Ghât right into Durbhunga (44 miles) 600 tons or 22,400 maunds a day soon after the 15th April.

16. The present position, then, is—

The present actual average rate of despatch is—

	Weekly quantity in maunds.
From Bunkur Ghât	1,10,900
From Chumpta Ghât	42,600
From Monghyr, by the Alliance Company	22,750
From Mokameh, by the Alliance Company	7,680
	1,83,930

The amount already in the district, 16,41,000 maunds, leaves 25,59,000 maunds still to receive (out of the allotment of 42 lakhs), to which must be added, say nearly 2,00,000 lying at the ghâts when the account was made up, giving 27,50,000 maunds in all to be despatched into the interior.

Taking nine weeks' despatches from 28th March to 1st June to arrive at destination by 15th idem, the *present* despatches would give us by the 15th June—

Nine weeks' despatches, at 1,83,930 maunds a week ... 16,55,370

17. But we have the certainty (or almost certainty) of the following increase by means of the railway:—

The Durbhunga railway will raise the despatches from Chumpta Ghât from 6,090 a day to 22,000 a day; and this increase will, it is hoped, last for at least fifty days, thus giving an extra supply of 7,95,500

or a total despatch of 24,50,000, against 27,50,000 to be carried.

18. 3,00,000 maunds remain.

For this we have the North-Western contractor, Nilcomul, but he has not yet begun the work he undertook.

We may hope, further, that the reserve carriage will help to make up any possible shortcoming in the above calculation.

There is at least one further resource, and that is the North Bhagulpore transport. Mr. Hankey writes that this is now immensely powerful, and that he can undertake to carry three lakhs of maunds into Tirhoot through North Bhagulpore, if only he can get the grain delivered to him, or the railway to carry. It may be considered that the above 3 lakhs, then, may either be sent by the arrangements already made or by the Bhagulpore route.

19. The general result of the above seems to be, that if the traffic remains uninterrupted till 15th June, we may expect to carry the whole Tirhoot supply. In the event of an unusually early rainy season, the land traffic may be interrupted, but in that case we may hope that the necessities of the district will also cease earlier, and the water routes will be opened.

20. The only apprehension is, that owing to the delay in the Chumpta Ghât forwarding arrangements, when the railway begins to work fully, too much

grain may be accumulated at Durbhunga, and there may be difficulty in sending it on in time to Allapore and other stations of Mudhoobunnee. In that view it would seem to be preferable to send part of the supply by the Bhagulpore routes to Allapore direct.

21. Seeing that it is not desirable to send forward from the river side to Durbhunga, more grain than can be forwarded to its ultimate destination, (after the rains commence Monghyr would be a better point of departure than Durbhunga), and seeing the complaints that have been made of interference with private trade, the Lieutenant-Governor thinks it would be desirable not to take up local pack-bullocks and donkeys for transport from the Ganges, these animals being only used for the distribution beyond Durbhunga, when absolutely necessary.

22. The districts in the Patna Division, south of the Ganges, call for only brief notice.

SHAHABAD.

19. The allotment for Shahabad is put by Sir Richard Temple's Minute No. 61, dated 26th March, at 1,27,000 maunds. The district has received 65,000 maunds. For the Soane Circle 1,90,000 maunds are said to be required, of which 1,23,113 had been received; 66,887 more have to be ordered.

For the district and the canal together 1,28,887 more are required, of which 75,000 are to be rice, sent up to stations between Arrah and Mogul Serai. The rest is to be brought from the North-Western Provinces.

20. The district carriage has moved 3,000 maunds a day, and can do more if pressed. No grain has been sent since the 9th March for Arrah, or since 24th February for the Soane Circle. Some has now to be sent, but there is no urgency in the despatches for either this district or Gya.

GYA.

21. Sir Richard Temple's Minute No. 60, dated 25th March, provides 2,20,000 maunds for Gya; 1,40,000 are already there; 80,000 more have to be sent. Of this, 55,000 maunds is to be rice, and 25,000 grain from North-Western Provinces. Gya can move over 3,000 maunds a day. No grain has gone up since 8th March, owing to the shortness of railway waggons and demands of other places.

The transport of the allotted grain into the interior of the Shahabad and Gya Districts can be effected without doubt or difficulty, if only the railway can carry the required amounts to the railway stations early enough in the season.

PATNA.

22. The allotment here is 67,500, of which 58,822 have been delivered. None has been sent up since 23rd February; but as the district can move 22,000 maunds a day, it can take its balance at any time if required.

BHAGULPORE.

23. For North Bhagulpore the allotment by Minute No. 25, dated 19th February, is 7,30,000 maunds.

The last transport returns show to 28th March 4,57,491 maunds received, leaving a balance due of 2,72,509 maunds. All the routes were working clear, and rice did not come to hand fast enough for the transport power. Sir Richard Temple wished 40,000 maunds a week to go for this district to stations between Bhagulpore and Monghyr; and Mr. Hankey writes that the transport power is expanding immensely, if only they could get grain to keep the carts employed. The railway despatches for the week beginning 30th March are to be daily:—

	Minimum.	Maximum.
	Mds.	Mds.
To Monghyr ... } for North Bhagulpore	5,000	6,000
To Sultangunge ... } for North Bhagulpore	4,000	6,000
	9,000	12,000
Weekly =	63,000	= 84,000

24. The actual daily average despatch into the interior from Jugdischuck, opposite Sultangunge, has been 3,610 maunds, and from Monghyr 3,520 maunds; but Mr. Hankey says that it is only want of grain that has kept the average down, as they really carried up to 7,682 maunds from Jugdischuck on an average of 11 days when full of grain. The Monghyr route can easily, he adds, carry 6,000 or 7,000 maunds a day. Even at the rate of 7,130 maunds from both ghâts, the whole balance due to Bhagulpore would be delivered in 38 days from 28th March, *i.e.*, by early in May. If they can carry say 13,000 maunds a week, the whole will be cleared off in 21 days from the 28th March.

If Bhagulpore is to carry three lakhs of maunds for North Tirhoot, its carriage will be kept employed up to the middle of June.

Excluding, however, any arrangements for Tirhoot by this route, 6,000 or even 5,000 maunds a day would be a sufficient supply for Bhagulpore.

MONGHYR.

25. The allotment for this district is fixed by Sir Richard Temple's Minute No. 64, at 3,78,000 maunds, and of this quantity 1,92,000 had, when Sir Richard wrote, been received into the district, plus 20,000, by the Court of Wards, leaving to be sent 1,66,000, all of which Sir Richard Temple said might come from the North-Western Provinces. The transport returns show an actual receipt of 1,95,933 maunds. No despatches have been made from Calcutta for this district since the 13th March, as the demands of other districts were more urgent, and the carrying power of the East Indian Railway was considerably below the mark. The Collector estimates that he has carriage available for over 5,000 maunds daily. The Monghyr grain stores and its distressed tracts are near to the railway; the district has already carried away promptly every maund it received, and if only the railway can supply the stations before the end of the season, all the Monghyr grain will be in position well before the middle of June.

SONTHAL PERGUNNAHS.

26. Sir Richard Temple has settled that a total of 1,35,000 maunds in all should be sent to the Sonthal Pergunnahs. Of this 15,000 maunds have already been sent; the storehouses and distressed tracts are near the railway; and this moderate supply of grain can be carried into the interior as soon as it arrives.

PURNEAH.

27. For Purneah, by Minute No. 44 of the 7th March, the allotment is 6,50,000 maunds. Besides this, 1,50,000 were to be carried through Purneah into Dinagepore, while it was contemplated that 1,50,000 maunds for Purneah might go *vid* the Mahanuddee. This arrangement leaves the amount to be carted by Purneah from Caragola at 6,50,000 maunds. Mr. Hankey's report of the 12th March estimated that the carriage had developed so that they could carry at least 2,00,000 a month. Up to the 22nd March they had carted away from Caragola 4,24,749 maunds, and the carriage was adequate to taking much more than they had got (*viz.*, 8,922 maunds a day in the fortnight ending 21st March.)

The transport return dated 28th March shows 4,36,645 maunds as received into the district at Caragola, leaving 2,13,355 to be received. But these figures are certainly a day or two in arrear. Probably we may say, in round numbers, that on the 28th Purneah had not more than 1,90,000 maunds to receive at Caragola, and part of this was already delivered at Colgong and Sahibgunj. But we may take 1,90,000 as an outside figure.

28. The average despatch into the interior from Caragola for 30 days ending 27th March was 6,800. At that rate Purneah will have completely received its supply *vid* Caragola in 27 days, or by about the 24th of April. There will remain the 1,50,000 maunds which are to come into Purneah *vid* the Mahanuddee to replace the 1,50,000 which Purneah has to give to Dinagepore. Mr. Hankey says he can carry this from Sahibgunj up the Mahanuddee after the rains begin, if necessary. If the East Indian Railway could carry all the grain we require before the rains, then Purneah could complete its allotment, plus the 1,50,000 for Dinagepore, by the Caragola route alone. But in case of necessity the Caragola despatches might be reduced to 5,000 maunds per diem.

CHOTA NAGPORE.

31. A small quantity of grain (28,000 maunds at present) has been allotted to Manbhoom, and 25,000 maunds to Hazareebagh, and 10,000 to Palamow, which has been sent from the Soane allotment, being replaced there by despatches to an equivalent amount.

32. Moorshedabad is also at present permitted to draw up to 5,000 maunds from Government stores. Up to date only 500 have been sent.

EAST INDIAN RAILWAY POWER.

33. There remains now the all-important question of the carrying capacity of the East Indian Railway (of the Eastern Bengal Railway no doubt is entertained). The districts had in the last days of March yet to receive, *vid* the East Indian Railway, in round numbers, the following quantities of grain:—

	Mds.	
To Sarun	1,50,000	
,, Chumparun	4,00,000	
,, Tirhoot	25,59,000	
,, Patna	10,000	
,, Gya	80,000	
,, Shahabad and Soane Circles ...	1,28,000	
		33,27,000
,, Bhagulpore	2,72,000	
,, Monghyr	1,66,000	
,, Purneah	1,90,000	
,, Sonthal Pergunnahs	1,20,000	
,, Dinagepore, by Hyatpore, 2,000 a day for 60 days	1,20,000	
		8,68,000
**Grand total by East Indian Railway ... . **		**41,95,000, or about 154,000 tons.**
From this we may deduct—		
Mr. Hewitt's local purchases at Patna	**5,64,000**	
North-Western Provinces' grain for Shahabad and Soane Canal ...	**63,000**	
North-Western Provinces' grain for Gya	**25,000**	
Ditto ditto for Monghyr ...	**1,66,000**	
		8,28,000
Which leaves for *up* trains		**33,67,000 or about 124,000 tons.**

At an average rate of despatch of 2,000 tons per day, this amount would be cleared off by the 31st of May.

This does not provide for Chota Nagpore and Burdwan requirements, which are not very great.

In fact, however, we cannot afford to delay despatches from Calcutta so long as the above, seeing the vicissitudes of the seasons, and that our district carrying power is now raised to a very high point. It would be extremely desirable to carry and store as much as possible in the next six weeks.

34. If we could work the railway up to the full amount that the carrying power of all the districts could be calculated on to take away, we should have to send about the following quantities weekly:—

	Mds.
For Sarun	35,000
,, Chumparun	60,000
,, Tirhoot, with the Durbhunga Railway appliances ...	3,10,000
,, Shahabad, Gya, and Patna	15,000
,, Bhagulpore	70,000
,, Monghyr and Sonthalia	20,000
,, Purneah	60,000
,, Chota Nagpore Districts	10,000
Total ...	5,80,000

i.e., we should have to send 21,323 tons a week, or about 3,000 tons a day. This the railway cannot carry. But, as above shown, some districts will have drawn all their stock long before the latest date and the despatches of some must be eased off, so that if the railway can take without fail 2,500 tons a day, as now arranged, we may expect that all the grain will be stored before the rains, if the monsoon sets in at the usual time. This, however, will still involve some easing off of the transport now available.

Coming now to Eastern Bengal, and first—

RUNGPORE.

35. Sir Richard Temple's allotment for Rungpore is 3,00,000 maunds. Up to 27th March 1,46,534 maunds have been despatched from Calcutta, leaving 1,53,466 to be sent up in April and May. The transport returns show 1,29,004 received. The Eastern Bengal Railway Company's steamer can make 2½ trips from Goalundo to Kaligunge every month, and carry 25,000 maunds each trip. Mr. Davies, the sub-divisional officer of Goalundo, is also sending rice up in such native boats as he can hire suitable for the journey. These two sources of despatch will ensure 1,20,000 maunds being landed at Kaligunge on or before the 20th May. For the remaining 33,466 we have one of the India General Steam Navigation Company's steamers (either the *Bombay* or the *Lucknow*) and two flats, which will be transferred to Goalundo as soon as the Eastern Bengal Railway's additional steamer, the *Alfred*, commences to ply on the Kooshtea and Rajmehal route. She was to be at Kooshtea before April 1st; and the India General Steam Navigation Company's steamer, which is to be sent to Goalundo, will easily make two trips between the time she joins and the 10th May, carrying 20,000 each trip. This amply covers the 33,466 maunds required at Kaligunge to complete Sir Richard Temple's allotment. There is no reason to fear any break down in this part of the transport arrangements. It will rest with the local authorities to ensure the success of the transport from Kaligunge into the interior. When Sir Richard Temple wrote his Minute No. 47, *i.e.*, on the 14th March, the rice for Rungpore itself was being carried by boat up the Teesta, and that destined for other parts of the district was being sent on by cart. There were 500 boats and 1,000 carts available, the estimated carrying power of which was 2,500 maunds daily. This would give a supply up to the 20th May of over one and half lakhs of maunds, and up to the breaking of the rains, say up to 15th June, of 75,000 maunds more. The water-routes will improve during the rains; and, unless any unforeseen accident should arise, the present arrangements may be confidently relied upon to perform the work expected of them. If more grain be required after the rainy season commences, it can be sent up by water from Kaligunge, where a reserve can, if necessary, be stored.

BOGRA.

36. The estimated requirements of this district are 2,40,000* maunds. Up to 27th March (according to the transport returns, which are not; however, it is believed, really up to date,) 52,974 maunds had been received into the district, leaving to be sent, during April or May, 1,87,026 maunds. The India General Steam Navigation Company's regular steamers will take 10,000 maunds each trip, and can make three trips in April and two in May. This provides for 50,000 maunds. Then we have the New River Steam Company's Steamer *Nepal* and two flats plying between Goalundo and Shohagipara, and carrying 20,000 maunds each trip. Between 1st April and 20th May she will make four trips and carry 80,000 maunds. There remains but 57,000 maunds (in round numbers) to be provided for. This will be taken by the steamer *Sultan* and her two flats, recently hired from Mr. Jackson. She and her flats take 14,000 maunds, and ought to make at least four trips from the date of her arrival at Goalundo (during the four weeks in April) to the 31st May. If any further steamer power is required for this route, the India General Steam Navigation Company's steamer *Lucknow* will, as per the next foregoing paragraph, be free from the Kaligunge route by the 10th May. It remains for the local authorities to arrange to carry away the grain as fast as it arrives, and, with water and land carriage together, this will not be difficult.

* *Vide* Sir Richard Temple's Minute of 16th March 1874.

REMAINING DISTRICTS OF RAJSHAHYE DIVISION.

37. With the exception of Bogra and Rungpore, which are supplied by steamer at two points, Shohajipara and Kaligunge, respectively, all the districts of the Rajshahye division and the Northern Bengal Railway draw their supplies by several routes from the following points:—Hyatpore, Manikchuck, Rampore Bauleah, Godagari, Dhapari, and Goalundo. It is impossible to say the exact destination of all the grain sent up from the above main depôts, and it is therefore necessary to group the remaining districts together, and treat them as supplied collectively therefrom; thus—

District.	Allotment.	Received at main depôts north of Ganges up to March 28th.	Balance to be received.
	Mds.	Mds.	Mds.
Dinagepore	1,200,000		
Maldah	150,000		
Rajshahye	100,000		
Northern Bengal Railway	100,000		
Total ...	1,550,000	781,700*	768,300

38. By the latest returns available the actual despatches to the interior of the above districts averaged 17,000 maunds daily from all the depôts, *i.e.*—

	Mds.
From Hyatpore	1,300
„ Manikchuck	1,700
„ Godagari	7,000
„ Beauleah	1,800
„ Dhapari	2,152
„ Noonnuggur	3,100
Total ...	17,052

But the above is not nearly the full carrying power of the available transport, and the grain was being sent off nearly as fast as received. Until lately, the Rajshahye depôts have not been fully supplied with rice, owing to the greater and more urgent requirements of the other two divisions. If rice be available, the Eastern Bengal Railway can carry *at least* 28,000 maunds a day to the main receiving depôts at Kooshtea and Goalundo. At the rate of 17,000 maunds daily, all the rice, if delivered north of the Ganges, will have started for the districts in 45 days, or before the twelfth May; and at the rate of 20,000 maunds daily, in 38 days, or by the first week in May. This would ensure most of its being stored before the rains.

In his Minute No. 45 of 11th March 1874 on the Dinagepore district, Sir Richard Temple says:—"I have seen something of the transport arrangements, and so far as I have seen they are efficient. * * * * * The Collector and Commissioner are justified in their confidence that the million of maunds will be stored by the rains."

39. But in these districts it would be sufficient if the great mass of the grain reached main depôts on the upper reaches of the rivers before the rains commence. It could then be distributed easily in boats. And of the grain reaching such depôts in time there is now certainly no doubt.

40. The routes now being worked are thus described by Sir Richard Temple:—

"I.—Railway, Eastern Bengal. Terminus *Goalundo*.

"By country boats across the Ganges to junction of its affluent the Oorasagur; then through the Chullun Bheel Lake into the Attrai, passing through the Pubna and Rajshahye districts to Nowgong, a depôt on the Dinagepore

* These figures are certainly incomplete, 14,50,000 maunds have been despatched to the Eastern districts up to the 31st. The transport returns show only 9,63,686 maunds received at the depôts on the north of the Ganges in these districts including Rungpore and Bogra. But the balances on the 1st April at the despatching depôts on the south bank, were only 1,04,710 maunds, showing that much more than 9,63,686 maunds was on its way across, if not actually arrived.

frontier; thence through southern part of the Dinagepore district to Putneetola on the Attrai, a distressed locality; distance entirely by water 70 miles.

" II.—By steamer up the Brahmapootra to Noakeela opposite Bogra, thence by carts through Bogra district to Ghoraghaut and Bhadureea, distressed localities in south-eastern corner of the Dinagepore district; distance by water 120 miles, by land 50 miles.

" III.—Eastern Bengal Railway. Terminus *Kooshtea.*

" By steamer and country boats up the Ganges to Rampore Beauleah, on north bank; thence by carts through Rajshahye district to Putneetola, already mentioned; distance by water 40 miles, by land 50 miles.

" IV.—By steamer and country boats up the Ganges to Godagaree, at junction of the Mahanuddee; thence by carts through parts of the Rajshahye and Malda districts straight on to Dinagepore. This is the first of the two main routes for the centre of the Dinagepore district; distance by water 60 miles, by land 90 miles.

" V.—By steamer and boats to Godagaree; thence entirely by boats up the Mahanuddee to Rohimpore, junction of the Poorna-Bhaba in the Malda district; thence up the Poorna-Bhaba past Neetpore to Gungarampore, distressed localities in the Dinagepore district; distance entirely by water 140 miles.

" VI.—By steamer and country boats to Godagaree: thence entirely by boats up the Mahanuddee to Malda: thence by carts through Malda district to Tumboolee, distressed portion of Dinagepore district, and on to Dinagepore. This is the second of the two main routes to Dinagepore; distance by water 110 miles, land 60 miles.

" VII.—By steamer and boats to Godagaree, to Malda, where transhipped into smaller boats and carried up the Mahanuddee to Churamun (Dinagepore district), junction of the Koolik; thence up the Koolik to Raigunj; thence by carts to Hemtabad and its neighbourhood; distance by water 150 miles; by land 20 miles.

" VIII.—By steamer up the Ganges to Manick Chuck, opposite Rajmehal, on north bank; thence by cart to Neema Serai on the Mahanuddee in district of Maldah; thence by boats up the Mahanuddee to Churamun (Dinagepore district), and Raigunj; distance by water 150 miles, by land 20 miles.

" IX.—Station East Indian Railway, *Rajmehal.* Cross Ganges by boats to Manick Chuck; thence by carts to Neema Serai; thence by boats to Churamun. Also by carts past Neema Serai to Dinagepore; distance by water 40 miles, by land 20 miles in the first case and 60 in the second.

" X.—Station East Indian Railway, *Sahebgunj.* Down Ganges by boats to Hyatpore, north bank: thence by carts through Malda district to Churamun and Raigunj; distance by water 20 miles, by land 25.

" XI.—*Sahebgunj.*—Across river by steamer to Caragola: thence by carts through Purneah district to Dengrah Ghaut; thence to Hemtabad (Dinagepore district) and to Kishengunj (Purneah): thence to Nekmurd (Dinagepore); distance by water miles, and by land 90 miles in the first case and 120 miles in the second case."

The Manick Chuck route has since been abandoned, but as its carriage will be made available for other lines there is no general loss of carrying power.

42. The only question remaining is whether there is transport enough to get the grain across the Ganges in time. For ferrying the Government grain across the Ganges from Kooshtea there are now working, besides country boats, the steamers named in the margin; and the transport officer at Kooshtea reports that he can put across the river from Kooshtea up to 300,000 maunds a month; and he has worked up to this rate for some weeks. It would seem therefore certain that the arrangements made are more than sufficient to secure the object in view.

Peel and two flats; *Koladyne* and one flat; *Lucknow* and two flats; *Bombay* and two flats; *Star of Dacca* and one flat. It is expected that the Eastern Bengal Railway steamer *Alfred* with two flats will take the place of either the *Bombay* or the *Lucknow* and set her free from the 1st April, for the Bogra route. There will still remain, however, five steamers on the Kooshtea berth.

A. MACKENZIE,
Junior Secy. to the Govt. of Bengal.

CALCUTTA,
The 30th March 1874.

SIR R. TEMPLE'S NOTE REGARDING THE RAILWAY TRANSPORT.

Minute No. 68, *by the* HON'BLE SIR RICHARD TEMPLE, K.C.S.I., *dated Calcutta, the 4th April* 1874.

1. HIS Honor the Lieutenant-Governor has shown me the proceedings of the Government of Bengal regarding the transport arrangements for the Patna and Bhagulpore divisions, and invited me to state my opinion as to the means of inland carriage in those two divisions in relation to the transport of Government grain by the East Indian Railway Company.

2. From a consideration of the latest returns received, it appears that the inland carriage is carrying away from the several railway stations upwards of 2,000 tons a day. And this, too, after allowing for a short quantity, below engagement, being carried by the Alliance Company, and without counting the Government reserve carriage.

3. The Durbhunga State Railway has begun to carry grain, and will very shortly be carrying 800 tons a day. This quantity, added to the 2,000 tons, will make up a total of 2,800 tons daily.

4. I understand, however, that the Railway Company are not at present prepared to carry more than 2,500 tons daily. It is, of course, of vital importance that the amount carried should never, even for a single day, fall short of this amount. If this amount be maintained, the total quantity allotted will be sent forward from the several railway stations before the 1st June, and stored at the depôts in the interior by the 15th June, that is, the commencement of the rainy season, provided that no unforeseen accident occurs. And therefore the proposed arrangement may prove sufficient.

5. On the other hand, it has been seen above that the inland transit in the Patna and Bhagulpore divisions is now carrying, or is prepared to continue carrying, away somewhat more than the amount above set down, and I learn from the proceedings of the Government of Bengal that in some places the demands of the local authorities for Government grain have been unavoidably reduced in order that the limit of 2,500 tons daily, set down to be carried by the railway, may be observed.

6. Looking to the latest reports, I should consider that 3,000 tons daily can be carried away by local resources, from the several railway stations thus:—

	Tons.
Durbhunga Railway	800
Country carriage	2,200
	3,000

It is to be observed too that the Durbhunga Railway is reported to be able to carry from 1,000 to 1,200 tons a day, and that the short-coming on the part of the Alliance Company may yet be partly retrieved.

7. On the whole, it is not too much to say that if every effort be strained by the local authorities to carry away the grain as fast as possible, upwards of 3,000 tons a day could be sent forward from the railway stations.

8. The result might be, that the various quantities which make up the total amount allotted, would arrive at their various destinations in the interior of the districts sometime before the latest safe-day, namely the 15th of June. This would not be a disadvantage, but on the contrary a great and a commanding advantage, for it would be a safe-guard against the many unforeseen accidents which might occur towards the end of the hot season. This margin of time might allow the authorities to repair losses, damages, or misfortunes, to which such a service and such operations as those now before us are very liable. It is therefore greatly to the interest of the districts concerned and conducive to the safety of the people that the authorities should have grain supplied to them, (within the limits of the allotments,) as fast as they can carry it away.

9. Great pressure has been put upon the local authorities to organise their transport as strongly as possible. And they have answered to that call

in a manner which will, I trust, be found worthy of the approbation of Government. And it would be very convenient if their districts could be allowed to reap the full benefit of these arrangements.

10. If, therefore, it be possible for the East Indian Railway Company to carry more than 2,500 tons of Government grain a day, say 3,000 tons, or even 3,400 tons a day, that would be a considerable advantage to the general relief operations in Behar. Whether the Company could do this, with due regard to other considerations, is a matter on which I need not attempt to give an opinion. But I should feel sure that, subject to the direction of the Government of India, the Company will endeavour to effect this object if it be found reasonably practicable.

11. It is to be remembered that the amount carried by local carriage, as above set down, refers to the Patna and Bhagulpore divisions and is irrespective of the local carriage of the Rajshahye division.

12. In offering these general remarks, however, I do not forget that besides the question of the carrying powers of the East Indian Railway, there is the consideration of the transport by sea from Burmah to Calcutta. It may or may not be possible to land sufficient quantities of the rice at Howrah in time to afford consignments to the amounts required to keep the inland carriage, up-country, up to its full working power. That, of course, is a matter upon which I am not, at this moment, able to form any accurate opinion.

No. 121, dated Calcutta, the 31st March 1874.

From—G. H. K. HART, ESQ., on special duty,

To—The Offg. Secretary to the Government of Bengal, Statistical Dept.

I AM directed by the Hon'ble Sir Richard Temple to report the completion of his second tour in the distressed districts.

2. The various Minutes, Nos. 39 to 62, 64 and 67, already submitted to the Government of Bengal, comprise all the remarks and recommendations which seemed from inquiry on the spot to be required. It is hoped that they will be found to treat of all the points adverted to in your letter No. 1236—S.R. of the 4th March, with one exception.

3. This exception is the case of Chota Nagpore, which country Sir Richard has been unable to visit by reason of the shortness of the time available.

4. I am to take this opportunity of submitting three Minutes, namely No. 63, summarising the statistics of the Patna division in relation to scarcity and relief, and No. 65 for the Bhagulpore division (which may be taken together with the previous Minute No. 52 of 18th March, for the Rajshahye relief division), and No. 66, giving an abstract of the several summaries for the whole country comprised in the divisions of Patna, Bhagulpore, and Rajshahye, so far as the operations are concerned, which have come under Sir Richard Temple's cognizance.

5. He desires to tender his acknowledgments to His Honor the Lieutenant-Governor for the support so promptly accorded to all the recommendations which have been made; and he trusts that the general result of the proceedings may prove satisfactory to the Government of Bengal.

No. 109, dated Malda, the 18th March 1874.

From—G. H. K. HART, ESQ., on special duty with SIR R. TEMPLE, K.C.S.I.,

To—The HON'BLE C. E. BERNARD, C.S., Offg. Secretary to the Government of Bengal.

I AM directed to forward, for submission to His Honor the Lieutenant-Governor, copy of a Minute by the Hon'ble Sir Richard Temple, No. 52, dated 18th March, summarising under one view the main points connected with the districts of Dinagepore, Rungpore, Bogra and Malda, as regards the anticipated distress therein.

Minute No. 52 *by the* HON'BLE SIR RICHARD TEMPLE, K.C.S.I., *dated Malda, the* 18*th March* 1874.

1. I HAVE now completed my journey through the worst portions of the four districts of the Rajshahye Division where severe distress is expected, *viz.*, the districts of Dinagepore, Rungpore, Bogra, and Malda, which have been formed by the local Government into a separate relief division under Mr. W. LeF. Robinson as Commissioner. The observations and proposals which I have made regarding each of the districts will be found in the Minutes Nos. 45, 46, 47, 48, and 51 dated 11th, 14th, 16th and 18th March. It now remains briefly to summarise the main points under one view.

2. The area and population of the four districts may be stated as follows:—

Districts.	Area in square miles.	Population.	Number per square mile.
Dinagepore	4,126	1,501,924	364
Rungpore	3,476	2,149,972	619
Bogra	1,501	689,467	459
Malda	1,813	676,426	373
Total ...	10,916	5,017,789	459

3. The number of persons which I have estimated, in consultation with the local authorities, as likely to need aid from Government during the worst months of the distress, together with the percentages of such numbers on the population, may be stated thus:—

	Numbers at worst from 2 to 4 months.	Percentage on population.	
Dinagepore ...	426,530	60 per cent on ...	419,500
		30 „ ...	582,766
Rungpore ...	127,400	20 „ ...	123,000
		15 „ ...	255,000
		10 „ ...	120,000
		50 „ ...	18,000
		5 „ ...	145,000
Bogra ...	112,500	30 „ ...	258,123
		20 „ ...	175,243
Malda ...	62,433	30 „ ...	92,011
		25 „ ...	55,316
		15 „ ...	48,999
		10 „ ...	103,758
		5 „ ...	65,548
Total	728,863		

4. The provision of Government grain, as already ordered by the local Government, or as now proposed by me, may be thus stated in maunds:—

	Already ordered by local Government.	Additional, proposed by me.	Total.	Already advised in district up to 7th March.
Dinagepore ...	10,00,000	2,00,000	12,00,000	2,00,000
Rungpore ...	2,00,000	1,00,000	3,00,000	1,20,000
Bogra ...	50,000	1,90,000	2,40,000	20,000
Malda ...	1,00,000	50,000	1,50,000	29,000
Total ...	13,50,000	5,40,000	18,90,000	3,69,000

5. I was particularly requested by the Government of Bengal to revise the relief arrangements in these districts, and to settle them wherever they remained to be settled. I found that this business was to some considerable extent done in Dinagepore, and partly in Rungpore. I have now, in consultation with the local officers, fixed all the circles. Their numbers are as follow:—

	No. of Circles.	European Officers.	Native Officers.	Subordinate Officials.		
				Civil.	Department Public Works.	Medical.
Dinagepore ...	13	9	4	29	13	13
Rungpore ...	9	4	5	9	6	9
Bogra ...	7	3	4	3	6	6
Malda ...	3	3	2	5	3	3
Total ...	32	19	15	46	28	31

6. All the officers (Native and European) have been appointed. Most, though not all of them, have joined. Of the subordinate officials, most of the civil have been appointed, but many have not yet joined. Few only of the medical or Public Works subordinate officials have been appointed, but I have made urgent application for them.

7. The relief works consist chiefly of roads and of tanks. The total length of the roads in miles I give below. The tanks are numerous, but number cannot be given. The number of laborers as known up to the latest report is also given, but it is increasing daily.

	No. of laborers as *known up to* 2nd week of March.	Total length of relief roads of district in miles.
Dinagepore	43,500	420
Rungpore	7,000	723
Bogra	3,935	160
Malda	2,252	187
Total ...	56,687	1,490

8. The rate of wages for an adult male is 2½ annas in the Dinagepore, Rungpore, and Bogra districts per diem, task-work not being undertaken under 3 annas. The same rates prevail in Malda.

9. The number of circles in which I have authorised the sale of Government grain under the rules is—

Dinagepore	4	Bogra	none.
Rungpore	3	Malda	1

10. The number of grain depôts in the several districts, nearly all of which depôts contain stores, is as follows:—

Dinagepore	30
Rungpore	15
Bogra	8
Malda	8
Total ...	61

11. The number of carts employed in the transport of grain in the several districts is as follows: if this number appears small as compared with other divisions, we must remember that in all the districts water carriage is largely used, sometimes by country boats and sometimes by steamers.

	Carts with pair of bullocks.	Country boats.	Steamers.
Dinagepore	5,000	250	...
Rungpore	450	50	1
Bogra	250	20	1
Malda	2,000	400	1
Total ...	7,700	720	3
Add carts from Purneah District employed in Dinagepore District ...	1,500		
Total ...	9,200		

Pack-bullocks not having as yet been employed. A reserve of 1,500 carts has been ordered, 500 for each of the districts of Dinagepore, Rungpore and Malda.

12. The amount of advances as yet taken by zemindars for the assistance of their tenantry, and the money advanced to traders for the importation of grain from a distance, may be thus approximately given, though it is hoped the amount will be largely increased. In round numbers, zemindars have taken Rs. 90,000, traders Rs. 40,000.

13. The number of persons at present receiving charitable relief may be thus stated for the present, though it is to be feared that the number will now increase:—

	Daily.
Dinagepore	None.
Rungpore	3,460
Bogra	None.
Malda	2,936
Total ...	6,396

In Bogra some relief is given by private subscriptions.

14. No death from want, or from disease caused immediately by want, has as yet been reported from any district.

15. The cause of the distress in all the districts is the partial failure of the summer or *aus* rice crop, and the still greater failure of the winter (hemantee) rice crop, from scantiness of rain in the summer and autumn of 1873, together with the absence of any considerable cultivation, in the distressed tracts, of spring crops—wheat and pulses—to make up for loss of rice.

16. The worst period of distress in all the four districts is expected to set in during May, and to last till the middle of August; but the distress will last in some degree till December.

17. Private import trade is tolerably active in the Rungpore, Bogra, and Malda districts, but not at all in Dinagepore. Again, the situation of the Dinagepore district is much more difficult than that of the other three districts, because it is isolated at all times, landlocked in the hot season, though enjoying some facilities of water carriage in the rains; whereas the other three are on the banks of the large rivers, navigable by boats or steamers all the year round.

18. Lastly, I desire to speak in high commendation of the Relief Commissioner, Mr. W. LeF. Robinson. His extensive local knowledge, his promptitude in action, and his thoughtful care for the people, entitle him to the confidence of Government in the execution of his very important duty.

Minute by the HON'BLE SIR RICHARD TEMPLE, K.C.S.I., *No.* 63, *dated Bhagulpore, the* 27*th March* 1874.

FROM the latter part of January to the beginning of March, I was chiefly engaged in visiting the worst portions of the three districts in the Patna Division where severe distress is anticipated, *viz.*, Tirhoot, Chumparun, and Sarun. I have since passed through the districts of Shahabad and Gya and consulted the local authorities regarding the prospect of, and preparations for, the scarcity. I have also visited the Patna district, where no general scarcity at all is anticipated. That district is excluded from consideration in this Minute, which thus includes the whole of the Patna Division or Commissionership, except the district of Patna. The remarks and recommendations which I made will be found in the Minutes written during my visit, especially Nos. 1, 2, 5, 6, 10, 13 to 15, 17 to 19, 22 to 24, 29 to 36, 40, 57, 60, 61 and 67.

2. I now desire briefly to summarise, under one view, the main points, with the remark that any apparent discrepancies between the figures given in this Minute and in my former Minutes above cited are to be accounted for by the accession of more recent information having modified the statistics first presented.

3. The area and population of the five districts are as follow:—

District.	Area in square miles.	Population.
Tirhoot	6,343	4,384,700
Chumparun	3,531	1,440,800
Sarun	2,654	2,063,900
Shahabad...	4,385	1,724,000
Gya	4,718	1,949,700
Total ...	21,631	11,563,100

4. The numbers of persons whom I have estimated, after conferring with the local authorities, as likely to need aid from Government during the period of worst distress, together with the proportion those numbers bear to the total population concerned, may be thus set forth :—

District.	Number at worst period.	Percentage on population.
Tirhoot	1,000,000	23 per cent. on whole population.
Chumparun	316,000	50 per cent. on 285,600. 20 „ on 404,100. 15 „ on 466,200. 10 „ on 284,900.
Sarun	280,000	13 per cent. on whole population.
Shahabad	105,000	6 per cent. on „
Gya	93,000	5 per cent. on „
Total ...	1,794,000	

5. These numbers have been obtained after separate enquiry by the local officers under my own observation for each tract in detail in each district by taking on the whole population a percentage representing those who are expected at the worst period to need assistance in some shape or other from Government, the percentages varying according to the circumstances of each tract.

6. The figures below give the quantities of grain which I have recommended to be sent, and the quantities which have, up to the middle of March, arrived within the several districts. I understand that the whole of the quantities recommended have been ordered by the Government.

District.	Recommended and ordered.	Arrived in the district.
Tirhoot	4,200,000	1,280,000
Chumparun	1,150,000	604,000
Sarun	680,000	310,000
Shahabad	317,000	179,000
Gya	220,000	140,000
Total ...	6,567,000	2,463,000

Of this total quantity full 88 per cent. consists of rice, and the remainder, or 12 per cent., consists of mixed grain—wheat, Indian-corn, &c., chiefly obtained from the North-Western Provinces.

7. In communication with the local officers on the spot, I ordered the establishment of relief circles under the rules sanctioned by the Government of India, where they seemed to be required, and recommended the early appointment of officers, one for each circle, to supervise the distribution of relief, the relief works, and the medical arrangements. The numbers of such circles are as follow :—

Tirhoot	32
Chumparun	6
Sarun	1
Shahabad	0
Gya	0
Total	39

8. Before leaving the Patna Division to inspect the Bhagulpore and Rajshahye Divisions, I had fixed the places for these circles, arranged that there should be one superior officer and one native officer to each circle (with one superior European officer over each set of circles), and obtained the services of many of the European officers and most of the native officers required for the establishment on the above scale. The native officers were chiefly men selected from the Army.

9. Shortly afterwards Sir George Campbell proceeded to Durbhunga, and personally supervised the working of the circles, in several places enlarging the organization according as the distress developed itself. Among other things he obtained the services of a number of trained native civil officials from the North-Western Provinces.

Subsequently, with Sir George Campbell's approval, I have obtained the services of a further number of native officials from the North-Western Provinces. And it has now been arranged that each circle shall have at least one European or one superior native officer and two subordinate native officers, some circles having more, according to circumstances. I have arranged, with Sir George Campbell's approval, that the temporary establishment shall be made up to this complement. It may now be said that all the officers, European and native, have joined, or are on their way. Those who have not joined are being pushed on as rapidly as possible. These remarks apply to the Tirhoot and Chumparun districts.

10. For the districts of Shahabad, Gya, and Sarun, where the distress will not be of such a nature as to require the formation of circles, I have arranged that there shall be four superior native officials appointed as supervisors for each district, or twelve in all, to go the rounds of the villages and to see that all necessary measures are adopted.

11. The additional establishment for relief of the whole division may be approximately stated as follows :—

District.	European supervising officers.	Circle officers.	Native officers.	Total.
Tirhoot	5	32	64	101
Chumparun	2	6	12	20
Sarun	1	2	6	9
Shahabad	...	...	4	4
Gya	...	1	4	5
Total ...	8	41	90	139

These numbers are in addition to the ordinary civil establishment of the district, European and native, all of whom are actively engaged in relief, which indeed forms an integral part of the civil administration.

12. With all the relief officers there are associated very many private gentlemen, European and native, scattered all over the country as members of sub-divisional committees or sub-committees. I cannot now state the number of those non-official coadjutors, but it must be considerable and greatly exceeding the numbers of the relief officers. In Tirhoot, Chumparun, and Sarun, the indigo planters collectively and individually are rendering the most important aid. Many native zemindars are doing the same. It will be interesting hereafter to record the particulars of the non-official assistance thus rendered. I am sanguine that it will be found to be worthy of commemoration.

13. Before the period of my visit a permanent line of electric telegraph from Patna to Segowlee (north of Chumparun), *viâ* Mozufferpore and Motiharee, had been sanctioned and had been completed as far as Mozufferpore. But to save time I proposed that the remainder of the line should be made as a temporary line, and that there should be an extension to Bettia and Ramnugger. I then, after consulting the local officers, recommended that temporary lines should be made to all the principal centres of the Tirhoot district. This was sanctioned by Government, and the temporary telegraph lines, now complete and in work, may be thus stated :—

Line.	Miles.
Mozufferpore to Motiharee, Bettia, and Ramnugger ...	102
Mozufferpore to Seetamurhee	32
Mozufferpore *viâ* Durbhunga to Mudhoobunnee	48
Barrh to Durbhunga, with branch to Tajpore	60
Mudhoobunnee to Nuraya	30
Total ...	272

14. The great public works which subserve most beneficially the purposes of relief are—

	Miles.
The Soane Canal	380
The Gunduck embankment	90
Total ...	470

and now the high level canal in the district of Chumparun, which is ordered to be commenced. The number of persons employed on, and the quantity of grain required for, these works are included in the total figures which I give for the several districts.

15. Besides these great works there are lesser relief works specially projected by the local officers. They consist chiefly of roads (earth-work) and tanks (excavation). The tanks under operation are numerous and scattered all over the country, and their number is increasing daily, and I cannot give it exactly. But the length of relief roads may be stated as follows :—

District.	Relief Roads.—Miles.
Tirhoot	710
Chumparun	520
Sarun	575
Shahabad	487
Gya	185
Total ...	2,477

Besides the work on all these lines of road, there are the special repairs being executed under European supervision on the lines of the transit of grain, as will be explained presently.

16. The number employed on relief works of all kinds may be stated as follows :—

District.	Number of persons.
Tirhoot	450,000
Chumparun, including Gunduck works	100,000
Sarun	90,000
Shahabad	2,000
Gya	1,000
Soane Canal works	33,000
Total ...	676,000

If the number should seem small for Shahabad and Gya, then we must remember that the relief laborers of those two districts are chiefly on the Soane canal works.

17. The number of persons receiving gratuitous relief is small. According to the latest information, it did not exceed 4,200 in Tirhoot, and 1,200 in Chumparun.

18. For the supervision of the relief roads and tanks, I have at various times applied for the services of overseers, which applications have been approved by Government, and the men have either joined or are on their way. Also several additional Engineer officers have been appointed. The number may be stated as follows :—

District.	Superintending Engineer.	Executive and Assistant Engineers.	Overseers.
Tirhoot	1	6	25
Chumparun	...	2	6
Sarun	...	2	3
Shahabad	...	...	2
Gya	...	...	4
Total ...	1	10	40

These are in addition to the establishment on the Soane canal works and on the Gunduck embankment, also to the ordinary Public Works establishment of the district, all of which assist in respect of relief works so far as they can.

19. For the work of the relief, I have applied for and obtained the services of native doctors and hospital assistants as below :—

District.	Native doctors and hospital assistants.
Tirhoot	60
Chumparun	14
Sarun	...
Shahabad	...
Gya	...
Total ...	74

I found the districts of Sarun, Shahabad, and Gya so far supplied with this class of men that more need not be applied for, especially considering the more urgent requirements of other districts and the difficulty of procuring the men.

20. The grain supplied by Government is sent to depôts at places selected with reference to the area of distress. The number may be thus stated for the several districts :—

Districts.	Number of depôts.
Tirhoot	74
Chumparun	24
Sarun	32
Shahabad	30
Gya	17
Total ...	177

All these depôts contain stores of grain. From these depôts the grain will be distributed according to circumstances.

21. The grain is despatched from Calcutta by separate arrangements, and reaches the stations on the East Indian Railway from Mokameh to Mogul Serai. It then comes under the charge of the Relief Department of the Patna Commissionership. That portion (which is by far the greatest) destined for the Tirhoot and Chumparun districts, is conveyed to the south or right bank of the Ganges by four small branches near Mokameh, Barrh, Futwa, and Patna; of which four branches three have been made especially for this occasion. It is then placed on board steamers, or barges towed by steamers, and conveyed to three points on the north or left bank, namely, Bunkur opposite Patna, Chumpta opposite Barrh, and a point opposite Mokameh. At these points it comes under the charge of the inland transport service, and is carried to the depôts by certain main routes which may be described as follows :—

Point of departure.	Route.	Distance in miles.
Bunkur ...	To Motiharee, Gobindgunj, Bettia, and Ramnugger	155
	To Poosa, Durbhunga, Mudhoobunnee ...	77
	To Seetamurhee and Sursoond	80
Chumpta ...	To Durbhunga and Nuraya, north-eastern corner of Tirhoot district	95
Opposite Mokameh...	To Durbhunga	50
	Total ...	457

From these main lines there are branch routes, too numerous to mention here, to the various grain depôts.

22. The grain for Sarun is carried by carts from the station of Arrah, and crossing the Ganges, is carried to Hutwa and Sadowa, distance from 80 to 90 miles.

23. The grain for Shahabad is sent from the railway stations between Arrah and Mogul Serai and carted into the interior; average distance 50 miles.

24. The grain for Gya is sent from the railway stations at or near Patna, and is carted into the interior to a distance of 60 miles.

25. The means of transport at present employed may be approximately set forth in numbers as below :—

District.	Steamers.	Country boats.	Carts.	Cartmen.	Draught bullocks.	Camels.	Pack-bullocks.
Tirhoot	5	900	58,000	60,000	116,000	2,000	3,000
Chumparun	.....	200	8,000	8,500	17,000	.....	.....
Sarun	.....	100*	3,500	3,600	7,000	.....	.....
Shahabad	.....	.....	1,000	1,050	2,000	.....	.....
Gya	.....	.....	500	525	1,000	.....	.....
Total	5	1,200	71,000	73,675	143,000	2,000	3,000

26. These various means of transport have been hired by Government. The carts and bullocks are for the most part brought into the field by five associations of European contractors. These contractors are indigo planters, gentlemen living on their own estates in the neighbourhood of the routes of transit. These contracts have been made by the local officers under my own supervision. The arrangements are at present working well, save in one case, where the contractors have not yet succeeded in carrying the full quantity engaged for. The remaining carts are furnished by small contractors, natives. It is remarkable that all the carts and bullocks are obtained within the limits of the Patna Division. The camels and pack-bullocks are furnished by a large native contractor from the North-Western Provinces.

27. Upon each of the main transit routes above mentioned there are several European officers to see to emergent repairs, to clear away obstacles, to construct temporary crossings, and the like; and with them there are also one regiment of Pioneers (natives) and five companies of Sappers; the whole being under the command of Colonel Macgregor, of the Quarter-Master-General's Department. At the two main points of departure, Bunkur and Chumpta, there is a special organisation on a large scale under selected European officers.

28. Besides these means I have, with the approval of Government, caused to be engaged a body of reserve transport of a strength equal to 4,250 carts drawn by 10,000 bullocks, capable of carrying (at the rate of 16 maunds a cart) 68,000 maunds per daily march of twelve miles; also 6,000 pack-bullocks or pack-ponies. These carts and animals have for the most part been purchased for Government in the North-Western Provinces and in the Shahabad district. The carts are divided into detachments of 250 carts each, with a complete military organization under European and Native officers. This arrangement is being carried out under Mr. H. Rivett-Carnac. This reserve is intended to remedy any mishap or failure which may occur with the contract hired carriage; and its organization is designed to render it as effective as possible for this end.

29. With a view to obtaining an additional resource on the route from Chumpta to Durbhunga, which is by far the most important of all the routes, I strongly recommended, at the end of January last, the construction of a tramway, distance 50 miles. The Government, after consideration, sanctioned the project, with important additions, whereby the line becomes a railway. The work is progressing under the good auspices of Mr. Molesworth and Major Staunton.

* The number of boats was much larger than is here set down, while the navigation of the Gunduck continued feasible. Double the number of boats now employed may be expected on the river as soon as the rains set in.

30. The advances of money (repayable) obtained from Government by landowners for the assistance of their tenantry and by traders for the importation of grain may be set forth as below :—

District.	By zemindars for the ryots.	By native traders for importation.	Total.
Tirhoot	95,506	522,650	618,156
Chumparun	60,000	132,000	192,000
Sarun	286,890	129,700	416,590
Shahabad	....	3,300	3,300
Gya	8,800	10,000	18,800
Total ...	451,196	797,650	1,248,846

31. I ordered Government grain to be offered for sale under clause 9, Rule 3, Part II, of Rules for Relief Committees, at the rate of ten seers to the rupee, in the several circles which form the eastern half of the Mudhoobunnee and Durbhunga sub-divisions. This order has been carried out. I afterwards directed that a rate of 12 seers to the rupee should be allowed. This order has not, however, been carried out as yet.

32. I cannot finish this summary without taking the opportunity of giving my testimony to the judgment, discrimination, and assiduity displayed by the Commissioner, Mr. Stuart Bayley, in the discharge of the extraordinarily difficult duties which have devolved on him ever since the first threatening of scarcity in Behar. The ability with which he has sustained the pressure of so many urgent affairs, simultaneously presenting themselves for decision, entitle him to the commendation and the confidence of Government. I trust that he may in due course witness the successful result of his labours.

33. I also desire to commend to the notice of Government the exertions of Mr. J. Hewitt, the Deputy of the Commissioner of Patna. He has had a prominent share in the transit arrangements on both banks of the Ganges, and his general assistance to the Commissioner in all affairs relating to the scarcity has proved very valuable.

No. 119, dated Bhagulpore, the 28th March 1874.

From—L. C. Abbott, Esq., on duty with Sir Richard Temple, K.C.S.I.,
To—The Offg. Secretary to the Government of Bengal, Scarcity and Relief Dept.

I am directed to forward copy of a Minute No. 64 of 28th March, recorded by Sir Richard Temple, regarding the requirements of the Monghyr District.

Minute by the Hon'ble Sir Richard Temple, K.C.S.I., *No.* 64, *dated Bhagulpore, the 28th March* 1874.

Having visited the Monghyr District and discussed its affairs relating to scarcity with the Commissioner, Mr. Barlow, and the Collector, Mr. Lockwood, and the principal relief officer, Mr. Currie, I have to record the following observations.

2. The district is divided by the Ganges into two parts, northern and southern. On both banks of the river, especially the northern, there are spring crops which have turned out excellently well, and thus a large portion of the district is placed beyond the reach of apprehension.

3. But in the northern part of the district there is a tract named Bukhtearpore, included in the thana of Gogree, which is separated from the basin of the Ganges by a belt of swamp, and in which the main staple, rice, has failed, having produced a one-anna to two-annas yield. In the southern part is also a broad tract comprising the thanas of Sheikhpoora and Secundra, dependent mainly on the rice crop, which for the most part failed, having a yield of only 3 annas. There is also a hilly tract (around a branch of the Vindhyas jutting out against the Ganges) within which the rice crop has failed, especially near Khurrukpore, belonging to the Durbhunga Raj. Throughout the district there are autumn crops, Indian-corn, and the like, which last proved indifferent, with a yield of only 6 annas.

4. The general situation may be summarised thus.—Several tracts of the district have lost the greater part of its food-supply for nearly a year. But in juxtaposition with these there are tracts with excellent crops. There are as good facilities for trade and communication as could reasonably be expected in any district. At present the poorer classes in the distressed districts are engaged in cutting the harvest in the flourishing tracts, and when this employment ceases (in a few days more), they will probably come in great numbers suddenly on the hands of Government for relief. Thus the period of distress will be probably at its worst from the 15th April till the 15th June, when, if the rains fall favorably, there will be again employment obtainable. But the distress, though mitigated, will last till the produce of the autumn crop comes in by the beginning of September, after which time the distress will cease.

5. I requested the Collector to estimate the numbers of persons whom he expects will need assistance from Government, and he would take 40 per cent. on the population of the Bukhtearpore portion of the Gogree thana, on the population of the Sheikhpoora and Secundra thanas, and on the population round Khurrukpore, which calculation gives this result:—

In what thana.	Persons who will need assistance from Government.
Gogree	42,000
Secundra	44,000
Sheikhpoora	79,000
Khurrukpore	7,000
Total ...	172,000

I would accept this part of the estimate.

6. It is further agreed that we must provide for the whole number for two months (from 15th April to 15th June).

7. The Collector thinks that from 15th June to 1st October we should provide for a quarter of the number. The Commissioner thinks that it would not be safe to take less than a half.

8. The result of the two calculations may be seen thus—

Estimate by Commissioner.

	Mds.
172,000 for 2 months, at ¾ seer per day	1,93,500
86,000 for 3½ months, at ¾ seer per day	1,69,312
Total	3,62,812

Estimate by Collector.

172,000 for 2 months, at ¾ seer per day	1,93,500
43,000 for 3½ months, at ¾ seer per day	84,656
Total	2,78,156

9. I concur in the Commissioner's estimate, and consider that 3,60,000 maunds, plus 5 per cent. for wastage (18,000 maunds), making 3,78,000 maunds in all, should be provided for the Monghyr District.

10. Already 3,00,000 maunds have been ordered by the local Government, of which 1,92,000 maunds have been stored. Besides this there are 20,000 maunds stored by the Court of Wards (Durbhunga) at Khurrukpore, which added to the 1,92,000, makes up 2,12,000 maunds, leaving 1,66,000 maunds yet to be sent. But as the grain sent as yet consists of rice, the remainder can conveniently be supplied, if the Government sees fit, by mixed grain obtained in the North-Western Provinces.

11. After communicating with me on the occasion of my visit to Soopole, the Commissioner has fixed the following relief circles, which appear to be quite appropriate;—

1. Bukhtearpore ... ... North of Ganges.
2. Luckee Serai
3. Secundra } ... ... South of Ganges.
4. Sheikhpoora

The three last named circles form a group, and have been constituted a relief sub-division under Mr. Currie, C.S.

12. The local Government has already appointed European officers to each of these circles. I had previously authorized the Commissioner to appoint one native officer to each circle. I have now requested him to appoint a second native officer to each circle, which he will be able to do immediately. There is at least one overseer for public works in each circle; a native doctor has also been appointed to each.

13. I have the pleasure to state that the Commissioner and the Collector speak in high terms of the conduct of the zemindars in the distressed tracts, who are keeping their tenantry from their own resources, taking advances from Government for this purpose, and constructing tanks and such like works in the villages. The number of such tanks is reported to be at least 34. The Durbhunga Court of Wards also, through Mr. Roberts, the local manager, is setting the best example to neighbouring zemindars by storing grain, constructing works, and assisting ryots.

14. The amount of cash advances obtained from Government is shewn in the subjoined table; the amount is creditable to the district authorities:—

Monghyr District.

	Rs.
Advances for purchases of grain, under paragraph 4 of Circular No. 80 of 17th November 1873	56,800
For land improvement, under paragraph 21 of Circular No. 80 of 17th November 1873	33,790
Generally for helping ryots, under Government orders No. 4004 of 18th December 1873	11,300
Total ...	1,01,890

15. The length of relief roads amounts to 254 miles.

16. The number of relief laborers, including those employed by zemindars on their tanks and those employed by the Court of Wards, may be stated for the present time at 12,000.

17. This is less than the numbers for some of the previous periods. But, as already explained, the people have gone off to the harvesting. It is to be feared that they will soon return to the relief works in much larger numbers than ever.

18. In this district, however, relief circles are in working order, and adequate quantities of grain are stored at all the points of probable requirement. And I have seen no district better prepared than Monghyr to meet an emergency of this kind. The Collector, Mr. Lockwood, and the principal relief officer, Mr. Currie, merit the confidence of Government.

R. TEMPLE.

Minute by the HON'BLE SIR RICHARD TEMPLE, K.C.S.I., ***No. 65, dated Bhagulpore, the 28th March*** 1874.

I HAVE on three separate occasions during my two recent tours visited portions of the Bhagulpore Division or Commissionership. The observations and proposals which I have felt called upon to make will be found in my various Minutes written from the places visited, *viz.*, Nos. 25 to 28, 39, 41 to 44, 54A, and 64.

I now desire to bring together the main points in a synoptical shape, embodying in this Minute the latest information received by me as to the result of the orders I gave and the recommendations I made in the Minutes above cited.

2. There are four districts belonging to this division, in all of which distress, more or less, is anticipated, namely, Bhagulpore, Purneah, Monghyr, and the Sonthal Pergunnahs. I have marched through the most parts of Bhagulpore and Purneah, and I have passed by one of the worst parts of Monghyr.

3. The area and population may be thus stated :—

District.	Area in square miles.	Population.
Bhagulpore	4,327	1,826,300
Purneah	4,957	1,714,800
Monghyr	3,913	1,812,900
Sonthal Pergunnahs	5,488	1,259,300
Total ...	18,685	6,613,300

4. The numbers of persons whom I have, in consultation with the local authorities, estimated as likely to require assistance from Government during the period of severest scarcity, together with the proportion between those numbers and the total population concerned, are as follow :—

District.	Number of people likely to need assistance.	Percentage on population concerned.
Bhagulpore ...	274,650	50 per cent. on 342,936 30 „ „ 344,587
Purneah	240,000	30 „ „ 364,266 15 „ „ 527,051 and 50,000 souls for rest of the district.
Monghyr... ...	172,000	40 per cent. on 430,000
Sonthal Pergunnahs ...	60,000	25 „ „ 240,000
Total ...	746,650	

5. The quantities of grain which I have recommended to be provided, and the quantities which have arrived in the several districts, are as follow :—

District.	Amount recommended. Mds.	Arrived in district. Mds.
Bhagulpore ...	7,30,000	1,74,550
Purneah	6,50,000	3,45,000
Monghyr	3,78,000	2,12,000*
Sonthal Pergunnahs ...	1,35,000	10,000
Total	18,93,000	7,41,550

The grain consists almost entirely of rice.

6. I have, in communication with the local authorities, fixed the relief circles for the distressed tracts in Bhagulpore, Purneah, and the Sonthal Pergunnahs. The Commissioner fixed the circles in the Monghyr District after consulting carefully with me. The numbers are as below :—

District.	Number of relief circles.
Bhagulpore	7
Purneah	8
Monghyr	4
Sonthal Pergunnahs	2
Total ...	21

7. For the management of these circles the following establishments have been made up :—

Districts.	European supervising officers.	Circle officers.	Native officers.	Total.
Bhagulpore	3	7	14	24
Purneah	2	8	16	26
Monghyr	2	4	8	14
Sonthal Pergunnahs	1	2	4	7
Total ...	8	21	42	71

* Including 20,000 maunds stored by the Durbhunga Raj (under Court of Wards) at Khurrukpore.

These establishments are in addition to the regular civil establishments of the district, who all assist in relief which is an integral part of the district work.

8. The relief works consist chiefly of roads (earth-work) and of tanks (excavation). The tanks are scattered all over the country, and I cannot give their number; but the length of the roads projected may be set down thus :—

District.	Length of relief roads in miles.
Bhagulpore	215
Purneah	505
Monghyr	254
Sonthal Pergunnahs	230
Total ...	1,204

9. The numbers of relief laborers are given below :—

District.	Number of relief laborers.
Bhagulpore	21,000
Purneah	12,000
Monghyr	12,000
Sonthal Pergunnahs	2,100
Total ...	47,100

10. I have, in communication with the Commissioner, proposed that the rate of payment for unskilled labor should be 1½ annas for a man per diem, with proportionately less amount for women and children, and that 2 annas per diem should be given, under a system of task-work, to the more skilled or stronger laborers.

11. There is the following extra establishment employed for relief works :—

District.	Superintending Engineers.	Executive Engineers.	Assistant Engineers.	Overseers.
Bhagulpore	1	0	2	7
Purneah	0	1	3	8
Monghyr	0	0	1	4
Sonthal Pergunnahs	0	0	1	0
Total ...	1	1	7	19

These are in addition to the ordinary establishment of public works in the district, all of whom aid in the operations of relief so far as they can.

12. The number of grain depôts may be stated thus :—

District.	Number of grain depôts.
Bhagulpore	32
Purneah	30
Monghyr	13
Sonthal Pergunnahs	11
Total ...	86

13. The grain is conveyed to the depôts by the following means : It is carried by the East Indian Railway to the stations of Sahebgunj, Colgong, Sooltangunj, and Monghyr, all on the south or right bank of the Ganges. From Sahebgunj it is carried across the Ganges by steamer, and from the other stations by boats or barges, to points on the north or left bank of the Ganges : whence it is carried to its various destinations by carts.

H.

14. The transport service consists of the following number of carts and country boats or barges :—

District.	Carts.	Draught bullocks.	Cartmen.	Country boats or barges.	Steamers.
Bhagulpore	8,000	17,000	8,000	151	.....
Purneah	8,000	17,000	8,000	200	1
Monghyr	2,000	4,000	2,000	39	.....
Sonthal Pergunnahs	200	400	200	.....	.....
Total ...	18,200	38,400	18,200	390	1

15. Zemindars and traders have been repeatedly invited to take advances from Government, the former to enable them to assist their ryots, the latter to enable them to import grain for sale. The result is that up to 28th March the following sums have been taken approximately :—

District.	By zemindars for ryots.	By traders for importation.	Total.
Bhagulpore	37,400	68,000	1,05,400
Purneah	32,150	60,700	92,850
Monghyr	11,300	56,800	68,100
Sonthal Pergunnahs	....	....	....
Total ..	80,850	1,85,500	2,66,350

Government advances to ryots in Kissengunge (Purneah) for the purchase of seed-grain, or for subsistence, have also been authorised.

16. **Returns made up to 28th March show that the following numbers of persons were in receipt of gratuitous relief from Government :—**

In Bhagulpore	1,300
„ Purneah	5,335
„ Monghyr	1,603
„ Sonthal Pergunnahs	....
Total ..	8,238

17. I have, on the recommendation of the local authorities, ordered the sale of Government grain at the rate of 12 seers to the rupee at the depôts in the thannahs of Bulrampore, of Kudbah, and of Kusbah Amour, in the Purneah district, in the parts of the Soopole and Muddehpoora sub-divisions of the Bhagulpore district, and at certain points in the Monghyr district.

18. In concluding this minute, I desire to cordially acknowledge the assistance I have received in my enquiries and proceedings from Mr. G. N. Barlow, the Commissioner, and to express my confidence in his ability to deal effectively and promptly with any difficulty that may arise in connection with the scarcity.

19. I also desire to bring to the notice of Government the very valuable services of Mr. H. Hankey, C.S., the Special Superintendent of Transport, both as regards the collection of country carriage under direct agency and the management of large contracts for the transport of Government grain.

Minute by the HON'BLE SIR RICHARD TEMPLE, K.C.S.I., *No.* 66, *dated Bhagulpore, the* 28*th March* 1874.

MY minutes Nos. 52, 63, and 65 of 18th, 27th, and 28th March, present an abstract of what has been recommended, ordered, and done during my tours through the divisions or Commissionerships of Patna, of Bhagulpore, and of Rajshahye; separate figures in those minutes are given for each district wherein severe distress is anticipated, and a total for each division. I now desire to draw up a brief *resumé*, giving separate figures for each of the divi-

sions above named, and a grand total for so much of Bengal and Behar as I have visited.

2. The total area and population of the three divisions is as follows :—

Division or Commissionership.	Total area in sq. miles.	Total population.
Patna	23,732	13,122,743
Bhagulpore	18,685	6,613,358
Rajshahye	17,694	8,893,738
Total ...	60,111	28,629,839

3. But it is only within certain tracts in each division that distress is anticipated. I give below the area and population of the districts or tracts in each division wherein severe distress is looked for, together with the proportion borne by the distressed parts to the whole of each division as respects area and population :—

Division or Commissionership.	Likely to be distressed.		Percentage of distressed tracts on total.	
	Area of tracts.	Population of tracts.	Area.	Population.
Patna	16,666	8,124,164	70·22 per cent.	61·90 per cent.
Bhagulpore	7,623	2,957,607	40·8 „	44·72 „
Rajshahye	8,098	3,491,936	45·76 „	39·26 „
Total ...	32,387	14,573,707		

4. **The number of persons which I have taken as being likely to need assistance from Government during the worst period of the scarcity, together with the percentage of those numbers on the total population and on the population of the distressed tracts, are given below :—**

Division or Commissionership.	Number of people estimated to require aid at worst period.	Percentage on distressed population.	Percentage on total population.
Patna	1,794,000	22·08 per cent.	13·67 per cent.
Bhagulpore	746,650	25·24 „	11·29 „
Rajshahye	802,863*	20·87 „	8·2 „
Total ...	3,433,713		

5. The following figures give particulars of the quantities of grain which I have recommended to be provided by Government, and the quantities which have already arrived in the districts :—

Division or Commissionership.	Provision recommended.	Arrived in the districts.
Patna	6,567,000	2,463,000
Bhagulpore	1,893,000	741,550
Rajshahye	2,090,000†	370,000
Total ...	10,550,000	3,574,550

* Including 44,000 persons in the Rajshahye district and, say, 80,000 on the Northern Bengal State Railway.

† Including the provision of 200,000 maunds for the Rajshahye district and the Northern Bengal State Railway.

6. The number of relief circles established, together with the numbers of officers allotted thereto, is given below :—

Division or Commissionership.	Number of circles.	Relief Officers.			Superintending Engineers.	Executive and Assistant Engineers.	Public Works Overseers.	Native Doctors and Hospital Assistants.
		European Superior Officers.	Circle Officers.	Native Officers.				
Patna	39	8	41	90	1	10	40	74
Bhagulpore	21	8	21	42	1	8	19	18
Rajshahye	31	19	31	15	1	.....	28	31
Total ...	91	35	93	147	* 3	18	87	123

This special relief establishment is over and above the ordinary civil establishments of the districts, all of which aid in the distribution of relief, which is an integral part of the administration of the various districts. Besides these, too, is the establishment on the Soane canal, the Gunduck embankments, and the Northern Bengal State Railway.

7. The banks and other miscellaneous relief works cannot be stated numerically; but the length of the relief roads, of the Soane canal, of the Gunduck embankment, and of the Northern Bengal State Railway within the distressed tracts is given below in miles :—

Division or Commissionership.	Relief roads.	Soane Canal.	Gunduck Embankments.	Northern Bengal (State) Railway.	Temporary Telegraph.
Patna	2,477	380	90	...	272
Bhagulpore	1,204	...	...	...	20
Rajshahye	1,490	...	...	178	44
Total ...	5,171	380	90	178	336

8. The number of relief laborers as given in my several minutes may be thus abstracted :—

Division or Commissionership.	Persons employed on relief works.
Patna	676,000
Bhagulpore	47,100
Rajshahye	63,700†
Total ...	786,800

9. The number of grain depôts opened, at all of which there are now stores of grain, is given below :—

Division or Commissionership.	Grain Depôts.
Patna	177
Bhagulpore	86
Rajshahye	61
Total ...	324

10. The means at present employed in the transport of Government grain are tabulated below, the figures being, however, only approximate :—

Division or Commissionership.	European officers.	Carts.	Cartmen.	Draught bullocks.	Camels.	Pack animals.	Country boats.	Steamers	Number of main routes of transport by land and water.
Patna	21	71,000	73,675	143,000	2,000	3,000	1,200	5	5
Bhagulpore	7	18,200	18,200	38,400	.....	.....	390	1	4
Rajshahye	5	9,200	9,200	18,400	.....	.....	720	3	11
	33	98,400	101,075	199,800	2,000	3,000	2,310	9	20
Government reserve ...	12	4,250	4,250	10,000	.....	6,000	.....	.....	.....
Total ...	45	102,650	105,325	209,800	2,000	9,000	2,310	9	20

* One Chief Engineer has since been appointed.
† Including 7,000 labourers on the Northern Bengal (State) Railway.

In order to strengthen the principal line of transit in Eastern Tirhoot, the railway is being constructed from Chumpta to Durbhunga, a distance of 50 miles.

11. Advances of money have been obtained from Government in the following sums :—

Division or Commissionership.	By Zemindars for assistance of their tenantry.	By traders for importation of grain.	Total.
	Rs.	Rs.	Rs.
Patna	4,51,196	7,97,650	12,48,846
Bhagulpore	80,850	1,85,500	2,66,350
Rajshahye	90,000	46,000	1,36,000
Total ...	6,22,046	10,29,150	16,51,196

Advances have also been authorised to ryots, both for their subsistence during the time which must elapse before their autumn and winter harvests are reaped, and for seed-grain to sow the autumn crops. But there are as yet no returns of the amounts of such advances made.

12. The approximate number of recipients of gratuitous relief from Government are :—

In Patna Division or Commissionership	...	...	5,400
„ Bhagulpore Division „	...	...	8,200
„ Rajshahye „ „	...	...	6,400
Total		...	20,000

13. In the three divisions the rates of wages for relief labor range from two to three annas per diem where there is task-work, and one to two annas where there is not. The above rates are for men; proportionally lesser rates are allowed for women and children.

No. 120, dated Calcutta, the 31st March 1874.

From—G. H. K. Hart, Esq., on Special Duty,
To—The Offg. Secretary to the Government of Bengal, Statistical Department.

I am directed to forward, for submission to His Honor the Lieutenant-Governor, copy of a minute by the Hon'ble Sir Richard Temple, No. 67, dated 28th instant, containing request for the despatch of 9 more public works overseers to the Chumparun and Sarun districts.

Minute by the Hon'ble Sir Richard Temple, K.C.S.I., *No.* 67, *dated Bhagulpore, the* 28*th March* 1874.

I have to request that the Government of Bengal will be pleased to send nine public works overseers in addition to the number already sent to the Patna division.

The men are required to supervise the relief works in Chumparun and Sarun, viz. six for the former and three for the latter district.

No. 2060 S. R., dated 4th April 1874.

From—C. Bernard, Esq., Officiating Secy. to the Govt. of Bengal, in the Statistical Dept.,
To—C. E. Buckland, Esq., on special duty with the Hon'ble Sir Richard Temple.

I am directed to acknowledge the receipt of Mr. Hart's letter No. 121 of the 31st March, notifying Sir Richard Temple's return from his second tour in the famine districts.

2. The Lieutenant-Governor desires to thank Sir Richard Temple very heartily for all the assistance he has given the Bengal Government, and for the manner in which that assistance was given, while they have worked together. The Lieutenant-Governor is sure that Sir Richard Temple's proceedings have eminently subserved the public interest.

3. I am to state that the minutes received with Mr. Hart's letter under acknowledgment, together with minute No. 52, will be submitted to the Government of India, as giving a clear and comprehensive summary of the arrangements now made, and the opportunity will be taken to submit a note, showing, together with other matters, the satisfactory working of the transport arrangements for which the Bengal Government is so much indebted to Sir Richard Temple.

4. The Lieutenant-Governor believes that Sir Richard Temple has now seen all the districts in which danger may be apprehended except those of the Burdwan and Chota Nagpore divisions. Fortunately, the affected parts of those divisions are extremely accessible, and it is hoped that any amount of assistance they may require will not be extremely large. The Lieutenant-Governor has directed papers recently received regarding these divisions, to be submitted to Sir Richard Temple, and has no doubt Sir Richard will soon be in a position to judge what is required.

5. Sir George Campbell deems it most fortunate that, since he is compelled to cede his place at a time when the country is so critically situated, he should surrender it into the hands of a man both so eminent for his personal qualities, and so thoroughly cognizant of the subject which now engrosses the attention of Government, as is Sir Richard Temple.

Sir George Campbell would, in conclusion, beg again to thank Sir Richard Temple for the efficient aid he has rendered to himself during the last months of his administration.

					Metals	...	...	4,610	...	4,610	...	Bareilly ...	2,943	1·1	3·3	Traffic.—Owing to an accident to the Salawar Lock traffic was impeded for some time, still on the whole these returns show a very large increase over those of the corresponding month of last year, both in 'Up' and 'Down' consignments. The Traffic Manager reports that it is expected that a considerable portion of the grain which is now awaiting carriage at nearly all the stations on the line of railway from Lahore to Khutowlee will be carried by this line after [illegible] March. But this will depend on the condition of the Salawar Lock 6 miles below Khutowlee, which is causing serious apprehension.

GOVERNMENT OF INDIA.

ABSTRACT OF THE PROCEEDINGS OF THE COUNCIL OF THE GOVERNOR GENERAL OF INDIA, ASSEMBLED FOR THE PURPOSE OF MAKING LAWS AND REGULATIONS UNDER THE PROVISIONS OF THE ACT OF PARLIAMENT 24 & 25 VIC., CAP. 67.

The Council met at Government House on Tuesday, the 7th April 1874.

PRESENT:

His Excellency the Viceroy and Governor General of India, G. M. S. I., *presiding*.
His Honour the Lieutenant-Governor of Bengal.
The Hon'ble Sir Richard Temple, K. C. S. I.
The Hon'ble B. H. Ellis.
Major-General the Hon'ble Sir H. W. Norman, K. C. B.
The Hon'ble A. Hobhouse, Q. C.
The Hon'ble E. C. Bayley, C. S. I.
His Highness the Mahárájá of Vizianagram, K. C. S. I.
The Hon'ble Rájá Ramánáth Tagore.
The Hon'ble R. A. Dalyell.
The Hon'ble B. D. Colvin.

ASSAM CHIEF COMMISSIONER'S POWERS BILL.

The Hon'ble MR. HOBHOUSE moved that the Bill to provide for the exercise of the powers hitherto exercised by the Lieutenant-Governor and Board of Revenue of Bengal in the territories forming the Chief Commissionership of Assam, as amended, be passed. He said that the Council would remember that the only reason why this Bill was not passed at the last meeting was that some objection was taken to the spelling of the names in the Schedule to the Bill, and it was on that account that this motion stood over. Now the spelling had been subjected to a severe criticism in the proper quarters. Our Military friends with their usual sagacity had attacked one untenable post, and with their usual gallantry had captured it. That post was Nowgong. With that one exception, the spelling had run the gauntlet successfully, and the Bill stood as it was. He had no remarks of his own to make upon it.

His Honour THE LIEUTENANT-GOVERNOR said, as the hon'ble and learned member in charge of the Bill had told them, since this Bill was last before the Council there had been only one amendment in its spelling, and that was a very great improvement to be sure. The spelling of the word "Nowgong" was a very great improvement upon what it was before, namely Naugáon. But as regards the other districts, the new or compromised spelling had been left. His HONOUR would only say that in the North-Western Provinces and in Bengal the system had been followed of maintaining the names of districts according to the old established mode of spelling them. Districts were well-known places. He found that some of the names of districts in Assam were spelled in the Bill in the new-fangled manner: they were spelled in a new manner, with certain diacritical marks. It was a mere question whether the Government of India chose to depart from or to retain the spelling of well-known names of districts, or to allow new-fangled modes of spelling upon any system of compromise. He found that Kamroop, was changed into "Kámrúp," and Durrung was changed into "Darrang." If that was the decision of the Government of India he had nothing more to say, it was for the Government to approve or otherwise of the compromise.

The Hon'ble MR. BAYLEY believed the spelling now adopted in the Bill was the same as that used in the maps issued by Government, and he thought the Council were right in adopting it.

The Motion was put and agreed to.

EUROPEAN VAGRANCY BILL.

The Hon'ble MR. BAYLEY moved that the Report of the Select Committee on the Bill to consolidate and amend the law relating to European Vagrancy,

be taken into consideration. He said that in originally introducing this Bill, he had explained that it was not desired to initiate any great reform in the principle of the measure already in existence. It was in fact merely intended to amend certain details which had been found defective in practice and to consolidate the law, which was already spread over two enactments, into one. As he then said, the main changes which were proposed were three in number: they were, first, to amend a slight defect in the law as to making persons who imported European servants in charge of horses responsible for their maintenance after their landing; secondly, to enable the governing officers in charge of work-houses to maintain discipline; and, lastly, to enable persons who deserted from a work-house, while on absence under a ticket-of-leave, to be punished.

Since the Bill had been introduced, it had been circulated to the various Local Governments, and we had received from them, and more particularly from the Governments of Madras and Bombay, a good many suggestions which the Select Committee had considered very carefully, and some of which had been adopted. The Committee had, for example, in section two amended the definition of "person of European extraction." Some difficulty was felt under the existing definition with regard to persons who were not of pure British blood, although of legitimate descent. Many of these were virtually in all respects as natives of this country, and the provisions of this Act were obviously inapplicable to them, although they came within the technical definition of "person of European extraction." At the suggestion, therefore, of the Secretary in the Legislative Department, a clause had been added to the definition which provides that it should not include persons commonly called Eurasians or East Indians. This, it was hoped, would be sufficient to meet the difficulty.

There was another rather curious point, that as the law now stands, although a Magistrate might enquire into the cases of vagrants brought before him by the Police, yet, if a vagrant came before the Magistrate himself, the Magistrate could do nothing until he had given the man in charge of the Police and so had the man secured and brought before himself. The Committee had amended section five to remedy this anomaly.

Under clause nine a certificate can be given to enable a vagrant to seek for work. It was found that sometimes these certificates were used by the persons to whom they were given as a pretext for going about begging. An alteration had, therefore, been made in the form of the certificate, by which, if a person was so found begging, his certificate would become void.

Then we came to the question of giving the Governors of work-houses sufficient power to maintain stringent discipline. In the clause upon this point which formed part of the original Bill, considerable alterations had been made. In the first place, at the suggestion of the Government of Madras, the Committee had introduced a modification in the form of the section which would enable powers to be given not directly to the Governors, but sometimes to the Governor under the supervision of the Committee of Management. In some of these work-houses, the Governors were officers of considerable standing who were in the receipt of high salaries: in other cases, the work-house was managed by a committee of officers with an officer ordinarily of the rank of a sergeant, and who was in receipt of a very small salary. It had, therefore, been thought necessary to enable the Local Governments to give the power intended to be given to the Governor, to the really governing body of the work-house.

In the next place, the Committee had considered very carefully the scale of punishment to be prescribed for breaches of discipline. It had ultimately been thought better to confine the summary authority of the Governor of the work-house or the Committee of Management within comparatively small limits, and to provide that when any really serious offence against discipline was committed, the case should be brought before a Magistrate, before whom the offender would undergo formal trial and conviction. In these last cases, the punishment which might be awarded would not be carried out in the work-house, as would be done in cases of punishment inflicted under the summary orders of the Governor or the Committee, but in Jail. The provision made in the Bill for punishments under summary order were solitary confinement for

seven days, solitary confinement for three days upon a diet reduced to such extent as the Local Government should prescribe, hard labour for seven days and reduction of diet as aforesaid for five days. He did not think that these punishments were excessive, but he hoped they would suffice to meet such petty breaches of discipline as the Governors of work-houses would ordinarily have to deal with.

There was before some difficulty as to the correct procedure to be followed in the case of a vagrant refusing to go before a Magistrate. It had now been provided that a vagrant so refusing might be arrested without a warrant, and taken before a Magistrate.

Then with regard to any proceeding under Part V of the Bill, we had made an alteration in respect to the declaration mentioned in clause five, by which it had been made *primâ facie* evidence that the person under detention was a vagrant. That was a technical point which had been left doubtful in the original Bill.

So far as regards the Bill as it now stood. There were one or two provisions which were pressed upon the Committee by the Local Governments, but which it had not been thought proper to adopt. To one of these MR. BAYLEY had alluded before, which was that the Governors of work-houses should have the power of flogging. This the Committee had not thought necessary, for as the class of persons with whom this Bill would deal were not actual criminals, although to a certain extent they were *quasi*-criminals, the Committee did not consider that they should be lightly subjected to punishment of this kind. Then, again, the Bombay Government specially urged upon the Committee to declare the power of the Government to prescribe that work might be performed in work-houses. Now, the Select Committee thought that the law as it stood was sufficient to meet that point. The place of confinement for vagrants was itself designated as a work-house, and he thought there should be no doubt that it was a place for work. We had moreover given the Local Government power to prescribe rules for the management of work-houses, and to enforce obedience to those rules. So far, therefore, it seemed to us that under the law as it stood the Local Government could do all that was necessary. He had looked into the English law upon the subject, and found that under the English law the places of confinement for vagrants were designated work-houses, and there was no special provision for the imposition of work, although there was a provision in 55 Geo. iii, c. 137, s. 5, for the punishment of persons who refused to work. It might be said that although, as he believed, it was not absolutely necessary, yet it might be safe to give in express terms the power to impose work. But it appeared to the Select Committee that there was considerable objection to minute provisions of that kind, for it was almost impossible by any amount of foresight beforehand to provide for every similar minute necessity that might arise; and if the legislature took upon itself the province of determining beforehand and of providing beforehand for every possible contingency, it took away from what ought to be the natural discretion of the Courts to interpret the language of the law according to the most obvious common sense, and therefore the Committee had on that account deliberately abstained from saying in so many words what every man might naturally infer from the language employed to be the meaning and intention of the law.

Then there was another point which was pressed upon the attention of the Select Committee both by the Governments of Madras and Bombay. They wished to have the power to deport vagrants whether the vagrants wished it or not. At present they were deported only if they had no ostensible means of living and if they wished it. As the Bill was originally drawn by Sir Henry Maine, a clause to the effect suggested by the Madras and Bombay Governments formed part of it. But in Committee that clause was struck out, and it was struck out on account of a doubt as to the legal competence of the Council to make such a provision, that was to say, it was a question how far any law to that effect would have legal force outside of the territorial jurisdiction of the Government of India. MR. BAYLEY thought it was possible that an Act of this Council might have sufficient force in this respect, but at any rate there was a very serious doubt upon the subject; it was therefore considered unsafe to insert

such a provision in the law. Moreover, although the Local Governments whom he had mentioned had both unanimously asked for such a clause, it did not appear that any real necessity for it existed. He thought the effect of the present law was practically sufficient, and did in fact get rid of all or nearly all of the persons of whom it was desirable to be rid.

MR. BAYLEY had nothing more to say as to the details of the Bill. He had explained all that the Select Committee had done and all that they had omitted to do. In all other respects the law was precisely upon the same footing as when it was passed originally by the Council. The Bill no doubt was one of a very peculiar and somewhat stringent nature. It was introduced to meet an evil which had grown almost intolerable—one which had interfered materially with the police of the country, and which was not only a scandal, but had almost assumed the dimensions of a political embarrassment. It was not until, upon all these grounds, the question was absolutely forced upon the notice of Government that action was taken in the matter. The subject was very attentively considered when the Bill was originally introduced. The Government of India had since watched the operation of the law very carefully, and had required from all the Local Governments minute periodical returns of its operation, and had invited suggestions for its amendment. The amendments which the Select Committee had thought fit to make were all the results of those suggestions. But as to the main principles of the Bill, it remained intact. The alterations suggested were only in the details, and he thought he might fairly say that he hoped that this Bill, as the law had hitherto done, would work well. It had not only checked in a very great and material degree what at one time was a serious and growing evil, but it had also worked in a manner which had been very humane, and had operated very much to the benefit of the very unfortunate class of people of whom it treated.

His Honour THE LIEUTENANT-GOVERNOR said he had not had an opportunity of studying the details of this Bill, but he wished to add his testimony to this, that he thought the present law did require amendment. He was satisfied that the matter was in very good hands, and he trusted that the amendments supplied by this Bill would be such as were wanted. He might, however, say that he was not prepared to go to the length which the hon'ble member in charge of the Bill did, and say that the present law had worked well. He was sorry to say that the practical working of the law had been attended with very considerable difficulty; very considerable difficulty had been experienced in regard to the people who were not to be transported under the Bill, and considerable questions and considerable correspondence and difficulties had also arisen in regard to the people who were to be transported, and HIS HONOUR must express his regret that the hon'ble member in charge of the Bill had not seen his way to comply with the recommendations submitted by the Governments of Madras and Bombay, because in this Presidency also difficulty had been felt in regard to those who were not willing to be transported. Here in Calcutta it had come to this, that we had filled our jails with vagrants: we had got them into jail, but we had not been able to get rid of them. In two or three cases we had been obliged to accept their promises of future good behaviour and had let them go free. Under these circumstances, HIS HONOUR should have been very glad if the hon'ble member had been able to accept the recommendations of the Madras and Bombay Governments and given a power of deportation in these cases to the Local Governments. It was the very greatest possible evil that men of the class which this Bill affected should enter and go about this country in the way they did, disgracing their country and disgracing the British name. HIS HONOUR thought it most desirable that there should be sufficient power given by the Bill over these men. However, he hoped that the amendments, so far as they went, would be found good, always excepting the one point with which the hon'ble member in charge of the Bill regretted he had not power to deal.

The Hon'ble MR. HOBHOUSE said that with reference to the point which had just been mentioned by His Honour the Lieutenant-Governor, he was

particeps criminis, if there was any crime in the matter. He entertained considerable doubt as to the power of the Council to pass such a law as was asked for. The matter had been fully debated when the existing Act was passed, and Sir Henry Maine then intimated his opinion that the Council had no such power. MR. HOBHOUSE was disposed to agree with Sir Henry Maine. He did not mean to say that the question was not arguable, but he thought the balance inclined to the negative. Our power was to legislate for persons in British India. British India was a place within certain limits, and it might include the usual distance of three miles or a cannon-shot from the shore; but when you got beyond that, our laws had no binding force upon European British subjects, and it was for Europeans entirely, and European British subjects principally, that this law was intended. He thought we might find ourselves subject to considerable embarrassment if a question as to the validity of our law were raised by a person who had got beyond our territorial limits. He believed it would be wiser, as this legislature was not a sovereign legislature, but was confined to certain limits defined by its charter, to keep within those limits; and if we had a grave doubt in any matter, it would be better to abstain from passing a law with regard to which such doubt existed.

Looking also at the matter from a practical point of view, he did not believe that such a provision could work. It was quite true, as the Lieutenant-Governor had said, that there was considerable embarrassment in working the law even as it stood. We had complaints from Liverpool, from the Mauritius, from Australia; in fact people tell us that they do not want our vagrants any more than we want them ourselves. Now, if you sent a man to a place to which he wished to go, he was likely to find some friends or some occupation for himself, and you had some guarantee for his good behaviour; but if you took a man away by force from where he was and set him down in some place where he did not wish to go, what likelihood was there that he would earn his bread honestly when there? There appeared to MR. HOBHOUSE to be no more sure way of driving people into the commission of crime than taking them by force from hence and putting them down on some shore where they did not want to go. That was a course which, he thought, must get us into trouble greater than the trouble we now had. These were the reasons why he objected to the course proposed by the Local Governments, and he believed they had received the assent of his colleagues on the Select Committee.

The Motion was put and agreed to.

The Hon'ble MR. BAYLEY said, that before moving the next motion, he wished to ask His Excellency the President's assent to move a verbal amendment in section three, clause (*a*) between the words "New Zealand" and "or the Cape Colony." Since the Bill had been drawn the Secretary had ascertained that the Colony of Natal had been separated from Cape Colony, and what MR. BAYLEY proposed was merely to insert the word "Natal" after "New Zealand." He did not think there was any objection to the amendment, and as it was a purely verbal one, perhaps it could be made without necessitating the postponement of the next motion.

The Motion was put and agreed to.

The Hon'ble MR. BAYLEY applied to His Excelleney the President to suspend the Rules for the conduct of business to enable him to move that the Bill be passed.

His Excellency THE PRESIDENT observed that it was not necessary to suspend the Rules, unless any member had an objection to the motion, which the President should consider a valid objection.

The Hon'ble MR. BAYLEY then moved that the Bill as amended together with the amendment now adopted be passed.

The Motion was put and agreed to.

BOMBAY REVENUE JURISDICTION BILL.

The Hon'ble MR. ELLIS presented the preliminary Report of the Select Committee on the Bill to limit the jurisdiction of the Civil Courts throughout the Bombay Presidency in matters relating to the land-revenue. He said

that though he had no motion to make, he begged permission to make a few remarks, and to explain the alterations that had been made in the Bill. He would premise that a great many petitions had been presented against the principle of the Bill. With two or three exceptions the whole of these petitions were in precisely the same words, and had evidently a common origin: they did not, therefore, carry so much weight as if they had been the spontaneous productions of the different districts and associations from which they came. Still he recognized among the signatures the names of many of the Native community for whose opinions he had much regard, and he should be sorry if their representations were set aside without due deliberation. In this case, full consideration had been given to all that had been urged, but the objections taken had in no way shaken the conclusions previously arrived at. The presentation of a report was not the proper occasion to go into all the arguments for and against a Bill. MR. ELLIS desired only to correct some misapprehension on one or two points. In the first place, it was a mistake to suppose that this was a quasi-private Bill. The Bill had been prepared on the motion of the Bombay Government; the principle had been discussed and approved by the Government of India, and he had been requested to take charge of the Bill and bring it before this Council. He might add that he had had the advantage of consulting the learned Chief Justice, Sir Richard Couch, and that this high judicial authority, whose opinion carried great weight both from his position and from his special local knowledge of the Bombay Presidency, had expressed his full concurrence in the principle of the Bill, and had approved of the form in which it was at present framed.

In the next place, there was misapprehension as to the scope of the Bill. To correct this, he could not do better than refer to a pamphlet published by Mr. Shámráo Vithal, a pleader of the High Court of Bombay, who had favoured him with a copy. The object of the pamphlet was to show how injuriously the measure before the Council would affect the right of the people to appeal to the Civil Courts for redress of wrongs inflicted by revenue officers, and to this end the compiler had collected together twenty-five decisions against Government passed by the Courts within the last ten years. Now he (MR. ELLIS) had analyzed this collection. Setting aside one case, of which the report was too meagre to enable him to judge, he found that out of the remaining twenty-four cases cited, there were only *two* of the class which would, by the passing of this Bill, be excluded from the cognizance of the Courts, and of these one was the case of Wamnají Sadásiv so frequently referred to. Thus it would be obvious that it was by no means the design of the present Bill to give revenue officers complete immunity from being sued in the Civil Courts, and it would be also seen that until recently there had not been in the course of many years any cases of the class to be excluded. Both the two decisions already referred to were quite recent, and it was owing to a number of cases of the same class having lately arisen that the necessity for legislation became apparent.

He would now briefly mention the modifications made by the Select Committee, which were numerous, though the principle of the Bill had been maintained. The original preamble had been altered as being no longer appropriate in consequence of the change in framing the essential section of the Bill. This section (3) had now been based on the section of the Revenue Bill recently passed for the North-Western Provinces, providing for the exclusion of the Civil Courts from cognizance of certain matters. That section was passed without any expression of dissent either from the Council or from the public, and it had now, by the modifications made by the Select Committee, been adapted to the circumstances of the Bombay Presidency. A comparison, however, would show that the North-Western Provinces Act was the more stringent, especially in excluding the Courts from cognizance of disputes between private parties *inter se* regarding revenue or rent. These suits the Bombay Courts would continue to entertain. On the same principle, the Select Committee had omitted clause (*c*) of section three of the original draft—a clause framed in accordance with the law in what had been termed "the newer districts" of that Presidency. This omission left power to the

Civil Courts to deal also with complaints of exaction by district and village officers.

On the other hand, some additions had been made to the Bill, as introduced. A section had been added to provide for an appeal to a Commissioner from the orders of an executive officer. Moreover, following the precedent of the Revenue Bill of the North-Western Provinces, specific reference had been made in the present Bill to village officers and servants, whose appointments and official remuneration the Courts would not be at liberty to discuss; and, indeed, so far as concerned both the official lands and the cash payments held by these persons, the jurisdiction of the Civil Courts was probably sufficiently barred under the existing law.

As these changes were of some importance, the Select Committee had recommended the republication of the amended Bill. He had no motion to make at the present stage.

HIGH COURTS CRIMINAL PROCEDURE AND PRESIDENCY POLICE MAGISTRATES BILLS.

The Hon'ble MR. HOBHOUSE presented the Report of the Select Committee on the Bill to regulate the Procedure of the High Courts in the exercise of their Original Criminal Jurisdiction, and for other purposes. He pointed out that the notice intimated that he had also to present a supplementary report, but for certain reasons turning on matters of form he wished not to present that supplementary report, but to substitute a motion of which notice had been circulated though somewhat late in the day. Upon the report that he presented, he had no motion to make, and would have made no observations if it were not that it contained one important matter to which he thought the attention of the Council should be drawn, and because it contained the reason why he was about to make an irregular motion for presenting a new Bill. The matter to which he referred was an alteration in the constitution of juries. He was not going to argue the matter here. The Committee had recommended that the Bill be republished, and on its being republished, he had no doubt that there would be a great deal of criticism and of controversy. He would now only say that they had received very strong representations as to the extreme burden that service on juries laid upon residents in Calcutta. It was from Calcutta they had heard, because here we were in Calcutta and within reach of those who are interested in the question; but he supposed that the burden was not less in the other Presidency towns. There seemed no reason in the nature of things why the number of the jurors in the Presidency towns should differ from that in the Mofussil, and the Committee therefore considered that the easiest way of giving relief from the burden was to lessen the number of jurors. They had also received several express opinions to the effect that jurors might be conveniently reduced in number, and opinions also that the rule about unanimity might be dispensed with in the Presidency towns as it had been in the Mofussil. The Committee then proposed to make the alterations set forth in paragraph 11 of the report. The proposal was this—

"A verdict of guilty or not guilty, as the case may be, shall be delivered either when the jury are unanimous in their opinion, or when as many as six are of one opinion and the Judge agrees with them.

"When the jury are satisfied that they will not be unanimous, but six of them are of one opinion, the foreman shall so inform the Judge.

"If the Judge disagrees with the majority, he shall then discharge the jury.

"If there are not so many as six who agree in opinion, the Judge shall, after the lapse of such time as he thinks reasonable, discharge the jury."

The Council would see that instead of the present law of unanimity, the Committee proposed a rule that six out of the nine, and the Judge should concur to secure a verdict. Otherwise the jury should be discharged.

The other part of the report which MR. HOBHOUSE would mention was that which recommended that the Bill should be cut into two. When he introduced the Bill into the Council, he explained the two parts. It was thought at first that as the whole related to criminal procedure and to the Presidency towns, it would be convenient to join the two into one Bill. It was found, however, that different discussions arose, and that different persons

were interested in the two different parts; and, in all probability, one part might be advanced with considerably greater speed than the other part. We had therefore thought it better to cut the Bill into two, and we proposed to treat the first part of the Bill, which was also the part indicated by the title, as representing the original Bill.

As to the other half, in point of form it should be introduced as a new Bill, and he should ask His Excellency the President to suspend the rules of business and to allow him to introduce it that day as a new Bill. The Council would see that this was a pure matter of form, and that in point of substance everything had been done that was requisite. The Committee had drawn a supplementary report to the original report on the High Courts' Criminal Procedure Bill. That supplementary report showed how they had dealt with the second part of that Bill—the part which related to the Police Magistrates in the Presidency towns. He would beg the Council to take that supplementary report as being in effect the Statement of Objects and Reasons to the Bill which he should now ask leave to introduce, and which he should subsequently introduce.

He had explained to the Council, when he introduced the Bill, that with regard to the practice of the Courts of the Police Magistrates, the subject was one of which he could not pretend to have any personal cognizance. Probably not many of the Council could have such cognizance. He did not suppose that any body could say of any part of the Code of Criminal Procedure that it was or was not expedient to apply it to the procedure of Police Magistrates in the Presidency towns, except persons who had had experience as Police Magistrates of the Presidency towns. For that reason the Bill as introduced had followed closely the suggestions of the only gentlemen who had sent in any detailed suggestions. These were the suggestions of the Police Magistrates of the town of Madras who had bestowed great pains in going through the Procedure Code and pointing out the parts which seemed to them applicable to the business of Police Magistrates. The suggestions were sent up with the approval of the Government of Madras, and formed the basis of the second part of the Bill. Since the introduction of the Bill, further suggestions had been made by the Madras authorities, who had again been carefully considering the subject. Those suggestions were principally in the direction of excluding portions of the Criminal Procedure Code from application to Police Magistrates. The Committee did not feel themselves quite competent to deal with the matter if unassisted, and MR. HOBHOUSE would explain exactly what they had done. They had put themselves in communication with Mr. Dickens, the Police Magistrate, and that gentleman had, with great kindness and pains, been going through the whole matter. He had given up some of his valuable time by attending the Committee, who had examined the suggestions of the Madras Magistrates with him. Therefore, the Committee had a valuable criticism upon those suggestions, the bulk of which had been adopted. That was the substance of the Bill which MR. HOBHOUSE now asked leave to introduce. The whole of the details were shown in the report, but he did not know that there was any detail so important that he should specially point it out to the Council. He now moved for leave to introduce the Bill to extend certain parts of the Code of Criminal Procedure to the Courts of the Police Magistrates in the Presidency Towns.

The Motion was put and agreed to.

The Hon'ble MR. HOBHOUSE also applied to His Excellency the President to suspend the Rules for the Conduct of Business.

His Excellency THE PRESIDENT observed that it appeared to him that the rules of the Council had been substantially complied with, with regard to the Bill, and therefore it was nothing more than a matter of form to suspend the rules on this occasion.

The Hon'ble MR. HOBHOUSE then introduced the Bill and moved that it be referred to a Select Committee with instructions to report in two months.

His Honour THE LIEUTENANT-GOVERNOR said he was inclined to think that the Committee had done very wisely in cutting what was one Bill into two Bills. He thought that it had been rightly explained that one part of the

Bill referred to matters and places beyond the Presidency towns, and that the other portion was confined to the Presidency towns. The second part of the Bill dealt with a very important question, which was not quite sufficiently treated in the original form of the Bill. Therefore, he thought the Committee had done wisely in dividing the Bill into two parts. He could not, however, say that he was prepared to follow the hon'ble and learned member in charge of the Bill in all the observations he had made.

With regard to the first part of what was originally one Bill, he had only that day seen the report of the Select Committee; but he was inclined to think that the amendments proposed were good amendments. With regard to the question of the number of persons of which a jury should be composed, he quite agreed with the hon'ble member in charge of the Bill that it was desirable that the number should be reduced. HIS HONOUR had said that he had only seen the report of the Committee that morning, and he spoke from memory and without book when he said that his impression was that in the Courts of the interior the number of a jury was not fixed at nine, but it might be fixed by order of the Local Government at nine, seven or five. His own opinion was that nine was an unnecessarily large number, and might be reduced, and he believed the number had been reduced in most of the districts in Bengal. Therefore, he ventured to suggest that if a fixed number should be taken to form a jury, seven would, probably, be a more convenient number than nine.

Then with regard to the question of unanimity, HIS HONOUR had a good deal to do with the working of juries in England, and had carefully observed the working of the English system. His practical belief had been from an English point of view, that in the great majority of cases in which there was an unreasonable difference of opinion, only one juror differed from the others, and taking the question from an English point of view, his opinion inclined towards the view that if the whole of the jury, except one, was unanimous, the verdict should be accepted. That was to say, that in the case of there being only one dissentient in the jury, that one dissentient should be non-effective. He was inclined, however, to believe that the view taken by the Committee that two-thirds of the jury, with the concurrence of the Judge, should be entitled to give a verdict, was a very reasonable and good proposition, and well worthy of the consideration of the Council.

HIS HONOUR was sorry to see that the first part of the Bill was postponed indefinitely for future consideration, and that the second part of the Bill was still in a very inchoate state. This Bill had been a long time before the Council. We who were interested in the Bill thought we had done something towards its maturity when we obtained the consent two years ago of the hon'ble member who lately occupied the seat of his hon'ble friend opposite, to stand sponsor to the Bill. But he regretted to see that the Bill had been somewhat neglected, and that it had dragged on a somewhat ill-nurtured and uncared for existence. Now he trusted that the hon'ble member in charge was inclined to adopt the Bill as his own, and that it would now be properly nourished and brought up.

With regard to the second part of the Bill, to which the motion before the Council was specially designed, HIS HONOUR might say that he did not think that the Bill had yet attained anything like the shape which it deserved to attain. Certain parts of the Criminal Procedure Code were declared applicable to the Police Courts of the Presidency towns, but he did not find that any provision was made for those parts of the Police procedure which did not come within the scope of the parts of the Criminal Procedure Code which were proposed to be extended. Provision was wanting in the Bill for the rest of the procedure of Police Courts. He thought that the clauses of the Bill did not touch what he had persistently pressed upon the Government of India as his opinion, namely, that there was that floating undefined English law which rendered the procedure of these Courts altogether uncertain, altogether obscure, and altogether beyond the powers of the public to comprehend.

The English common law in the country of its birth to which it was adopted by long practice, was no doubt in some respects a good law. But

when you came to extend it to another country under a different state of things, it was a most obscure airything. On a former occasion he showed that the English law which prevailed here was not the modern English law, and not either the ancient English law, but something which was introduced bit by bit in a manner which no mortal could understand between the years 1750 and 1800; and we were now still in that stage in which no mortal could say what was the English law which now prevailed in Calcutta. He should be sorry to see now any Bill passed which would leave the law in that extremely indefinite state. He was willing to concede that so far as the first part of the Bill went, it was a fair measure of reform. But he hoped that a great measure of this kind after several years of growth would not be passed without being made worthy of the time and labour which had been bestowed and which would be bestowed upon it. He trusted that the hon'ble member having taken charge of this neglected step-child would make it still more worthy of his name and reputation, and would settle by it the whole criminal procedure of the Presidency towns; that we should get rid of some English notions which were to be found existing amongst us in such offices as that of Sheriffs and the like, amalgamate the whole duties of Coroners with those of Magistrates, and give a succinct procedure and a written and a sensible guide to the criminal procedure of the Presidency towns.

The Hon'ble MR. HOBHOUSE said in regard to the delay in introducing the Bill, he thought the Lieutenant-Governor must have forgotten that up to a short time before its introduction we were in correspondence with the Local Governments about it. He believed he was correct in saying that that correspondence was commenced at the request of the Bengal Government. It was true that the Lieutenant-Governor had urged the Legislative Department and MR. HOBHOUSE personally to go on with the Bill, but the answer was that we must wait for the opinions that had been asked. It was a matter of difficulty requiring special and local knowledge, and it would not have been wise to go on with the Bill before they were in possession of the materials which were necessary to a full and proper treatment of the matter. He was not conscious of any neglect in his Department. When he introduced the Bill, he had been at the pains to explain the lapse of time between obtaining leave to introduce the Bill and its actual introduction. He could only coincide with the Lieutenant-Governor's hopes in this matter and wish they might be realized. If the Bill was a step-child, it should, at all events, receive as much attention as though it were a natural child.

With respect to the observation made by the Lieutenant-Governor as to the incompleteness of the second Bill, MR. HOBHOUSE was not aware that there was any part of the criminal procedure of Police Magistrates in the Presidency towns which would be left unprovided for by the present measure. If there was, we must call the attention of the Police Magistrates to it, and ask them what it was which went on in their Courts with respect to which they would not find a guide in the present Bill. As at present advised, he was not aware of any necessary provisions which were not included in the Bill: when he was told what they were he would promise to give them his best attention.

The Motion was put and agreed to.

BURMA COURTS ACT AMENDMENT BILL.

The Hon'ble MR. HOBHOUSE also moved for leave to introduce a Bill for the further amendment of the Burma Courts Act, 1872. He said that the Burma Courts Act was before the Council during the course of the year 1872 and had already been amended by Act I of 1873. It was an experiment setting up new machinery; and from time to time, as the machinery became clogged, it would require some fresh legislation to make it work smoothly. As various wants were discovered, they would be considered, and the Act amended. The present occasion for amendment was this. The Act established a great many Courts. The lowest was the Court of the Extra-Assistant Commissioner of the third class who had jurisdiction up to a certain value. The next was the Court of the Extra-Assistant Commissioner of a higher class and the Assistant Commis-

sioner with power to try a higher class of suits. The third was the Court of the Deputy Commissioner having jurisdiction in all suits of all values, and receiving appeals from the first and second grades of Courts. As to that a difficulty had arisen. The Act followed the principle of the other Acts passed for establishing Courts of judicature in other parts of the country. It entrusted the discharge of the higher judicial Courts to the officers in whom was reposed the duty of discharging the higher executive duties. In the meantime, in dividing the territories of Burma amongst the executive officers, it was found not convenient to have so high an officer as the Deputy Commissioner, the chief executive officer in all districts. It was also found inconvenient in some cases to have appeals from the two first mentioned grades of Courts lying to the Deputy Commissioner, who might not even be in the district in which those Courts were sitting. Therefore, the Chief Commissioner desired to be empowered to confer upon the officer (whatever might be his title) in chief executive charge of any District the appellate jurisdiction now exerciseable only by the Deputy Commissioner. That was the main reason for the present Bill.

At the same time opportunity would be taken to relieve the Recorder of Rangoon from complying with certain requirements under the Criminal Procedure Act, which at present compelled him to observe certain minute points of practice and to perform certain duties from which the High Courts were relieved. The opportunity would also be taken to revive certain Acts which the Burma Courts Act had repealed, and which it was now found were wanted.

The Motion was put and agreed to.

The following Select Committee was named:—

On the Bill to extend certain parts of the Code of Criminal Procedure to the Courts of the Police Magistrates in the Presidency Towns,—The Hon'ble Messrs. Ellis, Bayley and Dalyell and the Mover.

The Council then adjourned to Tuesday, the 21st April 1874.

GOVERNMENT OF INDIA.

PUBLIC WORKS DEPARTMENT.

IRRIGATION OPERATIONS OF FASL RABI IN THE PUNJAB UP TO 28th FEBRUARY 1874.

CANAL DIVISION.	WATER DISTRIBUTED DURING FEBRUARY 1874. Depth in Canal at Regulating Gauge. Full supply.	Depth in Canal at Regulating Gauge. Actual throughout.	Gross consumption. C. ft. per second. Estimated full supply.	Gross consumption. C. ft. per second. Actual average throughout.	NAVIGATION RETURN CANAL. Principal Items of Traffic. Up.	Down.	LAND IRRIGATED (APPROXIMATE). Zillah.	Acres.	RAINFALL. Average.	During month.	CHIEF CROPS (APPROXIMATE). Name.	Area in Acres.	Remarks.
BARI DOAB CANAL. 1st Division	...	...	...	...	...	...	Gurdáspur...	10,477	2·49	1·80	Wheat ...	85,479	The Canal having remained closed for repairs, there was no irrigation during the month. The difference between the area irrigated as shown here, and that in the previous month, is due to the entire area irrigated up to January, not having been reported in return for that month. There is an increase of 1,294 acres over the area irrigated during the corresponding period of preceding year. The Western Jumna Canal was re-opened on the 19th February 1874.

EWRY T. TANNER, *C. E.*,
For Asst. Secy. to Govt., Punjab, P. W. D., Irrign. Branch.

LAHORE,

GOVERNMENT OF INDIA.

DEPARTMENT OF REVENUE, AGRICULTURE, AND COMMERCE.

BENGAL FAMINE.

FIFTEENTH SPECIAL NARRATIVE OF THE DROUGHT IN BENGAL, FROM THE 3RD APRIL TO THE 16TH APRIL 1874.

1. On the 8th of April Sir George Campbell was permitted to resign the Lieutenant-Governorship of Bengal, and Sir Richard Temple was appointed to succeed him. The Lieutenant-Governor left the Presidency for the distressed districts on the night of Tuesday, the 14th April.

2. The weather during the fortnight under report has continued favorable on the whole. Rain has fallen in most of the districts of the Rajshahye, Dacca, and Chittagong divisions, and also in parts of North Bhaugulpore and Purneah. This has been very opportune for the early rice sowings, and all the accounts show that a larger area than usual is prepared for this crop. More rain is required, and the weather seems sufficiently unsettled to make it possible to hope for this. In the Patna division the drought still continues, and the millets and pulse now approaching maturity are withering for want of moisture, while it will be impossible to prepare the ground for rice sowing without some heavy showers.

The weather.

3. In the districts of Hooghly, Howrah, and Bankoora of the Burdwan division, prices have remained stationary, or with a tendency to fall. In Beerbhoom they have slightly risen. In Burdwan, although the price-current shows the price of common rice at over 14 seers per rupee, the Collector reports that in the interior of Bood-bood it is only procurable at 10 seers per rupee, or even less. There is no marked change in the Presidency division. In the Rajshahye division prices have risen slightly in Dinagepore, but were in the district narratives reported easier in Moorshedabad, Rajshahye and Maldah owing to private importations. At Rungpore sudder station they suddenly rose from Rs. 4 to Rs. 6-8 a maund, owing, it is said, to the demand for carriage on account of Government grain having paralyzed private trade. Only about 600 carts in all are here at present taken up for Government; and Mr. Robinson, the Relief Commissioner, reports that he has no doubt Rungpore could easily supply many more were proper rates paid. He is himself looking into this. From the district narrative it does not appear that prices in the interior have been at all affected. They are, however, extremely high throughout the south and west of this district. In the more eastern districts of Bengal the rates are either stationary or lower, except in Mymensing, which shows a rise. In Behar, south of the Ganges, the reaping of the rubbee crop has cheapened food-grains somewhat. North of the Ganges the harvest has not had the same effect, and in Soopool an upward tendency is observed notwithstanding the harvesting of a very fair spring crop.

Price of grain.

The price-current for the two weeks under report will be found at enclosure No. 2.

The present quotations of rice for some of the principal districts compare as follows:—

	NUMBER OF SEERS OF COMMON RICE SOLD FOR A RUPEE, 1874.

State of the crops.

4. The in-gathering of the rubbee or spring harvest has, in most of the Behar districts, been now brought to an end. In all those south of the Ganges the outturn has been much better than was originally anticipated; and in the Bhagulpore division, north of the Ganges, the yield has been on the whole very fair. In Sarun, however, the results are less satisfactory. The severe hail-storm of last month did much damage to the crop in parts, while the outturn generally appears to have been unequal, and in some tracts considerably below expectation. The firmness maintained by prices in spite of the reaping of this, ordinarily a most important crop in Sarun, is looked upon by the local officers as an unfavorable sign. In Chumparun the cheena, or lesser millet, was in a precarious condition from want of rain, except in tracts where irrigation had kept it alive. The outturn of the spring crop had not been here very satisfactory, and in the worst part of the district—Ramnuggur—there had been none to speak of. In Tirhoot the cheena (millet), and moong (pulse), are suffering from the continued drought, and it is impossible to prepare the land for rice. In all those districts where the mohwa tree grows, such as Bhagulpore, Monghyr, the Sonthal Pergunnahs, and the Chota Nagpore division, the crop this year has been singularly full and abundant, forming a most material addition to the food-supply of the poorer classes. In the Rajshahye division the rain which was much wanted to enable the ryots to complete the sowing of the early autumn crop has fallen pretty generally, and though more is still required, the sowings are now on the whole well-advanced. The silk-crop, which is always precarious, has, in the Rajshahye district, unfortunately proved a failure.

Seed-grain.

5. The question of seed-grain has become of more immediate interest in Eastern Bengal, where sowings are earlier than in Behar. The Collector of Dinagepore writes:—"As the bhadoi sowings have not yet been completed, it is not easy to determine with certainty the question of sufficiency of seed-grain, to which the attention of all circle officers has now for some time been directed. The impression, however, is that seed-grain, both for bhadoi and hemantee (autumn and winter rice), will be forthcoming, though at high rates. The inquiries made by the circle officers show that the people are themselves fully alive to the difficulty, and that dealers are purchasing and storing the produce of last harvest. I am more and more convinced that there is a sufficiency of seed-grain in the country, a stock which the sale of Government rice will tend to keep up." The price will however be high. Already in one district the price of seed-grain is higher than that of cleaned rice. In Rungpore it is noted that though

the ryots sometimes complained of want of seed, the lands where ready have all been sown, and a much larger area than usual has been cultivated with early rice. In the other districts of the Rajshahye division there will almost certainly be no lack of seed-grain. The view that seed would probably not be wanting was that taken by the late Lieutenant-Governor at paragraph 27 of his Tirhoot note appended to last narrative. Steps are being taken to assist, through the zemindars, those ryots who may be unable to buy seed at the high prices now ruling. In Tirhoot the subject has not been lost sight of, as the following extract from the district narrative will show:—

"Mr. MacDonnell and the sub-divisional officer of Hattee are now directing their attention to the relief of cultivators and small farmers whom it is difficult to bring to our relief works. To these they are making advances in money for seed-grain and in grain for their own support. The principle they have adopted is that of making advances to the applicants by whole villages, the applicants entering into an association or system of frank pledge for repayment, their estimate being based on returns submitted by putwarees showing the quantity of land cultivated by each applicant, and the quantity of seed-grain required being calculated at the rate of 20 seers per beegha. In some instances they have persuaded zemindars to take the seed advances into their own hands; and one zemindar, Baboo Bunsee Dareer of Ragopore, proprietor of nearly half the Lehra circle, is specially mentioned for the public spirit and humanity which he has displayed in this respect, and in the administration of relief operations on his estates under their directions."

No special reference is made to the subject in the Sarun and Chumparun narratives, but it is incidentally mentioned that in one sub-division of the latter district fully two-thirds of the rice lands had been already prepared for the next sowings. From Purneah it is reported that the trade in seed-grain is brisk.

Supply of grain.

6. The supplies of grain in the local markets are, in most districts of Behar, still sufficient to meet the demand, and have been supplemented to some extent by the new rubbee grain which is already coming into the market. In the interior of Durbhunga, however, supplies are said to be scarce save in one or two large bazars. In Mudhoobunnee, where the same scarcity had shown itself, the sale of Government rice has brought into the market stocks of other grains held by petty traders. At a few places in Seetamurhee, and in one or two bazars in Sarun, and at Bukhtiarpore in Monghyr, there was some failure of supplies. But generally throughout Behar the inferior grains are still procurable, though rice is everywhere very dear, and frequently not to be got. In the Rajshahye districts rice is becoming more and more difficult to buy, though other grains are generally available in sufficient quantity. The Dinagepore district officer thinks, however, that everything now points to exhaustion in the stocks of food-grains in that district, and traces a steady falling off in supplies, while the people are said to be anxious for the opening of the Government golahs. In Rungpore also, along the south-west and south of the district, deficiency is apparent until the tract on the east is reached, which is supplied by importation from the Brahmapooter. In all other parts of the district food is procurable at high prices. This is also the case generally in the Chota Nagpore and Burdwan divisions.

Private importations.

7. The railway is still carrying into Behar considerable supplies of grain on account of private traders. The figures for the fortnight ending the 4th April were—

	Tons.
From the North-West and Punjab	15,974
,, Calcutta	5,874
Total	21,848

The figures for the preceding fortnight were 17,928 tons from the North-West, and 7,737 tons from Calcutta.

The block at Patna city station reported in last narrative has been removed through the active aid of the Magistrate, and orders have been given for constructing at once a new siding and station yard, and otherwise improving

the traffic arrangements in order to prevent a recurrence of the difficulty (see appendix E.) A fall of prices in the Patna bazar led to a slackening in the rate of private import to Behar from the Punjab. The Government has not yet received a final report on the subject, but it is believed that the falling off was only temporary. The amount of private grain sent up from Calcutta also shows a falling off, possibly in consequence of the orders that Government grain should have priority of despatch. It is to be hoped, however, that carriage will be found for all the private as well as for the Government grain; and the Railway Company have been told that it is not intended to displace private grain despatches, but only that grain should take priority over ordinary traffic.

In the Rajshahye division there is a tolerably brisk private import into Rajshahye and Maldah on the Ganges, and to the parts of Rungpore lying near the Brahmapooter.

Export of grain by sea.

8. The usual note on the movement of food-grains will be found at appendix A. The Collector of Customs has furnished a consolidated statement showing the export of food-grains from Bengal ports during the month of March. The total export beyond Bengal was 16,933 tons, making a total of 190,094 tons since the 1st October last.

Condition of the people.

9. The condition of the people is very fully explained in the district narratives (enclosures Nos. 4, 5, 6, 7, 8, and 9). The increasing numbers flocking to our relief works indicate increasing severity in the pressure caused by high prices and a deficient market; and this fact is perhaps specially significant from its being very general, and occurring at a time when the cutting of the rubbee harvest afforded in many parts remunerative employment to large numbers of the laboring class. Every week, however, sees the relief organisation more complete and more competent to deal with distress. And on the whole, it may be said that (thanks solely to the Government provision of work and food) the condition of the people in the distressed districts is not worse. The famine has been got well in hand, and will, it may be hoped, be effectually met and averted. The Commissioner of Patna writes: "Distress in the north of Chumparun and Tirhoot has continued to increase steadily, and the number of people resorting to the relief works is daily becoming larger. The organisation for dealing with these distressed masses is, however, daily improving; and what were three weeks ago hungry mobs, clamorous for relief, are now by degrees being transformed into organised gangs of work-people, while those unable to work have been weeded out and made recipients of gratuitous relief, light-labor gangs being formed for those who are unable to join the able-bodied working portion. The relief circles have now all been provided with officers, and arrangements are being made for starting village works in each circle, so as to prevent overcrowding on the roads and the larger works; and it is to be hoped that by this means much useful work will be done, while the dangers arising from the massing of large and unmanageable bodies of people on a few great works will be avoided."

At appendix D will be found minutes by Sir Richard Temple summarising the principal statistics of distress, and the measures taken by Government to meet this emergency.

North Tirhoot.

10. A very full account was given in last narrative of the measures adopted in North Tirhoot. The present state of things in those tracts may be gathered from the following extracts:—

"In *Seetamurhee* sub-division the condition of the people has improved generally, but isolated cases of distressed women and children are still to be found. For all such cases the sub-divisional officer is specially providing."

In *Durbhunga* the sub-divisional officer has observed a marked improvement among the people, especially in the direction of Bahera. He writes:—

"I had myself grouped round Bahera, where I have no doubt the distress was as pronounced as in any other village in the sub-division. These were the villages in which I, in a former report, declared that famine had commenced. As then, so now, I had all the poor assembled; and were it not that I was assured by the jevt ryot and putwaree, and group-inspector, that no famine-deaths had occurred, and that in the people now before me I saw the starving creatures of a month ago, I scarcely could have credited the change. I visited the village when the putwaree was distributing the daily allowance. There were no complaints whatever, and the improved condition of the recipients proved that the village headmen had not deprived them of Government charity. Indeed, this system of village-relief everywhere I went I found working well."

Bahera was, it will be remembered, the tract where actual famine had shown itself, and anxiety regarding which was one of the chief causes of Sir George Campbell's visiting Tirhoot last month.

The *Mudhoobunnee* sub-divisional officer writes:—

"The time has now come when I must say that distress is general throughout the sub-division. A few favoured tracts, such as the neighbourhood of Ladma and Hurlaki thanas, are still comparatively fairly well off; but the fact that we have little less than half the population on our hands shews that distress is severe in general. But for the Government roads, we could not have hoped to cope with it."

From Mudhoobunnee several deaths are reported, five at least of which were probably due to privation or disease induced thereby. It is impossible to prevent such cases among the old and helpless, or among children, the classes which in fact furnish most of these cases. Every effort is, however, being made to discover and relieve those in want by careful village visitation and inspection, while food and work are everywhere available for all who will come for them. No famine deaths are reported from any other sub-divisions of Tirhoot. The water supply is unfortunately failing from want of rain, and should the needed showers not speedily fall a great aggravation of distress must undoubtedly be looked for.

South Tirhoot.

11. In the *Sudder*, *Hajïpore*, and *Tajpore* Divisions there is an increasing demand for work, but the condition of the people is, on the whole, not much changed for the worse. The accounts given a few weeks back of the state of some parts of the Sudder Sub-division have been found to be exaggerated. This tract, however, needs careful watching, and a circle organization has been formed to that end. The planters have come forward readily here, as they had already done elsewhere, to aid in looking after the village relief. The tobacco crop in Tajpore is expected to assist the ryots much, but there is some difficulty about getting the produce down to the Ganges as so many carts are taken up for carriage of grain. The Lieutenant-Governor has caused enquiry to be made as to whether return carts and Railway empties could not be made available for this purpose, and has sanctioned advances being given upon the security of the crop in case of need.

The rest of Behar.

12. In *Sarun* the ample provision of work made by Government has prevented any deterioration in the condition of the people. From *Chumparun* the same fact is reported. The people have been saved by the measures adopted for their relief, which are now described as being in good working order. Even in *Ramnuggur*, where the inhabitants depend almost entirely on Government help, direct or indirect, their state is reported to be sufficiently satisfactory. In *North Bhagulpore* the worst cases on the works are wanderers from Tirhoot. Village visitation is in progress, and will, it is hoped, bring to light any lurking distress, if such exists. In *Monghyr* there has been no change for the worse, rather the contrary, as the spring harvest has been good, and about six lakhs of rupees on account of opium payments have been distributed among the cultivators. In *Bukhtiarpore* only did the Relief Superintendent find very marked distress, where in two villages grain had to be doled out to 350 persons of the lowest classes who were found quite "famine-stricken." In *Purneah*

no change for the worse is reported, but incendiary fires are said to be becoming frequent. In the *Sonthal Pergunnahs* the "people look well everywhere", though they are said to be nearly at the end of their stores in parts; but, as the Deputy Commissioner remarks, "Sonthals would be merry and eat full meals up to their last handful of maize." Fortunately the Sonthals take very readily to out-door labor, and of this enough is provided.

13. In *Moorshedabad*, the old, infirm, and beggars are coming more on charitable relief, and the pressure is tightening in some parts, as indicated by the increasing resort of laborers to the works. The failure of the silk crop in *Rajshahye* will add to the distress there, but this is not as yet at all severe. Both here and in Moorshedabad arrangements have been made for careful inspection by circle officers (without, however, a full subordinate agency as in Tirhoot) and the doubtful parts will be closely watched. In *Dinagepore* the sale of Government grain and the ample supply of work has checked any development of distress. From the south of *Rungpore* the accounts are less favorable. Near Sadullapore and Govindgunge the village inspection has disclosed "greater distress than was anticipated." The district report says:—

Tho Rajshahye Division.

"In the tract lying west of the Kurotya, the state of the villages is wretched beyond description; the people have sold everything they possessed, and are now solely dependent on Government. Many have sold their plough-cattle, the last thing with which a Bengalee ryot parts. I found one instance where a man had sold the roof over his head. Many ryots have deserted the place altogether and gone to Bogra and elsewhere. The relief officer reports that the people seem to be most grateful for the relief works. The villages in this quarter are now quite deserted in the day-time. Every one is to be found on the road; the women are now coming readily, bringing their children with them. All are most anxious to get Government rice. The want of water is felt nearly as keenly as the want of food. In many villages people have to go two or three miles to bring a *gharah* of water. I have begun to excavate three old tanks in the worst parts, and am digging wells at every mile along the roads. A few cases of cholera, with one death, have occurred among the coolies. In many tracts on the south and the south-west of the district the poorer classes of ryots have been obliged to sell or pledge the few things they have. Many complain of the difficulty of having only one full meal of rice a day, and of having to eke out the second meal with various coarse substitutes for rice. There is much widely-diffused distress which is being carefully looked after, and relief to meet the circumstances that arise in each locality is promptly organised on the spot."

In *Maldah* it is feared that relief operations must be extended, and village-to-village inspection made, even in those tracts which have not hitherto been considered distressed. The numbers requiring relief in the north-west of the district are increasing rapidly; but no cases of starvation have yet been reported. The accounts received of late from *Pubna*, and especially from the *Serajgunge* division of that district, have been somewhat unfavorable. The parts bordering upon the distressed tracts of Rungpore, Dinagepore, and Rajshahye, may very possibly require more active assistance before the season is over. Meantime the Lieutenant-Governor has directed the opening of relief works, and authorised the Magistrate, in case of emergent need, to indent upon the nearest golahs of the neighbouring districts.

14. There has been some change for the worse in the Bood-bood, and to some extent in the Cutwa sub-divisions of the Burdwan district. The Collector reports that on personal inspection he finds the condition of the people in many villages wretched in the extreme. The endemic fever has already reduced the standard of health in those parts, and the number of applicants for relief has now become very considerable. The Lieutenant-Governor has himself gone to look into matters, and will give such further orders, supplementary to the measures of relief already taken, as may appear necessary. There is nothing fresh to report regarding any of the other districts of this division. The numbers on works and receiving charitable relief have increased, as was to be expected, with the advance of the season, but ample provision has been made to meet all needs. The Jungle

The Burdwan division.

Mehals of Midnapore, a remote tract, regarding which some anxiety was felt at first, are now believed to be safe from anything like severe distress.

15. A full report by Colonel Dalton upon the condition of the Chota Nagpore division to the end of March will be found at No. 8 of the enclosures. It will be seen that Palamow still continues to be the most distressed tract in this division, and that many people come to the works in an emaciated state. The relief organisation has been considerably strengthened here, and will now be able, it is hoped, to meet all demands on it. To both Manbhoom and Hazareebagh Government grain has been sent. In both districts, however, as well as in Palamow, the mohwa crop has given much relief to the poor. Work is provided for all who require it, and gratuitous relief is being given to those who cannot work. From Singbhoom the Deputy Commissioner reports:—

The Chota Nagpore division.

"The relief works that have been opened out in this district are proving of the utmost benefit, and there can be no doubt that but for them the short crops of the past season would have pressed hardly on the poorest. The assistance rendered was all required, and it is hoped and expected that through it the season will be tided over till the next crops. The mohwa and other wild fruit crops, more especially in the Kolhan, are turning out mercifully abundant, and they will supply food to the poorest for the next two months. The mohwa trees in the Kolhan are laden with blossoms in the most extraordinary manner, and blossoms themselves are of huge size and bursting with richness. Every tree is guarded with the most jealous care from the cattle. The Kols also prepare and eat the seed of the sâl tree; and the sâl trees this year are, beyond all experience, in most abundant bloom. It is no exaggeration to say that in the Kolhan forests 99 out of every 100 trees have blossomed, and blossomed in the most amazing way. In most cases literally not a leaf can be seen from the profusion and wealth of blossom. Other jungle fruits, the *cha* especially, are also in great abundance this year."

15. Fears have been felt from time to time lest the trade demand upon the eastern districts of the Dacca and Chittagong divisions for rice to supply the more distressed tracts to the west should affect unfavorably the position of the exporting tracts themselves. During the last week accounts have been received from Mymensing to the effect that in a small part of the Jamalpore sub-division there is a deficiency in the local food-supply. A proposal to import some Government grain has been submitted by the Commissioner. The Lieutenant-Governor has directed careful inquiry to be made as to the necessity of this. It seems probable that, surrounded as it is by districts which had surplus crops, this little corner may, by a little arrangement and stimulus given to local trade, be able to get supplies. Of course, if Government grain is really required, it will be given, and fortunately can be easily delivered by the Brahmapooter steamers at a ghât nearly opposite Kaligunge, where the Rungpore supplies are now being landed.

Mymensing.

16. In the Presidency division the only tracts regarding which any anxiety has been felt, are the north-west corner of Nuddea near Moorshedabad, and a small part of the Satkhira sub-division of the 24-Pergunnahs. In Nuddea the system of advances for works connected with land improvements and water-supply has led to the employment of the distressed poor in considerable numbers by private persons. About 4,000 souls thus find employment, besides 1,150 who are employed on Government roads; while weaving and spinning is provided for those who cannot labor out of doors. These measures have hitherto proved sufficient. In Satkhira, similarly, work is provided by Government for all who need it. The distress here is not severe as yet, though it is feared some suffering is in store for the people. A relief committee has however been formed.

The Presidency Division.

17. Among the papers printed as appendix C will be found a note summarising and reviewing the state and prospects of the Government transport arrangements up to the end of March. The general result is extremely satisfactory, showing that

Transport arrangements.

each district will have probably received its entire allotment of grain by the end of May—several districts long before that date—and we may fairly hope that the whole will thus have been stored before the rains set in. The letter to the Government of India, No. 2257—S.R. dated 10th April, with enclosures, in the same appendix, shows that the despatches for the Rajshahye division are now fast approaching completion.

The Lieutenant-Governor is satisfied, as regards the western districts, that the local transport can easily carry away all the grain that the railway can supply. The manner in which the district officers have answered to the calls made upon them by Government for the organisation of a strong transport service has been worthy of all praise. The minutes by Sir Richard Temple, Nos. 55 and 58, appendix G, to the 14th narrative, show what has been done to secure reserve carriage in case of any possible break-down; and the Government can now, the Lieutenant-Governor believes, rest assured that unless some very unforeseen accidents occur, no serious failure in the scheme of relief can happen owing to any insufficiency in the transport service.

Since the last narrative was written, the Secretary of State has advised the Government that contracts have been made for the construction of the ten small steamers referred to in paragraph 23 of the 11th narrative. They are each to carry 20 tons, and tow a barge carrying 20 tons more. They will be shipped in pieces by canal steamers before the end of April, and may be expected to be ready for work here by the beginning of July. These, with the four similar steamers now making in Calcutta, will be useful for distributing grain from district depôts by the inland rivers, or for carrying up any further allotments should the necessity for this arise.

The Durbhunga Railway has been completed, the engine having entered Durbhunga on the 15th April. This will help very materially in placing the grain allotted to Durbhunga and Mudhoobunnee. This aid was much wanted, for the Alliance Company of contractors have not yet succeeded in bringing up their despatches from Chumpta Ghât to anything like the anticipated figure; and Nilcomul, the North-West contractor, is also very backward in his arrangements. With the help of the railway, however, we can feel certain that all shortcomings will be now made up.

Despatches of Government grain.

18. The despatches of Government grain to the famine districts amounted (see appendix B) during the fortnight under report (*i.e.*, up to Tuesday, 14th April) to 14,19,266 maunds (52,565 tons), which is a great improvement upon the despatches of the fortnight before (38,705 tons.) The total despatches of Government grain from Calcutta to the distressed districts amount now to 65,73,969 maunds or 243,480 tons, while 150,925 tons had been finally stored to the date of the latest returns. The papers in appendix C show exactly how the case stands as regards the amount and despatch of the grain yet remaining to be sent to each district.

Local purchases at Patna.

19. The Patna dealers, whose undertaking to deliver 42,000 maunds a week of mixed grain for Tirhoot was noticed in paragraph 18 of the 13th narrative, are working out their contract very satisfactorily. There was a little shortcoming at first, caused partly by the difficulty they had in getting railway wagons, and partly by the want of bags of the size required; but all these difficulties have been overcome, and the grain they give, and the bags in which it is packed, are reported to be exceedingly good.

Relief works.

20. The fortnightly return of persons employed on relief works under officers of the Public Works Department will be found as usual at enclosure No. 10. The following table, however, shows more completely the number of laborers on Government and Court of Ward relief works by the latest returns:—

	Last Fortnight.	Fortnight under report.
Patna division	539,353	~~848,341~~ 806,875
Soane Canal works	31,289	33,933*
Gunduk embankments	28,834	29,299*
Bhagulpore division	51,430	87,198
Rajshahye „	82,586	167,871
Burdwan „ Nuddea, Chota Nagpore and Cooch Behar	22,000	47,794
Northern Bengal Railway	12,000	12,475
Total ...	767,492	~~1,220,911~~ 1,185,448

From the above it would seem that the estimates of distress at the worst season formed some weeks ago by Sir Richard Temple and the local officers will be realised—perhaps more than realised in the Patna division. On the other hand, the distress in the Rajshahye division is as yet somewhat less, and in the Bhagulpore division considerably less than the estimate. Now that the spring harvest is over, the numbers may be expected to increase everywhere. The work of breaking up the great gangs upon the north Tirhoot roads and diverting them to village works has been going on. The Additional Commissioner in Tirhoot has been authorised to make saltpetre manufacture a relief work, if he can do so at reasonable rates, taking the necessary precautions for the protection of the salt revenue by buying in the salt or otherwise. Mr. Metcalfe was sanguine that he could employ great numbers in this way. In Sarun the *cowrie* system, under which each laborer is paid a certain number of cowries for each basket-full of earth carried, is reported to have answered well on the Hutwa Raj works, the outturn of work having proved on measurement to be all round not less than half the amount which able-bodied laborers at contract rates would be expected to show in ordinary seasons. At the same time care is taken that the weakest and youngest on the works can earn a livelihood. On the Sarun district works the plan has not been tried generally, from a fear lest the condition of payment-by-results should deter those really in need from seeking employment freely. In Chumparun it has been introduced more extensively for able-bodied laborers, separate invalid gangs being arranged for those unfit for task-work. In most districts an attempt is being made to exact a moderate amount of real labor from those who are able to give it. In Bogra, there has been a considerable influx of laborers on the roads, and the system in force seems to have been unduly lax. The Relief Commissioner has had his attention drawn to the matter.

Irrigation Department relief works.

21. On the Soane Canal Works the average number of laborers was 33,933 during the fortnight, as against 31,282 in that preceding. But as the returns of three of the Dehree sub-divisions have not been received, the figures are incomplete. Laborers are said to be increasing rapidly in the Arrah division. The Gunduk embankments gave employment to 29,299 persons on the average, but the returns for the Upper Gunduk works were incomplete. The work is mostly task-work, but weakly people presenting themselves are paid by daily wages, or on a liberal cowrie-system.

Northern Bengal Railway.

22. The number of laborers on the Northern Bengal Railway has not as yet much increased, but it is said that more are gradually coming in. On the railway, and the feeder roads, there were 12,475 on an average last fortnight. Arrangements are being made for sending large gangs from Bogra. The earth-work done is now equal to a bank 26 miles long, and 4 feet high. 1,80,000 bricks have been burnt; 50,000 are now in kilns; and 17,24,000 have been moulded.

* Incomplete.

23. The system under which charitable relief is being distributed was fully explained at paragraph 23 of last Narrative. The number of people now in receipt of charitable relief of all kinds according to the latest returns was:—

Charitable Relief.

Gya	430
Shahabad	180
Tirhoot	65,230
Sarun	1,016
Chumparun	17,076
Moorshedabad	379
Dinagepore	4,464
Maldah	931
Rajshahye	185
Bogra	583
Rungpore	6,827
Bhagulpore	2,804
Purneah	2,178
Monghyr	1,367
Burdwan	9,137
Hooghly	901
Bankoora	1,200
Beerbhoom	683
Maunbhoom	600
Palamow	300
Total ...	116,471

The following extracts from the Tirhoot report will show how matters are now being managed in Durbhunga and Mudhoobunnee:—

The sub-divisional officer of Durbhunga thus reports: "I have already explained the machinery of charitable relief as it existed when first set in action. I have now to refer to an extension of the system, by which, while retaining our former organisation, we are enabled to render the administration of relief more searching and certain. It consists in having prepared through the jeyt ryot and putwaree of each village a list of all those who are in want of relief in the village, and according to this list the group store-keeper dispenses weekly to each village in the group the quantity of grain required for the week's consumption. The distribution is made in the village, by the village headmen and the putwaree. Among the other duties of the inspector will be that of seeing that in this respect the village headmen are up to their work. This sub-division has been divided into 12 circles. The Banhar and Warisnugur circles being outside the area where distress was most pressing, were not taken in hand till now. Of the other circles, the grouping has been completed in all except Lehera, Gungdak, and Hya ghât, where some villages still remain ungrouped. But before this week ends the work will be completed in these. In all of these villages the officers are at work, having the village list of distressed people made out; and looking to the fact that as our groups are made up, and inspectors appointed, this work can go on simultaneously in every group, it ought to be completed within a fortnight at farthest. My returns of those on charitable relief are incomplete, some circle officers having been unable to send in any returns, and others only returns for some groups. From these fragmentary returns I learn that the daily average on charitable relief is 14,563. I believe this, however, to be much under the real number."

The Mudhoobunnee officer writes: "Charitable relief is now everywhere at work on the ticket system. The system of giving out cotton, too, is taking root, particularly under Messrs. Ozanne, Williams, Nicholay, and Baboo Ishree Pershad. I am establishing, through the relief superintendent at most places, *quasi* hospitals under the native doctors, for care of those who are, either by starvation or disease, unfitted to go to their own people, or to work. I would have the distribution of cooked food, where it is given, also under the superintendence of native doctors if a European is not present, as natives are slow to enquire into cases in which care and extra attention is required."

In the other sub-divisions, also, careful arrangements are being elaborated to meet any distress that may exist.

In Sarun, the numbers on charitable relief are very small. In the whole Hutwa Raj, only 60 persons are shown as receiving charity at present, and at most 800 to 1,000 persons are expected to need aid in the Hutwa sub-division. In Chumparun, the organisation has, with the aid of planters, been made

apparently very complete. In the districts south of the Ganges, and in most of Rajshahye division, only beggars and friendless individuals, and in Monghyr some of the very lowest classes, have as yet come in for charitable aid. In Burdwan, upwards of 9,000 persons are shown as attending the food-depôts and relief-houses. The poorer classes in this district have become accustomed to take cooked food readily at the fever food-depôts, and they have no scruples in coming for this form of relief when pinched by high prices as they are at present.

24. But little information is given in the district narratives as yet with regard to the sale of Government grain. In Bukhtiarpore (North Monghyr), 2,000 maunds have been sold to the public. From Purneah the district officer reports:—

Sales of Government grain.

"At Dengra and Kusba Amour there is less private trade than in other parts, but the scarcity is beginning to encourage private enterprise here as elsewhere. A cloth merchant of Kissengunge has opened a large store on the banks of the river, and keeps his supply up by small boats. In this neighbourhood I last fortnight authorised the sale of Government rice. Mr. Gouldsbury sold 10 maunds at Ratahat, and Mr. Wyer 16 maunds at Mathour, and 107 maunds 11½ seers at Ootri, at 15 seers per Burmah and 12 seers Bengal. The consequence of this was, that on the next hât day, at Ratahat and Mathour, not a single private trader appeared. I consequently reduced the rates to 12 seers, and forbade the sale of Government grain at the public hâts. This has restored confidence, and the beparees are now buying as fast as ever from the Purneah bazar from the merchants who import it from Ceragolah I have directed the relief officers at Dengra and Kusba Amour to sell at 12 seers and 10 seers at their relief centres on fixed days; and, after inquiry, to village communities or group of villages; not more than 100 maunds to be sold at each circle until further orders."

In Dinagepore sales to the public have begun in limited tracts, and the Magistrate is ready to sell more generally as soon as the necessity arises. In Rungpore grain damaged by the accidental burning down of a Government golah was eagerly bought up by the people at fair rates.

25. The subscriptions to the central relief committee, including those from England, amount to Rs. 13,05,373 up to date, exclusive of the Government subsidy.

26. The subject of advances to ryots is one of fast-growing importance. The extract given above in paragraph from the Durbhunga sub-divisional report shows how the plan is being worked in Tirhoot.

Advances to ryots.

In Sarun nearly 3½ lakhs of rupees have been advanced to zemindars to be expended in grain or money advances to their ryots. The following extract from Mr. Howe's report on Ramnuggur is interesting, and worthy of special notice in connection with this subject:—

"The questions of the most pressing importance are, *first*, to provide the 'Assamee' (or cultivating) population with sufficient food-grain; *secondly*, to provide them with, or to enable them to obtain seed-grain. Almost the entire population of the sub-division is agricultural, and the proportion of the cultivating class that comes to our works is small, though the actual numbers are large. The remainder now depend almost entirely on the advances they have received either from their zemindars or from Government, nor have they anything except advances to look forward to until the next rice crop is reaped. The best of them are poor and in debt, and it is from this fact that the question of advances becomes so difficult. On the one hand, unless advances are immediately made on a large scale, the 'Assamee' population will be reduced to starvation; while, on the other hand, there is the risk that, unless great care is taken in investigating each case, the security will be insufficient. To make advances too readily (except in the comparatively small class of cases coming under Rule F*) tends to demoralise the people, and renders them reckless in getting still further into debt. The difficulty is to combine sufficient promptness with sufficient caution, and to make a searching investigation without thereby losing the right moment for action. Mr. Howe has submitted a scheme which has been sanctioned, and on which he has been acting. The following is an outline of this:—A register (mouzahwar) is prepared in each tuppah, in which the amount required approximately for each village is entered. This register is prepared in the first instance by the inspector of the circle, assisted, where possible, by any influential member of the committee resident in the tuppah. It is then carefully tested by the officer in charge of the circle, who can alter (increase or lessen) the total amount fixed in round numbers. As soon as this has been done, a certain quantity of grain is sent

* *i.e.*, in the case of persons whose caste or family position preclude them from laboring.

to each village, where it is kept in charge of the headmen of the village, from whom due security for its safe custody is taken. The class of cases requiring most immediate relief, *i.e.*, 'Assamees' coming under Rule F (which fortunately are comparatively few), will then be taken up and disposed of summarily. These men can be readily found, as there are but few in each village. The object of sending grain to each village, Mr. Howe explains, is, *'first'* to give confidence, for experience shows that the mere presence of grain in a village (if the object of its being brought is known) has this effect; *secondly*, to enable the advances under Rule F to be made at once. The summary inquiry preceding distribution under Rule F will be carried on simultaneously, and, having once decided to whom to give under this rule, there is nothing like *immediate action*, which of course can only be taken if the grain is ready; *thirdly*, because now is the best time for carrying grain throughout the interior, and we should therefore avail ourselves of it. Having provided every village with an amount of grain which approximately will suffice for advances, and having relieved the worst cases under Rule F, a formal register will be prepared and carefully tested by circle inspectors and officers in charge of circles:—

1. Name of mouzah.
2. Amount already distributed either by Rajah of Bettiah, or under Rajah of Ramnuggur's loan.
3. Number and names of Assamees requiring advances, with amount required by each.
4. Nature of security.
5. Remarks.

When this return has been carefully tested, the zemindar will be called upon either to make the advance or to go security, Government making the tuccavee distribution. If he declines, the best security available will be taken, and the procedure laid down in circular No. 1088 of 25th February will be followed, *i.e.*, the zemindar will be warned that Government reserves the right to recover the advance by legislation or otherwise."

In Monghyr application for advances of this kind are numerous. The system pursued in Purneah is described thus:—

"In villages, when the people are badly off, grain is advanced on credit, the village community giving a joint bond for the repayment of the advance. This system works capitally, it keeps the people in food, it allows them to spend their money on seed, which is procurable in nearly every hât and is being imported largely from the north, and it enables us to distribute our grain at no cost at a time when carriage is available. Mr. Wyer at the Sudder has worked this system, and found that it succeeds better than any other, the people like it, and it is far better than making them advances in money, except in places (which are, in my opinion, very few) where there is no seed-grain to be had. In most villages the well-to-do ryots have seed-grain which they are ready to advance to their poorer neighbours if they see any prospect of being repaid. An advance of Government grain for food on joint security, or its sale in some cases, prevents the seed-grain from being eaten, keeps the poorer people in their homes, and enables them to cultivate their fields. The brisk trade in seed-grain is a good sign."

In Dinagepore such advances will, it is hoped, be given largely through zemindars. In Rungpore also the applications are many, and upwards of Rs. 90,000 have been advanced for this purpose. The Lieutenant-Governor is again about to call the attention of all officers in distressed districts to the fact that when the rains put a stop to out-door labor, the plan of advancing grain to ryots will be the best means open to us of tiding them over the months that must pass before they reap any crop from their fields. The security of the village headmen, or the collective security of a body of ryots, would generally be sufficient to warrant such advances.

Reserve officers.

27. The Government of India has arranged to provide a reserve of civil officers to take the place of any now employed who may break down during the course of relief operations. When the transport work is over, the Military officers now engaged in superintending that work will also be available for relief.

Stock and cash accounts.

28. Forms of account for cash and stock transactions have been supplied to the districts where Government grain is stored, and on the 15th April stock was to be taken at all golahs and store-houses.

By order of the Lieutenant-Governor of Bengal,

A. MACKENZIE,

Junior Secretary to the Government of Bengal.

CALCUTTA,
The 16th April 1874.

RESOLUTION.

SCARCITY AND RELIEF DEPARTMENT.

Calcutta, the 14th April 1874.

READ—

The District Narratives of the Patna Division for the fortnight ending on the 4th April 1874.

1. *Patna.*—Prices have fallen in the Patna district, and the yield of the spring crops has been much larger than was expected. The Lieutenant-Governor is glad to know that the suggestions, made by a committee of which Mr. Mangles was a member, for relieving the block of traffic at the Patna city station are being carried out. The Lieutenant-Governor is much concerned to hear that the coarse up-country grains in the Patna store-houses are being injured by weevils; he approves of their being sent across the Ganges for immediate use in North Behar. In other districts where there has been a demand for grain, the coarser grains have, under the orders of Government, been sold; and in the Bhagulpore division the grain which was getting spoilt has been sold at a reduced rate. The Lieutenant-Governor will now cause the issue of separate orders directing that the coarse grains in store in any distressed districts be examined, and sold off at once if they are getting spoiled. It will be necessary for the Tirhoot officers to watch carefully the storage and keeping of the northern grains now being delivered at Futwah Ghât.

2. *Gya.*—From the Gya district, also, it is reported that the yield of the spring crop is very much better than had been anticipated. The Magistrate-Collector concurs in the view, which he believes the people of the district to hold, that Gya will not be afflicted by "anything like famine" if the autumn crops are good. So long as there is no general distress, and so long as the invalid gangs suffice to provide for the weaker laborers, the Lieutenant-Governor approves of Mr. Palmer's adherence to the payment-by-results system. But the progress of the works must be closely watched, so that no weakly may be turned off, or left with insufficient for their maintenance. As yet it will not be possible to send further grain-supplies to Gya, while the needs of North Tirhoot are so very urgent; 196 persons appear to be daily in receipt of charitable relief, and the arrangements for providing this relief appear to be sufficient for present needs. The Lieutenant-Governor is glad to learn that the people of Gya have contributed liberally (subscribing Rs. 18,254) towards the district relief fund.

3. *Shahabad.*—The account of supplies of crops and of prices is favorable. It would be convenient that the Magistrate-Collector of Gya and Shahabad should, as do all other Magistrates, note the daily average of work-people for the fortnight under Section B, instead of referring to a return which is to be sent some days after to another department of Government; the Narratives would then be complete in themselves. The Lieutenant-Governor can hardly think that a rich open district like Shahabad cannot produce enough carts to carry promptly the small quantity of grain allotted to Shahabad, as well as to lift the Sarun supply from the railway station to the river. All other districts have, by offering fairly liberal rates of hire, educed very ample means of transport, and the Lieutenant-Governor anticipates that Mr. Alexander will, if any necessity occurs, be equally successful. Charitable relief is, it seems, being given daily to 239 persons. The applicants are only professional beggars and persons who suffer from physical infirmities.

4. *Tirhoot.*—Private supplies of grain are said to be insufficient in parts of the north-western sub-divisions, and prices are very high, notwithstanding that Government stores have been opened largely for sales to the public. In Mudhoobunnee the effect of opening the Government stores appears to have been satisfactory; and the Lieutenant-Governor would wish in future Narratives to have more complete information regarding the conduct and effect of sales to the public. Arrangements will be made to send up to Durbhunga and Mudhoobunnee the required quantity of copper coin as soon as possible. The condition of the people in Seetamurhee appears to be tolerably good; and it is very satisfactory to receive such assurances as Mr. Macdonnell gives of the improvement in the condition of the people of Bahera. With regard to Mr. Magrath's remarks (paragraph 12 of the Narrative), the Lieutenant-Governor would observe that a sub-divisional officer, if he find more assistance absolutely necessary, must at once represent such needs, and must not content himself with vague references in his fortnightly Narrative. Mr. Magrath is in frequent personal communication with the Additional Commissioner, and he must report at once if further superintendence is required.

5. The Lieutenant-Governor sees the difficulty which prevents the Saraisur tobacco-growers from disposing of their produce, and he will await anxiously any practicable recommendations the Commissioner may make upon the subject. He would hope that the transport department might be able to help dealers with backward empty carts or wagons on the Durbhunga railway, if only purchasers will come forward, and efficient arrangements are made to prevent delay in putting the tobacco on vehicles. At present, Sir Richard Temple would not entertain a proposal for Government to buy the tobacco, though he would quite approve of advances being made through zemindars on its security.

6. It is satisfactory that Mr. Worsley should be able to report that the condition of people in the head-quarter sub-division is as yet good. Of the deaths reported in paragraph 16, as having occurred in the Mudhoobunnee sub-division, it would seem that perhaps five may have been really due to privation. No famine-deaths are reported from other sub-divisions.

7. The figures given for relief laborers would seem to be wrongly copied; and they differ, moreover, from the numbers telegraphed from the sub-division on about the same date that the Narrative was written. Mr. Magrath telegraphed on the 6th April 250,000 people on the Mudhoobunnee works, whereas the present Narrative gives 192,000. Possibly, the latter figures may be the daily average for the fortnight.

8. The amount of grain stored in Durbhunga is still very small, compared to the allotment and the requirements of this great sub-division. Next Narrative will, it is hoped, show that the Durbhunga railway has begun to pour grain into the sub-division.

9. The Lieutenant-Governor does not fully understand Mr. Magrath's remarks at paragraph 23, and he begs that the question of the best way of making advances to ryots may be brought up before him when he reaches Durbhunga this week. He wishes advances to be given to substantial ryots who may be in need, but he desires that such advances may be in grain rather than in money.

10. On the whole, the Lieutenant-Governor is satisfied with the progress made in getting the relief organisation thoroughly to work. In regard to the plan, explained at paragraph 30, of paying salaries to the assistants of planters who may efficiently supervise extensive relief operations, separate orders have been issued on a reference made by the Commissioner. Meanwhile, the arrangement described at paragraph 30 may stand until the Commissioner reports it for sanction with his recommendation.

11. *Sarun.*—The bazars seem to be on the whole well supplied, and at only one mart out of thirty is Indian-corn quoted at a dearer rate than 14 seers per rupee. Mr. Drummond is disposed (paragraph 14) to take a less hopeful view of the spring crop yield than he did before, and it is clear that the hail-storm of the middle of March did much destruction over a considerable area. The condition of the people, however, in the parts where failure of crops was greatest has not grown worse during the fortnight, though the numbers coming upon the relief works have risen during the fortnight from 90,000 to 135,000. The Lieutenant-Governor hopes that misunderstanding such as is alluded to at paragraph 29 of the Narrative will not recur; if the Wards' estate where relief works are required cannot afford the outlay, the works must be continued from Government funds, and people must be on no account turned away. Any question as to the source from which the outlay is to be met can be subsequently discussed and settled.

12. The question raised at paragraph 33 of the Narrative, as to Government taking over certain extra grain (28,000 maunds), ordered for miscellaneous Wards' estates in Sarun, can be settled when the Commissioner's recommendation shall be received. Meanwhile, the grain can be received, transported, and stored as a part of the Government allotment for the district, and the Calcutta grain officers will be directed, pending further orders, to reckon this quantity (28,000 maunds) as receipts towards the Sarun allotment.

13. The Lieutenant-Governor notices with satisfaction that the Magistrate-Collector of Sarun continues to give large advances to zemindars for the maintenance of their ryots. The Lieutenant-Governor would wish that these advances should for the future be made, as far as possible, in grain, at the rate of Rs. 2-8 a maund for Burmah cargo rice, and Rs. 3-4 a maund for the better kinds of clean rice.

14. Seeing that the system of relief works has shielded the district so far from general distress, the Lieutenant-Governor will not press the Magistrate-Collector to make more extended or elaborate arrangements for charitable relief, beyond what is described in his paragraphs 36-38.

15. *Chumparun.*—The Chumparun Narrative is, the Lieutenant-Governor is glad to find, very satisfactory. The people, whether on the works or in their villages, are getting into better condition; few cases of emaciation are seen, and no cases of starvation are heard of. Supplies of grain are, with help of the Government stores which have been opened in the worst tracts, sufficient, though clean rice is nowhere selling cheaper than 11 seers the rupee. The Lieutenant-Governor quite approves of the action of Mr. Oldham and some of the other relief officers, in exacting light task-work from the work-people who have not recovered their strength and condition.

The quantity of grain finally stored in the district is now 500,000 maunds, and should suffice for the work-people, and for advances to ryots. The Lieutenant-Governor is very anxious that this business of making advances to ryots should be pressed on systematically and actively; and he has been much interested in reading Mr. Howe's account of the system under which he makes his advances. Seeing how very badly off the ryots in Ramnuggur are said to be, and how very doubtful (the areas given at page 4 as the total spring and cheena breadths in a large tract are almost incredibly small) the prospect of the millet crops is, the grain advances to ryots cannot be begun too early. Those who happily have grain of their own will not take the Government grain when they know they have to repay it. If the difficulty about material security for advances be very great, the relief officer must be content with the security of the village headmen, or the collective security of a body of ryots.

By order of the Lieutenant-Governor of Bengal,

C. BERNARD,
Offg. Secy. to the Govt. of Bengal.

No. 2399—S.R.

Copy, with copy of the District Narratives, forwarded to the Commissioner of Patna, whose attention is invited to paragraphs 1, 5, and 11; to the Relief Commissioner Durbhunga, whose attention is invited to paragraphs 4 and 9; to the Commissioners of Rajshahye, Bhagulpore, and the Relief Commissioner, Rajshahye, whose attention is drawn to the remarks in the Patna Narrative, about injury done to the coarser grains in store, and who are requested to take steps for giving effect to the orders in paragraph 1 for the examination and disposal of these grains; and to the Magistrate-Collectors of Patna, Gya, Shahabad, Tirhoot, Sarun, and Chumparun.

By order of the Lieutenant-Governor of Bengal,

C. BERNARD,
Offg. Secy. to the Govt. of Bengal.

CALCUTTA,
The 14th April 1874.

No. B, dated Bankipore, the 5th April 1874.

From—A. C. MANGLES, ESQ., Collector of Patna,
To—The Offg. Secretary to the Government of Bengal, Statistical Department.

I have the honor to submit the following narrative for the fortnight ending Saturday, the 4th instant.

A.—STATE OF THE COUNTRY.

2. The bazaars at the head-quarters and the interior of the district are still well supplied with grain of all descriptions, and I have not heard of there being any deficiency anywhere.

3. I have during the fortnight been busily engaged in endeavouring to clear the block at the Patna city and ghât stations, and I am glad to say that I have to a certain extent succeeded in doing so, inasmuch as the company have been able to unload all their wagons, and none are now standing under load. To do this, however, I have been obliged, besides visiting the stations myself, to depute Mr. Assistant Magistrate Allen to the Patna city station, and one of my deputy magistrates to the ghât station, to look after the railway clerks, and at the same time to see that the mahajuns come to take delivery of their goods. This can hardly be said to be the legitimate work of district officers; but still as I am satisfied that unless there is proper European supervision a block would again occur, I am still rendering the assistance to the company, in the hope that it will soon take this responsibility upon itself, and appoint officers to settle all disputes arising between the clerks and the mahajuns regarding the charge of demurrage and the giving and taking delivery of goods.

4. The following were the prices of grain obtaining during the fortnight:—

	Seers.
Patna.	
Rice, best	11
,, common	13
Wheat	16
Barley mixed with gram	21
Jowar	21
Maize	19
Gram	20
Behar.	
Rice, common	12¼
Maize	15
Wheat	13
Barley	17
Gram	17½
Dinapore.	
Rice	11½ to 12¼
Maize	15½ to 17½
Wheat	13 to 15½
Khesaree	18 to 19
Mussoor	18 to 19

No return has been received from Barrh as yet.

5. From the above it will be seen that the prices of all sorts of grain, not excepting rice, have fallen in the principal marts; and in the mofussil also, owing to the harvesting of the rubbee crops, there has been a slight tendency to cheaper rates, and this even in those parts of the district where we expected to have the greatest distress, the rice and bhadoi crops having been almost failures.

6. We had no rain during the fortnight, and it was not required, as what we wanted was dry weather to allow of the cold-weather crops being cut and harvested. This has now

nearly been completed, and the outturn is better than was expected. On this subject the Deputy Collector of Behar writes: "There has been a full 16-anna crop over the land that had been sown with rubbee. Taking the average of the yield of the former years, this year's produce is by no means less than three-fourths." In the Barrh sub-division I should reckon the crop as a 14-anna one, and in the Sudder and Dinapore sub-division at not less than 12 annas. During the fortnight I deputed one of my deputy collectors, Syed Ameer Hossain, to visit the south and south-west portions of the district, they being the parts concerning which I had the greatest anxiety, and I was glad to learn from him that nowhere had there been less than an 8-anna crop, whilst in some parts there had been full 16 annas.

7. No case of misery or starvation was brought to light during the fortnight; and though the high prices are to a certain extent felt by the lower classes, they have, during the late harvest, been able to collect a certain amount of grain which will assist in keeping them till the next bhadoi crop comes in. There is an abundance of grain in this district, so that all we want is to provide labor, of which there is plenty on our roads for those seeking it.

8. No case of grain-robbery was reported during the fortnight, and the 8 cases of theft were all of a petty nature.

9. The statement of crimes, prescribed by the Government circular of 20th December last, not having yet been received from the District Superintendent, cannot be submitted with this report, but it will be forwarded as soon as possible.

10. 124 emigrants for British Burmah were registered during the fortnight. Of these 75 have already been despatched to Calcutta, and the remaining 49 will be sent immediately. Of the 124, 56 were residents of this district, 24 of Gya, 14 of Sarun, 10 of Tirhoot, 1 of Chumparun, and 9 came from the North-Western Provinces.

B.—Relief Works.

11. The daily number of laborers on our relief works and local roads is fast increasing; and now that the harvesting of spring crops has been completed, I expect it will continue to do so. By the latest returns received from the Executive Engineer, which bring us up to the 28th of March, there were 10,015 laborers employed on the different works throughout the district, or some 1,000 in excess of the number reported in my last fortnightly.

12. In my original scheme for relief works, submitted to Government through the Commissioner in December last, I had, in addition to the works on the roads, estimated for Rs. 32,000 to be expended on the excavation of tanks where found necessary; and in my last fortnightly I informed that I had selected the sites for six such tanks. As the work in the fields is now daily becoming shorter, I have applied to the Commissioner for sanction to commence on some of these tanks, and for this purpose have asked that Rs. 10,000 out of Rs. 32,000 estimated may be placed at my disposal.

13. During the fortnight we received Government sanction to the proposed work of reclaiming a large swamp at the back of the Patna city, which work will be taken in hand at once; and as it is to cost some Rs. 50,000 should afford labor to all those seeking it in the city and its surrounding villages for some months to come, or at any rate till the rains, when they will be able to again find employment in the fields.

C.—Transport of Grain.

14. The subjoined figures will show the quantity of grain imported into the district during the fortnight ending the 28th ultimo:—

	Rice.	Wheat, oats, and barley.	Janera.	Other grains.
	Mds.	Mds.	Mds.	Mds.
By rail	2,28,172	64,357	62,172	1,81,016
By river	550	100	3,610	1,540
Total ...	2,29,092	64,457	65,782	1,82,556

Or a grand total of 5,41,817 maunds, exclusive of wheat, was received at the Futwah branch line for Government, but inclusive of the Government grain received at Barrh and Mokameh. The figures showing the actual quantity of such Government grain have not been obtained; but it is roughly estimated to have been about 1,50,000 maunds, leaving the balance of 3,91,817 as private importations.

15. During the week ending the 28th ultimo, the private importations at the Patna ghât station have again fallen below those at the Patna city station, as shown by the following figures:—

	Mds.
Patna ghât	66,990
Patna city	86,252

And I am satisfied that the increase of receipts at the Patna ghât, as shown in my previous narrative, was only owing to the Railway Company having compelled consignees to consign their goods to the ghât during the block, and to ease the city station.

16. Our means of transport continue sufficient to meet all requirements; and now that large batches of bullocks and carts are continually coming from the North-Western Provinces,

I hope that I shall not again be compelled to have recourse to our local means of transport in the conveyance of treasure to other districts, and shall be able to leave it entirely for the use of private traders.

17. In my last fortnightly narrative I informed that I had made arrangements for the supply of 85,000 maunds of fodder for Tirhoot, and I have now made other arrangements for another 15,000 maunds, thus completing the lakh which I was called upon to supply. Behar has already commenced sending in its share, consisting of 25,000 maunds to Chumpta, and my supplies for Bunker Ghât will begin coming in from to-morrow. I propose starting it for the purpose of weighment, &c., in the old jail buildings at Deegah, which are on the banks of the river, and from whence therefore there will be no difficulty in sending it on to its final destination.

D.—Storage of Government Grain.

18. No further supplies of grain have been received in this district, and no alterations have been made in the distribution of that which had been previously stored. All the golahs in the Sudder sub-division were visited during the fortnight by the Deputy Collector, Syed Ameer Hossain, who has been appointed district grain officer. He reports favorably regarding them; and states that, so far, the grain stored has not been damaged by climate or insects; but I am sorry to say we have not been so fortunate in the Barrh and the Behar sub-divisions, from whence the sub-divisional officers report that all the coarse grains have been attacked by weavils and other insects, and are fast being destroyed. I have obtained the Commissioner's sanction to sending the Barrh stores across the river to Tirhoot for immediate use, and if the same cannot be done with the grain now in Behar, I will direct the Deputy Collector to sell it for what it will fetch. The Dinapore sub-divisional officer also reports that his grain has, to some extent, been damaged; and as it is not likely that we shall ever require any of it, I intend asking the Commissioner's sanction to be allowed to dispose of all the up-country grain assigned to this district.

E.—Advances to Private Parties.

19. No advances for purchase of grain were made during the fortnight. I have already expended the sum allotted me for the purpose; and so long as our markets continue as well stocked as they are at present, I do not consider that any further advances are necessary, especially as those who have taken them and have purchased grain find considerable difficulty in disposing of it, as the prices in the local markets are quite as low as they could afford to sell at.

20. The sum of Rs. 9,500 was advanced during the fortnight to different zemindars in the Behar sub-division for agricultural improvements. Some other applications were received, but rejected, as from inquiry it was elicited that the money was not intended to be spent on the works entered in the petitions, but either to cover low expenses or to be used in paying debts, &c.

F.—Charitable Relief.

21. Nothing was done under this head during the fortnight, there having been no necessity for it. Some of the native gentlemen, both in the city and in the interior of the district, have opened alms-houses, which at present meet all requirements.

G.—Financial Result.

	Rs.	As.	P.	Rs.	As.	P.
As per account already rendered	.....			1,85,421	3	0
Paid to nazir on account of railway freight of 3 boxes of medicines	3	0	0

Grand Total				1,96,167	7	6

No. 507F, dated Gya, the 6th April 1874.

From—A. V. PALMER, ESQ., Collector of Gya,

To—The Secretary to the Government of Bengal, Relief and Scarcity Department.

I have the honor to submit my fortnightly report on relief and scarcity in Gya district for the fortnight ending Saturday, 4th April.

A.—STATE OF THE COUNTRY.

2. The bazars continue to be sufficiently supplied with food-grains of all sorts. The annexed table will show the reported price-currents during the past fortnight. It will be observed that food-grains are generally somewhat cheaper than they were a fortnight ago. This is the result of the reaping of the spring harvest, some of which produce has already come into the market.

3. The rates as here detailed may be taken as being the highest rates that obtain, and there is no doubt that agriculturists and field laborers obtain their supplies very much below the rates here stated :—

BAZARS.	WHEAT.		BARLEY.		RICE, BEST SORT.		RICE, COMMON.		MILLET.		MAIZE.		GRAM.

4. There has been no rainfall within the district during the past fortnight. The weather has been everything that could be desired for gathering in the harvest. The sufficient rain in February brought new life to the rubbee crops, which resulted in the ears of corn being well filled and the crops heavy. From every part of my district I am assured that the outturn has realized the most sanguine anticipations. Since the heavy rain in February we have had occasional showers up to within the last fortnight, during which bright weather and a wholesome westerly wind have prevailed.

5. I dare say that a more favorable weather for the harvest could not have been. For the past month at least I have neither seen nor heard of caterpillars, blight, or such like crop-destroyers.

6. I am happy to be able still to pronounce the condition of the people to be generally good.

7. It is extraordinary, with all the preparations around and the unusual action of the Government in importing food, to notice the apathetic character of the people. They at any rate have no gloomy anticipations, nor do the higher classes of natives anticipate anything like a famine. In this view I concur. I think that after the rubbee crops are threshed and stored, we must be prepared to find labor for the laboring and other classes, as distinct from agriculturists.

8. That the time has not yet arrived is clear from the indifference with which laborers come to our works, and the terms they wish to enforce before working at them.

9. No cases of misery or starvation have happily yet been heard of. Measures are being taken by which the state of each tract is ascertained, and where any real distress is apparent immediate relief has hitherto been afforded.

10. Grain thefts and robberies are not materially increasing, but offences against property generally, as previously noticed, have been steadily increasing for several months past.

11. The annexed comparative statements will exemplify at a glance what I have just stated.

Comparative Statement of crime in which grain was stolen in the Gya District for the month of March 1874, as compared with those corresponding month of 1873 and 1872.

	Theft in which grain was stolen, sections 379 and 380.					House-breaking in which grain was stolen, section 457.					Total of all crimes.

B.—RELIEF WORKS.

12. The statement to be submitted two days hence to the Public Works Department of the Bengal Secretariat will, at a glance, give all detailed information of numbers of work-people employed. This information I have not by me at present in a complete form.

13. The marking out of the Puraya road has not yet been reported completed. I have begged the Executive Engineer to hasten it as much as possible, as I am anxious to commence work there by the 10th of this month. During the fortnight the Warisligunge road has been started in the Nowada Sub-division, an invalid gang having at the outset been employed.

14. There appears to be some hesitation with laborers to do work on the payment-by-result system. This I attribute to one or two cases in which duffadars on invalid gangs have freely dealt out daily payments without in the least degree exercising themselves in seeing that a fair amount of labor was given in return.

15. I have very great difficulty in obtaining competent duffadars, and also in getting them promptly looked after. Food in some cases is obtainable at a greater distance than I should wish; but many laborers bring their food with them; and as long as the laborers themselves are content with the existing arrangements, it is impolitic to make fresh ones, which, though for their benefit, would not be so construed, and might serve as a ground for discontent. The Magistrate of Jehanabad asserts that the able-bodied persons coming for work object to the payment-by-result system, inasmuch as they distrust the duffadars and Government.

16. If the system as indicated in my last report is followed and the work measured up every other day, and these measurements be again tested by a superior officer every 7 or 15 days, it is simply impossible that cause for distrust should exist, and I am quite satisfied that, if the sub-divisional and other officer superintending the work will personally take a little trouble to set the work going, this form of relief is by far the best adapted for able-bodied men seeking employment. These men should not be permitted to overcrowd the invalid gangs, the cases of the two sets of men being altogether different.

C.—Transport of Food.

17. The annexed table will give in a compact and condensed form an approximate account of food-supplies privately imported during the fortnight.

Private Importations.

Bazars.	Wheat.	Barley.	Rice, best sort.	Rice, common.	Millet.	Maize.	Gram.	Total.
	Mds.	Mds	Mds.	Mds.	Mds.	Mds.	Mds	Mds.
Gya	476	241	193	1,404	36	228	372	2,950
Nowada	...	...	...	12	...	...	35	47
Jehanabad	65	75	23	64	...	52	74	353
Aurungabad	154	...	15	300	...	8	145	622
Daoodnuggur	2,300	600	1,700	1,700	...	100	1,200	7,600
Total ...	2,995	916	1,931	3,490	36	388	1,826	11,572

18. This gives a total of 11,572 maunds against 9,599 maunds imported during the previous fortnight. This increase of 1,973 maunds is satisfactory.

19. Similarly there has been an improvement in the private importations reported in the the Sudder Bazar of Gya as hereunder shewn :—

Bazars.	Wheat.	Barley.	Rice, best sort.	Rice, common.	Millet.	Maize.	Gram.	Total.
	Mds.	Mds.	Mds.	Mds.	Mds.	Mds.	Mds.	Mds.
Fortnight ending 4th April	476	241	193	1,404	36	228	372	2,950
Ditto ditto 21st March	477	137	65	1,212	22	367	217	2,497

20. There is at present a diminution in the supply of carts. This is attributed, and rightly so I think, to two causes.

1*st*.—The very high rates and quasi-impressment of carts entering Patna for service in carriage of grain to the north of the Ganges.

2*ndly*.—To the large number of carts at present secured by the Opium Department for conveying opium jars to the Patna godown. The opium season in this district has been a bumper one. I trust that the latter cause will cease to exist before I am required to transport from Patna my newly allotted supply of grain.

D.—Storage of Government Grain.

21. The following is a summary of grain already stored in the district :—

	Mds.
In Sudder Sub-division	46,490
In Jehanabad	34,850
In Nowada	35,116
In Aurungabad	28,800
Total ...	1,45,256

22. I have about 5,000 maunds still to receive of my former allotments (1,50,000 maunds), which I have requested Mr. Toynbee to send to Bankipore. Under Sir Richard Temple's instructions a further allotment of 70,000 maunds has been advised, and which I have distributed thus :—

Sub-divisions.	Grain.	Rice.	Total.
	Mds.	Mds.	Mds.
Sudder Sub-division	10,000	25,000	35,000
Jehanabad „	5,000	5,000	10,000
Nowada „	5,000	10,000	15,000
Aurungabad „	5,000	5,000	10,000

23. And I have, reqested the Commissioner and Mr. Toynbee to send these quantities to the railway stations, Bihta, Bankipore, and Buktearpore, respectively.

24. I do not apprehend that it will be necessary to incur further expense for housing this grain. Of the 70,000 maunds 50,000 will go to Gya and Nowada, at both of which places I have arranged with the Sub-Deputy Opium Agent for accommodation.

E.—Advances to Private Parties.

25. These advances are—

1*st*.—For purchase of grain.

2*nd*.—For land improvement.

1*st*.—*For purchase of grain*.—During the fortnight there have been three applications; of these one has been granted and two are under inquiry.

2*nd*.—*For Land Improvement*.—The first of the annexed statements will show the transactions during the past fortnight, and the second what the total number of applications have been and how disposed of

Advances taken for Land Improvement.
