Chingleput
DISTRICT COLLECTOR'S OFFICE,
Saidapet 4th May 1897

From

D. D. Munday Esquire
Collector of the
Chingleput District,

To

The Secretary to Government,
Local & Municipal Department,
Madras.

SIR,

G.O. 684^m
24/3/97

In continuation of my letter Ref on No. 426^{fmlb}, dated 11th March 1897, I have the honor to report for the information of Government that the District Medical and Sanitary Officer, Chingleput, informed me in his letter No. 1407, dated 26th April 1897, that he had visited Jomporur, a village in the Chingleput Taluk, on the 25th Id, in consequence of his having received from the Local Hospital Assistant on the previous day a report of 3 cases of glandular swellings and fever. The District Medical Officer found that they were not ca

of Bubonic Plague. I received the letter on the 27th Idem and forwarded a copy of it on the same date to the Sanitary Commissioner for Madras.

2. The District Medical and Sanitary officer also reported the matter in detail to the Sanitary Commissioner for Madras in his letter No. 11407, dated 26th April & (this copy enclosed). On receipt of this letter the Sanitary Commissioner sent a telegram to him (copy enclosed) stating that he considers "full action as to segregation in house and disinfection essential." (The telegram was received by him yesterday, and shown to me in the afternoon). I have therefore notified the District Gazette that the Regulations issued by Government under the Epidemic Diseases Act, 1897, shall take effect from this date, the 4th May, village of Temporum and have

appointed the Tahsildar of Chingleput Taluk to exercise powers granted by Regulation District Medical and Sanitary and the Tahsildar were to go to village this morning and arrange the segregation of the three in question and otherwise carry out the Sanitary Commissioner's orders.

I have the honor to be,
Your most obedient
servant,
Ag. C.

To

The Sanitary Commissioner
Madras

Sir,

I have the honor to bring
notice that on the evening of 21st Instant I received a letter from
Hospital Assistant Timppornay
that 3 cases of fever with gland
swellings had occurred in the
Timppornay and that he was unable to
diagnose them as abortive or a
plague. The cases were first at
day since, and were only brought
to his notice on 23rd Instant when
they were free from fever
swelling of glands had almost
appeared in one case but is
present in the other two.

I proceeded to visit the
yesterday morning.

The persons suffering were
aged 50 mother of 2 and 3.

12
1835. m.v.

aged 50
aged 25

are fairly well off and live in
principal streets of the town
are stone cutters by trade and
lands which they cultivate. The
fairly large and ventilated,
household consists of nine persons
20 and 10 females the ages of
range from 50 to 17 years the
and backyards are fairly clean.
family has not left the town
20 years, nor have they been
any person from any place
with plague they live principally
at Naggi.

There is a well in the backyards but
their supply of drinking water
is quite scant which is close to

following is the history of the

female aged 50 was first attacked
and swelling of glands in left

April 97 subsequently fever

on 15 and 16 she went to
complaining of fever and

for Ague. She made no mention

of

of pain and swelling axillary

On 16 April the two males
were attacked with pain and
glands, the former of left axilla
latter of right axilla. From the
of the former to me I gather he
felt pain in left axilla, then he
swelling which gradually increased
with increased pain. The swelling
to the whole of the left pectoralis
muscle; with the spread of the
fever appeared. He then attended
dispensary on 16. Complaining of
continued fever and was treated
such. He attended again on 17 but
neither occasion did he make
of the glandular swellings. The
better and he did not attend
after the 17 April. In the case of
man aged 25 the disease took the
course but in a milder form
case of his elder brother and
appear that he took any medicine.

All three complained of
vertigo and pains in limbs &
presence of the fever.

When I examined the patient
I found them up and about.
however that the old woman
elder man still felt weak and

to tie down more than usual
All three covered with beetle stains
in.

6 woman had a single small
swelling in the middle of left
around the skin thin dry and
was infiltrated with a lot
fatty products; the gland was
to touch.

in aged 35 swelling in middle
the about the size of an egg tender
around there were signs of old
left pectoral muscle both
is more prominent than right.

in aged 25 small single enlarged
middle of right axilla - not
touch.

men were free from glandular
in groin.

It thus be seen that the cases are
in plaque at all either of
nate or abortive type. but of
atory fever consequent on
the cause of the adenitis I
discover the fact of 3 persons
use, being attacked within a
of each other points to a local
it does not explain the
enjoyed by the other 6 members
of

of the household.

I have directed the Hospital
to watch the cases carefully &
reports the progress of the cases
any other similar cases occur
