APPENDIX.

A few simple Rules for the treatment of Plague before the Doctor arrives.

The patient should be treated as much in the open air as possible. A tent well protected from the sun and with the side *kanats* raised to allow wind to blow through, makes an excellent sick ward. The floor should be kept covered with lime-wash, renewed once in two days or so. Everything leaving the sick-room should be disinfected. Glass, cutlery and crockery should be scalded. Bedding and clothes should be boiled for half an hour or soaked in disinfectant for some hours before washing. The most convenient disinfectant is ½ oz. mercuric chloride, 1 oz. hydrochloric acid in 3 gallons (a stable-bucket full) of water, coloured with red-ink powder. No metallic vessels should be used for storing this solution, and any clothes soaked in it should be steeped for an hour in water before being sent to the dhobie. *All* discharges of the patient should be sprinkled with lime and at once burned.

The patient should be kept constantly lying down, not being allowed to sit up even to relieve bladder or bowels until at least four days after fever has ceased. This is to avoid danger of sudden collapse and death from failure of heart's action.

As the tongue is generally coated, calomel in a dose of 5 to 10 grains should be given, followed by a dose of salts some hours after, if necessary. Sponging and ice to the head for the fever, but no phenacetin or antifebrin, as the heart is early affected. Stimulants are early called for and should be given with a liberal hand. For the thirst, ice to suck, and any ordinary cooling drink in moderation. Food should be given in small quantities and frequently, chicken or other soup or essence, conjee, milk, milk and soda iced. The stomach should not be distended with large quantities of food or drink.

Retention of urine may occur early in delirium, and will require the catheter.

A FEW SIMPLE RULES FOR THE TREATMENT OF PLAGUE

BEFORE THE DOCTOR ARRIVES.

2P

The patient should be treated as much in the open air as possible. A tent well protected from the sun and with the side kanats raisd to allow wind to blow through, makes an excellent sick ward. The floor should be kept covered with lime-wash, renewed once in two days or so. Everything leaving the sick-room should be disinfected. Glass cutlery and crockery should be scalded. Bedding and clothes should be boiled for half an hour or soaked in disinfectant for some hours before washing. The most convenient disinfectant is ½oz mercuric chloride, 1oz. hydrochloric acid in 5 gallons (a stable--bucket full) of water, coloured with red-ink powder. No metallic vessels should be used for storing this solution, and any clothes soaked in it should be steeped for an hour in water before being sent to the dhobie. All discharges of the patient should be sprinkled with lime and at once burned.

The patient should be kept constantly lying down, not being allowed to sit up even to relieve bladder or bowels until at least 4 days after fever has ceased. This is to avoid danger of sudden collapse and death from failure of heart's action.

As the tongue is generally coated, calomel in a dose of 5 to 10 grains should be given, followed by a dose of salts some hours after, if necessary. Sponging and ice to the head for the fever, but no phenacetin or antifebrin, as the heart is early affected. Stimulants are early called for and should be given with a liberal hand. ~~Beer and stout for Europeans, whisky and brandy well diluted and iced.~~ For the thirst, ice to suck, and any ordinary cooling drink in moderation. Food should be given in small quantities and frequently, chicken or other soup or essence, conjee, milk, milk and soda iced. The stomach should not be distended with large quantities of food or drink.

Retention of urine may occur early in delirium, and will require the catheter.
