READ—the following papers:—

Report from the Cantonment Water-supply Committee, Bellary, dated 5th Feb. 1889, No. 148.
Endorsement of the Public Department, dated 11th February 1889.
Letter from the Superintending Engineer, III Circle, dated 30th April 1889, No. 253.

ORDER—dated 17th May 1889, No. 1317 W., Public Works.

The first paper recorded above is the report of the Committee assembled under G.O., No. 3609 W., dated 14th November 1888, to inquire into the question of the water-supply to the cantonment of Bellary. The consideration of the report will be deferred pending the results of the investigation of the Tungabhadra project, for which a special officer, Mr. A. S. Russell, Executive Engineer, has recently been appointed.

No. 253.

Superintending Engineer's Office,
3RD CIRCLE,

Bellary 30 April 1889.

From,

Col. S. Smalley
SUPERINTENDING ENGINEER,

IIIrd CIRCLE.

To,

THE Chief Engineer

Sir,

1317

Madras

Enclosures.

Statement of
the

Your Memo No. 1095 C dated 5th
March 1889.

The Statement in my Memo
to the Collector of Bellary appended to
the report of the Committee on the Water
supply to the Cantonment that it would
take 10 1/2 inches of rain fall in the catchment
to fill Aliore Tank an inadvertent error in
your Memo under reply, was not meant to
imply that in ordinary years the tank would
be filled by that, or the whole yearly rain
fall averaged at 16 1/2 inches, but only that
it would take at least that amount of
rainfall on the catchment to fill it and
it should have been added if continuous

tank filling rain. No argument was based on this bare statement. On the contrary all my suggestions were and are to enlarge the catchment of Alipore and Fischer's tanks as far as physical limits would permit in order to bring every drop of rain possible into them for storage.

2. I forward a compilation of the rain fall Register maintained in the Executive Engineer's Office from April 1885 to March 1889 inclusive, compared with the Register of Alipore tank for the same period as far as available, and of the Fort Ditch. For Fischer's tank no register has been maintained hitherto: no note has been made in the Registers hitherto, of how much water was let down to the Fort Ditch or what depth passed off to waste over the weirs of Alipore and Fischer's and the Fort Ditch weirs respectively, nor of the surplus discharged by the Chuttnum Nullah over the Annicut.

- In future the Registers must show daily
- (a) Water passing over Chuttnum Nullah Annicut
 - (b) — Do — through — Do — 1st sluice
 - (c) — Do — over Alipore tank weir
 - (d) — Do — through Alipore tank sluice
 - (e) — Do — over Fischer's tank 2 weirs.
 - (f) — Do — through — Do — 2 sluices.
 - (g) — Do — over Fort Ditch Weir.
- (1317)

We might also have contoured plans of Alipore tank, Fischer's tank, and the Fort Ditch and surveys of their catchment area including extended catchment and fixed Bench Marks on the weirs and sills of sluices. The plans we have are not to be depended on and there have been alterations since they were drawn which are not marked on them. I propose that the whole scheme be resurveyed and levelled. A fair gauge should probably be maintained independently at Alipore tank.

7

3. The catchment of Alipore tank is divided into 2 parts viz^t that of the Chuttrun Vallah which is turned into the tank. 6.43 Sq. miles (and which it was proposed to increase to 9 Sq. miles by turning another Vallah into it, but this was never carried out); and that independent of the Chuttrun Vallah 2.5 Sq. miles. The full supply is given 22.72' on the sluice gauge but the greatest recorded supply is not more than 19' in November 1874, when it was mentioned, & was not considered safe, to let in more having regard to the banks and settlements. The tank is calculated to hold 94 millions ft.

On looking through the Comparative Gister sent herewith, it will be observed at the heaviest rain fall in one day corded during the period to which it

refers was on the 30th June 1887 4" which ^{raised} Alipore tank from 0 to 7'6" and the Fort Ditch from 4'9" to 11'10". There had been rain previously which must have saturated the ground more or less. The highest record for Alipore tank is 8' Nov. 1885. 15'9". This was after heavy rain in the previous 2 months. The total rain fall of that year was exceptionally heavy, nearly double the average. The highest record for the Fort Ditch is Dec. 18'6" 13'8". The lowest record for Alipore tank is nil the water from it being let down to the Fort Ditch about the 1st March annually. The lowest record in the Fort Ditch is 3'8" on the 22nd June 1885.

(317)

I have the honour to be
Sir
Your most obed^t servant.

H. Malley C.E.

Supg. Engineer
3rd Mile

Bellary Water Supply

1317
W
 In my notes on this
 subject I have advocated
 the tentative measures,
 A. B. C recommended
 by the Committee, being
 carried out, and the
 fact that the Tungabhadra
 project is about to be taken
 up, seems to me an
 additional reason to
 avoid any expenditure
 on works, connected with
 the improvement of the
 Bellary water supply,
 that may afterwards
 require modification
 in connection with that
 project.

W. M. S.
6.5.89

I do not think that
 any money should be
 spent on carrying out the
 proposals of the Committee
 pending the result of the in-
 vestigation of the Tungabhadra
 Project for which person
 Mr Russell has been lately
 appointed.
